Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32 chip by Espressif.

After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then building, and flashing firmware onto an ESP32 board.

Note: This is documentation for branch release/v4.0 of ESP-IDF. Other ESP-IDF Versions are also available.

1.1 Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth 4.2
- Dual high performance cores
- Ultra Low Power co-processor
- Several peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

Hardware:

- An ESP32 board
- USB cable - USB A / micro USB B
- Computer running Windows, Linux, or macOS

Software:

- Toolchain to compile code for ESP32
- Build tools - CMake and Ninja to build a full Application for ESP32
- ESP-IDF that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the Toolchain
- Text editor to write programs (Projects) in C, e.g., Eclipse
Chapter 1. Get Started

Fig. 1: Development of applications for ESP32

1.3 Development Board Overviews

If you have one of ESP32 development boards listed below, you can click on the link to learn more about its hardware.

1.3.1 ESP32-DevKitC V4 Getting Started Guide

This guide shows how to start using the ESP32-DevKitC V4 development board. For description of other versions of ESP32-DevKitC check ESP32 Hardware Reference.

What You Need

- ESP32-DevKitC V4 board
- USB A / micro USB B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP32-DevKitC V4 is a small-sized ESP32-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-DevKitC V4 on a breadboard.

To cover a wide range of user requirements, the following versions of ESP32-DevKitC V4 are available:

- different ESP32 modules
  - ESP32-WROOM-32
  - ESP32-WROOM-32D
  - ESP32-WROOM-32U
Chapter 1. Get Started

- ESP32-SOLO-1
- ESP32-WROOM
- ESP32-WROOM-B
- ESP32-WROOM-I
- ESP32-WROOM-B (IPEX)

• male or female pin headers.

<td>Most of the pins on the ESP module are broken out to the pin headers on the board. You can program ESP32 to enable multiple functions such as PWM, ADC, DAC, I2C, I2S, SPI, etc.</td>
</tr>
</tbody>
</table>
Note: The pins D0, D1, D2, D3, CMD and CLK are used internally for communication between ESP32 and SPI flash memory. They are grouped on both sides near the USB connector. Avoid using these pins, as it may disrupt access to the SPI flash memory / SPI RAM.

Note: The pins GPIO16 and GPIO17 are available for use only on the boards with the modules ESP32-WROOM and ESP32-SOLO-1. The boards with ESP32-WROVER modules have the pins reserved for internal use.

Power Supply Options

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

Warning: The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.

Note on C15

The component C15 may cause the following issues on earlier ESP32-DevKitC V4 boards:

- The board may boot into Download mode
- If you output clock on GPIO0, C15 may impact the signal

In case these issues occur, please remove the component. The figure below shows C15 highlighted in yellow.

Fig. 3: Location of C15 (yellow) on ESP32-DevKitC V4 board

Start Application Development

Before powering up your ESP32-DevKitC V4, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to ESP32 Hardware Reference, where Section Installation Step by Step will quickly help you set up the development environment and then flash an example project onto your board.

ESP32-DevKitC V2 Getting Started Guide  This guide shows how to start using the ESP32-DevKitC V2 development board.

What You Need

- ESP32-DevKitC V2 board
- USB A / micro USB B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview  ESP32-DevKitC V2 is a small-sized ESP32-based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-DevKitC V4 on a breadboard.

Functional Description  The following figure and the table below describe the key components, interfaces and controls of the ESP32-DevKitC V2 board.
## Key Component

### Power Supply Options

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3.3V / GND header pins

**Warning:** The power supply must be provided using **one and only one of the options above**, otherwise the board and/or the power supply source can be damaged.

### Start Application Development

Before powering up your ESP32-DevKitC V2, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to [ESP32 Hardware Reference](#), where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

1.3.2 ESP-WROVER-KIT V4.1 Getting Started Guide

This guide shows how to get started with the ESP-WROVER-KIT V4.1 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V4.1 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview

ESP-WROVER-KIT is an ESP32-based development board produced by Espressif.

ESP-WROVER-KIT features the following integrated components:

- ESP32-WROVER-B module
- LCD screen
- MicroSD card slot

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

---

Note: ESP32’s GPIO16 and GPIO17 are used as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview

The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description

The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Chapter 1. Get Started

Fig. 6: ESP-WROVER-KIT block diagram

Fig. 7: ESP-WROVER-KIT board layout - front
### FT2232
The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232 chip enhances user-friendliness in terms of application development and debugging. See ESP-WROVER-KIT V4.1 schematic.

### 32.768 kHz
External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.

### 0R
Zero-ohm resistor intended as a placeholder for a current shunt, can be desoldered or replaced with a current shunt to facilitate the measurement of ESP32’s current consumption in different modes.

### ESP32-WROVER-B
This ESP32 module features 64-Mbit PSRAM for flexible extended storage and data processing capabilities.

### Diagnostic LEDs
Four red LEDs connected to the GPIO pins of FT2232. Intended for future use.

### UART
Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP2 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.

### SPI
By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the voltage of this interface is 3.3V.

### CTS/RTS
Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.

### JTAG
JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP2 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.

### USB Port
USB interface. Power supply for the board as well as the communication interface between a computer and the board.

### EN/Reset Button
Reset button. Systems

### Boot Button
Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.

---

*Fig. 8: ESP-WROVER-KIT board layout - back*
Setup Options

There are three jumper blocks available to set up the board functionality. The most frequently required options are listed in the table below.
### Chapter 1. Get Started

</tr>
</tbody>
</table>
**Allocation of ESP32 Pins**

Some pins / terminals of ESP32 are allocated for use with the onboard or external hardware. If that hardware is not used, e.g., nothing is plugged into the Camera (JP4) header, then these GPIOs can be used for other purposes.

Some of the pins, such as GPIO0 or GPIO2, have multiple functions and some of them are shared among onboard and external peripheral devices. Certain combinations of peripherals cannot work together. For example, it is not possible to do JTAG debugging of an application that is using SD card, because several pins are shared by JTAG and the SD card slot.

In other cases, peripherals can coexist under certain conditions. This is applicable to, for example, LCD screen and SD card that share only a single pin GPIO21. This pin is used to provide D/C (Data / Control) signal for the LCD as well as the CD (Card Detect) signal read from the SD card slot. If the card detect functionality is not essential, then it may be disabled by removing R167, so both LCD and SD may operate together.

For more details on which pins are shared among which peripherals, please refer to the table in the next section.

**Main I/O Connector / JP1**  The JP1 connector consists of 14x2 male pins whose functions are shown in the middle two “I/O” columns of the table below. The two “Shared With” columns on both sides describe where else on the board a certain GPIO is used.

- **LED** - RGB LED
- **MicroSD** - MicroSD Card / J4
- **LCD** - LCD / U5
- **PSRAM** - ESP32-WROVER-B’s PSRAM

**32.768 kHz Oscillator**

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>GPIO32</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>GPIO32</td>
</tr>
</tbody>
</table>

**Note:** Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.
SPI Flash / JP2

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>JTAG Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 CLK / GPIO6</td>
<td>TRST_N</td>
</tr>
<tr>

<td>TDO</td>
</tr>
<tr>
<td>4 SD2 / GPIO9</td>
<td>TDI</td>
</tr>
<tr>
<td>5 SD3 / GPIO10</td>
<td>TCK</td>
</tr>
</tbody>
</table>

**Important:** The module’s flash bus is connected to the jumper block JP2 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP2.

### Start Application Development

Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

**Initial Setup**

- Please set only the following jumpers shown in the pictures below:
  - Select USB as the power source using the jumper block JP7.
  - Enable UART communication using the jumper block JP2.

Do not install any other jumpers.

Turn the **Power Switch** to ON, the **5V Power On LED** should light up.

**Now to Development**

Please proceed to **ESP32 Hardware Reference**, where Section **Installation Step by Step** will quickly help you set up the development environment and then flash an example project onto your board.
Chapter 1. Get Started

ESP-WROVER-KIT V3 Getting Started Guide  This guide shows how to get started with the ESP-WROVER-KIT V3 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V3 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview  ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and MicroSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER

Its another distinguishing feature is the embedded FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview  The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description  The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture

**32.768 kHz Oscillator**

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO32</td>
</tr>
<tr>
<td>GPIO33</td>
</tr>
</tbody>
</table>

**Note:**  Since GPIO32 and GPIO33 are connected to the oscillator by default, they are not connected to the JP1 I/O connector to maintain signal integrity. This allocation may be changed from the oscillator to JP1 by desoldering the zero-ohm resistors from positions R11 / R23 and re-soldering them to positions R12 / R24.
**SPI Flash / JP13**

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>Camera Signal</th>
</tr>

<tr>
<td>SD2 / GPIO9</td>
<td></td>
</tr>
<tr>
<td>SD3 / GPIO10</td>
<td></td>
</tr>
<tr>
<td>CMD / GPIO11</td>
<td></td>
</tr>
</tbody>
</table>

**Important:** The module’s flash bus is connected to the jumper block JP13 through zero-ohm resistors R140 ~ R145. If the flash memory needs to operate at the frequency of 80 MHz, for reasons such as improving the integrity of bus signals, you can desolder these resistors to disconnect the module’s flash bus from the pin header JP13.

### Start Application Development

Before powering up your ESP-WROVER-KIT, please make sure that the board is in good condition with no obvious signs of damage.

### Initial Setup

Please set only the following jumpers shown in the pictures below:

- Select USB as the power source using the jumper block JP7.
- Enable UART communication using the jumper block JP11.

Do not install any other jumpers.

Turn the **Power Switch** to ON, the **5V Power On LED** should light up.

### Now to Development

Please proceed to ESP32 Hardware Reference, where Section Installation Step by Step will quickly help you set up the development environment and then flash an example project onto your board.

ESP-WROVER-KIT V2 Getting Started Guide This guide shows how to get started with the ESP-WROVER-KIT V2 development board and also provides information about its functionality and configuration options. For the description of other ESP-WROVER-KIT versions, please check ESP32 Hardware Reference.

What You Need

- ESP-WROVER-KIT V2 board
- USB 2.0 cable (A to Micro-B)
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.

Overview ESP-WROVER-KIT is an ESP32-based development board produced by Espressif. This board features an integrated LCD screen and MicroSD card slot.

ESP-WROVER-KIT comes with the following ESP32 modules:

- ESP32-WROOM-32
- ESP32-WROVER

It is another distinguishing feature is the embedded FTDI FT232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger. ESP-WROVER-KIT makes development convenient, easy, and cost-effective.

Most of the ESP32 I/O pins are broken out to the board’s pin headers for easy access.

Note: The version with the ESP32-WROVER module uses ESP32’s GPIO16 and GPIO17 as chip select and clock signals for PSRAM. By default, the two GPIOs are not broken out to the board’s pin headers in order to ensure reliable performance.

Functionality Overview The block diagram below shows the main components of ESP-WROVER-KIT and their interconnections.

Functional Description The following two figures and the table below describe the key components, interfaces, and controls of the ESP-WROVER-KIT board.

The table below provides description in the following manner:

- Starting from the first picture’s top right corner and going clockwise
- Then moving on to the second picture
Chapter 1. Get Started

Fig. 12: ESP-WROVER-KIT block diagram

Fig. 13: ESP-WROVER-KIT board layout - front
Fig. 14: ESP-WROVER-KIT board layout - back
### Key Component | Description
--- | ---
32.768 kHz | External precision 32.768 kHz crystal oscillator serves as a clock with low-power consumption while the chip is in Deep-sleep mode.
ESP32 Module | Either ESP32-WROOM-32 or ESP32-WROVER with an integrated ESP32. The ESP32-WROVER module features all the functions of ESP32-WROOM-32 and integrates an external 32-MBit PSRAM for flexible extended storage and data processing capabilities.
CTS/RTS | Serial port flow control signals: the pins are not connected to the circuitry by default. To enable them, short the respective pins of JP14 with jumpers.
UART | Serial port. The serial TX/RX signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP11 respectively. By default, these pairs of pins are connected with jumpers. To use ESP32’s serial interface, remove the jumpers and connect another external serial device to the respective pins.
SPI | By default, ESP32 uses its SPI interface to access flash and PSRAM memory inside the module. Use these pins to connect ESP32 to another SPI device. In this case, an extra chip select (CS) signal is needed. Please note that the interface voltage for the version with ESP32-WROVER is 1.8V, while that for the version with ESP32-WROOM-32 is 3.3V.
JTAG | JTAG interface. JTAG signals of FT2232 and ESP32 are broken out to the inward and outward sides of JP8 respectively. By default, these pairs of pins are disconnected. To enable JTAG, short the respective pins with jumpers as shown in Section Setup Options.
FT2232 | The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 features USB-to-UART and USB-to-JTAG functionalities.
EN | Reset button.
Boot | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.
USB | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
Power Select | Power supply selector interface. The board can be powered either via USB or via the 5V Input interface. Select the power source with a jumper. For more details, see Section Setup Options, jumper header JP7.
Power Key | Power On/Off Switch. Toggling toward USB powers the board on, toggling away from USB powers the board off.
5V Input | The 5V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).
LDO | NCP1117(1A). 5V-to-3.3V LDO. NCP1117 can provide a maximum current of 1A. The LDO on the board has a fixed output voltage. Although, the user can install an LDO with adjustable output voltage. For details, please refer to ESP-WROVER-KIT V2 schematic.
Camera | Camera interface, a standard OV7670 camera module.
RGB | Red, green and blue (RGB) light emitting diodes (LEDs), can be controlled by pulse width modulation (PWM).
I/O | All the pins on the ESP32 module are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc.
MicroSD Card | MicroSD card slot for data storage: when ESP32 enters the download mode, GPIO2 cannot be held high. However, a pull-up resistor is required on GPIO2 to enable the MicroSD Card. By default, GPIO2 and the pull-up resistor R153 are disconnected. To enable the SD Card, use jumpers on JP1 as shown in Section Setup Options.
LCD | Support for mounting and interfacing a 3.2” SPI (standard 4-wire Serial Peripheral Interface) LCD, as shown on figure ESP-WROVER-KIT board layout - back.

**Setup Options** There are five jumper blocks available to set up the board functionality. The most frequently required options are listed in the table below.

1.3.3 ESP32-PICO-KIT V4 / V4.1 Getting Started Guide

This guide shows how to get started with the ESP32-PICO-KIT V4 / V4.1 mini development board. For the description of other ESP32-PICO-KIT versions, please check ESP32 Hardware Reference.

This particular description covers ESP32-PICO-KIT V4 and V4.1. The difference is the upgraded USB-UART bridge from CP2102 in V4 with up to 1 Mbps transfer rates to CP2102N in V4.1 with up to 3 Mbps transfer rates.

What You Need

- ESP32-PICO-KIT mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section Start Application Development.
Overview

ESP32-PICO-KIT is an ESP32-based mini development board produced by Espressif.

The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module with complete Wi-Fi and Bluetooth functionalities. Compared to other ESP32 modules, ESP32-PICO-D4 integrates the following peripheral components in one single package, which otherwise would need to be installed separately:

- 40 MHz crystal oscillator
- 4 MB flash
- Filter capacitors
- RF matching links

This setup reduces the costs of additional external components as well as the cost of assembly and testing and also increases the overall usability of the product.

The development board features a USB-UART Bridge circuit which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access. For compatibility with Dupont wires, 2 x 17 header pads are populated with two rows of male pin headers. The remaining 2 x 3 header pads beside the antenna are not populated. These pads may be populated later by the user if required.

Note:

1. The 2 x 3 pads not populated with pin headers are connected to the flash memory embedded in the ESP32-PICO-D4 SiP module. For more details see module’s datasheet in Related Documents.
2. ESP32-PICO-KIT comes with male headers by default.

Functionality Overview

The block diagram below shows the main components of ESP32-PICO-KIT and their interconnections.

Fig. 15: ESP32-PICO-KIT block diagram
Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT board.

![ESP32-PICO-KIT board layout](image)

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.
### Chapter 1. Get Started

### Power Supply Options

There are three mutually exclusive ways to provide power to the board:

- Micro USB port, default power supply
- 5V / GND header pins
- 3V3 / GND header pins

**Warning:** The power supply must be provided using one and only one of the options above, otherwise the board and/or the power supply source can be damaged.

### Pin Descriptions

The two tables below provide the Name and Function of I/O header pins on both sides of the board, see ESP32-PICO-KIT board layout. The pin numbering and header names are the same as in the schematic given in Related Documents.

</table>
The following notes give more information about the items in the tables above.

1. This pin is connected to the flash pin of ESP32-PICO-D4.
2. 32.768 kHz crystal oscillator: a) input b) output
3. This pin is connected to the pin of the USB bridge chip on the board.
4. The operating voltage of ESP32-PICO-KIT’s embedded SPI flash is 3.3V. Therefore, the strapping pin MTDI should hold bit zero during the module power-on reset. If connected, please make sure that this pin is not held up on reset.

Start Application Development

Before powering up your ESP32-PICO-KIT, please make sure that the board is in good condition with no obvious signs of damage.

After that, proceed to ESP32 Hardware Reference, where Section Installation Step by Step will quickly help you set up the development environment and then flash an example project onto your board.

Board Dimensions

The dimensions are 52 x 20.3 x 10 mm (2.1” x 0.8” x 0.4”).

For the board physical construction details, please refer to its Reference Design listed below.

ESP32-PICO-KIT V3 Getting Started Guide  This guide shows how to get started with the ESP32-PICO-KIT V3 mini development board. For the description of other ESP32-PICO-KIT versions, please check ESP32 Hardware Reference.
Chapter 1. Get Started

What You Need

- ESP32-PICO-KIT V3 mini development board
- USB 2.0 A to Micro B cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*.

Overview

ESP32-PICO-KIT V3 is an ESP32-based mini development board produced by Espressif. The core of this board is ESP32-PICO-D4 - a System-in-Package (SiP) module.

The development board features a USB-UART Bridge circuit, which allows developers to connect the board to a computer’s USB port for flashing and debugging.

All the IO signals and system power on ESP32-PICO-D4 are led out to two rows of 20 x 0.1” header pads on both sides of the development board for easy access.

Functional Description

The following figure and the table below describe the key components, interfaces, and controls of the ESP32-PICO-KIT V3 board.

Below is the description of the items identified in the figure starting from the top left corner and going clockwise.
Fig. 19: ESP32-PICO-KIT V3 board layout
### Key Component | Description
---|---
| ESP32-PICO-D4 | Standard ESP32-PICO-D4 module soldered to the ESP32-PICO-KIT V3 board. The complete ESP32 system on a chip (ESP32 SoC) has been integrated into the SiP module, requiring only an external antenna with LC matching network, decoupling capacitors, and a pull-up resistor for EN signals to function properly.
| LDO | 5V-to-3.3V Low dropout voltage regulator (LDO).
| USB-UART bridge | Single-chip USB-UART bridge provides up to 1 Mbps transfers rates.
| Micro USB Port | USB interface. Power supply for the board as well as the communication interface between a computer and the board.
| Power On LED | This red LED turns on when power is supplied to the board.
| I/O | All the pins on ESP32-PICO-D4 are broken out to pin headers. You can program ESP32 to enable multiple functions, such as PWM, ADC, DAC, I2C, I2S, SPI, etc.
| BOOT Button | Download button. Holding down Boot and then pressing EN initiates Firmware Download mode for downloading firmware through the serial port.
| EN Button | Reset button.

#### 1.3.4 ESP32-Ethernet-Kit V1.0 Getting Started Guide

This guide shows how to get started with the ESP32-Ethernet-Kit development board and also provides information about its functionality and configuration options.

The *ESP32-Ethernet-Kit* is an Ethernet-to-Wi-Fi development board that enables Ethernet devices to be interconnected over Wi-Fi. At the same time, to provide more flexible power supply options, the ESP32-Ethernet-Kit also supports power over Ethernet (PoE).

**What You Need**

- *ESP32-Ethernet-Kit V1.0 board*
- USB 2.0 A to Micro B Cable
- Computer running Windows, Linux, or macOS

You can skip the introduction sections and go directly to Section *Start Application Development*. 
Overview

ESP32-Ethernet-Kit is an ESP32-based development board produced by Espressif.

It consists of two development boards, the Ethernet board A and the PoE board B. The Ethernet board (A) contains Bluetooth / Wi-Fi dual-mode ESP32-WROVER-B module and IP101GRI, a Single Port 10/100 Fast Ethernet Transceiver (PHY). The PoE board (B) provides power over Ethernet functionality. The A board can work independently, without the board B installed.

For the application loading and monitoring the Ethernet board (A) also features FTDI FT2232HL chip - an advanced multi-interface USB bridge. This chip enables to use JTAG for direct debugging of ESP32 through the USB interface without a separate JTAG debugger.

Functionality Overview

The block diagram below shows the main components of ESP32-Ethernet-Kit and their interconnections.

Functional Description

The following two figures and tables describe the key components, interfaces, and controls of the ESP32-Ethernet-Kit.

**Ethernet Board (A)** The table below provides description starting from the picture’s top right corner and going clockwise.
Chapter 1. Get Started

Fig. 21: ESP32-Ethernet-Kit block diagram (click to enlarge)

Fig. 22: ESP32-Ethernet-Kit - Ethernet board (A) layout (click to enlarge)
### Chapter 1. Get Started

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-WROOM B</td>
<td>This ESP32 module features 64-Mbit PSRAM for flexible extended storage and data processing capabilities.</td>
</tr>
<tr>
<td>GPIO Header 2</td>
<td>Five unpopulated through-hole solder pads to provide access to selected GPIOs of ESP32. For details, see GPIO Header 2.</td>
</tr>
<tr>
<td>Flow Control</td>
<td>A jumper header with access to the board signals. For details, see Flow Control.</td>
</tr>
<tr>
<td>Function Switch</td>
<td>A DIP switch used to configure the functionality of selected GPIOs of ESP32. For details, see Function Switch.</td>
</tr>
<tr>
<td>Tx/Rx LEDs</td>
<td>Two LEDs to show the status of UART transmission.</td>
</tr>
<tr>
<td>GPIO Header 3</td>
<td>Provides access to some GPIOs of ESP32 that can be used depending on the position of the Function Switch.</td>
</tr>
<tr>
<td>FT2232</td>
<td>The FT2232 chip serves as a multi-protocol USB-to-serial bridge which can be programmed and controlled via USB to provide communication with ESP32. FT2232 also features USB-to-JTAG interface which is available on channel A of the chip, while USB-to-serial is on channel B. The FT2232 chip enhances user-friendliness in terms of application development and debugging. See ESP32-Ethernet-Kit V1.0 Ethernet board (A) schematic.</td>
</tr>
<tr>
<td>USB Port</td>
<td>USB interface. Power supply for the board as well as the communication interface between a computer and the board.</td>
</tr>
<tr>
<td>Power Switch</td>
<td>Power On/Off Switch. Toggling toward the Boot button powers the board on, toggling away from Boot powers the board off.</td>
</tr>
<tr>
<td>5V Input</td>
<td>The 5V power supply interface can be more convenient when the board is operating autonomously (not connected to a computer).</td>
</tr>
<tr>
<td>5V Power On LED</td>
<td>This red LED turns on when power is supplied to the board, either from USB or 5V Input.</td>
</tr>
<tr>
<td>DC/DC Converter</td>
<td>Provided DC 5 V to 3.3 V conversion, output current up to 2A.</td>
</tr>
<tr>
<td>Board B Connectors</td>
<td>A pair male header pins for mounting the PoE board (B).</td>
</tr>
<tr>
<td>IP101GRI (PHY)</td>
<td>The physical layer (PHY) connection to the Ethernet cable is implemented using the IP101GRI chip. The connection between PHY and ESP32 is done through the reduced media-independent interface (RMII), a variant of the media-independent interface (MII) standard. The PHY supports the IEEE 802.3 / 802.3u standard of 10/100Mbps.</td>
</tr>
<tr>
<td>RJ45 Port</td>
<td>Ethernet network data transmission port.</td>
</tr>
<tr>
<td>Magnetics Module</td>
<td>The Magnetics are part of the Ethernet specification to protect against faults and transients, including rejection of common mode signals between the transceiver IC and the cable. The magnetics also provide galvanic isolation between the transceiver and the Ethernet device.</td>
</tr>
<tr>
<td>Link/Activity LEDs</td>
<td>(green and red) that respectively indicate the “Link” and “Activity” statuses of the PHY.</td>
</tr>
<tr>
<td>BOOT Button</td>
<td>Download button. Holding down BOOT and then pressing CH_PU initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>CH_PU Button</td>
<td>Reset button.</td>
</tr>
</tbody>
</table>
**PoE Board (B)** This board converts power delivered over the Ethernet cable (PoE) to provide a power supply for the Ethernet board (A). The main components of the PoE board (B) are shown on the block diagram under *Functionality Overview*.

The PoE board (B) has the following features:

- Support for IEEE 802.3at
- Power output: 5 V, 1.4 A

To take advantage of the PoE functionality the **RJ45 Port** of the Ethernet board (A) should be connected with an Ethernet cable to a switch that supports PoE. When the Ethernet board (A) detects 5 V power output from the PoE board (B), the USB power will be automatically cut off.

![Fig. 23: ESP32-Ethernet-Kit - PoE board (B) layout (click to enlarge)](image)

<table>
<thead>
<tr>

<td>CTS signal of FT2232</td>
</tr>
</tbody>
</table>
GPIO Allocation

This section describes allocation of ESP32 GPIOs to specific interfaces or functions of the ESP32-Ethernet-Kit.

**IP101GRI (PHY) Interface**  The allocation of the ESP32 (MAC) pins to IP101GRI (PHY) is shown in the table below.

<table>
<thead>
<tr>
<th>ESP32 Pin (MAC)</th>
<th>IP101GRI (PHY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO21</td>
<td>TX_EN</td>
</tr>
<tr>
<td>GPIO19</td>
<td>TXD[0]</td>
</tr>
<tr>
<td>GPIO22</td>
<td>TXD[1]</td>
</tr>
<tr>
<td>GPIO25</td>
<td>RXD[0]</td>
</tr>
<tr>
<td>GPIO26</td>
<td>RXD[1]</td>
</tr>
<tr>
<td>GPIO27</td>
<td>CRS_DV</td>
</tr>
<tr>
<td>GPIO0</td>
<td>REF_CLK</td>
</tr>
</tbody>
</table>

**Note:** Except for REF_CLK, the allocation of all pins under the *RMII Interface* is fixed and cannot be changed either through IOMUX or GPIO Matrix.

**GPIO Header 1**  This header exposes some GPIOs that are not used elsewhere on the ESP32-Ethernet-Kit.

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO32</td>
<td>...</td>
</tr>
<tr>
<td>GPIO33</td>
<td>...</td>
</tr>
<tr>
<td>GPIO34</td>
<td>...</td>
</tr>
<tr>
<td>GPIO35</td>
<td>...</td>
</tr>
<tr>
<td>GPIO36</td>
<td>...</td>
</tr>
<tr>
<td>GPIO39</td>
<td>...</td>
</tr>
</tbody>
</table>

**GPIO Header 2**  This header contains the GPIOs with specific RMII functionality (except GPIO2). Depending on the situation, specific Ethernet applications might require this functionality.

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>RMII Function</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO17</td>
<td>EMAC_CLK_180</td>
<td>See note 1</td>
</tr>
<tr>
<td>GPIO16</td>
<td>EMAC_CLK_OUT</td>
<td>See note 1</td>
</tr>
<tr>
<td>GPIO4</td>
<td>EMAC_TX_ER</td>
<td></td>
</tr>
<tr>
<td>GPIO2</td>
<td>n/a</td>
<td>See note 2</td>
</tr>
<tr>
<td>GPIO5</td>
<td>EMAC_RX_CLK</td>
<td>See note 2</td>
</tr>
</tbody>
</table>

**Note:**

1. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROOM-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
2. Functionality depends on the settings of the *Function Switch*. 
**Chapter 1. Get Started**

**GPIO Header 3** The functionality of GPIOs connected to this header depends on the settings of the *Function Switch*.

<table>

</tbody>
</table>

**Note:**

1. GPIO2 is used to enable external oscillator of the PHY.
2. GPIO0 is a source of 50 MHz reference clock for the PHY. The clock signal is first inverted, to account for transmission line delay, and then supplied to the PHY.
3. To prevent affecting the power-on state of GPIO0 by the clock output on the PHY side, the PHY external oscillator is enabled using GPIO2 after ESP32 is powered up.
4. The ESP32 pins GPIO16 and GPIO17 are not broken out to the ESP32-WROVER-B module and therefore not available for use. If you need to use these pins, please solder a module without SPIRAM memory inside, e.g. the ESP32-WROOM-32D or ESP32-SOLO-1.
Chapter 1. Get Started

Start Application Development

Before powering up your ESP32-Ethernet-Kit, please make sure that the board is in good condition with no obvious signs of damage.

Initial Setup

1. Set the **Function Switch** on the *Ethernet board (A)* to its default position by turning all the switches to **ON**.
2. To simplify flashing and testing the application, do not install any jumpers and do not connect any signals to the board headers.
3. The *PoE board (B)* can now be plugged in, but do not connect external power to it.
4. Connect the *Ethernet board (A)* to the PC with a USB cable.
5. Turn the **Power Switch** from GND to 5V0 position, the **5V Power On LED** should light up.

Now to Development   Proceed to *Get Started*, where Section *Installation Step by Step* will quickly help you set up the development environment and then flash an example project onto your board.

Move on to the next section only if you have successfully completed all the above steps.

Configure and Load the Ethernet Example   After setting up the development environment and testing the board, you can configure and flash the *ethernet/ethernet* example. This example has been created for testing Ethernet functionality. It supports different PHY, including *IP101GRI* installed on *ESP32-Ethernet-Kit V1.0 board*.

1.4 Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

1.4.1 Setting up Development Environment

- Step 1. Install prerequisites for *Windows, Linux or macOS*
- Step 2. Get ESP-IDF
- Step 3. Set up the tools
- Step 4. Set up the environment variables

1.4.2 Creating Your First Project

- Step 5. Start a Project
- Step 6. Connect Your Device
- Step 7. Configure
- Step 8. Build the Project
- Step 9. Flash onto the Device
- Step 10. Monitor
1.5  Step 1. Install prerequisites

Some tools need to be installed on the computer before proceeding to the next steps. Follow the links below for the instructions for your OS:

1.5.1  Standard Setup of Toolchain for Windows

Introduction

ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we’re going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse or another graphical IDE with CMake support instead.

Note: Limitation: the installation path of Python or ESP-IDF must not contain white spaces or parentheses.

Limitation: the installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with “Unicode UTF-8” support. System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option “Beta: Use Unicode UTF-8 for worldwide language support” - Ok and reboot the computer.

ESP-IDF Tools Installer

The easiest way to install ESP-IDF’s prerequisites is to download one of ESP-IDF Tools Installers from this URL: https://dl.espressif.com/dl/esp-idf/?idf=4.0

What is the use case for Online and Offline Installer  Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory %userprofile%\espressif

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.

Components of the installation  The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is %userprofile%\Desktop\esp-idf where %userprofile% is your home directory.

Launching ESP-IDF Environment  At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Run ESP-IDF Command Prompt (cmd.exe):
Chapter 1. Get Started

Fig. 24: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Fig. 25: ESP-IDF PowerShell
Fig. 26: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF Command Prompt (cmd.exe)
Fig. 27: ESP-IDF Command Prompt
Using the Command Prompt

For the remaining Getting Started steps, we’re going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.

Next Steps

If the ESP-IDF Tools Installer has finished successfully, then the development environment setup is complete. Proceed directly to Step 5. Start a Project.

Related Documents

For advanced users who want to customize the install process:

Updating ESP-IDF tools on Windows

**Install ESP-IDF tools using install.bat**  From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\espressif`.

**Add ESP-IDF tools to PATH using export.bat**  ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn’t started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

When this is done, the tools will be available in this command prompt.
1.5.2 Standard Setup of Toolchain for Linux

Install Prerequisites

To compile with ESP-IDF you need to get the following packages:

- **CentOS 7:**
  ```
  sudo yum -y update && sudo yum install git wget flex bison gperf python3
  --python3-pip python3-setuptools cmake ninja-build ccache
  ```

  CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- **Ubuntu and Debian:**
  ```
  sudo apt-get install git wget flex bison gperf python3 python3-pip
  python3-setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util
  ```

- **Arch:***
  ```
  sudo pacman -S --needed gcc git make ncurses flex bison gperf python-pip cmake
  --ninja ccache
  ```

**Note:** CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.

Additional Tips

**Permission issues /dev/ttyUSB0**  With some Linux distributions you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32. This can be solved by adding the current user to the dialout group.

**Arch Linux Users**  To run the precompiled gdb (xtensa-esp32-elf-gdb) in Arch Linux requires ncurses 5, but Arch uses ncurses 6.

Backwards compatibility libraries are available in AUR for native and lib32 configurations:

- [https://aur.archlinux.org/packages/ncurses5-compat-libs/](https://aur.archlinux.org/packages/ncurses5-compat-libs/)
- [https://aur.archlinux.org/packages/lib32-ncurses5-compat-libs/](https://aur.archlinux.org/packages/lib32-ncurses5-compat-libs/)

Before installing these packages you might need to add the author’s public key to your keyring as described in the “Comments” section at the links above.

Alternatively, use crosstool-NG to compile a gdb that links against ncurses 6.

**Fixing broken pip on Ubuntu 16.04**

Package python3-pip could be broken without possibility to upgrade it. Package has to be removed and installed manually using script get-pip.py:

```
apt remove python3-pip python3-virtualenv; rm -r ~/.local
rm -r ~/.espressif/python_env && python get-pip.py
```

**Python 2 deprecation**

Python 2 reached its end of life and support for it in ESP-IDF will be removed soon. Please install Python 3.6 or higher. Instructions for popular Linux distributions are listed above.
Next Steps

To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

1.5.3 Standard Setup of Toolchain for Mac OS

Install Prerequisites

ESP-IDF will use the version of Python installed by default on macOS.

• install pip:

```
sudo easy_install pip
```

• install CMake & Ninja build:
  – If you have HomeBrew, you can run:

```
brew install cmake ninja
```
  – If you have MacPorts, you can run:

```
sudo port install cmake ninja
```
  – Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.

• It is strongly recommended to also install ccache for faster builds. If you have HomeBrew, this can be done via brew install ccache or sudo port install ccache on MacPorts.

Note: If an error like this is shown during any step:

```
```

Then you will need to install the XCode command line tools to continue. You can install these by running xcode-select --install.

Installing Python 3 Basing on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like Python 2.7.17, your default interpreter is Python 2.7. If so, also check if Python 3 isn’t already installed on your computer:

```
python3 --version
```

If above command returns an error, it means Python 3 is not installed.

Below is an overview of steps to install Python 3.

• Installing with HomeBrew can be done as follows:

```
brew install python3
```

• If you have MacPorts, you can run:

```
sudo port install python38
```
Python 2 deprecation

Python 2 reached its end of life and support for it in ESP-IDF will be removed soon. Please install Python 3.6 or higher. Instructions for macOS are listed above.

Next Steps

To carry on with development environment setup, proceed to **Step 2. Get ESP-IDF**.

### 1.6 Step 2. Get ESP-IDF

To build applications for the ESP32, you need the software libraries provided by Espressif in ESP-IDF repository.

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

**Note:** This guide uses the directory `~/esp` on Linux and macOS or `%userprofile%\esp` on Windows as an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

#### 1.6.1 Linux and macOS

Open Terminal, and run the following commands:

```bash
cd ~/esp
git clone -b release/v4.0 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult [ESP-IDF Versions](https://github.com/espressif/esp-idf) for information about which ESP-IDF version to use in a given situation.

#### 1.6.2 Windows

In addition to installing the tools, [ESP-IDF Tools Installer](https://github.com/espressif/esp-idf) for Windows introduced in Step 1 can also download a copy of ESP-IDF.

Consult [ESP-IDF Versions](https://github.com/espressif/esp-idf) for information about which ESP-IDF version to use in a given situation.

If you wish to download ESP-IDF without the help of ESP-IDF Tools Installer, refer to these instructions.
1.7 Step 3. Set up the tools

Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc.

1.7.1 Windows

ESP-IDF Tools Installer for Windows introduced in Step 1 installs all the required tools.

If you want to install the tools without the help of ESP-IDF Tools Installer, open the Command Prompt and follow these steps:

```bash
cd %userprofile%\esp\esp-idf
install.bat
```

1.7.2 Linux and macOS

```bash
cd ~/esp/esp-idf
./install.sh
```

1.7.3 Alternative File Downloads

The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn’t change the URLs used to access any Git repositories.

**Windows**

To prefer the Espressif download server when running the ESP-IDF Tools Installer or installing tools from the command line, open the System control panel, then click on Advanced Settings. Add a new Environment Variable (of type either User or System) with the name IDF_GITHUB_ASSETS and value dl.espressif.com/github_assets. Click OK once done.

If the command line window or ESP-IDF Tools Installer window was already open before you added the new environment variable, you will need to close and reopen it.

While this environment variable is still set, the ESP-IDF Tools Installer and the command line installer will prefer the Espressif download server.

**Linux and macOS**

To prefer the Espressif download server when installing tools, use the following sequence of commands when running install.sh:

```bash
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```
1.7.4 Customizing the tools installation path

The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: $HOME/.espressif on Linux and macOS, %USERPROFILE%\espressif on Windows. If you wish to install the tools into a different directory, set the environment variable IDF_TOOLS_PATH before running the installation scripts. Make sure that your user has sufficient permissions to read and write this path.

If changing the IDF_TOOLS_PATH, make sure it is set to the same value every time the install.bat/install.sh and export.bat/export.sh scripts are executed.

1.8 Step 4. Set up the environment variables

The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

1.8.1 Windows

ESP-IDF Tools Installer for Windows creates an “ESP-IDF Command Prompt” shortcut in the Start Menu. This shortcut opens the Command Prompt and sets up all the required environment variables. You can open this shortcut and proceed to the next step.

Alternatively, if you want to use ESP-IDF in an existing Command Prompt window, you can run:

%userprofile%\esp\esp-idf\export.bat

1.8.2 Linux and macOS

In the terminal where you are going to use ESP-IDF, run:

. $HOME/esp/esp-idf/export.sh

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing export.sh:

1. Copy and paste the following command to your shell’s profile (.profile, .bashrc, .zprofile, etc.)

alias get_idf=''. $HOME/esp/esp-idf/export.sh'

2. Refresh the configuration by restarting the terminal session or by running source [path to profile], for example, source ~/.bashrc.

Now you can run get_idf to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add export.sh to your shell’s profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

1.9 Step 5. Start a Project

Now you are ready to prepare your application for ESP32. You can start with get-started/hello_world project from examples directory in IDF.

Copy get-started/hello_world to ~/esp directory:
Chapter 1. Get Started

1.9.1 Linux and macOS

```bash
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

1.9.2 Windows

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it.

It is also possible to build examples in-place, without copying them first.

**Important**: The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

1.10 Step 6. Connect Your Device

Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows**: names like COM1
- **Linux**: starting with /dev/tty
- **macOS**: starting with /dev/cu.

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32* for full details.

**Note**: Keep the port name handy as you will need it in the next steps.

1.11 Step 7. Configure

Navigate to your hello_world directory from Step 5. Start a Project and run the project configuration utility menuconfig.

1.11.1 Linux and macOS

```bash
cd ~/esp/hello_world
idf.py menuconfig
```

1.11.2 Windows

```bash
cd %userprofile%\esp\hello_world
idf.py menuconfig
```

If the previous steps have been done correctly, the following menu appears:

To navigate and use menuconfig, press the following keys:
1.12 Step 8. Build the Project

Build the project by running:

```
$ idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```bash
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
... (more lines of build system output)
[527/527] Generating hello-world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash --flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello-world.
--bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'
```

Attention: If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, enable single core mode (CONFIG_FREERTOS_UNICORE) in menuconfig before flashing examples.
Chapter 1. Get Started

If there are no errors, the build will finish by generating the firmware binary .bin file.

1.13 Step 9. Flash onto the Device

Flash the binaries that you just built onto your ESP32 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32 board’s serial port name from Step 6. Connect Your Device.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on `idf.py` arguments, see `idf.py`.

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

Running `esptool.py` in directory `(...).esp/hello_world`

```
Executing "python [...]/esp-idf/components/esptool_py/esptool/esptool.py -b 460800...
   -write_flash fflash_project_args"...
esptool.py -b 460800 write_flash --flash_mode dio --flash_size detect --flash_freq --40m 0x1000 bootloader/bootloader.bin 0x8000 partition_table/partition-table.bin...
   -0x10000 hello-world.bin
esptool.py v2.3.1

Leaving...
Hard resetting via RTS pin...
```

If there are no issues by the end of the flash process, the module will be reset and the “hello_world” application will be running.
## 1.14 Step 10. Monitor

To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace `PORT` with your serial port name).

This command launches the **IDF Monitor** application:

```
$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello-world.elf"...
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+\] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
... Hello world!
Restarting in 10 seconds...
I (211) cpu_start: Starting scheduler on APP CPU.
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+\]`.

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26MHz crystal. Most development board designs use 40MHz, so ESP-IDF uses this frequency as a default value.

```
~Z0YY(10,1|0666)Xn@y.i!DRZYZ(0 jpi0|@+z5Ymvp
```

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to `menuconfig`.
3. Go to Component config -> ESP32-specific -> Main XTAL frequency, then change `CONFIG_ESP32_XTAL_FREQ_SEL` to 26MHz.
4. After that, *build and flash* the application again.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- `idf.py` for a full reference of `idf.py` commands and options.

**That’s all that you need to get started with ESP32!**

Now you are ready to try some other examples, or go straight to developing your own applications.
1.15 Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing \texttt{esp-idf} folder and clone it again, as if performing the initial installation described in \textit{Step 2. Get ESP-IDF}.

Another solution is to update only what has changed. \textit{The update procedure depends on the version of ESP-IDF you are using.}

After updating ESP-IDF, execute \texttt{install.sh} (\texttt{install.bat} on Windows) again, in case the new ESP-IDF version requires different versions of tools. See instructions at \textit{Step 3. Set up the tools}.

Once the new tools are installed, update the environment using \texttt{export.sh} (\texttt{export.bat} on Windows). See instructions at \textit{Step 4. Set up the environment variables}.

1.16 Related Documents

1.16.1 Establish Serial Connection with ESP32

This section provides guidance how to establish serial connection between ESP32 and PC.

\textbf{Connect ESP32 to PC}

Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below are the links to drivers for ESP32 boards produced by Espressif:

\begin{tabular}{|l|l|l|}
\hline
Development Board & USB Driver & Remarks \\
\hline
\textit{ESP32-DevKitC}  & CP210x &  \\
\textit{ESP32-LyraT}  & CP210x &  \\
\textit{ESP32-LyraTD-MSC}  & CP210x &  \\
\textit{ESP32-PICO-KIT}  & CP210x &  \\
\textit{ESP-WROVER-KIT}  & FTDI &  \\
\textit{ESP32 Demo Board}  & FTDI &  \\
\textit{ESP-Prog}  & FTDI & Programmer board (w/o ESP32) \\
\textit{ESP32-MeshKit-Sense}  & n/a & Use with ESP-Prog \\
\textit{ESP32-Sense Kit}  & n/a & Use with ESP-Prog \\
\hline
\end{tabular}

\begin{itemize}
\item CP210x: CP210x USB to UART Bridge VCP Drivers
\item FTDI: FTDI Virtual COM Port Drivers
\end{itemize}

The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with and operating system and automatically installed upon connecting one of the listed boards to the PC.

\textbf{Check port on Windows}

Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT.
Fig. 29: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 30: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Chapter 1. Get Started

Check port on Linux and MacOS

To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board/dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

MacOS

```
ls /dev/cu.*
```

**Note:** MacOS users: if you don’t see the serial port then check you have the USB/serial drivers installed as shown in the Getting Started guide for your particular development board. For MacOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer …” where the developer name is Silicon Labs or FTDI.

Adding user to dialout on Linux

The currently logged user should have read and write access to the serial port over USB. On most Linux distributions, this is done by adding the user to dialout group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to uucp group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

Verify serial connection

Now verify that the serial connection is operational. You can do this using a serial terminal program. In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32. An example log by ESP32 is shown below.

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configis: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
```

(continues on next page)
Fig. 31: Setting Serial Communication in PuTTY on Windows
Fig. 32: Setting Serial Communication in PuTTY on Linux
If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the esptool documentation for more details.

**Note:** Close serial terminal after verification that communication is working. In the next step we are going to use a different application to upload a new firmware to ESP32. This application will not be able to access serial port while it is open in terminal.

If you got here from Step 6. Connect Your Device when installing s/w for ESP32 development, then you can continue with Step 7. Configure.

### 1.16.2 Build and Flash with Eclipse IDE

ESP-IDF V4.0 has a new CMake-based build system as the default build system.

There is a new ESP-IDF Eclipse Plugin that works with the CMake-based build system. Please refer to https://github.com/espressif/idf-eclipse-plugin/blob/master/README.md for further instructions.

If you require Eclipse IDE support for legacy ESP_IDF Make build system, you can follow the legacy GNU Make build system Getting Started guide which has steps for Building and Flashing with Eclipse IDE.

### 1.16.3 IDF Monitor

The IDF monitor tool is mainly a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some IDF-specific features.

This tool can be launched from an IDF project by running `idf.py monitor`.

For the legacy GNU Make system, run `make monitor`.

**Keyboard Shortcuts**

For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.
<table>
<thead>
<tr>
<th>Keyboard Shortcut</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl+]</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl+T</td>
<td>Menu escape key</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>• Ctrl+T</td>
<td>Send the menu character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+]</td>
<td>Send the exit character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+P</td>
<td>Reset target into bootloader to pause app via RTS line</td>
<td>Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.</td>
</tr>
<tr>
<td>• Ctrl+R</td>
<td>Reset target board via RTS</td>
<td>Resets the target board and re-starts the application via the RTS line (if connected).</td>
</tr>
<tr>
<td>• Ctrl+F</td>
<td>Build and flash the project</td>
<td>Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl+A (or A)</td>
<td>Build and flash the app only</td>
<td>Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl+Y</td>
<td>Stop/resume log output printing on screen</td>
<td>Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.</td>
</tr>
<tr>
<td>• Ctrl+L</td>
<td>Stop/resume log output saved to file</td>
<td>Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).</td>
</tr>
<tr>
<td>• Ctrl+H (or H)</td>
<td>Display all keyboard shortcuts</td>
<td></td>
</tr>
<tr>
<td>• Ctrl+X (or X)</td>
<td>Exit the program</td>
<td></td>
</tr>
</tbody>
</table>

Any keys pressed, other than Ctrl-} and Ctrl-T, will be sent through the serial port.

**IDF-specific features**

**Automatic Address Decoding** Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4_______, IDF Monitor uses addr2line to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was unhandled.
Register dump:

```
PC : 0x400f360d PS : 0x00060330 A0 : 0x800dbf56 A1 :

    0x400dbf82:0x3ffb7e60 0x400d071d:0x3ffb7e90

To decode each address, IDF Monitor runs the following command in the background:

xtensa-esp32-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS

Lauching GDB with GDBStub    By default, if esp-idf crashes, the panic handler prints relevant registers and the
    stack dump (similar to the ones above) over the serial port. Then it resets the board.

Optionally, the panic handler can be configured to run GDBStub, the tool which can communicate with GDB project
debugger. GDBStub allows to read memory, examine call stack frames and variables, etc. It is not as versatile as
JTAG debugging, but this method does not require any special hardware.

To enable GDBStub, open the project configuration menu (idf.py menuconfig) and set CONFIG_ESP32_PANIC to
Invoke GDBStub.

In this case, if the panic handler is triggered, as soon as IDF Monitor sees that GDBStub has loaded, it automatically
pauses serial monitoring and runs GDB with necessary arguments. After GDB exits, the board is reset via the RTS
serial line. If this line is not connected, please reset the board manually by pressing its Reset button.
Chapter 1. Get Started

In the background, IDF Monitor runs the following command:

```bash
xtensa-esp32-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex_
interrupt build/PROJECT.elf
```

**Output Filtering**  IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:` `<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set {N, E, W, I, D, V, *} referring to a level for logging.

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e. `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using * defaults to Verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the logging library. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks *, or colons : to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

**Examples Of Filtering Rules:**

- `*` can be used to match any tags. However, the string `PRINT_FILTER="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `*:N` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules "tag1:V", "tag1:v", "tag1:", "tag1:*", and "tag1" are equivalent.
- Rule "tag1:W tag1:E" is equivalent to "tag1:E" because any consequent occurrence of the same tag name overwrites the previous one.
- Rule "tag1:I tag2:W" only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule "tag1:I tag2:W tag3:N" is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule "tag1:I tag2:W tag3:N *:V" is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

**A More Complex Filtering Example**  The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564  
entry 0x40078d4c  
E (31) esp_image: image at 0x30000 has invalid magic byte  
W (31) esp_image: image at 0x30000 has invalid SPI mode 255  
E (39) boot: Factory app partition is not bootable  
I (568) cpu_start: Pro cpu up.  
I (569) heap_init: Initializing. RAM available for dynamic allocation:  
I (603) cpu_start: Pro cpu start user code  
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

(continues on next page)
The captured output for the filtering options PRINT_FILTER="wifi esp_image:E light_driver:I"

E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0

The options `PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2

Known Issues with IDF Monitor

Issues Observed on Windows

• If in the Windows environment you receive the error “winpty: command not found”, fix it by running `pacman -S winpty`.
• Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
• Occasionally, when “idf.py” or “make” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
• When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

1.16.4 Customized Setup of Toolchain

Instead of downloading binary toolchain from Espressif website (see Step 3. Set up the tools) you may build the toolchain yourself.

If you can’t think of a reason why you need to build it yourself, then probably it’s better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

• if you want to customize toolchain build configuration
• if you want to use a different GCC version (such as 4.8.5)
• if you want to hack gcc or newlib or libstdc++
• if you are curious and/or have time to spare
• if you don’t trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.

Setup Windows Toolchain from Scratch

This is a step-by-step alternative to running the ESP-IDF Tools Installer for the CMake-based build system. Installing all of the tools by hand allows more control over the process, and also provides the information for advanced users to customize the install.

To quickly setup the toolchain and other tools in standard way, using the ESP-IDF Tools installer, proceed to section Standard Setup of Toolchain for Windows.

Note: The GNU Make based build system requires the MSYS2 Unix compatibility environment on Windows. The CMake-based build system does not require this environment.
Chapter 1. Get Started

Get ESP-IDF

Note: Previous versions of ESP-IDF used the MSYS2 bash terminal command line. The current cmake-based build system can run in the regular Windows Command Prompt which is used here.

If you use a bash-based terminal or PowerShell, please note that some command syntax will be different to what is shown below.

Open Command Prompt and run the following commands:

```bash
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone -b release/v4.0 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into %userprofile%\esp\esp-idf.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

Note: The git clone option -b release/v4.0 tells git to clone the branch in the ESP-IDF repository git corresponding to this version of the documentation.

Note: GitHub’s “Download zip file” feature does not work with ESP-IDF, a git clone is required. As a fallback, Stable version can be installed without Git.

Note: Do not miss the --recursive option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```bash
cd esp-idf
git submodule update --init
```

Tools

cmake Download the latest stable release of CMake for Windows and run the installer.

When the installer asks for Install Options, choose either “Add CMake to the system PATH for all users” or “Add CMake to the system PATH for the current user”.

Ninja build Note: Ninja currently only provides binaries for 64-bit Windows. It is possible to use CMake and idf.py with other build tools, such as mingw-make, on 32-bit windows. However this is currently undocumented.

Download the ninja latest stable Windows release from the (download page).

The Ninja for Windows download is a .zip file containing a single ninja.exe file which needs to be unzipped to a directory which is then added to your Path (or you can choose a directory which is already on your Path).

Python Download the latest Python for Windows installer, and run it.

The “Customise” step of the Python installer gives a list of options. The last option is “Add python.exe to Path”. Change this option to select “Will be installed”.

Once Python is installed, open a Windows Command Prompt from the Start menu and run the following command:
Chapter 1. Get Started

```bash
pip install --user pyserial
```

**MConf for IDF**  Download the configuration tool mconf-idf from the kconfig-frontends releases page. This is the mconf configuration tool with some minor customizations for ESP-IDF. This tool will also need to be unzipped to a directory which is then added to your Path.

**Toolchain Setup**  Download the precompiled Windows toolchain:

Unzip the file to C:\Program Files (or some other location). The file contains a single directory xtensa-esp32-elf.

Next, the bin subdirectory of this directory must be added to your Path. For example, the directory to add may be C:\Program Files\xtensa-esp32-elf\bin.

**Note:** If you already have the MSYS2 environment (for use with the “GNU Make” build system) installed, you can skip the separate download and add the directory C:\msys32\opt\xtensa-esp32-elf\bin to the Path instead, as the toolchain is included in the MSYS2 environment.

**Adding Directory to Path**  To add any new directory to your Windows Path environment variable:

Open the System control panel and navigate to the Environment Variables dialog. (On Windows 10, this is found under Advanced System Settings).

Double-click the Path variable (either User or System Path, depending if you want other users to have this directory on their path.) Go to the end of the value, and append ;<new value>.

**Next Steps**  To carry on with development environment setup, proceed to Step 3. Set up the tools.

**Setup Linux Toolchain from Scratch**

The following instructions are alternative to downloading binary toolchain from Espressif website. To quickly setup the binary toolchain, instead of compiling it yourself, backup and proceed to section *Standard Setup of Toolchain for Linux*.

**Install Prerequisites**  To compile with ESP-IDF you need to get the following packages:

- **CentOS 7**:

  ```
  sudo yum -y update &&
  sudo yum install git wget ncurses-devel flex bison gperf
  --python3 python3-pip cmake ninja-build ccache
  ```

  CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- **Ubuntu and Debian**:

  ```
  sudo apt-get install git wget libncurses-dev flex bison gperf python3 python3-
  --pip python3-setuptools python3-indirect python3-cryptography python3-future-
  --python3-pyparsing python3-pyelftools cmake ninja-build ccache libffi-dev-
  --libssl-dev dfu-util
  ```

- **Arch**:

  ```
  sudo pacman -Sy --needed gcc git make ncurses flex bison gperf python3-pyserial-
  --python-cryptography python3-future python3-pyparsing python3-pyelftools cmake-
  --ninja ccache dfu-util
  ```

(continues on next page)
Note: CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.

Compile the Toolchain from Source

- Install dependencies:
  - CentOS 7:
    ```
sudo yum install gawk gperf grep gettext ncurses-devel python3 python3-
    dev automake bison flex texinfo help2man libtool make
    ```
  - Ubuntu pre-16.04:
    ```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
    dev automake bison flex texinfo help2man libtool make
    ```
  - Ubuntu 16.04 or newer:
    ```
sudo apt-get install gawk gperf grep gettext python python-dev automake-
    bison flex texinfo help2man libtool libtool-bin make
    ```
  - Debian 9:
    ```
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
    dev automake bison flex texinfo help2man libtool libtool-bin make
    ```
  - Arch:
    ```
sudo pacman -Sy --needed python-pip
    ```

Create the working directory and go into it:

```
mkdir -p ~/esp
cd ~/esp
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r3
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in ~/esp/crosstool-NG/builds/xtensa-esp32-elf. Follow instructions for standard setup to add the toolchain to your PATH.

**Python 2 deprecation**  
Python 2 reached its end of life and support for it in ESP-IDF will be removed soon. Please install Python 3.6 or higher. Instructions for popular Linux distributions are listed above.

**Next Steps**  
To carry on with development environment setup, proceed to *Step 2. Get ESP-IDF*. 

Submit Document Feedback
Setup Toolchain for Mac OS from Scratch

Package Manager  To set up the toolchain from scratch, rather than downloading a pre-compiled toolchain, you will need to install either the MacPorts or homebrew package manager.

MacPorts needs a full XCode installation, while homebrew only needs XCode command line tools.

See Customized Setup of Toolchain section for some of the reasons why installing the toolchain from scratch may be necessary.

Install Prerequisites

- install pip:
  ```
sudo easy_install pip
  ```

- install pyserial:
  ```
pip install --user pyserial
  ```

- install CMake & Ninja build:
  - If you have HomeBrew, you can run:
    ```
brew install cmake ninja
    ```
  - If you have MacPorts, you can run:
    ```
sudo port install cmake ninja
    ```

Compile the Toolchain from Source

- Install dependencies:
  - with MacPorts:
    ```
sudo port install gsed gawk binutils gperf grep gettext wget libtool
    ~autoconf automake make
    ```
  - with homebrew:
    ```
brew install gnu-sed gawk binutils gperftools gettext wget help2man
    ~libtool autoconf automake make
    ```

Create a case-sensitive filesystem image:

```
hdutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive_ HFS+"
```

Mount it:

```
hdiutil mount ~/esp/crosstool.dmg
```

Create a symlink to your work directory:

```
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

Go into the newly created directory:

```
cd ~/esp/ctng-volume
```

Download crosstool-NG and build it:
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r3
git submodule update --init
./bootstrap && ./configure --enable-local && make

Build the toolchain:

./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf

Toolchain will be built in ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf. To use it, you need to add ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf/bin to PATH environment variable.

Python 2 deprecation  Python 2 reached its end of life and support for it in ESP-IDF will be removed soon. Please install Python 3.6 or higher. Instructions for macOS are listed above.

Next Steps  To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

1.16.5 Get Started (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

This document is intended to help you set up the software development environment for the hardware based on Espressif ESP32.

After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then how to build and flash firmware onto an ESP32 board.

Note: This is documentation for branch release/v4.0 of ESP-IDF. Other ESP-IDF Versions are also available.

Introduction

ESP32 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth 4.2
- Dual high performance cores
- Ultra Low Power co-processor
- Several peripherals

Powered by 40 nm technology, ESP32 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.
Chapter 1. Get Started

What You Need

Hardware:

• An ESP32 board
• USB cable - USB A / micro USB B
• Computer running Windows, Linux, or macOS

Software:

• Toolchain to build the Application for ESP32
• ESP-IDF that essentially contains API (software libraries and source code) for ESP32 and scripts to operate the Toolchain
• Text editor to write programs (Projects) in C, e.g., Eclipse

Fig. 33: Development of applications for ESP32

Development Board Overviews

If you have one of ESP32 development boards listed below, you can click on the link to learn more about its hardware.

Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

Setting up Development Environment

• Step 1. Set up the Toolchain for Windows, Linux or macOS
• Step 2. Get ESP-IDF
• Step 3. Set Environment Variables
• Step 4. Install the Required Python Packages
Creating Your First Project

- Step 5. Start a Project
- Step 6. Connect Your Device
- Step 7. Configure
- Step 8. Build and Flash
- Step 9. Monitor

Step 1. Set up the Toolchain

The toolchain is a set of programs for compiling code and building applications.

The quickest way to start development with ESP32 is by installing a prebuilt toolchain. Pick up your OS below and follow the provided instructions.

Standard Setup of Toolchain for Windows (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

**Introduction** Windows doesn’t have a built-in “make” environment, so as well as installing the toolchain you will need a GNU-compatible environment. We use the MSYS2 environment to provide this. You don’t need to use this environment all the time (you can use Eclipse or some other front-end), but it runs behind the scenes.

**Toolchain Setup** The quick setup is to download the Windows all-in-one toolchain & MSYS2 zip file from dl.espressif.com:

Unzip the zip file to C: (or some other location, but this guide assumes C:) and it will create an msys32 directory with a pre-prepared environment.

**Important:** If another toolchain location is used (different than the default C:\msys32), please ensure that the path where the all-in-one toolchain gets unzipped is a plain ASCII, contains no spaces, symlinks or accents.

**Check it Out** Open a MSYS2 MINGW32 terminal window by running C:\msys32\mingw32.exe. The environment in this window is a bash shell. Create a directory named esp that is a default location to develop ESP32 applications. To do so, run the following shell command:

```
mkdir -p ~/esp
```

By typing cd ~/esp you can then move to the newly created directory. If there are no error messages you are done with this step.

Use this window in the following steps setting up development environment for ESP32.

Next Steps To carry on with development environment setup, proceed to section Step 2. Get ESP-IDF.

Updating The Environment When IDF is updated, sometimes new toolchains are required or new requirements are added to the Windows MSYS2 environment. To move any data from an old version of the precompiled environment to a new one:

- Take the old MSYS2 environment (ie C:\msys32) and move/ rename it to a different directory (ie C:\msys32_old).
- Download the new precompiled environment using the steps above.
Chapter 1. Get Started

**Fig. 34: MSYS2 MINGW32 shell window**

- Unzip the new MSYS2 environment to `C:\msys32` (or another location).
- Find the old `C:\msys32_old\home` directory and move this into `C:\msys32`.
- You can now delete the `C:\msys32_old` directory if you no longer need it.

You can have independent different MSYS2 environments on your system, as long as they are in different directories.

There are also steps to update the existing environment without downloading a new one, although this is more complex.

**Related Documents**

**Setup Windows Toolchain from Scratch (Legacy GNU Make)**

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Setting up the environment gives you some more control over the process, and also provides the information for advanced users to customize the install. The **pre-built environment**, addressed to less experienced users, has been prepared by following these steps.

To quickly setup the toolchain in standard way, using a prebuilt environment, proceed to section **Standard Setup of Toolchain for Windows (Legacy GNU Make)**.

**Configure Toolchain & Environment from Scratch**

This process involves installing MSYS2, then installing the MSYS2 and Python packages which ESP-IDF uses, and finally downloading and installing the Xtensa toolchain.

- Navigate to the MSYS2 installer page and download the `msys2-i686-xxxxxxx.exe` installer executable (we only support a 32-bit MSYS environment, it works on both 32-bit and 64-bit Windows.) At time of writing, the latest installer is `msys2-i686-20161025.exe`.

- Run through the installer steps. **Uncheck the “Run MSYS2 32-bit now” checkbox at the end.**

- Once the installer exits, open Start Menu and find “MSYS2 MinGW 32-bit” to run the terminal.

(Why launch this different terminal? MSYS2 has the concept of different kinds of environments. The default “MSYS” environment is Cygwin-like and uses a translation layer for all Windows API calls. We need the “MinGW” environment in order to have a native Python which supports COM ports.)

- The ESP-IDF repository on github contains a script in the tools directory titled `windows_install_prerequisites.sh`. If you haven’t got a local copy of the ESP-IDF yet, that’s OK - you can just download that one file in Raw format from here: `tools/windows/windows_install_prerequisites.sh`. Save it somewhere on your computer.

- Type the path to the shell script into the MSYS2 terminal window. You can type it as a normal Windows path, but use forward-slashes instead of back-slashes. ie: `C:/Users/myuser/Downloads/windows_install_prerequisites.sh`. You can read the script beforehand to check what it does.

- The `windows_install_prerequisites.sh` script will download and install packages for ESP-IDF support, and the ESP32 toolchain.
Troubleshooting

- While the install script runs, MSYS may update itself into a state where it can no longer operate. You may see errors like the following:

```
*** fatal error - cygheap base mismatch detected - 0x612E5408/0x612E4408. This problem is probably due to using incompatible versions of the cygwin DLL.
```

If you see errors like this, close the terminal window entirely (terminating the processes running there) and then re-open a new terminal. Re-run `windows_install_prerequisites.sh` (tip: use the up arrow key to see the last run command). The update process will resume after this step.

- MSYS2 is a “rolling” distribution so running the installer script may install newer packages than what is used in the prebuilt environments. If you see any errors that appear to be related to installing MSYS2 packages, please check the MSYS2-packages issues list for known issues. If you don’t see any relevant issues, please raise an IDF issue.

MSYS2 Mirrors in China  There are some (unofficial) MSYS2 mirrors inside China, which substantially improves download speeds inside China.

To add these mirrors, edit the following two MSYS2 mirrorlist files before running the setup script. The mirrorlist files can be found in the `/etc/pacman.d` directory (i.e. `c:\msys2\etc\pacman.d`).

Add these lines at the top of `mirrorlist.mingw32`:

```
Server = https://mirrors.ustc.edu.cn/msys2/mingw/i686/
Server = http://mirror.bit.edu.cn/msys2/REPOS/MINGW/i686
```

Add these lines at the top of `mirrorlist.msys`:

```
Server = http://mirrors.ustc.edu.cn/msys2/msys/$arch
Server = http://mirror.bit.edu.cn/msys2/REPOS/MSYS2/$arch
```

HTTP Proxy  You can enable an HTTP proxy for MSYS and PIP downloads by setting the `http_proxy` variable in the terminal before running the setup script:

```
export http_proxy='http://http.proxy.server:PORT'
```

Or with credentials:

```
export http_proxy='http://user:password@http.proxy.server:PORT'
```

Add this line to `/etc/profile` in the MSYS directory in order to permanently enable the proxy when using MSYS.

Alternative Setup: Just download a toolchain  If you already have an MSYS2 install or want to do things differently, you can download just the toolchain here:

Note:  If you followed instructions Configure Toolchain & Environment from Scratch, you already have the toolchain and you won’t need this download.

Important:  Just having this toolchain is not enough to use ESP-IDF on Windows. You will need GNU make, bash, and sed at minimum. The above environments provide all this, plus a host compiler (required for menuconfig support).
Next Steps  
To carry on with development environment setup, proceed to section Step 2. Get ESP-IDF.

Updating The Environment  
When IDF is updated, sometimes new toolchains are required or new system requirements are added to the Windows MSYS2 environment.

Rather than setting up a new environment, you can update an existing Windows environment & toolchain:

- Update IDF to the new version you want to use.
- Run the tools/windows/windows_install_prerequisites.sh script inside IDF. This will install any new software packages that weren’t previously installed, and download and replace the toolchain with the latest version.

The script to update MSYS2 may also fail with the same errors mentioned under Troubleshooting.

If you need to support multiple IDF versions concurrently, you can have different independent MSYS2 environments in different directories. Alternatively you can download multiple toolchains and unzip these to different directories, then use the PATH environment variable to set which one is the default.

Standard Setup of Toolchain for Linux (Legacy GNU Make)  
Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Install Prerequisites  
To compile with ESP-IDF you need to get the following packages:

- CentOS 7:

  ```shell
  sudo yum install gcc git wget make ncurses-devel flex bison gperf python-
  ^-python2-cryptography
  ```

- Ubuntu and Debian:

  ```shell
  sudo apt-get install gcc git wget make libncurses-dev flex bison gperf python-
  ^python-pip python-setuptools python-serial python-cryptography python-future-
  ^python-pyparsing python-pyelftools libffi-dev libssl-dev
  ```

- Arch:

  ```shell
  sudo pacman -S --needed gcc git make ncurses flex bison gperf python-pyserial-
  ^python-cryptography python-future python-pyparsing python-pyelftools
  ```

Note: Some older Linux distributions may be missing some of the Python packages listed above (or may use pyserial version 2.x which is not supported by ESP-IDF). It is possible to install these packages via pip instead - as described in section Step 4. Install the Required Python Packages.

Toolchain Setup  
ESP32 toolchain for Linux is available for download from Espressif website:

- for 64-bit Linux:
  https://dl.espressif.com/dl/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-linux-amd64.tar.gz

- for 32-bit Linux:

1. Download this file, then extract it in ~/.esp directory:

   ```bash
   mkdir -p ~/esp
   cd ~/esp
   tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-linux-amd64.tar.
   gz
   ```

Submit Document Feedback
• for 32-bit Linux:

```bash
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp_2020r3-linux-i686.tar.gz
```

2. The toolchain will be extracted into ~/esp/xtensa-esp32-elf/ directory. To use it, you will need to update your PATH environment variable in ~/.profile file. To make xtensa-esp32-elf available for all terminal sessions, add the following line to your ~/.profile file:

```bash
export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

Alternatively, you may create an alias for the above command. This way you can get the toolchain only when you need it. To do this, add different line to your ~/.profile file:

```bash
alias get_esp32='export PATH="$HOME/esp/xtensa-esp32-elf/bin:$PATH"'
```

Then when you need the toolchain you can type get_esp32 on the command line and the toolchain will be added to your PATH.

**Note:** If you have /bin/bash set as login shell, and both .bash_profile and .profile exist, then update .bash_profile instead. In CentOS, alias should set in .bashrc.

3. Log off and log in back to make the .profile changes effective. Run the following command to verify if PATH is correctly set:

```
printenv PATH
```

You are looking for similar result containing toolchain’s path at the beginning of displayed string:

```
$ printenv PATH
/home/user-name/esp/xtensa-esp32-elf/bin:/home/user-name/bin:/home/user-name/.
--local/bin:/usr/local/sbin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/
--games:/usr/local/games:/snap/bin
```

Instead of /home/user-name there should be a home path specific to your installation.

**Permission issues /dev/ttyUSB0** With some Linux distributions you may get the F{ailed to open port /dev/ttyUSB0 error message when flashing the ESP32. *This can be solved by adding the current user to the dialout group.*

**Arch Linux Users** To run the precompiled gdb (xtensa-esp32-elf-gdb) in Arch Linux requires ncurses 5, but Arch uses ncurses 6.

Backwards compatibility libraries are available in AUR for native and lib32 configurations:

- https://aur.archlinux.org/packages/ncurses5-compat-libs/
- https://aur.archlinux.org/packages/lib32-ncurses5-compat-libs/

Before installing these packages you might need to add the author’s public key to your keyring as described in the “Comments” section at the links above.

Alternatively, use crosstool-NG to compile a gdb that links against ncurses 6.

**Next Steps** To carry on with development environment setup, proceed to section *Step 2. Get ESP-IDF.*

**Related Documents**
Setup Linux Toolchain from Scratch (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Note: Standard process for installing the toolchain is described here. See Customized Setup of Toolchain section for some of the reasons why installing the toolchain from scratch may be necessary.

Install Prerequisites
To compile with ESP-IDF you need to get the following packages:

• Ubuntu and Debian:

```bash
sudo apt-get install gcc git wget make libncurses-dev flex bison gperf python-
--python-pip python-setuptools python-serial python-cryptography python-future-
--python-pyparsing python-pyelftools libffi-dev libssl-dev
```

• Arch:

```bash
sudo pacman -S --needed gcc git make ncurses flex bison gperf python-pyserial-
--python-cryptography python-future python-pyparsing python-pyelftools
```

Note: Some older (pre-2014) Linux distributions may use pyserial version 2.x which is not supported by ESP-IDF. In this case please install a supported version via pip as it is described in section Step 4. Install the Required Python Packages.

Compile the Toolchain from Source

• Install dependencies:
  – CentOS 7:

```bash
sudo yum install gawk gperf grep gettext ncurses-devel python python-devel-
--automake bison flex texinfo help2man libtool
```

  – Ubuntu pre-16.04:

```bash
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
--dev automake bison flex texinfo help2man libtool
```

  – Ubuntu 16.04 or newer:

```bash
sudo apt-get install gawk gperf grep gettext python python-dev automake-
--bison flex texinfo help2man libtool libtool-bin
```

  – Debian 9:

```bash
sudo apt-get install gawk gperf grep gettext libncurses-dev python python-
--dev automake bison flex texinfo help2man libtool libtool-bin
```

  – Arch:

```bash
TODO
```

Create the working directory and go into it:

```bash
mkdir -p ~/esp
cd ~/esp
```

Download crosstool-NG and build it:
Chapter 1. Get Started

```bash
# Install toolchain

git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r3
git submodule update --init
./bootstrap && ./configure --enable-local && make

# Build the toolchain

./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf

Toolchain will be built in ~/esp/crosstool-NG/builds/xtensa-esp32-elf. Follow instructions for standard setup to add the toolchain to your PATH.

Next Steps To carry on with development environment setup, proceed to section Step 2. Get ESP-IDF.

Standard Setup of Toolchain for Mac OS (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Install Prerequisites

- install pip:

  ```bash
  sudo easy_install pip
  ```

Note: pip will be used later for installing the required Python packages.

Toolchain Setup ESP32 toolchain for macOS is available for download from Espressif website:

Download this file, then extract it in ~/esp directory:

```bash
mkdir -p ~/esp
cd ~/esp
tar -xzf ~/Downloads/xtensa-esp32-elf-gcc8_4_0-esp-2020r3-macos.tar.gz
```

The toolchain will be extracted into ~/esp/xtensa-esp32-elf/ directory.

To use it, you will need to update your PATH environment variable in ~/.profile file. To make xtensa-esp32-elf available for all terminal sessions, add the following line to your ~/.profile file:

```bash
export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH
```

Alternatively, you may create an alias for the above command. This way you can get the toolchain only when you need it. To do this, add different line to your ~/.profile file:

```bash
alias get_esp32="export PATH=$HOME/esp/xtensa-esp32-elf/bin:$PATH"
```

Then when you need the toolchain you can type `get_esp32` on the command line and the toolchain will be added to your PATH.

Next Steps To carry on with development environment setup, proceed to section Step 2. Get ESP-IDF.
Chapter 1. Get Started

Related Documents

Setup Toolchain for Mac OS from Scratch (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Note: Standard process for installing the toolchain is described here. See Customized Setup of Toolchain section for some of the reasons why installing the toolchain from scratch may be necessary.

Install Prerequisites

• install pip:

  ```
  sudo easy_install pip
  ```

  Note: pip will be used later for installing the required Python packages.

Compile the Toolchain from Source

• Install dependencies:
  – Install either MacPorts or homebrew package manager. MacPorts needs a full XCode installation, while homebrew only needs XCode command line tools.
  – with MacPorts:

    ```
    sudo port install gsed gawk binutils gperf grep gettext wget libtool
    ~autoconf automake
    ```

  – with homebrew:

    ```
    brew install gnu-sed gawk binutils gperftools gettext wget help2man
    ~libtool autoconf automake
    ```

Create a case-sensitive filesystem image:

  ```
  hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive...
  ~HFS+"
  ```

Mount it:

  ```
  hdiutil mount ~/esp/crosstool.dmg
  ```

Create a symlink to your work directory:

  ```
  mkdir -p ~/esp
  ln -s /Volumes/ctng ~/esp/ctng-volume
  ```

Go into the newly created directory:

  ```
  cd ~/esp/ctng-volume
  ```

Download crosstool-NG and build it:

  ```
  git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2020r3
  ```

(continues on next page)
Chapter 1. Get Started

(continued from previous page)

```
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```
./ct-ng xtensa-esp32-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32-elf
```

Toolchain will be built in `~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32-elf`. Follow instructions for standard setup to add the toolchain to your PATH.

**Next Steps**  To carry on with development environment setup, proceed to section *Step 2. Get ESP-IDF*.

<table>
<thead>
<tr>
<th>Windows</th>
<th>Linux</th>
<th>macOS</th>
</tr>
</thead>
</table>

**Note:** This guide uses the directory `~/esp` on Linux and macOS or `%userprofile%\esp` on Windows as an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

Depending on your experience and preferences, you may want to customize your environment instead of using a prebuilt toolchain. To set up the system your own way go to Section *Customized Setup of Toolchain (Legacy GNU Make)*.

**Step 2. Get ESP-IDF**

Besides the toolchain, you also need ESP32-specific API (software libraries and source code). They are provided by Espressif in ESP-IDF repository.

To get a local copy of ESP-IDF, navigate to your installation directory and clone the repository with `git clone`. Open Terminal, and run the following commands:

```
cd ~/esp
git clone -b release/v4.0 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult *ESP-IDF Versions* for information about which ESP-IDF version to use in a given situation.

**Note:** The `git clone -b release/v4.0` tells git to clone the branch in the ESP-IDF repository `git clone` corresponding to this version of the documentation.
Chapter 1. Get Started

**Note:** GitHub’s “Download zip file” feature does not work with ESP-IDF, a `git clone` is required. As a fallback, Stable version can be installed without Git.

**Note:** Do not miss the `--recursive` option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```bash
cd esp-idf
git submodule update --init
```

---

**Step 3. Set Environment Variables**

The toolchain uses the environment variable IDF_PATH to access the ESP-IDF directory. This variable should be set up on your computer, otherwise projects will not build.

These variables can be set temporarily (per session) or permanently. Please follow the instructions specific to Windows, Linux and macOS in Section Add IDF_PATH to User Profile (Legacy GNU Make).

---

**Step 4. Install the Required Python Packages**

The python packages required by ESP-IDF are located in IDF_PATH/requirements.txt. You can install them by running:

```bash
python -m pip install --user -r $IDF_PATH/requirements.txt
```

**Note:** Please check the version of the Python interpreter that you will be using with ESP-IDF. For this, run the command `python --version` and depending on the result, you might want to use `python3`, `python3.7` or similar instead of just `python`, e.g.:

```bash
python3 -m pip install --user -r $IDF_PATH/requirements.txt
```

---

**Step 5. Start a Project**

Now you are ready to prepare your application for ESP32. You can start with `get-started/hello_world` project from examples directory in IDF.

Copy `get-started/hello_world` to the `~/esp` directory:

**Linux and macOS**

```bash
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

**Windows**

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it.

It is also possible to build examples in-place, without copying them first.
Important: The esp-idf build system does not support spaces in the paths to either esp-idf or to projects.

Step 6. Connect Your Device

Now connect your ESP32 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows**: names like COM1
- **Linux**: starting with /dev/tty
- **macOS**: starting with /dev/cu.

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32 (Legacy GNU Make)* for full details.

Note: Keep the port name handy as you will need it in the next steps.

Step 7. Configure

Navigate to your hello_world directory from **Step 5. Start a Project** and run the project configuration utility menuconfig.

**Linux and macOS**

```bash
cd ~/esp/hello_world
make menuconfig
```

**Windows**

```bash
cd %userprofile%\esp\hello_world
make menuconfig
```

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

Fig. 35: Project configuration - Home window

In the menu, navigate to **Serial flasher config** > **Default serial port** to configure the serial port, where project will be loaded to. Confirm selection by pressing enter, save configuration by selecting **< Save >** and then exit menuconfig by selecting **< Exit >**.

To navigate and use menuconfig, press the following keys:
Chapter 1. Get Started

- Arrow keys for navigation
- Enter to go into a submenu
- Esc to go up one level or exit
- ? to see a help screen. Enter key exits the help screen
- Space, or Y and N keys to enable (Yes) and disable (No) configuration items with checkboxes “[*]”
- ? while highlighting a configuration item to display help about that item
- / to find configuration items

**Attention:** If you use ESP32-DevKitC board with the ESP32-SOLO-1 module, enable single core mode (CONFIG_FREERTOS_UNICORE) in menuconfig before flashing examples.

Step 8. Build and Flash

Build and flash the project by running:

```
make flash
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries. After that, these binaries will be flashed onto your ESP32 board.

If there are no issues by the end of the flash process, you will see messages (below) describing progress of the loading process. Then the board will be reset and the “hello_world” application will start up.

```
esptool.py v2.0-beta2
Flashing binaries to serial port /dev/ttyUSB0 (app at offset 0x10000)...

```

If you’d like to use the Eclipse IDE instead of running make, check out the *Eclipse guide*.

Step 9. Monitor

To check if “hello_world” is indeed running, type `make monitor`.

This command launches the *IDF Monitor* application:
Chapter 1. Get Started

```
$ make monitor
MONITOR
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
... 
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
... 
Hello world!
Restarting in 10 seconds...
I (211) cpu_start: Starting scheduler on APP CPU.
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+].

If IDF monitor fails shortly after the upload, or if instead of the messages above you see a random garbage similar to what is given below, your board is likely using a 26MHz crystal. Most development board designs use 40MHz, so ESP-IDF uses this frequency as a default value.

```
c600}{Xn@y,!66{0Pw+)00Hn9a—/99!8t600P6-8k600e0e46gjA 
~zY06Y{i0,1 66 c600}{Xn@y,!Dr@zY(0 jpi}0+z5Ymvp
```

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config -> ESP32-specific -> Main XTAL frequency, then change CONFIG_ESP32_XTAL_FREQ_SEL to 26MHz.
4. After that, build and flash the application again.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
make flash monitor
```

See also IDF Monitor for handy shortcuts and more details on using IDF monitor.

**That’s all that you need to get started with ESP32!**

Now you are ready to try some other examples, or go straight to developing your own applications.

**Environment Variables**

Some environment variables can be specified whilst calling make allowing users to override arguments without the need to reconfigure them using make menuconfig.
Variables

<table>
<thead>
<tr>
<th>Description &amp; Usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP-PORT</td>
</tr>
<tr>
<td>ESP-BAUD</td>
</tr>
<tr>
<td>MONITOR-BAUD</td>
</tr>
</tbody>
</table>

Note: You can export environment variables (e.g. `export ESPPORT=/dev/ttyUSB1`). All subsequent calls of `make` within the same terminal session will use the exported value given that the variable is not simultaneously overridden.

Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing esp-idf folder and clone it again, as if performing the initial installation described in Step 2. Get ESP-IDF.

If downloading to a new path, remember to Add IDF_PATH to User Profile (Legacy GNU Make) so that the toolchain scripts can find ESP-IDF in its release specific location.

Another solution is to update only what has changed. The update procedure depends on the version of ESP-IDF you are using.

Related Documents

Add IDF_PATH to User Profile (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

To preserve setting of `IDF_PATH` environment variable between system restarts, add it to the user profile, following instructions below.

Windows

The user profile scripts are contained in `C:/msys32/etc/profile.d/` directory. They are executed every time you open an MSYS2 window.

1. Create a new script file in `C:/msys32/etc/profile.d/` directory. Name it `export_idf_path.sh`.
2. Identify the path to ESP-IDF directory. It is specific to your system configuration and may look something like `C:\msys32\home\user-name\esp\esp-idf`.
3. Add the export command to the script file, e.g.:

   ```
   export IDF_PATH="C:/msys32/home/user-name/esp/esp-idf"
   ```

   Remember to replace back-slashes with forward-slashes in the original Windows path.
4. Save the script file.
5. Close MSYS2 window and open it again. Check if `IDF_PATH` is set, by typing:

   ```
   printenv IDF_PATH
   ```

   The path previously entered in the script file should be printed out.

If you do not like to have `IDF_PATH` set up permanently in user profile, you should enter it manually on opening of an MSYS2 window:
Chapter 1. Get Started

export IDF_PATH="C:/msys32/home/user-name/esp/esp-idf"

If you got here from section Step 3. Set Environment Variables, while installing s/w for ESP32 development, then go back to section Step 5. Start a Project.

**Linux and MacOS** Set up IDF_PATH by adding the following line to ~/.profile file:

```
export IDF_PATH=~/.esp/esp-idf
```

Log off and log in back to make this change effective.

**Note:** If you have /bin/bash set as login shell, and both .bash_profile and .profile exist, then update .bash_profile instead.

Run the following command to check if IDF_PATH is set:

```
printenv IDF_PATH
```

The path previously entered in ~/.profile file (or set manually) should be printed out.

If you do not like to have IDF_PATH set up permanently, you should enter it manually in terminal window on each restart or logout:

```
export IDF_PATH=~/.esp/esp-idf
```

If you got here from section Step 3. Set Environment Variables, while installing s/w for ESP32 development, then go back to section Step 5. Start a Project.

**Establish Serial Connection with ESP32 (Legacy GNU Make)**

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

This section provides guidance how to establish serial connection between ESP32 and PC.

**Connect ESP32 to PC** Connect the ESP32 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32 board (or external converter dongle), search for drivers in internet and install them.

Below are the links to drivers for ESP32 and other boards produced by Espressif:

<table>

- CP210x: CP210x USB to UART Bridge VCP Drivers
- FTDI: FTDI Virtual COM Port Drivers

The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with and operating system and automatically installed upon connecting one of the listed boards to the PC.
Chapter 1. Get Started

**Check port on Windows**  Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

![USB to UART bridge of ESP32-DevKitC in Windows Device Manager](image)

**Fig. 36: USB to UART bridge of ESP32-DevKitC in Windows Device Manager**

**Check port on Linux and MacOS**  To check the device name for the serial port of your ESP32 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

**Linux**

```
ls /dev/tty*
```

**MacOS**

```
ls /dev/cu.*
```

**Adding user to dialout on Linux**  The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.
Fig. 37: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Verify serial connection  Now verify that the serial connection is operational. You can do this using a serial terminal program. In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

![PuTTY Configuration](image)

Fig. 38: Setting Serial Communication in PuTTY on Windows

Then open serial port in terminal and check, if you see any log printed out by ESP32. The log contents will depend on application loaded to ESP32. An example log by ESP32 is shown below.

```
ets Jun 8 2016 00:22:57

...
```
Fig. 39: Setting Serial Communication in PuTTY on Linux
Chapter 1. Get Started

If you see some legible log, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32.

Note: For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the esptool documentation for more details.

Note: Close serial terminal after verification that communication is working. In next step we are going to use another application to upload ESP32. This application will not be able to access serial port while it is open in terminal.

If you got here from section Step 6. Connect Your Device when installing s/w for ESP32 development, then go back to section Step 7. Configure.

Build and Flash with Make (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Finding a project As well as the esp-idf-template project, ESP-IDF comes with some example projects on github in the examples directory.

Once you’ve found the project you want to work with, change to its directory and you can configure and build it.

Configuring your project

```
make menuconfig
```

Compiling your project

```
make all
```

…will compile app, bootloader and generate a partition table based on the config.

Flashing your project When make all finishes, it will print a command line to use esptool.py to flash the chip. However you can also do this from make by running:

```
make flash
```

This will flash the entire project (app, bootloader and partition table) to a new chip. Also if partition table has ota_data then this command will flash a initial ota_data. It allows to run the newly loaded app from a factory partition (or the first OTA partition, if factory partition is not present). The settings for serial port flashing can be configured with make menuconfig.

You don’t need to run make all before running make flash, make flash will automatically rebuild anything which needs it.

Compiling & Flashing Just the App After the initial flash, you may just want to build and flash just your app, not the bootloader and partition table:

- make app - build just the app.
- make app-flash - flash just the app.

make app-flash will automatically rebuild the app if it needs it.

There’s no downside to reflashing the bootloader and partition table each time, if they haven’t changed.
The Partition Table  Once you’ve compiled your project, the “build” directory will contain a binary file with a name like “my_app.bin”. This is an ESP32 image binary that can be loaded by the bootloader.

A single ESP32’s flash can contain multiple apps, as well as many kinds of data (calibration data, filesystems, parameter storage, etc). For this reason, a partition table is flashed to offset 0x8000 in the flash.

Each entry in the partition table has a name (label), type (app, data, or something else), subtype and the offset in flash where the partition is loaded.

The simplest way to use the partition table is to make menuconfig and choose one of the simple predefined partition tables:

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

In both cases the factory app is flashed at offset 0x10000. If you make partition_table then it will print a summary of the partition table.

For more details about partition tables and how to create custom variations, view the documentation.

Build and Flash with Eclipse IDE (Legacy GNU Make)

Note: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

Installing Eclipse IDE  The Eclipse IDE gives you a graphical integrated development environment for writing, compiling and debugging ESP-IDF projects.

- Start by installing the esp-idf for your platform (see files in this directory with steps for Windows, OS X, Linux).
- We suggest building a project from the command line first, to get a feel for how that process works. You also need to use the command line to configure your esp-idf project (via make menuconfig), this is not currently supported inside Eclipse.
- Download the Eclipse Installer for your platform from eclipse.org.
- When running the Eclipse Installer, choose “Eclipse for C/C++ Development” (in other places you’ll see this referred to as CDT.)

Setting up Eclipse  Once your new Eclipse installation launches, follow these steps:

Import New Project

- Eclipse makes use of the Makefile support in ESP-IDF. This means you need to start by creating an ESP-IDF project. You can use the idf-template project from github, or open one of the examples in the esp-idf examples subdirectory.
- Once Eclipse is running, choose File -> Import…
- In the dialog that pops up, choose “C/C++” -> “Existing Code as Makefile Project” and click Next.
- On the next page, enter “Existing Code Location” to be the directory of your IDF project. Don’t specify the path to the ESP-IDF directory itself (that comes later). The directory you specify should contain a file named “Makefile” (the project Makefile).
- On the same page, under “Toolchain for Indexer Settings” choose “Cross GCC”. Then click Finish.

Project Properties

- The new project will appear under Project Explorer. Right-click the project and choose Properties from the context menu.
- Click on the “Environment” properties page under “C/C++ Build”. Click “Add…” and enter name BATCH_BUILD and value 1.
- Click “Add…” again, and enter name IDF_PATH. The value should be the full path where ESP-IDF is installed. Windows users can copy the IDF_PATH from windows explorer.
• Edit the PATH environment variable. Keep the current value, and append the path to the Xtensa toolchain installed as part of IDF setup, if this is not already listed on the PATH. A typical path to the toolchain looks like /home/user-name/esp/xtensa-esp32-elf/bin. Note that you need to add a colon : before the appended path. Windows users will need to prepend C:\msys32\mingw32\bin;C:\msys32\opt\xtensa-esp32-elf\bin;C:\msys32\usr\bin to PATH environment variable (If you installed msys32 to a different directory then you’ll need to change these paths to match).

• On macOS, add a PYTHONPATH environment variable and set it to /Library/Frameworks/Python.framework/Versions/2.7/lib/python2.7/site-packages. This is so that the system Python, which has pyserial installed as part of the setup steps, overrides any built-in Eclipse Python.

ADDITIONAL NOTE: If either the IDF_PATH directory or the project directory is located outside C:\msys32\home directory, you will have to give custom build command in C/C++ Build properties as: python ${IDF_PATH}/tools/windows/eclipse_make.py (Please note that the build time may get significantly increased by this method.)

Navigate to “C/C++ General” -> “Preprocessor Include Paths” property page:
  • Click the “Providers” tab
  • In the list of providers, click “CDT Cross GCC Built-in Compiler Settings”. Change “Command to get compiler specs” to xtensa-esp32-elf-gcc ${FLAGS} -std=c++11 -E -P -v -dD "${INPUTS}".
  • In the list of providers, click “CDT GCC Build Output Parser” and change the “Compiler command pattern” to xtensa-esp32-elf-{gcc|g++|c++|cc|cpp|clang}

Navigate to “C/C++ General” -> “Indexer” property page:
  • Check “Enable project specific settings” to enable the rest of the settings on this page.
  • Uncheck “Allow heuristic resolution of includes”. When this option is enabled Eclipse sometimes fails to find correct header directories.

Navigate to “C/C++ Build” -> “Behavior” property page:
  • Check “Enable parallel build” to enable multiple build jobs in parallel.

Building in Eclipse Before your project is first built, Eclipse may show a lot of errors and warnings about undefined values. This is because some source files are automatically generated as part of the esp-idf build process. These errors and warnings will go away after you build the project.

  • Click OK to close the Properties dialog in Eclipse.
  • Outside Eclipse, open a command line prompt. Navigate to your project directory, and run make menu-config to configure your project’s esp-idf settings. This step currently has to be run outside Eclipse.

If you try to build without running a configuration step first, esp-idf will prompt for configuration on the command line - but Eclipse is not able to deal with this, so the build will hang or fail.

  • Back in Eclipse, choose Project -> Build to build your project.

TIP: If your project had already been built outside Eclipse, you may need to do a Project -> Clean before choosing Project -> Build. This is so Eclipse can see the compiler arguments for all source files. It uses these to determine the header include paths.

Flash from Eclipse You can integrate the “make flash” target into your Eclipse project to flash using esptool.py from the Eclipse UI:

  • Right-click your project in Project Explorer (important to make sure you select the project, not a directory in the project, or Eclipse may find the wrong Makefile.)
  • Select Build Targets -> Create from the context menu.
  • Type “flash” as the target name. Leave the other options as their defaults.
  • Now you can use Project -> Build Target -> Build (Shift+F9) to build the custom flash target, which will compile and flash the project.

Note that you will need to use “make menuconfig” to set the serial port and other config options for flashing. “make menuconfig” still requires a command line terminal (see the instructions for your platform.)
Follow the same steps to add bootloader and partition_table targets, if necessary.

**Customized Setup of Toolchain (Legacy GNU Make)** Instead of downloading binary toolchain from Espressif website (see *Step 1. Set up the Toolchain*) you may build the toolchain yourself.

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

If you can’t think of a reason why you need to build it yourself, then probably it’s better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

- if you want to customize toolchain build configuration
- if you want to use a different GCC version (such as 4.8.5)
- if you want to hack gcc or newlib or libstdc++
- if you are curious and/or have time to spare
- if you don’t trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.
Chapter 2

API Reference

2.1 Bluetooth API

2.1.1 Controller && VHCI

Overview

Instructions

Application Example

Check bluetooth/bluedroid/hci folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE HCI command for BLE advertising - bluetooth/bluedroid/hci/controller_vhci_ble_adv.

API Reference

Header File

- bt/include/esp_bt.h

Functions

esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)

Set BLE TX power Connection Tx power should only be set after connection created.

Return ESP_OK - success, other - failed

Parameters

- power_type: The type of which tx power, could set Advertising/Connection/Default and etc
- power_level: Power level(index) corresponding to absolute value(dbm)

esp_power_level_t esp_ble_tx_power_get (esp_ble_power_type_t power_type)

Get BLE TX power Connection Tx power should only be get after connection created.

Return >= 0 - Power level, < 0 - Invalid

Parameters

- power_type: The type of which tx power, could set Advertising/Connection/Default and etc

esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on.
Please call the function after esp_bt_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

Return ESP_OK - success, other - failed

Parameters
- min_power_level: The minimum power level
- max_power_level: The maximum power level

```c
esp_err_t esp_bredr_tx_power_get(esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)
```

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

Return ESP_OK - success, other - failed

Parameters
- min_power_level: The minimum power level
- max_power_level: The maximum power level

```c
esp_err_t esp_bredr_sco_datapath_set(esp_sco_data_path_t data_path)
```

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established

Return ESP_OK - success, other - failed

Parameters
- data_path: SCO data path

```c
esp_err_t esp_bt_controller_init(esp_bt_controller_config_t *cfg)
```

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

Return ESP_OK - success, other - failed

Parameters
- cfg: Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

```c
esp_err_t esp_bt_controller_deinit(void)
```

De-initialize BT controller to free resource and delete task.

This function should be called only once, after any other BT functions are called.

Return ESP_OK - success, other - failed

```c
esp_err_t esp_bt_controller_enable(esp_bt_mode_t mode)
```

Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

Return ESP_OK - success, other - failed

Parameters
- mode: : the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of esp_bt_controller_init().

```c
esp_err_t esp_bt_controller_disable(void)
```

Disable BT controller.

Return ESP_OK - success, other - failed

```c
esp_bt_controller_status_t esp_bt_controller_get_status(void)
```

Get BT controller is initialised/de-initialised/enabled/disabled.

Return status value

```c
bool esp_vhci_host_check_send_available(void)
```

esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.
void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)

esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

Parameters
• data: the packet point
• len: the packet length

esp_err_t esp_vhci_host_register_callback (const esp_vhci_host_callback_t *callback)

esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

Return  ESP_OK - success, ESP_FAIL - failed

Parameters
• callback: esp_vhci_host_callback type variable

esp_err_t esp_bt_controller_mem_release (esp_bt_mode_t mode)

esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function

Return  ESP_OK - success, other - failed

Parameters
• mode: the mode want to release memory

esp_err_t esp_bt_mem_release (esp.bt_mode_t mode)

esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap.

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.
For example, if a user only uses Bluetooth for setting the WiFi configuration, and does not use Bluetooth in the rest of the product operation. In such cases, after receiving the WiFi configuration, you can disable/deinitialize Bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```c
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

**Note** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

**Return** ESP_OK - success, other - failed

**Parameters**
- `mode`: the mode whose memory is to be released

```c
esp_err_t esp_bt_sleep_enable(void)
```

Enable Bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for Bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_BTDM_MODEM_SLEEP is set and "ORIG mode" is selected. In ORIG modem sleep mode, Bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wake up according to the scheduled interval and resume the work. It can also wake up earlier upon external request using function “esp_bt_controller_wakeup_request”.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_bt_sleep_disable(void)
```

Disable Bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, Bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, Bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_scan_duplicate_list_flush(void)
```

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

**Note** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Return**
- ESP_OK : success
- other : failed

**Structures**

```c
struct esp_bt_controller_config_t
```

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.
Public Members

- `uint16_t controller_task_stack_size`
  Bluetooth controller task stack size

- `uint8_t controller_task_prio`
  Bluetooth controller task priority

- `uint8_t hci_uart_no`
  If use UART1/2 as HCI IO interface, indicate UART number

- `uint32_t hci_uart_baudrate`
  If use UART1/2 as HCI IO interface, indicate UART baudrate

- `uint8_t scan_duplicate_mode`
  scan duplicate mode

- `uint8_t scan_duplicate_type`
  scan duplicate type

- `uint16_t normal_adv_size`
  Normal adv size for scan duplicate

- `uint16_t mesh_adv_size`
  Mesh adv size for scan duplicate

- `uint16_t send_adv_reserved_size`
  Controller minimum memory value

- `uint32_t controller_debug_flag`
  Controller debug log flag

- `uint8_t mode`
  Controller mode: BR/EDR, BLE or Dual Mode

- `uint8_t ble_max_conn`
  BLE maximum connection numbers

- `uint8_t bt_max_acl_conn`
  BR/EDR maximum ACL connection numbers

- `uint8_t bt_sco_datapath`
  SCO data path, i.e. HCI or PCM module

- `bool auto_latency`
  BLE auto latency, used to enhance classic BT performance

- `bool bt_legacy_auth_vs_evt`
  BR/EDR Legacy auth complete event required to protect from BIAS attack

- `uint8_t bt_max_sync_conn`
  BR/EDR maximum ACL connection numbers. Effective in menuconfig

- `uint8_t ble_sca`
  BLE low power crystal accuracy index

- `uint8_t pcm_role`
  PCM role (master & slave)

- `uint8_t pcm_polar`
  PCM polar trig (falling clk edge & rising clk edge)

- `uint32_t magic`
  Magic number

- `struct esp_vhci_host_callback esp_vhci_host_callback`
  `esp_vhci_host_callback` used for vhci call host function to notify what host need to do
Public Members

void (*notify_host_send_available)(void)
callback used to notify that the host can send packet to controller

int (*notify_host_recv)(uint8_t *data, uint16_t len)
callback used to notify that the controller has a packet to send to the host

Macros

#define ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
#define BT_CONTROLLER_INIT_CONFIG_DEFAULT()

Type Definitions
typedef struct esp_vhci_host_callback esp_vhci_host_callback_t

esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations
enum esp_bt_mode_t
    Bluetooth mode for controller enable/disable.
    
    Values:
    
    ESP_BT_MODE_IDLE = 0x00
        Bluetooth is not running
    ESP_BT_MODE_BLE = 0x01
        Run BLE mode
    ESP_BT_MODE_CLASSIC_BT = 0x02
        Run Classic BT mode
    ESP_BT_MODE_BTDM = 0x03
        Run dual mode

enum [anonymous]
    BLE sleep clock accuracy(SCA), values for ble_sca field in esp_bt_controller_config_t, currently only
    ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.
    
    Values:
    
    ESP_BLE_SCA_500PPM = 0
        BLE SCA at 500ppm
    ESP_BLE_SCA_250PPM
        BLE SCA at 250ppm
    ESP_BLE_SCA_150PPM
        BLE SCA at 150ppm
    ESP_BLE_SCA_100PPM
        BLE SCA at 100ppm
    ESP_BLE_SCA_75PPM
        BLE SCA at 75ppm
    ESP_BLE_SCA_50PPM
        BLE SCA at 50ppm
    ESP_BLE_SCA_30PPM
        BLE SCA at 30ppm
    ESP_BLE_SCA_20PPM
        BLE SCA at 20ppm
**enum esp_bt_controller_status_t**

Bluetooth controller enable/disable/initialised/de-initialised status.

Values:

- `ESP_BT_CONTROLLER_STATUS_IDLE` = 0
- `ESP_BT_CONTROLLER_STATUS_INITED`
- `ESP_BT_CONTROLLER_STATUS_ENABLED`
- `ESP_BT_CONTROLLER_STATUS_NUM`

**enum esp_ble_power_type_t**

BLE tx power type `ESP_BLE_PWR_TYPE_CONN_HDL0-8`: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. `ESP_BLE_PWR_TYPE_ADV` : for advertising/scan response. `ESP_BLE_PWR_TYPE_SCAN` : for scan. `ESP_BLE_PWR_TYPE_DEFAULT` : if each connection’s TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use `ESP_PWR_LVL_P3` as default for ADV/SCAN/CONN0-9.

Values:

- `ESP_BLE_PWR_TYPE_CONN_HDL0` = 0
  For connection handle 0
- `ESP_BLE_PWR_TYPE_CONN_HDL1` = 1
  For connection handle 1
- `ESP_BLE_PWR_TYPE_CONN_HDL2` = 2
  For connection handle 2
- `ESP_BLE_PWR_TYPE_CONN_HDL3` = 3
  For connection handle 3
- `ESP_BLE_PWR_TYPE_CONN_HDL4` = 4
  For connection handle 4
- `ESP_BLE_PWR_TYPE_CONN_HDL5` = 5
  For connection handle 5
- `ESP_BLE_PWR_TYPE_CONN_HDL6` = 6
  For connection handle 6
- `ESP_BLE_PWR_TYPE_CONN_HDL7` = 7
  For connection handle 7
- `ESP_BLE_PWR_TYPE_CONN_HDL8` = 8
  For connection handle 8
- `ESP_BLE_PWR_TYPE_ADV` = 9
  For advertising
- `ESP_BLE_PWR_TYPE_SCAN` = 10
  For scan
- `ESP_BLE_PWR_TYPE_DEFAULT` = 11
  For default, if not set other, it will use default value
- `ESP_BLE_PWR_TYPE_NUM` = 12
  TYPE numbers

**enum esp_power_level_t**

Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).

Values:

- `ESP_PWR_LVL_N12` = 0
  Corresponding to -12dbm
ESP_PWR_LVL_N9 = 1
  Corresponding to -9dbm
ESP_PWR_LVL_N6 = 2
  Corresponding to -6dbm
ESP_PWR_LVL_N3 = 3
  Corresponding to -3dbm
ESP_PWR_LVL_N0 = 4
  Corresponding to 0dbm
ESP_PWR_LVL_P3 = 5
  Corresponding to +3dbm
ESP_PWR_LVL_P6 = 6
  Corresponding to +6dbm
ESP_PWR_LVL_P9 = 7
  Corresponding to +9dbm

ESP_PWR_LVL_N14 = ESP_PWR_LVL_N12
  Backward compatibility! Setting to -14dbm will actually result to -12dbm
ESP_PWR_LVL_N11 = ESP_PWR_LVL_N9
  Backward compatibility! Setting to -11dbm will actually result to -9dbm
ESP_PWR_LVL_N8 = ESP_PWR_LVL_N6
  Backward compatibility! Setting to -8dbm will actually result to -6dbm
ESP_PWR_LVL_N5 = ESP_PWR_LVL_N3
  Backward compatibility! Setting to -5dbm will actually result to -3dbm
ESP_PWR_LVL_N2 = ESP_PWR_LVL_N0
  Backward compatibility! Setting to -2dbm will actually result to 0dbm
ESP_PWR_LVL_P1 = ESP_PWR_LVL_P3
  Backward compatibility! Setting to +1dbm will actually result to +3dbm
ESP_PWR_LVL_P4 = ESP_PWR_LVL_P6
  Backward compatibility! Setting to +4dbm will actually result to +6dbm
ESP_PWR_LVL_P7 = ESP_PWR_LVL_P9
  Backward compatibility! Setting to +7dbm will actually result to +9dbm

def
  Bluetooth audio data transport path.
  Values:
  ESP_SCO_DATA_PATH_HCI = 0
    data over HCI transport
  ESP_SCO_DATA_PATH_PCM = 1
    data over PCM interface

BT MAIN API

Overview Instructions

Application Example Instructions

API Reference

Header File
- bt/host/bluedroid/api/include/api/esp_bt_main.h

Functions

esp_bluedroid_status_t esp_bluedroid_get_status (void)
Get bluetooth stack status.

Return Bluetooth stack status

esp_err_t esp_bluedroid_enable (void)
Enable bluetooth, must after esp_bluedroid_init()

Return
- ESP_OK : Succeed
- Other : Failed

esp_err_t esp_bluedroid_disable (void)
Disable bluetooth, must prior to esp_bluedroid_deinit()

Return
Chapter 2. API Reference

- ESP_OK: Succeed
- Other: Failed

`esp_err_t esp_bluedroid_init (void)`

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

**Return**
- ESP_OK: Succeed
- Other: Failed

`esp_err_t esp_bluedroid_deinit (void)`

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

**Return**
- ESP_OK: Succeed
- Other: Failed

**Enumerations**

`enum esp_bluedroid_status_t`  
Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

**Values:**

- `ESP_BLUEDROID_STATUS_UNINITIALIZED` = 0  
  Bluetooth not initialized
- `ESP_BLUEDROID_STATUS_INITIALIZED`  
  Bluetooth initialized but not enabled
- `ESP_BLUEDROID_STATUS_ENABLED`  
  Bluetooth initialized and enabled

**BT DEVICE APIs**

**Overview**  
Bluetooth device reference APIs.

**Instructions**

**Application Example**  
Instructions

**API Reference**

**Header File**
- `bt/host/bluedroid/api/include/api/esp_bt_device.h`

**Functions**

`const uint8_t *esp_bt_dev_get_address (void)`

Get bluetooth device address. Must use after “esp_bluedroid_enable()”.

**Return**  
- Bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

`esp_err_t esp_bt_dev_set_device_name (const char *name)`

Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully. A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

**Return**
- ESP_OK: Succeed
- ESP_ERR_INVALID_ARG: if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
Chapter 2. API Reference

• ESP_FAIL : others

Parameters
• [in] name: device name to be set

2.1.3 BT LE

GAP API

Overview

Application Example
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  – bluetooth/bluedroid/ble/gatt_security_client
  – GATT Security Client Example Walkthrough
• This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  – bluetooth/bluedroid/ble/gatt_security_server
  – GATT Security Server Example Walkthrough

API Reference

Header File

• bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

Functions

esp_err_t esp_ble_gap_register_callback (esp_gap_ble_cb_t callback)
This function is called to occur gap event, such as scan result.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] callback: callback function

esp_err_t esp_ble_gap_config_adv_data (esp_ble_adv_data_t *adv_data)
This function is called to override the BTA default ADV parameters.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] adv_data: Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

esp_err_t esp_ble_gap_set_scan_params (esp_ble_scan_params_t *scan_params)
This function is called to set scan parameters.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] scan_params: Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params
Chapter 2. API Reference

```c
esp_err_t esp_ble_gap_start_scanning(uint32_t duration)
```
This procedure keep the device scanning the peer device which advertising on the air.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] duration: Keeping the scanning time, the unit is second.

```c
esp_err_t esp_ble_gap_stop_scanning()
```
This function call to stop the device scanning the peer device which advertising on the air.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_start_advertising(esp_ble_adv_params_t *adv_params)
```
This function is called to start advertising.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] adv_params: pointer to User defined adv_params data structure.

```c
esp_err_t esp_ble_gap_stop_advertising()
```
This function is called to stop advertising.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_update_conn_params(esp_ble_conn_update_params_t *params)
```
Update connection parameters, can only be used when connection is up.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] params: - connection update parameters

```c
esp_err_t esp_ble_gap_set_pkt_data_len(esp_bd_addr_t remote_device, uint16_t tx_data_length)
```
This function is to set maximum LE data packet size.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)
```
This function sets the static Random Address and Non-Resolvable Private Address for the application.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] rand_addr: the random address which should be setting

```c
esp_err_t esp_ble_gap_clear_rand_addr()
```
This function clears the random address for the application.

**Return**
- ESP_OK : success
- other : failed
**esp_err_t esp_ble_gap_config_local_privacy**(bool privacy_enable)

Enable/disable privacy on the local device.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] privacy_enable: - enable/disable privacy on remote device.

**esp_err_t esp_ble_gap_config_local_icon**(uint16_t icon)

set local gap appearance icon

Return
- ESP_OK : success
- other : failed

Parameters

**esp_err_t esp_ble_gap_update_whitelist**(bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)

Add or remove device from white list.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] add_remove: the value is true if added the ble device to the white list, and false remove to the white list.
- [in] remote_bda: the remote device address add/remove from the white list.
- [in] wl_addr_type: whitelist address type

**esp_err_t esp_ble_gap_get_whitelist_size**(uint16_t* length)

Get the whitelist size in the controller.

Return
- ESP_OK : success
- other : failed

Parameters
- [out] length: the white list length.

**esp_err_t esp_ble_gap_set_prefer_conn_params**(esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] bd_addr: BD address of the peripheral
- [in] min_conn_int: minimum preferred connection interval
- [in] max_conn_int: maximum preferred connection interval
- [in] slave_latency: preferred slave latency
- [in] supervision_tout: preferred supervision timeout

**esp_err_t esp_ble_gap_set_device_name**(const char *name)

Set device name to the local device.

Return
- ESP_OK : success
Chapter 2. API Reference

esp_err_t esp_ble_gap_get_local_used_addr(esp_bd_addr_t *local_used_addr, uint8_t *addr_type)

This function is called to get local used address and address type. uint8_t *esp_bluetooth_dev_get_address(void) get the public address.

Parameters
- [in] local_used_addr: - current local used ble address (six bytes)
- [in] addr_type: - ble address type

uint8_t *esp_ble_resolve_adv_data(uint8_t *adv_data, uint8_t type, uint8_t *length)

This function is called to get ADV data for a specific type.

Parameters
- [in] adv_data: - pointer of ADV data which to be resolved
- [in] type: - finding ADV data type
- [out] length: - return the length of ADV data not including type

esp_err_t esp_ble_gap_config_adv_data_raw(uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw advertising data. User need to fill ADV data by self.

Parameters
- [in] raw_data: - raw advertising data
- [in] raw_data_len: - raw advertising data length, less than 31 bytes

esp_err_t esp_ble_gap_config_scan_rsp_data_raw(uint8_t *raw_data, uint32_t raw_data_len)

This function is called to set raw scan response data. User need to fill scan response data by self.

Parameters
- [in] raw_data: - raw scan response data
- [in] raw_data_len: - raw scan response data length, less than 31 bytes

esp_err_t esp_ble_gap_read_rssi(esp_bd_addr_t remote_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

Parameters
- [in] remote_addr: - The remote connection device address.

esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)

This function is called to add a device info into the duplicate scan exceptional list.

Parameters
• [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
• [in] device_info: the device information.

```c
esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device(
    esp_ble_duplicate_exceptional_info_type_t type,
    esp_duplicate_info_t device_info)
```

This function is called to remove a device info from the duplicate scan exceptional list.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.

```c
esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list(
    esp_duplicate_scan_exceptional_list_type_t list_type)
```

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] list_type: duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

```c
esp_err_t esp_ble_gap_set_security_param(
    esp_ble_sm_param_t param_type, void *value, uint8_t len)
```

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like ‘Impersonation in the Pin Pairing Protocol’ (CVE-2020-26555) and ‘Authentication of the LE Legacy Pairing Protocol’.

To accept only secure connection mode, it is necessary do as following:

1. Set bit ESP_LE_AUTH_REQ_SC_ONLY (param_type is ESP_BLE_SM_AUTHEN_REQ_MODE), bit ESP_LE_AUTH_BOND and bit ESP_LE_AUTH_REQ_MITM is optional as required.
2. Set to ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE (param_type is ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH).

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] param_type: the type of the param which to be set
- [in] value: the param value
- [in] len: the length of the param value

```c
esp_err_t esp_ble_gap_security_rsp(esp_bd_addr_t bd_addr, bool accept)
```

Grant security request access.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] bd_addr: BD address of the peer
- [in] accept: accept the security request or not

```c
esp_err_t esp_ble_set_encryption(esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)
```

Set a gap parameter value. Use this function to change the default GAP parameter values.
Return - ESP_OK: success
  • other: failed

Parameters
  • [in] bd_addr: the address of the peer device need to encryption
  • [in] sec_act: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

`esp_err_t esp_ble_passkey_reply(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)`
Reply the key value to the peer device in the legacy connection stage.

Return - ESP_OK: success
  • other: failed

Parameters
  • [in] bd_addr: BD address of the peer
  • [in] accept: passkey entry successful or declined.
  • [in] passkey: passkey value, must be a 6 digit number, can be lead by 0.

`esp_err_t esp_ble_confirm_reply(esp_bd_addr_t bd_addr, bool accept)`
Reply the confirm value to the peer device in the secure connection stage.

Return - ESP_OK: success
  • other: failed

Parameters
  • [in] bd_addr: BD address of the peer device

`esp_err_t esp_ble_remove_bond_device(esp_bd_addr_t bd_addr)`
Removes a device from the security database list of peer device. It manages unpairing event while connected.

Return - ESP_OK: success
  • other: failed

Parameters
  • [in] bd_addr: BD address of the peer device

`int esp_ble_get_bond_device_num(void)`
Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return - >= 0: bonded devices number.
  • ESP_FAIL: failed

`esp_err_t esp_ble_get_bond_device_list(int* dev_num, esp_ble_bond_dev_t* dev_list)`
Get the device from the security database list of peer device. It will return the device bonded information immediately.

Return - ESP_OK: success
  • other: failed

Parameters
  • [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
  • [out] dev_list: an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

`esp_err_t esp_ble_oob_req_reply(esp_bd_addr_t bd_addr, uint8_t* TK, uint8_t len)`
This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

Return - ESP_OK: success
  • other: failed

Parameters
  • [in] bd_addr: BD address of the peer device.
  • [in] TK: TK value, the TK value shall be a 128-bit random number
  • [in] len: length of tk, should always be 128-bit
\[\text{esp_err_t esp_ble_gap_disconnect (esp_bd_addr_t remote\_device)}\]

This function is to disconnect the physical connection of the peer device. gattc may have multiple virtual GATT server connections when multiple app_id registered. \(\text{esp_ble_gattc\_close (esp\_gatt\_if\_t gatt\_if, uint16\_t conn\_id)}\) only close one virtual GATT server connection. If there exist other virtual GATT server connections, it does not disconnect the physical connection. \(\text{esp_ble\_gap\_disconnect(esp\_bd\_addr\_t remote\_device)}\) disconnect the physical connection directly.

\textbf{Return} - ESP_OK : success
\textbf{• other} : failed

\textbf{Parameters}
• [in] remote_device: BD address of the peer device

\[\text{esp_err_t esp_ble_get\_current\_conn\_params (esp\_bd\_addr\_t bd\_addr, esp\_gap\_conn\_params\_t *conn\_params)}\]

This function is called to read the connection parameters information of the device.

\textbf{Return} - ESP_OK : success
\textbf{• other} : failed

\textbf{Parameters}
• [in] bd_addr: BD address of the peer device.
• [out] conn_params: the connection parameters information

\[\text{esp_err_t esp_gap\_ble\_set\_authorization (esp\_bd\_addr\_t bd\_addr, bool authorize)}\]

This function is called to authorized a link after Authentication(MITM protection)

\textbf{Return} - ESP_OK : success
\textbf{• other} : failed

\textbf{Parameters}
• [in] bd_addr: BD address of the peer device.
• [out] authorize: Authorized the link or not.

\textbf{Unions}

\textbf{union esp\_ble\_key\_value\_t}
\#include <esp\_gap\_ble\_api.h> union type of the security key value

\textbf{Public Members}

\textbf{esp\_ble\_penc\_keys\_t penc\_key}
received peer encryption key

\textbf{esp\_ble\_pcsrk\_keys\_t pcsrk\_key}
received peer device SRK

\textbf{esp\_ble\_pid\_keys\_t pid\_key}
peer device ID key

\textbf{esp\_ble\_lenc\_keys\_t lenc\_key}
local encryption reproduction keys LTK = d1(ER,DIV,0)

\textbf{esp\_ble\_lcsrk\_keys lcsrk\_key}
local device CSRK = d1(ER,DIV,1)

\textbf{union esp\_ble\_sec\_t}
\#include <esp\_gap\_ble\_api.h> union associated with ble security

\textbf{Public Members}

\textbf{esp\_ble\_sec\_key\_notif\_t key\_notif}
passkey notification

\textbf{esp\_ble\_sec\_req\_t ble\_req}
BLE SMP related request
*esp BLE key* / ble_key
BLE SMP keys used when pairing

*esp BLE local id keys* / ble_id_keys
BLE ID event

*esp BLE auth compl* / auth_cmpl
Authentication complete indication.

union esp ble gap cb param_t
#include <esp_gap_ble_api.h> Gap callback parameters union.

Public Members

```c
struct esp_ble_gap_cb_param_t::{ble_adv_data_cmpl_evt_param} adv_data_cmpl
Event parameter of ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT
```

```c
struct esp bleeding cb param_t::{ble_scan_rsp_data_cmpl_evt_param} scan_rsp_data_cmpl
Event parameter of ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT
```

```c
struct esp bleeding cb param_t::{ble_scan_param_cmpl_evt_param} scan_param_cmpl
Event parameter of ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT
```

```c
struct esp bleeding cb param_t::{ble_scan_result_evt_param} scan_rst
Event parameter of ESP_GAP_BLE_SCAN_RESULT_EVT
```

```c
struct esp bleeding cb param_t::{ble_adv_data_raw_cmpl_evt_param} adv_data_raw_cmpl
Event parameter of ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT
```

```c
struct esp bleeding cb param_t::{ble_scan_rsp_data_raw_cmpl_evt_param} scan_rsp_data_raw_cmpl
Event parameter of ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT
```

```c
struct esp bleeding cb param_t::{ble_adv_start_cmpl_evt_param} adv_start_cmpl
Event parameter of ESP_GAP_BLE_ADV_START_COMPLETE_EVT
```

```c
struct esp bleeding cb param_t::{ble_scan_start_cmpl_evt_param} scan_start_cmpl
Event parameter of ESP_GAP_BLE_SCAN_START_COMPLETE_EVT
```

```c
esp BLE sec t* ble_security
ble gap security union type
```

```c
struct esp bleeding cb param_t::{ble_scan_stop_cmpl_evt_param} scan_stop_cmpl
Event parameter of ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT
```

```c
struct esp bleeding cb param_t::{ble_adv_stop_cmpl_evt_param} adv_stop_cmpl
Event parameter of ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT
```

```c
struct esp bleeding cb param_t::{ble_set_rand_cmpl_evt_param} set_rand_addr_cmpl
Event parameter of ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT
```

```c
struct esp bleeding cb param_t::{ble_update_conn_params_evt_param} update_conn_params
Event parameter of ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT
```

```c
struct esp bleeding cb param_t::{ble_pkt_data_length_cmpl_evt_param} pkt_data_length_cmpl
Event parameter of ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT
```

```c
struct esp bleeding cb param_t::{ble_local_privacy_cmpl_evt_param} local_privacy_cmpl
Event parameter of ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT
```

```c
struct esp bleeding cb param_t::{ble_remove_bond_dev_cmpl_evt_param} remove_bond_dev_cmpl
Event parameter of ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT
```

```c
struct esp bleeding cb param_t::{ble_clear_bond_dev_cmpl_evt_param} clear_bond_dev_cmpl
Event parameter of ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT
```

```c
struct esp bleeding cb param_t::{ble_get_bond_dev_cmpl_evt_param} get_bond_dev_cmpl
Event parameter of ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT
```
**struct esp_ble_gap_cb_param_t::ble_read_rssi_cmpl_evt_param**

`read_rssi_cmpl`  
Event parameter of ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT

**struct esp_ble_gap_cb_param_t::ble_update_whitelist_cmpl_evt_param**

`update_whitelist_cmpl`  
Event parameter of ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT

**struct esp_ble_gap_cb_param_t::ble_update_duplicate_exceptional_list_cmpl_evt_param**

`update_duplicate_exceptional_list_cmpl`  
Event parameter of ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT

```

Public Members

```c
esp_gap_search_evt_t search_evt
Search event type
```
```c
esp_bd_addr_t bda
Bluetooth device address which has been searched
```
```c
esp_bt_dev_type_t dev_type
Device type
```
```c
esp_ble_addr_type_t ble_addr_type
Ble device address type
```
```c
esp_ble_evt_type_t ble_evt_type
Ble scan result event type
```
```c
int rssi
Searched device’s RSSI
```
```c
uint8_t ble_adv[ESP_BLE_ADV_DATA_LEN_MAX + ESP_BLE_SCAN_RSP_DATA_LEN_MAX]
Received EIR
```
```c
int flag
Advertising data flag bit
```
```c
int num_resps
Scan result number
```
```c
uint8_t adv_data_len
Adv data length
```
```c
uint8_t scan_rsp_len
Scan response length
```
```c
uint32_t num_dis
The number of discard packets
```

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT.
```

Public Members

```c
esp_bt_status_t status
Indicate the set scan response data operation success status
```

Max connection interval

uint16_t latency
Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t conn_int
Current connection interval

uint16_t timeout
Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

struct ble_update_duplicate_exceptional_list_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.
Public Members

`esp_bt_status_t status`  
Indicate update duplicate scan exceptional list operation success status

`uint8_t subcode`  
Define in `esp_bt_duplicate_exceptional_subcode_type_t`

`uint16_t length`  
The length of `device_info`

`esp_duplicate_info_t device_info`  
Device information, when subcode is ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN, the value is invalid

```c
struct ble_update_whitelist_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.
```

Public Members

`esp_bt_status_t status`  
Indicate the add or remove whitelist operation success status

`esp_ble_wl_opration_t wl_opration`  
The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

Structures

```c
struct esp_ble_adv_params_t
Advertising parameters.
```

Public Members

`uint16_t adv_int_min`  
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

`uint16_t adv_int_max`  
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

`esp_ble_adv_type_t adv_type`  
Advertising type

`esp_ble_addr_type_t own_addr_type`  
Owner bluetooth device address type

`esp_bd_addr_t peer_addr`  
Peer device bluetooth device address

`esp_ble_addr_type_t peer_addr_type`  
Peer device bluetooth device address type, only support public address type and random address type

`esp_ble_adv_channel_t channel_map`  
Advertising channel map

`esp_ble_adv_filter_t adv_filter_policy`  
Advertising filter policy

```c
struct esp_ble_adv_data_t
Advertising data content, according to “Supplement to the Bluetooth Core Specification”
```
**Public Members**

bool **set_scan_rsp**
Set this advertising data as scan response or not

bool **include_name**
Advertising data include device name or not

bool **include_txpower**
Advertising data include TX power

int **min_interval**
Advertising data show slave preferred connection min interval. The connection interval in the following manner: \(\text{connIntervalMin} = \text{Conn\_Interval\_Min} \times 1.25 \text{ ms}\) \(\text{Conn\_Interval\_Min}\) range: 0x0006 to 0x0C80
Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int **max_interval**
Advertising data show slave preferred connection max interval. The connection interval in the following manner: \(\text{connIntervalMax} = \text{Conn\_Interval\_Max} \times 1.25 \text{ ms}\) \(\text{Conn\_Interval\_Max}\) range: 0x0006 to 0x0C80
\(\text{Conn\_Interval\_Max}\) shall be equal to or greater than the \(\text{Conn\_Interval\_Min}\). Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int **appearance**
External appearance of device

uint16_t **manufacturer_len**
Manufacturer data length

uint8_t * **p_manufacturer_data**
Manufacturer data point

uint16_t **service_data_len**
Service data length

uint8_t * **p_service_data**
Service data point

uint16_t **service_uuid_len**
Service uuid length

uint8_t * **p_service_uuid**
Service uuid array point

uint8_t **flag**
Advertising flag of discovery mode, see BLE\_ADV\_DATA\_FLAG detail

**struct esp_ble_scan_params_t**
Ble scan parameters.

**Public Members**

**esp_ble_scan_type_t** **scan_type**
Scan type

**esp_ble_addr_type_t** **own_addr_type**
Owner address type

**esp_ble_scan_filter_t** **scan_filter_policy**
Scan filter policy

uint16_t **scan_interval**
Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds
uint16_t scan_window
  Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to
  LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time
  Range: 2.5 msec to 10240 msec

`esp_ble_scan_duplicate_t scan_duplicate`
  The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising
  reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate ad-
  vertising reports for each packet received

`struct esp_gap_conn_params_t`
  connection parameters information

**Public Members**

uint16_t interval
  connection interval

uint16_t latency
  Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
  Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
  Time = N * 10 msec Time Range: 100 msec to 32 seconds

`struct esp_ble_conn_update_params_t`
  Connection update parameters.

**Public Members**

`esp_bd_addr_t bda`
  Bluetooth device address

uint16_t min_int
  Min connection interval

uint16_t max_int
  Max connection interval

uint16_t latency
  Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
  Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
  Time = N * 10 msec Time Range: 100 msec to 32 seconds

`struct esp_ble_pkt_data_length_params_t`
  BLE pkt date length keys.

**Public Members**

uint16_t rx_len
  pkt rx data length value

uint16_t tx_len
  pkt tx data length value

`struct esp_ble_penc_keys_t`
  BLE encryption keys.
Public Members

`esp_bt_octet16_t ltk`
   The long term key

`esp_bt_octet8_t rand`
   The random number

`uint16_t ediv`
   The ediv value

`uint8_t sec_level`
   The security level of the security link

`uint8_t key_size`
   The key size (7~16) of the security link

```c
struct esp_ble_pcsrk_keys_t
BLE CSRK keys.
```

Public Members

`uint32_t counter`
   The counter

`esp_bt_octet16_t csrk`
   The csrk key

`uint8_t sec_level`
   The security level

```c
struct esp_ble_pid_keys_t
BLE pid keys.
```

Public Members

`esp_bt_octet16_t irk`
   The irk value

`esp_ble_addr_type_t addr_type`
   The address type

`esp_bd_addr_t static_addr`
   The static address

```c
struct esp_ble_lenc_keys_t
BLE Encryption reproduction keys.
```

Public Members

`esp_bt_octet16_t ltk`
   The long term key

`uint16_t div`
   The div value

`uint8_t key_size`
   The key size of the security link

`uint8_t sec_level`
   The security level of the security link
struct esp_ble_lcsrk_keys
   BLE SRK keys.

Public Members

uint32_t counter
   The counter value

uint16_t div
   The div value

uint8_t sec_level
   The security level of the security link

esp_bt_octet16_t csrk
   The csrk key value

struct esp_ble_sec_key_notif_t
   Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

esp_bd_addr_t bd_addr
   peer address

uint32_t passkey
   the numeric value for comparison. If just_works, do not show this number to UI

struct esp_ble_sec_req_t
   Structure of the security request.

Public Members

esp_bd_addr_t bd_addr
   peer address

struct esp_ble_bond_key_info_t
   struct type of the bond key information value

Public Members

esp_ble_key_mask_t key_mask
   the key mask to indicate which key is present

esp_ble_penc_keys_t penc_key
   received peer encryption key

esp_ble_pcsrk_keys_t pcsrk_key
   received peer device SRK

esp_ble_pid_keys_t pid_key
   peer device ID key

struct esp_ble_bond_dev_t
   struct type of the bond device value
Public Members

`esp_bd_addr_t bd_addr`
peer address

`esp_ble_bond_key_info_t bond_key`
the bond key information

`struct esp_ble_key_t`
union type of the security key value

Public Members

`esp_bd_addr_t bd_addr`
peer address

`esp_ble_key_type_t key_type`
key type of the security link

`esp_ble_key_value_t p_key_value`
the pointer to the key value

`struct esp_ble_local_id_keys_t`
structure type of the ble local id keys value

Public Members

`esp_bt_octet16_t ir`
the 16 bits of the ir value

`esp_bt_octet16_t irk`
the 16 bits of the ir key value

`esp_bt_octet16_t dhk`
the 16 bits of the dh key value

`struct esp_ble_auth_cmpl_t`
Structure associated with ESP_AUTH_CMPL_EVT.

Public Members

`esp_bd_addr_t bd_addr`
BD address peer device.

`bool key_present`
Valid link key value in key element

`esp_link_key key`
Link key associated with peer device.

`uint8_t key_type`
The type of Link Key

`bool success`
TRUE of authentication succeeded, FALSE if failed.

`uint8_t fail_reason`
The HCI reason/error code for when success=FALSE

`esp_ble_addr_type_t addr_type`
Peer device address type

Espressif Systems 132 Release v4.0.3-189-g7c4f5fa
*esp_bt_dev_type_t* `dev_type`
Device type

*esp_ble_auth_req_t* `auth_mode`
authentication mode

**Macros**

- `ESP_BLE_ADV_FLAG_LIMIT_DISC`
  BLE_ADV_DATA_FLAG data flag bit definition used for advertising data flag
- `ESP_BLE_ADV_FLAG_GEN_DISC`
- `ESP_BLE_ADV_FLAG_BREDR_NOT_SPT`
- `ESP_BLE_ADV_FLAG_DMT_CONTROLLER_SPT`
- `ESP_BLE_ADV_FLAG_DMT_HOST_SPT`
- `ESP_BLE_ADV_FLAG_NON_LIMIT_DISC`
- `ESP_LE_KEY_NONE`
- `ESP_LE_KEY_PENC`
- `ESP_LE_KEY_PID`
- `ESP_LE_KEY_PCSRK`
- `ESP_LE_KEY_PLK`
- `ESP_LE_KEY_LLK`
- `ESP_LE_KEY_LENC`
- `ESP_LE_KEY_LID`
- `ESP_LE_KEY_LCSRK`
- `ESP_LE_AUTH_NO_BOND`
- `ESP_LE_AUTH_BOND`

ESP_BLE_APPEARANCE_OUTDOOR_SPORTS_LOCATION_POD_AND_NAV
ESP_GAP_BLE_ADD_WHITELIST_COMPLETE_EVT
  This is the old name, just for backwards compatibility.
ESP_BLE_ADV_DATA_LEN_MAX
  Advertising data maximum length.
ESP_BLE_SCAN_RSP_DATA_LEN_MAX
  Scan response data maximum length.
BLE_BIT (n)

Type Definitions
typedef uint8_t esp_ble_key_type_t
typedef uint8_t esp_ble_auth_req_t
combination of the above bit pattern
typedef uint8_t esp_ble_io_cap_t
combination of the io capability
typedef uint8_t esp_duplicate_info_t[ESP_BD_ADDR_LEN]
typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_t event, esp_ble_gap_cb_param_t *param)
GAP callback function type.

Parameters
  • event:: Event type
  • param:: Point to callback parameter, currently is union type
Enumerations

```c
enum esp_gap_ble_cb_event_t
{
    GAP_BLE_callback_event_type.

    Values:

    ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT = 0
        When advertising data set complete, the event comes

    ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT
        When scan response data set complete, the event comes

    ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT
        When scan parameters set complete, the event comes

    ESP_GAP_BLE_SCAN_RESULT_EVT
        When one scan result ready, the event comes each time

    ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT
        When raw advertising data set complete, the event comes

    ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT
        When raw advertising data set complete, the event comes

    ESP_GAP_BLE_ADV_START_COMPLETE_EVT
        When start advertising complete, the event comes

    ESP_GAP_BLE_SCAN_START_COMPLETE_EVT
        When start scan complete, the event comes

    ESP_GAP_BLE_AUTH_CMPL_EVT

    ESP_GAP_BLE_KEY_EVT

    ESP_GAP_BLE_SEC_REQ_EVT

    ESP_GAP_BLE_PASSKEY_CONFIRM_EVT

    ESP_GAP_BLE_OOB_REQ_EVT

    ESP_GAP_BLE_LOCAL_IR_EVT

    ESP_GAP_BLE_LOCAL_ER_EVT

    ESP_GAP_BLE_NC_REQ_EVT

    ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT
        When stop adv complete, the event comes

    ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT
        When stop scan complete, the event comes

    ESP_GAP_BLE_SET_STATIC_ADDR_EVT
        When set the static rand address complete, the event comes

    ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT
        When update connection parameters complete, the event comes

    ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT
        When set pkt length complete, the event comes

    ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT
        When Enable/disable privacy on the local device complete, the event comes

    ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT
        When remove the bond device complete, the event comes

    ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT
        When clear the bond device clear complete, the event comes

};
```
Chapter 2. API Reference

ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT
When get the bond device list complete, the event comes

ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT
When read the rssi complete, the event comes

ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT
When add or remove whitelist complete, the event comes

ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT
When update duplicate exceptional list complete, the event comes

ESP_GAP_BLE_EVT_MAX

enum esp_ble_adv_data_type
The type of advertising data(not adv_type)

Values:

enum esp_ble_scan_type_t
Ble scan type.
Values:

BLE_SCAN_TYPE_PASSIVE = 0x0
Passive scan

BLE_SCAN_TYPE_ACTIVE = 0x1
Active scan

enum esp_ble_scan_filter_t
Ble scan filter type.
Values:

BLE_SCAN_FILTER_ALLOW_ALL = 0x0
Accept all:
1. advertisement packets except directed advertising packets not addressed to this device (default).

BLE_SCAN_FILTER_ALLOW_ONLY_WLST = 0x1
Accept only:
1. advertisement packets from devices where the advertiser’s address is in the White list.
2. Directed advertising packets which are not addressed for this device shall be ignored.

BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR = 0x2
Accept all:
1. undirected advertisement packets, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

BLE_SCAN_FILTER_ALLOW_WLST_PRA_DIR = 0x3
Accept all:
1. advertisement packets from devices where the advertiser’s address is in the White list, and
2. directed advertising packets where the initiator address is a resolvable private address, and
3. directed advertising packets addressed to this device.

enum esp_ble_scan_duplicate_t
Ble scan duplicate type.
Values:

BLE_SCAN_DUPLICATE_DISABLE = 0x0
the Link Layer should generate advertising reports to the host for each packet received

BLE_SCAN_DUPLICATE_ENABLE = 0x1
the Link Layer should filter out duplicate advertising reports to the Host
BLE_SCAN_DUPLICATE_MAX = 0x2
0x02–0xFF, Reserved for future use

enum esp_gap_search_evt_t
Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

ESP_GAP_SEARCH_INQ_RES_EVT = 0
Inquiry result for a peer device.

ESP_GAP_SEARCH_INQ_CMPL_EVT = 1
Inquiry complete.

ESP_GAP_SEARCH_DISC_RES_EVT = 2
Discovery result for a peer device.

ESP_GAP_SEARCH_DISC_BLE_RES_EVT = 3
Discovery result for BLE GATT based service on a peer device.

ESP_GAP_SEARCH_DISC_CMPL_EVT = 4
Discovery complete.

ESP_GAP_SEARCH_DISC_BLE_CMPL_EVT = 5
Discovery complete.

ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT = 6
Search cancelled

ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT = 7
The number of pkt discarded by flow control

enum esp_ble_evt_type_t
Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:

ESP_BLE_EVT_CONN_ADV = 0x00
Connectable undirected advertising (ADV_IND)

ESP_BLE_EVT_CONN_DIR_ADV = 0x01
Connectable directed advertising (ADV_DIRECT_IND)

ESP_BLE_EVT_DISC_ADV = 0x02
Scannable undirected advertising (ADV_SCAN_IND)

ESP_BLE_EVT_NON_CONN_ADV = 0x03
Non connectable undirected advertising (ADV_NONCONN_IND)

ESP_BLE_EVT_SCAN_RSP = 0x04
Scan Response (SCAN_RSP)

enum esp_ble_wl_operation_t

Values:

ESP_BLE_WHITELIST_REMOVE = 0X00
remove mac from whitelist

ESP_BLE_WHITELIST_ADD = 0X01
add address to whitelist

enum esp_bt_duplicate_exceptional_subcode_type_t

Values:

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD = 0
Add device info into duplicate scan exceptional list

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE
Remove device info from duplicate scan exceptional list
ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN
Clean duplicate scan exceptional list

enum esp_ble_duplicate_exceptional_info_type_t
Values:
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR = 0
BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID
BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE
BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV
BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ...
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV
BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ...

enum esp_duplicate_scan_exceptional_list_type_t
Values:
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST = BLE_BIT(0)
duplicate scan exceptional addr list
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST = BLE_BIT(1)
duplicate scan exceptional mesh link ID list
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST = BLE_BIT(2)
duplicate scan exceptional mesh beacon type list
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST = BLE_BIT(3)
duplicate scan exceptional mesh adv with provisioning service uuid
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST = BLE_BIT(4)
duplicate scan exceptional mesh adv with provisioning service uuid
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST = 0xFFFF
duplicate scan exceptional all list

Instructions

API Reference

Header File
• bt/host/bluedroid/api/include/api/esp_gatt_defs.h

Unions
union esp_gatt_rsp_t

#include <esp_gatt_defs.h> GATT remote read request response type.
Public Members

```c
esp_gatt_value_t attr_value
  Gatt attribute structure
uint16_t handle
  Gatt attribute handle
```

Structures

```c
struct esp_gatt_id_t
  Gatt id, include uuid and instance id.
```

Public Members

```c
esp_bt_uuid_t uuid
  UUID
uint8_t inst_id
  Instance id
```

```c
struct esp_gatt_svc_id_t
  Gatt service id, include id (uuid and instance id) and primary flag.
```

Public Members

```c
esp_gatt_id_t id
  Gatt id, include uuid and instance
bool is_primary
  This service is primary or not
```

```c
struct esp_attr_desc_t
  Attribute description (used to create database)
```

Public Members

```c
uint16_t uuid_length
  UUID length
uint8_t *uuid_p
  UUID value
uint16_t perm
  Attribute permission
uint16_t max_length
  Maximum length of the element
uint16_t length
  Current length of the element
uint8_t *value
  Element value array
```

```c
struct esp_attr_control_t
  attribute auto response flag
```
Public Members

uint8_t auto_rsp
if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will by replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

struct esp_gatts_attr_db_t
attribute type added to the gatt server database

Public Members

esp_attr_control_t attr_control
The attribute control type

esp_attr_desc_t att_desc
The attribute type

struct esp_attr_value_t
set the attribute value type

Public Members

uint16_t attr_max_len
attribute max value length

uint16_t attr_len
attribute current value length

uint8_t *attr_value
the pointer to attribute value

struct esp_gatts_incl_svc_desc_t
Gatt includes service entry element.

Public Members

uint16_t start_hdl
Gatt start handle value of included service

uint16_t end_hdl
Gatt end handle value of included service

uint16_t uuid
Gatt attribute value UUID of included service

struct esp_gatts_incl128_svc_desc_t
Gatt include 128 bit service entry element.

Public Members

uint16_t start_hdl
Gatt start handle value of included 128 bit service

uint16_t end_hdl
Gatt end handle value of included 128 bit service

struct esp_gatt_value_t
Gatt attribute value.
Public Members

```c
uint8_t value[ESP_GATT_MAX_ATTR_LEN]
    Gatt attribute value

uint16_t handle
    Gatt attribute handle

uint16_t offset
    Gatt attribute value offset

uint16_t len
    Gatt attribute value length

uint8_t auth_req
    Gatt authentication request
```

```c
struct esp_gatt_attribute
    Connection attribute.
```

Public Members

```c
uint16_t interval
    connection interval

uint16_t latency
    Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
    Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
    Time = N * 10 msec Time Range: 100 msec to 32 seconds
```

```c
struct esp_gattc_multi_t
    read multiple attribute
```

Public Members

```c
uint8_t num_attr
    The number of the attribute

uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
    The handles list
```

```c
struct esp_gattc_db_elem_t
    data base attribute element
```

Public Members

```c
esp_gatt_db_attr_type_t type
    The attribute type

uint16_t attribute_handle
    The attribute handle, it’s valid for all of the type

uint16_t start_handle
    The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

uint16_t end_handle
    The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE
```
Chapter 2. API Reference

`esp_gatt_char_prop_t` properties
The characteristic properties, it’s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

`esp_bt_uuid_t` uuid
The attribute uuid, it’s valid for all of the type

```c
struct esp_gattc_service_elem_t
service element
```

**Public Members**

bool `is_primary`
The service flag, true if the service is primary service, else is secondary service

```c
uint16_t `start_handle`
The start handle of the service
```

```c
uint16_t `end_handle`
The end handle of the service
```

```c
esp_bt_uuid_t `uuid`
The uuid of the service
```

```c
struct esp_gattc_char_elem_t
characteristic element
```

**Public Members**

```c
uint16_t `char_handle`
The characteristic handle
```

```c
esp_gatt_char_prop_t `properties`
The characteristic properties
```

```c
esp_bt_uuid_t `uuid`
The characteristic uuid
```

```c
struct esp_gattc_descr_elem_t
descriptor element
```

**Public Members**

```c
uint16_t `handle`
The characteristic descriptor handle
```

```c
esp_bt_uuid_t `uuid`
The characteristic descriptor uuid
```

```c
struct esp_gattc_incl_svc_elem_t
include service element
```

**Public Members**

```c
uint16_t `handle`
The include service current attribute handle
```

```c
uint16_t `incl_srvc_s_handle`
The start handle of the service which has been included
```

```c
uint16_t `incl_srvc_e_handle`
The end handle of the service which has been included
```
**esp_bt_uuid_t uuid**

The include service uuid

ESP_GATT_CHAR_PROP_BIT_NOTIFY
ESP_GATT_CHAR_PROP_BIT_INDICATE
ESP_GATT_CHAR_PROP_BIT_AUTH
ESP_GATT_CHAR_PROP_BIT_EXT_PROP
ESP_GATT_MAX_ATTR_LEN
  GATT maximum attribute length.
ESP_GATT_RSP_BY_APP
ESP_GATT_AUTO_RSP
ESP_GATT_IF_NONE
  If callback report gatte_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions
typedef uint16_t esp_gatt_perm_t
typedef uint8_t esp_gatt_char_prop_t
typedef uint8_t esp_gatt_if_t
  Gatt interface type, different application on GATT client use different gatt_if

Enumerations
enum esp_gatt_prep_write_type
  Attribute write data type from the client.
  Values:
    ESP_GATT_PREP_WRITE_CANCEL = 0x00
      Prepare write cancel
    ESP_GATT_PREP_WRITE_EXEC = 0x01
      Prepare write execute
enum esp_gatt_status_t
  GATT success code and error codes.
  Values:
    ESP_GATT_OK = 0x0
    ESP_GATT_INVALID_HANDLE = 0x01
    ESP_GATT_READ_NOT_PERMIT = 0x02
    ESP_GATT_WRITE_NOT_PERMIT = 0x03
    ESP_GATT_INVALID_PDU = 0x04
    ESP_GATT_INSUF_AUTHENTICATION = 0x05
    ESP_GATT_REQ_NOT_SUPPORTED = 0x06
    ESP_GATT_INVALID_OFFSET = 0x07
    ESP_GATT_INSUF_AUTHORIZATION = 0x08
    ESP_GATT_PREPARE_Q_FULL = 0x09
    ESP_GATT_NOT_FOUND = 0x0a

```

```c
enum esp_gatt_conn_reason_t
{
    GattConnectionReasonUnknown = 0,
    GattConnectionL2capFailure = 1,
};
```

Values:

- **ESP_GATT_CONN_UNKNOWN**: Gatt connection unknown
- **ESP_GATT_CONN_L2C_FAILURE**: General L2cap failure
ESP_GATT_CONN_TIMEOUT  = 0x08
    Connection timeout
ESP_GATT_CONN_TERMINATE_PEER_USER  = 0x13
    Connection terminate by peer user
ESP_GATT_CONN_TERMINATE_LOCAL_HOST  = 0x16
    Connection terminated by local host
ESP_GATT_CONN_FAIL_ESTABLISH  = 0x3e
    Connection fail to establish
ESP_GATT_CONN_LMP_TIMEOUT  = 0x22
    Connection fail for LMP response tout
ESP_GATT_CONN_CONN_CANCEL  = 0x0100
    L2CAP connection cancelled
ESP_GATT_CONN_NONE  = 0x0101
    No connection to cancel

enum esp_gatt_auth_req_t
    Gatt authentication request type.
    Values:
    ESP_GATT_AUTH_REQ_NONE  = 0
    ESP_GATT_AUTH_REQ_NO_MITM  = 1
    ESP_GATT_AUTH_REQ_MITM  = 2
    ESP_GATT_AUTH_REQ_SIGNED_NO_MITM  = 3
    ESP_GATT_AUTH_REQ_SIGNED_MITM  = 4

enum esp_service_source_t
    Values:
    ESP_GATT_SERVICE_FROM_REMOTE_DEVICE  = 0
    ESP_GATT_SERVICE_FROM_NVS_FLASH  = 1
    ESP_GATT_SERVICE_FROM_UNKNOWN  = 2

enum esp_gatt_write_type_t
    Gatt write type.
    Values:
    ESP_GATT_WRITE_TYPE_NO_RSP  = 1
        Gatt write attribute need no response
    ESP_GATT_WRITE_TYPE_RSP  =
        Gatt write attribute need remote response

enum esp_gatt_db_attr_type_t
    the type of attribute element
    Values:
    ESP_GATT_DB_PRIMARY_SERVICE
        Gatt primary service attribute type in the cache
    ESP_GATT_DB_SECONDARY_SERVICE
        Gatt secondary service attribute type in the cache
    ESP_GATT_DB_CHARACTERISTIC
        Gatt characteristic attribute type in the cache
    ESP_GATT_DB_DESCRIPTOR
        Gatt characteristic descriptor attribute type in the cache
**ESP_GATT_DB_INCLUDED_SERVICE**
Gatte include service attribute type in the cache

**ESP_GATT_DB_ALL**
Gatte all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

## GATT SERVER API

### Overview

**Application Example**  
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT server demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - bluetooth/bluedroid/ble/gatt_server_service_table
  - GATT Server Service Table Example Walkthrough
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - bluetooth/bluedroid/ble/gatt_server
  - GATT Server Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_server

### API Reference

**Header File**

- bt/host/bluedroid/api/include/api/esp_gatts_api.h

**Functions**

```c
esp_err_t esp_ble_gatts_register_callback (esp_gatts_cb_t callback)
```
This function is called to register application callbacks with BTA GATTS module.

**Return**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gatts_app_register (uint16_t app_id)
```
This function is called to register application identifier.

**Return**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gatts_app_unregister (esp_if_t gatts_if)
```
unregister with GATT Server.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- [in] gatts_if: GATT server access interface

```c
esp_err_t esp_ble_gatts_create_service (esp_if_t gatts_if, esp_gatt_svc_id_t *service_id, uint16_t num_handle)
```
Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to
report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] service_id: service ID.
- [in] num_handle: number of handle requested for this service.

```c
esp_err_t esp_ble_gatts_create_attr_tab(const esp_gatts_attr_db_t *gatts_attr_db,
                                         esp_gatt_if_t gatts_if, uint8_t max_nb_attr, uint8_t srvc_inst_id)
```

Create a service attribute tab.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] gatts_attr_db: the pointer to the service attr tab
- [in] gatts_if: GATT server access interface
- [in] max_nb_attr: the number of attribute to be added to the service database.
- [in] srvc_inst_id: the instance id of the service

```c
esp_err_t esp_ble_gatts_add_included_service(uint16_t service_handle, uint16_t included_service_handle)
```

This function is called to add an included service. This function have to be called between `esp_ble_gatts_create_service` and `esp_ble_gatts_add_char`. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] service_handle: service handle to which this included service is to be added.
- [in] included_service_handle: the service ID to be included.

```c
esp_err_t esp_ble_gatts_add_char(uint16_t service_handle, esp_bt_uuid_t *char_uuid,
                                  esp_gatt_perm_t perm, esp_gatt_char_prop_t property,
                                  esp_attr_value_t *char_val, esp_attr_control_t *control)
```

This function is called to add a characteristic into a service.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] service_handle: service handle to which this included service is to be added.
- [in] char_uuid: Characteristic UUID.
- [in] perm: Characteristic value declaration attribute permission.
- [in] property: Characteristic Properties
- [in] char_val: Characteristic value
- [in] control: attribute response control byte

```c
esp_err_t esp_ble_gatts_add_char_descr(uint16_t service_handle, esp_bt_uuid_t *descr_uuid,
                                       esp_gatt_perm_t perm, esp_attr_value_t *char_descr_val, esp_attr_control_t *control)
```

This function is called to add characteristic descriptor. When it’s done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

**Return**
- ESP_OK : success
- other : failed
Chapter 2. API Reference

Parameters
- [in] service_handle: service handle to which this characteristic descriptor is to be added.
- [in] perm: descriptor access permission.
- [in] descr_uuid: descriptor UUID.
- [in] char_descr_val:: Characteristic descriptor value
- [in] control:: attribute response control byte

esp_err_t esp_ble_gatts_delete_service (uint16_t service_handle)
This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] service_handle: service handle to be deleted.

esp_err_t esp_ble_gatts_start_service (uint16_t service_handle)
This function is called to start a service.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] service_handle: the service handle to be started.

esp_err_t esp_ble_gatts_stop_service (uint16_t service_handle)
This function is called to stop a service.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] service_handle: service to be topped.

esp_err_t esp_ble_gatts_send_indicate (esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)
Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gatts_if: GATT server access interface
- [in] conn_id: - connection id to indicate.
- [in] attr_handle: - attribute handle to indicate.
- [in] value_len: - indicate value length.
- [in] value: value to indicate.
- [in] need_confirm: - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

esp_err_t esp_ble_gatts_send_response (esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)
This function is called to send a response to a request.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gatts_if: GATT server access interface
• [in] trans_id: - transfer id
• [in] status: - response status
• [in] rsp: - response data.

`esp_err_t esp_ble_gatts_set_attr_value (uint16_t attr_handle, uint16_t length, const uint8_t *value)`

This function is called to set the attribute value by the application.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] attr_handle: the attribute handle which to be set
- [in] length: the value length
- [in] value: the pointer to the attribute value

`esp_gatt_status_t esp_ble_gatts_get_attr_value (uint16_t attr_handle, uint16_t *length, const uint8_t *value)`

Retrieve attribute value.

**Return**
- ESP_GATT_OK : success
- other : failed

**Parameters**
- [in] attr_handle: Attribute handle.
- [out] length: pointer to the attribute value length
- [out] value: Pointer to attribute value payload, the value cannot be modified by user

`esp_err_t esp_ble_gatts_open (esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)`

Open a direct open connection or add a background auto connection.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address.
- [in] is_direct: direct connection or background auto connection

`esp_err_t esp_ble_gatts_close (esp_gatt_if_t gatts_if, uint16_t conn_id)`

Close a connection a remote device.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] conn_id: connection ID to be closed.

`esp_err_t esp_ble_gatts_send_service_change_indication (esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)`

Send service change indication.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

**Unions**
union esp_ble_gatts_cb_param_t
#include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

Type Definitions

```c
typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if,
    esp_ble_gatts_cb_param_t *param)
```

GATT Server callback function type.

Parameters

- event:: Event type
- gatts_if:: GATT server access interface, normally different gatts_if correspond to different profile
- param:: Point to callback parameter, currently is union type

Enumerations
enum esp_gatts_cb_event_t
GATT Server callback function events.

Values:

ESP_GATTS_REG_EVT = 0
    When register application id, the event comes

ESP_GATTS_READ_EVT = 1
    When gatt client request read operation, the event comes

ESP_GATTS_WRITE_EVT = 2
    When gatt client request write operation, the event comes

ESP_GATTS_EXEC_WRITE_EVT = 3
    When gatt client request execute write, the event comes

ESP_GATTS_MTU_EVT = 4
    When set mtu complete, the event comes

ESP_GATTS_CONF_EVT = 5
    When receive confirm, the event comes

ESP_GATTS_UNREG_EVT = 6
    When unregister application id, the event comes

ESP_GATTS_CREATE_EVT = 7
    When create service complete, the event comes

ESP_GATTS_ADD_INCL_SRVC_EVT = 8
    When add included service complete, the event comes

ESP_GATTS_ADD_CHAR_EVT = 9
    When add characteristic complete, the event comes

ESP_GATTS_ADD_CHAR_DESCR_EVT = 10
    When add descriptor complete, the event comes

ESP_GATTS_DELETE_EVT = 11
    When delete service complete, the event comes

ESP_GATTS_START_EVT = 12
    When start service complete, the event comes

ESP_GATTS_STOP_EVT = 13
    When stop service complete, the event comes

ESP_GATTS_CONNECT_EVT = 14
    When gatt client connect, the event comes

ESP_GATTS_DISCONNECT_EVT = 15
    When gatt client disconnect, the event comes

ESP_GATTS_OPEN_EVT = 16
    When connect to peer, the event comes

ESP_GATTS_CANCEL_OPEN_EVT = 17
    When disconnect from peer, the event comes

ESP_GATTS_CLOSE_EVT = 18
    When gatt server close, the event comes

ESP_GATTS_LISTEN_EVT = 19
    When gatt listen to be connected the event comes

ESP_GATTS_CONGEST_EVT = 20
    When congest happen, the event comes

ESP_GATTS_RESPONSE_EVT = 21
    When gatt send response complete, the event comes
Chapter 2. API Reference

ESP_GATTS_CREAT_ATTR_TAB_EVT = 22
When gatt create table complete, the event comes

ESP_GATTS_SET_ATTR_VAL_EVT = 23
When gatt set attr value complete, the event comes

ESP_GATTS_SEND_SERVICE_CHANGE_EVT = 24
When gatt send service change indication complete, the event comes

GATT CLIENT API

Overview

Application Example  Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - bluetooth/bluedroid/ble/gatt_client
  - GATT Client Example Walkthrough
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - bluetooth/bluedroid/ble/gattc_multi_connect
  - GATT Client Multi-connection Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_client

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_gattc_api.h

Functions

`esp_err_t esp_ble_gattc_register_callback(esp_gattc_cb_t callback)`
This function is called to register application callbacks with GATTC module.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] callback: pointer to the application callback function.

`esp_err_t esp_ble_gattc_app_register(uint16_t app_id)`
This function is called to register application callbacks with GATTC module.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] app_id: Application Identify (UUID), for different application

`esp_err_t esp_ble_gattc_app_unregister(esp_gatt_if_t gattc_if)`
This function is called to unregister an application from GATTC module.

Return
- ESP_OK: success
- other: failed
**Parameters**

- `[in]` gattc_if: Gatt client access interface.

**`esp_err_t esp_ble_gattc_open`**

### Parameters

- `[in]` gattc_if: Gatt client access interface.
- `[in]` remote_bda: remote device bluetooth device address.
- `[in]` remote_addr_type: remote device bluetooth device the address type.
- `[in]` is_direct: direct connection or background auto connection(by now, background auto connection is not supported).

**`esp_err_t esp_ble_gattc_close`**

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

**Parameters**

- `[in]` gattc_if: Gatt client access interface.
- `[in]` conn_id: connection ID to be closed.

**`esp_err_t esp_ble_gattc_send_mtu_req`**

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

**Parameters**

- `[in]` gattc_if: Gatt client access interface.
- `[in]` conn_id: connection ID.

**`esp_err_t esp_ble_gattc_search_service`**

This function is called to get service from local cache. This function report service search result by a callback event, and followed by a service search complete event.

**Parameters**

- `[in]` gattc_if: Gatt client access interface.
- `[in]` conn_id: connection ID.
- `[in]` svc_uuid: a UUID of the service application is interested in. If Null, discover for all services.

**`esp_gatt_status_t esp_ble_gattc_get_service`**

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service.

**Parameters**

- `[in]` gattc_if: Gatt client access interface.
- `[in]` conn_id: connection ID.
- `[in]` svc_uuid: a UUID of the service application is interested in. If Null, discover for all services.
Chapter 2. API Reference

- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] svc_uuid: the pointer to the service uuid.
- [out] result: The pointer to the service which has been found in the gatt cache.
- [inout] count: input the number of service want to find, it will output the number of service has been found in the gatt cache with the given service uuid.
- [in] offset: Offset of the service position to get.

```c
esp_gatt_status_t esp_ble_gattc_get_all_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_char_elem_t *result, uint16_t *count, uint16_t offset)
```

Find all the characteristic with the given service in the gatt cache. Note: It just get characteristic from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle.
- [in] end_handle: the attribute end handle.
- [out] result: The pointer to the characteristic in the service.
- [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gatt cache with the given service.
- [in] offset: Offset of the characteristic position to get.

```c
esp_gatt_status_t esp_ble_gattc_get_all_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gattc_descr_elem_t *result, uint16_t*count, uint16_t offset)
```

Find all the descriptor with the given characteristic in the gatt cache. Note: It just get descriptor from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] char_handle: the given characteristic handle
- [out] result: The pointer to the descriptor in the characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gatt cache with the given characteristic.
- [in] offset: Offset of the descriptor position to get.

```c
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)
```

Find the characteristic with the given characteristic uuid in the gatt cache. Note: It just get characteristic from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
• [in] start_handle: the attribute start handle
• [in] end_handle: the attribute end handle
• [in] char_uuid: the characteristic uuid
• [out] result: The pointer to the characteristic in the service.
• [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gatt cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gatt cache Note: It just get descriptor from local cache, won’t get from remote devices.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] char_uuid: the characteristic uuid.
- [out] result: The pointer to the descriptor in the given characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gatt cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gatt cache Note: It just get descriptor from local cache, won’t get from remote devices.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] char_handle: the characteristic handle.
- [out] result: The pointer to the descriptor in the given characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gatt cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gatt cache Note: It just get include service from local cache, won’t get from remote devices.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
Chapter 2. API Reference

- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `incl_uuid`: the include service uuid
- [out] `result`: The pointer to the include service in the given service.
- [inout] `count`: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_attr_count(
    esp_gatt_if_t gattc_if, uint16_t conn_id,
    esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle,
    uint16_t char_handle, uint16_t* count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `type`: the attribute type.
- [in] `start_handle`: the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] `end_handle`: the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] `char_handle`: the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- [out] `count`: output the number of attribute has been found in the gattc cache with the given attribute type.

```c
esp_gatt_status_t esp_ble_gattc_get_db(
    esp_gatt_if_t gattc_if, uint16_t conn_id,
    start_handle, uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `conn_id`: connection ID which identify the server.
- [in] `db`: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- [in] `count`: number of elements in database.

```c
esp_err_t esp_ble_gattc_read_char(
    esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
    esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic handle.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `handle`: characteristic handle to read.
- [in] `auth_req`: authenticate request type
**esp_err_t esp_ble_gattc_read_by_type**

```c
(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic UUID.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] start_handle: the attribute start handle.
- [in] end_handle: the attribute end handle
- [in] uuid: The UUID of attribute which will be read.
- [in] auth_req: authenticate request type

**esp_err_t esp_ble_gattc_read_multiple**

```c
(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] read_multi: pointer to the read multiple parameter.
- [in] auth_req: authenticate request type

**esp_err_t esp_ble_gattc_read_char_descr**

```c
(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: descriptor handle to read.
- [in] auth_req: authenticate request type

**esp_err_t esp_ble_gattc_write_char**

```c
(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic handle to write.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] write_type: the type of attribute write operation.
- [in] auth_req: authentication request.
This function is called to write characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID
- [in] `handle`: descriptor handle to write.
- [in] `value_len`: length of the value to be written.
- [in] `value`: the value to be written.
- [in] `write_type`: the type of attribute write operation.
- [in] `auth_req`: authentication request.

This function is called to prepare write a characteristic value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID
- [in] `handle`: characteristic handle to prepare write.
- [in] `offset`: offset of the write value.
- [in] `value_len`: length of the value to be written.
- [in] `value`: the value to be written.
- [in] `auth_req`: authentication request.

This function is called to prepare write a characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID
- [in] `handle`: characteristic descriptor handle to prepare write.
- [in] `offset`: offset of the write value.
- [in] `value_len`: length of the value to be written.
- [in] `value`: the value to be written.
- [in] `auth_req`: authentication request.

This function is called to execute write a prepare write sequence.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
• [in] is_execute: execute or cancel.

```c
esp_err_t esp_ble_gattc_register_for_notify(esp_gatt_if_t gatt_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to register for notification of a service.

**Return**
- ESP_OK: registration succeeds
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_unregister_for_notify(esp_gatt_if_t gatt_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to de-register for notification of a service.

**Return**
- ESP_OK: unregister succeeds
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_cache_refresh(esp_bd_addr_t remote_bda)
```

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] remote_bda: remote device BD address.

```c
esp_err_t esp_ble_gattc_cache_assoc(esp_gatt_if_t gatt_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr, bool is_assoc)
```

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address mainly that device want to used the database has stored in the local cache. The source address mainly that device want to share the database to the associated address device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] src_addr: the source address which provide the attribute table.
- [in] assoc_addr: the associated device address which went to share the attribute table with the source address.
- [in] is_assoc: true add the associated device address, false remove the associated device address.

```c
esp_err_t esp_ble_gattc_cache_get_addr_list(esp_gatt_if_t gatt_if)
```

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

**Return**
- ESP_OK: success
- other: failed
Parameters

- **in** `gattc_if`: Gatt client access interface.

```c
esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)
```

Clean the service cache of this device in the gattc stack.

Return

- ESP_OK: success
- other: failed

Parameters

- **in** `remote_bda`: remote device BD address.

Unions

```c
union esp_ble_gattc_cb_param_t
```

Include `<esp_gattc_api.h>` Gatt client callback parameters union.

Public Members

```c
struct esp_ble_gattc_cb_param_t::gattc_reg_evt_param reg
```

Gatt client callback param of ESP_GATTC_REG_EVT

Chapter 2. API Reference

uint16_t offset
The prepare write offset, this value is valid only when prepare write

Type Definitions
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)
GATT Client callback function type.

Parameters
- event:: Event type
- gattc_if: GATT client access interface, normally different gattc_if correspond to different profile
- param: Point to callback parameter, currently is union type

Enumerations
class enum esp_gattc_cb_event_t
GATT Client callback function events.

Values:

ESP_GATTC_REG_EVT = 0
When GATT client is registered, the event comes

ESP_GATTC_REG_EVT = 1
When GATT client is unregistered, the event comes

ESP_GATTC_OPEN_EVT = 2
When GATT virtual connection is set up, the event comes

ESP_GATTC_READ_CHAR_EVT = 3
When GATT characteristic is read, the event comes

ESP_GATTC_WRITE_CHAR_EVT = 4
When GATT characteristic write operation completes, the event comes

ESP_GATTC_CLOSE_EVT = 5
When GATT virtual connection is closed, the event comes

ESP_GATTC_SEARCH_CMPL_EVT = 6
When GATT service discovery is completed, the event comes

ESP_GATTC_SEARCH_RES_EVT = 7
When GATT service discovery result is got, the event comes

ESP_GATTC_READ_DESCR_EVT = 8
When GATT characteristic descriptor read completes, the event comes

ESP_GATTC_WRITE_DESCR_EVT = 9
When GATT characteristic descriptor write completes, the event comes

ESP_GATTC_NOTIFY_EVT = 10
When GATT notification or indication arrives, the event comes

ESP_GATTC_PREP_WRITE_EVT = 11
When GATT prepare-write operation completes, the event comes

ESP_GATTC_EXEC_EVT = 12
When write execution completes, the event comes

ESP_GATTC_ACL_EVT = 13
When ACL connection is up, the event comes

ESP_GATTC_CANCEL_OPEN_EVT = 14
When GATT client ongoing connection is cancelled, the event comes
ESP_GATT_C_SRVC_CHG_EVT = 15
    When “service changed” occurs, the event comes

ESP_GATT_ENC_CMPL_CB_EVT = 17
    When encryption procedure completes, the event comes

ESP_GATT_CFG_MTU_EVT = 18
    When configuration of MTU completes, the event comes

ESP_GATT_ADV_DATA_EVT = 19
    When advertising of data, the event comes

ESP_GATT_MULT_ADV_ENB_EVT = 20
    When multi-advertising is enabled, the event comes

ESP_GATT_MULT_ADV_UPD_EVT = 21
    When multi-advertising parameters are updated, the event comes

ESP_GATT_MULT_ADV_DATA_EVT = 22
    When multi-advertising data arrives, the event comes

ESP_GATT_MULT_ADV_DIS_EVT = 23
    When multi-advertising is disabled, the event comes

ESP_GATT_CONGEST_EVT = 24
    When GATT connection congestion comes, the event comes

ESP_GATT_BTH_SCAN_ENB_EVT = 25
    When batch scan is enabled, the event comes

ESP_GATT_BTH_SCAN_CFG_EVT = 26
    When batch scan storage is configured, the event comes

ESP_GATT_BTH_SCAN_RD_EVT = 27
    When Batch scan read event is reported, the event comes

ESP_GATT_BTH_SCAN_THR_EVT = 28
    When Batch scan threshold is set, the event comes

ESP_GATT_BTH_SCAN_PARAM_EVT = 29
    When Batch scan parameters are set, the event comes

ESP_GATT_BTH_SCAN_DIS_EVT = 30
    When Batch scan is disabled, the event comes

ESP_GATT_SCANFLT_CFG_EVT = 31
    When Scan filter configuration completes, the event comes

ESP_GATT_SCANFLT_PARAM_EVT = 32
    When Scan filter parameters are set, the event comes

ESP_GATT_SCANFLT_STATUS_EVT = 33
    When Scan filter status is reported, the event comes

ESP_GATT_ADV_VSC_EVT = 34
    When advertising vendor spec content event is reported, the event comes

ESP_GATT_REG_FOR_NOTIFY_EVT = 38
    When register for notification of a service completes, the event comes

ESP_GATT_UNREG_FOR_NOTIFY_EVT = 39
    When unregister for notification of a service completes, the event comes

ESP_GATT_CONNECT_EVT = 40
    When the ble physical connection is set up, the event comes

ESP_GATT_DISCONNECT_EVT = 41
    When the ble physical connection disconnected, the event comes
ESP_GATTC_READ_MULTIPLE_EVT = 42
When the ble characteristic or descriptor multiple complete, the event comes

ESP_GATTC_QUEUE_FULL_EVT = 43
When the gattc command queue full, the event comes

ESP_GATTC_SET_ASSOC_EVT = 44
When the ble gattc set the associated address complete, the event comes

ESP_GATTC_GET_ADDR_LIST_EVT = 45
When the ble get gattc address list in cache finish, the event comes

ESP_GATTC_DIS_SRVC_CMPL_EVT = 46
When the ble discover service complete, the event comes

**BLUFI API**

**Overview**  BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

**Application Example**  Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - bluetooth/bluedroid/ble/blufi

**API Reference**

**Header File**

- bt/host/bluedroid/api/include/api/esp_blufi_api.h

**Functions**

`esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)`
This function is called to receive blufi callback event.

Return ESP_OK - success, other - failed

Parameters
- [in] callbacks: callback functions

`esp_err_t esp_blufi_profile_init (void)`
This function is called to initialize blufi_profile.

Return ESP_OK - success, other - failed

`esp_err_t esp_blufi_profile_deinit (void)`
This function is called to de-initialize blufi_profile.

Return ESP_OK - success, other - failed

`esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)`
This function is called to send wifi connection report.

Return ESP_OK - success, other - failed

Parameters
- opmode: wifi opmode
• sta_conn_state: station is already in connection or not
• softap_conn_num: softap connection number
• extra_info: extra information, such as sta_ssid, softap_ssid and etc.

`esp_err_t esp_blufi_send_wifi_list` (uint16_t apCount, esp_blufi_ap_record_t *list)
This function is called to send wifi list.

Return  ESP_OK - success, other - failed
Parameters
• apCount: wifi list count
• list: wifi list

`uint16_t esp_blufi_get_version` (void)
Get BLUFI profile version.

Return  Most 8bit significant is Great version, Least 8bit is Sub version

`esp_err_t esp_blufi_close` (esp_gatt_if_t gatts_if, uint16_t conn_id)
Close a connection a remote device.

Return  • ESP_OK : success
        • other : failed
Parameters
• [in] gatts_if: GATT server access interface
• [in] conn_id: connection ID to be closed.

`esp_err_t esp_blufi_send_error_info` (esp_blufi_error_state_t state)
This function is called to send blufi error information.

Return  ESP_OK - success, other - failed
Parameters
• state: error state

`esp_err_t esp_blufi_send_custom_data` (uint8_t *data, uint32_t data_len)
This function is called to custom data.

Return  ESP_OK - success, other - failed
Parameters
• data: custom data value
• data_len: the length of custom data

Unions
union esp_blufi_cb_param_t
#include <esp_blufi_api.h> BLUFI callback parameters union.

Public Members

```
struct esp_blufi_cb_param_t::blufi_init_finish_evt_param init_finish
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct esp_blufi_cb_param_t::blufi_deinit_finish_evt_param deinit_finish
Blufi callback param of ESP_BLUFI_EVENT_DEINIT_FINISH

struct esp_blufi_cb_param_t::blufi_set_wifi_mode_evt_param wifi_mode
Blufi callback param of ESP_BLUFI_EVENT_INIT_FINISH

struct esp_blufi_cb_param_t::blufi_connect_evt_param connect
Blufi callback param of ESP_BLUFI_EVENT_CONNECT

struct esp_blufi_cb_param_t::blufi_disconnect_evt_param disconnect
Blufi callback param of ESP_BLUFI_EVENT_DISCONNECT
```
struct esp_blufi_cb_param_t::blufi_recv_sta_bssid_evt_param sta_bssid
  Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_BSSID

struct esp_blufi_cb_param_t::blufi_recv_sta_ssid_evt_param sta_ssid
  Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_SSID

struct esp_blufi_cb_param_t::blufi_recv_sta_passwd_evt_param sta_passwd
  Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_PASSWD

struct esp_blufi_cb_param_t::blufi_recv_softap_ssid_evt_param softap_ssid
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_SSID

struct esp_blufi_cb_param_t::blufi_recv_softap_passwd_evt_param softap_passwd
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD

struct esp_blufi_cb_param_t::blufi_recv_softap_max_conn_num_evt_param softap_max_conn_num
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM

struct esp_blufi_cb_param_t::blufi_recv_softap_auth_mode_evt_param softap_auth_mode
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE

struct esp_blufi_cb_param_t::blufi_recv_softap_channel_evt_param softap_channel
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL

struct esp_blufi_cb_param_t::blufi_recv_username_evt_param username
  Blufi callback param of ESP_BLUFI_EVENT_RECV_USERNAME

struct esp_blufi_cb_param_t::blufi_recv_ca_evt_param ca
  Blufi callback param of ESP_BLUFI_EVENT_RECV_CA_CERT

struct esp_blufi_cb_param_t::blufi_recv_client_cert_evt_param client_cert
  Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_CERT

struct esp_blufi_cb_param_t::blufi_recv_server_cert_evt_param server_cert
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_CERT

struct esp_blufi_cb_param_t::blufi_recv_client_pkey_evt_param client_pkey
  Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY

struct esp_blufi_cb_param_t::blufi_recv_server_pkey_evt_param server_pkey
  Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY

struct esp_blufi_cb_param_t::blufi_get_error_evt_param report_error
  Blufi callback param of ESP_BLUFI_EVENT_REPORT_ERROR

struct esp_blufi_cb_param_t::blufi_recv_custom_data_evt_param custom_data
  Blufi callback param of ESP_BLUFI_EVENT_RECV_CUSTOM_DATA

struct blufi_connect_evt_param
  #include <esp_blufi_api.h> ESP_BLUFI_EVENT_CONNECT.

Public Members

  esp_bd_addr_t remote_bda
  Blufi Remote bluetooth device address

channel of softap interface

bool softap_channel_set
is channel of softap interface set

struct esp_blufi_ap_record_t
Description of an WiFi AP.

Public Members

uint8_t ssid[33]
SSID of AP

int8_t rssi
signal strength of AP

struct esp_blufi_callbacks_t
BLUFI callback functions type.

Public Members

esp_blufi_event_cb_t event_cb
BLUFI event callback

esp_blufi_negotiate_data_handler_t negotiate_data_handler
BLUFI negotiate data function for negotiate share key

esp_blufi_encrypt_func_t encrypt_func
BLUFI encrypt data function with share key generated by negotiate_data_handler

esp_blufi_decrypt_func_t decrypt_func
BLUFI decrypt data function with share key generated by negotiate_data_handler

esp_blufi_checksum_func_t checksum_func
BLUFI check sum function (FCS)

Type Definitions
typedef void (*esp_blufi_event_cb_t)(esp_blufi_cb_event_t event, esp_blufi_cb_param_t *param)
BLUFI event callback function type.

Parameters
• event:: Event type
• param:: Point to callback parameter, currently is union type
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t *
**output_data, int *output_len, bool *need_free)
BLUFI negotiate data handler.
Parameters
- *data*: data from phone
- *len*: length of data from phone
- *output_data*: data want to send to phone
- *output_len*: length of data want to send to phone
- *need_free*: output reporting if memory needs to be freed or not

```c
typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
```
BLUFI encrypt the data after negotiate a share key.

Return Nonnegative number is encrypted length, if error, return negative number;

Parameters
- *iv8*: initial vector(8bit), normally, blufi core will input packet sequence number
- *crypt_data*: plain text and encrypted data, the encrypt function must support autochthonous encrypt
- *crypt_len*: length of plain text

```c
typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
```
BLUFI decrypt the data after negotiate a share key.

Return Nonnegative number is decrypted length, if error, return negative number;

Parameters
- *iv8*: initial vector(8bit), normally, blufi core will input packet sequence number
- *crypt_data*: encrypted data and plain text, the encrypt function must support autochthonous decrypt
- *crypt_len*: length of encrypted text

```c
typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)
```
BLUFI checksum.

Parameters
- *iv8*: initial vector(8bit), normally, blufi core will input packet sequence number
- *data*: data need to checksum
- *len*: length of data

Enumerations
```c
enum esp_blufi_cb_event_t
```
Values:
- ESP_BLUFI_EVENT_INIT_FINISH = 0
- ESP_BLUFI_EVENT_DEINIT_FINISH
- ESP_BLUFI_EVENT_SET_WIFI_OPMODE
- ESP_BLUFI_EVENT_BLE_CONNECT
- ESP_BLUFI_EVENT_BLE_DISCONNECT
- ESP_BLUFI_EVENT_REQ_CONNECT_TO_AP
- ESP_BLUFI_EVENT_REQ_DISCONNECT_FROM_AP
- ESP_BLUFI_EVENT_GET_WIFI_STATUS
- ESP_BLUFI_EVENT_DEAUTHENTICATE_STA
- ESP_BLUFI_EVENT_RECV_STA_BSSID
- ESP_BLUFI_EVENT_RECV_STA_SSID
- ESP_BLUFI_EVENT_RECV_STA_PASSWD
- ESP_BLUFI_EVENT_RECV_SOFTAP_SSID
- ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD
- ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM
ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE
ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL
ESP_BLUFI_EVENT_RECV_USERNAME
ESP_BLUFI_EVENT_RECV_CA_CERT
ESP_BLUFI_EVENT_RECVCLIENT_CERT
ESP_BLUFI_EVENT_RECV_SERVER_CERT
ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY
ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY
ESP_BLUFI_EVENT_RECV_SLAVE_DISCONNECT_BLE
ESP_BLUFI_EVENT_GET_WIFI_LIST
ESP_BLUFI_EVENT_REPORT_ERROR
ESP_BLUFI_EVENT_RECV_CUSTOM_DATA

```c
enum esp_blufi_sta_conn_state_t
{
    BLUFIconfigstatus.
    Values:
    ESP_BLUFI_STA_CONN_SUCCESS = 0x00
    ESP_BLUFI_STA_CONN_FAIL = 0x01
}
```

```c
enum esp_blufi_init_state_t
{
    BLUFIinitstatus.
    Values:
    ESP_BLUFI_INIT_OK = 0
    ESP_BLUFI_INIT_FAILED
}
```

```c
enum esp_blufi_deinit_state_t
{
    BLUFIdeinitstatus.
    Values:
    ESP_BLUFI_DEINIT_OK = 0
    ESP_BLUFI_DEINIT_FAILED
}
```

```c
enum esp_blufi_error_state_t
{
    BLUFIerrorstatus.
    Values:
    ESP_BLUFI_SEQUENCE_ERROR = 0
    ESP_BLUFI_CHECKSUM_ERROR
    ESP_BLUFI_DECRYPT_ERROR
    ESP_BLUFI_ENCRYPT_ERROR
    ESP_BLUFI_INIT_SECURITY_ERROR
    ESP_BLUFI_DH_MALLOC_ERROR
    ESP_BLUFI_DH_PARAM_ERROR
    ESP_BLUFI_READ_PARAM_ERROR
    ESP_BLUFI_MAKE_PUBLIC_ERROR
    ESP_BLUFI_DATA_FORMAT_ERROR
}
2.1.4 CLASSIC BT  

CLASSIC BLUETOOTH GAP API

Overview  Instructions

Application Example  Instructions

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_gap_bt_api.h

Functions

```c
static uint32_t esp_bt_gap_get_cod_srvc(uint32_t cod)
get major service field of COD
Return major service bits
Parameters
• [in] cod: Class of Device

static uint32_t esp_bt_gap_get_cod_major_dev(uint32_t cod)
get major device field of COD
Return major device bits
Parameters
• [in] cod: Class of Device

static uint32_t esp_bt_gap_get_cod_minor_dev(uint32_t cod)
get minor service field of COD
Return minor service bits
Parameters
• [in] cod: Class of Device

static uint32_t esp_bt_gap_get_cod_format_type(uint32_t cod)
get format type of COD
Return format type
Parameters
• [in] cod: Class of Device

static bool esp_bt_gap_is_valid_cod(uint32_t cod)
declare the integrity of COD
Return
• true if cod is valid
• false otherwise
Parameters
• [in] cod: Class of Device
```

```c
esp_err_t esp_bt_gap_register_callback(esp_gap_cb_t callback)
register callback function. This function should be called after esp_bluedroid_enable() completes successfully
Return
• ESP_OK : Succeed
• ESP_FAIL: others
```
**esp_err_t esp_bt_gap_set_scan_mode(esp_bt_connection_mode_t c_mode, esp_bt_discovery_mode_t d_mode)**

Set discoverability and connectability mode for legacy bluetooth. This function should be called after esp_bluedroid_enable() completes successfully.

**Return**
- ESP_OK : Succeed
- ESP_ERR_INVALID_ARG: if argument invalid
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] c_mode: : one of the enums of esp_bt_connection_mode_t
- [in] d_mode: : one of the enums of esp_bt_discovery_mode_t

**esp_err_t esp_bt_gap_start_discovery(esp_bt_inq_mode_t mode, uint8_t inq_len, uint8_t num_rsps)**

This function starts Inquiry and Name Discovery. It should be called after esp_bluedroid_enable() completes successfully. When Inquiry is halted and cached results do not contain device name, then Name Discovery will connect to the peer target to get the device name. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT when Inquiry is started or Name Discovery is completed. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_RES_EVT each time the two types of discovery results are got.

**Return**
- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if invalid parameters are provided
- ESP_FAIL: others

**Parameters**
- [in] mode: - Inquiry mode
- [in] inq_len: - Inquiry duration in 1.28 sec units, ranging from 0x01 to 0x30. This parameter only specifies the total duration of the Inquiry process,
  - when this time expires, Inquiry will be halted.
- [in] num_rsps: - Number of responses that can be received before the Inquiry is halted, value 0 indicates an unlimited number of responses.

**esp_err_t esp_bt_gap_cancel_discovery(void)**

Cancel Inquiry and Name Discovery. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_DISC_STATE_CHANGED_EVT if Inquiry or Name Discovery is cancelled by calling this function.

**Return**
- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_bt_gap_get_remote_services(esp_bd_addr_t remote_bda)**

Start SDP to get remote services. This function should be called after esp_bluedroid_enable() completes successfully. esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVCS_EVT after service discovery ends.

**Return**
- ESP_OK : Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_bt_gap_get_remote_service_record(esp_bd_addr_t remote_bda, esp_bt_uuid_t *uuid)**

Start SDP to look up the service matching uuid on the remote device. This function should be called after esp_bluedroid_enable() completes successfully.

esp_bt_gap_cb_t will be called with ESP_BT_GAP_RMT_SRVC_REC_EVT after service discovery ends

**Return**
Chapter 2. API Reference

- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`uint8_t* esp_bt_gap_resolve_eir_data(uint8_t* eir, esp_bt_eir_type_t type, uint8_t* length)`

This function is called to get EIR data for a specific type.

**Return**
- pointer of starting position of eir data excluding eir data type, NULL if not found

**Parameters**
- [in] eir: - pointer of raw eir data to be resolved
- [in] type: - specific EIR data type
- [out] length: - return the length of EIR data excluding fields of length and data type

`esp_err_t esp_bt_gap_config_eir_data(esp_bt_eir_data_t* eir_data)`

This function is called to config EIR data.

esp_bt_gap_cb_t will be called with ESP_BT_GAP_CONFIG_EIR_DATA_EVT after config EIR ends.

**Return**
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

**Parameters**
- [in] eir_data: - pointer of EIR data content

`esp_err_t esp_bt_gap_set_cod(esp_bt_cod_t cod, esp_bt_cod_mode_t mode)`

This function is called to set class of device. esp_bt_gap_cb_t will be called with ESP_BT_GAP_SET_COD_EVT after set COD ends Some profile have special restrictions on class of device, changes may cause these profile do not work.

**Return**
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_INVALID_ARG: if param is invalid
- ESP_FAIL: others

**Parameters**
- [in] cod: - class of device
- [in] mode: - setting mode

`esp_err_t esp_bt_gap_get_cod(esp_bt_cod_t* cod)`

This function is called to get class of device.

**Return**
- ESP_OK: Succeed
- ESP_FAIL: others

**Parameters**
- [out] cod: - class of device

`esp_err_t esp_bt_gap_read_rssi_delta(esp_bd_addr_t remote_addr)`

This function is called to read RSSI delta by address after connected. The RSSI value returned by ESP_BT_GAP_READ_RSSI_DELTA_EVT.

**Return**
- ESP_OK: Succeed
- ESP_FAIL: others

**Parameters**
- [in] remote_addr: - remote device address, corresponding to a certain connection handle.

`esp_err_t esp_bt_gap_remove_bond_device(esp_bd_addr_t bd_addr)`

Removes a device from the security database list of peer device.

**Return**
- ESP_OK: success
- ESP_FAIL: failed

**Parameters**
Chapter 2. API Reference

- [in] bd_addr: BD address of the peer device

int esp_bt_gap_get_bond_device_num (void)
Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return - >= 0: bonded devices number.
- ESP_FAIL: failed

esp_err_t esp_bt_gap_get_bond_device_list(int *dev_num, esp_bd_addr_t *dev_list)
Get the device from the security database list of peer device. It will return the device bonded information immediately.

Return
- ESP_OK: Succeed
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- [out] dev_list: an array(buffer) of esp_bd_addr_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

esp_err_t esp_bt_gap_set_pin(esp_bt_pin_type_t pin_type, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)
Set pin type and default pin code for legacy pairing.

Return - ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

Parameters
- [in] pin_type: Use variable or fixed pin. If pin_type is ESP_BT_PIN_TYPE_VARIABLE, pin_code and pin_code_len will be ignored, and ESP_BT_GAP_PIN_REQ_EVT will come when control requests for pin code. Else, will use fixed pin code and not callback to users.
- [in] pin_code_len: Length of pin_code
- [in] pin_code: Pin_code

esp_err_t esp_bt_gap_pin_reply(esp_bd_addr_t bd_addr, bool accept, uint8_t pin_code_len, esp_bt_pin_code_t pin_code)
Reply the pin_code to the peer device for legacy pairing when ESP_BT_GAP_PIN_REQ_EVT is coming.

Return - ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

Parameters
- [in] bd_addr: BD address of the peer
- [in] accept: Pin_code reply successful or declined.
- [in] pin_code_len: Length of pin_code
- [in] pin_code: Pin_code

esp_err_t esp_bt_gap_set_security_param(esp_bt_sp_param_t param_type, void *value, uint8_t len)
Set a GAP security parameter value. Overrides the default value.

Return - ESP_OK : success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

Parameters
- [in] param_type: the type of the param which is to be set
- [in] value: the param value
- [in] len: the length of the param value
**esp_err_t esp_bt_gap_ssp_passkey_reply** *(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)*

Reply the key value to the peer device in the legacy connection stage.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- other: failed

**Parameters**
- [in] bd_addr: BD address of the peer
- [in] accept: passkey entry successful or declined.
- [in] passkey: passkey value, must be a 6 digit number, can be lead by 0.

**esp_err_t esp_bt_gap_ssp_confirm_reply** *(esp_bd_addr_t bd_addr, bool accept)*

Reply the confirm value to the peer device in the legacy connection stage.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- other: failed

**Parameters**
- [in] bd_addr: BD address of the peer device
- [in] accept: numbers to compare are the same or different.

**esp_err_t esp_bt_gap_set_qos** *(esp_bd_addr_t remote_bda, uint32_t t_poll)*

Config Quality of service.

**Return**
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not yet enabled
- other: failed

**Parameters**
- [in] remote_bda: The remote device’s address
- [in] t_poll: Poll interval, the maximum time between transmissions which from the master to a particular slave on the ACL logical transport. unit is 0.625ms

**Unions**

```c

list of service UUIDs of remote device
Structures

struct esp_bt_cod_t

Class of device.

Public Members

uint32_t reserved_2 : 2
undefined

uint32_t minor : 6
minor class

uint32_t major : 5
major class

uint32_t service : 11
service class

uint32_t reserved_8 : 8
undefined

struct esp_bt_gap_dev_prop_t

Bluetooth Device Property Descriptor.

Public Members

esp_bt_gap_dev_prop_type_t type
device property type

int len
device property value length

void *val
device property value

struct esp_bt_eir_data_t

EIR data content, according to “Supplement to the Bluetooth Core Specification”.

Public Members

bool fec_required
FEC is required or not, true by default

bool include_txpower
EIR data include TX power, false by default

bool include_uuid
EIR data include UUID, false by default

uint8_t flag
EIR flags, see ESP_BT_EIR_FLAG for details, EIR will not include flag if it is 0, 0 by default

uint16_t manufacturer_len
Manufacturer data length, 0 by default

uint8_t *p_manufacturer_data
Manufacturer data point

uint16_t url_len
URL length, 0 by default

uint8_t *p_url
URL point
Macros

ESP_BT_GAP_RSSI_HIGH_THRLD
RSSI threshold.

ESP_BT_GAP_RSSI_LOW_THRLD
Low RSSI threshold

ESP_BT_GAP_MAX_BDNAME_LEN
Maximum bytes of Bluetooth device name.

ESP_BT_GAP_EIR_DATA_LEN
Maximum size of EIR Significant part.

ESP_BT_EIR_TYPE_FLAGS
Extended Inquiry Response data type.

Flag with information such as BR/EDR and LE support

ESP_BT_EIR_TYPE_INCMPL_16BITS_UUID
Incomplete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_16BITS_UUID
Complete list of 16-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_32BITS_UUID
Incomplete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_32BITS_UUID
Complete list of 32-bit service UUIDs

ESP_BT_EIR_TYPE_INCMPL_128BITS_UUID
Incomplete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_CMPL_128BITS_UUID
Complete list of 128-bit service UUIDs

ESP_BT_EIR_TYPE_SHORT_LOCAL_NAME
Shortened Local Name

ESP_BT_EIR_TYPE_CMPL_LOCAL_NAME
Complete Local Name

ESP_BT_EIR_TYPE_TX_POWER_LEVEL
Tx power level, value is 1 octet ranging from -127 to 127, unit is dBm

ESP_BT_EIR_TYPE_URL
Uniform resource identifier

ESP_BT_EIR_TYPE_MANU_SPECIFIC
Manufacturer specific data

ESP_BT_EIR_TYPE_MAX_NUM
MAX number of EIR type

ESP_BT_EIR_FLAG_LIMIT_DISC
ESP_BT_EIR_FLAG_GEN_DISC
ESP_BT_EIR_FLAG_BREDR_NOT_SPT
ESP_BT_EIR_FLAG_DMT_CONTROLLER_SPT
ESP_BT_EIR_FLAG_DMT_HOST_SPT

ESP_BT_EIR_MAX_LEN
ESP_BT_PIN_CODE_LEN
Max pin code length

ESP_BT_IO_CAP_OUT
Chapter 2. API Reference

ESP_BT_IO_CAP_IO
ESP_BT_IO_CAP_IN
ESP_BT_IO_CAP_NONE

ESP_BT_COD_SRVC_BIT_MASK
Bits of major service class field.
Major service bit mask

ESP_BT_COD_SRVC_BIT_OFFSET
Major service bit offset

ESP_BT_COD_MAJOR_DEV_BIT_MASK
Bits of major device class field.
Major device bit mask

ESP_BT_COD_MAJOR_DEV_BIT_OFFSET
Major device bit offset

ESP_BT_COD_MINOR_DEV_BIT_MASK
Bits of minor device class field.
Minor device bit mask

ESP_BT_COD_MINOR_DEV_BIT_OFFSET
Minor device bit offset

ESP_BT_COD_FORMAT_TYPE_BIT_MASK
Bits of format type.
Format type bit mask

ESP_BT_COD_FORMAT_TYPE_OFFSET
Format type bit offset

ESP_BT_COD_FORMAT_TYPE_1
Class of device format type 1.

ESP_BT_GAP_MIN_INQ_LEN
Minimum and Maximum inquiry length Minimum inquiry duration, unit is 1.28s

ESP_BT_GAP_MAX_INQ_LEN
Maximum inquiry duration, unit is 1.28s

Type Definitions
typedef uint8_t esp_bt_eir_type_t
typedef uint8_t esp_bt_pin_code_t[ESP_BT_PIN_CODE_LEN]
Pin Code (upto 128 bits) MSB is 0

typedef uint8_t esp_bt_io_cap_t
combination of the io capability

typedef void (*esp_bt_gap_cb_t)(esp_bt_gap_cb_event_t event, esp_bt_gap_cb_param_t *param)
bluetooth GAP callback function type

Parameters
• event:: Event type
• param:: Pointer to callback parameter

Enumerations
enum esp_bt_cod_mode_t
class of device settings

Values:
ESP_BT_SET_COD_MAJOR_MINOR = 0x01
overwrite major, minor class

ESP_BT_SET_COD_SERVICE_CLASS = 0x02
set the bits in the input, the current bit will remain

ESP_BT_CLR_COD_SERVICE_CLASS = 0x04
clear the bits in the input, others will remain

ESP_BT_SET_COD_ALL = 0x08
overwrite major, minor, set the bits in service class

ESP_BT_INIT_COD = 0xa
overwrite major, minor, and service class

enum esp_bt_connection_mode_t
Discoverability and Connectability mode.

Values:

ESP_BT_NON_CONNECTABLE
Non-connectable

ESP_BT_CONNECTABLE
Connectable

enum esp_bt_discovery_mode_t
Values:

ESP_BT_NON_DISCOVERABLE
Non-discoverable

ESP_BT_LIMITED_DISCOVERABLE
Limited Discoverable

ESP_BT_GENERAL_DISCOVERABLE
General Discoverable

enum esp_bt_gap_dev_prop_type_t
Bluetooth Device Property type.

Values:

ESP_BT_GAP_DEV_PROP_BDNAME = 1
Bluetooth device name, value type is int8_t []

ESP_BT_GAP_DEV_PROP_COD
Class of Device, value type is uint32_t

ESP_BT_GAP_DEV_PROP_RSSI
Received Signal strength Indication, value type is int8_t, ranging from -128 to 127

ESP_BT_GAP_DEV_PROP_EIR
Extended Inquiry Response, value type is uint8_t []

enum esp_bt_cod_srvc_t
Major service class field of Class of Device, multiple bits can be set.

Values:

ESP_BT_COD_SRVC_NONE = 0
None indicates an invalid value

ESP_BT_COD_SRVC_LMTD_DISCOVER = 0x1
Limited Discoverable Mode

ESP_BT_COD_SRVC_POSITIONING = 0x8
Positioning (Location identification)

ESP_BT_COD_SRVC_NETWORKING = 0x10
Networking, e.g. LAN, Ad hoc
ESP_BT_COD_SRVC_RENDERING = 0x20
Rendering, e.g. Printing, Speakers

ESP_BT_COD_SRVC_CAPTUREING = 0x40
Capturing, e.g. Scanner, Microphone

ESP_BT_COD_SRVC_OBJ_TRANSFER = 0x80
Object Transfer, e.g. v-Inbox, v-Folder

ESP_BT_COD_SRVC_AUDIO = 0x100
Audio, e.g. Speaker, Microphone, Headset service

ESP_BT_COD_SRVC_TELEPHONY = 0x200
Telephony, e.g. Cordless telephony, Modem, Headset service

ESP_BT_COD_SRVC_INFORMATION = 0x400
Information, e.g., WEB-server, WAP-server

enum esp_bt_pin_type_t
Values:

ESP_BT_PIN_TYPE_VARIABLE = 0
Refer to BTM_PIN_TYPE_VARIABLE

ESP_BT_PIN_TYPE_FIXED = 1
Refer to BTM_PIN_TYPE_FIXED

enum esp_bt_sp_param_t
Values:

ESP_BT_SP_IOCAP_MODE = 0
Set IO mode

enum esp_bt_cod_major_dev_t
Major device class field of Class of Device.
Values:

ESP_BT_COD_MAJOR_DEV_MISC = 0
Miscellaneous

ESP_BT_COD_MAJOR_DEV_COMPUTER = 1
Computer

ESP_BT_COD_MAJOR_DEV_PHONE = 2
Phone(cellular, cordless, pay phone, modem

ESP_BT_COD_MAJOR_DEV_LAN_NAP = 3
LAN, Network Access Point

ESP_BT_COD_MAJOR_DEV_AV = 4
Audio/Video(headset, speaker, stereo, video display, VCR

ESP_BT_COD_MAJOR_DEV_PERIPHERAL = 5
Peripheral(mouse, joystick, keyboard)

ESP_BT_COD_MAJOR_DEV_IMAGING = 6
Imaging(printer, scanner, camera, display

ESP_BT_COD_MAJOR_DEV_WEARABLE = 7
Wearable

ESP_BT_COD_MAJOR_DEV_TOY = 8
Toy

ESP_BT_COD_MAJOR_DEV_HEALTH = 9
Health

ESP_BT_COD_MAJOR_DEV_UNCATEGORIZED = 31
Uncategorized: device not specified
Chapter 2. API Reference

```c
enum esp_bt_gap_discovery_state_t
    Bluetooth Device Discovery state
    Values:
    ESP_BT_GAP_DISCOVERY_STOPPED
        device discovery stopped
    ESP_BT_GAP_DISCOVERY_STARTED
        device discovery started

enum esp_bt_gap_cb_event_t
    BT GAP callback events.
    Values:
    ESP_BT_GAP_DISC_RES_EVT = 0
        device discovery result event
    ESP_BT_GAP_DISC_STATE_CHANGED_EVT
        discovery state changed event
    ESP_BT_GAP_RMT_SRVCS_EVT
        get remote services event
    ESP_BT_GAP_RMT_SRVC_REC_EVT
        get remote service record event
    ESP_BT_GAP_AUTH_CMPL_EVT
        AUTH complete event
    ESP_BT_GAP_PIN_REQ_EVT
        Legacy Pairing Pin code request
    ESP_BT_GAP_CFM_REQ_EVT
        Simple Pairing User Confirmation request.
    ESP_BT_GAP_KEY_NOTIF_EVT
        Simple Pairing Passkey Notification
    ESP_BT_GAP_KEY_REQ_EVT
        Simple Pairing Passkey request
    ESP_BT_GAP_READ_RSSI_DELTA_EVT
        read rssi event
    ESP_BT_GAP_CONFIG_EIR_DATA_EVT
        config EIR data event
    ESP_BT_GAP_REMOVE_BOND_DEV_COMPLETE_EVT
        remove bond device complete event
    ESP_BT_GAP_QOS_CMPL_EVT
        QOS complete event

ESP_BT_GAP_EVT_MAX
```

```c
enum esp_bt_inq_mode_t
    Inquiry Mode
    Values:
    ESP_BT_INQ_MODE_GENERAL_INQUIRY
        General inquiry mode
    ESP_BT_INQ_MODE_LIMITED_INQUIRY
        Limited inquiry mode
```
Bluetooth A2DP API

Overview

Instructions

Application Example
Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a A2DP sink client demo. This demo can be discovered and connected by A2DP source device and receive the audio stream from remote device - bluetooth/bluedroid/classic_bt/a2dp_sink

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_a2dp_api.h

Functions

**esp_err_t esp_a2d_register_callback (esp_a2d_cb_t callback)**
Register application callback function to A2DP module. This function should be called only after esp_bluedroid_enable() completes successfully, used by both A2DP source and sink.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters

- [in] callback: A2DP event callback function

**esp_err_t esp_a2d_sink_register_data_callback (esp_a2d_sink_data_cb_t callback)**
Register A2DP sink data output function; For now the output is PCM data stream decoded from SBC format. This function should be called only after esp_bluedroid_enable() completes successfully, used only by A2DP sink. The callback is invoked in the context of A2DP sink task whose stack size is configurable through menuconfig.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters

- [in] callback: A2DP sink data callback function

**esp_err_t esp_a2d_sink_init (void)**
Initialize the bluetooth A2DP sink module. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

Return

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_a2d_sink_deinit (void)**
De-initialize for A2DP sink module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
**Chapter 2. API Reference**

- **ESP_FAIL**: others

  `esp_err_t esp_a2d_sink_connect (esp_bd_addr_t remote_bda)`
  
  Connect to remote bluetooth A2DP source device, must after esp_a2d_sink_init()

  **Return**
  - ESP_OK: connect request is sent to lower layer
  - ESP_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL: others

  **Parameters**
  - [in] remote_bda: remote bluetooth device address

- **ESP_FAIL**: others

  `esp_err_t esp_a2d_sink_disconnect (esp_bd_addr_t remote_bda)`
  
  Disconnect from the remote A2DP source device.

  **Return**
  - ESP_OK: disconnect request is sent to lower layer
  - ESP_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL: others

  **Parameters**
  - [in] remote_bda: remote bluetooth device address

- **ESP_FAIL**: others

  `esp_err_t esp_a2d_media_ctrl (esp_a2d_media_ctrl_t ctrl)`
  
  media control commands; this API can be used for both A2DP sink and source

  **Return**
  - ESP_OK: control command is sent to lower layer
  - ESP_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL: others

  **Parameters**
  - [in] ctrl: control commands for A2DP data channel

- **ESP_FAIL**: others

  `esp_err_t esp_a2d_source_init (void)`
  
  Initialize the bluetooth A2DP source module. This function should be called after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_INIT_SUCCESS will reported to the APP layer. Note: A2DP can work independently. If you want to use AVRC together, you should initiate AVRC first.

  **Return**
  - ESP_OK: if the initialization request is sent successfully
  - ESP_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL: others

- **ESP_FAIL**: others

  `esp_err_t esp_a2d_source_deinit (void)`
  
  De-initialize for A2DP source module. This function should be called only after esp_bluedroid_enable() completes successfully, and ESP_A2D_PROF_STATE_EVT with ESP_A2D_DEINIT_SUCCESS will reported to APP layer.

  **Return**
  - ESP_OK: success
  - ESP_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL: others

- **ESP_FAIL**: others

  `esp_err_t esp_a2d_source_register_data_callback (esp_a2d_source_data_cb_t callback)`
  
  Register A2DP source data input function; For now the input is PCM data stream. This function should be called only after esp_bluedroid_enable() completes successfully. The callback is invoked in the context of A2DP source task whose stack size is configurable through menuconfig.

  **Return**
  - ESP_OK: success
  - ESP_INVALID_STATE: if bluetooth stack is not yet enabled
  - ESP_FAIL: if callback is a NULL function pointer

  **Parameters**
  - [in] callback: A2DP source data callback function
**Esp_err_t esp_a2d_source_connect (esp_bd_addr_t remote_bda)**

Connect to remote A2DP sink device, must after esp_a2d_source_init()

**Return**
- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_bda: remote bluetooth device address

**Esp_err_t esp_a2d_source_disconnect (esp_bd_addr_t remote_bda)**

Disconnect from the remote A2DP sink device.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_bda: remote bluetooth device address

**Unions**

union esp_a2d_cb_param_t

#include <esp_a2dp_api.h> A2DP state callback parameters.

**Public Members**

struct esp_a2d_cb_param_t::a2d_conn_stat_param conn_stat
A2DP connection status

struct esp_a2d_cb_param_t::a2d_audio_stat_param audio_stat
audio stream playing state

struct esp_a2d_cb_param_t::a2d_audio_cfg_param audio_cfg
media codec configuration information

struct esp_a2d_cb_param_t::media_ctrl_stat_param media_ctrl_stat
status in acknowledgement to media control commands

struct esp_a2d_cb_param_t::a2d_prof_stat_param a2d_prof_stat
status to indicate a2d prof init or deinit

struct a2d_audio_cfg_param
#include <esp_a2dp_api.h> ESP_A2D_AUDIO_CFG_EVT.

  esp_a2d_mct_t type
    A2DP media codec type

union esp_a2d_mcc_t::[anonymous] cie
  A2DP codec information element

Macros

ESP_A2D_MCT_SBC
  Media codec types supported by A2DP.

  SBC

ESP_A2D_MCT_M12
  MPEG-1, 2 Audio
```
ESP_A2D_MCT_M24
MPEG-2, 4 AAC

ESP_A2D_MCT_ATRAC
ATRAC family

ESP_A2D_MCT_NON_A2DP

ESP_A2D_CIE_LEN_SBC

ESP_A2D_CIE_LEN_M12

ESP_A2D_CIE_LEN_M24

ESP_A2D_CIE_LEN_ATRAC

Type Definitions

typedef uint8_t esp_a2d_mct_t

typedef void (*esp_a2d_cb_t)(esp_a2d_cb_event_t event, esp_a2d_cb_param_t *param)
A2DP profile callback function type.

Parameters
- event: Event type
- param: Pointer to callback parameter

typedef void(*esp_a2d_sink_data_cb_t(const uint8_t*buf,uint32_t len))
A2DP profile data callback function.

Parameters
- [in] buf: data received from A2DP source device and is PCM format decoder from SBC
decoder; buf references to a static memory block and can be overwritten by upcoming data
- [in] len: size(in bytes) in buf

typedef int32_t(*esp_a2d_source_data_cb_t)(uint8_t*buf,int32_t len)
A2DP source data read callback function.

Return
size of bytes read successfully, if the argument len is -1, this value is ignored.

Parameters
- [in] buf: buffer to be filled with PCM data stream from higher layer
- [in] len: size(in bytes) of data block to be copied to buf. -1 is an indication to user that data
buffer shall be flushed

Enumerations

enum esp_a2d_connection_state_t
Bluetooth A2DP connection states.

Values:

ESP_A2D_CONNECTION_STATE_DISCONNECTED = 0
connection released

ESP_A2D_CONNECTION_STATE_CONNECTING
connecting remote device

ESP_A2D_CONNECTION_STATE_CONNECTED
connection established

ESP_A2D_CONNECTION_STATE_DISCONNECTING
disconnecting remote device

enum esp_a2d_disc_rsn_t
Bluetooth A2DP disconnection reason.

Values:

ESP_A2D_DISC_RSN_NORMAL = 0
Finished disconnection that is initiated by local or remote device
Chapter 2. API Reference

ESP_A2D_DISC_RSN_ABNORMAL
Abnormal disconnection caused by signal loss

enum esp_a2d_audio_state_t
Bluetooth A2DP datapath states.
Values:

ESP_A2D_AUDIO_STATE_REMOTE_SUSPEND = 0
audio stream datapath suspended by remote device

ESP_A2D_AUDIO_STATE_STOPPED
audio stream datapath stopped

ESP_A2D_AUDIO_STATE_STARTED
audio stream datapath started

enum esp_a2d_media_ctrl_ack_t
A2DP media control command acknowledgement code.
Values:

ESP_A2D_MEDIA_CTRL_ACK_SUCCESS = 0
media control command is acknowledged with success

ESP_A2D_MEDIA_CTRL_ACK_FAILURE
media control command is acknowledged with failure

ESP_A2D_MEDIA_CTRL_ACK_BUSY
media control command is rejected, as previous command is not yet acknowledged

enum esp_a2d_media_ctrl_t
A2DP media control commands.
Values:

ESP_A2D_MEDIA_CTRL_NONE = 0
Not for application use, use inside stack only.

ESP_A2D_MEDIA_CTRL_CHECK_SRC_RDY
check whether AVDTP is connected, only used in A2DP source

ESP_A2D_MEDIA_CTRL_START
command to set up media transmission channel

ESP_A2D_MEDIA_CTRL_STOP
command to stop media transmission

ESP_A2D_MEDIA_CTRL_SUSPEND
command to suspend media transmission

enum esp_a2d_init_state_t
Bluetooth A2DP Initiation states.
Values:

ESP_A2D_DEINIT_SUCCESS = 0
A2DP profile deinit successful event

ESP_A2D_INIT_SUCCESS
A2DP profile init successful event

enum esp_a2d_cb_event_t
A2DP callback events.
Values:

ESP_A2D_CONNECTION_STATE_EVT = 0
connection state changed event
Chapter 2. API Reference

ESP_A2D_AUDIO_STATE_EVT
audio stream transmission state changed event

ESP_A2D_AUDIO_CFG_EVT
audio codec is configured, only used for A2DP SINK

ESP_A2D_MEDIA_CTRL_ACK_EVT
acknowledge event in response to media control commands

ESP_A2D_PROF_STATE_EVT
indicate a2dp init&deinit complete

BT AVRCP APIs

Overview Bluetooth AVRCP reference APIs.

Instructions

Application Example Instructions

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_avrc_api.h

Functions

esp_err_t esp_avrc_ct_register_callback(esp_avrc_ct_cb_t callback)
Register application callbacks to AVRCP module. This function should be called after esp_bluedroid_enable() completes successfully.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] callback: AVRCP controller callback function

esp_err_t esp_avrc_ct_init (void)
Initialize the bluetooth AVRCP controller module. This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be initialized before A2DP.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

esp_err_t esp_avrc_ct_deinit (void)
De-initialize AVRCP controller module. This function should be called after after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRC should be deinitialized before A2DP.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others
**esp_err_t esp_avrc_ct_send_set_player_value_cmd**(uint8_t tl, uint8_t attr_id, uint8_t value_id)

Send player application settings command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Return**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- [in] tl: transaction label, 0 to 15, consecutive commands should use different values.
- [in] attr_id: player application setting attribute IDs from one of esp_avrc_ps_attr_ids_t
- [in] value_id: attribute value defined for the specific player application setting attribute

**esp_err_t esp_avrc_ct_send_get_rn_capabilities_cmd**(uint8_t tl)

Send GetCapabilities PDU to AVRCP target to retrieve remote device’s supported notification event_ids. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Return**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**

- [in] tl: transaction label, 0 to 15, consecutive commands should use different values.

**esp_err_t esp_avrc_ct_send_register_notification_cmd**(uint8_t tl, uint8_t event_id, uint32_t event_parameter)

Send register notification command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Return**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

**Parameters**

- [in] tl: transaction label, 0 to 15, consecutive commands should use different values.
- [in] event_id: id of events, e.g. ESP_AVRC_RN_PLAY_STATUS_CHANGE, ESP_AVRC_RN_TRACK_CHANGE, etc.
- [in] event_parameter: playback interval for ESP_AVRC_RN_PLAY_POS_CHANGED; For other events, value of this parameter is ignored.

**esp_err_t esp_avrc_ct_send_set_absolute_volume_cmd**(uint8_t tl, uint8_t volume)

Send set absolute volume command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Return**

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_ERR_NOT_SUPPORTED: if the event_id is not supported in current implementation
- ESP_FAIL: others

**Parameters**

- [in] tl: transaction label, 0 to 15, consecutive commands should use different values.
- [in] volume: volume, 0 to 0x7f, means 0% to 100%

**esp_err_t esp_avrc_ct_send_metadata_cmd**(uint8_t tl, uint8_t attr_mask)

Send metadata command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

**Return**

- ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] tl: : transaction label, 0 to 15, consecutive commands should use different values.
• [in] attr_mask: : mask of attributes, e.g. ESP_AVRC_MD_ATTR_ID_TITLE | ESP_AVRC_MD_ATTR_ID_ARTIST.

esp_err_t esp_avrc_ct_send_passthrough_cmd(uint8_t tl, uint8_t key_code, uint8_t key_state)

Send passthrough command to AVRCP target. This function should be called after ESP_AVRC_CT_CONNECTION_STATE_EVT is received and AVRCP connection is established.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] tl: : transaction label, 0 to 15, consecutive commands should use different values.
• [in] key_code: : passthrough command code, e.g. ESP_AVRC_PT_CMD_PLAY, ESP_AVRC_PT_CMD_STOP, etc.
• [in] key_state: : passthrough command key state, ESP_AVRC_PT_CMD_STATE_PRESSED or ESP_AVRC_PT_CMD_STATE_RELEASED

esp_err_t esp_avrc_tg_register_callback(esp_avrc_tg_cb_t callback)

Register application callbacks to AVRCP target module; This function should be called after esp_bluedroid_enable() completes successfully.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

Parameters
• [in] callback: AVRCP target callback function

esp_err_t esp_avrc_tg_init(void)

Initialize the bluetooth AVRCP target module, This function should be called after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRCP should be initialized before A2DP.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_avrc_tg_deinit(void)

De-initialize AVRCP target module. This function should be called after after esp_bluedroid_enable() completes successfully. Note: AVRC cannot work independently, AVRC should be used along with A2DP and AVRCP should be deinitialized before A2DP.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
• ESP_FAIL: others

esp_err_t esp_avrc_tg_get_psth_cmd_filter(esp_avrc_psth_filter_t filter,
                                         esp_avrc_psth_bit_mask_t *cmd_set)

Get the current filter of remote passthrough commands on AVRCP target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init(). For filter type ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, the retrieved command set is constant and it covers all of the passthrough commands that can possibly be supported. For filter type ESP_AVRC_PSTH_FILTER_SUPPORT_COMMANDS, the retrieved command set covers the passthrough commands selected to be supported according to current configuration. The configuration can be changed using esp_avrc_tg_set_psth_cmd_filter()
Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_FAIL: otherwise

```c
esp_err_t esp_avrc_tg_set_psth_cmd_filter(esp_avrc_psth_filter_t filter, const esp_avrc_psth_bit_mask_t *cmd_set)
```

Set the filter of remote passthrough commands on AVRC target. Filter is given by filter type and bit mask for the passthrough commands. This function should be called after esp_avrc_tg_init(). If filter type is ESP_AVRC_PSTH_FILTER_SUPPORT_CMD, the passthrough commands which are set to 1 as given in cmd_set will generate ESP_AVRC_CT_PASSTHROUGH_RSP_EVT callback event and are auto-accepted in the protocol stack, other commands are replied with response type “NOT IMPLEMENTED” (8). The set of supported commands should be a subset of allowed command set. The allowed command set can be retrieved using esp_avrc_tg_get_psth_cmd_filter() with filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD.”

Filter type “ESP_AVRC_PSTH_FILTER_ALLOWED_CMD” does not apply to this function.

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if filter type is invalid or cmd_set is NULL
- ESP_ERR_NOT_SUPPORTED:: if filter type is ESP_AVRC_PSTH_FILTER_ALLOWED_CMD, or cmd_set includes unallowed commands

```c
bool esp_avrc_psth_bit_mask_operation(esp_avrc_bit_mask_op_t op, esp_avrc_psth_bit_mask_t *psth, esp_avrc_pt_cmd_t cmd)
```

Operate on the type esp_avrc_psth_bit_mask_t with regard to a specific PASSTHROUGH command.

Return

For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR, return true for a successful operation, otherwise return false. For operation ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false.

Parameters

- [in] op: operation requested on the bit mask field
- [in] psth: pointer to passthrough command bit mask structure
- [in] cmd: passthrough command code

```c
esp_err_t esp_avrc_tg_get_rn_evt_cap(const esp_avrc_rn_evt_cap_mask_t *evt_set)
```

Get the requested event notification capabilities on local AVRC target. The capability is returned in a bit mask representation in evt_set. This function should be called after esp_avrc_tg_init(). For capability type ESP_AVRC_RN_CAP_ALLOWED_EVT, the retrieved event set is constant and it covers all of the notification events that can possibly be supported with current implementation. For capability type ESP_AVRC_RN_CAP_SUPPORTED_EVT, the event set covers the notification events selected to be supported under current configuration. The configuration can be changed using esp_avrc_tg_set_rn_evt_cap() function.

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not enabled or AVRC TG is not initialized
- ESP_ERR INVALID_ARG: if cap is invalid or evt_set is NULL
- ESP_FAIL: otherwise

```c
esp_err_t esp_avrc_tg_set_rn_evt_cap(const esp_avrc_rn_evt_cap_mask_t *evt_set)
```

Set the event notification capabilities on local AVRC target. The capability is given in a bit mask representation in evt_set and must be a subset of allowed event IDs with current implementation. This function should be called after esp_avrc_tg_init().

Return

- ESP_OK: success
- ESP_ERR_INVALID_STATE: if Bluetooth stack is not enabled
- ESP_ERR_INVALID_ARG: if evt_set is NULL
bool esp_avrc_rn_evt_bit_mask_operation(esp_avrc_bit_mask_op_t op,
                        esp_avrc_rn_evt_cap_mask_t *events,
                        esp_avrc_rn_event_ids_t event_id)

Operate on the type esp_avrc_rn_evt_cap_mask_t with regard to a specific event.

Return For operation ESP_AVRC_BIT_MASK_OP_SET or ESP_AVRC_BIT_MASK_OP_CLEAR,
return true for a successful operation, otherwise return false For operation
ESP_AVRC_BIT_MASK_OP_TEST, return true if the corresponding bit is set, otherwise false

Parameters
• [in] op: operation requested on the bit mask field
• [in] events: pointer to event notification capability bit mask structure
• [in] event_id: notification event code

esp_err_t esp_avrc_tg_send_rn_rsp(esp_avrc_rn_event_ids_t event_id,
                        esp_avrc_rn_rsp_t rsp,
                        esp_avrc_rn_param_t *param)

Send RegisterNotification Response to remote AVRCP controller. Local event notification capability can be
set using esp_avrc_tg_set_rn_evt_cap(), in a bit mask representation in evt_set. This function should be called
after esp_avrc_tg_init()

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: if bluetooth stack is not enabled or AVRCTG is not initialized
• ESP_ERR_INVALID_ARG: if evt_set is NULL

Parameters
• [in] event_id: notification event ID that remote AVRCP CT registers
• [in] rsp: notification response code
• [in] param: parameters included in the specific notification

Unions
union esp_avrc_rn_param_t
#include <esp_avrc_api.h> AVRCP notification parameters.

Public Members

uint8_t volume
response data for ESP_AVRC_RN_VOLUME_CHANGE, ranges 0..127

esp_avrc_playback_stat_t playback
response data for ESP_AVRC_RN_PLAY_STATUS_CHANGE

uint8_t elm_id[8]
response data for ESP_AVRC_RN_TRACK_CHANGE

uint32_t play_pos
response data for ESP_AVRC_RN_PLAY_POS_CHANGED, in millisecond

esp_avrc_batt_stat_t batt
response data for ESP_AVRC_RN_BATTERY_STATUS_CHANGE

union esp_avrc_ct_cb_param_t
#include <esp_avrc_api.h> AVRC controller callback parameters.

Public Members

struct esp_avrc_ct_cb_param_t::avrc_ct_conn_stat_param conn_stat
AVRC connection status

struct esp_avrc_ct_cb_param_t::avrc_ct_psth_rsp_param psth_rsp
pass through command response

struct esp_avrc_ct_cb_param_t::avrc_ct_meta_rsp_param meta_rsp
metadata attributes response
struct esp_avrc_ct_cb_param_t::avrc_ct_change_notify_param change_ntf
notifications
struct esp_avrc_ct_cb_param_t::avrc_ct_rmt_feats_param rmt_feats
AVRC features discovered from remote SDP server
struct esp_avrc_ct_cb_param_t::avrc_ct_get_rn_caps_rsp_param get_rn_caps_rsp
get supported event capabilities response from AVRCP target
struct esp_avrc_ct_cb_param_t::avrc_ct_set_volume_rsp_param set_volume_rsp
set absolute volume response event

struct avrc_ct_change_notify_param
#include <esp_avrc_api.h> ESP_AVRC_CT_CHANGE_NOTIFY_EVT.

Public Members

uint8_t event_id
id of AVRC event notification

esp_avrc_rn_param_t event_parameter
event notification parameter

struct avrc_ct_conn_stat_param
#include <esp_avrc_api.h> ESP_AVRC_CT_CONNECTION_STATE_EVT.

Public Members

bool connected
whether AVRC connection is set up

esp_bd_addr_t remote_bda
remote bluetooth device address

struct avrc_ct_get_rn_caps_rsp_param
#include <esp_avrc_api.h> ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT.

Public Members

uint8_t cap_count
number of items provided in event or company_id according to cap_id used

esp_avrc_rn_evt_cap_mask_t evt_set
supported event_ids represented in bit-mask

struct avrc_ct_meta_rsp_param
#include <esp_avrc_api.h> ESP_AVRC_CT_METADATA_RSP_EVT.

Public Members

uint8_t attr_id
id of metadata attribute

uint8_t *attr_text
attribute itself

int attr_length
attribute character length

struct avrc_ct_psth_rsp_param
#include <esp_avrc_api.h> ESP_AVRC_CT_PASSTHROUGH_RSP_EVT.
Public Members

uint8_t tl
    transaction label, 0 to 15

uint8_t key_code
    passthrough command code

uint8_t key_state
    0 for PRESSED, 1 for RELEASED

struct avrc_ct_rmt_feats_param
    \#include <esp_avrc_api.h> ESP_AVRC_CTREMOTE FEATURES_EVT.

Public Members

uint32_t feat_mask
    AVRC feature mask of remote device

uint16_t tg_feat_flag
    feature flag of remote device as TG

esp_bd_addr_t remote_bda
    remote bluetooth device address

struct avrc_ct_set_volume_rsp_param
    \#include <esp_avrc_api.h> ESP_AVRC_CT_SETbsolute VOLUME_RSP_EVT.

Public Members

uint8_t volume
    the volume which has actually been set, range is 0 to 0x7f, means 0% to 100%

union esp_avrc_tg_cb_param_t
    \#include <esp_avrc_api.h> AVRC target callback parameters.

Public Members

struct esp_avrc_tg_cb_param_t::avrc_tg_conn_stat_param conn_stat
    AVRC connection status

struct esp_avrc_tg_cb_param_t::avrc_tg_rmt_feats_param rmt_feats
    AVRC features discovered through SDP

struct esp_avrc_tg_cb_param_t::avrc_tg_psth_cmd_param psth_cmd
    passthrough command

struct esp_avrc_tg_cb_param_t::avrc_tg_set_abs_vol_param set_abs_vol
    set absolute volume command targeted on audio sink

struct esp_avrc_tg_cb_param_t::avrc_tg_reg_ntf_param reg_ntf
    register notification

struct avrc_tg_conn_stat_param
    \#include <esp_avrc_api.h> ESP_AVRC_TG CONNECTION STATE_EVT.
Public Members

bool `connected`
whether AVRC connection is set up

`esp_bd_addr_t remote_bda`
remote bluetooth device address

```c
#include <esp_avrc_api.h>
```
ESP_AVRC_TG_PASSTHROUGH_CMD_EVT.

Public Members

```c
uint8_t `key_code`
passthrough command code
```

```c
uint8_t `key_state`
0 for PRESSED, 1 for RELEASED
```

Public Members

```c
#include <esp_avrc_api.h>
```
ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT.

Public Members

```c
uint8_t `event_id`
event id of AVRC RegisterNotification
```

```c
uint32_t `event_parameter`
event notification parameter
```

Public Members

```c
#include <esp_avrc_api.h>
```
ESP_AVRC_TG_REMOTE_FEATURES_EVT.

Public Members

```c
uint32_t `feat_mask`
AVRC feature mask of remote device
```

```c
uint16_t `ct_feat_flag`
feature flag of remote device as CT
```

`esp_bd_addr_t remote_bda`
remote bluetooth device address

Public Members

```c
#include <esp_avrc_api.h>
```
ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT.

Public Members

```c
uint8_t `volume`
volumeranges from 0 to 127
```

Structures

```c
struct esp_avrc_psth_bit_mask_t
```
AVRC passthrough command bit mask.
Public Members

```c
uint16_t bits[8]
```
bit mask representation of PASSTHROUGH commands

```c
struct esp_avrc_rn_evt_cap_mask_t
```
AVRC target notification event capability bit mask.

Public Members

```c
uint16_t bits
```
bit mask representation of PASSTHROUGH commands

Macros

```c
ESP_AVRC_TRANS_LABEL_MAX
```
max transaction label

Type Definitions

```c
typedef void (*esp_avrc_ct_cb_t)(esp_avrc_ct_cb_event_t event, esp_avrc_ct_cb_param_t *param)
```
AVRCP controller callback function type.

Parameters

- `event`: : Event type
- `param`: : Pointer to callback parameter union

```c
typedef void (*esp_avrc_tg_cb_t)(esp_avrc_tg_cb_event_t event, esp_avrc_tg_cb_param_t *param)
```
AVRCP target callback function type.

Parameters

- `event`: : Event type
- `param`: : Pointer to callback parameter union

Enumerations

```c
enum esp_avrc_features_t
```
AVRC feature bit mask.

Values:

```c
ESP_AVRC_FEAT_RCTG = 0x0001 /* remote control target */
ESP_AVRC_FEAT_RCCT = 0x0002 /* remote control controller */
ESP_AVRC_FEAT_VENDOR = 0x0008 /* remote control vendor dependent commands */
ESP_AVRC_FEAT_BROWSE = 0x0010 /* use browsing channel */
ESP_AVRC_FEAT_META_DATA = 0x0040 /* remote control metadata transfer command/response */
ESP_AVRC_FEAT_ADV_CTRL = 0x0200 /* remote control advanced control command/response */
```

```c
enum esp_avrc_feature_flag_t
```
AVRC supported features flag retrieved in SDP record.

Values:
ESP_AVRC_FEAT_FLAG_CAT1 = 0x0001
    category 1
ESP_AVRC_FEAT_FLAG_CAT2 = 0x0002
    category 2
ESP_AVRC_FEAT_FLAG_CAT3 = 0x0004
    category 3

enum esp_avrc_psth_filter_t
AVRC passthrough command filter.

Values:

ESP_AVRC_PSTH_FILTER_ALLOWED_CMD = 0
  all of the PASSTHROUGH commands that can possibly be used, immutable
ESP_AVRC_PSTH_FILTER_SUPPORTED_CMD = 1
  PASSTHROUGH commands selectively supported according to the current configuration
ESP_AVRC_PSTH_FILTER_SUPPORT_MAX

enum esp_avrc_bit_mask_op_t
Values:

ESP_AVRC_BIT_MASK_OP_TEST = 0
operation code to test a specific bit

ESP_AVRC_BIT_MASK_OP_SET = 1
operation code to set a specific bit

ESP_AVRC_BIT_MASK_OP_CLEAR = 2
operation code to clear a specific bit

enum esp_avrc_pt_cmd_state_t
AVRC passthrough command state.
Values:

ESP_AVRC_PT_CMD_STATE_PRESSED = 0
key pressed

ESP_AVRC_PT_CMD_STATE_RELEASED = 1
key released

enum esp_avrc_ct_cb_event_t
AVRC Controller callback events.
Values:

ESP_AVRC_CT_CONNECTION_STATE_EVT = 0
connection state changed event

ESP_AVRC_CT_PASSTHROUGH_RSP_EVT = 1
passthrough response event

ESP_AVRC_CT_METADATA_RSP_EVT = 2
metadata response event

ESP_AVRC_CT_PLAY_STATUS_RSP_EVT = 3
play status response event

ESP_AVRC_CT_CHANGE_NOTIFY_EVT = 4
notification event

ESP_AVRC_CT_REMOTE_FEATURES_EVT = 5
feature of remote device indication event

ESP_AVRC_CT_GET_RN_CAPABILITIES_RSP_EVT = 6
supported notification events capability of peer device

ESP_AVRC_CT_SET_ABSOLUTE_VOLUME_RSP_EVT = 7
set absolute volume response event

enum esp_avrc_tg_cb_event_t
AVRC Target callback events.
Values:

ESP_AVRC_TG_CONNECTION_STATE_EVT = 0
connection state changed event

ESP_AVRC_TG_REMOTE_FEATURES_EVT = 1
feature of remote device indication event

ESP_AVRC_TG_PASSTHROUGH_CMD_EVT = 2
passthrough command event

ESP_AVRC_TG_SET_ABSOLUTE_VOLUME_CMD_EVT = 3
set absolute volume command from remote device
ESP_AVRC_TG_REGISTER_NOTIFICATION_EVT = 4
register notification event

enum esp_avrc_md_attr_mask_t
AVRC metadata attribute mask.

Values:

ESP_AVRC_MD_ATTR_TITLE = 0x1
   title of the playing track
ESP_AVRC_MD_ATTR_ARTIST = 0x2
   track artist
ESP_AVRC_MD_ATTR_ALBUM = 0x4
   album name
ESP_AVRC_MD_ATTR_TRACK_NUM = 0x8
   track position on the album
ESP_AVRC_MD_ATTR_NUM_TRACKS = 0x10
   number of tracks on the album
ESP_AVRC_MD_ATTR_GENRE = 0x20
   track genre
ESP_AVRC_MD_ATTR_PLAYING_TIME = 0x40
   total album playing time in milliseconds

enum esp_avrc_rn_event_ids_t
AVRC event notification ids.

Values:

ESP_AVRC_RN_PLAY_STATUS_CHANGE = 0x01
   track status change, eg. from playing to paused
ESP_AVRC_RN_TRACK_CHANGE = 0x02
   new track is loaded
ESP_AVRC_RN_TRACK_REACHED_END = 0x03
   current track reached end
ESP_AVRC_RN_TRACK_REACHED_START = 0x04
   current track reached start position
ESP_AVRC_RN_PLAY_POS_CHANGED = 0x05
   track playing position changed
ESP_AVRC_RN_BATTERY_STATUS_CHANGE = 0x06
   battery status changed
ESP_AVRC_RN_SYSTEM_STATUS_CHANGE = 0x07
   system status changed
ESP_AVRC_RN_APP_SETTING_CHANGE = 0x08
   application settings changed
ESP_AVRC_RN_NOW_PLAYING_CHANGE = 0x09
   now playing content changed
ESP_AVRC_RN_AVAILABLE_PLAYERS_CHANGE = 0x0a
   available players changed
ESP_AVRC_RN_ADDRESSED_PLAYER_CHANGE = 0x0b
   the addressed player changed
ESP_AVRC_RN_UIDS_CHANGE = 0x0c
   UIDs changed
Chapter 2. API Reference

ESP_AVRC_RN_VOLUME_CHANGE = 0x0d
volume changed locally on TG

ESP_AVRC_RN_MAX_EVT

enum esp_avrc_rn_evt_cap_t
AVRC target notification event notification capability.
Values:

ESP_AVRC_RN_CAP_ALLOWED_EVT = 0
all of the notification events that can possibly be supported, immutable

ESP_AVRC_RN_CAP_SUPPORTED_EVT = 1
notification events selectively supported according to the current configuration

ESP_AVRC_RN_CAP_MAX

enum esp_avrc_rn_rsp_t
AVRC notification response type.
Values:

ESP_AVRC_RN_RSP_INTERIM = 13
initial response to RegisterNotification, should be sent T_mtp(1000ms) from receiving the command

ESP_AVRC_RN_RSP_CHANGED = 15
final response to RegisterNotification command

enum esp_avrc_ps_attr_ids_t
AVRC player setting ids.
Values:

ESP_AVRC_PS_EQUALIZER = 0x01
equalizer, on or off

ESP_AVRC_PS_REPEAT_MODE = 0x02
repeat mode

ESP_AVRC_PS_SHUFFLE_MODE = 0x03
shuffle mode

ESP_AVRC_PS_SCAN_MODE = 0x04
scan mode on or off

ESP_AVRC_PS_MAX_ATTR

enum esp_avrc_ps_eq_value_ids_t
AVRC equalizer modes.
Values:

ESP_AVRC_PS_EQUALIZER_OFF = 0x1
equalizer OFF

ESP_AVRC_PS_EQUALIZER_ON = 0x2
equalizer ON

enum esp_avrc_ps_rpt_value_ids_t
AVRC repeat modes.
Values:

ESP_AVRC_PS_REPEAT_OFF = 0x1
repeat mode off

ESP_AVRC_PS_REPEAT_SINGLE = 0x2
single track repeat
**Chapter 2. API Reference**

```c
ESP_AVRC_PS_REPEAT_GROUP = 0x3

group repeat

enum esp_avrc_ps_shf_value_ids_t
AVRC shuffle modes.
Values:

ESP_AVRC_PS_SHUFFLE_OFF = 0x1
ESP_AVRC_PS_SHUFFLE_ALL = 0x2
ESP_AVRC_PS_SHUFFLE_GROUP = 0x3

enum esp_avrc_ps_scn_value_ids_t
AVRC scan modes.
Values:

ESP_AVRC_PS_SCAN_OFF = 0x1
  scan off
ESP_AVRC_PS_SCAN_ALL = 0x2
  all tracks scan
ESP_AVRC_PS_SCAN_GROUP = 0x3
  group scan

enum esp_avrc_rsp_t
AVCCTP response codes.
Values:

ESP_AVRC_RSP_NOT_IMPL = 8
  not implemented
ESP_AVRC_RSP_ACCEPT = 9
  accept
ESP_AVRC_RSP_REJECT = 10
  reject
ESP_AVRC_RSP_IN_TRANS = 11
  in transition
ESP_AVRC_RSP_IMPL_STBL = 12
  implemented/stable
ESP_AVRC_RSP_CHANGED = 13
  changed
ESP_AVRC_RSP_INTERIM = 15
  interim

enum esp_avrc_batt_stat_t
AVRCP battery status.
Values:

ESP_AVRC_BATT_NORMAL = 0
  normal state
ESP_AVRC_BATT_WARNING = 1
  unable to operate soon
ESP_AVRC_BATT_CRITICAL = 2
  cannot operate any more
ESP_AVRC_BATT_EXTERNAL = 3
  plugged to external power supply
```
ESP_AVRC_BATT_FULL_CHARGE = 4
when completely charged from external power supply

**enum esp_avrc_playback_stat_t**
AVRCP current status of playback.

*Values:*

ESP_AVRC_PLAYBACK_STOPPED = 0
stopped
ESP_AVRC_PLAYBACK_PLAYING = 1
playing
ESP_AVRC_PLAYBACK_PAUSED = 2
paused
ESP_AVRC_PLAYBACK_FWD_SEEK = 3
forward seek
ESP_AVRC_PLAYBACK_REV_SEEK = 4
reverse seek
ESP_AVRC_PLAYBACK_ERROR = 0xFF
error

---

**SPP API**

**Overview**

**Instructions**

**Application Example** Check bluetooth/bluedroid/classic_bt folder in ESP-IDF examples, which contains the following application:

- This is a SPP demo. This demo can discover the service, connect, send and receive SPP data bluetooth/bluedroid/classic_bt/bt_spp_acceptor, bluetooth/bluedroid/classic_bt/bt_spp_initiator

**API Reference**

**Header File**

- bt/host/bluedroid/api/include/api/esp_spp_api.h

**Functions**

`esp_err_t esp_spp_register_callback (esp_spp_cb_t callback)`
This function is called to init callbacks with SPP module.

*Return*

- ESP_OK: success
- other: failed

*Parameters*

- [in] callback: pointer to the init callback function.

`esp_err_t esp_spp_init (esp_spp_mode_t mode)`
This function is called to init SPP.

*Return*

- ESP_OK: success
- other: failed

*Parameters*

- [in] mode: Choose the mode of SPP, ESP_SPP_MODE_CB or ESP_SPP_MODE_VFS.
**esp_err_t esp_spp_deinit()**

This function is called to uninit SPP.

**Return**
- ESP_OK: success
- other: failed

**esp_err_t esp_spp_start_discovery(esp_bd_addr_t bd_addr)**

This function is called to performs service discovery for the services provided by the given peer device. When the operation is complete the callback function will be called with a ESP_SPP_DISCOVERY_COMP_EVT.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] bd_addr: Remote device bluetooth device address.

**esp_err_t esp_spp_connect(esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t remote_scn, esp_bd_addr_t peer_bd_addr)**

This function makes an SPP connection to a remote BD Address. When the connection is initiated or failed to initiate, the callback is called with ESP_SPP_CL_INIT_EVT. When the connection is established or failed, the callback is called with ESP_SPP_OPEN_EVT.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] role: Master or slave.
- [in] remote_scn: Remote device bluetooth device SCN.
- [in] peer_bd_addr: Remote device bluetooth device address.

**esp_err_t esp_spp_disconnect(uint32_t handle)**

This function closes an SPP connection.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] handle: The connection handle.

**esp_err_t esp_spp_start_srv(esp_spp_sec_t sec_mask, esp_spp_role_t role, uint8_t local_scn, const char *name)**

This function create a SPP server and starts listening for an SPP connection request from a remote Bluetooth device. When the server is started successfully, the callback is called with ESP_SPP_START_EVT. When the connection is established, the callback is called with ESP_SPP_SRV_OPEN_EVT.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] role: Master or slave.
- [in] local_scn: The specific channel you want to get. If channel is 0, means get any channel.
- [in] name: Server’s name.

**esp_err_t esp_spp_stop_srv(void)**

This function stops all SPP servers. The operation will close all active SPP connection first, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with
ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Returns

- ESP_OK: success
- other: failed

`esp_err_t esp_spp_stop_srv_scn(uint8_t scn)`

This function stops a specific SPP server. The operation will close all active SPP connection first on the specific SPP server, then the callback function will be called with ESP_SPP_CLOSE_EVT, and the number of ESP_SPP_CLOSE_EVT is equal to the number of connection. When the operation is completed, the callback is called with ESP_SPP_SRV_STOP_EVT. This function must be called after esp_spp_init() successful and before esp_spp_deinit().

Returns

- ESP_OK: success
- other: failed

Parameters

- [in] scn: Server channel number.

`esp_err_t esp_spp_write(uint32_t handle, int len, uint8_t *p_data)`

This function is used to write data, only for ESP_SPP_MODE_CB.

Returns

- ESP_OK: success
- other: failed

Parameters

- [in] handle: The connection handle.
- [in] len: The length of the data written.
- [in] p_data: The data written.

`esp_err_t esp_spp_vfs_register()`

This function is used to register VFS.

Returns

- ESP_OK: success
- other: failed

Unions

`union esp_spp_cb_param_t`  
#include <esp_spp_api.h> SPP callback parameters union.

Public Members

```c
struct esp_spp_cb_param_t::spp_init_evt_param init
    SPP callback param of SPP_INIT_EVT

struct esp_spp_cb_param_t::spp_uninit_evt_param uninit
    SPP callback param of SPP_UNINIT_EVT

struct esp_spp_cb_param_t::spp_discovery_comp_evt_param disc_comp
    SPP callback param of SPP_DISCOVERY_COMP_EVT

struct esp_spp_cb_param_t::spp_open_evt_param open
    SPP callback param of ESP_SPP_OPEN_EVT

struct esp_spp_cb_param_t::spp_srv_open_evt_param srv_open
    SPP callback param of ESP_SPP_SRV_OPEN_EVT

struct esp_spp_cb_param_t::spp_close_evt_param close
    SPP callback param of ESP_SPP_CLOSE_EVT
```
struct esp_spp_cb_param_t::spp_start_evt_param start
    SPP callback param of ESP_SPP_START_EVT

struct esp_spp_cb_param_t::spp_srv_stop_evt_param srv_stop
    SPP callback param of ESP_SPP_SRV_STOP_EVT

struct esp_spp_cb_param_t::spp_cl_init_evt_param cl_init
    SPP callback param of ESP_SPP_CL_INIT_EVT

struct esp_spp_cb_param_t::spp_write_evt_param write
    SPP callback param of ESP_SPP_WRITE_EVT

struct esp_spp_cb_param_t::spp_data_ind_evt_param data_ind
    SPP callback param of ESP_SPP_DATA_IND_EVT

struct esp_spp_cb_param_t::spp_cong_evt_param cong
    SPP callback param of ESP_SPP_CONG_EVT

struct spp_cl_init_evt_param
    #include <esp_spp_api.h> ESP_SPP_CL_INIT_EVT.

Public Members

    esp_spp_status_t status
    uint32_t handle
        The connection handle
    uint8_t sec_id
        security ID used by this server
    bool use_co
        TRUE to use co_rfc_data

#define ESP_SPP_SEC_MITM 5
#define ESP_SPP_SEC_IN_16_DIGITS 6
#define ESP_SPP_MAX_MTU 7
#define ESP_SPP_MAX_SCN 8
```

No security. relate to BTA_SEC_NONE in bta/bta_api.h
Authorization required (only needed for out going connection ) relate to BTA_SEC_AUTHORIZE in bta/bta_api.h
Authentication required. relate to BTA_SEC_AUTHENTICATE in bta/bta_api.h
Encryption required. relate to BTA_SEC_ENCRYPT in bta/bta_api.h
Mode 4 level 4 service, i.e. incoming/outgoing MITM and P-256 encryption relate to BTA_SEC_MODE4_LEVEL4 in bta/bta_api.h
Man-In-The_Middle protection relate to BTA_SEC_MITM in bta/bta_api.h
Min 16 digit for pin code relate to BTA_SEC_IN_16_DIGITS in bta/bta_api.h
SPP max MTU
SPP max SCN

Type Definitions

```c
typedef uint16_t esp_spp_sec_t;
typedef void (esp_spp_cb_t) (esp_spp_cb_event_t event, esp_spp_cb_param_t *param);
```

SPP callback function type.

Parameters

- event: Event type
- param: Point to callback parameter, currently is union type

Enumerations

```c
typedef enum esp_spp_status_t {
    ESP_SPP_SUCCESS = 0,
    ESP_SPP_FAILURE
} Values;
```

Successful operation.
Generic failure.
Chapter 2. API Reference

ESP_SPP_BUSY
Temporarily can not handle this request.

ESP_SPP_NO_DATA
No data

ESP_SPP_NO_RESOURCE
No more resource

ESP_SPP_NEED_INIT
SPP module shall init first

ESP_SPP_NEED_DEINIT
SPP module shall deinit first

ESP_SPP_NO_CONNECTION
Connection may have been closed

ESP_SPP_NO_SERVER
No SPP server

enum esp_spp_role_t
Values:

ESP_SPP_ROLE_MASTER = 0
Role: master

ESP_SPP_ROLE_SLAVE = 1
Role: slave

enum esp_spp_mode_t
Values:

ESP_SPP_MODE_CB = 0
When data is coming, a callback will come with data

ESP_SPP_MODE_VFS = 1
Use VFS to write/read data

enum esp_spp_cb_event_t
SPP callback function events.
Values:

ESP_SPP_INIT_EVT = 0
When SPP is init, the event comes

ESP_SPP_UNINIT_EVT = 1
When SPP is uninit, the event comes

ESP_SPP_DISCOVERY_COMP_EVT = 8
When SDP discovery complete, the event comes

ESP_SPP_OPEN_EVT = 26
When SPP Client connection open, the event comes

ESP_SPP_CLOSE_EVT = 27
When SPP connection closed, the event comes

ESP_SPP_START_EVT = 28
When SPP server started, the event comes

ESP_SPP_CL_INIT_EVT = 29
When SPP client initiated a connection, the event comes

ESP_SPP_DATA_IND_EVT = 30
When SPP connection received data, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_CONG_EVT = 31
When SPP connection congestion status changed, the event comes, only for ESP_SPP_MODE_CB
ESP_SPP_WRITE_EVT = 33
When SPP write operation completes, the event comes, only for ESP_SPP_MODE_CB

ESP_SPP_SRV_OPEN_EVT = 34
When SPP Server connection open, the event comes

ESP_SPP_SRV_STOP_EVT = 35
When SPP server stopped, the event comes

HFP DEFINES

Overview      Instructions

API Reference

Header File
- bt/host/bluedroid/api/include/api/esp_hf_defs.h

Enumerations

enum esp_hf_volume_control_target_t
Bluetooth HFP audio volume control target.
Values:
    ESP_HF_VOLUME_CONTROL_TARGET_SPK = 0
        speaker
    ESP_HF_VOLUME_CONTROL_TARGET_MIC
        microphone

enum esp_hf_roaming_status_t
+CIND roaming status indicator values
Values:
    ESP_HF_ROAMING_STATUS_INACTIVE = 0
        roaming is not active
    ESP_HF_ROAMING_STATUS_ACTIVE
        a roaming is active

enum esp_hf_call_status_t
+CIND call status indicator values
Values:
    ESP_HF_CALL_STATUS_NO_CALLS = 0
        no call in progress
    ESP_HF_CALL_STATUS_CALL_IN_PROGRESS = 1
        call is present(active or held)

enum esp_hf_call_setup_status_t
+CIND call setup status indicator values
Values:
    ESP_HF_CALL_SETUP_STATUS_NONE = 0
        no call setup in progress
    ESP_HF_CALL_SETUP_STATUS_INCOMING = 1
        incoming call setup in progress
Chapter 2. API Reference

ESP_HF_CALL_SETUP_STATUS_OUTGOING_DIALING = 2
outgoing call setup in dialing state

ESP_HF_CALL_SETUP_STATUS_OUTGOING_ALERTING = 3
outgoing call setup in alerting state

enum esp_hf_call_held_status_t
+ CIND call held indicator values

Values:

ESP_HF_CALL_HELD_STATUS_NONE = 0
no calls held

ESP_HF_CALL_HELD_STATUS HELD_AND_ACTIVE = 1
both active and held call

ESP_HF_CALL_HELD_STATUS HELD = 2
call on hold, no active call

enum esp_hf_service_availability_status_t
+ CIND network service availability status

Values:

ESP_HF_SERVICE_AVAILABILITY_STATUS_UNAVAILABLE = 0
service not available

ESP_HF_SERVICE_AVAILABILITY_STATUS_AVAILABLE
service available

enum esp_hf_current_call_status_t
+ CLCC status of the call

Values:

ESP_HF_CURRENT_CALL_STATUS_ACTIVE = 0
active

ESP_HF_CURRENT_CALL_STATUS HELD = 1
held

ESP_HF_CURRENT_CALL_STATUS.Dialing (outgoing calls only)

ESP_HF_CURRENT_CALL_STATUS ALERTING = 3
alerting (outgoing calls only)

ESP_HF_CURRENT_CALL_STATUS Incoming = 4
incoming (incoming calls only)

ESP_HF_CURRENT_CALL_STATUS_WAITING = 5
waiting (incoming calls only)

ESP_HF_CURRENT_CALL_STATUS HELD BY RESP HOLD = 6
call held by response and hold

enum esp_hf_current_call_direction_t
+ CLCC direction of the call

Values:

ESP_HF_CURRENT_CALL_DIRECTION_OUTGOING = 0
outgoing

ESP_HF_CURRENT_CALL_DIRECTION_INCOMING = 1
incoming
enum esp_hf_current_call_mpty_type_t
+CLCC multi-party call flag

Values:

ESP_HF_CURRENT_CALL_MPTY_TYPE_SINGLE = 0
not a member of a multi-party call

ESP_HF_CURRENT_CALL_MPTY_TYPE_MULTI = 1
member of a multi-party call

enum esp_hf_current_call_mode_t
+CLCC call mode

Values:

ESP_HF_CURRENT_CALL_MODE_VOICE = 0
ESP_HF_CURRENT_CALL_MODE_DATA = 1
ESP_HF_CURRENT_CALL_MODE_FAX = 2

enum esp_hf_call_addr_type_t
+CLCC address type

Values:

ESP_HF_CALL_ADDR_TYPE_UNKNOWN = 0x81
unknown address type

ESP_HF_CALL_ADDR_TYPE_INTERNATIONAL = 0x91
international address

enum esp_hf_subscriber_service_type_t
+CNUM service type of the phone number

Values:

ESP_HF_SUBSCRIBER_SERVICE_TYPE_UNKNOWN = 0
unknown

ESP_HF_SUBSCRIBER_SERVICE_TYPEVOICE
voice service

ESP_HF_SUBSCRIBER_SERVICE_TYPE_FAX
fax service

enum esp_hf_btrh_status_t
+BTRH response and hold result code

Values:

ESP_HF_BTRH_STATUS_HELD = 0
incoming call is put on hold in AG

ESP_HF_BTRH_STATUS_ACCEPTED
held incoming call is accepted in AG

ESP_HF_BTRH_STATUS_REJECTED
held incoming call is rejected in AG

enum esp_hf_btrh_cmd_t
AT+BTRH response and hold action code.

Values:

ESP_HF_BTRH_CMD_HOLD = 0
put the incoming call on hold

ESP_HF_BTRH_CMD_ACCEPT = 1
accept a held incoming call
ESP_HF_BTRH_CMD_REJECT = 2
reject a held incoming call

enum esp hf at response code t
response indication codes for AT commands

Values:
ESP_HF_AT_RESPONSE_CODE_OK = 0
acknowledges execution of a command line
ESP_HF_AT_RESPONSE_CODE_ERR
command not accepted
ESP_HF_AT_RESPONSE_CODE_NO_CARRIER
connection terminated
ESP_HF_AT_RESPONSE_CODE_BUSY
busy signal detected
ESP_HF_AT_RESPONSE_CODE_NO_ANSWER
connection completion timeout
ESP_HF_AT_RESPONSE_CODE_DELAYED
delayed
ESP_HF_AT_RESPONSE_CODE_BLACKLISTED
blacklisted
ESP_HF_AT_RESPONSE_CODE_CME
CME error

enum esp hf vr state t
voice recognition state

Values:
ESP_HF_VR_STATE_DISABLED = 0
voice recognition disabled
ESP_HF_VR_STATE_ENABLED
voice recognition enabled

enum esp hf chld type t
AT+CHLD command values.

Values:
ESP_HF_CHLD_TYPE_REL = 0
<0>, Terminate all held or set UDUB( “busy”) to a waiting call
ESP_HF_CHLD_TYPE_REL_ACC
<1>, Terminate all active calls and accepts a waiting/held call
ESP_HF_CHLD_TYPE_HOLD_ACC
<2>, Hold all active calls and accepts a waiting/held call
ESP_HF_CHLD_TYPE_MERGE
<3>, Add all held calls to a conference
ESP_HF_CHLD_TYPE_MERGE_DETACH
<4>, connect the two calls and disconnects the subscriber from both calls
ESP_HF_CHLD_TYPE_REL_X
<1x>, releases specified calls only
ESP_HF_CHLD_TYPE_PRIV_X
<2x>, request private consultation mode with specified call
enum esp_hf_cme_err_t
Extended Audio Gateway Error Result Code Response.

Values:

- ESP_HF_CME_AG_FAILURE = 0
  ag failure
- ESP_HF_CME_NO_CONNECTION_TO_PHONE = 1
  no connection to phone
- ESP_HF_CME_OPERATION_NOT_ALLOWED = 3
  operation not allowed
- ESP_HF_CME_OPERATION_NOT_SUPPORTED = 4
  operation not supported
- ESP_HF_CME_PH_SIM_PIN_REQUIRED = 5
  PH-SIM PIN Required
- ESP_HF_CME_SIM_NOT_INSERTED = 10
  SIM not inserted
- ESP_HF_CME_SIM_PIN_REQUIRED = 11
  SIM PIN required
- ESP_HF_CME_SIM_PUK_REQUIRED = 12
  SIM PUK required
- ESP_HF_CME_SIM_FAILURE = 13
  SIM failure
- ESP_HF_CME_SIM_BUSY = 14
  SIM busy
- ESP_HF_CME_INCORRECT_PASSWORD = 16
  incorrect password
- ESP_HF_CME_SIM_PIN2_REQUIRED = 17
  SIM PIN2 required
- ESP_HF_CME_SIM_PUK2_REQUIRED = 18
  SIM PUK2 required
- ESP_HF_CME_MEMORY_FULL = 20
  memory full
- ESP_HF_CME_INVALID_INDEX = 21
  invalid index
- ESP_HF_CME_MEMORY_FAILURE = 23
  memory failure
- ESP_HF_CME_TEXT_STRING_TOO_LONG = 24
  test string too long
- ESP_HF_CME_INVALID_CHARACTERS_IN_TEXT_STRING = 25
  invalid characters in text string
- ESP_HF_CME_DIAL_STRING_TOO_LONG = 26
  dial string too long
- ESP_HF_CME_INVALID_CHARACTERS_IN_DIAL_STRING = 27
  invalid characters in dial string
- ESP_HF_CME_NO_NETWORK_SERVICE = 30
  no network service
- ESP_HF_CME_NETWORK_TIMEOUT = 31
  network timeout
ESP_HF_CME_NETWORK_NOT_ALLOWED = 32
    network not allowed emergency calls only

HFP CLIENT API

Overview

API Reference

Header File

- bt/host/bluedroid/api/include/api/esp_hf_client_api.h

Functions

`esp_err_t esp_hf_client_register_callback(esp_hf_client_cb_t callback)`

Register application callback function to HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully, used by HFP client.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

Parameters

- [in] callback: HFP client event callback function

`esp_err_t esp_hf_client_init(void)`

Initialize the bluetooth HFP client module. This function should be called after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: if the initialization request is sent successfully
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_deinit(void)`

De-initialize for HFP client module. This function should be called only after esp_bluedroid_enable() completes successfully.

Return

- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

`esp_err_t esp_hf_client_connect(esp_bd_addr_t remote_bda)`

Connect to remote bluetooth HFP audio gateway(AG) device, must after esp_hf_client_init()

Return

- ESP_OK: connect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters

- [in] remote_bda: remote bluetooth device address

`esp_err_t esp_hf_client_disconnect(esp_bd_addr_t remote_bda)`

Disconnect from the remote HFP audio gateway.

Return

- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
Chapter 2. API Reference

- [in] remote_bda: remote bluetooth device address

**esp_err_t esp_hf_client_connect_audio(esp_bd_addr_t remote_bda)**

Create audio connection with remote HFP AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_bda: remote bluetooth device address

**esp_err_t esp_hf_client_disconnect_audio(esp_bd_addr_t remote_bda)**

Release the established audio connection with remote HFP AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] remote_bda: remote bluetooth device address

**esp_err_t esp_hf_client_start_voice_recognition(void)**

Enable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_stop_voice_recognition(void)**

Disable voice recognition in the AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_volume_update(esp_hf_volume_control_target_t type, int volume)**

Volume synchronization with AG. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] type: volume control target, speaker or microphone
- [in] volume: gain of the speaker of microphone, ranges 0 to 15

**esp_err_t esp_hf_client_dial(const char *number)**

Place a call with a specified number. If number is NULL, last called number is called. As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- [in] number: number string of the call. If NULL, the last number is called (aka re-dial)
**esp_err_t esp_hf_client_dial_memory** *(int location)*

Place a call with number specified by location(speed dial). As a precondition, to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[in]** location: location of the number in the memory

**esp_err_t esp_hf_client_send_chld_cmd** *(esp_hf_chld_type_t chld, int idx)*

Send call hold and multiparty commands, or enhanced call control commands(Use AT+CHLD). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[in]** chld: AT+CHLD call hold and multiparty handling AT command.
- **[in]** idx: used in Enhanced Call Control Mechanisms, used if chld is ESP_HF_CHLD_TYPE_REL_X or ESP_HF_CHLD_TYPE_PRV_X

**esp_err_t esp_hf_client_send_btrh_cmd** *(esp_hf_btrh_cmd_t btrh)*

Send response and hold action command(Send AT+BTRH command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[in]** btrh: response and hold action to send

**esp_err_t esp_hf_client_answer_call** *(void)*

Answer an incoming call(send ATA command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_reject_call** *(void)*

Reject an incoming call(send AT+CHUP command), As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_query_current_calls** *(void)*

Query list of current calls in AG(send AT+CLCC command), As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if Bluetooth stack is not yet enabled
- ESP_FAIL: others

**esp_err_t esp_hf_client_query_current_operator_name** *(void)*

Query the name of currently selected network operator in AG(use AT+COPS commands) As a precondition
to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
typedef enum esp_err_t esp_hf_client_retrieve_subscriber_info(void)
```
Get subscriber information number from AG (send AT+CNUM command) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
typedef enum esp_err_t esp_hf_client_send_dtmf(char code)
```
Transmit DTMF codes during an ongoing call (use AT+VTS commands) As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

**Parameters**
- **[in]** code: dtmf code, single ascii character in the set 0-9, #, *, A-D

```c
typedef enum esp_err_t esp_hf_client_request_last_voice_tag_number(void)
```
Request a phone number from AG corresponding to last voice tag recorded (send AT+BINP command). As a precondition to use this API, Service Level Connection shall exist with AG.

**Return**
- ESP_OK: disconnect request is sent to lower layer
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

```c
typedef enum esp_err_t esp_hf_client_register_data_callback(esp_hf_client_incoming_data_cb_t recv, esp_hf_client_outgoing_data_cb_t send)
```
Register HFP client data output function; the callback is only used in the case that Voice Over HCI is enabled.

**Return**
- ESP_OK: success
- ESP_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: if callback is a NULL function pointer

**Parameters**
- **[in]** recv: HFP client incoming data callback function
- **[in]** send: HFP client outgoing data callback function

```c
void esp_hf_client_outgoing_data_ready(void)
```
Trigger the lower-layer to fetch and send audio data. This function is only only used in the case that Voice Over HCI is enabled. Precondition is that the HFP audio connection is connected. After this function is called, lower layer will invoke esp_hf_client_outgoing_data_cb_t to fetch data.

```c
void esp_hf_client_pcm_resample_init(uint32_t src_sps, uint32_t bits, uint32_t channels)
```
Initialize the down sampling converter. This is a utility function that can only be used in the case that Voice Over HCI is enabled.

**Parameters**
- **[in]** src_sps: original samples per second(source audio data, i.e. 48000, 32000, 16000, 44100, 22050, 11025)
- **[in]** bits: number of bits per pcm sample (16)
- **[in]** channels: number of channels (i.e. mono(1), stereo(2)…)

```c
void esp_hf_client_pcm_resample_deinit(void)
```
Deinitialize the down sampling converter.
int32_t esp_hf_client_pcm_resample(void *src, uint32_t in_bytes, void *dst)

Down sampling utility to convert high sampling rate into 8K/16bits 1-channel mode PCM samples. This can only be used in the case that Voice Over HCI is enabled.

Return number of samples converted

Parameters

• [in] src: pointer to the buffer where the original sampling PCM are stored
• [in] in_bytes: length of the input PCM sample buffer in byte
• [in] dst: pointer to the buffer which is to be used to store the converted PCM samples

Unions
union esp_hf_client_cb_param_t

Type Definitions

typedef void(*esp_hf_client_incoming_data_cb_t)(const uint8_t*buf,uint32_t len)
HFP client incoming data callback function, the callback is useful in case of Voice Over HCI.

Parameters

• [in] buf: : pointer to incoming data(payload of HCI synchronous data packet), the buffer is
allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
• [in] len: : size(in bytes) in buf

typedef uint32_t(*esp_hf_client_outgoing_data_cb_t)(uint8_t*buff,uint32_t len)
HFP client outgoing data callback function, the callback is useful in case of Voice Over HCI. Once audio
connection is set up and the application layer has prepared data to send, the lower layer will call this function
to read data and then send. This callback is supposed to be implemented as non-blocking, and if data is not
enough, return value 0 is supposed.

Return length of data successfully read

Parameters

• [in] buff: : pointer to incoming data(payload of HCI synchronous data packet), the buffer is
allocated inside bluetooth protocol stack and will be released after invoke of the callback is finished.
• [in] len: : size(in bytes) in buff

typedef void(*esp_hf_client_cb_t)(esp_hf_client_cb_event_t event, esp_hf_client_cb_param_t
*param)
HFP client callback function type.

Parameters

• event: : Event type
• param: : Pointer to callback parameter

Enumerations

enum esp_hf_client_connection_state_t
Bluetooth HFP RFCOMM connection and service level connection status.

Values:

ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTED = 0
RFCOMM data link channel released

ESP_HF_CLIENT_CONNECTION_STATE_CONNECTING
connecting remote device on the RFCOMM data link

ESP_HF_CLIENT_CONNECTION_STATE_CONNECTED
RFCOMM connection established

ESP_HF_CLIENT_CONNECTION_STATE_SLC_CONNECTED
service level connection established

ESP_HF_CLIENT_CONNECTION_STATE_DISCONNECTING
disconnecting with remote device on the RFCOMM dat link

Submit Document Feedback
enum esp_hf_client_audio_state_t

  Bluetooth HFP audio connection status.

  **Values:**

  ESP_HF_CLIENT_AUDIO_STATE_DISCONNECTED = 0
  audio connection released

  ESP_HF_CLIENT_AUDIO_STATE_CONNECTING
  audio connection has been initiated

  ESP_HF_CLIENT_AUDIO_STATE_CONNECTED
  audio connection is established

  ESP_HF_CLIENT_AUDIO_STATE_CONNECTED_MSBC
  MSBC audio connection is established

enum esp_hf_client_in_band_ring_state_t

  in-band ring tone state

  **Values:**

  ESP_HF_CLIENT_IN_BAND_RINGTONE_NOT_PROVIDED = 0

  ESP_HF_CLIENT_IN_BAND_RINGTONE_PROVIDED

enum esp_hf_client_cb_event_t

  HF CLIENT callback events.

  **Values:**

  ESP_HF_CLIENT_CONNECTION_STATE_EVT = 0
  connection state changed event

  ESP_HF_CLIENT_AUDIO_STATE_EVT
  audio connection state change event

  ESP_HF_CLIENT_BVRA_EVT
  voice recognition state change event

  ESP_HF_CLIENT_CIND_CALL_EVT
  call indication

  ESP_HF_CLIENT_CIND_CALL_SETUP_EVT
  call setup indication

  ESP_HF_CLIENT_CIND_CALL_HELD_EVT
  call held indication

  ESP_HF_CLIENT_CIND_SERVICE_AVAILABILITY_EVT
  network service availability indication

  ESP_HF_CLIENT_CIND_SIGNAL_STRENGTH_EVT
  signal strength indication

  ESP_HF_CLIENT_CIND_ROAMING_STATUS_EVT
  roaming status indication

  ESP_HF_CLIENT_CIND_BATTERY_LEVEL_EVT
  battery level indication

  ESP_HF_CLIENT_COPS_CURRENT_OPERATOR_EVT
  current operator information

  ESP_HF_CLIENT_BTRH_EVT
  call response and hold event

  ESP_HF_CLIENT_CLIP_EVT
  Calling Line Identification notification
Chapter 2. API Reference

ESP_HF_CLIENT_CCWA_EVT
  call waiting notification

ESP_HF_CLIENT_CLCC_EVT
  list of current calls notification

ESP_HF_CLIENT_VOLUME_CONTROL.EVT
  audio volume control command from AG, provided by +VGM or +VGS message

ESP_HF_CLIENT_AT_RESPONSE_EVT
  AT command response event

ESP_HF_CLIENT_CNUM_EVT
  subscriber information response from AG

ESP_HF_CLIENT_BSIR_EVT
  setting of in-band ring tone

ESP_HF_CLIENT_BINP_EVT
  requested number of last voice tag from AG

ESP_HF_CLIENT_RING_IND_EVT
  ring indication event

2.1.5 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

![Fig. 1: ESP NimBLE Stack](image)

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function nim-
ble_port_freertos_init. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

**Programming Sequence**

To begin with, make sure that the NimBLE stack is enabled from menuconfig choose NimBLE for the Bluetooth host.

Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks_INITIALIZATION
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

**API Reference**

**Header File**

- `bt/host/nimble/esp-hci/include/esp_nimble_hci.h`

**Functions**

```c
esp_err_t esp_nimble_hci_init (void)
Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

**Return**

- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

```c
esp_err_t esp_nimble_hci_and_controller_init (void)
Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```c
void ble_host_task (void *param) {
    nimble_port_run (); //This function will return only when nimble_port_ 
    --stop () is executed.
    nimble_port_freertos_deinit ();
}

int ret = esp_nimble_hci_and_controller_init ();
if ({ ret != ESP_OK }) {
    ESP_LOGE (TAG, "esp_nimble_hci_and_controller_init () failed with error: \d ":
          , ret);
    return ;
}
```

(continues on next page)
nimble_port_init();
//Initialize the NimBLE Host configuration
nimble_port_freertos_init(ble_host_task);

nimble_port_freertos_init() is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to nimble_port_run(). If a separate task is not required, calling nimble_port_run() will run the NimBLE host in the current task.

Return
- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

esp_err_t esp_nimble_hci_deinit (void)
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

Note This function should be called after the NimBLE host is deinitialized.

Return
- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

esp_err_t esp_nimble_hci_and_controller_deinit (void)
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

Note This function should not be executed in the context of Bluetooth host task.
Note This function should be called after the NimBLE host is deinitialized.

```c
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();
    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with...
        esp_err_t ret);
    }
}
```

If nimble_port_freertos_init() is used during initialization, then nimble_port_freertos_deinit() should be called in the host task after nimble_port_run().

Return
- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

Macros

- BLE_HCI_UART_H4_EVT
Chapter 2. API Reference

2.1.6 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section *Getting Started with ESP-BLE-MESH*. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section *ESP-BLE-MESH Architecture*.

Application Examples and Demos

Please refer to Sections *ESP-BLE-MESH Examples* and *ESP-BLE-MESH Demo Videos*.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- ESP-BLE-MESH Definitions
- ESP-BLE-MESH Core API Reference
- ESP-BLE-MESH Models API Reference

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- `bt/esp_ble_mesh/api/esp_ble_mesh_defs.h`

Unions

```c
union esp_ble_mesh_prov_cb_param_t
    #include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.
```

Public Members

```c

proxy_client_disconnect_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_set_filter_type_comp_param
proxy_client_set_filter_type_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_add_filter_addr_comp_param
proxy_client_add_filter_addr_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_proxy_client_remove_filter_addr_comp_param
proxy_client_remove_filter_addr_comp
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_model_sub_group_addr_comp_param
model_sub_group_addr_comp
Event parameters of ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_model_unsub_group_addr_comp_param
model_unsub_group_addr_comp
Event parameters of ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_deinit_mesh_comp_param
deinit_mesh_comp
Event parameter of ESP_BLE_MESH_DEINIT_MESH_COMP_EVT

struct ble_mesh_deinit_mesh_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_DEINIT_MESH_COMP_EVT.

Public Members

int err_code
Indicate the result of BLE Mesh deinitialization

struct ble_mesh_friend_friendship_establish_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT.

Public Members

uint16_t lpn_addr
Low Power Node unicast address

struct ble_mesh_friend_friendship_terminate_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.

Public Types

enum [anonymous]
This enum value is the reason of friendship termination on the friend node side

Values:

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received
**Chapter 2. API Reference**

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ</code></td>
<td>Receive Friend Request from existing Low Power Node</td>
</tr>
<tr>
<td><code>ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR</code></td>
<td>Receive Friend Clear from other friend node</td>
</tr>
<tr>
<td><code>ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE</code></td>
<td>Friend feature disabled or corresponding NetKey is deleted</td>
</tr>
</tbody>
</table>

### Public Members

- `uint16_t lpn_addr`
  - Low Power Node unicast address

- `esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous] reason`
  - This enum value is the reason of friendship termination on the friend node side. Friendship terminated reason

```c
struct ble_mesh_heartbeat_msg_recv_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.
```

### Public Members

- `uint8_t hops`
  - Heartbeat hops (InitTTL - RxTTL + 1)

- `uint16_t feature`
  - Bit field of currently active features of the node

```c
struct ble_mesh_input_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_EVT.
```

### Public Members

- `esp_ble_mesh_input_action_t action`
  - Action of Input OOB Authentication

- `uint8_t size`
  - Size of Input OOB Authentication

```c
struct ble_mesh_input_number_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_NUM_COMP_EVT.
```

### Public Members

- `int err_code`
  - Indicate the result of inputting number

```c
struct ble_mesh_input_string_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_STR_COMP_EVT.
```

### Public Members

- `int err_code`
  - Indicate the result of inputting string

```c
struct ble_mesh_link_close_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT.
```
Public Members

`esp_ble_mesh_prov_bearer_t bearer`  
Type of the bearer used when device link is closed

```c
#include <esp_ble_mesh_defs.h>  
ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT.
```

Public Members

`esp_ble_mesh_prov_bearer_t bearer`  
Type of the bearer used when device link is open

```c
#include <esp_ble_mesh_defs.h>  
ESP_BLE_MESH_LPN_DISABLE_COMP_EVT.
```

Public Members

`int err_code`  
Indicate the result of disabling LPN functionality

```c
#include <esp_ble_mesh_defs.h>  
ESP_BLE_MESH_LPN_ENABLE_COMP_EVT.
```

Public Members

`int err_code`  
Indicate the result of enabling LPN functionality

```c
#include <esp_ble_mesh_defs.h>  
ESP_BLE_MESH_LPN_FRIENDSHIP.EstablishEvt.
```

Public Members

`uint16_t friend_addr`  
Friend Node unicast address

```c
#include <esp_ble_mesh_defs.h>  
ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT.
```

Public Members

`uint16_t friend_addr`  
Friend Node unicast address

```c
#include <esp_ble_mesh_defs.h>  
ESP_BLE_MESH_LPN_POLL_COMP_EVT.
```

Public Members

`int err_code`  
Indicate the result of sending Friend Poll

```c

uint16_t power
The value of the Generic Power Actual state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_power_actual
The Generic Power Actual state

uint16_t lightness
The value of the Light Lightness Actual state
The value of the Light Lightness Linear state
The value of the Light CTL Lightness state
The value of the Light HSL Lightness state
The value of the Light xyL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lightness_actual
The Light Lightness Actual state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lightness_linear
The Light Lightness Linear state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_lightness
The Light CTL Lightness state

uint16_t temperature
The value of the Light CTL Temperature state

int16_t delta_uv
The value of the Light CTL Delta UV state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_temp_delta_uv
The Light CTL Temperature & Delta UV states

uint16_t hue
The value of the Light HSL Hue state

uint16_t saturation
The value of the Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl
The Light HSL composite state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_lightness
The Light HSL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_hue
The Light HSL Hue state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_saturation
The Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_xyl_lightness
The Light xyL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lc_light_onoff
The Light LC Light OnOff state

union esp_ble_mesh_model_cb_param_t
#include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.
Chapter 2. API Reference

Public Members

```c
struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_operation_evt_param model_operation
    Event parameter of ESP_BLE_MESH_MODEL_OPERATION_EVT

   Indicate if erasing flash when deinit mesh stack
```

```c
struct esp_ble_mesh_elem_t
   Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h
```

Public Members

```c
uint16_t element_addr
   Element Address, assigned during provisioning.
```

```c
const uint16_t location
   Location Descriptor (GATT Bluetooth Namespace Descriptors)
```

```c
const uint8_t sig_model_count
   SIG Model count
```

```c
const uint8_t vnd_model_count
   Vendor Model count
```

```c
esp_ble_mesh_model_t *sig_models
   SIG Models
```

```c
esp_ble_mesh_model_t *vnd_models
   Vendor Models
```

```c
struct esp_ble_mesh_model_pub_t
   Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h
```

Public Members

```c
esp_ble_mesh_model_t *model
   Pointer to the model to which the context belongs. Initialized by the stack.
```

```c
uint16_t publish_addr
   Publish Address.
```

```c
uint16_t app_idx : 12
   Publish AppKey Index.
```

```c
uint16_t cred : 1
   Friendship Credentials Flag.
```
uint16_t send_rel : 1
    Force reliable sending (segment acks)

uint8_t ttl
    Publish Time to Live.

uint8_t retransmit
    Retransmit Count & Interval Steps.

uint8_t period
    Publish Period.

uint8_t period_div : 4
    Divisor for the Period.

uint8_t fast_period : 1
    Use FastPeriodDivisor

uint8_t count : 3
    Retransmissions left.

uint32_t period_start
    Start of the current period.

struct net_buf_simple *msg
    Publication buffer, containing the publication message.
    This will get correctly created when the publication context has been defined using the
    ESP_BLE_MESH_MODEL_PUB_DEFINE macro.
    ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

esp_ble_mesh_cb_t update
    Callback used to update publish message. Initialized by the stack.

struct k_delayed_work timer
    Publish Period Timer. Initialized by the stack.

uint8_t dev_role
    Role of the device that is going to publish messages

struct esp_ble_mesh_model_op_t
    Abstraction that describes a model operation context. This structure is associated with struct
    bt_mesh_model_op in mesh_access.h

Public Members

const uint32_t opcode
    Message opcode

const size_t min_len
    Message minimum length

esp_ble_mesh_cb_t param_cb
    Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model_cbs_t
    Abstraction that describes a model callback structure. This structure is associated with struct
    bt_mesh_model_cb in mesh_access.h.

Public Members

esp_ble_mesh_cb_t init_cb
    Callback used during model initialization. Initialized by the stack.
struct esp_ble_mesh_model

Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

union esp_ble_mesh_model::[anonymous] [anonymous]

  Model ID

  uint8_t element_idx
  Internal information, mainly for persistent storage. Belongs to Nth element

  uint8_t model_idx
  Is the Nth model in the element

  uint16_t flags
  Information about what has changed

  esp_ble_mesh_elem_t *element
  The Element to which this Model belongs

  esp_ble_mesh_model_pub_t *const pub
  Model Publication

  uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
  AppKey List

  uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
  Subscription List (group or virtual addresses)

  esp_ble_mesh_model_op_t *op
  Model operation context

  esp_ble_mesh_model_ctxt_t *cb
  Model callback structure

  void *user_data
  Model-specific user data

struct esp_ble_mesh_msg_ctx_t

Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

Public Members

  uint16_t net_idx
  NetKey Index of the subnet through which to send the message.

  uint16_t app_idx
  AppKey Index for message encryption.

  uint16_t addr
  Remote address.

  uint16_t recv_dst
  Destination address of a received message. Not used for sending.

  int8_t recv_rssi
  RSSI of received packet. Not used for sending.

  uint8_t recv_ttl : 7
  Received TTL value. Not used for sending.

  uint8_t send_rel : 1
  Force sending reliably by using segment acknowledgement
uint8_t send_ttl
    TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t recv_op
    Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t *model
    Model corresponding to the message, no need to be initialized before sending message

bool srv_send
    Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t
    Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t
    Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

Public Members

uint16_t cid
    16-bit SIG-assigned company identifier

uint16_t pid
    16-bit vendor-assigned product identifier

uint16_t vid
    16-bit vendor-assigned product version identifier

size_t element_count
    Element count

esp_ble_mesh_elem_t *elements
    A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t
    Information of the device which is going to be added for provisioning.

Public Members

esp_ble_mesh_bd_addr_t addr
    Device address

esp_ble_mesh_addr_type_t addr_type
    Device address type

uint8_t uuid[16]
    Device UUID

uint16_t oob_info
    Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

esp_ble_mesh_prov_bearer_t bearer
    Provisioning Bearer

struct esp_ble_mesh_device_delete_t
    Information of the device which is going to be deleted.

Public Members

esp_ble_mesh_bd_addr_t addr
    Device address
**Chapter 2. API Reference**

**esp_ble_mesh_addr_type_t addr_type**
Device address type

uint8_t **uuid**[16]
Device UUID

uint8_t **flag**
BIT0: device address; BIT1: device UUID

**struct esp_ble_mesh_prov_data_info_t**
Information of the provisioner which is going to be updated.

**Public Members**

uint16_t **net_idx**
NetKey Index

uint8_t **flags**
Flags

uint32_t **iv_index**
IV Index

uint8_t **flag**
BIT0: net_idx; BIT1: flags; BIT2: iv_index

**struct esp_ble_mesh_node_t**
Information of the provisioned node

**Public Members**

*esp_ble_mesh_bd_addr_t* **addr**
Node device address

*esp_ble_mesh_addr_type_t* **addr_type**
Node device address type

uint8_t **dev_uuid**[16]
Device UUID

uint16_t **oob_info**
Node OOB information

uint16_t **unicast_addr**
Node unicast address

uint8_t **element_num**
Node element number

uint16_t **net_idx**
Node NetKey Index

uint8_t **flags**
Node key refresh flag and iv update flag

uint32_t **iv_index**
Node IV Index

uint8_t **dev_key**[16]
Node device key

char **name**[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
Node name

uint16_t **comp_length**
Length of Composition Data
uint8_t *comp_data  
Value of Composition Data

**struct esp_ble_mesh_fast_prov_info_t**  
Context of fast provisioning which need to be set.

**Public Members**

uint16_t unicast_min  
Minimum unicast address used for fast provisioning

uint16_t unicast_max  
Maximum unicast address used for fast provisioning

uint16_t net_idx  
Netkey index used for fast provisioning

uint8_t flags  
Flags used for fast provisioning

uint8_t iv_index  
IV Index used for fast provisioning

uint8_t offset  
Offset of the UUID to be compared

uint8_t match_len  
Length of the UUID to be compared

uint8_t match_val[16]  
Value of UUID to be compared

**struct esp_ble_mesh_heartbeat_filter_info_t**  
Context of Provisioner heartbeat filter information to be set

**Public Members**

uint16_t hb_src  
Heartbeat source address (unicast address)

uint16_t hb_dst  
Heartbeat destination address (unicast address or group address)

**struct esp_ble_mesh_client_op_pair_t**  
BLE Mesh client models related definitions.  
Client model Get/Set message opcode and corresponding Status message opcode

**Public Members**

uint32_t cli_op  
The client message opcode

uint32_t status_op  
The server status opcode corresponding to the client message opcode

**struct esp_ble_mesh_client_t**  
Client Model user data context.
Public Members

*esp_ble_mesh_model_t* `model`  
Pointer to the client model. Initialized by the stack.

int `op_pair_size`  
Size of the `op_pair`

*const esp_ble_mesh_client_op_pair_t* `op_pair`  
Table containing get/set message opcode and corresponding status message opcode

uint32_t `publish_status`  
Callback used to handle the received unsolicited message. Initialized by the stack.

void *`internal_data`  
Pointer to the internal data of client model

uint8_t `msg_role`  
Role of the device (Node/Provisioner) that is going to send messages

*struct esp_ble_mesh_client_common_param_t*  
Common parameters of the messages sent by Client Model.

Public Members

*esp_ble_mesh_opcode_t* `opcode`  
Message opcode

*esp_ble_mesh_model_t* `model`  
Pointer to the client model structure

*esp_ble_mesh_msg_ctx_t* `ctx`  
The context used to send message

int32_t `msg_timeout`  
Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t `msg_role`  
Role of the device - Node/Provisioner

*struct esp_ble_mesh_state_transition_t*  
Parameters of the server model state transition

Public Functions

**BLE_MESH_ATOMIC_DEFINE** (flag, `ESP_BLE_MESH_SERVER_FLAG_MAX`)  
Flag used to indicate if the transition timer has been started internally.

If the model which contains `esp_ble_mesh_state_transition_t` sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

Public Members

bool `just_started`  
Indicate if the state transition has just started

uint8_t `trans_time`  
State transition time

uint8_t \_remain\_time
Remaining time of state transition

uint8_t \_delay
Delay before starting state transition

uint32_t \_quo\_tt
Duration of each divided transition step

uint32_t \_counter
Number of steps which the transition duration is divided

uint32_t \_total\_duration
State transition total duration

int64_t \_start\_timestamp
Time when the state transition is started

\textbf{struct} \_k\_delayed\_work\_timer
Timer used for state transition

\textbf{struct} esp\_ble\_mesh\_last\_msg\_info\_t
Parameters of the server model received last same set message.

\textbf{Public Members}

uint8_t \_tid
Transaction number of the last message

uint16_t \_src
Source address of the last message

uint16_t \_dst
Destination address of the last message

int64_t \_timestamp
Time when the last message is received

\textbf{struct} esp\_ble\_mesh\_server\_rsp\_ctrl\_t
Parameters of the Server Model response control

\textbf{Public Members}

uint8_t \_get\_auto\_rsp
1
BLE Mesh Server Response Option.

1. If get\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP, then the response of Client Get messages need to be replied by the application;
2. If get\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_AUTO\_RSP, then the response of Client Get messages will be replied by the server models;
3. If set\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP, then the response of Client Set messages need to be replied by the application;
4. If set\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_AUTO\_RSP, then the response of Client Set messages will be replied by the server models;
5. If status\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_RSP\_BY\_APP, then the response of Server Status messages need to be replied by the application;
6. If status\_auto\_rsp is set to ESP\_BLE\_MESH\_SERVER\_AUTO\_RSP, then the response of Server Status messages will be replied by the server models; Response control for Client Get messages

uint8_t \_set\_auto\_rsp
1
Response control for Client Set messages

uint8_t \_status\_auto\_rsp
1
Response control for Server Status messages
Chapter 2. API Reference

Macros

- **ESP_BLE_HOST_STATUS_ENABLED**
  - The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC

- **ESP_BLE_HOST_STATUS_CHECK**(status)

- **ESP_BLE_MESH_SDU_MAX_LEN**
  - Length of a short Mesh MIC.

- **ESP_BLE_MESH_MIC_SHORT**
  - Length of a long Mesh MIC.

- **ESP_BLE_MESH_MIC_LONG**
  - The maximum length of a BLE Mesh provisioned node name.

- **ESP_BLE_MESH_NODE_NAME_MAX_LEN**
  - The maximum length of a BLE Mesh unprovisioned device name.

- **ESP_BLE_MESH_DEVICE_NAME_MAX_LEN**
  - The maximum length of settings user id.

- **ESP_BLE_MESH_SETTINGS_UID_SIZE**
  - Invalid settings index.

- **ESP_BLE_MESH_INVALID_SETTINGS_IDX**
  - Define the BLE Mesh octet 16 bytes size.

- **ESP_BLE_MESH_OCTET16_LEN**

- **ESP_BLE_MESH_OCTET8_LEN**

- **ESP_BLE_MESH_CID_NVAL**
  - Special TTL value to request using configured default TTL.

- **ESP_BLE_MESH_TTL_DEFAULT**
  - Maximum allowed TTL value.

- **ESP_BLE_MESH_TTL_MAX**

- **ESP_BLE_MESH_ADDR_UNASSIGNED**

- **ESP_BLE_MESH_ADDR_ALL_NODES**

- **ESP_BLE_MESH_ADDR_PROXIES**

- **ESP_BLE_MESH_ADDR_FRIENDS**

- **ESP_BLE_MESH_ADDR_RELAYS**

- **ESP_BLE_MESH_KEY_UNUSED**

- **ESP_BLE_MESH_KEY_DEV**

- **ESP_BLE_MESH_KEY_PRIMARY**

- **ESP_BLE_MESH_KEY_ANY**
  - Primary Network Key index.

- **ESP_BLE_MESH_NET_PRIMARY**
  - Relay state value.

- **ESP_BLE_MESH_RELAY_DISABLED**

- **ESP_BLE_MESH_RELAY_ENABLED**

- **ESP_BLE_MESH_RELAY_NOT_SUPPORTED**
  - Beacon state value.

- **ESP_BLE_MESH_BEACON_DISABLED**

- **ESP_BLE_MESH_BEACON_ENABLED**
  - GATT Proxy state value.
Chapter 2. API Reference

ESP_BLE_MESH_GATT_PROXY_DISABLED
ESP_BLE_MESH_GATT_PROXY_ENABLED
ESP_BLE_MESH_GATT_PROXY_NOT_SUPPORTED
Friend state value
ESP_BLE_MESH_FRIEND_DISABLED
ESP_BLE_MESH_FRIEND_ENABLED
ESP_BLE_MESH_FRIEND_NOT_SUPPORTED
Node identity state value
ESP_BLE_MESH_NODE_IDENTITY_STOPPED
ESP_BLE_MESH_NODE_IDENTITY_RUNNING
ESP_BLE_MESH_NODE_IDENTITY_NOT_SUPPORTED
Supported features
ESP_BLE_MESH_FEATURE_RELAY
ESP_BLE_MESH_FEATURE_PROXY
ESP_BLE_MESH_FEATURE_FRIEND
ESP_BLE_MESH_FEATURE_LOW_POWER
ESP_BLE_MESH_FEATURE_ALL_SUPPORTED
ESP_BLE_MESH_ADDR_IS_UNICAST(addr)
ESP_BLE_MESH_ADDR_IS_GROUP(addr)
ESP_BLE_MESH_ADDR_IS_VIRTUAL(addr)
ESP_BLE_MESH_ADDR_IS_RFU(addr)
ESP_BLE_MESH_INVALID_NODE_INDEX

ESP_BLE_MESH_TRANSMIT (count, int_ms)
Encode transmission count & interval steps.
Note For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about 90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random delay).
Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.
Parameters
  • count: Number of retransmissions (first transmission is excluded).
  • int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

ESP_BLE_MESH_GET_TRANSMIT_COUNT (transmit)
Decode transmit count from a transmit value.
Return Transmission count (actual transmissions equal to N + 1).
Parameters
  • transmit: Encoded transmit count & interval value.

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL (transmit)
Decode transmit interval from a transmit value.
Return Transmission interval in milliseconds.
Parameters
  • transmit: Encoded transmit count & interval value.

ESP_BLE_MESH_PUBLISH_TRANSMIT (count, int_ms)
Encode Publish Retransmit count & interval steps.
Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.
Parameters
• **count**: Number of retransmissions (first transmission is excluded).

• **int_ms**: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT** (transmit)

Decode Publish Retransmit count from a given value.

**Return**
Retransmission count (actual transmissions equal to N + 1).

**Parameters**
- **transmit**: Encoded Publish Retransmit count & interval value.

**ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL** (transmit)

Decode Publish Retransmit interval from a given value.

**Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)**

**Return**
Transmission interval in milliseconds.

**Parameters**
- **transmit**: Encoded Publish Retransmit count & interval value.

**ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN**

Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN**

Maximum length of string used by Output OOB authentication

**ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN**

Macros used to define message opcode

**ESP_BLE_MESH_MODEL_OP_1** (b0)

**ESP_BLE_MESH_MODEL_OP_2** (b0, b1)

**ESP_BLE_MESH_MODEL_OP_3** (b0, cid)

This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

**ESP_BLE_MESH_SIG_MODEL** (_id, _op, _pub, _user_data)

This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

**ESP_BLE_MESH_VENDOR_MODEL** (_company, _id, _op, _pub, _user_data)

**ESP_BLE_MESH_ELEMENT** (_loc, _mods, _vnd_mods)

Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

**Note**
This macro is associated with BLE_MESH_ELEM in mesh_access.h

**Parameters**
- **_loc**: Location Descriptor.
- **_mods**: Array of SIG models.
- **_vnd_mods**: Array of vendor models.

**ESP_BLE_MESH_PROV** (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

**BT_OCTET32_LEN**

**BD_ADDR_LEN**

**ESP_BLE_MESH_ADDR_TYPE_PUBLIC**

**ESP_BLE_MESH_ADDR_TYPE_RANDOM**

**ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC**

**ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM**

**ESP_BLE_MESH_MODEL_PUB_DEFINE** (_name, _msg_len, _role)

Define a model publication context.

**Parameters**
- **_name**: Variable name given to the context.
- `_msg_len`: Length of the publication message.
- `_role`: Role of the device which contains the model.

```c
ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)
```

Define a model operation context.

**Parameters**
- `_opcode`: Message opcode.
- `_min_len`: Message minimum length.

```c
ESP_BLE_MESH_MODEL_OP_END
```

Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

```c
ESP_BLE_MESH_MODEL_NONE
```

Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in `mesh_access.h`.

ADD_DEV_RM_AFTER_PROV_FLAG

Device will be removed from queue after provisioned successfully.

ADD_DEV_START_PROV_NOW_FLAG

Start provisioning device immediately.

ADD_DEV_FLUSHABLE_DEV_FLAG

Device can be removed when queue is full and new device is going to be added.

DEL_DEV_ADDR_FLAG

DEL_DEV_UUID_FLAG

PROV_DATA_NET_IDX_FLAG

PROV_DATA_FLAGS_FLAG

PROV_DATA_IV_INDEX_FLAG

ESP_BLE_MESH_HEARTBEAT_FILTER_ACCEPTLIST

ESP_BLE_MESH_HEARTBEAT_FILTER_REJECTLIST

Provisioner heartbeat filter operation.

ESP_BLE_MESH_HEARTBEAT_FILTER_ADD

ESP_BLE_MESH_HEARTBEAT_FILTER_REMOVE

ESP_BLE_MESH_MODEL_ID_CONFIG_SRV

BLE Mesh models related Model ID and Opcode definitions.

typedef uint8_t BD_ADDR[BD_ADDR_LEN]
typedef uint8_t esp_ble_mesh_bd_addr_t[BD_ADDR_LEN]
  BLE device address type.
typedef struct esp_ble_mesh_model esp_ble_mesh_model_t
typedef uint8_t esp_ble_mesh_dev_add_flag_t
typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
  esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_get_state function.
typedef uint32_t esp_ble_mesh_opcode_config_client_set_t

esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t

esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model’s request messages.

typedef uint8_t esp_ble_mesh_cfg_status_t

This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32_t esp_ble_mesh_opcode_health_client_get_t

esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_health_client_set_t

esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t

esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model’s request messages.

typedef uint32_t esp_ble_mesh_generic_message_opcode_t

esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state.Generic OnOff Message Opcode

typedef uint32_t esp_ble_mesh_sensor_message_opcode_t

esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state.Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t

esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state.Time Message Opcode

typedef uint32_t esp_ble_mesh_light_message_opcode_t

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state.Light Lightness Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t

End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

defined as:

enum esp_ble_mesh_prov_cb_event_t
Values:

ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
Initialize BLE Mesh provisioning capabilities and internal data information completion event

ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
Set the unprovisioned device name completion event

ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
Enable node provisioning functionality completion event

ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
Disable node provisioning functionality completion event

ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
Establish a BLE Mesh link event

ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
Close a BLE Mesh link event

ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
Generate Node input OOB public key event

ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
Generate Node Output Number event

ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
Generate Node Output String event

ESP_BLE_MESH_NODE_PROV_INPUT_EVT
Event requiring the user to input a number or string

ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
Provisioning done event
ESP_BLE_MESH_NODE_PROV_RESET_EVT
Provisioning reset event

ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
Node set oob public key completion event

ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT
Node input number completion event

ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT
Node input string completion event

ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT
Enable BLE Mesh Proxy Identity advertising completion event

ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT
Enable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
Disable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT
Node add NetKey locally completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT
Node add AppKey locally completion event

ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT
Node bind AppKey to model locally completion event

ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT
Provisioner enable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT
Provisioner disable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT
Provisioner receives unprovisioned device beacon event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT
Provisioner read unprovisioned device OOB public key event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT
Provisioner input value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT
Provisioner output value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT
Provisioner establish a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT
Provisioner close a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT
Provisioner provisioning done event

ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event

ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT
Provisioner start to provision an unprovisioned device completion event

ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT
Provisioner delete a device from the list, close provisioning link with the device completion event

ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event
ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT
Provisioner set net_idx/flags/iv_index used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT
Provisioner set static oob value used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT
Provisioner set unicast address of primary element completion event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT
Provisioner read unprovisioned device OOB public key completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT
Provisioner input number completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT
Provisioner input string completion event

ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT
Provisioner set node name completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT
Provisioner add local app key completion event

ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT
Provisioner update local app key completion event

ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT
Provisioner bind local model with local app key completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT
Provisioner add local network key completion event

ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT
Provisioner update local network key completion event

ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT
Provisioner store node composition data completion event

ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT
Provisioner delete node with uuid completion event

ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT
Provisioner delete node with unicast address completion event

ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT
Provisioner start to receive heartbeat message completion event

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT
Provisioner set the heartbeat filter type completion event

ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT
Provisioner set the heartbeat filter information completion event

ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT
Provisioner receive heartbeat message event

ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT
Provisioner directly erase settings completion event

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner open settings with index completion event

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT
Provisioner open settings with user id completion event

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner close settings with index completion event
ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT
Provisioner close settings with user id completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner delete settings with index completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT
Provisioner delete settings with user id completion event

ESP_BLE_MESH_SET_FAST_prov_INFO_COMP_EVT
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT
Set fast provisioning action completion event

ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT
Receive Heartbeat message event

ESP_BLE_MESH_LPn_ENABLE_COMP_EVT
Enable Low Power Node completion event

ESP_BLE_MESH_LPn_DISABLE_COMP_EVT
Disable Low Power Node completion event

ESP_BLE_MESH_LPn_POLL_COMP_EVT
Low Power Node send Friend Poll completion event

ESP_BLE_MESH_LPn_FRIENDSHIP_ESTABLISH_EVT
Low Power Node establishes friendship event

ESP_BLE_MESH_LPn_FRIENDSHIP_TERMINATE_EVT
Low Power Node terminates friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
Friend Node establishes friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
Friend Node terminates friendship event

ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
Proxy Client receives Network ID advertising packet event

ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
Proxy Client establishes connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
Proxy Client terminates connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
Proxy Client receives Proxy Filter Status event

ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
Proxy Client connect completion event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
Proxy Client disconnect completion event

ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
Proxy Client set filter type completion event

ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
Proxy Client add filter address completion event

ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
Proxy Client remove filter address completion event

ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model subscribes group address completion event
Chapter 2. API Reference

ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model unsubscribes group address completion event

ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
De-initialize BLE Mesh stack completion event

ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]
BLE Mesh server models related definitions.
This enum value is the flag of transition timer operation
Values:

ESP_BLE_MESH_SERVER_TRANS_TIMER_START
ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t
This enum value is the type of server model states
Values:

ESP_BLE_MESH_GENERIC_ONOFF_STATE
ESP_BLE_MESH_GENERIC_LEVEL_STATE
ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE
ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
ESP_BLE_MESH_LIGHT_HSL_STATE
ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t
Values:

ESP_BLE_MESH_MODEL_OPERATION_EVT
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

ESP_BLE_MESH_MODEL_SEND_COMP_EVT
User-defined models send messages completion event

ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
User-defined models publish messages completion event

ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
User-defined client models receive publish messages event

ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
Timeout event for the user-defined client models that failed to receive response from peer server models
ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
When a model is configured to publish messages periodically, this event will occur during every publish period.

ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
Server models update state value completion event

ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:
- ESP-BLE-MESH Stack Initialization
- Reading of Local Data Information
- Low Power Operation (Updating)
- Send/Publish Messages, add Local AppKey, etc.
- ESP-BLE-MESH Node/Provisioner Provisioning
- ESP-BLE-MESH GATT Proxy Server

ESP-BLE-MESH Stack Initialization

Header File
- `bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h`

Functions

```c
esp_err_t esp_ble_mesh_init(esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)
```
Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

**Note** After calling this API, the device needs to call `esp_ble_mesh_prov_enable()` to enable provisioning functionality again.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] prov`: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
- `[in] comp`: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

```c
esp_err_t esp_ble_mesh_deinit(esp_ble_mesh_deinit_param_t *param)
```
De-initialize BLE Mesh module.

**Note** This function shall be invoked after `esp_ble_mesh_client_model_deinit()`.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

Reading of Local Data Information

Header File
- `bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h`
Functions

int32_t esp_ble_mesh_get_model_publish_period(esp_ble_mesh_model_t *model)
Get the model publish period, the unit is ms.

**Return** Publish period value on success, 0 or (negative) error code from errno.h on failure.

**Parameters**

uint16_t esp_ble_mesh_get_primary_element_address(esp_ble_mesh_model_t *model)
Get the address of the primary element.

**Return** Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

uint16_t *esp_ble_mesh_is_model_subscribed_to_group(esp_ble_mesh_model_t *model, uint16_t group_addr)
Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

**Return** Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

**Parameters**
- [in] model: Pointer to the model.
- [in] group_addr: Group address.

esp_ble_mesh_elem_t *esp_ble_mesh_find_element(uint16_t element_addr)
Find the BLE Mesh element pointer via the element address.

**Return** Pointer to the element on success, or NULL on failure.

**Parameters**
- [in] element_addr: Element address.

uint8_t esp_ble_mesh_get_element_count(void)
Get the number of elements that have been registered.

**Return** Number of elements.

esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model(const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)
Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Return** Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

**Parameters**
- [in] element: Element to which the model belongs.
- [in] company_id: A 16-bit company identifier assigned by the Bluetooth SIG.

esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model(const esp_ble_mesh_elem_t *element, uint16_t model_id)
Find the SIG model with the given element and Model id.

**Return** Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

**Parameters**
- [in] element: Element to which the model belongs.

const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data(void)
Get the Composition data which has been registered.

**Return** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.
esp_err_t esp_ble_mesh_model_subscribe_group_addr(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner subscribes a group address.

Note This function shall not be invoked before node is provisioned or Provisioner is enabled.
Return ESP_OK on success or error code otherwise.

Parameters
• [in] element_addr: Unicast address of the element to which the model belongs.
• [in] group_addr: The group address to be subscribed.

esp_err_t esp_ble_mesh_model_unsubscribe_group_addr(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner unsubscribes a group address.

Note This function shall not be invoked before node is provisioned or Provisioner is enabled.
Return ESP_OK on success or error code otherwise.

Parameters
• [in] element_addr: Unicast address of the element to which the model belongs.
• [in] group_addr: The subscribed group address.

const uint8_t* esp_ble_mesh_node_get_local_net_key(uint16_t net_idx)

This function is called by Node to get the local NetKey.

Return NetKey on success, or NULL on failure.

Parameters
• [in] net_idx: NetKey index.

const uint8_t* esp_ble_mesh_node_get_local_app_key(uint16_t app_idx)

This function is called by Node to get the local AppKey.

Return AppKey on success, or NULL on failure.

Parameters
• [in] app_idx: AppKey index.

esp_err_t esp_ble_mesh_node_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)

This function is called by Node to add a local NetKey.

Note This function can only be called after the device is provisioned.
Return ESP_OK on success or error code otherwise.

Parameters
• [in] net_key: NetKey to be added.
• [in] net_idx: NetKey Index.

esp_err_t esp_ble_mesh_node_add_local_app_key(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)

This function is called by Node to add a local AppKey.

Note The net_idx must be an existing one. This function can only be called after the device is provisioned.
Return ESP_OK on success or error code otherwise.

Parameters
• [in] app_key: AppKey to be added.
• [in] net_idx: NetKey Index.
• [in] app_idx: AppKey Index.

esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)
This function is called by Node to bind AppKey to model locally.

**Note** If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `element_addr`: Node local element address
- **[in]** `company_id`: Node local company id
- **[in]** `model_id`: Node local model id
- **[in]** `app_idx`: Node local appkey index

---

**Low Power Operation (Updating)**

**Header File**
- `bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h`

**Functions**

- `esp_err_t esp_ble_mesh_lpn_enable(void)`
  Enable BLE Mesh device LPN functionality.
  
  **Note** This API enables LPN functionality. Once called, the proper Friend Request will be sent.
  
  **Return** ESP_OK on success or error code otherwise.

- `esp_err_t esp_ble_mesh_lpn_disable(bool force)`
  Disable BLE Mesh device LPN functionality.
  
  **Return** ESP_OK on success or error code otherwise.

  **Parameters**
  - **[in]** `force`: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

- `esp_err_t esp_ble_mesh_lpn_poll(void)`
  LPN tries to poll messages from the Friend Node.
  
  **Note** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.
  
  **Return** ESP_OK on success or error code otherwise.

---

**Send/Publish Messages, add Local AppKey, etc.**

**Header File**
- `bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h`

**Functions**

- `esp_err_t esp_ble_mesh_register_custom_model_callback(esp_ble_mesh_model_cb_t callback)`
  Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events generated for the user-defined models:
  - Call back the messages received by user-defined client and server models to the application layer;
  - If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
• If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
• If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

Note The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_model_msg_opcode_init(uint8_t* data, uint32_t opcode)
Add the message opcode to the beginning of the model message before sending or publishing the model message.

Note This API is only used to set the opcode of the message.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] data: Pointer to the message data.
• [in] opcode: The message opcode.

esp_err_t esp_ble_mesh_client_model_init(esp_ble_mesh_model_t *model)
Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variabled within the user_data(defined using esp_ble_mesh_client_t_) of the client model need to be initialized.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] model: BLE Mesh Client model to which the message belongs.

esp_err_t esp_ble_mesh_client_model_deinit(esp_ble_mesh_model_t *model)
De-initialize the user-defined client model.

Note This function shall be invoked before esp_ble_mesh_deinit() is called.

Return ESP_OK on success or error code otherwise.

Parameters

esp_err_t esp_ble_mesh_server_model_send_msg(esp_ble_mesh_model_t *model,
                                           esp_ble_mesh_msg_ctx_t *ctx,
                                           uint32_t opcode, uint16_t length, uint8_t *data)
Send server model messages(such as server model status messages).

Return ESP_OK on success or error code otherwise.

Parameters
• [in] model: BLE Mesh Server Model to which the message belongs.
• [in] ctx: Message context, includes keys, TTL, etc.
• [in] length: Message length (exclude the message opcode).
• [in] data: Parameters of Access Payload (exclude the message opcode) to be sent.

esp_err_t esp_ble_mesh_client_model_send_msg(esp_ble_mesh_model_t *model,
                                            esp_ble_mesh_msg_ctx_t *ctx,
                                            uint32_t opcode, uint16_t length, uint8_t *data,
                                            int32_t msg_timeout, bool need_rsp,
                                            esp_ble_mesh_dev_role_t device_role)
Send client model message (such as model get, set, etc).

Return ESP_OK on success or error code otherwise.

Parameters
• [in] model: BLE Mesh Client Model to which the message belongs.
**Chapter 2. API Reference**

- **[in] ctx**: Message context, includes keys, TTL, etc.
- **[in] opcode**: Message opcode.
- **[in] length**: Message length (exclude the message opcode).
- **[in] data**: Parameters of the Access Payload (exclude the message opcode) to be sent.
- **[in] msg_timeout**: Time to get response to the message (in milliseconds).
- **[in] need_rsp**: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- **[in] device_role**: Role of the device (Node/Provisioner) that sends the message.

```c
esp_err_t esp_ble_mesh_model_publish(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)
```

Send a model publication message.

**Note** Before calling this function, the user needs to ensure that the model publication message (esp_ble_mesh_model_pub_t::msg) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in] model**: Mesh (client) Model publishing the message.
- **[in] opcode**: Message opcode.
- **[in] length**: Message length (exclude the message opcode).
- **[in] data**: Parameters of the Access Payload (exclude the message opcode) to be sent.
- **[in] device_role**: Role of the device (node/provisioner) publishing the message of the type esp_ble_mesh_dev_role_t.

```c
esp_err_t esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model, esp_ble_mesh_server_state_type_t type, esp_ble_mesh_server_state_value_t *value)
```

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

**Note** Currently this API is used to update bound state value, not for all server model states.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in] model**: Server model which is going to update the state.
- **[in] type**: Server model state type.
- **[in] value**: Server model state value.

```c
esp_err_t esp_ble_mesh_node_local_reset()
```

Reset the provisioning procedure of the local BLE Mesh node.

**Note** All provisioning information in this node will be deleted and the node needs to be re provisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_node_name(uint16_t index, const char *name)
```

This function is called to set the node (provisioned device) name.

**Note** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in] index**: Index of the node in the node queue.
- **[in] name**: Name (end by ‘0’) to be set for the node.

```c
const char *esp_ble_mesh_provisioner_get_node_name(uint16_t index)
```

This function is called to get the node (provisioned device) name.

**Note** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return** Node name on success, or NULL on failure.

**Parameters**
- **[in] index**: Index of the node in the node queue.
Chapter 2. API Reference

uint16_t esp_ble_mesh_provisioner_get_node_index(const char *name)
This function is called to get the node (provisioned device) index.

Return  Node index on success, or an invalid value (0xFFFF) on failure.

Parameters  
• [in] name: Name of the node (end by ‘\0’).

esp_err_t esp_ble_mesh_provisioner_store_node_comp_data(uint16_t unicast_addr, uint8_t *data, uint16_t length)
This function is called to store the Composition Data of the node.

Return  ESP_OK on success or error code otherwise.

Parameters  
• [in] unicast_addr: Element address of the node
• [in] data: Pointer of Composition Data
• [in] length: Length of Composition Data

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid(const uint8_t uuid[16])
This function is called to get the provisioned node information with the node device uuid.

Return  Pointer of the node info struct or NULL on failure.

Parameters  
• [in] uuid: Device UUID of the node

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr(uint16_t unicast_addr)
This function is called to get the provisioned node information with the node unicast address.

Return  Pointer of the node info struct or NULL on failure.

Parameters  
• [in] unicast_addr: Unicast address of the node

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name(const char *name)
This function is called to get the provisioned node information with the node name.

Return  Pointer of the node info struct or NULL on failure.

Parameters  
• [in] name: Name of the node (end by ‘\0’).

uint16_t esp_ble_mesh_provisioner_get_prov_node_count(void)
This function is called by Provisioner to get provisioned node count.

Return  Number of the provisioned nodes.

const esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry(void)
This function is called by Provisioner to get the entry of the node table.

Note  After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro CONFIG_BLE_MESH_MAX_PROV_NODES to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the *(esp_ble_mesh_node_t **node) is NULL. For example: ``` const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for(int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if( node ) { ……  } ```

Return  Pointer to the start of the node table.

esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid(const uint8_t uuid[16])
This function is called to delete the provisioned node information with the node device uuid.

Return  ESP_OK on success or error code otherwise.

Parameters  
• [in] uuid: Device UUID of the node
Chapter 2. API Reference

**esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr** (uint16_t unicast_addr)

This function is called to delete the provisioned node information with the node unicast address.

**Parameters**

- [in] unicast_addr: Unicast address of the node

**Return** ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_add_local_app_key** (const uint8_t app_key[16],
uint16_t net_idx, uint16_t app_idx)

This function is called to add a local AppKey for Provisioner.

**Note**

- **app_key**: If set to NULL, app_key will be generated internally.
- **net_idx**: Should be an existing one.
- **app_idx**: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] app_key: The app key to be set for the local BLE Mesh stack.
- [in] app_idx: The app key index.

**esp_err_t esp_ble_mesh_provisioner_update_local_app_key** (const uint8_t app_key[16],
uint16_t net_idx, uint16_t app_idx)

This function is used to update a local AppKey for Provisioner.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] app_key: Value of the AppKey.
- [in] net_idx: Corresponding NetKey Index.
- [in] app_idx: The AppKey Index

**const uint8_t* esp_ble_mesh_provisioner_get_local_app_key** (uint16_t net_idx, uint16_t app_idx)

This function is called by Provisioner to get the local app key value.

**Return** App key on success, or NULL on failure.

**Parameters**

- [in] app_idx: Application key index.

**esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model** (uint16_t element_addr,
uint16_t app_idx,
uint16_t model_id,
uint16_t company_id)

This function is called by Provisioner to bind own model with proper app key.

**Note**

- **company_id**: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] element_addr: Provisioner local element address
- [in] app_idx: Provisioner local app key index
- [in] model_id: Provisioner local model id
- [in] company_id: Provisioner local company id

**esp_err_t esp_ble_mesh_provisioner_add_local_net_key** (const uint8_t net_key[16],
uint16_t net_idx)

This function is called by Provisioner to add local network key.

**Note**

- **net_key**: If set to NULL, net_key will be generated internally.
- **net_idx**: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.
Return ESP_OK on success or error code otherwise.

Parameters
- [in] net_key: The network key to be added to the Provisioner local BLE Mesh stack.

*esp_err_t* esp_ble_mesh_provisioner_update_local_net_key(const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to update a local network key.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] net_key: Value of the NetKey.

*const uint8_t* esp_ble_mesh_provisioner_get_local_net_key(uint16_t net_idx)

This function is called by Provisioner to get the local network key value.

Return Network key on success, or NULL on failure.

Parameters

*esp_err_t* esp_ble_mesh_provisioner_recv_heartbeat(bool enable)

This function is called by Provisioner to enable or disable receiving heartbeat messages.

Note If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] enable: Enable or disable receiving heartbeat messages.

*esp_err_t* esp_ble_mesh_provisioner_set_heartbeat_filter_type(uint8_t type)

This function is called by Provisioner to set the heartbeat filter type.

Note 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.
   1. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] type: Heartbeat filter type (acceptlist or rejectlist).

*esp_err_t* esp_ble_mesh_provisioner_set_heartbeat_filter_info(uint8_t op, esp_ble_mesh_heartbeat_filter_info_t *info)

This function is called by Provisioner to add or remove a heartbeat filter entry.

1. If the operation is “REMOVE”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
   * The filter entry with the same SRC or DST will be removed.

Note 1. If the operation is “ADD”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
   * If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
   * If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
   * If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] op: Add or REMOVE
• \[\text{in}\] info: Heartbeat filter entry information, including: `hb_src` - Heartbeat source address; `hb_dst` - Heartbeat destination address;

```c
esp_err_t esp_ble_mesh_provisioner_direct_erase_settings (void)
```

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

Note This function can be invoked when the mesh stack is not initialized or has been de-initialized.

Return ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_open_settings_with_index (uint8_t index)
```

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Return ESP_OK on success or error code otherwise.

Parameters
  • \[\text{in}\] index: Settings index.

```c
esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid (const char *uid)
```

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Return ESP_OK on success or error code otherwise.

Parameters
  • \[\text{in}\] uid: Settings user id.

```c
esp_err_t esp_ble_mesh_provisioner_close_settings_with_index (uint8_t index, bool erase)
```

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.

1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides being cleaned from the mesh stack.
2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) …

Return ESP_OK on success or error code otherwise.

Parameters
  • \[\text{in}\] index: Settings index.
  • \[\text{in}\] erase: Indicate if erasing mesh information.

```c
esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid (const char *uid, bool erase)
```

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.

1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides being cleaned from the mesh stack.
2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) …

Return ESP_OK on success or error code otherwise.

Parameters
  • \[\text{in}\] uid: Settings user id.
  • \[\text{in}\] erase: Indicate if erasing mesh information.
**esp_err_t** `esp_ble_mesh_provisioner_delete_settings_with_index` (uint8_t *index)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] index: Settings index.

**esp_err_t** `esp_ble_mesh_provisioner_delete_settings_with_uid` (const char *uid)

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

**Note** When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] uid: Settings user id.

**const char** * `esp_ble_mesh_provisioner_get_settings_uid` (uint8_t *index)

This function is called by Provisioner to get settings user id.

**Return** Setting user id on success or NULL on failure.

**Parameters**

- [in] index: Settings index.

**uint8_t** `esp_ble_mesh_provisioner_get_settings_index` (const char *uid)

This function is called by Provisioner to get settings index.

**Return** Settings index.

**Parameters**

- [in] uid: Settings user id.

**uint8_t** `esp_ble_mesh_provisioner_get_free_settings_count` (void)

This function is called by Provisioner to get the number of free settings user id.

**Return** Number of free settings user id.

**const uint8_t** * `esp_ble_mesh_get_fast_prov_app_key` (uint16_t net_idx, uint16_t app_idx)

This function is called to get fast provisioning application key.

**Return** Application key on success, or NULL on failure.

**Parameters**

- [in] app_idx: Application key index.

**Type Definitions**

```c
typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)
```

: event, event code of user-defined model events; param, parameters of user-defined model events

**ESP-BLE-MESH Node/Provisioner Provisioning**

**Header File**

- bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

**Functions**

**esp_err_t** `esp_ble_mesh_register_prov_callback` (esp_ble_mesh_prov_cb_t callback)

Register BLE Mesh provisioning callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

Chapter 2. API Reference

- [in] callback: Pointer to the callback function.

bool esp_ble_mesh_node_is_provisioned(void)
Check if a device has been provisioned.

Return TRUE if the device is provisioned, FALSE if the device is unprovisioned.

esp_err_t esp_ble_mesh_node_prov_enable(esp_ble_mesh_prov_bearer_t bearers)
Enable specific provisioning bearers to get the device ready for provisioning.

Note PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.
Return ESP_OK on success or error code otherwise.
Parameters
- bearers: Bit-wise OR of provisioning bearers.

esp_err_t esp_ble_mesh_node_prov_disable(esp_ble_mesh_prov_bearer_t bearers)
Disable specific provisioning bearers to make a device inaccessible for provisioning.

Return ESP_OK on success or error code otherwise.
Parameters
- bearers: Bit-wise OR of provisioning bearers.

esp_err_t esp_ble_mesh_node_set_oob_pub_key(uint8_t pub_key_x[32], uint8_t pub_key_y[32],
uint8_t private_key[32])
Unprovisioned device set own oob public key & private key pair.

Note In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends
that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.
So as an unprovisioned device, it should use this function to input the Public Key exchanged through the
out-of-band mechanism.
Return ESP_OK on success or error code otherwise.
Parameters
- [in] pub_key_x: Unprovisioned device’s Public Key X
- [in] pub_key_y: Unprovisioned device’s Public Key Y
- [in] private_key: Unprovisioned device’s Private Key

esp_err_t esp_ble_mesh_node_input_number(uint32_t number)
Provide provisioning input OOB number.

Note This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT
with ESP_BLE_MESH_ENTER_NUMBER as the action.
Return ESP_OK on success or error code otherwise.
Parameters
- [in] number: Number input by device.

esp_err_t esp_ble_mesh_node_input_string(const char *string)
Provide provisioning input OOB string.

Note This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT
with ESP_BLE_MESH_ENTER_STRING as the action.
Return ESP_OK on success or error code otherwise.
Parameters
- [in] string: String input by device.

esp_err_t esp_ble_mesh_set_unprovisioned_device_name(const char *name)
Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its
advertising data.

Note This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t
apply to PB-ADV mode.
Return ESP_OK on success or error code otherwise.
Parameters
- [in] name: Unprovisioned device name
**esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key (uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])**

Provisioner inputs unprovisioned device’s oob public key.

**Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] link_idx: The provisioning link index
- [in] pub_key_x: Unprovisioned device’s Public Key X
- [in] pub_key_y: Unprovisioned device’s Public Key Y

**esp_err_t esp_ble_mesh_provisioner_input_string (const char *string, uint8_t link_idx)**

Provide provisioning input OOB string.

This is intended to be called after the `esp_ble_mesh_prov_t prov_input_num` callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] string: String input by Provisioner.
- [in] link_idx: The provisioning link index.

**esp_err_t esp_ble_mesh_provisioner_input_number (uint32_t number, uint8_t link_idx)**

Provide provisioning input OOB number.

This is intended to be called after the `esp_ble_mesh_prov_t prov_input_num` callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] number: Number input by Provisioner.
- [in] link_idx: The provisioning link index.

**esp_err_t esp_ble_mesh_provisioner_prov_enable (esp_ble_mesh_prov_bearer_t bearers)**

Enable one or more provisioning bearers.

**Note** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

**esp_err_t esp_ble_mesh_provisioner_prov_disable (esp_ble_mesh_prov_bearer_t bearers)**

Disable one or more provisioning bearers.

**Note** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

**esp_err_t esp_ble_mesh_provisioner_add_unprov_dev (esp_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_add_flag_t flags)**

Add unprovisioned device info to the unprov_dev queue.

**Return** ESP_OK on success or error code otherwise.

**Note** 1. Currently address type only supports public address and static random address.
   1. If device UUID and/or device address as well as address type already exist in the device queue, but the bearer is different from the existing one, add operation will also be successful and it will update the provision bearer supported by the device.
   2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its un-provisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device’s advertising packets, it will start provisioning the device internally.
• In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.

3. Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.
   • If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   • Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG cannot be enabled at the same time.

**Parameters**

- **add_dev**: Pointer to a struct containing the device information
- **flags**: Flags indicate several operations on the device information
  - Remove device information from queue after device has been provisioned (BIT0)
  - Start provisioning immediately after device is added to queue (BIT1)
  - Device can be removed if device queue is full (BIT2)

```c
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t uuid[16],
                                                        esp_ble_mesh_bd_addr_t addr,
                                                        esp_ble_mesh_addr_type_t addr_type,
                                                        esp_ble_mesh_prov_bearer_t bearer, uint16_t oob_info,
                                                        uint16_t unicast_addr)
```

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

**Return** Zero on success or (negative) error code otherwise.

**Note**: 1. Currently address type only supports public address and static random address.
1. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.
2. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
3. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and “esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.

**Parameters**

- **uuid**: Device UUID of the unprovisioned device
- **addr**: Device address of the unprovisioned device
- **addr_type**: Device address type of the unprovisioned device
- **bearer**: Provisioning bearer going to be used by Provisioner
- **oob_info**: OOB info of the unprovisioned device
- **unicast_addr**: Unicast address going to be allocated for the unprovisioned device

```c
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```

Delete device from queue, and reset current provisioning link with the device.
Note If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] del_dev: Pointer to a struct containing the device information.

```c
esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t *match_val, uint8_t match_len, uint8_t offset, bool prov_after_match)
```

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] match_val: Value to be compared with the part of the device UUID.
• [in] match_len: Length of the compared match value.
• [in] offset: Offset of the device UUID to be compared (based on zero).
• [in] prov_after_match: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

```c
esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)
```

This function is called by Provisioner to set provisioning data information before starting to provision.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] prov_data_info: Pointer to a struct containing net_idx or flags or iv_index.

```c
esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t *value, uint8_t length)
```

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

Note The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

Return ESP_OK on success or error code otherwise.

Parameters

• [in] value: Pointer to the static oob value.
• [in] length: Length of the static oob value.

```c
esp_err_t esp_ble_mesh_provisioner_set_primary_elem_addr(uint16_t addr)
```

This function is called by Provisioner to set own Primary element address.

Note This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct esp_ble_mesh_prov_t will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] addr: Unicast address of the Primary element of Provisioner.

```c
esp_err_t esp_ble_mesh_set_fast_prov_info(esp_ble_mesh_fast_prov_info_t *fast_prov_info)
```

This function is called to set provisioning data information before starting fast provisioning.

Return ESP_OK on success or error code otherwise.
Parameters

• [in] fast_prov_info: Pointer to a struct containing unicast address range, net_idx, etc.

`esp_err_t esp_ble_mesh_set_fast_prov_action(esp_ble_mesh_fast_prov_action_t action)`

This function is called to start/suspend/exit fast provisioning.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] action: fast provisioning action (i.e. enter, suspend, exit).

Type Definitions

typedef void (*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event,

.esp_ble_mesh_prov_cb_param_t *param)

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the
unprovisioned device queue.

Parameters

• [in] addr: Pointer to the unprovisioned device address.
• [in] addr_type: Unprovisioned device address type.
• [in] adv_type: Adv packet type(ADV_IND or ADV_NONCONN_IND).
• [in] oob_info: OOB information of the unprovisioned device.
• [in] bearer: Adv packet received from PB-GATT or PB-ADV bearer.

ESP-BLE-MESH GATT Proxy Server

Header File

• bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h

Functions

`esp_err_t esp_ble_mesh_proxy_identity_enable(void)`

Enable advertising with Node Identity.

Note This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising
using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal
conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically
by BLE Mesh stack after the device is provisioned.

Return ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_gatt_enable(void)`

Enable BLE Mesh GATT Proxy Service.

Return ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_gatt_disable(void)`

Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy
Service.

Return ESP_OK on success or error code otherwise.
esp_err_t esp_ble_mesh_proxy_client_connect(esp_ble_mesh_bd_addr_t addr, esp_ble_mesh_addr_type_t addr_type, uint16_t net_idx)

Proxy Client creates a connection with the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] addr: Device address of the Proxy Server.
- [in] addr_type: Device address type (public or static random).

esp_err_t esp_ble_mesh_proxy_client_disconnect(uint8_t conn_handle)

Proxy Client terminates a connection with the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] conn_handle: Proxy connection handle.

esp_err_t esp_ble_mesh_proxy_client_set_filter_type(uint8_t conn_handle, uint16_t net_idx, esp_ble_mesh_proxy_filter_type_t filter_type)

Proxy Client sets the filter type of the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] conn_handle: Proxy connection handle.
- [in] net_idx: Corresponding NetKey Index.
- [in] filter_type: whitelist or blacklist.

esp_err_t esp_ble_mesh_proxy_client_add_filter_addr(uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)

Proxy Client adds address to the Proxy Server filter list.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] conn_handle: Proxy connection handle.
- [in] net_idx: Corresponding NetKey Index.
- [in] addr: Pointer to the filter address.
- [in] addr_num: Number of the filter address.

esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr(uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)

Proxy Client removes address from the Proxy Server filter list.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] conn_handle: Proxy connection handle.
- [in] net_idx: Corresponding NetKey Index.
- [in] addr: Pointer to the filter address.
- [in] addr_num: Number of the filter address.

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:
- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
Chapter 2. API Reference

- Time and Scenes Client/Server Models
- Lighting Client/Server Models

Note: Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

- bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)
```

Register BLE Mesh Config Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_register_config_server_callback(esp_ble_mesh_cfg_server_cb_t callback)
```

Register BLE Mesh Config Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                           esp_ble_mesh_cfg_client_get_state_t *get_state)
```

Get the value of Config Server Model states using the Config Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

- [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *
                                            params,
                                            esp_ble_mesh_cfg_client_set_state_t *
                                            set_state)
```

Set the value of the Configuration Server Model states using the Config Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

- [in] set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Unions

```c
union esp_ble_mesh_cfg_client_get_state_t
```

#include <esp_ble_mesh_config_model_api.h>

struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_sub
    Heartbeat Subscription

struct esp_ble_mesh_cfg_composition_data_get_t
    Parameters of Config Composition Data Get.
```
Public Members

uint8_t page
Page number of the Composition Data.

struct esp_ble_mesh_cfg_model_pub_get_t
Parameters of Config Model Publication Get.

Public Members

uint16_t element_addr
The element address

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_sig_model_sub_get_t
Parameters of Config SIG Model Subscription Get.

Public Members

uint16_t element_addr
The element address

uint16_t model_id
The model id

struct esp_ble_mesh_cfg_vnd_model_sub_get_t
Parameters of Config Vendor Model Subscription Get.

Public Members

uint16_t element_addr
The element address

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_app_key_get_t
Parameters of Config AppKey Get.

Public Members

uint16_t net_idx
The network key index

struct esp_ble_mesh_cfg_node_identity_get_t
Parameters of Config Node Identity Get.
Public Members

uint16_t net_idx
   The network key index

struct esp_ble_mesh_cfg_sig_model_app_get_t
   Parameters of Config SIG Model App Get.

Public Members

uint16_t element_addr
   The element address
uint16_t model_id
   The model id
uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_vnd_model_app_get_t
   Parameters of Config Vendor Model App Get.

Public Members

uint16_t net_idx
   The network key index

struct esp_ble_mesh_cfg_lpn_polltimeout_get_t
   Parameters of Config Low Power Node PollTimeout Get.

Public Members

uint16_t lpn_addr
   The unicast address of the Low Power node

struct esp_ble_mesh_cfg_beacon_set_t
   Parameters of Config Beacon Set.

Public Members

uint8_t beacon
   New Secure Network Beacon state

struct esp_ble_mesh_cfg_default_ttl_set_t
   Parameters of Config Default TTL Set.
Public Members

uint8_t *ttl
The default TTL state value

struct esp_ble_mesh_cfg_friend_set_t
Parameters of Config Friend Set.

Public Members

uint8_t *friend_state
The friend state value

struct esp_ble_mesh_cfg_gatt_proxy_set_t
Parameters of Config GATT Proxy Set.

Public Members

uint8_t *gatt_proxy
The GATT Proxy state value

struct esp_ble_mesh_cfg_relay_set_t
Parameters of Config Relay Set.

Public Members

uint8_t *relay
The relay value
uint8_t *relay_retransmit
The relay retransmit value

struct esp_ble_mesh_cfg_net_key_add_t
Parameters of Config NetKey Add.

Public Members

uint16_t *net_idx
The network key index
uint8_t *net_key[16]
The network key value

struct esp_ble_mesh_cfg_app_key_add_t
Parameters of Config AppKey Add.

Public Members

uint16_t *net_idx
The network key index
uint16_t *app_idx
The app key index
uint8_t *app_key[16]
The app key value

struct esp_ble_mesh_cfg_model_app_bind_t
Parameters of Config Model App Bind.
Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint16_t model_app_idx
    Index of the app key to bind with the model
```

```c
uint16_t model_id
    The model id
```

```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_model_pub_set_t
    Parameters of Config Model Publication Set.
```

Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint16_t publish_addr
    Value of the publish address
```

```c
uint16_t publish_app_idx
    Index of the application key
```

```c
bool cred_flag
    Value of the Friendship Credential Flag
```

```c
uint8_t publish_ttl
    Default TTL value for the publishing messages
```

```c
uint8_t publish_period
    Period for periodic status publishing
```

```c
uint8_t publish_retransmit
    Number of retransmissions and number of 50-millisecond steps between retransmissions
```

```c
uint16_t model_id
    The model id
```

```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_model_sub_add_t
    Parameters of Config Model Subscription Add.
```

Public Members

```c
uint16_t element_addr
    The element address
```

```c
uint16_t sub_addr
    The address to be added to the Subscription List
```

```c
uint16_t model_id
    The model id
```

```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF
```

```c
struct esp_ble_mesh_cfg_model_sub_delete_t
    Parameters of Config Model Subscription Delete.
```
Public Members

uint16_t element_addr
The element address

uint16_t sub_addr
The address to be removed from the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_overwrite_t
Parameters of Config Model Subscription Overwrite.

Public Members

uint16_t element_addr
The element address

uint16_t sub_addr
The address to be added to the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_add_t
Parameters of Config Model Subscription Virtual Address Add.

Public Members

uint16_t element_addr
The element address

uint8_t [16] label_uuid
The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_delete_t
Parameters of Config Model Subscription Virtual Address Delete.

Public Members

uint16_t element_addr
The element address

uint8_t [16] label_uuid
The Label UUID of the virtual address to be removed from the Subscription List

uint16_t model_id
The model id
struct esp_ble_mesh_cfg_model_sub_va_overwrite_t
Parameters of Config Model Subscription Virtual Address Overwrite.

Public Members

uint16_t **element_addr**
   The element address

uint8_t **label_uuid**[16]
   The Label UUID of the virtual address to be added to the Subscription List

uint16_t **model_id**
   The model id

uint16_t **company_id**
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_va_set_t
Parameters of Config Model Publication Virtual Address Set.

Public Members

uint16_t **element_addr**
   The element address

uint8_t **label_uuid**[16]
   Value of the Label UUID publish address

uint16_t **model_id**
   Index of the application key

bool **cred_flag**
   Value of the Friendship Credential Flag

uint8_t **publish_ttl**
   Default TTL value for the publishing messages

uint8_t **publish_period**
   Period for periodic status publishing

uint8_t **publish_retransmit**
   Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t **model_id**
   The model id

uint16_t **company_id**
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_all_t
Parameters of Config Model Subscription Delete All.

Public Members

uint16_t **element_addr**
   The element address

uint16_t **model_id**
   The model id
```c
uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_net_key_update_t
    Parameters of Config NetKey Update.

    Public Members

    uint16_t net_idx
        The network key index
    uint8_t net_key[16]
        The network key value

struct esp_ble_mesh_cfg_net_key_delete_t
    Parameters of Config NetKey Delete.

    Public Members

    uint16_t net_idx
        The network key index

struct esp_ble_mesh_cfg_app_key_update_t
    Parameters of Config AppKey Update.

    Public Members

    uint16_t net_idx
        The network key index
    uint16_t app_idx
        The app key index
    uint8_t app_key[16]
        The app key value

struct esp_ble_mesh_cfg_app_key_delete_t
    Parameters of Config AppKey Delete.

    Public Members

    uint16_t net_idx
        The network key index
    uint16_t app_idx
        The app key index

struct esp_ble_mesh_cfg_node_identity_set_t
    Parameters of Config Node Identity Set.

    Public Members

    uint16_t net_idx
        The network key index
    uint8_t identity
        New Node Identity state

struct esp_ble_mesh_cfg_model_app_unbind_t
    Parameters of Config Model App Unbind.
```
Public Members

uint16_t *element_addr
The element address

uint16_t *model_app_idx
Index of the app key to bind with the model

uint16_t *model_id
The model id

uint16_t *company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_kr_phase_set_t
Parameters of Config Key Refresh Phase Set.

Public Members

uint16_t *net_idx
The network key index

uint8_t *transition
New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_net_transmit_set_t
Parameters of Config Network Transmit Set.

Public Members

uint8_t *net_transmit
Network Transmit State

struct esp_ble_mesh_cfg_heartbeat_pub_set_t
Parameters of Config Model Heartbeat Publication Set.

Public Members

uint16_t *dst
Destination address for Heartbeat messages

uint8_t *count
Number of Heartbeat messages to be sent

uint8_t *period
Period for sending Heartbeat messages

uint8_t *ttl
TTL to be used when sending Heartbeat messages

uint16_t *feature
Bit field indicating features that trigger Heartbeat messages when changed

uint16_t *net_idx
NetKey Index

struct esp_ble_mesh_cfg_heartbeat_sub_set_t
Parameters of Config Model Heartbeat Subscription Set.
Public Members

uint16_t src  
Source address for Heartbeat messages

uint16_t dst  
Destination address for Heartbeat messages

uint8_t period  
Period for receiving Heartbeat messages

struct esp_ble_mesh_cfg_beacon_status_cb_t  
Parameter of Config Beacon Status

Public Members

uint8_t beacon  
Secure Network Beacon state value

struct esp_ble_mesh_cfg_comp_data_status_cb_t  
Parameters of Config Composition Data Status

Public Members

uint8_t page  
Page number of the Composition Data

struct net_buf_simple *composition_data  
Pointer to Composition Data for the identified page

struct esp_ble_mesh_cfg_default_ttl_status_cb_t  
Parameter of Config Default TTL Status

Public Members

uint8_t default_ttl  
Default TTL state value

struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t  
Parameter of Config GATT Proxy Status

Public Members

uint8_t gatt_proxy  
GATT Proxy state value

struct esp_ble_mesh_cfg_relay_status_cb_t  
Parameters of Config Relay Status

Public Members

uint8_t relay  
Relay state value

uint8_t retransmit  
Relay retransmit value (number of retransmissions and number of 10-millisecond steps between retransmissions)
struct esp_ble_mesh_cfg_model_pub_status_cb_t
Parameters of Config Model Publication Status

**Public Members**

- `uint8_t status`
  Status Code for the request message
- `uint16_t element_addr`
  Address of the element
- `uint16_t publish_addr`
  Value of the publish address
- `uint16_t app_idx`
  Index of the application key
- `bool cred_flag`
  Value of the Friendship Credential Flag
- `uint8_t ttl`
  Default TTL value for the outgoing messages
- `uint8_t period`
  Period for periodic status publishing
- `uint8_t transmit`
  Number of retransmissions and number of 50-millisecond steps between retransmissions
- `uint16_t company_id`
  Company ID
- `uint16_t model_id`
  Model ID

struct esp_ble_mesh_cfg_model_sub_status_cb_t
Parameters of Config Model Subscription Status

**Public Members**

- `uint8_t status`
  Status Code for the request message
- `uint16_t element_addr`
  Address of the element
- `uint16_t sub_addr`
  Value of the address
- `uint16_t company_id`
  Company ID
- `uint16_t model_id`
  Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
Parameters of Config NetKey Status

**Public Members**

- `uint8_t status`
  Status Code for the request message
uint16_t net_idx
Index of the NetKey

**struct esp_ble_mesh_cfg_app_key_status_cb_t**
Parameters of Config AppKey Status

### Public Members

- **uint8_t status**
  Status Code for the request message
- **uint16_t net_idx**
  Index of the NetKey
- **uint16_t app_idx**
  Index of the application key

**struct esp_ble_mesh_cfg_mod_app_status_cb_t**
Parameters of Config Model App Status

### Public Members

- **uint8_t status**
  Status Code for the request message
- **uint16_t element_addr**
  Address of the element
- **uint16_t app_idx**
  Index of the application key
- **uint16_t company_id**
  Company ID
- **uint16_t model_id**
  Model ID

**struct esp_ble_mesh_cfg_friend_status_cb_t**
Parameter of Config Friend Status

### Public Members

- **uint8_t friend_state**
  Friend state value

**struct esp_ble_mesh_cfg_hb_pub_status_cb_t**
Parameters of Config Heartbeat Publication Status

### Public Members

- **uint8_t status**
  Status Code for the request message
- **uint16_t dst**
  Destination address for Heartbeat messages
- **uint8_t count**
  Number of Heartbeat messages remaining to be sent
- **uint8_t period**
  Period for sending Heartbeat messages
Chapter 2. API Reference

uint8_t `ttl`
TTL to be used when sending Heartbeat messages

uint16_t `features`
Features that trigger Heartbeat messages when changed

uint16_t `net_idx`
Index of the NetKey

```
struct esp_ble_mesh_cfg_hb_sub_status_cb_t
Parameters of Config Heartbeat Subscription Status
```

**Public Members**

uint8_t `status`
Status Code for the request message

uint16_t `src`
Source address for Heartbeat messages

uint16_t `dst`
Destination address for Heartbeat messages

uint8_t `period`
Remaining Period for processing Heartbeat messages

uint8_t `count`
Number of Heartbeat messages received

uint8_t `min_hops`
Minimum hops when receiving Heartbeat messages

uint8_t `max_hops`
Maximum hops when receiving Heartbeat messages

```
struct esp_ble_mesh_cfg_net_trans_status_cb_t
Parameters of Config Network Transmit Status
```

**Public Members**

uint8_t `net_trans_count`
Number of transmissions for each Network PDU originating from the node

uint8_t `net_trans_step`
Maximum hops when receiving Heartbeat messages

```
struct esp_ble_mesh_cfg_model_sub_list_cb_t
Parameters of Config SIG/Vendor Subscription List
```

**Public Members**

uint8_t `status`
Status Code for the request message

uint16_t `element_addr`
Address of the element

uint16_t `company_id`
Company ID

uint16_t `model_id`
Model ID
struct net_buf_simple *sub_addr
A block of all addresses from the Subscription List

struct esp_ble_mesh_cfg_net_key_list_cb_t
Parameter of Config NetKey List

Public Members

struct net_buf_simple *net_idx
A list of NetKey Indexes known to the node

struct esp_ble_mesh_cfg_app_key_list_cb_t
Parameters of Config AppKey List

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
NetKey Index of the NetKey that the AppKeys are bound to

struct net_buf_simple *app_idx
A list of AppKey indexes that are bound to the NetKey identified by NetKeyId

struct esp_ble_mesh_cfg_node_id_status_cb_t
Parameters of Config Node Identity Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint8_t identity
Node Identity state

struct esp_ble_mesh_cfg_model_app_list_cb_t
Parameters of Config SIG/Vendor Model App List

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct net_buf_simple *app_idx
All AppKey indexes bound to the Model

struct esp_ble_mesh_cfg_kr_phase_status_cb_t
Parameters of Config Key Refresh Phase Status
Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint8_t phase
Key Refresh Phase state

struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
Parameters of Config Low Power Node PollTimeout Status

Public Members

uint16_t lpn_addr
The unicast address of the Low Power node

int32_t poll_timeout
The current value of the PollTimeout timer of the Low Power node

struct esp_ble_mesh_cfg_client_cb_param_t
Configuration Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t *params
The client common parameters

esp_ble_mesh_cfg_client_common_cb_param_t status_cb
The config status message callback values

struct esp_ble_mesh_state_change_cfg_mod_pub_set_t
Configuration Server model related context.

Public Members

uint16_t element_addr
Element Address

uint16_t pub_addr
Publish Address

uint16_t app_idx
AppKey Index

bool cred_flag
Friendship Credential Flag

uint8_t pub_ttl
Publish TTL

uint8_t pub_period
Publish Period

uint8_t pub_retransmit
Publish Retransmit

    Parameters of Config AppKey Delete

    Public Members

    uint16_t net_idx
        NetKey Index
    uint16_t app_idx
        AppKey Index

struct esp_ble_mesh_state_change_cfg_model_app_bind_t
    Parameters of Config Model App Bind

    Public Members

    uint16_t element_addr
        Element Address
    uint16_t app_idx
        AppKey Index
    uint16_t company_id
        Company ID
uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_model_app_unbind_t
Parameters of Config Model App Unbind

Public Members

uint16_t element_addr
Element Address
uint16_t app_idx
AppKey Index
uint16_t company_id
Company ID
uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
Parameters of Config Key Refresh Phase Set

Public Members

uint16_t net_idx
NetKey Index
uint8_t kr_phase
New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_server_cb_param_t
Configuration Server model callback parameters

Public Members

esp_ble_mesh_model_t *model
Pointer to the server model structure
esp_ble_mesh_msg_ctx_t ctx
Context of the received message
esp_ble_mesh_cfg_server_cb_value_t value
Value of the received configuration messages

Macros

ESP_BLE_MESH_MODEL_CFG_SRV (srv_data)
Define a new Config Server Model.

Note The Config Server Model can only be included by a Primary Element.
Return New Config Server Model instance.
Parameters
• srv_data: Pointer to a unique Config Server Model user_data.

ESP_BLE_MESH_MODEL_CFG_CLI (cli_data)
Define a new Config Client Model.

Note The Config Client Model can only be included by a Primary Element.
Return New Config Client Model instance.
Parameters
• cli_data: Pointer to a unique struct esp_ble_mesh_client_t.
**Type Definitions**

```c
typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t

Configuration Server Model context
```

```c
typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event,
                                          esp_ble_mesh_cfg_client_cb_param_t *param)
```

Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event,
                                          esp_ble_mesh_cfg_server_cb_param_t *param)
```

Configuration Server Model callback function type.

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

**Enumerations**

```c
enum esp_ble_mesh_cfg_client_cb_event_t
```

This enum value is the event of Configuration Client Model

**Values:**

- `ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT`
- `ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT`
- `ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT`
- `ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT`
- `ESP_BLE_MESH_CFG_CLIENT_EVT_MAX`

```c
enum esp_ble_mesh_cfg_server_cb_event_t
```

This enum value is the event of Configuration Server model

**Values:**

- `ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT`
- `ESP_BLE_MESH_CFG_SERVER_EVT_MAX`

**Health Client/Server Models**

**Header File**

- `bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h`

**Functions**

```c
esp_err_t esp_ble_mesh_register_generic_client_callback(esp_ble_mesh_generic_client_cb_t callback)
```

Register BLE Mesh Generic Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `callback`: Pointer to the callback function.
```c
esp_err_t esp_ble_mesh_generic_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                            esp_ble_mesh_generic_client_get_state_t *get_state)
```

Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `params`: Pointer to BLE Mesh common client parameters.
- **[in]** `get_state`: Pointer to generic get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_generic_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                                esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `params`: Pointer to BLE Mesh common client parameters.
- **[in]** `set_state`: Pointer to generic set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback(esp_ble_mesh_generic_server_cb_t *callback)
```

Register BLE Mesh Generic Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** `callback`: Pointer to the callback function.

---

**Unions**

## Structures

### struct esp_ble_mesh_gen_onoff_set_t

Bluetooth Mesh Generic Client Model Get and Set parameters structure.

- **Public Members**
  - `bool op_en`
    - Indicate if optional parameters are included
  - `uint8_t onoff`
    - Target value of Generic OnOff state
  - `uint8_t tid`
    - Transaction ID
  - `uint8_t trans_time`
    - Time to complete state transition (optional)
  - `uint8_t delay`
    - Indicate message execution delay (C.1)

### struct esp_ble_mesh_gen_level_set_t

Parameters of Generic Level Set.

- **Public Members**
  - `bool op_en`
    - Indicate if optional parameters are included
  - `int16_t level`
    - Target value of Generic Level state
uint8_t tid
    Transaction ID
uint8_t trans_time
    Time to complete state transition (optional)
uint8_t delay
    Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_delta_set_t**
Parameters of Generic Delta Set.

**Public Members**

bool op_en
    Indicate if optional parameters are included
int32_t level
    Delta change of Generic Level state
uint8_t tid
    Transaction ID
uint8_t trans_time
    Time to complete state transition (optional)
uint8_t delay
    Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_move_set_t**
Parameters of Generic Move Set.

**Public Members**

bool op_en
    Indicate if optional parameters are included
int16_t delta_level
    Delta Level step to calculate Move speed for Generic Level state
uint8_t tid
    Transaction ID
uint8_t trans_time
    Time to complete state transition (optional)
uint8_t delay
    Indicate message execution delay (C.1)

**struct esp_ble_mesh_gen_def_trans_time_set_t**
Parameter of Generic Default Transition Time Set.

**Public Members**

uint8_t trans_time
    The value of the Generic Default Transition Time state

**struct esp_ble_mesh_gen_onpowerup_set_t**
Parameter of Generic OnPowerUp Set.
Chapter 2. API Reference

Public Members

uint8_t onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_set_t
Parameters of Generic Power Level Set.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t power
Target value of Generic Power Actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_power_default_set_t
Parameter of Generic Power Default Set.

Public Members

uint16_t power
The value of the Generic Power Default state

struct esp_ble_mesh_gen_power_range_set_t
Parameters of Generic Power Range Set.

Public Members

uint16_t range_min
Value of Range Min field of Generic Power Range state

uint16_t range_max
Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_loc_global_set_t
Parameters of Generic Location Global Set.

Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

struct esp_ble_mesh_gen_loc_local_set_t
Parameters of Generic Location Local Set.
Public Members

`int16_t local_north`
Local Coordinates (North)

`int16_t local_east`
Local Coordinates (East)

`int16_t local_altitude`
Local Altitude

`uint8_t floor_number`
Floor Number

`uint16_t uncertainty`
Uncertainty

`struct esp_ble_mesh_gen_user_property_get_t`
Parameter of Generic User Property Get.

Public Members

`uint16_t property_id`
Property ID identifying a Generic User Property

`struct esp_ble_mesh_gen_user_property_set_t`
Parameters of Generic User Property Set.

Public Members

`uint16_t property_id`
Property ID identifying a Generic User Property

`struct net_buf_simple *property_value`
Raw value for the User Property

`struct esp_ble_mesh_gen_admin_property_get_t`
Parameter of Generic Admin Property Get.

Public Members

`uint16_t property_id`
Property ID identifying a Generic Admin Property

`uint8_t user_access`
Enumeration indicating user access

`struct net_buf_simple *property_value`
Raw value for the Admin Property

`struct esp_ble_mesh_gen_manufacturer_property_get_t`
Parameter of Generic Manufacturer Property Get.
Public Members

uint16_t property_id
   Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_gen_manufacturer_property_set_t
   Parameters of Generic Manufacturer Property Set.

Public Members

uint16_t property_id
   Property ID identifying a Generic Manufacturer Property

uint8_t user_access
   Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
   Parameter of Generic Client Properties Get.

Public Members

uint16_t property_id
   A starting Client Property ID present within an element

struct esp_ble_mesh_gen_onoff_status_cb_t
   Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.

Parameters of Generic OnOff Status.

Public Members

bool op_en
   Indicate if optional parameters are included

uint8_t present_onoff
   Current value of Generic OnOff state

uint8_t target_onoff
   Target value of Generic OnOff state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_gen_level_status_cb_t
   Parameters of Generic Level Status.

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t present_level
   Current value of Generic Level state

int16_t target_level
   Target value of the Generic Level state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_gen_def_trans_time_status_cb_t
   Parameter of Generic Default Transition Time Status.
Public Members

`uint8_t trans_time`

The value of the Generic Default Transition Time state

`struct esp_ble_mesh_gen_onpowerup_status_cb_t`

Public Members

`uint8_t onpowerup`

The value of the Generic OnPowerUp state

`struct esp_ble_mesh_gen_power_level_status_cb_t`

Parameters of Generic Power Level Status.

Public Members

`bool op_en`

Indicate if optional parameters are included

`uint16_t present_power`

Current value of Generic Power Actual state

`uint16_t target_power`

Target value of Generic Power Actual state (optional)

`uint8_t remain_time`

Time to complete state transition (C.1)

`struct esp_ble_mesh_gen_power_last_status_cb_t`

Parameter of Generic Power Last Status.

Public Members

`uint16_t power`

The value of the Generic Power Last state

`struct esp_ble_mesh_gen_power_default_status_cb_t`

Parameter of Generic Power Default Status.

Public Members

`uint16_t power`

The value of the Generic Default Last state

`struct esp_ble_mesh_gen_power_range_status_cb_t`

Parameters of Generic Power Range Status.

Public Members

`uint8_t status_code`

Status Code for the request message

`uint16_t range_min`

Value of Range Min field of Generic Power Range state

`uint16_t range_max`

Value of Range Max field of Generic Power Range state
struct esp_ble_mesh_gen_battery_status_cb_t
Parameters of Generic Battery Status.

Public Members

uint32_t battery_level : 8
Value of Generic Battery Level state

uint32_t time_to_discharge : 24
Value of Generic Battery Time to Discharge state

uint32_t time_to_charge : 24
Value of Generic Battery Time to Charge state

uint32_t flags : 8
Value of Generic Battery Flags state

struct esp_ble_mesh_gen_loc_global_status_cb_t
Parameters of Generic Location Global Status.

Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

struct esp_ble_mesh_gen_loc_local_status_cb_t
Parameters of Generic Location Local Status.

Public Members

int16_t local_north
Local Coordinates (North)

int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

struct esp_ble_mesh_gen_user_properties_status_cb_t
Parameter of Generic User Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N User Property IDs

struct esp_ble_mesh_gen_user_property_status_cb_t
Parameters of Generic User Property Status.
Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic User Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the User Property (C.1)

struct esp_ble_mesh_gen_admin_properties_status_cb_t
Parameter of Generic Admin Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
Parameters of Generic Admin Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access (optional)
struct net_buf_simple *property_value
   Raw value for the Manufacturer Property (C.1)

struct esp_ble_mesh_gen_client_properties_status_cb_t
   Parameter of Generic Client Properties Status.

Public Members

struct net_buf_simple *property_ids
   Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_cb_param_t
   Generic Client Model callback parameters

Public Members

int error_code
   Appropriate error code

esp_ble_mesh_client_common_param_t *params
   The client common parameters.

esp_ble_mesh_gen_client_status_cb_t status_cb
   The generic status message callback values

struct esp_ble_mesh_gen_onoff_state_t
   Parameters of Generic OnOff state

Public Members

uint8_t onoff
   The present value of the Generic OnOff state

uint8_t target_onoff
   The target value of the Generic OnOff state

struct esp_ble_mesh_gen_onoff_srv_t
   User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
   Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t state
   Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t last
   Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
   Parameters of state transition

struct esp_ble_mesh_gen_level_state_t
   Parameters of Generic Level state
Chapter 2. API Reference

Public Members

int16_t level
The present value of the Generic Level state

int16_t target_level
The target value of the Generic Level state

int16_t last_level
When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t last_delta
The last delta change of the Generic Level state

bool move_start
Indicate if the transition of the Generic Level state has been started

bool positive
Indicate if the transition is positive or negative

struct esp_ble_mesh_gen_level_srv_t
User data of Generic Level Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_level_state_t state
Parameters of the Generic Level state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

int32_t tt_delta_level
Delta change value of level state transition

struct esp_ble_mesh_gen_def_trans_time_state_t
Parameter of Generic Default Transition Time state

Public Members

uint8_t trans_time
The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_def_trans_time_srv_t
User data of Generic Default Transition Time Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Default Transition Time Server Model. Initialized internally.
Chapter 2. API Reference

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
   Response control of the server model received messages

esp_ble_mesh_gen_def_trans_time_state_t *state
   Parameters of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_state_t
   Parameter of Generic OnPowerUp state

Public Members

uint8_t onpowerup
   The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_onoff_srv_t
   User data of Generic Power OnOff Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic Power OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp ctrl
   Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t *state
   Parameters of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_onoff_setup_srv_t
   User data of Generic Power OnOff Setup Server Model

Public Members

esp_ble_mesh_model_t *model
   Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp ctrl
   Response control of the server model received messages

esp_ble_mesh_gen_onpowerup_state_t *state
   Parameters of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_state_t
   Parameters of Generic Power Level state

Public Members

uint16_t power_actual
   The present value of the Generic Power Actual state

uint16_t target_power_actual
   The target value of the Generic Power Actual state

uint16_t power_last
   The value of the Generic Power Last state

uint16_t power_default
   The value of the Generic Power Default state

uint8_t status_code
   The status code of setting Generic Power Range state
```
Chapter 2. API Reference

uint16_t power_range_min
The minimum value of the Generic Power Range state

uint16_t power_range_max
The maximum value of the Generic Power Range state

struct esp_ble_mesh_gen_power_level_srv_t
User data of Generic Power Level Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_level
Delta change value of level state transition

struct esp_ble_mesh_gen_power_level_setup_srv_t
User data of Generic Power Level Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state

struct esp_ble_mesh_gen_battery_srv_t
User data of Generic Battery Server Model

Public Members

uint32_t battery_level : 8
The value of the Generic Battery Level state

uint32_t time_to_discharge : 24
The value of the Generic Battery Time to Discharge state

uint32_t time_to_charge : 24
The value of the Generic Battery Time to Charge state

uint32_t battery_flags : 8
The value of the Generic Battery Flags state

struct esp_ble_mesh_gen_battery_srv_t
User data of Generic Battery Server Model
Public Members

*esp_ble_mesh_model_t* \*model
   Pointer to the Generic Battery Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* \*rsp_ctrl
   Response control of the server model received messages

*esp_ble_mesh_gen_battery_state_t* \*state
   Parameters of the Generic Battery state

*struct esp_ble_mesh_gen_location_state_t*
   Parameters of Generic Location state

Public Members

int32_t \_global_latitude
   The value of the Global Latitude field

int32_t \_global_longitude
   The value of the Global Longitude field

int16_t \_global_altitude
   The value of the Global Altitude field

int16_t \_local_north
   The value of the Local North field

int16_t \_local_east
   The value of the Local East field

int16_t \_local_altitude
   The value of the Local Altitude field

uint8_t \_floor_number
   The value of the Floor Number field

uint16_t \_uncertainty
   The value of the Uncertainty field

*struct esp_ble_mesh_gen_location_srv_t*
   User data of Generic Location Server Model

Public Members

*esp_ble_mesh_model_t* \*model
   Pointer to the Generic Location Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* \*rsp_ctrl
   Response control of the server model received messages

*esp_ble_mesh_gen_location_state_t* \*state
   Parameters of the Generic Location state

*struct esp_ble_mesh_gen_location_setup_srv_t*
   User data of Generic Location Setup Server Model

Public Members

*esp_ble_mesh_model_t* \*model
   Pointer to the Generic Location Setup Server Model. Initialized internally.
**Chapter 2. API Reference**

`esp_ble_mesh_server_rsp_ctrl_t`  
Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`  
Parameters of the Generic Location state

**struct esp_ble_mesh_generic_property_t**  
Parameters of Generic Property states

### Public Members

- `uint16_t id`  
The value of User/Admin/Manufacturer Property ID
- `uint8_t user_access`  
The value of User Access field
- `uint8_t admin_access`  
The value of Admin Access field
- `uint8_t manu_access`  
The value of Manufacturer Access field
- `struct net_buf_simple *val`  
The value of User/Admin/Manufacturer Property

**struct esp_ble_mesh_gen_user_prop_srv_t**  
User data of Generic User Property Server Model

### Public Members

- `esp_ble_mesh_model_t *model`  
Pointer to the Generic User Property Server Model. Initialized internally.
- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`  
Response control of the server model received messages
- `uint8_t property_count`  
Generic User Property count
- `esp_ble_mesh_generic_property_t *properties`  
Parameters of the Generic User Property state

**struct esp_ble_mesh_gen_admin_prop_srv_t**  
User data of Generic Admin Property Server Model

### Public Members

- `esp_ble_mesh_model_t *model`  
Pointer to the Generic Admin Property Server Model. Initialized internally.
- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`  
Response control of the server model received messages
- `uint8_t property_count`  
Generic Admin Property count
- `esp_ble_mesh_generic_property_t *properties`  
Parameters of the Generic Admin Property state

**struct esp_ble_mesh_gen_manu_prop_srv_t**  
User data of Generic Manufacturer Property Server Model

### Public Members

- `esp_ble_mesh_model_t *model`  
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.
Public Members

*esp_ble_mesh_model_t* `model`
Point to the Generic Manufacturer Property Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages

uint8_t `property_count`
Generic Manufacturer Property count

*esp_ble_mesh_generic_property_t* `properties`
Parameters of the Generic Manufacturer Property state

Public Members

*esp_ble_mesh_model_t* `model`
Pointer to the Generic Client Property Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages

uint8_t `id_count`
Generic Client Property ID count

uint16_t `property_ids`
Parameters of the Generic Client Property state

Public Members

uint8_t `onoff`
The value of Generic OnOff state

Public Members

int16_t `level`
The value of Generic Level state

Public Members

int16_t `level`
The value of Generic Level state

Public Members

int16_t `level`
The value of Generic Level state

Public Members

struct esp_ble_mesh_gen_client_prop_srv_t
User data of Generic Client Property Server Model
Public Members

```c
int16_t level
The value of Generic Level state
```

```c
struct esp_ble_mesh_state_change_gen_def_trans_time_set_t
Parameter of Generic Default Transition Time Set state change event
```

Public Members

```c
uint8_t trans_time
The value of Generic Default Transition Time state
```

```c
struct esp_ble_mesh_state_change_gen_onpowerup_set_t
Parameter of Generic OnPowerUp Set state change event
```

Public Members

```c
uint8_t onpowerup
The value of Generic OnPowerUp state
```

```c
struct esp_ble_mesh_state_change_gen_power_level_set_t
Parameter of Generic Power Level Set state change event
```

Public Members

```c
uint16_t power
The value of Generic Power Actual state
```

```c
struct esp_ble_mesh_state_change_gen_power_default_set_t
Parameter of Generic Power Default Set state change event
```

Public Members

```c
uint16_t power
The value of Generic Power Default state
```

```c
struct esp_ble_mesh_state_change_gen_power_range_set_t
Parameters of Generic Power Range Set state change event
```

Public Members

```c
uint16_t range_min
The minimum value of Generic Power Range state
```

```c
uint16_t range_max
The maximum value of Generic Power Range state
```

```c
struct esp_ble_mesh_state_change_gen_loc_global_set_t
Parameters of Generic Location Global Set state change event
```

Public Members

```c
int32_t latitude
The Global Latitude value of Generic Location state
```
Chapter 2. API Reference

int32_t longitude
The Global Longitude value of Generic Location state

int16_t altitude
The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
Parameters of Generic Location Local Set state change event

Public Members

int16_t north
The Local North value of Generic Location state

int16_t east
The Local East value of Generic Location state

int16_t altitude
The Local Altitude value of Generic Location state

uint8_t floor_number
The Floor Number value of Generic Location state

uint16_t uncertainty
The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
Parameters of Generic User Property Set state change event

Public Members

uint16_t id
The property id of Generic User Property state

struct net_buf_simple *value
The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
The property id of Generic Admin Property state

uint8_t access
The property access of Generic Admin Property state

struct net_buf_simple *value
The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t id
The property id of Generic Manufacturer Property state

uint8_t access
The property value of Generic Manufacturer Property state
struct esp_ble_mesh_server_recv_gen_user_property_get_t
Context of the received Generic User Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
Context of the received Generic Manufacturer Property message

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_server_recv_gen_client_properties_get_t
Context of the received Generic Client Properties Get message

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_server_recv_gen_onoff_set_t
Context of the received Generic OnOff Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t onoff
Target value of Generic OnOff state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_level_set_t
Context of the received Generic Level Set message

Public Members
Chapter 2. API Reference

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t level
   Target value of Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_delta_set_t
   Context of the received Generic Delta Set message

Public Members

bool op_en
   Indicate if optional parameters are included

int32_t delta_level
   Delta change of Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_move_set_t
   Context of the received Generic Move Set message

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t delta_level
   Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t
   Context of the received Generic Default Transition Time Set message
Chapter 2. API Reference

Public Members

uint8_t trans_time
The value of the Generic Default Transition Time state

struct esp_ble_mesh_server_recv_gen_onpowerup_set_t
Context of the received Generic OnPowerUp Set message

Public Members

uint8_t onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_server_recv_gen_power_level_set_t
Context of the received Generic Power Level Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t power
Target value of Generic Power Actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_power_default_set_t
Context of the received Generic Power Default Set message

Public Members

uint16_t power
The value of the Generic Power Default state

struct esp_ble_mesh_server_recv_gen_power_range_set_t
Context of the received Generic Power Range Set message

Public Members

uint16_t range_min
Value of Range Min field of Generic Power Range state

uint16_t range_max
Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_server_recv_gen_loc_global_set_t
Context of the received Generic Location Global Set message
Chapter 2. API Reference

**Public Members**

```c
int32_t global_latitude
Global Coordinates (Latitude)
```

```c
int32_t global_longitude
Global Coordinates (Longitude)
```

```c
int16_t global_altitude
Global Altitude
```

```c
struct esp_ble_mesh_server_recv_gen_loc_local_set_t
Context of the received Generic Location Local Set message
```

**Public Members**

```c
int16_t local_north
Local Coordinates (North)
```

```c
int16_t local_east
Local Coordinates (East)
```

```c
int16_t local_altitude
Local Altitude
```

```c
uint8_t floor_number
Floor Number
```

```c
uint16_t uncertainty
Uncertainty
```

```c
struct esp_ble_mesh_server_recv_gen_user_property_set_t
Context of the received Generic User Property Set message
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic User Property
```

```c
struct net_buf_simple *property_value
Raw value for the User Property
```

```c
struct esp_ble_mesh_server_recv_gen_admin_property_set_t
Context of the received Generic Admin Property Set message
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic Admin Property
```

```c
uint8_t user_access
Enumeration indicating user access
```

```c
struct net_buf_simple *property_value
Raw value for the Admin Property
```

```c
struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t
Context of the received Generic Manufacturer Property Set message
```
Public Members

uint16_t **property_id**
Property ID identifying a Generic Manufacturer Property

uint8_t **user_access**
Enumeration indicating user access

```c
struct esp_ble_mesh_generic_server_cb_param_t
Generic Server Model callback parameters
```

Public Members

```c
esp_ble_mesh_model_t *model
Pointer to Generic Server Models
```

```c
esp_ble_mesh_msg_ctx_t *ctx
Context of the received messages
```

```c
esp_ble_mesh_generic_server_cb_value_t *value
Value of the received Generic Messages
```

Macros

**ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI** (cli_pub, cli_data)
Define a new Generic OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

**Return** New Generic OnOff Client Model instance.

**Parameters**

- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI** (cli_pub, cli_data)
Define a new Generic Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

**Return** New Generic Level Client Model instance.

**Parameters**

- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI** (cli_pub, cli_data)
Define a new Generic Default Transition Time Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

**Return** New Generic Default Transition Time Client Model instance.

**Parameters**

- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI** (cli_pub, cli_data)
Define a new Generic Power OnOff Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

**Return** New Generic Power OnOff Client Model instance.

**Parameters**

- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.
**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI** (cli_pub, cli_data)
Define a new Generic Power Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

**Return** New Generic Power Level Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI** (cli_pub, cli_data)
Define a new Generic Battery Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

**Return** New Generic Battery Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI** (cli_pub, cli_data)
Define a new Generic Location Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI** (cli_pub, cli_data)
Define a new Generic Property Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

**Return** New Generic Property Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV** (srv_pub, srv_data)
Generic Server Models related context.

Define a new Generic OnOff Server Model.

**Note** 1. The Generic OnOff Server Model is a root model.
1. This model shall support model publication and model subscription.

**Return** New Generic OnOff Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV** (srv_pub, srv_data)
Define a new Generic Level Server Model.

**Note** 1. The Generic Level Server Model is a root model.
1. This model shall support model publication and model subscription.

**Return** New Generic Level Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV** (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.
Chapter 2. API Reference

Note 1. The Generic Default Transition Time Server Model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic Default Transition Time Server Model instance.

Parameters
  • srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  • srv_data: Pointer to the unique struct `esp_ble_mesh_gen_def_trans_time_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

Note 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
1. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.
2. This model shall support model publication and model subscription.

Parameters
  • srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  • srv_data: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

1. This model shall support model subscription.

Parameters
  • srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  • srv_data: Pointer to the unique struct `esp_ble_mesh_gen_power_onoff_setup_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Power Level Server Model.

Note 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

Return New Generic Power Level Server Model instance.

Parameters
  • srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  • srv_data: Pointer to the unique struct `esp_ble_mesh_gen_power_level_srv_t`.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power Level Setup Server Model.

1. This model shall support model subscription.

Return New Generic Power Level Setup Server Model instance.

Parameters
  • srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  • srv_data: Pointer to the unique struct `esp_ble_mesh_gen_power_level_setup_srv_t`.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)
Define a new Generic Battery Server Model.

Note 1. The Generic Battery Server Model is a root model.
1. This model shall support model publication and model subscription.
2. The model may be used to represent an element that is powered by a battery.

Return New Generic Battery Server Model instance.

Parameters
Chapter 2. API Reference

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV (srv_pub, srv_data)**

Define a new Generic Location Server Model.

**Note**
1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model may be used to represent an element that knows its location (global or local).

**Return** New Generic Location Server Model instance.

**Parameters**

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV (srv_pub, srv_data)**

Define a new Generic Location Setup Server Model.

**Note**
1. The Generic Location Setup Server model extends the Generic Location Server model.
   1. This model shall support model subscription.

**Return** New Generic Location Setup Server Model instance.

**Parameters**

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)**

Define a new Generic User Property Server Model.

**Note**
1. The Generic User Property Server model is a root model.
   1. This model shall support model publication and model subscription.

**Return** New Generic User Property Server Model instance.

**Parameters**

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)**

Define a new Generic Admin Property Server Model.

**Note**
1. The Generic Admin Property Server model extends the Generic User Property Server model.
   1. This model shall support model publication and model subscription.

**Return** New Generic Admin Property Server Model instance.

**Parameters**

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)**

Define a new Generic Manufacturer Property Server Model.

**Note**
1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
   1. This model shall support model publication and model subscription.

**Return** New Generic Manufacturer Property Server Model instance.

**Parameters**

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)**

Define a new Generic Client Property Server Model.

**Note**
1. The Generic Client Property Server model is a root model.
   1. This model shall support model publication and model subscription.

**Return** New Generic Client Property Server Model instance.

**Parameters**

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`. 
Type Definitions

```c
typedef void (*esp_ble_mesh_generic_client_cb_t)(
    esp_ble_mesh_generic_client_cb_event_t event,
    esp_ble_mesh_generic_client_cb_param_t *param)
```

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_generic_server_cb_t)(
    esp_ble_mesh_generic_server_cb_event_t event,
    esp_ble_mesh_generic_server_cb_param_t *param)
```

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

Enumerations

```c
class esp_ble_mesh_generic_client_cb_event_t
```

This enum value is the event of Generic Client Model

**Values:**
- `ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT`
- `ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT`
- `ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT`
- `ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT`
- `ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX`

```c
class esp_ble_mesh_gen_user_prop_access_t
```

This enum value is the access value of Generic User Property

**Values:**
- `ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT`
- `ESP_BLE_MESH_GEN_USER_ACCESS_READ`
- `ESP_BLE_MESH_GEN_USER_ACCESS_WRITE`
- `ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE`

```c
class esp_ble_mesh_gen_admin_prop_access_t
```

This enum value is the access value of Generic Admin Property

**Values:**
- `ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP`
- `ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ`
- `ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE`
- `ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE`

```c
class esp_ble_mesh_gen_manu_prop_access_t
```

This enum value is the access value of Generic Manufacturer Property

**Values:**
ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP
ESP_BLE_MESH_GEN_MANU_ACCESS_READ

enum esp_ble_mesh_generic_server_cb_event_t
This enum value is the event of Generic Server Model

Values:

ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback
to the application layer when Generic Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback
to the application layer when Generic Set/Set Unack messages are received.

ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Generic Get messages are received.

ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Generic Set/Set Unack messages are received.

ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX

Generic Client/Server Models

Header File

- bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

Functions

esp_err_t esp_ble_mesh_register_health_client_callback(esp_ble_mesh_health_client_cb_t callback)
Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.
Return ESP_OK on success or error code otherwise.
Parameters

- [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_register_health_server_callback(esp_ble_mesh_health_server_cb_t callback)
Register BLE Mesh Health Server Model callback.
Return ESP_OK on success or error code otherwise.
Parameters

- [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_health_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_get_state_t *get_state)
This function is called to get the Health Server states using the Health Client Model get messages.
Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_opcode_health_client_get_tinesp_ble_mesh_defs.h
Return ESP_OK on success or error code otherwise.
Parameters

- [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside.
  Shall not be set to NULL.
**esp_err_t esp_ble_mesh_health_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_set_state_t *set_state)**

This function is called to set the Health Server states using the Health Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** params: Pointer to BLE Mesh common client parameters.
- **[in]** set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**esp_err_t esp_ble_mesh_health_server_fault_update (esp_ble_mesh_elem_t *element)**

This function is called by the Health Server Model to update the context of its Health Current status.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** element: The element to which the Health Server Model belongs.

**Unions**

```c
union esp_ble_mesh_health_client_get_state_t
    #include<esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET
    ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET
    the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.
```

**Public Members**

```c
esp_ble_mesh_health_fault_get_t fault_get
    For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.
```

```c
union esp_ble_mesh_health_client_set_state_t
    #include<esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR
    ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT
    ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD
    ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK ESP_BLE_MESH_MODEL_OP_ATTENTION_SET
    ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK the set_state parameter in the
    esp_ble_mesh_health_client_set_state function should not be set to NULL.
```

**Public Members**

```c
esp_ble_mesh_health_attention_set_t attention_set
    For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.
```

```c
esp_ble_mesh_health_period_set_t period_set
    For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.
```

```c
esp_ble_mesh_health_fault_test_t fault_test
    For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.
```

```c
esp_ble_mesh_health_fault_clear_t fault_clear
    For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.
```

```c
union esp_ble_mesh_health_client_common_cb_param_t
    #include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.
```
Chapter 2. API Reference

Public Members

```c
esp_ble_mesh_health_current_status_cb_t current_status
The health current status value
```

```c
esp_ble_mesh_health_fault_status_cb_t fault_status
The health fault status value
```

```c
esp_ble_mesh_health_period_status_cb_t period_status
The health period status value
```

```c
esp_ble_mesh_health_attention_status_cb_t attention_status
The health attention status value
```

```c
union esp_ble_mesh_health_server_cb_param_t
#include <esp_ble_mesh_health_model_api.h> Health Server Model callback parameters union.
```

Public Members

```c
esp_ble_mesh_health_fault_update_comp_cb_t fault_update_comp
ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
```

```c
esp_ble_mesh_health_fault_clear_cb_t fault_clear
ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
```

```c
esp_ble_mesh_health_fault_test_cb_t fault_test
ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
```

```c
esp_ble_mesh_health_attention_on_cb_t attention_on
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
```

```c
esp_ble_mesh_health_attention_off_cb_t attention_off
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
```

Structures

```c
struct esp_ble_mesh_health_srv_cb_t
ESP BLE Mesh Health Server Callback
```

Public Members

```c
esp_ble_mesh_cb_t fault_clear
Clear health registered faults. Initialized by the stack.
```

```c
esp_ble_mesh_cb_t fault_test
Run a specific health test. Initialized by the stack.
```

```c
esp_ble_mesh_cb_t attention_on
Health attention on callback. Initialized by the stack.
```

```c
esp_ble_mesh_cb_t attention_off
Health attention off callback. Initialized by the stack.
```

```c
struct esp_ble_mesh_health_test_t
ESP BLE Mesh Health Server test Context
```

Public Members

```c
uint8_t id_count
Number of Health self-test ID
```

```c
const uint8_t * test_ids
Array of Health self-test IDs
```

uint16_t company_id
Bluetooth assigned 16-bit Company ID
```

```c
struct esp_ble_mesh_health_attention_on_cb_t
Parameter of Health Attention On event
```
Public Members

```c
esp_ble_mesh_model_t *model
```
Pointer to the Health Server Model

```c
uint8_t time
```
Duration of attention timer on (in seconds)

```c
struct esp_ble_mesh_health_attention_off_cb_t
```
Parameter of Health Attention Off event

Public Members

```c
esp_ble_mesh_model_t *model
```
Pointer to the Health Server Model

Macros

```
ESP_BLE_MESH_MODEL_HEALTH_SRV (srv, pub)
```
Define a new Health Server Model.

**Note** The Health Server Model can only be included by a Primary Element.

**Return** New Health Server Model instance.

**Parameters**

- `srv`: Pointer to the unique struct `esp_ble_mesh_health_srv_t`.
- `pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

```
ESP_BLE_MESH_MODEL_HEALTH_CLI (cli_data)
```
Define a new Health Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Health Client Model.

**Return** New Health Client Model instance.

**Parameters**

- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```
ESP_BLE_MESH_HEALTH_PUB_DEFINE (_name, _max, _role)
```
A helper to define a health publication context

**Parameters**

- `_name`: Name given to the publication context variable.
- `_max`: Maximum number of faults the element can have.
- `_role`: Role of the device which contains the model.

```
ESP_BLE_MESH_HEALTH_STANDARD_TEST
```
SIG identifier of Health Fault Test. 0x01~0xFF: Vendor Specific Test.

```
ESP_BLE_MESH_NO_FAULT
```
Fault values of Health Fault Test. 0x33~0x7F: Reserved for Future Use. 0x80~0xFF: Vendor Specific Warning/Error.

Type Definitions

typedef void (*esp_ble_mesh_health_client_cb_t)(
    esp_ble_mesh_health_client_cb_event_t event,
    esp_ble_mesh_health_client_cb_param_t *param)

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_health_server_cb_t)(
    esp_ble_mesh_health_server_cb_event_t event,
    esp_ble_mesh_health_server_cb_param_t *param)

Health Server Model callback function type.

Parameters
• event: Event type
• param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_health_client_cb_event_t
This enum value is the event of Health Client Model

Values:
ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX

enum esp_ble_mesh_health_server_cb_event_t
This enum value is the event of Health Server Model

Values:
ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

Sensor Client/Server Models

Header File
• bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h
Functions

```c
esp_err_t esp_ble_mesh_register_light_client_callback(esp_ble_mesh_light_client_cb_t callback)
```

Register BLE Mesh Light Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `[in] callback`: pointer to the callback function.

```c
esp_err_t esp_ble_mesh_light_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                         esp_ble_mesh_light_client_get_state_t *get_state)
```

Get the value of Light Server Model states using the Light Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `[in] get_state`: Pointer of light get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_light_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                           esp_ble_mesh_light_client_set_state_t *set_state)
```

Set the value of Light Server Model states using the Light Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `[in] set_state`: Pointer of light set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_lighting_server_callback(esp_ble_mesh_lighting_server_cb_t callback)
```

Register BLE Mesh Lighting Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- `[in] callback`: Pointer to the callback function.

Unions

```c
union esp_ble_mesh_light_client_get_state_t
#include <esp_ble_mesh_lighting_model_api.h>
```

Lighting Client Model get message union.

**Public Members**

```c
esp_ble_mesh_light_lc_property_get_t lc_property_get
```

For ESP_BLE_MESH_MODEL_OP_LIGHT_LC_PROPERTY_GET

```c

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light lightness linear state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lightness_default_set_t
   Parameter of Light Lightness Default Set

Public Members

uint16_t lightness
   The value of the Light Lightness Default state

struct esp_ble_mesh_light_lightness_range_set_t
   Parameters of Light Lightness Range Set

Public Members

uint16_t range_min
   Value of range min field of light lightness range state

uint16_t range_max
   Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_set_t
   Parameters of Light CTL Set

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t ctl_lightness
   Target value of light ctl lightness state

uint16_t ctl_temperature
   Target value of light ctl temperature state

int16_t ctl_delta_uv
   Target value of light ctl delta UV state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)
struct esp_ble_mesh_light_ctl_temperature_set_t
Parameters of Light CTL Temperature Set

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t ctl_temperature
Target value of light ctl temperature state

int16_t ctl_delta_uv
Target value of light ctl delta UV state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range Set

Public Members

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_light_ctl_default_set_t
Parameters of Light CTL Default Set

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t temperature
Value of light temperature default state

int16_t delta_uv
Value of light delta UV default state

struct esp_ble_mesh_light_hsl_set_t
Parameters of Light HSL Set

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t hsl_lightness
Target value of light hsl lightness state

uint16_t hsl_hue
Target value of light hsl hue state
### Public Members

- **bool op_en**
  - Indicate if optional parameters are included

- **uint16_t hue**
  - Target value of light hsl hue state

- **uint8_t tid**
  - Transaction ID

- **uint8_t trans_time**
  - Time to complete state transition (optional)

- **uint8_t delay**
  - Indicate message execution delay (C.1)

---

### Public Members

- **uint16_t lightness**
  - Value of light lightness default state

- **uint16_t hue**
  - Value of light hue default state
uint16_t saturation
Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_set_t
Parameters of Light HSL Range Set

Public Members

uint16_t hue_range_min
Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_set_t
Parameters of Light xyL Set

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t xyl_lightness
The target value of the Light xyL Lightness state

uint16_t xyl_x
The target value of the Light xyL x state

uint16_t xyl_y
The target value of the Light xyL y state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
Parameters of Light xyL Default Set

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t xyl_x
The value of the Light xyL x Default state

uint16_t xyl_y
The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_set_t
Parameters of Light xyL Range Set
Chapter 2. API Reference

Public Members

uint16_t xyl_x_range_min
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t xyl_y_range_min
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t xyl_y_range_max
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_light_lc_mode_set_t
Parameter of Light LC Mode Set

Public Members

uint8_t mode
The target value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_set_t
Parameter of Light LC OM Set

Public Members

uint8_t mode
The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_set_t
Parameters of Light LC Light OnOff Set

Public Members

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lc_property_get_t
Parameter of Light LC Property Get

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct esp_ble_mesh_light_lc_property_set_t
Parameters of Light LC Property Set
Chapter 2. API Reference

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property

struct esp_ble_mesh_light_lightness_status_cb_t
Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_lightness
Current value of light lightness actual state

uint16_t target_lightness
Target value of light lightness actual state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_linear_status_cb_t
Parameters of Light Lightness Linear Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_lightness
Current value of light lightness linear state

uint16_t target_lightness
Target value of light lightness linear state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_last_status_cb_t
Parameter of Light Lightness Last Status

Public Members

uint16_t lightness
The value of the Light Lightness Last state

struct esp_ble_mesh_light_lightness_default_status_cb_t
Parameter of Light Lightness Default Status

Public Members

uint16_t lightness
The value of the Light Lightness default State

struct esp_ble_mesh_light_lightness_range_status_cb_t
Parameters of Light Lightness Range Status
Public Members

uint8_t status_code
Status Code for the request message

uint16_t range_min
Value of range min field of light lightness range state

uint16_t range_max
Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_status_cb_t
Parameters of Light CTL Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_lightness
Current value of light ctl lightness state

uint16_t present_ctl_temperature
Current value of light ctl temperature state

uint16_t target_ctl_lightness
Target value of light ctl lightness state (optional)

uint16_t target_ctl_temperature
Target value of light ctl temperature state (C.1)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_status_cb_t
Parameters of Light CTL Temperature Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_temperature
Current value of light ctl temperature state

uint16_t present_ctl_delta_uv
Current value of light ctl delta UV state

uint16_t target_ctl_temperature
Target value of light ctl temperature state (optional)

uint16_t target_ctl_delta_uv
Target value of light ctl delta UV state (C.1)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t
Parameters of Light CTL Temperature Range Status
Chapter 2. API Reference

Public Members

`uint8_t status_code`
Status code for the request message

`uint16_t range_min`
Value of temperature range min field of light ctl temperature range state

`uint16_t range_max`
Value of temperature range max field of light ctl temperature range state

`struct esp_ble_mesh_light_ctl_default_status_cb_t`
Parameters of Light CTL Default Status

Public Members

`uint16_t lightness`
Value of light lightness default state

`uint16_t temperature`
Value of light temperature default state

`int16_t delta_uv`
Value of light delta UV default state

`struct esp_ble_mesh_light_hsl_status_cb_t`
Parameters of Light HSL Status

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t hsl_lightness`
Current value of light hsl lightness state

`uint16_t hsl_hue`
Current value of light hsl hue state

`uint16_t hsl_saturation`
Current value of light hsl saturation state

`uint8_t remain_time`
Time to complete state transition (optional)

`struct esp_ble_mesh_light_hsl_target_status_cb_t`
Parameters of Light HSL Target Status

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t hsl_lightness_target`
Target value of light hsl lightness state

`uint16_t hsl_hue_target`
Target value of light hsl hue state

`uint16_t hsl_saturation_target`
Target value of light hsl saturation state
uint8_t remain_time
    Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_hue_status_cb_t
Parameters of Light HSL Hue Status

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t present_hue
    Current value of light hsl hue state

uint16_t target_hue
    Target value of light hsl hue state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_saturation_status_cb_t
Parameters of Light HSL Saturation Status

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t present_saturation
    Current value of light hsl saturation state

uint16_t target_saturation
    Target value of light hsl saturation state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_default_status_cb_t
Parameters of Light HSL Default Status

Public Members

uint16_t lightness
    Value of light lightness default state

uint16_t hue
    Value of light hue default state

uint16_t saturation
    Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_status_cb_t
Parameters of Light HSL Range Status

Public Members

uint8_t status_code
    Status code for the request message

uint16_t hue_range_min
    Value of hue range min field of light hsl hue range state
uint16_t hue_range_max
    Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
    Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
    Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_status_cb_t
    Parameters of Light xyL Status

    Public Members

    bool op_en
        Indicate whether optional parameters included

    uint16_t xyl_lightness
        The present value of the Light xyL Lightness state

    uint16_t xyl_x
        The present value of the Light xyL x state

    uint16_t xyl_y
        The present value of the Light xyL y state

    uint8_t remain_time
        Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_target_status_cb_t
    Parameters of Light xyL Target Status

    Public Members

    bool op_en
        Indicate whether optional parameters included

    uint16_t target_xyl_lightness
        The target value of the Light xyL Lightness state

    uint16_t target_xyl_x
        The target value of the Light xyL x state

    uint16_t target_xyl_y
        The target value of the Light xyL y state

    uint8_t remain_time
        Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_default_status_cb_t
    Parameters of Light xyL Default Status

    Public Members

    uint16_t lightness
        The value of the Light Lightness Default state

    uint16_t xyl_x
        The value of the Light xyL x Default state

    uint16_t xyl_y
        The value of the Light xyL y Default state
### struct esp_ble_mesh_light_xyl_range_status_cb_t
Parameters of Light xyL Range Status

**Public Members**

- `uint8_t status_code`
  Status Code for the requesting message

- `uint16_t xyl_x_range_min`
  The value of the xyL x Range Min field of the Light xyL x Range state

- `uint16_t xyl_x_range_max`
  The value of the xyL x Range Max field of the Light xyL x Range state

- `uint16_t xyl_y_range_min`
  The value of the xyL y Range Min field of the Light xyL y Range state

- `uint16_t xyl_y_range_max`
  The value of the xyL y Range Max field of the Light xyL y Range state

### struct esp_ble_mesh_light_lc_mode_status_cb_t
Parameter of Light LC Mode Status

**Public Members**

- `uint8_t mode`
  The present value of the Light LC Mode state

### struct esp_ble_mesh_light_lc_om_status_cb_t
Parameter of Light LC OM Status

**Public Members**

- `uint8_t mode`
  The present value of the Light LC Occupancy Mode state

### struct esp_ble_mesh_light_lc_light_onoff_status_cb_t
Parameters of Light LC Light OnOff Status

**Public Members**

- `bool op_en`
  Indicate whether optional parameters included

- `uint8_t present_light_onoff`
  The present value of the Light LC Light OnOff state

- `uint8_t target_light_onoff`
  The target value of the Light LC Light OnOff state (Optional)

- `uint8_t remain_time`
  Time to complete state transition (C.1)

### struct esp_ble_mesh_light_lc_property_status_cb_t
Parameters of Light LC Property Status
Public Members

```c
uint16_t property_id
Property ID identifying a Light LC Property
```

```c
struct net_buf_simple *property_value
Raw value for the Light LC Property
```

```c
struct esp_ble_mesh_light_client_cb_param_t
Lighting Client Model callback parameters
```

Public Members

```c
int error_code
Appropriate error code
```

```c
esp_ble_mesh_client_common_param_t *params
The client common parameters.
```

```c
esp_ble_mesh_light_client_status_cb_t *status_cb
The light status message callback values
```

```c
struct esp_ble_mesh_light_lightness_state_t
Parameters of Light Lightness state
```

Public Members

```c
uint16_t lightness_linear
The present value of Light Lightness Linear state
```

```c
uint16_t target_lightness_linear
The target value of Light Lightness Linear state
```

```c
uint16_t lightness_actual
The present value of Light Lightness Actual state
```

```c
uint16_t target_lightness_actual
The target value of Light Lightness Actual state
```

```c
uint16_t lightness_last
The value of Light Lightness Last state
```

```c
uint16_t lightness_default
The value of Light Lightness Default state
```

```c
uint8_t status_code
The status code of setting Light Lightness Range state
```

```c
uint16_t lightness_range_min
The minimum value of Light Lightness Range state
```

```c
uint16_t lightness_range_max
The maximum value of Light Lightness Range state
```

```c
struct esp_ble_mesh_light_lightness_srv_t
User data of Light Lightness Server Model
```

Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the Lighting Lightness Server Model. Initialized internally.
```
**Chapter 2. API Reference**

def esp_ble_mesh_server_rsp_ctrl_t:
    cls, Response control of the server model received messages
    public esp_ble_mesh_server_rsp_ctrl_t

**Public Members**

- **esp_ble_mesh_model_t**
  - Pointer to the Lighting Lightness Setup Server Model. Initialized internally.
- **esp_ble_mesh_server_rsp_ctrl_t**
  - Response control of the server model received messages
- **esp_ble_mesh_light_lightness_state_t**
  - Parameters of the Light Lightness state
- **esp_ble_mesh_last_msg_info_t**
  - Parameters of the last received set message
- **esp_ble_mesh_state_transition_t**
  - Parameters of state transition

**Public Members**

- **struct esp_ble_mesh_light_lightness_setup_srv_t**
  - User data of Light Lightness Setup Server Model

**Public Members**

- **uint16_t lightness**
  - The present value of Light CTL Lightness state
- **uint16_t target_lightness**
  - The target value of Light CTL Lightness state
- **uint16_t temperature**
  - The present value of Light CTL Temperature state
- **uint16_t target_temperature**
  - The target value of Light CTL Temperature state
- **int16_t delta_uv**
  - The present value of Light CTL Delta UV state
- **int16_t target_delta_uv**
  - The target value of Light CTL Delta UV state
- **uint8_t status_code**
  - The status code of setting Light CTL Temperature Range state
- **uint16_t temperature_range_min**
  - The minimum value of Light CTL Temperature Range state
- **uint16_t temperature_range_max**
  - The maximum value of Light CTL Temperature Range state

Espressif Systems 404 Release v4.0.3-189-g7c4f5fa

Chapter 2. API Reference

uint16_t lightness_default
The value of Light Lightness Default state

uint16_t temperature_default
The value of Light CTL Temperature Default state

int16_t delta_uv_default
The value of Light CTL Delta UV Default state

struct esp_ble_mesh_light_ctl_srv_t
User data of Light CTL Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting CTL Server Model. Initialized internally.

esp_ble_mesh_server_rsp ctrl_t *rsp ctrl
Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t *state
Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_lightness
Delta change value of lightness state transition

int32_t tt_delta_temperature
Delta change value of temperature state transition

int32_t tt_delta_delta_uv
Delta change value of delta uv state transition

struct esp_ble_mesh_light_ctl_setup_srv_t
User data of Light CTL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting CTL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp ctrl_t *rsp ctrl
Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t *state
Parameters of the Light CTL state

struct esp_ble_mesh_light_ctl_temp_srv_t
User data of Light CTL Temperature Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

esp_ble_mesh_server_rsp ctrl_t *rsp ctrl
Response control of the server model received messages
Chapter 2. API Reference

```c
esp_ble_mesh_light_ctl_state_t *state
Parameters of the Light CTL state
```

```c
esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message
```

```c
esp_ble_mesh_state_transition_t transition
Parameters of state transition
```

```c
int32_t tt_delta_temperature
Delta change value of temperature state transition
```

```c
int32_t tt_delta_delta_uv
Delta change value of delta uv state transition
```

```c
struct esp_ble_mesh_light_hsl_state_t
Parameters of Light HSL state
```

### Public Members

```c
uint16_t lightness
The present value of Light HSL Lightness state
```

```c
uint16_t target_lightness
The target value of Light HSL Lightness state
```

uint8_t status_code
The status code of setting Light HSL Hue & Saturation Range state
```

```c
uint16_t hue_range_min
The minimum value of Light HSL Hue Range state
```

```c
uint16_t hue_range_max
The maximum value of Light HSL Hue Range state
```

```c
uint16_t saturation_range_min
The minimum value of Light HSL Saturation state
```

```c
uint16_t saturation_range_max
The maximum value of Light HSL Saturation state
```

```c
struct esp_ble_mesh_light_hsl_srv_t
User data of Light HSL Server Model
```
Public Members

*esp_ble_mesh_model_t* `model`
Pointer to the Lighting HSL Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages.

*esp_ble_mesh_light_hsl_state_t* `state`
Parameters of the Light HSL state.

*esp_ble_mesh_last_msg_info_t* `last`
Parameters of the last received set message.

*esp_ble_mesh_state_transition_t* `transition`
Parameters of state transition.

int32_t `tt_delta_lightness`
Delta change value of lightness state transition.

int32_t `tt_delta_hue`
Delta change value of hue state transition.

int32_t `tt_delta_saturation`
Delta change value of saturation state transition.

struct `esp_ble_mesh_light_hsl_setup_srv_t`
User data of Light HSL Setup Server Model.

Public Members

*esp_ble_mesh_model_t* `model`
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages.

*esp_ble_mesh_light_hsl_state_t* `state`
Parameters of the Light HSL state.

struct `esp_ble_mesh_light_hsl_hue_srv_t`
User data of Light HSL Hue Server Model.

Public Members

*esp_ble_mesh_model_t* `model`
Pointer to the Lighting HSL Hue Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
Response control of the server model received messages.

*esp_ble_mesh_light_hsl_state_t* `state`
Parameters of the Light HSL state.

struct `esp_ble_mesh_light_hsl_sat_srv_t`
User data of Light HSL Saturation Server Model.
Public Members

*esp_ble_mesh_model_t* `model`
  Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`
  Response control of the server model received messages

*esp_ble_mesh_light_hsl_state_t* `state`
  Parameters of the Light HSL state

*esp_ble_mesh_last_msg_info_t* `last`
  Parameters of the last received set message

*esp_ble_mesh_state_transition_t* `transition`
  Parameters of state transition

int32_t `tt_delta_saturation`
  Delta change value of saturation state transition

struct `esp_ble_mesh_light_xyl_state_t`
  Parameters of Light xyL state

Public Members

uint16_t `lightness`
  The present value of Light xyL Lightness state

uint16_t `target_lightness`
  The target value of Light xyL Lightness state

uint16_t `x`
  The present value of Light xyL x state

uint16_t `target_x`
  The target value of Light xyL x state

uint16_t `y`
  The present value of Light xyL y state

uint16_t `target_y`
  The target value of Light xyL y state

uint16_t `lightness_default`
  The value of Light Lightness Default state

uint16_t `x_default`
  The value of Light xyL x Default state

uint16_t `y_default`
  The value of Light xyL y Default state

uint8_t `status_code`
  The status code of setting Light xyL x & y Range state

uint16_t `x_range_min`
  The minimum value of Light xyL x Range state

uint16_t `x_range_max`
  The maximum value of Light xyL x Range state

uint16_t `y_range_min`
  The minimum value of Light xyL y Range state

uint16_t `y_range_max`
  The maximum value of Light xyL y Range state
struct esp_ble_mesh_light_xyl_srv_t
User data of Light xyL Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting xyL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t *state
Parameters of the Light xyL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_lightness
Delta change value of lightness state transition

int32_t tt_delta_x
Delta change value of x state transition

int32_t tt_delta_y
Delta change value of y state transition

struct esp_ble_mesh_light_xyl_setup_srv_t
User data of Light xyL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting xyL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t *state
Parameters of the Light xyL state

struct esp_ble_mesh_light_xyl_state_t
Parameters of Light LC states

Public Members

uint32_t mode : 1
0b0 The controller is turned off.
• The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
• The binding with the Light Lightness state is enabled. The value of Light LC Mode state

uint32_t occupancy_mode : 1
The value of Light LC Occupancy Mode state

uint32_t light_onoff : 1
The present value of Light LC Light OnOff state

uint32_t target_light_onoff : 1
The target value of Light LC Light OnOff state
uint32_t occupancy : 1
The value of Light LC Occupancy state

uint32_t ambient_luxlevel : 24
The value of Light LC Ambient LuxLevel state

uint16_t linear_output
1. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

struct esp_ble_mesh_light_lc_property_state_t
Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

Public Members

uint32_t time_occupancy_delay
A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on
A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t time_prolong
A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual
A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state

uint16_t lightness_on
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state
uint16_t lightness_standby
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby
A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
An int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
Parameters of Light LC state machine

Public Members

uint8_t fade_on
The value of transition time of Light LC Time Fade On

uint8_t fade
The value of transition time of Light LC Time Fade
uint8_t fade_standby_auto
The value of transition time of Light LC Time Fade Standby Auto

uint8_t fade_standby_manual
The value of transition time of Light LC Time Fade Standby Manual

struct esp_ble_mesh_light_lc_state_machine_t::[anonymous] trans_time
The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and Lux Level Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

esp_ble_mesh_lc_state_t state
The value of Light LC state machine state

struct k_delayed_work timer
Timer of Light LC state machine

struct esp_ble_mesh_light_control_t
Parameters of Light Lightness controller

Public Members

esp_ble_mesh_light_lc_state_t state
Parameters of Light LC state

esp_ble_mesh_light_lc_property_state_t prop_state
Parameters of Light LC Property state

esp_ble_mesh_light_lc_state_machine_t state_machine
Parameters of Light LC state machine

struct esp_ble_mesh_light_lc_srv_t
User data of Light LC Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting LC Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_control_t *lc
Parameters of the Light controller

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

struct esp_ble_mesh_light_lc_setup_srv_t
User data of Light LC Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting LC Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
Chapter 2. API Reference

```c
esp_ble_mesh_light_control_t *lc
Parameters of the Light controller
```

```c
struct esp_ble_mesh_state_change_light_lightness_set_t
Parameter of Light Lightness Actual state change event
```

**Public Members**

```c
uint16_t lightness
The value of Light Lightness Actual state
```

```c
struct esp_ble_mesh_state_change_light_lightness_linear_set_t
Parameter of Light Lightness Linear state change event
```

**Public Members**

```c
uint16_t lightness
The value of Light Lightness Linear state
```

```c
struct esp_ble_mesh_state_change_light_lightness_default_set_t
Parameter of Light Lightness Default state change event
```

**Public Members**

```c
uint16_t lightness
The value of Light Lightness Default state
```

```c
struct esp_ble_mesh_state_change_light_lightness_range_set_t
Parameters of Light Lightness Range state change event
```

**Public Members**

```c
uint16_t range_min
The minimum value of Light Lightness Range state
```

```c
uint16_t range_max
The maximum value of Light Lightness Range state
```

```c
struct esp_ble_mesh_state_change_light_ctl_set_t
Parameters of Light CTL state change event
```

**Public Members**

```c
uint16_t lightness
The value of Light CTL Lightness state
```

```c
uint16_t temperature
The value of Light CTL Temperature state
```

```c
int16_t delta_uv
The value of Light CTL Delta UV state
```

```c
struct esp_ble_mesh_state_change_light_ctl_temperature_set_t
Parameters of Light CTL Temperature state change event
```
Public Members

uint16_t temperature
    The value of Light CTL Temperature state

int16_t delta_uv
    The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t
    Parameters of Light CTL Temperature Range state change event

Public Members

uint16_t range_min
    The minimum value of Light CTL Temperature Range state

uint16_t range_max
    The maximum value of Light CTL Temperature Range state

struct esp_ble_mesh_state_change_light_ctl_default_set_t
    Parameters of Light CTL Default state change event

Public Members

uint16_t lightness
    The value of Light Lightness Default state

uint16_t temperature
    The value of Light CTL Temperature Default state

int16_t delta_uv
    The value of Light CTL Delta UV Default state

struct esp_ble_mesh_state_change_light_hsl_set_t
    Parameters of Light HSL state change event

Public Members

uint16_t lightness
    The value of Light HSL Lightness state

uint16_t hue
    The value of Light HSL Hue state

uint16_t saturation
    The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_hue_set_t
    Parameter of Light HSL Hue state change event

Public Members

uint16_t hue
    The value of Light HSL Hue state

struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
    Parameter of Light HSL Saturation state change event
Public Members

```c
uint16_t saturation
The value of Light HSL Saturation state
```

```c
struct esp_ble_mesh_state_change_light_hsl_default_set_t
Parameters of Light HSL Default state change event
```

Public Members

```c
uint16_t lightness
The value of Light HSL Lightness Default state
```

```c
uint16_t hue
The value of Light HSL Hue Default state
```

```c
uint16_t saturation
The value of Light HSL Saturation Default state
```

```c
struct esp_ble_mesh_state_change_light_hsl_range_set_t
Parameters of Light HSL Range state change event
```

Public Members

```c
uint16_t hue_range_min
The minimum hue value of Light HSL Range state
```

```c
uint16_t hue_range_max
The maximum hue value of Light HSL Range state
```

```c
uint16_t saturation_range_min
The minimum saturation value of Light HSL Range state
```

```c
uint16_t saturation_range_max
The maximum saturation value of Light HSL Range state
```

```c
struct esp_ble_mesh_state_change_light_xyl_set_t
Parameters of Light xyL state change event
```

Public Members

```c
uint16_t lightness
The value of Light xyL Lightness state
```

```c
uint16_t x
The value of Light xyL x state
```

```c
uint16_t y
The value of Light xyL y state
```

```c
struct esp_ble_mesh_state_change_light_xyl_default_set_t
Parameters of Light xyL Default state change event
```

Public Members

```c
uint16_t lightness
The value of Light Lightness Default state
```

```c
uint16_t x
The value of Light xyL x Default state
```
Chapter 2. API Reference

uint16_t y
The value of Light xy L y Default state

struct esp_ble_mesh_state_change_light_xyl_range_set_t
Parameters of Light xyL Range state change event

Public Members

uint16_t x_range_min
The minimum value of Light xyL x Range state
uint16_t x_range_max
The maximum value of Light xyL x Range state
uint16_t y_range_min
The minimum value of Light xyL y Range state
uint16_t y_range_max
The maximum value of Light xyL y Range state

struct esp_ble_mesh_state_change_light_lc_mode_set_t
Parameter of Light LC Mode state change event

Public Members

uint8_t mode
The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_om_set_t
Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t mode
The value of Light LC Occupancy Mode state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event

Public Members

uint8_t onoff
The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_property_set_t
Parameters of Light LC Property state change event

Public Members

uint16_t property_id
The property id of Light LC Property state

struct net_buf_simple *property_value
The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t
Parameters of Sensor Status state change event
Public Members

uint16_t property_id
The value of Sensor Property ID

uint8_t occupancy
The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay
The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel
The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state
Parameters of Sensor Status related state

struct esp_ble_mesh_server_recv_light_lc_property_get_t
Context of the received Light LC Property Get message

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct esp_ble_mesh_server_recv_light_lightness_set_t
Context of the received Light Lightness Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light lightness actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_linear_set_t
Context of the received Light Lightness Linear Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light lightness linear state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)
Chapter 2. API Reference

```
uint8_t delay
    Indicate message execution delay (C.1)
```

```
struct esp_ble_mesh_server_recv_light_lightness_default_set_t
    Context of the received Light Lightness Default Set message
```

**Public Members**

```
uint16_t lightness
    The value of the Light Lightness Default state
```

```
struct esp_ble_mesh_server_recv_light_lightness_range_set_t
    Context of the received Light Lightness Range Set message
```

**Public Members**

```
uint16_t range_min
    Value of range min field of light lightness range state
```

```
uint16_t range_max
    Value of range max field of light lightness range state
```

```
struct esp_ble_mesh_server_recv_light_ctl_set_t
    Context of the received Light CTL Set message
```

**Public Members**

```
bool op_en
    Indicate if optional parameters are included
```

```
uint16_t lightness
    Target value of light ctl lightness state
```

```
uint16_t temperature
    Target value of light ctl temperature state
```

```
int16_t delta_uv
    Target value of light ctl delta UV state
```

```
uint8_t tid
    Transaction ID
```

```
uint8_t trans_time
    Time to complete state transition (optional)
```

```
uint8_t delay
    Indicate message execution delay (C.1)
```

```
struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t
    Context of the received Light CTL Temperature Set message
```

**Public Members**

```
bool op_en
    Indicate if optional parameters are included
```

```
uint16_t temperature
    Target value of light ctl temperature state
```

```
int16_t delta_uv
    Target value of light ctl delta UV state
```
uint8_t _tid
  Transaction ID

uint8_t _trans_time
  Time to complete state transition (optional)

uint8_t _delay
  Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t**
Context of the received Light CTL Temperature Range Set message

### Public Members

- **uint16_t range_min**
  Value of temperature range min field of light ctl temperature range state

- **uint16_t range_max**
  Value of temperature range max field of light ctl temperature range state

**struct esp_ble_mesh_server_recv_light_ctl_default_set_t**
Context of the received Light CTL Default Set message

### Public Members

- **uint16_t lightness**
  Value of light lightness default state

- **uint16_t temperature**
  Value of light temperature default state

- **int16_t delta_uv**
  Value of light delta UV default state

**struct esp_ble_mesh_server_recv_light_hsl_set_t**
Context of the received Light HSL Set message

### Public Members

- **bool op_en**
  Indicate if optional parameters are included

- **uint16_t lightness**
  Target value of light hsl lightness state

- **uint16_t hue**
  Target value of light hsl hue state

- **uint16_t saturation**
  Target value of light hsl saturation state

- **uint8_t _tid**
  Transaction ID

- **uint8_t _trans_time**
  Time to complete state transition (optional)

- **uint8_t _delay**
  Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_light_hsl_hue_set_t**
Context of the received Light HSL Hue Set message
Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t hue
  Target value of light hsl hue state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t
  Context of the received Light HSL Saturation Set message

Public Members

bool op_en
  Indicate if optional parameters are included

uint16_t saturation
  Target value of light hsl hue state

uint8_t tid
  Transaction ID

uint8_t trans_time
  Time to complete state transition (optional)

uint8_t delay
  Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_default_set_t
  Context of the received Light HSL Default Set message

Public Members

uint16_t lightness
  Value of light lightness default state

uint16_t hue
  Value of light hue default state

uint16_t saturation
  Value of light saturation default state

struct esp_ble_mesh_server_recv_light_hsl_range_set_t
  Context of the received Light HSL Range Set message

Public Members

uint16_t hue_range_min
  Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
  Value of hue range max field of light hsl hue range state
uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_server_recv_light_xyl_set_t
Context of the received Light xyl Set message

**Public Members**

bool op_en
Indicate whether optional parameters included

uint16_t lightness
The target value of the Light xyl Lightness state

uint16_t x
The target value of the Light xyl x state

uint16_t y
The target value of the Light xyl y state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_xyl_default_set_t
Context of the received Light xyl Default Set message

**Public Members**

uint16_t lightness
The value of the Light Lightness Default state

uint16_t x
The value of the Light xyl x Default state

uint16_t y
The value of the Light xyl y Default state

struct esp_ble_mesh_server_recv_light_xyl_range_set_t
Context of the received Light xyl Range Set message

**Public Members**

uint16_t x_range_min
The value of the xyl x Range Min field of the Light xyl x Range state

uint16_t x_range_max
The value of the xyl x Range Max field of the Light xyl x Range state

uint16_t y_range_min
The value of the xyl y Range Min field of the Light xyl y Range state

uint16_t y_range_max
The value of the xyl y Range Max field of the Light xyl y Range state
struct esp_ble_mesh_server_recv_light_lc_mode_set_t
Context of the received Light LC Mode Set message

**Public Members**

uint8_t mode
The target value of the Light LC Mode state

struct esp_ble_mesh_server_recv_light_lc_om_set_t
Context of the received Light OM Set message

**Public Members**

uint8_t mode
The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t
Context of the received Light LC Light OnOff Set message

**Public Members**

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lc_property_set_t
Context of the received Light LC Property Set message

**Public Members**

uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property

struct esp_ble_mesh_server_recv_sensor_status_t
Context of the received Sensor Status message

**Public Members**

struct net_buf_simple *data
Value of sensor data state (optional)

struct esp_ble_mesh_lighting_server_cb_param_t
Lighting Server Model callback parameters
Public Members

*esp_ble_mesh_model_t* `model`
  Pointer to Lighting Server Models

`esp_ble_mesh_msg_ctx_t` `ctx`
  Context of the received messages

`esp_ble_mesh_lighting_server_cb_value_t` `value`
  Value of the received Lighting Messages

Macros

`ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI` (cli_pub, cli_data)
  Define a new Light Lightness Client Model.

  **Note** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

  **Return** New Light Lightness Client Model instance.

  **Parameters**
  - `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  - `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI` (cli_pub, cli_data)
  Define a new Light CTL Client Model.

  **Note** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

  **Return** New Light CTL Client Model instance.

  **Parameters**
  - `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  - `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI` (cli_pub, cli_data)
  Define a new Light HSL Client Model.

  **Note** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

  **Return** New Light HSL Client Model instance.

  **Parameters**
  - `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  - `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI` (cli_pub, cli_data)
  Define a new Light xyL Client Model.

  **Note** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

  **Return** New Light xyL Client Model instance.

  **Parameters**
  - `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  - `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_LIGHT_LC_CLI` (cli_pub, cli_data)
  Define a new Light LC Client Model.

  **Note** This API needs to be called for each element on which the application needs to have a Light LC Client Model.

  **Return** New Light LC Client Model instance.

  **Parameters**
  - `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  - `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

`ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV` (srv_pub, srv_data)
  Lighting Server Models related context.
Define a new Light Lightness Server Model.

**Note** 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

**Return** New Light Lightness Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lightness_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV** (srv_pub, srv_data)

Define a new Light Lightness Setup Server Model.

**Note** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.
1. This model shall support model subscription.

**Return** New Light Lightness Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lightness_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV** (srv_pub, srv_data)

Define a new Light CTL Server Model.

**Note** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

**Return** New Light CTL Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV** (srv_pub, srv_data)

Define a new Light CTL Setup Server Model.

**Note** 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

**Return** New Light CTL Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV** (srv_pub, srv_data)

Define a new Light CTL Temperature Server Model.

**Note** 1. The Light CTL Temperature Server model extends the Generic Level Server model.

**Return** New Light CTL Temperature Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV** (srv_pub, srv_data)

Define a new Light HSL Server Model.
Note 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Return New Light HSL Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)
Define a new Light HSL Setup Server Model.

Note 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

Return New Light HSL Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (srv_pub, srv_data)
Define a new Light HSL Hue Server Model.

Note 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

Return New Light HSL Hue Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (srv_pub, srv_data)
Define a new Light HSL Saturation Server Model.

Note 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

Return New Light HSL Saturation Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (srv_pub, srv_data)
Define a new Light xYL Server Model.

Note 1. The Light xYL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xYL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return New Light xYL Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)
Define a new Light xYL Setup Server Model.
Chapter 2. API Reference

Note 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.
1. This model shall support model subscription.

Return New Light xyL Setup Server Model instance.
Parameters
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_xyil_setup_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_LC_SRV (srv_pub, srv_data)
Define a new Light LC Server Model.

Note 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
2. This model may be used to represent an element that is a client to a Sensor Server model and controls the Light Lightness Actual state via defined state bindings.

Return New Light LC Server Model instance.
Parameters
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV (srv_pub, srv_data)
Define a new Light LC Setup Server Model.

Note 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
1. This model shall support model publication and model subscription.
2. This model may be used to configure setup parameters for the Light LC Server model.

Return New Light LC Setup Server Model instance.
Parameters
- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

Type Definitions
typedef void (*esp_ble_mesh_light_client_cb_t)(
    esp_ble_mesh_light_client_cb_event_t event,
    esp_ble_mesh_light_client_cb_param_t *param)
Bluetooth Mesh Light Client Model function.
Lighting Client Model callback function type
Parameters
- **event**: Event type
- **param**: Pointer to callback parameter
typedef void (*esp_ble_mesh_lighting_server_cb_t)(
    esp_ble_mesh_lighting_server_cb_event_t event,
    esp_ble_mesh_lighting_server_cb_param_t *param)
Bluetooth Mesh Lighting Server Model function.
Lighting Server Model callback function type
Parameters
- **event**: Event type
- **param**: Pointer to callback parameter

Enumerations
enum esp_ble_mesh_light_client_cb_event_t
This enum value is the event of Lighting Client Model
Values:
ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT
Chapter 2. API Reference

ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX

enum esp_ble_mesh_lc_state_t
This enum value is the Light LC State Machine states

Values:
ESP_BLE_MESH_LC_OFF
ESP_BLE_MESH_LC_STANDBY
ESP_BLE_MESH_LC_FADE_ON
ESP_BLE_MESH_LC_RUN
ESP_BLE_MESH_LC_FADE
ESP_BLE_MESH_LC_PROLONG
ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL

enum esp_ble_mesh_lighting_server_cb_event_t
This enum value is the event of Lighting Server Model

Values:
ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Lighting Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Get messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT
When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Status message is received.

ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX

Time and Scenes Client/Server Models

Header File
• bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h

Functions
esp_err_t esp_ble_mesh_register_sensor_client_callback (esp_ble_mesh_sensor_client_cb_t callback)
Register BLE Mesh Sensor Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
Chapter 2. API Reference

- [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_sensor_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_get_state_t *get_state)
```

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] get_state: Pointer to sensor get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_sensor_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_set_state_t *set_state)
```

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] set_state: Pointer to sensor set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_sensor_server_callback(esp_ble_mesh_sensor_server_cb_t callback)
```

Register BLE Mesh Sensor Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] callback: Pointer to the callback function.

Unions

```c

Sensor Setting Get
```
Chapter 2. API Reference

```c
esp_ble_mesh_server_recv_sensor_get_t sensor_data
    Sensor Get

esp_ble_mesh_server_recv_sensor_column_get_t sensor_column
    Sensor Column Get

esp_ble_mesh_server_recv_sensor_series_get_t sensor_series
    Sensor Series Get

union esp_ble_mesh_sensor_server_recv_set_msg_t
    #include <esp_ble_mesh_sensor_model_api.h> Sensor Server Model received set message union.
    
    Public Members

esp_ble_mesh_server_recv_sensor_cadence_set_t sensor_cadence
    Sensor Cadence Set

esp_ble_mesh_server_recv_sensor_setting_set_t sensor_setting
    Sensor Setting Set

union esp_ble_mesh_sensor_server_cb_value_t
    #include <esp_ble_mesh_sensor_model_api.h> Sensor Server Model callback value union.
    
    Public Members

esp_ble_mesh_sensor_server_state_change_t state_change
    ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT

esp_ble_mesh_sensor_server_recv_get_msg_t get
    ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT

esp_ble_mesh_sensor_server_recv_set_msg_t set
    ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT

Structures

struct esp_ble_mesh_sensor_descriptor_get_t
    Bluetooth Mesh Sensor Client Model Get and Set parameters structure.
    Parameters of Sensor Descriptor Get

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID of a sensor (optional)

struct esp_ble_mesh_sensor_cadence_get_t
    Parameter of Sensor Cadence Get

Public Members

uint16_t property_id
    Property ID of a sensor

struct esp_ble_mesh_sensor_cadence_set_t
    Parameters of Sensor Cadence Set
```
Public Members

uint16_t property_id
Property ID for the sensor

uint8_t fast_cadence_period_divisor : 7
Divisor for the publish period

uint8_t status_trigger_type : 1
The unit and format of the Status Trigger Delta fields

struct net_buf_simple *status_trigger_delta_down
Delta down value that triggers a status message

struct net_buf_simple *status_trigger_delta_up
Delta up value that triggers a status message

uint8_t status_min_interval
Minimum interval between two consecutive Status messages

struct net_buf_simple *fast_cadence_low
Low value for the fast cadence range

struct net_buf_simple *fast_cadence_high
Fast value for the fast cadence range

struct esp_ble_mesh_sensor_settings_get_t
Parameter of Sensor Settings Get

Public Members

uint16_t sensor_property_id
Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t
Parameters of Sensor Setting Get

Public Members

uint16_t sensor_property_id
Property ID of a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t
Parameters of Sensor Setting Set

Public Members

uint16_t sensor_property_id
Property ID identifying a sensor

uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

struct net_buf_simple *sensor_setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_get_t
Parameters of Sensor Get
Chapter 2. API Reference

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID for the sensor (optional)

struct esp_ble_mesh_sensor_column_get_t
Parameters of Sensor Column Get

Public Members

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x
Raw value identifying a column

struct esp_ble_mesh_sensor_series_get_t
Parameters of Sensor Series Get

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property identifying a sensor

struct net_buf_simple *raw_value_x1
Raw value identifying a starting column (optional)

struct net_buf_simple *raw_value_x2
Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple *descriptor
Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
Parameters of Sensor Cadence Status

Public Members

uint16_t property_id
Property for the sensor

struct net_buf_simple *sensor_cadence_value
Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
Parameters of Sensor Settings Status
Chapter 2. API Reference

**Public Members**

```c
uint16_t sensor_property_id
    Property ID identifying a sensor
```

```c
struct net_buf_simple *sensor_setting_property_ids
    A sequence of N sensor setting property IDs (optional)
```

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t sensor_property_id
    Property ID identifying a sensor
```

```c
uint16_t sensor_setting_property_id
    Setting ID identifying a setting within a sensor
```

```c
uint8_t sensor_setting_access
    Read/Write access rights for the setting (optional)
```

```c
struct net_buf_simple *sensor_setting_raw
    Raw value for the setting
```

**Public Members**

```c
struct net_buf_simple *marshalled_sensor_data
    Value of sensor data state (optional)
```

**Public Members**

```c
uint16_t property_id
    Property identifying a sensor and the Y axis
```

```c
struct net_buf_simple *sensor_column_value
    Left values of sensor column status
```

**Public Members**

```c
uint16_t property_id
    Property identifying a sensor and the Y axis
```

```c
struct net_buf_simple *sensor_series_value
    Left values of sensor series status
```

**Public Members**

```c
struct esp_ble_mesh_sensor_client_cb_param_t
    Sensor Client Model callback parameters
```
Public Members

`int error_code`  
0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

`esp_ble_mesh_client_common_param_t *params`  
The client common parameters.

`esp_ble_mesh_sensor_client_status_cb_t *status_cb`  
The sensor status message callback values

`struct esp_ble_mesh_sensor_descriptor_t`  
Parameters of Sensor Descriptor state

Public Members

`uint32_t positive_tolerance` : 12  
The value of Sensor Positive Tolerance field

`uint32_t negative_tolerance` : 12  
The value of Sensor Negative Tolerance field

`uint32_t sampling_function` : 8  
The value of Sensor Sampling Function field

`uint8_t measure_period`  
The value of Sensor Measurement Period field

`uint8_t update_interval`  
The value of Sensor Update Interval field

`struct esp_ble_mesh_sensor_setting_t`  
Parameters of Sensor Setting state

Public Members

`uint16_t property_id`  
The value of Sensor Setting Property ID field

`uint8_t access`  
The value of Sensor Setting Access field

`struct net_buf_simple *raw`  
The value of Sensor Setting Raw field

`struct esp_ble_mesh_sensor_cadence_t`  
Parameters of Sensor Cadence state

Public Members

`uint8_t period_divisor` : 7  
The value of Fast Cadence Period Divisor field

`uint8_t trigger_type` : 1  
The value of Status Trigger Type field

`struct net_buf_simple *trigger_delta_down`  
Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field
struct net_buf_simple *trigger_delta_up
   The value of Status Trigger Delta Up field

uint8_t min_interval
   The value of Status Min Interval field

struct net_buf_simple *fast_cadence_low
   The value of Fast Cadence Low field

struct net_buf_simple *fast_cadence_high
   The value of Fast Cadence High field

struct esp_ble_mesh_sensor_data_t
   Parameters of Sensor Data state

Public Members

uint8_t format : 1
   Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1 – 16).
   Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 – 127). The value 0x7F represents a length of zero. The value of the Sensor Data format

uint8_t length : 7
   The value of the Sensor Data length

struct net_buf_simple *raw_value
   The value of Sensor Data raw value

struct esp_ble_mesh_sensor_series_column_t
   Parameters of Sensor Series Column state

Public Members

struct net_buf_simple *raw_value_x
   The value of Sensor Raw Value X field

struct net_buf_simple *column_width
   The value of Sensor Column Width field

struct net_buf_simple *raw_value_y
   The value of Sensor Raw Value Y field

struct esp_ble_mesh_sensor_state_t
   Parameters of Sensor states

Public Members

uint16_t sensor_property_id
   The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t descriptor
   Parameters of the Sensor Descriptor state

const uint8_t setting_count
   Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.

esp_ble_mesh_sensor_setting_t *settings
   Parameters of the Sensor Setting state
Chapter 2. API Reference

`esp_ble_mesh_sensor_cadence_t` *cadence*

The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state

`esp_ble_mesh_sensor_data_t` *sensor_data*

Parameters of the Sensor Data state

`esp_ble_mesh_sensor_series_column_t` *series_column*

Parameters of the Sensor Series Column state

`struct esp_ble_mesh_sensor_srv_t` User data of Sensor Server Model

**Public Members**

`esp_ble_mesh_model_t` *model*

Pointer to the Sensor Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t` *rsp_ctrl*

Response control of the server model received messages

`const uint8_t` *state_count*

Sensor state count

`esp_ble_mesh_sensor_state_t` *states*

Parameters of the Sensor states

`struct esp_ble_mesh_sensor_setup_srv_t` User data of Sensor Setup Server Model

**Public Members**

`esp_ble_mesh_model_t` *model*

Pointer to the Sensor Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t` *rsp_ctrl*

Response control of the server model received messages

`const uint8_t` *state_count*

Sensor state count

`esp_ble_mesh_sensor_state_t` *states*

Parameters of the Sensor states

`struct esp_ble_mesh_state_change_sensor_cadence_set_t` Parameters of Sensor Cadence Set state change event

**Public Members**

`uint16_t` *property_id*

The value of Sensor Property ID state

`uint8_t` *period_divisor : 7*

The value of Fast Cadence Period Divisor state

`uint8_t` *trigger_type : 1*

The value of Status Trigger Type state

`struct net_buf_simple` *trigger_delta_down*

The value of Status Trigger Delta Down state
Chapter 2. API Reference

```c
struct net_buf_simple *trigger_delta_up
    The value of Status Trigger Delta Up state

uint8_t min_interval
    The value of Status Min Interval state

struct net_buf_simple *fastCadenceLow
    The value of Fast Cadence Low state

struct net_buf_simple *fastCadenceHigh
    The value of Fast Cadence High state
```

```c
struct esp_ble_mesh_state_change_sensor_setting_set_t
    Parameters of Sensor Setting Set state change event
```

**Public Members**

```c
uint16_t property_id
    The value of Sensor Property ID state

uint16_t setting_property_id
    The value of Sensor Setting Property ID state

struct net_buf_simple *setting_value
    The value of Sensor Property Value state
```

```c
struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
    Context of the received Sensor Descriptor Get message
```

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID of a sensor (optional)
```

```c
struct esp_ble_mesh_server_recv_sensor_cadence_get_t
    Context of the received Sensor Cadence Get message
```

**Public Members**

```c
uint16_t property_id
    Property ID of a sensor
```

```c
struct esp_ble_mesh_server_recv_sensor_settings_get_t
    Context of the received Sensor Settings Get message
```

**Public Members**

```c
uint16_t property_id
    Property ID of a sensor
```

```c
struct esp_ble_mesh_server_recv_sensor_setting_get_t
    Context of the received Sensor Setting Get message
```
Chapter 2. API Reference

Public Members

uint16_t property_id
    Property ID of a sensor

uint16_t setting_property_id
    Setting ID identifying a setting within a sensor

struct esp_ble_mesh_server_recv_sensor_get_t
    Context of the received Sensor Get message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID for the sensor (optional)

struct esp_ble_mesh_server_recv_sensor_column_get_t
    Context of the received Sensor Column Get message

Public Members

uint16_t property_id
    Property identifying a sensor

struct net_buf_simple *raw_value_x
    Raw value identifying a column

struct esp_BLE_mesh_server_recv_sensor_series_get_t
    Context of the received Sensor Series Get message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property identifying a sensor

struct net_buf_simple *raw_value
    Raw value containing X1 and X2 (optional)

struct esp_BLE_mesh_server_recv_sensor_cadence_set_t
    Context of the received Sensor Cadence Set message

Public Members

uint16_t property_id
    Property ID for the sensor

struct net_buf_simple *cadence
    Value of Sensor Cadence state

struct esp_BLE_mesh_server_recv_sensor_setting_set_t
    Context of the received Sensor Setting Set message

Espressif Systems 438
Release v4.0.3-189-g7c4f5fa
Submit Document Feedback
Public Members

uint16_t property_id
   Property ID identifying a sensor

uint16_t setting_property_id
   Setting ID identifying a setting within a sensor

struct net_buf_simple *setting_raw
   Raw value for the setting

struct esp_ble_mesh_sensor_server_cb_param_t
   Sensor Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
   Pointer to Sensor Server Models

esp_ble_mesh_msg_ctx_t ctx
   Context of the received messages

esp_ble_mesh_sensor_server_cb_value_t value
   Value of the received Sensor Messages

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI(cli_pub, cli_data)
   Define a new Sensor Client Model.
   Note This API needs to be called for each element on which the application needs to have a Sensor Client Model.
   Return New Sensor Client Model instance.
   Parameters
      • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
      • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SENSOR_SRV(srv_pub, srv_data)
   Sensor Server Models related context.
   Define a new Sensor Server Model.
   Note 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.
      1. This model shall support model publication and model subscription.
   Return New Sensor Server Model instance.
   Parameters
      • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
      • srv_data: Pointer to the unique struct esp_ble_mesh_sensor_srv_t.

ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV(srv_pub, srv_data)
   Define a new Sensor Setup Server Model.
   Note 1. The Sensor Setup Server model extends the Sensor Server model.
      1. This model shall support model publication and model subscription.
   Return New Sensor Setup Server Model instance.
   Parameters
      • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
      • srv_data: Pointer to the unique struct esp_ble_mesh_sensor_setup_srv_t.

ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID
   Invalid Sensor Property ID

ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN
   Length of Sensor Property ID
ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN
Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE
Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE
Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD
Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL
Not applicable Sensor Update Interval

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID
Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN
Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN
Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ
Sensor Setting Access - Read

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE
Sensor Setting Access - Read & Write

ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN
Length of Sensor Divisor Trigger Type

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN
Length of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE
Maximum value of Sensor Period Divisor

ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX
Maximum value of Sensor Status Min Interval

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16
Sensor Status Trigger Type - Format Type “uint16”

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A
Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B
Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN
MPID length of Sensor Data Format A

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN
MPID length of Sensor Data Format B

ESP_BLE_MESH_SENSOR_DATA_ZERO_LEN
Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1–127). The value 0x7F represents a length of zero.

ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT(_data)
Get format of the sensor data.
Chapter 2. API Reference

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

Return Format of the sensor data.

Parameters

• _data: Pointer to the start of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)
Get length of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

Return Length (zero-based) of the sensor data.

Parameters

• _data: Pointer to the start of the sensor data.

• _fmt: Format of the sensor data.

ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)
Get Sensor Property ID of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

Return Sensor Property ID of the sensor data.

Parameters

• _data: Pointer to the start of the sensor data.

• _fmt: Format of the sensor data.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)
Generate a MPID value for sensor data with Format A.

Note 1. The Format field is 0b0 and indicates that Format A is used.
2. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
3. The Property ID is an 11-bit bit field representing 11 LSb of a Property ID.
4. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

Return 2-octet MPID value for sensor data with Format A.

Parameters

• _len: Length of Sensor Raw value.

• _id: Sensor Property ID.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)
Generate a MPID value for sensor data with Format B.

Note 1. The Format field is 0b1 and indicates Format B is used.
2. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
3. The Property ID is a 16-bit bit field representing a Property ID.
4. This format may be used for Property Values not longer than 128 octets and for any Property IDs.
   Property values longer than 128 octets are not supported by the Sensor Status message.
5. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

Return 3-octet MPID value for sensor data with Format B.

Parameters

• _len: Length of Sensor Raw value.

• _id: Sensor Property ID.

Type Definitions

typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)

Bluetooth Mesh Sensor Client Model function.

Sensor Client Model callback function type

Parameters
typedef void("esp_ble_mesh_sensor_server_cb_t") (esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)

Bluetooth Mesh Sensor Server Model function.

Sensor Server Model callback function type

Parameters

- event: Event type
- param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_sensor_client_cb_event_t

This enum value is the event of Sensor Client Model

Values:

ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

enum esp_ble_mesh_sensor_server_cb_event_t

This enum value is the event of Sensor Server Model

Values:

ESP_BLE_MESH_SENSOR_SERVEREvt_MAX

1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Sensor Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Get messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX
Lighting Client/Server Models

Header File

- bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

- esp_err_t esp_ble_mesh_register_time_scene_client_callback (esp_ble_mesh_time_scene_client_cb_t callback)

  Register BLE Mesh Time Scene Client Model callback.

  Return ESP_OK on success or error code otherwise.

  Parameters
  - [in] callback: Pointer to the callback function.

- esp_err_t esp_ble_mesh_time_scene_client_get_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_get_state_t *get_state)

  Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

  Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

  Return ESP_OK on success or error code otherwise.

  Parameters
  - [in] get_state: Pointer to time scene get message value. Shall not be set to NULL.

- esp_err_t esp_ble_mesh_time_scene_client_set_state (esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_time_scene_client_set_state_t *set_state)

  Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

  Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

  Return ESP_OK on success or error code otherwise.

  Parameters
  - [in] set_state: Pointer to time scene set message value. Shall not be set to NULL.

- esp_err_t esp_ble_mesh_register_time_scene_server_callback (esp_ble_mesh_time_scene_server_cb_t callback)

  Register BLE Mesh Time and Scenes Server Model callback.

  Return ESP_OK on success or error code otherwise.

  Parameters
  - [in] callback: Pointer to the callback function.

Unions

- union esp_ble_mesh_time_scene_client_get_state_t

Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

```c
uint8_t tai_seconds[5]
```

The current TAI time in seconds

```c
uint8_t sub_second
```

The sub-second time in units of 1/256 second

```c
uint8_t uncertainty
```

The estimated uncertainty in 10-millisecond steps

```c
uint16_t time_authority: 1
```

0 = No Time Authority, 1 = Time Authority

```c
uint16_t tai_utc_delta: 15
```

Current difference between TAI and UTC in seconds

```c
uint8_t time_zone_offset
```

The local time zone offset in 15-minute increments

```c
struct esp_ble_mesh_time_zone_set_t
```

Parameters of Time Zone Set

Public Members

```c
uint8_t time_zone_offset_new
```

Upcoming local time zone offset

```c
uint8_t tai_zone_change[5]
```

TAI Seconds time of the upcoming Time Zone Offset change

```c
struct esp_ble_mesh_tai_utc_delta_set_t
```

Parameters of TAI-UTC Delta Set
Public Members

uint16_t tai_utc_delta_new : 15
  Upcoming difference between TAI and UTC in seconds

uint16_t padding : 1
  Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
  TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_set_t
  Parameter of Time Role Set

Public Members

uint8_t time_role
  The Time Role for the element

struct esp_ble_mesh_scene_store_t
  Parameter of Scene Store

Public Members

uint16_t scene_number
  The number of scenes to be stored

struct esp_ble_mesh_scene_recall_t
  Parameters of Scene Recall

  bool op_en
    Indicate if optional parameters are included

  uint16_t scene_number
    The number of scenes to be recalled

  uint8_t tid
    Transaction ID

  uint8_t trans_time
    Time to complete state transition (optional)

  uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_scene_delete_t
  Parameter of Scene Delete

Public Members

uint16_t scene_number
  The number of scenes to be deleted

struct esp_ble_mesh_scheduler_act_get_t
  Parameter of Scheduler Action Get
Public Members

uint8_t index
Index of the Schedule Register entry to get

struct esp_ble_mesh_scheduler_act_set_t
Parameters of Scheduler Action Set

Public Members

uint64_t index : 4
Index of the Schedule Register entry to set

uint64_t year : 7
Scheduled year for the action

uint64_t month : 12
Scheduled month for the action

uint64_t day : 5
Scheduled day of the month for the action

uint64_t hour : 5
Scheduled hour for the action

uint64_t minute : 6
Scheduled minute for the action

uint64_t second : 6
Scheduled second for the action

uint64_t day_of_week : 7
Scheduled days of the week for the action

uint64_t action : 4
Action to be performed at the scheduled time

uint64_t trans_time : 8
Transition time for this action

uint16_t scene_number
Transition time for this action

struct esp_ble_mesh_time_status_cb_t
Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.
Parameters of Time Status

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t sub_second
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
Current difference between TAI and UTC in seconds
uint8_t time_zone_offset
   The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_status_cb_t
   Parameters of Time Zone Status

Public Members

uint8_t time_zone_offset_curr
   Current local time zone offset

uint8_t time_zone_offset_new
   Upcoming local time zone offset

uint8_t tai_zone_change[5]
   TAI Second time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_status_cb_t
   Parameters of TAI-UTC Delta Status

Public Members

uint16_t tai_utc_delta_curr : 15
   Current difference between TAI and UTC in seconds

uint16_t padding_1 : 1
   Always 0b0. Other values are Prohibited.

uint16_t tai_utc_delta_new : 15
   Upcoming difference between TAI and UTC in seconds

uint16_t padding_2 : 1
   Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
   TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_status_cb_t
   Parameter of Time Role Status

Public Members

uint8_t time_role
   The Time Role for the element

struct esp_ble_mesh_scene_status_cb_t
   Parameters of Scene Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint8_t status_code
   Status code of the last operation

uint16_t current_scene
   Scene Number of the current scene

uint16_t target_scene
   Scene Number of the target scene (optional)
Chapter 2. API Reference

```c
uint8_t remain_time
   Time to complete state transition (C.1)
```

```c
struct esp_ble_mesh_scene_register_status_cb_t
   Parameters of Scene Register Status
```

**Public Members**

- `uint8_t status_code`
  Status code for the previous operation
- `uint16_t current_scene`
  Scene Number of the current scene
- `struct net_buf_simple *scenes`
  A list of scenes stored within an element

```c
struct esp_ble_mesh_scheduler_status_cb_t
   Parameter of Scheduler Status
```

**Public Members**

- `uint16_t schedules`
  Bit field indicating defined Actions in the Schedule Register

```c
struct esp_ble_mesh_scheduler_act_status_cb_t
   Parameters of Scheduler Action Status
```

**Public Members**

- `uint64_t index : 4`
  Enumerates (selects) a Schedule Register entry
- `uint64_t year : 7`
  Scheduled year for the action
- `uint64_t month : 12`
  Scheduled month for the action
- `uint64_t day : 5`
  Scheduled day of the month for the action
- `uint64_t hour : 5`
  Scheduled hour for the action
- `uint64_t minute : 6`
  Scheduled minute for the action
- `uint64_t second : 6`
  Scheduled second for the action
- `uint64_t day_of_week : 7`
  Schedule days of the week for the action
- `uint64_t action : 4`
  Action to be performed at the scheduled time
- `uint64_t trans_time : 8`
  Transition time for this action
- `uint16_t scene_number`
  Transition time for this action
\textbf{struct esp_ble_mesh_time_scene_client_cb_param_t}

Time Scene Client Model callback parameters

**Public Members**

\begin{itemize}
    \item \textbf{int error_code}
        Appropriate error code
    \item \textbf{esp_ble_mesh_client_common_param_t *params}
        The client common parameters.
    \item \textbf{esp_ble_mesh_time_scene_client_status_cb_t status_cb}
        The scene status message callback values
\end{itemize}

\textbf{struct esp_ble_mesh_time_state_t}

Parameters of Time state

**Public Members**

\begin{itemize}
    \item \textbf{uint8_t tai_seconds[5]}
        The value of the TAI Seconds state
    \item \textbf{uint8_t subsecond}
        The value of the Subsecond field
    \item \textbf{uint8_t uncertainty}
        The value of the Uncertainty field
    \item \textbf{uint8_t time_zone_offset_curr}
        The value of the Time Zone Offset Current field
    \item \textbf{uint8_t time_zone_offset_new}
        The value of the Time Zone Offset New state
    \item \textbf{uint8_t tai_zone_change[5]}
        The value of the TAI of Zone Chaneg field
    \item \textbf{uint16_t time_authority : 1}
        The value of the Time Authority bit
    \item \textbf{uint16_t tai_utc_delta_curr : 15}
        The value of the TAI-UTC Delta Current state
    \item \textbf{uint16_t tai_utc_delta_new : 15}
        The value of the TAI-UTC Delta New state
    \item \textbf{uint8_t tai_delta_change[5]}
        The value of the TAI of Delta Change field
\end{itemize}

\textbf{struct esp_ble_mesh_time_state_t::[anonymous] time}

Parameters of the Time state

\begin{itemize}
    \item \textbf{uint8_t time_role}
        The value of the Time Role state
\end{itemize}

\textbf{struct esp_ble_mesh_time_srv_t}

User data of Time Server Model

**Public Members**

\begin{itemize}
    \item \textbf{esp_ble_mesh_model_t *model}
        Pointer to the Time Server Model. Initialized internally.
\end{itemize}
**Chapter 2. API Reference**

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_time_state_t *state
Parameters of the Time state
```

```c
struct esp_ble_mesh_time_setup_srv_t
User data of Time Setup Server Model
```

### Public Members

```c
esp_ble_mesh_model_t *model
Pointer to the Time Setup Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages
```

```c
esp_ble_mesh_time_state_t *state
Parameters of the Time state
```

```c
struct esp_ble_mesh_time_setup_srv_t
User data of Time Setup Server Model
```

### Public Members

1. Scene Store is an operation of storing values of a present state of an element.
2. The structure and meaning of the stored state is determined by a model. States to be stored are specified
   by each model.
3. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for
   all models present on all elements of a node.
4. If a model is extending another model, the extending model shall determine the Stored with Scene be-
   havior of that model. Parameters of Scene Register state

### Public Members

```c
uint16_t scene_number
The value of the Scene Number
```

```c
uint8_t scene_type
The value of the Scene Type
```

```c
struct net_buf_simple *scene_value
Scene value may use a union to represent later, the union contains structures of all the model states which
   can be stored in a scene. The value of the Scene Value
```

```c
struct esp_ble_mesh_scenes_state_t
Parameters of Scenes state.
```

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states
of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a
maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container
associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model
handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation.
The scene transition is in progress when at least one transition from the group of individual model transitions
is in progress.
Public Members

**const** uint16_t **scene_count**
The Scenes state’s scene count

*exp_ble_mesh_scene_register_t* **scenes**
Parameters of the Scenes state

uint16_t **current_scene**
The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

uint16_t **target_scene**
The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.

When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

uint8_t **status_code**
The status code of the last scene operation

bool **in_progress**
Indicate if the scene transition is in progress

**struct esp_ble_mesh_scene_srv_t**
User data of Scene Server Model

Public Members

*esp_ble_mesh_model_t* **model**
Pointer to the Scene Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* **rsp_ctrl**
Response control of the server model received messages

*esp_ble_mesh_scenes_state_t* **state**
Parameters of the Scenes state

*esp_ble_mesh_last_msg_info_t* **last**
Parameters of the last received set message

*esp_ble_mesh_state_transition_t* **transition**
Parameters of state transition

**struct esp_ble_mesh_scene_setup_srv_t**
User data of Scene Setup Server Model
Public Members

*esp_ble_mesh_model_t* `model`

- Pointer to the Scene Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* `rsp_ctrl`

- Response control of the server model received messages

*esp_ble_mesh_scenes_state_t* `state`

- Parameters of the Scenes state

Public Members

`struct esp_ble_mesh_schedule_register_t`

Parameters of Scheduler Register state

Public Members

`bool in_use`

- Indicate if the registered schedule is in use

`uint64_t year : 7`

- The value of Scheduled year for the action

`uint64_t month : 12`

- The value of Scheduled month for the action

`uint64_t day : 5`

- The value of Scheduled day of the month for the action

`uint64_t hour : 5`

- The value of Scheduled hour for the action

`uint64_t minute : 6`

- The value of Scheduled minute for the action

`uint64_t second : 6`

- The value of Scheduled second for the action

`uint64_t day_of_week : 7`

- The value of Schedule days of the week for the action

`uint64_t action : 4`

- The value of Action to be performed at the scheduled time

`uint64_t trans_time : 8`

- The value of Transition time for this action

`uint16_t scene_number`

- The value of Scene Number to be used for some actions

Public Members

`const uint8_t schedule_count`

- Scheduler count

*esp_ble_mesh_schedule_register_t* `schedules`

- Up to 16 scheduled entries

Public Members

*esp_ble_mesh_scheduler_state_t* `schedules`

- User data of Scheduler Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Scheduler Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_scheduler_state_t *state`
Parameters of the Scheduler state

`struct esp_ble_mesh_scheduler_setup_srv_t`
User data of Scheduler Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Scheduler Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_scheduler_state_t *state`
Parameters of the Scheduler state

`struct esp_ble_mesh_state_change_time_set_t`
Parameters of Time Set state change event

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr : 15
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
The local time zone offset in 15-minute increments

`struct esp_ble_mesh_state_change_time_status_t`
Parameters of Time Status state change event

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps
Chapter 2. API Reference

```c
uint16_t time_authority : 1
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr : 15
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
    The local time zone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_zone_set_t
    Parameters of Time Zone Set state change event

Public Members

uint8_t time_zone_offset_new
    Upcoming local time zone offset

uint8_t tai_zone_change[5]
    TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_state_change_tai_utc_delta_set_t
    Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t tai_utc_delta_new : 15
    Upcoming difference between TAI and UTC in seconds

uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_state_change_time_role_set_t
    Parameter of Time Role Set state change event

Public Members

uint8_t time_role
    The Time Role for the element

struct esp_ble_mesh_state_change_scene_store_t
    Parameter of Scene Store state change event

Public Members

uint16_t scene_number
    The number of scenes to be stored

struct esp_ble_mesh_state_change_scene_recall_t
    Parameter of Scene Recall state change event

Public Members

uint16_t scene_number
    The number of scenes to be recalled

struct esp_ble_mesh_state_change_scene_delete_t
    Parameter of Scene Delete state change event
```
Chapter 2. API Reference

Public Members

uint16_t `scene_number`
The number of scenes to be deleted

```c
struct esp_ble_mesh_state_change_scheduler_act_set_t
```
Parameter of Scheduler Action Set state change event

Public Members

```c
uint64_t index : 4
    Index of the Schedule Register entry to set
```
```c
uint64_t year : 7
    Scheduled year for the action
```
```c
uint64_t month : 12
    Scheduled month for the action
```
```c
uint64_t day : 5
    Scheduled day of the month for the action
```
```c
uint64_t hour : 5
    Scheduled hour for the action
```
```c
uint64_t minute : 6
    Scheduled minute for the action
```
```c
uint64_t second : 6
    Scheduled second for the action
```
```c
uint64_t day_of_week : 7
    Schedule days of the week for the action
```
```c
uint64_t action : 4
    Action to be performed at the scheduled time
```
```c
uint64_t trans_time : 8
    Transition time for this action
```
```c
uint16_t scene_number
    Scene number to be used for some actions
```

```c
struct esp_ble_mesh_server_recv_scheduler_act_get_t
```
Context of the received Scheduler Action Get message

Public Members

```c
uint8_t index
    Index of the Schedule Register entry to get
```

```c
struct esp_ble_mesh_server_recv_time_set_t
```
Context of the received Time Set message

Public Members

```c
uint8_t tai_seconds[5]
    The current TAI time in seconds
```
```c
uint8_t subsecond
    The sub-second time in units of 1/256 second
```
Chapter 2. API Reference

```c
uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
    The local time zone offset in 15-minute increments
```

```
struct esp_ble_mesh_server_recv_time_zone_set_t
    Context of the received Time Zone Set message

Public Members

uint8_t time_zone_offset_new
    Upcoming local time zone offset

uint8_t [5] tai_zone_change
    TAI Seconds time of the upcoming Time Zone Offset change
```

```
struct esp_ble_mesh_server_recv_tai_utc_delta_set_t
    Context of the received TAI UTC Delta Set message

Public Members

uint16_t tai_utc_delta_new : 15
    Upcoming difference between TAI and UTC in seconds

uint16_t padding : 1
    Always 0b0. Other values are Prohibited.

uint8_t [5] tai_delta_change
    TAI Seconds time of the upcoming TAI-UTC Delta change
```

```
struct esp_ble_mesh_server_recv_time_role_set_t
    Context of the received Time Role Set message

Public Members

uint8_t time_role
    The Time Role for the element
```

```
struct esp_ble_mesh_server_recv_scene_store_t
    Context of the received Scene Store message

Public Members

uint16_t scene_number
    The number of scenes to be stored
```

```
struct esp_ble_mesh_server_recv_scene_recall_t
    Context of the received Scene Recall message
```
Chapter 2. API Reference

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t scene_number
   The number of scenes to be recalled

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_scene_delete_t
   Context of the received Scene Delete message

Public Members

uint16_t scene_number
   The number of scenes to be deleted

struct esp_ble_mesh_server_recv_scheduler_act_set_t
   Context of the received Scheduler Action Set message

Public Members

uint64_t index : 4
   Index of the Schedule Register entry to set

uint64_t year : 7
   Scheduled year for the action

uint64_t month : 12
   Scheduled month for the action

uint64_t day : 5
   Scheduled day of the month for the action

uint64_t hour : 5
   Scheduled hour for the action

uint64_t minute : 6
   Scheduled minute for the action

uint64_t second : 6
   Scheduled second for the action

uint64_t day_of_week : 7
   Schedule days of the week for the action

uint64_t action : 4
   Action to be performed at the scheduled time

uint64_t trans_time : 8
   Transition time for this action

uint16_t scene_number
   Scene number to be used for some actions

struct esp_ble_mesh_server_recv_time_status_t
   Context of the received Time Status message
Public Members

- `uint8_t tai_seconds[5]`  
  The current TAI time in seconds

- `uint8_t subsecond`  
  The sub-second time in units of 1/256 second

- `uint8_t uncertainty`  
  The estimated uncertainty in 10-millisecond steps

- `uint16_t time_authority : 1`  
  0 = No Time Authority, 1 = Time Authority

- `uint16_t tai_utc_delta : 15`  
  Current difference between TAI and UTC in seconds

- `uint8_t time_zone_offset`  
  The local time zone offset in 15-minute increments

**struct esp_ble_mesh_time_scene_server_cb_param_t**  
Time Scene Server Model callback parameters

Public Members

- `esp_ble_mesh_model_t *model`  
  Pointer to Time and Scenes Server Models

- `esp_ble_mesh_msg_ctx_t ctx`  
  Context of the received messages

- `esp_ble_mesh_time_scene_server_cb_value_t value`  
  Value of the received Time and Scenes Messages

Macros

**ESP_BLE_MESH_MODEL_TIME_CLI (cli_pub, cli_data)**  
Define a new Time Client Model.

  **Note** This API needs to be called for each element on which the application needs to have a Time Client Model.

  **Return** New Time Client Model instance.

  **Parameters**
  - `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  - `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_SCENE_CLI (cli_pub, cli_data)**  
Define a new Scene Client Model.

  **Note** This API needs to be called for each element on which the application needs to have a Scene Client Model.

  **Return** New Scene Client Model instance.

  **Parameters**
  - `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  - `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)**  
Define a new Scheduler Client Model.

  **Note** This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

  **Return** New Scheduler Client Model instance.

  **Parameters**
  - `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
  - `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`. 
ESP_BLE_MESH_MODEL_TIME_SRV (srv_pub, srv_data)
Time Scene Server Models related context.
Define a new Time Server Model.

Note 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.
1. This model shall support model publication and model subscription.

Return New Time Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_time_srv_t.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)
Define a new Time Setup Server Model.

Note 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.
1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
2. This model does not support subscribing nor publishing.

Parameters
• srv_data: Pointer to the unique struct esp_ble_mesh_time_setup_srv_t.

ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)
Define a new Scene Server Model.

Note 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
2. The model may be present only on the Primary element of a node.

Return New Scene Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_scene_srv_t.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV (srv_pub, srv_data)
Define a new Scene Setup Server Model.

Note 1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
1. This model shall support model subscription.
2. The model may be present only on the Primary element of a node.

Return New Scene Setup Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_scene_setup_srv_t.

ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)
Define a new Scheduler Server Model.

Note 1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
2. The model may be present only on the Primary element of a node.
3. The model requires the Time Server model shall be present on the element.

Return New Scheduler Server Model instance.

Parameters
• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_scheduler_srv_t.
Define a new Scheduler Setup Server Model.

**Note** 1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
   2. This model shall support model subscription.

**Return** New Scheduler Setup Server Model instance.

**Parameters**

- **srv_pub**: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- **srv_data**: Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

**ESP_BLE_MESH_UNKNOWN_TAI_SECONDS**
Unknown TAI Seconds

**ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE**
Unknown TAI of Zone Change

**ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE**
Unknown TAI of Delta Change

**ESP_BLE_MESH_TAI.UTC_DELTA_MAX_VALUE**
Maximum TAI-UTC Delta value

**ESP_BLE_MESH.TAI.SECONDS_LEN**
Length of TAI Seconds

**ESP_BLE_MESH.TAI.OF_ZONE_CHANGE_LEN**
Length of TAI of Zone Change

**ESP_BLE_MESH.TAI.OF_DELTA_CHANGE_LEN**
Length of TAI of Delta Change

**ESP_BLE_MESH.INVALID_SCENE_NUMBER**
Invalid Scene Number

**ESP_BLE_MESH_SCENE_NUMBER_LEN**
Length of the Scene Number

**ESP_BLE_MESH_SCHEDULE.YEAR_ANY_YEAR**
Any year of the Scheduled year

**ESP_BLE_MESH_SCHEDULE.DAY_ANY_DAY**
Any day of the Scheduled day

**ESP_BLE_MESH_SCHEDULE.HOUR_ANY_HOUR**
Any hour of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE.HOUR_ONCE_A_DAY**
Any hour of the Scheduled Day

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR**
Any minute of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN**
Every 15 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC.EVERY_20_MIN**
Every 20 minutes of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR**
Once of the Scheduled hour

**ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN**
Any second of the Scheduled minute

**ESP_BLE_MESH_SCHEDULE_SEC.EVERY_15_SEC**
Every 15 seconds of the Scheduled minute
Chapter 2. API Reference

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE
Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY
Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY
Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLINET
Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS
Scene operation - Success

ESP_BLE_MESH_SCENE_REG_FULL
Scene operation - Scene Register Full

ESP_BLE_MESH_SCENE_NOT_FOUND
Scene operation - Scene Not Found

Type Definitions
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(
    esp_ble_mesh_time_scene_client_cb_event_t event,
    esp_ble_mesh_time_scene_client_cb_param_t *param)

Bluetooth Mesh Time Scene Client Model function.
Time Scene Client Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_time_scene_server_cb_t)(
    esp_ble_mesh_time_scene_server_cb_event_t event,
    esp_ble_mesh_time_scene_server_cb_param_t *param)

Bluetooth Mesh Time and Scenes Server Model function.
Time Scene Server Model callback function type

Parameters
• event: Event type
Chapter 2. API Reference

- **param**: Pointer to callback parameter

**Enumerations**

```plaintext
enum esp_ble_mesh_time_scene_client_cb_event_t
    This enum value is the event of TimeSceneClientModel
    Values:
    ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT
    ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT
    ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT
    ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT
    ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX
```

```plaintext
enum esp_ble_mesh_time_scene_server_cb_event_t
    This enum value is the event of TimeSceneServerModel
    Values:
    ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT
    ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT
    ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT
    ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT
    ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX
```

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice: * For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used. * For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

For the overview of the ESP32 Bluetooth stack architecture, follow the links below:

- ESP32 Bluetooth Architecture (PDF) [English]
- ESP32 Bluetooth Architecture (PDF) [中文]

Code examples for this API section are provided in the `bluetooth/bluedroid` directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- GATT Client Example Walkthrough
- GATT Server Service Table Example Walkthrough
- GATT Server Example Walkthrough
- GATT Security Client Example Walkthrough
- GATT Security Server Example Walkthrough
- GATT Client Multi-connection Example Walkthrough
2.2 Networking APIs

2.2.1 Wi-Fi

Wi-Fi

Introduction The WiFi libraries provide support for configuring and monitoring the ESP32 WiFi networking functionality. This includes configuration for:

- Station mode (aka STA mode or WiFi client mode). ESP32 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32.
- Combined AP-STA mode (ESP32 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WEP, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 WiFi packets.

Application Examples The wifi directory of ESP-IDF examples contains the following applications:

Code examples for Wi-Fi are provided in the wifi directory of ESP-IDF examples.

In addition, there is a simple esp-idf-template application that shows how to connect ESP32 module to an Access Point.

API Reference

Header File

- esp_wifi/include/esp_wifi.h

Functions

`esp_err_t esp_wifi_init(const wifi_init_config_t *config)`

Init WiFi Alloc resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc, this WiFi also start WiFi task.

Attention 1. This API must be called before all other WiFi API can be called
Attention 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to init the config to default values, this can guarantee all the fields got correct value when more fields are added into wifi_init_config_t in future release. If you want to set your owner initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT, please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

Return

- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

Parameters

- config: pointer to WiFi init configuration structure; can point to a temporary variable.

`esp_err_t esp_wifi_deinit(void)`

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

Attention 1. This API should be called if you want to remove WiFi driver from the system

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_set_mode(wifi_mode_t mode)`

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is soft-AP mode.
Chapter 2. API Reference

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code in esp_err.h

Parameters
- *mode: WiFi operating mode

```c
esp_err_t esp_wifi_get_mode(wifi_mode_t *mode)
```
Get current operating mode of WiFi.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- *mode: store current WiFi mode

```c
esp_err_t esp_wifi_start()
```
Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_FAIL: other WiFi internal errors

```c
esp_err_t esp_wifi_stop()
```
Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_restore()
```
Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp_wifi_set_bandwidth,
- esp_wifi_set_protocol,
- esp_wifi_set_config related
- esp_wifi_set_mode

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_connect()
```
Connect the ESP32 WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
Attention 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
Attention 3. The scanning triggered by esp_wifi_start_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do re-connection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise
the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
• ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

`esp_err_t esp_wifi_disconnect (void)`
Disconnect the ESP32 WiFi station from the AP.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
• ESP_FAIL: other WiFi internal errors

`esp_err_t esp_wifi_clear_fast_connect (void)`
Currently this API is just an stub API.

Return
• ESP_OK: succeed
• others: fail

`esp_err_t esp_wifi_deauth_sta (uint16_t aid)`
deauthenticate all stations or associated id equals to aid

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_MODE: WiFi mode is wrong

Parameters
• aid: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

`esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)`
Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done.

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
• ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
• ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
• others: refer to error code in esp_err.h

Parameters
• config: configuration of scanning
• block: if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

`esp_err_t esp_wifi_scan_stop (void)`
Stop the scan in process.

Return
• ESP_OK: succeed
Chapter 2. API Reference

- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

**esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)**
Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- [out] number: store number of APs found in last scan

**esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)**
Get AP list found in last scan.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

**Parameters**
- [inout] number: As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- ap_records: wifi_ap_record_t array to hold the found APs

**esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)**
Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface not initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

**Parameters**
- ap_info: the wifi_ap_record_t to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_ap_record_t struct. For example, phy_11b = 1 imply that ap support 802.11b mode

**esp_err_t esp_wifi_set_ps (wifi_ps_type_t type)**
Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** ESP_OK: succeed

**Parameters**
- type: power save type

**esp_err_t esp_wifi_get_ps (wifi_ps_type_t *type)**
Get current WiFi power save type.

**Return** ESP_OK: succeed

**Parameters**
- [out] type: store current power save type

**esp_err_t esp_wifi_set_protocol (wifi_interface_t ifx, uint8_t protocol_bitmap)**
Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N)

**Attention** Currently we only support 802.11b or 802.11bg or 802.11bgn mode

**Return**
Chapter 2. API Reference

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interfaces
- protocol_bitmap: WiFi protocol bitmap

```c
esp_err_t esp_wifi_get_protocol (wifi_interface_t ifx, uint8_t *protocol_bitmap)
```
Get the current protocol bitmap of the specified interface.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interface
- [out] protocol_bitmap: store current WiFi protocol bitmap of interface ifx

```c
esp_err_t esp_wifi_set_bandwidth (wifi_interface_t ifx, wifi_bandwidth_t bw)
```
Set the bandwidth of ESP32 specified interface.

**Attention**
1. API return false if try to configure an interface that is not enabled
2. WIFI_BW_HT40 is supported only when the interface support 11N

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interface to be configured
- bw: bandwidth

```c
esp_err_t esp_wifi_get_bandwidth (wifi_interface_t ifx, wifi_bandwidth_t *bw)
```
Get the bandwidth of ESP32 specified interface.

**Attention**
1. API return false if try to get a interface that is not enable

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- ifx: interface to be configured
- [out] bw: store bandwidth of interface ifx

```c
esp_err_t esp_wifi_set_channel (uint8_t primary, wifi_second_chan_t second)
```
Set primary/secondary channel of ESP32.

**Attention**
1. This API should be called after esp_wifi_start()
2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs
4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
### Chapter 2. API Reference

- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

#### Parameters
- **primary**: for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second**: for HT20, second is ignored, for HT40, second is the second channel

#### esp_err_t esp_wifi_get_channel (uint8_t *primary, wifi_second_chan_t *second)

Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get an interface that is not enable

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

#### Parameters
- **primary**: store current primary channel
- [out] **second**: store current second channel

#### esp_err_t esp_wifi_set_country (const wifi_country_t *country)

Configure country info

**Attention** 1. The default country is {.cc="CN", .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}

**Attention** 2. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc="USA", .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc="JP", .schan=1, .nchan=14} then the country info that will be used is {.cc="JP", .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc="US", .schan=1, .nchan=11} in the example.

**Attention** 3. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, always use the configured country info.

**Attention** 4. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is changed also.

**Attention** 5. The country configuration is not stored into flash

**Attention** 6. This API doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

#### Parameters
- **country**: the configured country info

#### esp_err_t esp_wifi_get_country (wifi_country_t *country)

Get the current country info

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

#### Parameters
- **country**: country info

#### esp_err_t esp_wifi_set_mac (wifi_interface_t ifx, const uint8_t mac[6])

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX:XX”.

**Return**
- ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_IF: invalid interface
• ESP_ERR_WIFI_MAC: invalid MAC address
• ESP_ERR_WIFI_MODE: WiFi mode is wrong
• others: refer to error codes in esp_err.h

Parameters
• ifx: interface
• mac: the MAC address

`esp_err_t esp_wifi_get_mac (wifi_interface_t ifx, uint8_t mac[6])`
Get MAC address of specified interface.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_IF: invalid interface

Parameters
• ifx: interface
• [out] mac: store MAC address of interface ifx

`esp_err_t esp_wifi_set_promiscuous_rx_cb (wifi_promiscuous_cb_t cb)`
Register the RX callback function in the promiscuous mode.
Each time a packet is received, the registered callback function will be called.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• cb: callback

`esp_err_t esp_wifi_set_promiscuous (bool en)`
Enable the promiscuous mode.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• en: false - disable, true - enable

`esp_err_t esp_wifi_get_promiscuous (bool *en)`
Get the promiscuous mode.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• [out] en: store the current status of promiscuous mode

`esp_err_t esp_wifi_set_promiscuous_filter (const wifi_promiscuous_filter_t *filter)`
Enable the promiscuous mode packet type filter.

Note: The default filter is to filter all packets except WIFI_PKT_MISC

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• filter: the packet type filtered in promiscuous mode.

`esp_err_t esp_wifi_get_promiscuous_filter (wifi_promiscuous_filter_t *filter)`
Get the promiscuous filter.
Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- [out] filter: store the current status of promiscuous filter

`esp_err_t esp_wifi_set_promiscuous_ctrl_filter(const wifi_promiscuous_filter_t *filter)`

Enable subtype filter of the control packet in promiscuous mode.

Note  The default filter is to filter none control packet.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- filter: the subtype of the control packet filtered in promiscuous mode.

`esp_err_t esp_wifi_get_promiscuous_ctrl_filter(wifi_promiscuous_filter_t *filter)`

Get the subtype filter of the control packet in promiscuous mode.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters

- [out] filter: store the current status of subtype filter of the control packet in promiscuous mode

`esp_err_t esp_wifi_set_config(wifi_interface_t interface, wifi_config_t *conf)`

Set the configuration of the ESP32 STA or AP.

Attention 1. This API can be called only when specified interface is enabled, otherwise, API fail
Attention 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
Attention 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the erro code in esp_err.h

Parameters

- interface: interface
- conf: station or soft-AP configuration

`esp_err_t esp_wifi_get_config(wifi_interface_t interface, wifi_config_t *conf)`

Get configuration of specified interface.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

Parameters

- interface: interface
- [out] conf: station or soft-AP configuration

`esp_err_t esp_wifi_ap_get_sta_list(wifi_sta_list_t *sta)`

Get STAs associated with soft-AP.
**Chapter 2. API Reference**

**Attention** SSC only API

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**
- [out] sta: station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

```c
esp_err_t esp_wifi_ap_get_sta_aid(const uint8_t mac[6], uint16_t *aid)
```

Get AID of STA connected with soft-AP.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**
- mac: STA’s mac address
- [out] aid: Store the AID corresponding to STA mac

```c
esp_err_t esp_wifi_set_storage(wifi_storage_t storage)
```

Set the WiFi API configuration storage type.

**Attention** 1. The default value is WIFI_STORAGE_FLASH

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- storage: : storage type

```c
esp_err_t esp_wifi_set_vendor_ie(bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)
```

Set 802.11 Vendor-Specific Information Element.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

**Parameters**
- enable: If true, specified IE is enabled. If false, specified IE is removed.
- type: Information Element type. Determines the frame type to associate with the IE.
- idx: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- vnd_ie: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching vendor_ie_data_t. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

```c
esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)
```

Register Vendor-Specific Information Element monitoring callback.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- cb: Vendor-Specific Information Element monitoring callback.
**cb**: Callback function

**ctx**: Context argument, passed to callback function.

```c
esp_err_t esp_wifi_set_max_tx_power(int8_t power)
```

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the max_tx_power of the structure `wifi_country_t` variable.

**Attention** 3. Mapping Table {Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

**Attention** 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19], 8}, {[20, 27], 20}, {[28, 33], 28}, {[34, 43], 34}, {[44, 51], 44}, {[52, 55], 52}, {[56, 59], 56}, {[60, 65], 60}, {[66, 71], 66}, {[72, 79], 72}, {[80, 84], 80}}.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

**Parameters**
- **power**: Maximum WiFi transmitting power.

```c
esp_err_t esp_wifi_get_max_tx_power(int8_t *power)
```

Get maximum transmitting power after WiFi start.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**
- **power**: Maximum WiFi transmitting power, unit is 0.25dBm.

```c
esp_err_t esp_wifi_set_event_mask(uint32_t mask)
```

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various WIFI_EVENT_MASK_constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.

**Attention** 3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- **mask**: WiFi event mask.

```c
esp_err_t esp_wifi_get_event_mask(uint32_t *mask)
```

Get mask of WiFi events.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- **mask**: WiFi event mask.

```c
esp_err_t esp_wifi_80211_tx(wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)
```

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame
Return

- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

Parameters

- ifx: interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- buffer: raw ieee80211 buffer
- len: the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- en_sys_seq: indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

```c
estp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)
```

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters

- cb: callback
- ctx: context argument, passed to callback function

```c
estp_err_t esp_wifi_set_csi_config (const wifi_csi_config_t *config)
```

Set CSI data configuration.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- config: configuration

```c
estp_err_t esp_wifi_set_csi (bool en)
```

Enable or disable CSI.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- en: true - enable, false - disable

```c
estp_err_t esp_wifi_set_ant_gpio (const wifi_ant_gpio_config_t *config)
```

Set antenna GPIO configuration.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc
Parameters

- **config**: Antenna GPIO configuration.

```c
esp_err_t esp_wifi_get_ant_gpio(wifi_ant_gpio_config_t *config)
```
Get current antenna GPIO configuration.

Return

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_ARG**: invalid argument, e.g. parameter is NULL

Parameters

- **config**: Antenna GPIO configuration.

```c
esp_err_t esp_wifi_set_ant(const wifi_ant_config_t *config)
```
Set antenna configuration.

Return

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_ARG**: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

Parameters

- **config**: Antenna configuration.

```c
esp_err_t esp_wifi_get_ant(wifi_ant_config_t *config)
```
Get current antenna configuration.

Return

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_ARG**: invalid argument, e.g. parameter is NULL

Parameters

- **config**: Antenna configuration.

```c
esp_err_t esp_wifi_set_inactive_time(wifi_interface_t ifx, uint16_t sec)
```
Set the inactive time of the ESP32 STA or AP.

**Attention**

1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will forced deauth the STA. Default is 300s.

3. The inactive time configuration is not stored into flash

Return

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_ARG**: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

Parameters

- **ifx**: interface to be configured.
- **sec**: Inactive time. Unit seconds.

```c
esp_err_t esp_wifi_get_inactive_time(wifi_interface_t ifx, uint16_t *sec)
```
Get inactive time of specified interface.

Return

- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_ARG**: invalid argument

Parameters

- **ifx**: Interface to be configured.
- **sec**: Inactive time. Unit seconds.
**esp_err_t esp_wifi_stats_dump** (uint32_t modules)

Dump WiFi statistics.

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- modules: statistic modules to be dumped

**Structures**

```c
struct wifi_init_config_t
```

WiFi stack configuration parameters passed to esp_wifi_init call.

**Public Members**

```c
system_event_handler_t event_handler
```

WiFi event handler

```c
wifi_osi_funcs_t *osi_funcs
```

WiFi OS functions

```c
wpa_crypto_funcs_t wpa_crypto_funcs
```

WiFi station crypto functions when connect

```c
int static_rx_buf_num
```

WiFi static RX buffer number

```c
dynamic_rx_buf_num
```

WiFi dynamic RX buffer number

```c
tx_buf_type
```

WiFi TX buffer type

```c
static_tx_buf_num
```

WiFi static TX buffer number

```c
dynamic_tx_buf_num
```

WiFi dynamic TX buffer number

```c
cache_tx_buf_num
```

WiFi TX cache buffer number

```c
csi_enable
```

WiFi channel state information enable flag

```c
ampdu_rx_enable
```

WiFi AMPDU RX feature enable flag

```c
ampdu_tx_enable
```

WiFi AMPDU TX feature enable flag

```c
nvs_enable
```

WiFi NVS flash enable flag

```c
nano_enable
```

Nano option for printf/scan family enable flag

```c
rx_ba_win
```

WiFi Block Ack RX window size

```c
wifi_task_core_id
```

WiFi Task Core ID

```c
beacon_max_len
```

WiFi softAP maximum length of the beacon
int mgmt_sbuf_num
    WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t feature_caps
    Enables additional WiFi features and capabilities

int magic
    WiFi init magic number, it should be the last field

Macros
ESP_ERR_WIFI_NOT_INIT
    WiFi driver was not installed by esp_wifi_init
ESP_ERR_WIFI_NOT_STARTED
    WiFi driver was not started by esp_wifi_start
ESP_ERR_WIFI_NOT_STOPPED
    WiFi driver was not stopped by esp_wifi_stop
ESP_ERR_WIFI_IF
    WiFi interface error
ESP_ERR_WIFI_MODE
    WiFi mode error
ESP_ERR_WIFI_STATE
    WiFi internal state error
ESP_ERR_WIFI_CONN
    WiFi internal control block of station or soft-AP error
ESP_ERR_WIFI_NVS
    WiFi internal NVS module error
ESP_ERR_WIFI_MAC
    MAC address is invalid
ESP_ERR_WIFI_SSID
    SSID is invalid
ESP_ERR_WIFI_PASSWORD
    Password is invalid
ESP_ERR_WIFI_TIMEOUT
    Timeout error
ESP_ERR_WIFI_WAKE_FAIL
    WiFi is in sleep state (RF closed) and wakeup fail
ESP_ERR_WIFI_WOULD_BLOCK
    The caller would block
ESP_ERR_WIFI_NOT_CONNECT
    Station still in disconnect status
ESP_ERR_WIFI_POST
    Failed to post the event to WiFi task
ESP_ERR_WIFI_INIT_STATE
    Invalid WiFi state when init/deinit is called
ESP_ERR_WIFI_STOP_STATE
    Returned when WiFi is stopping
ESP_ERR_WIFI_NOT_ASSOC
    The WiFi connection is not associated
ESP_ERR_WIFI_TX_DISALLOW
The WiFi TX is disallowed

Type Definitions
typedef void(*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)
The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will
be called.

Parameters
• buf: Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated
  by ‘type’ parameter.
• type: promiscuous packet type.

typedef void(*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t *sa[6],
const wifi_vendor_ie_data_t *vnd_ie, int rssi)
Function signature for received Vendor-Specific Information Element callback.

Parameters
• ctx: Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.
• type: Information element type, based on frame type received.
• sa: Source 802.11 address.
• vnd_ie: Pointer to the vendor specific element data received.
• rssi: Received signal strength indication.

typedef void(*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)
The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

Parameters
• ctx: context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
• data: CSI data received. The memory that it points to will be deallocated after callback function
  returns.

Header File
• esp_wifi/include/esp_wifi_types.h
Unions

union wifi_config_t

```c
#include <esp_wifi_types.h>
```

Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config().

Public Members

```c
wifi_ap_config_t ap
```
configuration of AP

```c
wifi_sta_config_t sta
```
configuration of STA

Structures

struct wifi_country_t

Structure describing WiFi country-based regional restrictions.

Public Members

```c
char cc[3]
```
country code string

```c
uint8_t schan
```
start channel

```c
uint8_t nchan
```
total channel number

```c
int8_t max_tx_power
```
This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.

```c
wifi_country_policy_t policy
```
country policy

struct wifi_active_scan_time_t

Range of active scan times per channel.

Public Members

```c
uint32_t min
```
minimum active scan time per channel, units: millisecond

```c
uint32_t max
```
maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct wifi_scan_time_t

Aggregate of active & passive scan time per channel.

Public Members

```c
wifi_active_scan_time_t active
```
active scan time per channel, units: millisecond.

```c
uint32_t passive
```
passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.
struct wifi_scan_config_t
Parameters for an SSID scan.

Public Members

uint8_t *ssid
SSID of AP

uint8_t *bssid
MAC address of AP

uint8_t channel
channel, scan the specific channel

bool show_hidden
enable to scan AP whose SSID is hidden

wifi_scan_type_t scan_type
scan type, active or passive

wifi_scan_time_t scan_time
scan time per channel

struct wifi_ap_record_t
Description of a WiFi AP.

Public Members

uint8_t bssid[6]
MAC address of AP

uint8_t ssid[33]
SSID of AP

uint8_t primary
channel of AP

wifi_second_chan_t second
secondary channel of AP

int8_t rssi
signal strength of AP

wifi_auth_mode_t authmode
authmode of AP

wifi_cipher_type_t pairwise_cipher
pairwise cipher of AP

wifi_cipher_type_t group_cipher
group cipher of AP

wifi_ant_t ant
antenna used to receive beacon from AP

uint32_t phy_11b : 1
bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g : 1
bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n : 1
bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr : 1
bit: 3 flag to identify if low rate is enabled or not
Chapter 2. API Reference

```c
uint32_t wps : 1
    bit: 4 flag to identify if WPS is supported or not
uint32_t reserved : 27
    bit: 5..31 reserved

wifi_country_t country
    country information of AP

struct wifi_scan_threshold_t
    Structure describing parameters for a WiFi fast scan.

Public Members
int8_t rssi
    The minimum rssi to accept in the fast scan mode

wifi_auth_mode_t authmode
    The weakest authmode to accept in the fast scan mode

struct wifi_pmf_config_t
    Configuration structure for Protected Management Frame

Public Members
bool capable
    Advertizes support for Protected Management Frame. Device will prefer to connect in PMF mode if
    other device also advertizes PMF capability.

bool required
    Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable
    devices.

struct wifi_ap_config_t
    Soft-AP configuration settings for the ESP32.

Public Members
uint8_t ssid[32]
    SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length
    is set according to ssid_len.

uint8_t password[64]
    Password of ESP32 soft-AP.

uint8_t ssid_len
    Optional length of SSID field.

uint8_t channel
    Channel of ESP32 soft-AP

wifi_auth_mode_t authmode
    Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

uint8_t ssid_hidden
    Broadcast SSID or not, default 0, broadcast the SSID

uint8_t max_connection
    Max number of stations allowed to connect in, default 4, max 10

uint16_t beacon_interval
    Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~
    60000. Default value: 100
```
**struct wifi_sta_config_t**

STA configuration settings for the ESP32.

**Public Members**

- `uint8_t ssid[32]`  
  SSID of target AP.
- `uint8_t password[64]`  
  Password of target AP.
- `wifi_scan_method_t scan_method`  
  do all channel scan or fast scan
- `bool bssid_set`  
  whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
- `uint8_t bssid[6]`  
  MAC address of target AP
- `uint8_t channel`  
  channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.
- `uint16_t listen_interval`  
  Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.
- `wifi_sort_method_t sort_method`  
  sort the connect AP in the list by rssi or security mode
- `wifi_scan_threshold_t threshold`  
  When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.
- `wifi_pmf_config_t pmf_cfg`  
  Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

**struct wifi_sta_info_t**

Description of STA associated with AP.

**Public Members**

- `uint8_t mac[6]`  
  mac address
- `int8_t rssi`  
  current average rssi of sta connected
- `uint32_t phy_11b : 1`  
  bit: 0 flag to identify if 11b mode is enabled or not
- `uint32_t phy_11g : 1`  
  bit: 1 flag to identify if 11g mode is enabled or not
- `uint32_t phy_11n : 1`  
  bit: 2 flag to identify if 11n mode is enabled or not
- `uint32_t phy_lr : 1`  
  bit: 3 flag to identify if low rate is enabled or not
- `uint32_t reserved : 28`  
  bit: 4..31 reserved

```c
struct wifi_sta_list_t

List of stations associated with the ESP32 Soft-AP.

**Public Members**

- `wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]` - station list
- `int num` - number of stations in the list (other entries are invalid)

```c
struct vendor_ie_data_t

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

**Public Members**

- `uint8_t element_id` - Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)
- `uint8_t length` - Length of all bytes in the element data following this field. Minimum 4.
- `uint8_t vendor_oui_type` - Vendor-specific OUI type.
- `uint8_t payload[0]` - Payload. Length is equal to value in `length` field, minus 4.

```c
struct wifi_pkt_rx_ctrl_t

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

**Public Members**

- `signed rssi : 8` - Received Signal Strength Indicator (RSSI) of packet. Unit: dBm
- `unsigned rate : 5` - PHY rate encoding of the packet. Only valid for non HT(11bg) packet
- `unsigned __pad0__ : 1` - reserved
- `unsigned sig_mode : 2` - 0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet
- `unsigned __pad1__ : 16` - reserved
- `unsigned mcs : 7` - Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)
- `unsigned cwb : 1` - Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz
- `unsigned __pad2__ : 16` - reserved
unsigned smoothing: 1
    reserved
unsigned not_sounding: 1
    reserved
unsigned __pad3__: 1
    reserved
unsigned aggregation: 1
    Aggregation. 0: MPDU packet; 1: AMPDU packet
unsigned stbc: 2
    Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet
unsigned fec_coding: 1
    Flag is set for 11n packets which are LDPC
unsigned sgi: 1
    Short Guide Interval(SGI). 0: Long GI; 1: Short GI
signed noise_floor: 8
    noise floor of Radio Frequency Module(RF). unit: 0.25dBm
unsigned ampdu_cnt: 8
    ampdu cnt
unsigned channel: 4
    primary channel on which this packet is received
unsigned secondary_channel: 4
    secondary channel on which this packet is received. 0: none; 1: above; 2: below
unsigned __pad4__: 8
    reserved
unsigned timestamp: 32
    timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep
    is not enabled. unit: microsecond
unsigned __pad5__: 32
    reserved
unsigned __pad6__: 31
    reserved
unsigned ant: 1
    antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1
unsigned sig_len: 12
    length of packet including Frame Check Sequence(FCS)
unsigned __pad7__: 12
    reserved
unsigned rx_state: 8
    state of the packet. 0: no error; others: error numbers which are not public

struct wifi_promiscuous_pkt_t
    Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

Public Members

wifi_pkt_rx_ctrl_t rx_ctrl
    metadata header
uint8_t payload[0]
Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

struct wifi_promiscuous_filter_t
Mask for filtering different packet types in promiscuous mode.

Public Members

uint32_t filter_mask
OR of one or more filter values WIFI_PROMIS_FILTER_*

struct wifi_csi_config_t
Channel state information (CSI) configuration type.

Public Members

bool lltf_en
enable to receive legacy long training field (lltf) data. Default enabled

bool htltf_en
enable to receive HT long training field (htltf) data. Default enabled

bool stbc_htltf2_en
enable to receive space time block code HT long training field (stbc-hltf2) data. Default enabled

bool ltf_merge_en
enable to generate htlf data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

bool channel_filter_en
enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool manu_scale
manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8_t shift
manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct wifi_csi_info_t
CSI data type.

Public Members

wifi_pkt_rx_ctrl_t rx_ctrl
received packet radio metadata header of the CSI data

uint8_t mac[6]
source MAC address of the CSI data

bool first_word_invalid
first four bytes of the CSI data is invalid or not

int8_t *buf
buffer of CSI data

uint16_t len
length of CSI data

struct wifi_ant_gpio_t
WiFi GPIO configuration for antenna selection.
Public Members

```
uint8_t gpio_select : 1
Whether this GPIO is connected to external antenna switch
```

```
uint8_t gpio_num : 7
The GPIO number that connects to external antenna switch
```

```
struct wifi_ant_gpio_config_t
WiFi GPIOs configuration for antenna selection.
```

Public Members

```
wifi_ant_gpio_t gpio_cfg[4]
The configurations of GPIOs that connect to external antenna switch
```

```
struct wifi_ant_config_t
WiFi antenna configuration.
```

Public Members

```
wifi_ant_mode_t rx_ant_mode
WiFi antenna mode for receiving
```

```
wifi_ant_rx_ant_default
Default antenna mode for receiving, it’s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO
```

```
wifi_ant_mode_t tx_ant_mode
WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO
```

```
uint8_t enabled_ant0 : 4
Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0
```

```
uint8_t enabled_ant1 : 4
Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1
```

```
struct wifi_event_sta_scan_done_t
Argument structure for WIFI_EVENT_SCAN_DONE event
```

Public Members

```
uint32_t status
status of scanning APs: 0 — success, 1 — failure
```

```
uint8_t number
number of scan results
```

```
uint8_t scan_id
scan sequence number, used for block scan
```

```
struct wifi_event_sta_connected_t
Argument structure for WIFI_EVENT_STA_CONNECTED event
```

Public Members

```
uint8_t ssid[32]
SSID of connected AP
```

```
uint8_t ssid_len
SSID length of connected AP
```
uint8_t bssid[6]
    BSSID of connected AP

uint8_t channel
    channel of connected AP

wifi_auth_mode_t authmode
    authentication mode used by AP

struct wifi_event_sta_disconnected_t
    Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members

uint8_t ssid[32]
    SSID of disconnected AP

uint8_t ssid_len
    SSID length of disconnected AP

uint8_t bssid[6]
    BSSID of disconnected AP

uint8_t reason
    reason of disconnection

struct wifi_event_sta_authmode_change_t
    Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

wifi_auth_mode_t old_mode
    the old auth mode of AP

wifi_auth_mode_t new_mode
    the new auth mode of AP

struct wifi_event_sta_wps_er_pin_t
    Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

uint8_t pin_code[8]
    PIN code of station in enrollee mode

struct wifi_event_sta_wps_er_success_t
    Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

uint8_t ap_cred_cnt
    Number of AP credentials received

uint8_t ssid[MAX_SSID_LEN]
    SSID of AP

uint8_t passphrase[MAX_PASSPHRASE_LEN]
    Passphrase for the AP

struct wifi_event_sta_wps_er_success_t::[anonymous] ap_cred[MAX_WPS_AP_CRED]
    All AP credentials received from WPS handshake
struct wifi_event_ap_staconnected_t

Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

uint8_t *mac[6]
MAC address of the station connected to ESP32 soft-AP

uint8_t *aid
the aid that ESP32 soft-AP gives to the station connected to

struct wifi_event_ap_stadisconnected_t

Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t *mac[6]
MAC address of the station disconnects to ESP32 soft-AP

uint8_t *aid
the aid that ESP32 soft-AP gave to the station disconnects to

struct wifi_event_ap_probe_req_rx_t

Argument structure for WIFI_EVENT_AP_PROBEREQRECVD event

Public Members

int rssid
Received probe request signal strength

uint8_t *mac[6]
MAC address of the station which send probe request

Macros

WIFI_IF_STA
WIFI_IF_AP
WIFI_PROTOCOL_11B
WIFI_PROTOCOL_11G
WIFI_PROTOCOL_11N
WIFI_PROTOCOL_LR
ESP_WIFI_MAX_CONN_NUM
max number of stations which can connect to ESP32 soft-AP

WIFI_VENDOR_IE_ELEMENT_ID
WIFI_PROMIS_FILTER_MASK_ALL
filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT
filter the packets with type of WIFI_PKT_MGMT

WIFI_PROMIS_FILTER_MASK_CTRL
filter the packets with type of WIFI_PKT_CTRL

WIFI_PROMIS_FILTER_MASK_DATA
filter the packets with type of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_MISC
    filter the packets with type of WIFI_PKT_MISC

WIFI_PROMIS_FILTER_MASK_DATA_MPDU
    filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
    filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_FCSFAIL
    filter the FCS failed packets, do not open it in general

WIFI_PROMIS_CTRL_FILTER_MASK_ALL
    filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
    filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR
    filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA
    filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
    filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS
    filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
    filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
    filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
    filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
    filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL
    mask all WiFi events

WIFI_EVENT_MASK_NONE
    mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED
    mask SYSTEM_EVENT_AP_PROBEREQRECVED event

MAX_SSID_LEN
MAX_PASSPHRASE_LEN
MAX_WPS_AP_CRED
WIFI_STATIS_BUFFER
WIFI_STATIS_RXTX
WIFI_STATIS_HW
WIFI_STATIS_DIAG
WIFI_STATIS_ALL

Type Definitions
typedef esp_interface_t wifi_interface_t
Enumerations

enum wifi_mode_t
Values:

WIFI_MODE_NULL = 0
   null mode
WIFI_MODE_STA
   WiFi station mode
WIFI_MODE_AP
   WiFi soft-AP mode
WIFI_MODE_APSTA
   WiFi station + soft-AP mode
WIFI_MODE_MAX

enum wifi_country_policy_t
Values:

WIFI_COUNTRY_POLICY_AUTO
   Country policy is auto, use the country info of AP to which the station is connected
WIFI_COUNTRY_POLICY_MANUAL
   Country policy is manual, always use the configured country info

enum wifi_auth_mode_t
Values:

WIFI_AUTH_OPEN = 0
   authenticate mode: open
WIFI_AUTH_WEP
   authenticate mode: WEP
WIFI_AUTH_WPA_PSK
   authenticate mode: WPA_PSK
WIFI_AUTH_WPA2_PSK
   authenticate mode: WPA2_PSK
WIFI_AUTH_WPA_WPA2_PSK
   authenticate mode: WPA_WPA2_PSK
WIFI_AUTH_WPA2_ENTERPRISE
   authenticate mode: WPA2_ENTERPRISE
WIFI_AUTH_WPA3_PSK
   authenticate mode: WPA3_PSK
WIFI_AUTH_WPA2_WPA3_PSK
   authenticate mode: WPA2_WPA3_PSK
WIFI_AUTH_MAX

WIFI_REASON_CONNECTION_FAIL = 205
WIFI_REASON_AP_TSF_RESET = 206

enum wifi_second_chan_t
Values:

WIFI_SECOND_CHAN_NONE = 0
the channel width is HT20

WIFI_SECOND_CHAN_ABOVE
the channel width is HT40 and the secondary channel is above the primary channel

WIFI_SECOND_CHAN_BELOW
the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t
Values:

WIFI_SCAN_TYPE_ACTIVE = 0
active scan

WIFI_SCAN_TYPE_PASSIVE
passive scan

enum wifi_cipher_type_t
Values:

WIFI_CIPHER_TYPE_NONE = 0
the cipher type is none
WIFI_CIPHER_TYPE_WEP40
the cipher type is WEP40

WIFI_CIPHER_TYPE_WEP104
the cipher type is WEP104

WIFI_CIPHER_TYPE_TKIP
the cipher type is TKIP

WIFI_CIPHER_TYPE_CCMP
the cipher type is CCMP

WIFI_CIPHER_TYPE_TKIP_CCMP
the cipher type is TKIP and CCMP

WIFI_CIPHER_TYPE_AES_CMAC128
the cipher type is AES-CMAC-128

WIFI_CIPHER_TYPE_UNKNOWN
the cipher type is unknown

enum wifi_ant_t
WiFi antenna.

Values:

WIFI_ANT_ANT0
WiFi antenna 0

WIFI_ANT_ANT1
WiFi antenna 1

WIFI_ANT_MAX
Invalid WiFi antenna

enum wifi_scan_method_t
Values:

WIFI_FAST_SCAN = 0
Do fast scan, scan will end after find SSID match AP

WIFI_ALL_CHANNEL_SCAN
All channel scan, scan will end after scan all the channel

enum wifi_sort_method_t
Values:

WIFI_CONNECT_AP_BY_SIGNAL = 0
Sort match AP in scan list by RSSI

WIFI_CONNECT_AP_BY_SECURITY
Sort match AP in scan list by security mode

enum wifi_ps_type_t
Values:

WIFI_PS_NONE
No power save

WIFI_PS_MIN_MODEM
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

WIFI_PS_MAX_MODEM
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in wifi_sta_config_t

enum wifi_bandwidth_t
Values:

WIFI_BW_HT20 = 1
enum wifi_storage_t
Values:
WIFI_STORAGE_FLASH
   all configuration will store in both memory and flash
WIFI_STORAGE_RAM
   all configuration will only store in the memory

enum wifi_vendor_ie_type_t
Vendor Information Element type.
Determines the frame type that the IE will be associated with.
Values:
WIFI_VND_IE_TYPE_BEACON
WIFI_VND_IE_TYPE_PROBE_REQ
WIFI_VND_IE_TYPE_PROBE_RESP
WIFI_VND_IE_TYPE_ASSOC_REQ
WIFI_VND_IE_TYPE_ASSOC_RESP

enum wifi_vendor_ie_id_t
Vendor Information Element index.
Each IE type can have up to two associated vendor ID elements.
Values:
WIFI_VND_IE_ID_0
WIFI_VND_IE_ID_1

enum wifi_promiscuous_pkt_type_t
Promiscuous frame type.
Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.
Values:
WIFI_PKT_MGMT
   Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_CTRL
   Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_DATA
   Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_MISC
   Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.

enum wifi_ant_mode_t
WiFi antenna mode.
Values:
WIFI_ANT_MODE_ANT0
   Enable WiFi antenna 0 only
WIFI_ANT_MODE_ANT1
   Enable WiFi antenna 1 only
WIFI_ANT_MODE_AUTO
   Enable WiFi antenna 0 and 1, automatically select an antenna
**WIFI_ANT_MODE_MAX**
Invalid WiFi enabled antenna

**enum wifi_phy_rate_t**
WiFi PHY rate encodings.

*Values:*

- `WIFI_PHY_RATE_1M_L` = 0x00
  1 Mbps with long preamble
- `WIFI_PHY_RATE_2M_L` = 0x01
  2 Mbps with long preamble
- `WIFI_PHY_RATE_5M_L` = 0x02

WIFI_PHY_RATE_LORA_250K = 0x29
250 Kbps

WIFI_PHY_RATE_LORA_500K = 0x2A
500 Kbps

WIFI_PHY_RATE_MAX

enum wifi_event_t

WiFi event declarations

Values:

WIFI_EVENT_WIFI_READY = 0
ESP32 WiFi ready

WIFI_EVENT.Scan_DONE
ESP32 finish scanning AP

WIFI_EVENT_STA_START
ESP32 station start

WIFI_EVENT_STA_STOP
ESP32 station stop

WIFI_EVENT_STA_CONNECTED
ESP32 station connected to AP

WIFI_EVENT_STA_DISCONNECTED
ESP32 station disconnected from AP

WIFI_EVENT_STA.AuthMode_CHANGE
the auth mode of AP connected by ESP32 station changed

WIFI_EVENT_STA.WPS_ER_SUCCESS
ESP32 station wps succeeds in enrollee mode

WIFI_EVENT_STA.WPS_ER_FAILED
ESP32 station wps fails in enrollee mode
WIFI_EVENT_STA_WPS_ER_TIMEOUT
   ESP32 station wps timeout in enrollee mode

WIFI_EVENT_STA_WPS_ER_PIN
   ESP32 station wps pin code in enrollee mode

WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
   ESP32 station wps overlap in enrollee mode

WIFI_EVENT_AP_START
   ESP32 soft-AP start

WIFI_EVENT_AP_STOP
   ESP32 soft-AP stop

WIFI_EVENT_AP_STACONNECTED
   a station connected to ESP32 soft-AP

WIFI_EVENT_AP_STADISCONNECTED
   a station disconnected from ESP32 soft-AP

WIFI_EVENT_AP_PROBEREQRECVED
   Receive probe request packet in soft-AP interface

WIFI_EVENT_STA_BEACON_TIMEOUT
   ESP32 station beacon timeout

enum wifi_event_sta_wps_fail_reason_t
   Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

   Values:
   WPS_FAIL_REASON_NORMAL = 0
      ESP32 WPS normal fail reason
   WPS_FAIL_REASON_RECV_M2D
      ESP32 WPS receive M2D frame
   WPS_FAIL_REASON_MAX

SmartConfig

API Reference

Header File
   • esp_wifi/include/esp_smartconfig.h

Functions

const char *esp_smartconfig_get_version (void)
   Get the version of SmartConfig.

Return
   • SmartConfig version const char.

esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)
   Start SmartConfig, config ESP device to connect AP. You need to broadcast
   information by phone APP. Device sniffer special packets from the air
   that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.
Attention 2. Can not call esp_smartconfig_start twice before it finish, please call
esp_smartconfig_stop first.

Return
   • ESP_OK: succeed
   • others: fail

Parameters
• config: pointer to smartconfig start configure structure

```c
esp_err_t esp_smartconfig_stop(void)
```

Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

**Return**
- ESP_OK: succeed
- others: fail

```c
esp_err_t esp_esptouch_set_timeout(uint8_t time_s)
```

Set timeout of SmartConfig process.

**Attention** Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

**Return**
- ESP_OK: succeed
- others: fail

**Parameters**
- time_s: range 15s~255s, offset:45s.

```c
esp_err_t esp_smartconfig_set_type(smartconfig_type_t type)
```

Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

**Return**
- ESP_OK: succeed
- others: fail

**Parameters**
- type: Choose from the smartconfig_type_t.

```c
esp_err_t esp_smartconfig_fast_mode(bool enable)
```

Set mode of SmartConfig. default normal mode.

**Attention** 1. Please call it before API esp_smartconfig_start.  
**Attention** 2. Fast mode have corresponding APP(phone).  
**Attention** 3. Two mode is compatible.

**Return**
- ESP_OK: succeed
- others: fail

**Parameters**
- enable: false-disable(default); true-enable;

---

**Structures**

```c
struct smartconfig_event_got_ssid_pswd_t
```

Argument structure for SC_EVENT_GOT_SSID_PSWD event

**Public Members**

```c
uint8_t ssid[32]
```

SSID of the AP. Null terminated string.

```c
uint8_t password[64]
```

Password of the AP. Null terminated string.

```c
bool bssid_set
```

whether set MAC address of target AP or not.

```c
uint8_t bssid[6]
```

MAC address of target AP.

```c
smartconfig_type_t type
```

Type of smartconfig(ESP Touch or AirKiss).
uint8_t token
Token from cellphone which is used to send ACK to cellphone.

uint8_t cellphone_ip[4]
IP address of cellphone.

struct smartconfig_start_config_t
Configure structure for esp_smartconfig_start

Public Members

bool enable_log
Enable smartconfig logs.

Macros
SMARTCONFIG_START_CONFIG_DEFAULT()

Enumerations
enum smartconfig_type_t
Values:

SC_TYPE_ESPTOUCH = 0
protocol: ESPTouch

SC_TYPE_AIRKISS
protocol: AirKiss

SC_TYPE_ESPTOUCH_AIRKISS
protocol: ESPTouch and AirKiss

enum smartconfig_event_t
Smartconfig event declarations
Values:

SC_EVENT_SCAN_DONE
ESP32 station smartconfig has finished to scan for APs

SC_EVENT_FOUND_CHANNEL
ESP32 station smartconfig has found the channel of the target AP

SC_EVENT_GOT_SSID_PSWD
ESP32 station smartconfig got the SSID and password

SC_EVENT_SEND_ACK_DONE
ESP32 station smartconfig has sent ACK to cellphone

ESP-NOW

Overview
ESP-NOW is a kind of connectionless WiFi communication protocol which is defined by Espressif. In ESP-NOW, application data is encapsulated in vendor-specific action frame and then transmitted from one WiFi device to another without connection. CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

Frame Format
ESP-NOW uses vendor-specific action frame to transmit ESP-NOW data. The format of vendor-specific action frame is as follows:

| MAC Header | Category Code | Organization Identifier | Vendor Specific Content | FCS |

(continues on next page)
### Category Code
The Category field is set to the value(127) indicating the vendor-specific category.

### Organization Identifier
The Organization Identifier contains a unique identifier(0x18fe34) which is the first three bytes of MAC address applied by Espressif.

### Vendor Specific Content
The Vendor Specific Content contains vendor-specific field as follows:

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
<td>0~250 bytes</td>
</tr>
</tbody>
</table>

- **Element ID**: The Element ID field is set to the value(221) indicating the vendor-specific element.
- **Length**: The length is the total length of Organization Identifier, Type, Version and Body.
- **Organization Identifier**: The Organization Identifier contains a unique identifier(0x18fe34) which is the first three bytes of MAC address applied by Espressif.
- **Type**: The Type field is set to the value(4) indicating ESP-NOW.
- **Version**: The Version field is set to the version of ESP-NOW.
- **Body**: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address(0xff:0xff:0xff:0xff:0xff:0xff).

### Security
ESP-NOW use CCMP method which can be referenced in IEEE Std. 802.11-2012 to protect the vendor-specific action frame. The WiFi device maintains a Primary Master Key(PMK) and several Local Master Keys(LMK). The lengths of them are 16 bytes. PMK is used to encrypt LMK with AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used. If LMK of the paired device is set, it will be used to encrypt the vendor-specific action frame with CCMP method. The maximum number of different LMKs is six. Do not support encrypting multicast vendor-specific action frame.

### Initialization and De-initialization
Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after WiFi is started, so it is recommended to start WiFi before initializing ESP-NOW and stop WiFi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

### Add Paired Device
Before sending data to other device, call `esp_now_add_peer()` to add it to the paired device list first. The maximum number of paired devices is twenty. If security is enabled, the LMK must be set. ESP-NOW data can be sent from station or softap interface. Make sure that the interface is enabled before sending ESP-NOW data. A device with broadcast MAC address must be added before sending broadcast data. The range of the channel of paired device is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

### Send ESP-NOW Data
Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. There are several reasons failing to send ESP-NOW data, for example, the destination device doesn’t exist, the channels of the devices are not the same, the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeout happens, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicated data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW datagrams may lead to disorder of sending.
callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of previous sending has returned. The sending callback function runs from a high-priority WiFi task. So, do not do lengthy operations in the callback function. Instead, post necessary data to a queue and handle it from a lower priority task.

Receiving ESP-NOW Data Call `esp_now_register_recv_cb` to register receiving callback function. When receiving ESP-NOW data, receiving callback function is called. The receiving callback function also runs from WiFi task. So, do not do lengthy operations in the callback function. Instead, post necessary data to a queue and handle it from a lower priority task.

API Reference

Header File
- `esp_wifi/include/esp_now.h`

Functions

```c
esp_err_t esp_now_init (void)

Initialize ESPNOW function.

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_INTERNAL : Internal error
```

```c
esp_err_t esp_now_deinit (void)

De-initialize ESPNOW function.

Return
- ESP_OK : succeed
```

```c
esp_err_t esp_now_get_version (uint32_t *version)

Get the version of ESPNOW.

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_ARG : invalid argument

Parameters
- `version`: ESPNOW version
```

```c
esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)

Register callback function of receiving ESPNOW data.

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL : internal error

Parameters
- `cb`: callback function of receiving ESPNOW data
```

```c
esp_err_t esp_now_unregister_recv_cb (void)

Unregister callback function of receiving ESPNOW data.

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
```

```c
esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)

Register callback function of sending ESPNOW data.

Return
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
```
Chapter 2. API Reference

- **ESP_ERR_ESPNOW_INTERNAL**: internal error

**Parameters**
- `cb`: callback function of sending ESPNOW data

**esp_err_t esp_now_unregister_send_cb** (void)
Unregister callback function of sending ESPNOW data.

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_ESPNOW_NOT_INIT**: ESPNOW is not initialized

**esp_err_t esp_now_send** (const uint8_t *peer_addr, const uint8_t *data, size_t len)
Send ESPNOW data.

**Attention**
1. If `peer_addr` is not NULL, send data to the peer whose MAC address matches `peer_addr`
2. If `peer_addr` is NULL, send data to all of the peers that are added to the peer list
3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
4. The buffer pointed to by `data` argument does not need to be valid after esp_now_send returns

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_ESPNOW_NOT_INIT**: ESPNOW is not initialized
- **ESP_ERR_ESPNOW_ARG**: invalid argument
- **ESP_ERR_ESPNOW_INTERNAL**: internal error
- **ESP_ERR_ESPNOW_NO_MEM**: out of memory
- **ESP_ERR_ESPNOW_NOT_FOUND**: peer is not found
- **ESP_ERR_ESPNOW_IF**: current WiFi interface doesn’t match that of peer

**Parameters**
- `peer_addr`: peer MAC address
- `data`: data to send
- `len`: length of data

**esp_err_t esp_now_add_peer** (const esp_now_peer_info_t *peer)
Add a peer to peer list.

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_ESPNOW_NOT_INIT**: ESPNOW is not initialized
- **ESP_ERR_ESPNOW_ARG**: invalid argument
- **ESP_ERR_ESPNOW_INTERNAL**: internal error
- **ESP_ERR_ESPNOW_NO_MEM**: out of memory
- **ESP_ERR_ESPNOW_EXIST**: peer has existed

**Parameters**
- `peer`: peer information

**esp_err_t esp_now_del_peer** (const uint8_t *peer_addr)
Delete a peer from peer list.

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_ESPNOW_NOT_INIT**: ESPNOW is not initialized
- **ESP_ERR_ESPNOW_ARG**: invalid argument
- **ESP_ERR_ESPNOW_NOT_FOUND**: peer is not found

**Parameters**
- `peer_addr`: peer MAC address

**esp_err_t esp_now_mod_peer** (const esp_now_peer_info_t *peer)
Modify a peer.

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_ESPNOW_NOT_INIT**: ESPNOW is not initialized
- **ESP_ERR_ESPNOW_ARG**: invalid argument
- **ESP_ERR_ESPNOW_FULL**: peer list is full
Parameters

• peer: peer information

\[
\text{\texttt{esp_err_t esp_now_get_peer (const uint8_t* peer_addr, esp_now_peer_info_t* peer)}}
\]

Get a peer whose MAC address matches peer_addr from peer list.

Return

• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

Parameters

• peer_addr: peer MAC address
• peer: peer information

\[
\text{\texttt{esp_err_t esp_now_fetch_peer (bool from_head, esp_now_peer_info_t* peer)}}
\]

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

Return

• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

Parameters

• from_head: fetch from head of list or not
• peer: peer information

\[
\text{\texttt{bool esp_now_is_peer_exist (const uint8_t* peer_addr)}}
\]

Peer exists or not.

Return

• true : peer exists
• false : peer not exists

Parameters

• peer_addr: peer MAC address

\[
\text{\texttt{esp_err_t esp_now_get_peer_num (esp_now_peer_num_t* num)}}
\]

Get the number of peers.

Return

• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument

Parameters

• num: number of peers

\[
\text{\texttt{esp_err_t esp_now_set_pmk (const uint8_t* pmk) }}
\]

Set the primary master key.

Attention

1. primary master key is used to encrypt local master key

Return

• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument

Parameters

• pmk: primary master key

Structures

\[
\text{\texttt{struct esp_now_peer_info}}
\]

ESP NOW peer information parameters.
**Public Members**

- `uint8_t peer_addr[ESP_NOW_ETH_ALEN]`  
  ESPNOW peer MAC address that is also the MAC address of station or softap

- `uint8_t lmk[ESP_NOW_KEY_LEN]`  
  ESPNOW peer local master key that is used to encrypt data

- `uint8_t channel`  
  Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

- `wifi_interface_t ifidx`  
  Wi-Fi interface that peer uses to send/receive ESPNOW data

- `bool encrypt`  
  ESPNOW data that this peer sends/receives is encrypted or not

- `void *priv`  
  ESPNOW peer private data

**struct esp_now_peer_num**

Number of ESPNOW peers which exist currently.

**Public Members**

- `int total_num`  
  Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

- `int encrypt_num`  
  Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM

**Macros**

- `ESP_ERR_ESPNOW_BASE`  
  ESPNOW error number base.

- `ESP_ERR_ESPNOW_NOT_INIT`  
  ESPNOW is not initialized.

- `ESP_ERR_ESPNOW_ARG`  
  Invalid argument

- `ESP_ERR_ESPNOW_NO_MEM`  
  Out of memory

- `ESP_ERR_ESPNOW_FULL`  
  ESPNOW peer list is full

- `ESP_ERR_ESPNOW_NOT_FOUND`  
  ESPNOW peer is not found

- `ESP_ERR_ESPNOW_INTERNAL`  
  Internal error

- `ESP_ERR_ESPNOW_EXIST`  
  ESPNOW peer has existed

- `ESP_ERR_ESPNOW_IF`  
  Interface error

- `ESP_NOW_ETH_ALEN`  
  Length of ESPNOW peer MAC address

- `ESP_NOW_KEY_LEN`  
  Length of ESPNOW peer local master key
ESP_NOW_MAX_TOTAL_PEER_NUM
- Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM
- Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN
- Maximum length of ESPNOW data which is sent very time

Type Definitions
typedef struct esp_now_peer_info esp_now_peer_info_t
ESPNOW peer information parameters.
typedef struct esp_now_peer_num esp_now_peer_num_t
Number of ESPNOW peers which exist currently.
typedef void (*esp_now_recv_cb_t)(const uint8_t *mac_addr, const uint8_t *data, int data_len)
Callback function of receiving ESPNOW data.
Parameters
  • mac_addr: peer MAC address
  • data: received data
  • data_len: length of received data
typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
Callback function of sending ESPNOW data.
Parameters
  • mac_addr: peer MAC address
  • status: status of sending ESPNOW data (succeed or fail)

Enumerations
enum esp_now_send_status_t
Status of sending ESPNOW data.
Values:
  ESP_NOW_SEND_SUCCESS = 0
  Send ESPNOW data successfully
  ESP_NOW_SEND_FAIL
  Send ESPNOW data fail

ESP-MESH Programming Guide
This is a programming guide for ESP-MESH, including the API reference and coding examples. This guide is split
into the following parts:
  1. ESP-MESH Programming Model
  2. Writing an ESP-MESH Application
  3. Self Organized Networking
  4. Application Examples
  5. API Reference

For documentation regarding the ESP-MESH protocol, please see the ESP-MESH API Guide.

ESP-MESH Programming Model

Software Stack
The ESP-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-MESH software stack.
System Events  An application interfaces with ESP-MESH via ESP-MESH Events. Since ESP-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the Wi-Fi Event Task. The following diagram illustrates the interfaces for the various System Events in an ESP-MESH application.

The mesh_event_id_t defines all possible ESP-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-MESH events can be used, the application must register a Mesh Events handler via esp_event_handler_register() to the default event task. Should contain handlers for each event relevant to the application.

Typical use cases of mesh events include using events such as MESH_EVENT_PARENT_CONNECTED and MESH_EVENT_CHILD_CONNECTED to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, IP_EVENT_STA_GOT_IP and IP_EVENT_STA_LOST_IP can be used to indicate when the root node can and cannot transmit data to the external IP network.

Warning: When using ESP-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect.scan etc. Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-MESH’s self-organizing behavior. Therefore, user’s should not call Wi-Fi APIs after esp_mesh_start() is called, and before esp_mesh_stop() is called.

LwIP & ESP-MESH  The application can access the ESP-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

Each node is required to initialize LwIP by calling tcpip_adapter_init(). In order to prevent non-root node access to LwIP, the application should stop the following services after LwIP initialization:
Chapter 2. API Reference

- DHCP server service on the softAP interface.
- DHCP client service on the station interface.

The following code snippet demonstrates how to initialize LwIP for ESP-MESH applications.

```c
/* tcpip initialization */
tcpip_adapter_init();
/
* for mesh
* stop DHCP server on softAP interface by default
* stop DHCP client on station interface by default
*/
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
```

**Note:** ESP-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an IP address. Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-MESH Application** The prerequisites for starting ESP-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-MESH itself can be initialized.

```c
tcpip_adapter_init();
/*
* for mesh
* stop DHCP server on softAP interface by default
* stop DHCP client on station interface by default
*/
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
/
* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());
/
* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/
* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_,
  event_handler, NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-MESH Network**
3. **Start Mesh**

**Initialize Mesh** The following code snippet demonstrates how to initialize ESP-MESH

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/
* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_,
  event_handler, NULL));
```
Configuring an ESP-MESH Network

ESP-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code></td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-MESH.

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD, strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD, strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```

Start Mesh

The following code snippet demonstrates how to start ESP-MESH.

```c
/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-MESH, the application should check for ESP-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

Self Organized Networking

Self organized networking is a feature of ESP-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-MESH network are able to carryout the following actions without autonomously:

- Selection or election of the root node (see **Automatic Root Node Selection** in Building a Network)
- Selection of a preferred parent node (see **Parent Node Selection** in Building a Network)
- Automatic reconnection upon detecting a disconnection (see **Intermediate Parent Node Failure** in Managing a Network)

When self organized networking is enabled, the ESP-MESH stack will internally make calls to Wi-Fi driver APIs. Therefore, the application layer should not make any calls to Wi-Fi driver APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-MESH.

Toggling Self Organized Networking

Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:
• `bool enable` specifies whether to enable or disable self organized networking.
• `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending on the node type and the node’s current state. This parameter is unused when disabling self organized networking.

**Disabling Self Organized Networking**  The following code snippet demonstrates how to disable self organized networking.

```c
//Disable self organized networking
esp_mesh_set_self_organized(false, false);
```

ESP-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

**Enabling Self Organized Networking**  ESP-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.

<table>
<thead>
<tr>
<th>Select Parent</th>
<th>Is Root Node</th>
<th>Effects</th>
</tr>
</thead>
</table>
| N             | N            | • Nodes already connected to a parent node will remain connected.  
|               |              | • Nodes previously scanning for a parent node will stop scanning. Call `esp_mesh_connect()` to restart. |
|               | Y            | • A root node already connected to router will stay connected.  
|               |              | • A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect. |
| Y             | N            | • Nodes without a parent node will automatically select a preferred parent and connect.  
|               |              | • Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
|               | Y            | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |
Chapter 2. API Reference

The following code snippet demonstrates how to enable self organized networking.

```c
// Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
...

// Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**Calling Wi-Fi Driver API** There can be instances in which an application may want to directly call Wi-Fi driver API whilst using ESP-MESH. For example, an application may want to manually scan for neighboring APs. However, **self organized networking must be disabled before the application calls any Wi-Fi driver APIs**. This will prevent the ESP-MESH stack from attempting to call any Wi-Fi driver APIs and potentially interfering with the application’s calls. Therefore, application calls to Wi-Fi driver APIs should be placed between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using ESP-MESH.

```c
// Disable self organized networking
esp_mesh_set_self_organized(0, 0);

// Stop any scans already in progress
esp_wifi_scan_stop();
// Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

// Process scan results
...

// Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);
...

// Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);
...

// Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); // Don't select new parent
esp_mesh_connect(); // Manually reconnect to router
```

**Application Examples** ESP-IDF contains these ESP-MESH example projects:

The **Internal Communication Example** demonstrates how to setup a ESP-MESH network and have the root node send a data packet to every node within the network.

The **Manual Networking Example** demonstrates how to use ESP-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

**API Reference**
Chapter 2. API Reference

Header File

- esp_wifi/include/esp_mesh.h

Functions

`esp_err_t esp_mesh_init (void)`
Mesh initialization.
- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

**Return**
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_deinit (void)`
Mesh de-initialization.
- Release resources and stop the mesh

**Return**
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_start (void)`
Start mesh.
- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Return**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

`esp_err_t esp_mesh_stop (void)`
Stop mesh.
- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.

**Return**
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_send (const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)`
Send a packet over the mesh network.
- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

**Return**

Espressif Systems 511 Release v4.0.3-189-g7c4f5fa
Submit Document Feedback
Chapter 2. API Reference

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

Parameters

- **[in]** `to`: the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **[in]** `data`: pointer to a sending mesh packet
  - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  - Field protocol should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- **[in]** `flag`: bitmap for data sent
  - Speed up the route search
    * If the packet is to the root and "to" parameter is NULL, set this parameter to 0.
    * If the packet is to an internal device, MESH_DATA_P2P should be set.
    * If the packet is to the root ("to" parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    * If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use `esp_mesh_send_block_time()` to specify a blocking time.
  - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by `esp_mesh_recv_toDS()`. Generally, we suggest `esp_mesh_recv_toDS()` is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading `esp_mesh_recv_toDS()` which avoids unnecessary memory copy.
- **[in]** `opt`: options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- **[in]** `opt_count`: option count
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

```c
esp_err_t esp_mesh_send_block_time(uint32_t time_ms)
```

**Set blocking time of esp_mesh_send()**

**Attention** This API shall be called before mesh is started.

**Return**

- ESP_OK

**Parameters**

- **[in]** `time_ms`: blocking time of esp_mesh_send(), unit:ms
"esp_err_t" esp_mesh_recv (mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)

Receive a packet targeted to self over the mesh network.

flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

Attention Mesh RX queue should be checked regularly to avoid running out of memory.

- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

Return
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

Parameters
- [out] from: the address of the original source of the packet
- [out] data: pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- [in] timeout_ms: wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)
- [out] flag: bitmap for data received
  - MESH_DATA_FROMDS represents data from external IP network
  - MESH_DATA_TODS represents data directed upward within the mesh network

esp_err_t esp_mesh_recv_toDS (mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)  

Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default: 32. If this size is too large, and esp_mesh_recv_toDS() isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

Attention This API is only called by the root.

Return
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD

Parameters
- [out] from: the address of the original source of the packet
- [out] to: the address contains remote IP address and port (IPv4:PORT)
- [out] data: pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
• [in] timeout_ms: wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)
• [out] flag: bitmap for data received
  – MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

Parameters
• [out] opt: options desired to receive
• [in] opt_count: option count desired to receive

\[function\]
\[esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)\]
Set mesh stack configuration.

• Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
• Mesh network is established on a fixed channel (1-14).
• Mesh event callback is mandatory.
• Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
• Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max: 10).

Attention This API shall be called before mesh is started after mesh is initialized.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• [in] config: pointer to mesh stack configuration

\[function\]
\[esp_err_t esp_mesh_get_config(mesh_cfg_t *config)\]
Get mesh stack configuration.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• [out] config: pointer to mesh stack configuration

\[function\]
\[esp_err_t esp_mesh_set_router(const mesh_router_t *router)\]
Set router configuration.

Attention This API is used to dynamically modify the router configuration after mesh is configured.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• [in] router: pointer to router configuration

\[function\]
\[esp_err_t esp_mesh_get_router(mesh_router_t *router)\]
Get router configuration.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• [out] router: pointer to router configuration

```c
esp_err_t esp_mesh_set_id(const mesh_addr_t *id)
```

Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

**Parameters**
- [in] id: pointer to mesh network ID

```c
esp_err_t esp_mesh_get_id(mesh_addr_t *id)
```

Get mesh network ID.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [out] id: pointer to mesh network ID

```c
esp_err_t esp_mesh_set_type(mesh_type_t type)
```

Designate device type over the mesh network.

- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] type: device type

```c
mesh_type_t esp_mesh_get_type(void)
```

Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return** mesh type

```c
esp_err_t esp_mesh_set_max_layer(int max_layer)
```

Set network max layer value (max:25, default:25)

- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] max_layer: max layer value

```c
int esp_mesh_get_max_layer(void)
```

Get max layer value.

**Return** max layer value

```c
esp_err_t esp_mesh_set_ap_password(const uint8_t *pwd, int len)
```

Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED
## Chapter 2. API Reference

### Parameters

- **[in]** `pwd`: pointer to the password
- **[in]** `len`: password length

#### esp_err_t esp_mesh_set_ap_authmode(wifi_auth_mode_t authmode)

Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

#### wifi_auth_mode_t esp_mesh_get_ap_authmode(void)

Get mesh softAP authentication mode.

**Return** authentication mode

#### esp_err_t esp_mesh_set_ap_connections(int connections)

Set mesh softAP max connection value.

**Attention** This API shall be called before mesh is started.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

#### int esp_mesh_get_ap_connections(void)

Get mesh softAP max connection configuration.

**Return** the number of max connections

#### int esp_mesh_get_layer(void)

Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return** layer value

#### esp_err_t esp_mesh_get_parent_bssid(mesh_addr_t *bssid)

Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return**

- ESP_OK
- ESP_FAIL

#### bool esp_mesh_is_root(void)

Return whether the device is the root node of the network.

**Return** true/false

#### esp_err_t esp_mesh_set_self_organized(bool enable, bool select_parent)

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

**Attention** This API is used to dynamically modify whether to enable the self organizing.
Return

• ESP_OK
• ESP_FAIL

Parameters

• [in] enable: enable or disable self-organized networking
• [in] select_parent: Only valid when self-organized networking is enabled.
  – if select_parent is set to true, the root will give up its mesh root status and search for a new
    parent like other non-root devices.

bool esp_mesh_get_self_organized (void)
Return whether enable self-organized networking or not.

Return true/false

esp_err_t esp_mesh_waive_root (const mesh_vote_t *vote, int reason)
Cause the root device to give up (waive) its mesh root status.

• A device is elected root primarily based on RSSI from the external router.
• If external router conditions change, users can call this API to perform a root switch.
• In this API, users could specify a desired root address to replace itself or specify an attempts value to
  ask current root to initiate a new round of voting. During the voting, a better root candidate would be
  expected to find to replace the current one.
• If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better
  root candidate is found, keep the current one. If a better candidate is found, the new better one will send
  a root switch request to the current root, current root will respond with a root switch acknowledgment.
• After that, the new candidate will connect to the router to be a new root, the previous root will disconnect
  with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

Return

• ESP_OK
• ESP_ERR_MESH_QUEUE_FULL
• ESP_ERR_MESH_DISCARD
• ESP_FAIL

Parameters

• [in] vote: vote configuration
  – If this parameter is set NULL, the vote will perform the default 15 times.
  – Field percentage threshold is 0.9 by default.
  – Field is rc specified shall be false.
  – Field attempts shall be at least 15 times.
• [in] reason: only accept MESH_VOTE_REASON_ROOT_INITIATED for now

esp_err_t esp_mesh_set_vote_percentage (float percentage)
Set vote percentage threshold for approval of being a root.

• During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

Attention This API shall be called before mesh is started.

Return

• ESP_OK
• ESP_FAIL

Parameters

• [in] percentage: vote percentage threshold

float esp_mesh_get_vote_percentage (void)
Get vote percentage threshold for approval of being a root.

Return percentage threshold

esp_err_t esp_mesh_set_ap_assoc_expire (int seconds)
Set mesh softAP associate expired time (default:10 seconds)
• If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
• If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] seconds: the expired time

int esp_mesh_get_ap_assoc_expire (void)
Get mesh softAP associate expired time.

Return seconds

int esp_mesh_get_total_node_num (void)
Get total number of devices in current network (including the root)

Attention The returned value might be incorrect when the network is changing.
Return total number of devices (including the root)

int esp_mesh_get_routing_table_size (void)
Get the number of devices in this device’s sub-network (including self)

Return the number of devices over this device’s sub-network (including self)

esp_err_t esp_mesh_get_routing_table (mesh_addr_t *mac, int len, int *size)
Get routing table of this device’s sub-network (including itself)

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• [out] mac: pointer to routing table
• [in] len: routing table size (in bytes)
• [out] size: pointer to the number of devices in routing table (including itself)

esp_err_t esp_mesh_post_toDS_state (bool reachable)
Post the toDS state to the mesh stack.

Attention This API is only for the root.
Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] reachable: this state represents whether the root is able to access external IP network

esp_err_t esp_mesh_get_tx_pending (mesh_tx_pending_t *pending)
Return the number of packets pending in the queue waiting to be sent by the mesh stack.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [out] pending: pointer to the TX pending

esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)
Return the number of packets available in the queue waiting to be received by applications.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [out] pending: pointer to the RX pending
int esp_mesh_available_txupQ_num(const mesh_addr_t *addr, uint32_t *xseqno_in)

Return the number of packets could be accepted from the specified address.

Parameters
• [in] addr: self address or an associate children address
• [out] xseqno_in: sequence number of the last received packet from the specified address

esp_err_t esp_mesh_set_xon_qsize(int qsize)

Set the number of queue.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] qsize: default:32 (min:16)

int esp_mesh_get_xon_qsize(void)

Get queue size.

Return the number of queue

esp_err_t esp_mesh_allow_root_conflicts(bool allowed)

Set whether allow more than one root existing in one network.

Return
• ESP_OK
• ESP_WIFI_ERR_NOT_INIT
• ESP_WIFI_ERR_NOT_START

Parameters
• [in] allowed: allow or not

bool esp_mesh_is_root_conflicts_allowed(void)

Check whether allow more than one root to exist in one network.

Return true/false

esp_err_t esp_mesh_set_group_id(const mesh_addr_t *addr, int num)

Set group ID addresses.

Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters
• [in] addr: pointer to new group ID addresses
• [in] num: the number of group ID addresses

esp_err_t esp_mesh_delete_group_id(const mesh_addr_t *addr, int num)

Delete group ID addresses.

Return
• ESP_OK
• ESP_MESH_ERR_ARGUMENT

Parameters
• [in] addr: pointer to deleted group ID address
• [in] num: the number of group ID addresses

int esp_mesh_get_group_num(void)

Get the number of group ID addresses.

Return the number of group ID addresses

esp_err_t esp_mesh_get_group_list(mesh_addr_t *addr, int num)

Get group ID addresses.

Return
Chapter 2. API Reference

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters
- [out] addr: pointer to group ID addresses
- [in] num: the number of group ID addresses

bool esp_mesh_is_my_group(const mesh_addr_t *addr)
Check whether the specified group address is my group.

Return true/false

esp_err_t esp_mesh_set_capacity_num(int num)
Set mesh network capacity (max:1000, default:300)

Attention This API shall be called before mesh is started.

Return
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

Parameters
- [in] num: mesh network capacity

int esp_mesh_get_capacity_num(void)
Get mesh network capacity.

Return mesh network capacity

esp_err_t esp_mesh_set_ie_crypto_funcs(const mesh_crypto_funcs_t *crypto_funcs)
Set mesh IE crypto functions.

Attention This API can be called at any time after mesh is initialized.

Return
- ESP_OK

Parameters
- [in] crypto_funcs: crypto functions for mesh IE
  - If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

esp_err_t esp_mesh_set_ie_crypto_key(const char *key, int len)
Set mesh IE crypto key.

Attention This API can be called at any time after mesh is initialized.

Return
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters
- [in] key: ASCII crypto key
- [in] len: length in bytes, range:8-64

esp_err_t esp_mesh_get_ie_crypto_key(char *key, int len)
Get mesh IE crypto key.

Return
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters
- [out] key: ASCII crypto key
- [in] len: length in bytes, range:8-64

esp_err_t esp_mesh_set_root_healing_delay(int delay_ms)
Set delay time before starting root healing.

Return
- ESP_OK

Parameters
- [in] delay_ms: delay time in milliseconds
Chapter 2. API Reference

**int esp_mesh_get_root_healing_delay(void)**
Get delay time before network starts root healing.

**Return** delay time in milliseconds

**esp_err_t esp_mesh_fix_root(bool enable)**
Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

**Return**
- ESP_OK

**Parameters**
- [in] enable: enable or not

**bool esp_mesh_is_root_fixed(void)**
Check whether network Fixed Root Setting is enabled.

- Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

**Return** true/false

**esp_err_t esp_mesh_set_parent(const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)**
Set a specified parent for the device.

**Attention** This API can be called at any time after mesh is configured.

**Return**
- ESP_OK
- ESP_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_CONFIG

**Parameters**
- [in] parent: parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
- [in] parent_mesh_id: parent mesh ID.
  - If this value is not set, the original mesh ID is used.
- [in] my_type: mesh type
  - If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
- [in] my_layer: mesh layer
  - my_layer of the device may change after joining the network.
  - If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  - If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

**esp_err_t esp_mesh_scan_get_ap_ie_len(int *len)**
Get mesh networking IE length of one AP.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

**Parameters**
- [out] len: mesh networking IE length

**esp_err_t esp_mesh_scan_get_ap_record(wifi_ap_record_t *ap_record, void *buffer)**
Get AP record.

**Attention** Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time. See “manual_networking” example.
Return
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

Parameters
- [out] ap_record: pointer to one AP record
- [out] buffer: pointer to the mesh networking IE of this AP

```c
esp_err_t esp_mesh_flush_upstream_packets (void)
```
Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

Return
- ESP_OK

```c
esp_err_t esp_mesh_get_subnet_nodes_num (const mesh_addr_t *child_mac, int *nodes_num)
```
Get the number of nodes in the subnet of a specific child.

Return
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

Parameters
- [in] child_mac: an associated child address of this device
- [out] nodes_num: pointer to the number of nodes in the subnet of a specific child

```c
esp_err_t esp_mesh_get_subnet_nodes_list (const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)
```
Get nodes in the subnet of a specific child.

Return
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

Parameters
- [in] child_mac: an associated child address of this device
- [out] nodes: pointer to nodes in the subnet of a specific child
- [in] nodes_num: the number of nodes in the subnet of a specific child

```c
esp_err_t esp_mesh_disconnect (void)
```
Disconnect from current parent.

Return
- ESP_OK

```c
esp_err_t esp_mesh_connect (void)
```
Connect to current parent.

Return
- ESP_OK

```c
esp_err_t esp_mesh_flush_scan_result (void)
```
Flush scan result.

Return
- ESP_OK

```c
esp_err_t esp_mesh_switch_channel (const uint8_t *new_bssid, int csa_newchan, int csa_count)
```
Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

Return
• ESP_OK

Parameters

• [in] new_bssid: the new router BSSID if the router changes
• [in] csa_newchan: the new channel number to which the whole network is moving
• [in] csa_count: channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

```
esp_err_t esp_mesh_get_router_bssid(uint8_t* router_bssid)
```

Get the router BSSID.

Return

• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_WIFI_ARG

Parameters

• [out] router_bssid: pointer to the router BSSID

```
int64_t esp_mesh_get_tsf_time(void)
```

Get the TSF time.

Return  the TSF time

Unions

```
union mesh_addr_t
    #include <esp_mesh.h> Mesh address.
```

Public Members

```
uint8_t addr[6]  // mac address
mip_t mip  // mip address
```

```
union mesh_event_info_t
    #include <esp_mesh.h> Mesh event information.
```

Public Members

```
mesh_event_channel_switch_t channel_switch
    // channel switch
mesh_event_child_connected_t child_connected
    // child connected
mesh_event_childDisconnected_t child_disconnected
    // child disconnected
mesh_event_routing_table_change_t routing_table
    // routing table change
mesh_event_connected_t connected
    // parent connected
mesh_event_disconnected_t disconnected
    // parent disconnected
mesh_event_no_parent_found_t no_parent
    // no parent found
mesh_event_layer_change_t layer_change
    // layer change
```
mesh_event_toDS_state_t toDS_state
toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t vote_started
vote started

mesh_event_root_got_ip_t got_ip
root obtains IP address

mesh_event_root_address_t root_addr
root address

mesh_event_root_switch_req_t switch_req
root switch request

mesh_event_root_conflict_t root_conflict
other powerful root

mesh_event_root_fixed_t root_fixed
fixed root

mesh_event_scan_done_t scan_done
scan done

mesh_event_network_state_t network_state
network state, such as whether current mesh network has a root.

mesh_event_find_network_t find_network
network found that can join

mesh_event_router_switch_t router_switch
new router information

union mesh_rc_config_t
#include <esp_mesh.h> Vote address configuration.

Public Members

int attempts
max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t rc_addr
a new root address specified by users for API esp_mesh_waive_root()

Structures
struct mip_t
IP address and port.

Public Members

ip4_addr_t ip4
IP address

uint16_t port
port

struct mesh_event_channel_switch_t
Channel switch information.
Public Members

uint8_t channel
new channel

struct mesh_event_connected_t
Parent connected information.

Public Members

system_event_sta_connected_t connected
parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint8_t self_layer
layer

struct mesh_event_no_parent_found_t
No parent found information.

Public Members

int scan_times
scan times being through

struct mesh_event_layer_change_t
Layer change information.

Public Members

uint8_t new_layer
new layer

struct mesh_event_vote_started_t
vote started information

Public Members

int reason
vote reason, vote could be initiated by children or by the root itself

int attempts
max vote attempts before stopped

mesh_addr_t rc_addr
root address specified by users via API esp_mesh_waive_root()

struct mesh_event_find_network_t
find a mesh network that this device can join

Public Members

uint8_t channel
channel number of the new found network

uint8_t router_bssid[6]
router BSSID

struct mesh_event_root_switch_req_t
Root switch request information.
Public Members

int reason
   root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()

mesh_addr_t rc_addr
   the address of root switch requester

struct mesh_event_root_conflict_t
   Other powerful root address.

Public Members

int8_t rssi
   rssi with router

uint16_t capacity
   the number of devices in current network

uint8_t addr[6]
   other powerful root address

struct mesh_event_routing_table_change_t
   Routing table change.

Public Members

uint16_t rt_size_new
   the new value

uint16_t rt_size_change
   the changed value

struct mesh_event_root_fixed_t
   Root fixed.

Public Members

bool is_fixed
   status

struct mesh_event_scan_done_t
   Scan done event information.

Public Members

uint8_t number
   the number of APs scanned

struct mesh_event_network_state_t
   Network state information.

Public Members

bool is_rootless
   whether current mesh network has a root

struct mesh_opt_t
   Mesh option.
Chapter 2. API Reference

Public Members

```c
uint8_t type
   option type
uint16_t len
   option length
uint8_t* val
   option value
```

```
struct mesh_data_t
   Mesh data for esp_mesh_send() and esp_mesh_recv()
```

Public Members

```c
uint8_t* data
   data
uint16_t size
   data size
mesh_proto_t proto
   data protocol
mesh_tos_t tos
   data type of service
```

```
struct mesh_router_t
   Router configuration.
```

Public Members

```c
uint8_t ssid[32]
   SSID
uint8_t ssid_len
   length of SSID
uint8_t bssid[6]
   BSSID, if this value is specified, users should also specify “allow_router_switch”.
uint8_t password[64]
   password
bool allow_router_switch
   if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.
```

```
struct mesh_ap_cfg_t
   Mesh softAP configuration.
```

Public Members

```c
uint8_t password[64]
   mesh softAP password
uint8_t max_connection
   max number of stations allowed to connect in, max 10
```
struct mesh_cfg_t
    Mesh initialization configuration.

Public Members

uint8_t channel
    channel, the mesh network on

bool allow_channel_switch
    if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

mesh_addr_t mesh_id
    mesh network identification

mesh_router_t router
    router configuration

mesh_ap_cfg_t mesh_ap
    mesh softAP configuration

const mesh_crypto_funcs_t *crypto_funcs
    crypto functions

struct mesh_vote_t
    Vote.

Public Members

float percentage
    vote percentage threshold for approval of being a root

bool is_rc_specified
    if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

mesh_rc_config_t config
    vote address configuration

struct mesh_tx_pending_t
    The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int to_parent
    to parent queue

int to_parent_p2p
    to parent (P2P) queue

int to_child
    to child queue

int to_child_p2p
    to child (P2P) queue

int mgmt
    management queue

int broadcast
    broadcast and multicast queue
struct mesh_rx_pending_t
Thenumberofpacketsavailableinthequeuewaitingtobereceivedbyapplications.

Public Members

int toDS
toexternalDS
int toSelf
toSelf

Macros
MESH_ROOT_LAYER
rootlayervalue

ESP_ERR_MESH_TIMEOUT
timeout
ESP_ERR_MESH_DISCONNECTED
disconnectedwithparentonstationinterface
ESP_ERR_MESH_QUEUE_FAIL
queuefail
ESP_ERR_MESH_QUEUE_FULL
queuefull
ESP_ERR_MESH_NO_PARENT_FOUND
noparentfoundtojointhemeshnetwork
ESP_ERR_MESH_NO_ROUTE_FOUND
noroutefoundtoforwardthepacket
ESP_ERR_MESH_OPTION_NULL
no option found

ESP_ERR_MESH_OPTION_UNKNOWN
unknown option

ESP_ERR_MESH_XON_NO_WINDOW
no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
discard the packet

ESP_ERR_MESH_VOTING
vote in progress

MESH_DATA_ENC
Flags bitmap for esp_mesh_send() and esp_mesh_recv()
data encrypted (Unimplemented)

MESH_DATA_P2P
point-to-point delivery over the mesh network

MESH_DATA_FROMDS
receive from external IP network

MESH_DATA_TODS
identify this packet is target to external IP network

MESH_DATA_NONBLOCK
esp_mesh_send() non-block

MESH_DATA_DROP
in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP
identify this packet is target to a group address

MESH_OPT_SEND_GROUP
Option definitions for esp_mesh_send() and esp_mesh_recv()data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR
return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS
Flag of mesh networking IE.
vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE
no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND
root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED
fixed root

MESH_INIT_CONFIG_DEFAULT()
Type Definitions

typedef system_event_sta_got_ip_t mesh_event_root_got_ip_t
  IP settings from LwIP stack.

typedef mesh_addr_t mesh_event_root_address_t
  Root address.

typedef system_event_sta_disconnected_t mesh_event_disconnected_t
  Parent disconnected information.

typedef system_event_ap_staconnected_t mesh_event_child_connected_t
  Child connected information.

typedef system_event_ap_stadisconnected_t mesh_event_child_disconnected_t
  Child disconnected information.

typedef system_event_sta_connected_t mesh_event_router_switch_t
  New router information.

Enumerations

enum mesh_event_id_t
  Enumerated list of mesh event id.

Values:

  MESH_EVENT_STARTED
  mesh is started

  MESH_EVENT_STOPPED
  mesh is stopped

  MESH_EVENT_CHANNEL_SWITCH
  channel switch

  MESH_EVENT_CHILD_CONNECTED
  a child is connected on softAP interface

  MESH_EVENT_CHILD_DISCONNECTED
  a child is disconnected on softAP interface

  MESH_EVENT_ROUTING_TABLE_ADD
  routing table is changed by adding newly joined children

  MESH_EVENT_ROUTING_TABLE_REMOVE
  routing table is changed by removing leave children

  MESH_EVENT_PARENT_CONNECTED
  parent is connected on station interface

  MESH_EVENT_PARENT_DISCONNECTED
  parent is disconnected on station interface

  MESH_EVENT_NO_PARENT_FOUND
  no parent found

  MESH_EVENT_LAYER_CHANGE
  layer changes over the mesh network

  MESH_EVENT_TODS_STATE
  state represents whether the root is able to access external IP network

  MESH_EVENT_VOTE_STARTED
  the process of voting a new root is started either by children or by the root

  MESH_EVENT_VOTE_STOPPED
  the process of voting a new root is stopped
**MESH_EVENT_ROOT_ADDRESS**
the root address is obtained. It is posted by mesh stack automatically.

**MESH_EVENT_ROOT_SWITCH_REQ**
root switch request sent from a new voted root candidate

**MESH_EVENT_ROOT_SWITCH_ACK**
root switch acknowledgment responds the above request sent from current root

**MESH_EVENT_ROOT_ASKED_YIELD**
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

**MESH_EVENT_ROOT_FIXED**
when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

**MESH_EVENT_SCAN_DONE**
if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

**MESH_EVENT_NETWORK_STATE**
network state, such as whether current mesh network has a root.

**MESH_EVENT_STOP_RECONNECTION**
the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

**MESH_EVENT_FIND_NETWORK**
when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

**MESH_EVENT_ROUTER_SWITCH**
if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

**MESH_EVENT_MAX**

```c
enum mesh_type_t
{    // Device type.
    MESH_IDLE = 0,    // hasn’t joined the mesh network yet
    MESH_ROOT = 1,    // the only sink of the mesh network. Has the ability to access external IP network
    MESH_NODE = 2,    // intermediate device. Has the ability to forward packets over the mesh network
    MESH_LEAF = 3,    // has no forwarding ability
};
```

**MESH_PROTO_BIN**
binary

**MESH_PROTO_HTTP**
HTTP protocol

**MESH_PROTO_JSON**
JSON format
MESH_PROTO_MQTT
MQTT protocol

enum mesh_tos_t
For reliable transmission, mesh stack provides three type of services.
Values:
MESH_TOS_P2P
provide P2P (point-to-point) retransmission on mesh stack by default
MESH_TOS_E2E
provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)
MESH_TOS_DEF
no retransmission on mesh stack

enum mesh_vote_reason_t
Vote reason.
Values:
MESH_VOTE_REASON_ROOT_INITIATED = 1
vote is initiated by the root
MESH_VOTE_REASON_CHILD_INITIATED
vote is initiated by children

enum mesh_disconnect_reason_t
Mesh disconnect reason code.
Values:
MESH_REAISON_CYCLIC = 100
cyclic is detected
MESH_REASON_PARENT_IDLE
parent is idle
MESH_REASON_LEAF
the connected device is changed to a leaf
MESH_REASON_DIFF_ID
in different mesh ID
MESH_REASON_ROOTS
root conflict is detected
MESH_REASON_PARENT_STOPPED
parent has stopped the mesh
MESH_REASON_SCAN_FAIL
scan fail
MESH_REASON_IE_UNKNOWN
unknown IE
MESH_REASON_WAIVE_ROOT
waive root
MESH_REASON_PARENT_WORSE
parent with very poor RSSI
MESH_REASON_EMPTY_PASSWORD
use an empty password to connect to an encrypted parent
MESH_REASON_PARENT_UNENCRYPTED
connect to an unencrypted parent/router
enum mesh_event_toDS_state_t

The reachability of the root to a DS (distribute system)

Values:

MESH_TODS_UNREACHABLE
the root isn’t able to access external IP network

MESH_TODS_REACHABLE
the root is able to access external IP network

Code examples for the Wi-Fi API are provided in the wifi directory of ESP-IDF examples.
Code examples for ESP-MESH are provided in the mesh directory of ESP-IDF examples.

2.2.2 Ethernet

Ethernet

Application Example
• Ethernet basic example: ethernet/ethernet.
• Ethernet iperf example: ethernet/iperf.

Ethernet Driver Model
• esp_eth/include/esp_eth.h

Ethernet Common Interface
• esp_eth/include/esp_eth_com.h

Ethernet MAC Interface
• esp_eth/include/esp_eth_mac.h

Ethernet PHY Interface
• esp_eth/include/esp_eth_phy.h

Ethernet PHY Common Registers
• esp_eth/include/eth_phy_regs_struct.h

API Reference - Driver Model

Header File
• esp_eth/include/esp_eth.h

Functions

esp_err_t esp_eth_driver_install(const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)
Install Ethernet driver.

Return
• ESP_OK: install esp_eth driver successfully
• ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
• ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
• ESP_FAIL: install esp_eth driver failed because some other error occurred

**Parameters**
- [in] config: configuration of the Ethernet driver
- [out] out_hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_driver_uninstall (esp_eth_handle_t hdl)
```
Uninstall Ethernet driver.

**Note** It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Return**
- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_start (esp_eth_handle_t hdl)
```
Start Ethernet driver.

**Note** This API will start driver state machine and internal software timer (for checking link status).

**Return**
- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_stop (esp_eth_handle_t hdl)
```
Stop Ethernet driver.

**Note** This function does the opposite operation of esp_eth_start.

**Return**
- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_transmit (esp_eth_handle_t hdl, uint8_t* buf, uint32_t length)
```
General Transmit.

**Return**
- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_FAIL: transmit frame buffer failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver
- [in] buf: buffer of the packet to transfer
- [in] length: length of the buffer to transfer

```c
esp_err_t esp_eth_receive (esp_eth_handle_t hdl, uint8_t* buf, uint32_t *length)
```
General Receive.

**Return**
- ESP_OK: receive frame buffer successfully
- ESP_ERR_INVALID_ARG: receive frame buffer failed because of some invalid argument
- ESP_FAIL: receive frame buffer failed because some other error occurred

**Parameters**
• [in] hdl: handle of Ethernet driver
• [out] buf: buffer to preserve the received packet
• [out] length: length of the received packet

`esp_err_t esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)`

Misc IO function of Ethernet driver.

Return
• ESP_OK: process io command successfully
• ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
• ESP_FAIL: process io command failed because some other error occurred

Parameters
• [in] hdl: handle of Ethernet driver
• [in] cmd: IO control command
• [in] data: specified data for command

`esp_err_t esp_eth_increase_reference(esp_eth_handle_t hdl)`

Increase Ethernet driver reference.

Note Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

Return
• ESP_OK: increase reference successfully
• ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters
• [in] hdl: handle of Ethernet driver

`esp_err_t esp_eth_decrease_reference(esp_eth_handle_t hdl)`

Decrease Ethernet driver reference.

Return
• ESP_OK: increase reference successfully
• ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters
• [in] hdl: handle of Ethernet driver

Structures
`struct esp_eth_config_t`

Configuration of Ethernet driver.

Public Members

`esp_eth_mac_t *mac`  
Ethernet MAC object.

`esp_eth_phy_t *phy`  
Ethernet PHY object.

`uint32_t check_link_period_ms`  
Period time of checking Ethernet link status.

`esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length)`  
Input frame buffer to user’s stack.

Return
• ESP_OK: input frame buffer to upper stack successfully
• ESP_FAIL: error occurred when inputting buffer to upper stack

Parameters
• [in] eth_handle: handle of Ethernet driver
• [in] buffer: frame buffer that will get input to upper stack
Chapter 2. API Reference

• [in] length: length of the frame buffer

```c
esp_err_t (*on_lowlevel_init_done) (esp_eth_handle_t eth_handle)
```
Callback function invoked when lowlevel initialization is finished.

Return

- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

Parameters

- [in] eth_handle: handle of Ethernet driver

```c
esp_err_t (*on_lowlevel_deinit_done) (esp_eth_handle_t eth_handle)
```
Callback function invoked when lowlevel deinitialization is finished.

Return

- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

Parameters

- [in] eth_handle: handle of Ethernet driver

Macros

```c
ETH_DEFAULT_CONFIG (emac, ephy)
```
Default configuration for Ethernet driver.

Type Definitions

```c
typedef void *esp_eth_handle_t
```
Handle of Ethernet driver.

API Reference - Common Interface

Header File

- esp_eth/include/esp_eth_com.h

Structures

```c
struct esp_eth_mediator_s
```
Ethernet mediator.

Public Members

```c
esp_err_t (*phy_reg_read) (esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```
Read PHY register.

Return

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

Parameters

- [in] eth: mediator of Ethernet driver
- [in] phy_addr: PHY Chip address (0~31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

```c
esp_err_t (*phy_reg_write) (esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```
Write PHY register.

Return
- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

### Parameters

- **[in]** eth: mediator of Ethernet driver
- **[in]** phy_addr: PHY Chip address (0-31)
- **[in]** phy_reg: PHY register index code
- **[in]** reg_value: PHY register value

C:

```c
esp_err_t (*stack_input)(esp_eth_mediator_t *eth, uint8_t *buffer, uint32_t length)

Deliver packet to upper stack.
```

### Return

- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

### Parameters

- **[in]** eth: mediator of Ethernet driver
- **[in]** buffer: packet buffer
- **[in]** length: length of the packet

C:

```c
esp_err_t (*on_state_changed)(esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)

Callback on Ethernet state changed.
```

### Return

- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

### Parameters

- **[in]** eth: mediator of Ethernet driver
- **[in]** state: new state
- **[in]** args: optional argument for the new state

### Macros

- **ETH_MAX_PAYLOAD_LEN**
  - Maximum Ethernet payload size.
- **ETH_MIN_PAYLOAD_LEN**
  - Minimum Ethernet payload size.
- **ETH_HEADER_LEN**
  - Ethernet frame header size: Dest addr(6 Bytes) + Src addr(6 Bytes) + length/type(2 Bytes)
- **ETH_CRC_LEN**
  - Ethernet frame CRC length.
- **ETH_VLAN_TAG_LEN**
  - Optional 802.1q VLAN Tag length.
- **ETH_JUMBO_FRAME_PAYLOAD_LEN**
  - Jumbo frame payload size.
- **ETH_MAX_PACKET_SIZE**
  - Maximum frame size (1522 Bytes)
- **ETH_MIN_PACKET_SIZE**
  - Minimum frame size (64 Bytes)

### Type Definitions

```c
typedef struct esp_eth_mediator_s esp_eth_mediator_t

Ethernet mediator.
```

### Enumerations
enum esp_eth_state_t
  Ethernet driver state.
  
  Values:
  
  ETH_STATE_LLINIT
  Lowlevel init done

  ETH_STATE_DEINIT
  Deinit done

  ETH_STATE_LINK
  Link status changed

  ETH_STATE_SPEED
  Speed updated

  ETH_STATE_DUPLEX
  Duplex updated

enum esp_eth_io_cmd_t
  Command list for ioctl API.
  
  Values:
  
  ETH_CMD_G_MAC_ADDR
  Get MAC address

  ETH_CMD_S_MAC_ADDR
  Set MAC address

  ETH_CMD_G_PHY_ADDR
  Get PHY address

  ETH_CMD_S_PHY_ADDR
  Set PHY address

  ETH_CMD_G_SPEED
  Get Speed

  ETH_CMD_S_PROMISCUOUS
  Set promiscuous mode

enum eth_link_t
  Ethernet link status.
  
  Values:
  
  ETH_LINK_UP
  Ethernet link is up

  ETH_LINK_DOWN
  Ethernet link is down

enum eth_speed_t
  Ethernet speed.
  
  Values:
  
  ETH_SPEED_10M
  Ethernet speed is 10Mbps

  ETH_SPEED_100M
  Ethernet speed is 100Mbps

enum eth_duplex_t
  Ethernet duplex mode.
  
  Values:
ETH_DUPLEX_HALF
  Ethernet is in half duplex

ETH_DUPLEX_FULL
  Ethernet is in full duplex

class eth_event_t
  Ethernet event declarations.
  Values:
  
  ETHERNET_EVENT_START
  Ethernet driver start

  ETHERNET_EVENT_STOP
  Ethernet driver stop

  ETHERNET_EVENT_CONNECTED
  Ethernet got a valid link

  ETHERNET_EVENT_DISCONNECTED
  Ethernet lost a valid link

API Reference - MAC Interface

Header File
  * esp_eth/include/esp_eth_mac.h

Structures

struct esp_eth_mac_s
  Ethernet MAC.

Public Members

esp_err_t (*set_mediator)(esp_eth_mac_t *mac, esp_eth_mediator_t *eth)
  Set mediator for Ethernet MAC.

  Return
  * ESP_OK: set mediator for Ethernet MAC successfully
  * ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

  Parameters
  * [in] mac: Ethernet MAC instance
  * [in] eth: Ethernet mediator

esp_err_t (*init)(esp_eth_mac_t *mac)
  Initialize Ethernet MAC.

  Return
  * ESP_OK: initialize Ethernet MAC successfully
  * ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
  * ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

  Parameters
  * [in] mac: Ethernet MAC instance

esp_err_t (*deinit)(esp_eth_mac_t *mac)
  Deinitialize Ethernet MAC.

  Return
  * ESP_OK: deinitialize Ethernet MAC successfully
  * ESP_FAIL: deinitialize Ethernet MAC failed because some other error occurred
Chapter 2. API Reference

```
Parameters
• [in] mac: Ethernet MAC instance

esp_err_t(*start)(esp_eth_mac_t *mac)
Start Ethernet MAC.

Return
• ESP_OK: start Ethernet MAC successfully
• ESP_FAIL: start Ethernet MAC failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance

esp_err_t(*stop)(esp_eth_mac_t *mac)
Stop Ethernet MAC.

Return
• ESP_OK: stop Ethernet MAC successfully
• ESP_FAIL: stop Ethernet MAC failed because some error occurred

Parameters
• [in] mac: Ethernet MAC instance

esp_err_t(*transmit)(esp_eth_mac_t *mac, uint8_t*buf, uint32_t length)
Transmit packet from Ethernet MAC.

Return
• ESP_OK: transmit packet successfully
• ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
• ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
• ESP_FAIL: transmit packet failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] buf: packet buffer to transmit
• [in] length: length of packet

esp_err_t(*receive)(esp_eth_mac_t *mac, uint8_t*buf, uint32_t*length)
Receive packet from Ethernet MAC.

Note Memory of buf is allocated in the Layer2, make sure it get free after process.

Return
• ESP_OK: receive packet successfully
• ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
• ESP_FAIL: receive packet failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [out] buf: packet buffer which will preserve the received frame
• [out] length: length of the received packet

esp_err_t(*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t*reg_value)
Read PHY register.

Return
• ESP_OK: read PHY register successfully
• ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
• ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
• ESP_ERR_TIMEOUT: read PHY register failed because of timeout
• ESP_FAIL: read PHY register failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] phy_addr: PHY chip address (0~31)
• [in] phy_reg: PHY register index code
• [out] reg_value: PHY register value
```
**Chapter 2. API Reference**

```c
esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

**Return**
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] phy_addr: PHY chip address (0-31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

```c
esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Set MAC address.

**Return**
- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] addr: MAC address

```c
esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Get MAC address.

**Return**
- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [out] addr: MAC address

```c
esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)
```

Set speed of MAC.

**Return**
- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] speed: MAC speed

```c
esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
```

Set duplex mode of MAC.

**Return**
- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex mode failed because of invalid argument
- ESP_FAIL: set MAC duplex mode failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] duplex: MAC duplex

```c
esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)
```

Set link status of MAC.

**Return**
- ESP_OK: set link status successfully
• ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
• ESP_FAIL: set link status failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] link: Link status

\texttt{esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)}

Set promiscuous of MAC.

Return
• ESP_OK: set promiscuous mode successfully
• ESP_FAIL: set promiscuous mode failed because some error occurred

Parameters
• [in] mac: Ethernet MAC instance
• [in] enable: set true to enable promiscuous mode; set false to disable promiscuous mode

\texttt{esp_err_t (*del)(esp_eth_mac_t *mac)}

Free memory of Ethernet MAC.

Return
• ESP_OK: free Ethernet MAC instance successfully
• ESP_FAIL: free Ethernet MAC instance failed because some error occurred

Parameters
• [in] mac: Ethernet MAC instance

\textbf{Public Members}

\begin{verbatim}
uint32_t sw_reset_timeout_ms
    Software reset timeout value (Unit: ms)

uint32_t rx_task_stack_size
    Stack size of the receive task

uint32_t rx_task_prio
    Priority of the receive task

int smi_mdc_gpio_num
    SMI MDC GPIO number

int smi_mdio_gpio_num
    SMI MDIO GPIO number

uint32_t flags
    Flags that specify extra capability for mac driver
\end{verbatim}

\textbf{Macros}

\begin{verbatim}
ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE
    MAC driver can work when cache is disabled

ETH_MAC_FLAG_PIN_TO_CORE
    Pin MAC task to the CPU core where driver installation happened

ETH_MAC_DEFAULT_CONFIG()
    Default configuration for Ethernet MAC object.
\end{verbatim}

\textbf{Type Definitions}

\begin{verbatim}
typedef struct esp_eth_mac_s esp_eth_mac_t
    Ethernet MAC.
\end{verbatim}
API Reference - PHY Interface

Header File

- esp_eth/include/esp_eth_phy.h

Functions

```c
esp_eth_phy_t *esp_eth_phy_new_ip101(const eth_phy_config_t *config)
```
Create a PHY instance of IP101.

**Return**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**
- [in] config: configuration of PHY

```c
esp_eth_phy_t *esp_eth_phy_new_rtl8201(const eth_phy_config_t *config)
```
Create a PHY instance of RTL8201.

**Return**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**
- [in] config: configuration of PHY

```c
esp_eth_phy_t *esp_eth_phy_new_lan8720(const eth_phy_config_t *config)
```
Create a PHY instance of LAN8720.

**Return**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**
- [in] config: configuration of PHY

```c
esp_eth_phy_t *esp_eth_phy_new_dp83848(const eth_phy_config_t *config)
```
Create a PHY instance of DP83848.

**Return**
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

**Parameters**
- [in] config: configuration of PHY

Structures

```c
struct esp_eth_phy_s
```
Ethernet PHY.

Public Members

```c
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)
```
Set mediator for PHY.

**Return**
- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] mediator: mediator of Ethernet driver
```c
esp_err_t (*reset)(esp_eth_phy_t *phy)
Software Reset Ethernet PHY.

Return
• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
```

```c
esp_err_t (*reset_hw)(esp_eth_phy_t *phy)
Hardware Reset Ethernet PHY.

Note  Hardware reset is mostly done by pull down and up PHY’s nRST pin

Return
• ESP_OK: reset Ethernet PHY successfully
• ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
```

```c
esp_err_t (*init)(esp_eth_phy_t *phy)
Initialize Ethernet PHY.

Return
• ESP_OK: initialize Ethernet PHY successfully
• ESP_FAIL: initialize Ethernet PHY failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
```

```c
esp_err_t (*deinit)(esp_eth_phy_t *phy)
Deinitialize Ethernet PHY.

Return
• ESP_OK: deinitialize Ethernet PHY successfully
• ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

Parameters
• [in] phyL: Ethernet PHY instance
```

```c
esp_err_t (*negotiate)(esp_eth_phy_t *phy)
Start auto negotiation.

Return
• ESP_OK: restart auto negotiation successfully
• ESP_FAIL: restart auto negotiation failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
```

```c
esp_err_t (*get_link)(esp_eth_phy_t *phy)
Get Ethernet PHY link status.

Return
• ESP_OK: get Ethernet PHY link status successfully
• ESP_FAIL: get Ethernet PHY link status failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
```

```c
esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)
Power control of Ethernet PHY.

Return
• ESP_OK: control Ethernet PHY power successfully
• ESP_FAIL: control Ethernet PHY power failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
• [in] enable: set true to power on Ethernet PHY; set false to power off Ethernet PHY
```
**esp_err_t** (*set_addr*) *(esp_eth_phy_t *phy, uint32_t addr)*
Set PHY chip address.

Return
- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

Parameters
- [in] phy: Ethernet PHY instance
- [in] addr: PHY chip address

**esp_err_t** (*get_addr*) *(esp_eth_phy_t *phy, uint32_t *addr)*
Get PHY chip address.

Return
- ESP_OK: get Ethernet PHY address successfully
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

Parameters
- [in] phy: Ethernet PHY instance
- [out] addr: PHY chip address

**esp_err_t** (*del*) *(esp_eth_phy_t *phy)*
Free memory of Ethernet PHY instance.

Return
- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

Parameters
- [in] phy: Ethernet PHY instance

**struct eth_phy_config_t**
Ethernet PHY configuration.

**Public Members**

- **uint32_t phy_addr**
  PHY address

- **uint32_t reset_timeout_ms**
  Reset timeout value (Unit: ms)

- **uint32_t autonego_timeout_ms**
  Auto-negotiation timeout value (Unit: ms)

- **int reset_gpio_num**
  Reset GPIO number, -1 means no hardware reset

**Macros**

- **ESP_ETH_PHY_ADDR_AUTO**
- **ETH_PHY_DEFAULT_CONFIG()**
  Default configuration for Ethernet PHY object.

**Type Definitions**

- **typedef struct esp_eth_phy_s esp_eth_phy_t**
  Ethernet PHY.

Code examples for the Ethernet API are provided in the ethernet directory of ESP-IDF examples.

### 2.2.3 IP Network Layer
Chapter 2. API Reference

TCP/IP Adapter

The purpose of TCP/IP Adapter library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements TCP/IP Adapter for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some TCP/IP Adapter API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call TCP/IP Adapter APIs directly as they are called from the default network event handlers.

API Reference

Header File

- tcpip_adapter/include/tcpip_adapter.h

Functions

void tcpip_adapter_init (void)
Initialize the underlying TCP/IP stack.

Note This function should be called exactly once from application code, when the application starts up.

esp_err_t tcpip_adapter_eth_start (uint8_t *mac, tcpip_adapter_ip_info_t *ip_info, void *args)
Cause the TCP/IP stack to start the Ethernet interface with specified MAC and IP.

Note This function should be called after the Ethernet MAC hardware is initialized. In the default configuration, application code does not need to call this function - it is called automatically by the default handler for the SYSTEM_EVENT_ETH_START event.

Return
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS
- ESP_ERR_NO_MEM

Parameters
- [in] mac: Set MAC address of this interface
- [in] ip_info: Set IP address of this interface
- [in] args: extra args passed to tcpip_adapter

esp_err_t tcpip_adapter_sta_start (uint8_t *mac, tcpip_adapter_ip_info_t *ip_info)
Cause the TCP/IP stack to start the Wi-Fi Station interface with specified MAC and IP.

Note This function should be called after the Wi-Fi Station hardware is initialized. In the default configuration, application code does not need to call this function - it is called automatically by the default handler for the SYSTEM_EVENT_STA_START event.

Return
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS
- ESP_ERR_NO_MEM

Parameters
- [in] mac: Set MAC address of this interface
- [in] ip_info: Set IP address of this interface

esp_err_t tcpip_adapter_ap_start (uint8_t *mac, tcpip_adapter_ip_info_t *ip_info)
Cause the TCP/IP stack to start the Wi-Fi AP interface with specified MAC and IP.

DHCP server will be started automatically when this function is called.
**Note** This function should be called after the Wi-Fi AP hardware is initialized. In the default configuration, application code does not need to call this function - it is called automatically by the default handler for the SYSTEM_EVENT_AP_START event.

**Return**
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS
- ESP_ERR_NO_MEM

**Parameters**
- **[in]** mac: Set MAC address of this interface
- **[in]** ip_info: Set IP address of this interface

```c
esp_err_t tcpip_adapter_stop(tcpip_adapter_if_t tcpip_if)
```

Causes the TCP/IP stack to stop a network interface.

**Note** This API is called by the default Wi-Fi and Ethernet event handlers if the underlying network driver reports that the interface has stopped.

**Note** To stop an interface from application code, call the network-specific API (esp_wifi_stop() or esp_eth_stop()). The driver layer will then send a stop event and the event handler should call this API. Otherwise, the driver and MAC layer will remain started.

**Return**
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS
- ESP_ERR_TCPIP_ADAPTER_IF_NOT_READY

**Parameters**
- **[in]** tcpip_if: Interface which will be stopped

```c
esp_err_t tcpip_adapter_up(tcpip_adapter_if_t tcpip_if)
```

Causes the TCP/IP stack to bring up an interface.

**Note** This function is called automatically by the default event handlers for the Wi-Fi Station and Ethernet interfaces, in response to the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events, respectively.

**Note** This function is not normally used with Wi-Fi AP interface. If the AP interface is started, it is up.

**Return**
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_IF_NOT_READY

**Parameters**
- **[in]** tcpip_if: Interface to bring up

```c
esp_err_t tcpip_adapter_down(tcpip_adapter_if_t tcpip_if)
```

Causes the TCP/IP stack to shutdown an interface.

**Note** This function is called automatically by the default event handlers for the Wi-Fi Station and Ethernet interfaces, in response to the SYSTEM_EVENT_STA_DISCONNECTED and SYSTEM_EVENT_ETH_DISCONNECTED events, respectively.

**Note** This function is not normally used with Wi-Fi AP interface. If the AP interface is stopped, it is down.

**Return**
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_IF_NOT_READY

**Parameters**
- **[in]** tcpip_if: Interface to shutdown

```c
esp_err_t tcpip_adapter_get_ip_info(tcpip_adapter_if_t tcpip_if, tcpip_adapter_ip_info_t *ip_info)
```

Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack.

If the interface is down, IP information is read from a copy kept in the TCP/IP adapter library itself.
**Return**
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS

**Parameters**
- **[in]** `tcpip_if`: Interface to get IP information
- **[out]** `ip_info`: If successful, IP information will be returned in this argument.

```c
esp_err_t tcpip_adapter_set_ip_info(tcpip_adapter_if_t tcpip_if, const tcpip_adapter_ip_info_t* ip_info)
```

Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the TCP/IP adapter library is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note**
- DHCP client/server must be stopped before setting new IP information.
- Calling this interface for the Wi-Fi STA or Ethernet interfaces may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

**Return**
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS
- ESP_ERR_TCPIP_ADAPTER_DHCP_NOT_STOPPED If DHCP server or client is still running

**Parameters**
- **[in]** `tcpip_if`: Interface to set IP information
- **[in]** `ip_info`: IP information to set on the specified interface

```c
esp_err_t tcpip_adapter_set_dns_info(tcpip_adapter_if_t tcpip_if, tcpip_adapter_dns_type_t type, tcpip_adapter_dns_info_t* dns)
```

Set DNS Server information.

This function behaves differently for different interfaces:

- For Wi-Fi Station interface and Ethernet interface, up to three types of DNS server can be set (in order of priority):
  - Main DNS Server (TCPIP_ADAPTER_DNS_MAIN)
  - Backup DNS Server (TCPIP_ADAPTER_DNS_BACKUP)
  - Fallback DNS Server (TCPIP_ADAPTER_DNS_FALLBACK)

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API.

If DHCP client is disabled, all DNS server types can be set via this API only.

- For Wi-Fi AP interface, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).
  - The default Main DNS server is the IP of the Wi-Fi AP interface itself.
  - This function can override it by setting server type TCPIP_ADAPTER_DNS_MAIN.
  - Other DNS Server types are not supported for the Wi-Fi AP interface.

**Return**
- ESP_OK on success
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS invalid params

**Parameters**
- **[in]** `tcpip_if`: Interface to set DNS Server information
- **[in]** `type`: Type of DNS Server to set: TCPIP_ADAPTER_DNS_MAIN, TCPIP_ADAPTER_DNS_BACKUP, TCPIP_ADAPTER_DNS_FALLBACK
- **[in]** `dns`: DNS Server address to set

```c
esp_err_t tcpip_adapter_get_dns_info(tcpip_adapter_if_t tcpip_if, tcpip_adapter_dns_type_t type, tcpip_adapter_dns_info_t* dns)
```

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.
This may be result of a previous call to tcpip_adapter_set_dns_info(). If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Return**
- ESP_OK on success
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS invalid params

**Parameters**
- `[in] tcpip_if`: Interface to get DNS Server information
- `[in] type`: Type of DNS Server to get: TCPIP_ADAPTER_DNS_MAIN, TCPIP_ADAPTER_DNS_BACKUP, TCPIP_ADAPTER_DNS_FALLBACK
- `[out] dns`: DNS Server result is written here on success

```c
esp_err_t tcpip_adapter_get_old_ip_info(tcpip_adapter_if_t tcpip_if, tcpip_adapter_ip_info_t *ip_info)
```

Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

**Return**
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS

**Parameters**
- `[in] tcpip_if`: Interface to get old IP information
- `[out] ip_info`: If successful, IP information will be returned in this argument.

```c
esp_err_t tcpip_adapter_set_old_ip_info(tcpip_adapter_if_t tcpip_if, tcpip_adapter_ip_info_t *ip_info)
```

Set interface old IP information.

This function is called from the DHCP client for the Wi-Fi STA and Ethernet interfaces, before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

**Return**
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS

**Parameters**
- `[in] tcpip_if`: Interface to set old IP information
- `[in] ip_info`: Store the old IP information for the specified interface

```c
esp_err_t tcpip_adapter_create_ip6_linklocal(tcpip_adapter_if_t tcpip_if)
```

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEMEVENT_GOT_IP6 event will be sent.

**Return**
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS

**Parameters**
- `[in] tcpip_if`: Interface to create a link-local IPv6 address

```c
esp_err_t tcpip_adapter_get_ip6_linklocal(tcpip_adapter_if_t tcpip_if, ip6_addr_t *if_ip6)
```

Get interface link-local IPv6 address.
If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Return**
- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

**Parameters**
- [in] tcpip_if: Interface to get link-local IPv6 address
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

```c
esp_err_t tcpip_adapter_get_ip6_global(tcpip_adapter_if_t tcpip_if, ip6_addr_t *if_ip6)
```
Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Return**
- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

**Parameters**
- [in] tcpip_if: Interface to get global IPv6 address
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

```c
esp_err_t tcpip_adapter_get_ip6_global(tcpip_adapter_if_t tcpip_if, ip6_addr_t *if_ip6)
```
Get DHCP Server status.

**Return**
- ESP_OK

**Parameters**
- [in] tcpip_if: Interface to get status of DHCP server.
- [out] status: If successful, the status of the DHCP server will be returned in this argument.

```c
esp_err_t tcpip_adapter_dhcps_get_status(tcpip_adapter_if_t tcpip_if, tcpip_adapter_dhcp_status_t *status)
```
Set or Get DHCP server option.

**Return**
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS
- ESP_ERR_TCPIP_ADAPTER_DHCP_ALREADY_STOPPED
- ESP_ERR_TCPIP_ADAPTER_DHCP_ALREADY_STARTED

**Parameters**
- [in] opt_op: TCPIP_ADAPTER_OP_SET to set an option, TCPIP_ADAPTER_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.

```c
esp_err_t tcpip_adapter_dhcps_option(tcpip_adapter_dhcp_option_mode_t opt_op, tcpip_adapter_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
```
Start DHCP server.

**Note** Currently DHCP server is only supported on the Wi-Fi AP interface.

**Return**
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS
- ESP_ERR_TCPIP_ADAPTER_DHCP_ALREADY_STARTED

**Parameters**
- [in] tcpip_if: Interface to start DHCP server. Must be TCPIP_ADAPTER_IF_AP.
**Chapter 2. API Reference**

**esp_err_t tcpip_adapter_dhcps_stop**(tcpip_adapter_if_t tcpip_if)
Stop DHCP server.

*Note* Currently DHCP server is only supported on the Wi-Fi AP interface.

*Return*
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS
- ESP_ERR_TCPIP_ADAPTER_DHCP_ALREADY_STOPPED
- ESP_ERR_TCPIP_ADAPTER_IF_NOT_READY

*Parameters*
- [in] tcpip_if: Interface to stop DHCP server. Must be TCPIP_ADAPTER_IF_AP.

**esp_err_t tcpip_adapter_dhcpc_get_status**(tcpip_adapter_if_t tcpip_if,
    tcpip_adapter_dhcp_status_t *status)
Get DHCP client status.

*Return*
- ESP_OK

*Parameters*
- [in] tcpip_if: Interface to get status of DHCP client
- [out] status: If successful, the status of DHCP client will be returned in this argument.

**esp_err_t tcpip_adapter_dhcpc_option**(tcpip_adapter_dhcp_option_mode_t opt_op,
    tcpip_adapter_dhcp_option_id_t opt_id, void *opt_val,
    uint32_t opt_len)
Set or Get DHCP client’s option.

*Note* This function is not yet implemented

*Return*
- ESP_ERR_NOT_SUPPORTED (not implemented)

*Parameters*
- [in] opt_op: TCPIP_ADAPTER_OP_SET to set an option, TCPIP_ADAPTER_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.

**esp_err_t tcpip_adapter_dhcpc_start**(tcpip_adapter_if_t tcpip_if)
Start DHCP client.

*Note* DHCP Client is only supported for the Wi-Fi station and Ethernet interfaces.

*Note* The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

*Return*
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS
- ESP_ERR_TCPIP_ADAPTER_DHCP_ALREADY_STARTED
- ESP_ERR_TCPIP_ADAPTER_DHCPSC_START_FAILED

*Parameters*
- [in] tcpip_if: Interface to start the DHCP client

**esp_err_t tcpip_adapter_dhcpc_stop**(tcpip_adapter_if_t tcpip_if)
Stop DHCP client.

*Note* DHCP Client is only supported for the Wi-Fi station and Ethernet interfaces.

*Note* Calling tcpip_adapter_stop() or tcpip_adapter_down() will also stop the DHCP Client if it is running.

*Return*
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS
- ESP_ERR_TCPIP_ADAPTER_DHCP_ALREADY_STOPPED
- ESP_ERR_TCPIP_ADAPTER_IF_NOT_READY

*Parameters*
- [in] tcpip_if: Interface to stop the DHCP client
### esp_err_t tcpip_adapter_eth_input

```c
void* buffer, uint16_t len, void* eb)
```

Receive an Ethernet frame from the Ethernet interface.

This function will automatically be installed by `esp_eth_init()`. The Ethernet driver layer will then call this function to forward frames to the TCP/IP stack.

**Note** Application code does not usually need to use this function directly.

**Return**
- ESP_OK

**Parameters**
- **[in]** buffer: Received data
- **[in]** len: Length of the data frame
- **[in]** eb: Pointer to internal Wi-Fi buffer (ignored for Ethernet)

### esp_err_t tcpip_adapter_sta_input

```c
void* buffer, uint16_t len, void* eb)
```

Receive an 802.11 data frame from the Wi-Fi Station interface.

This function should be installed by calling `esp_wifi_reg_rxcb()`. The Wi-Fi driver layer will then call this function to forward frames to the TCP/IP stack.

**Note** Installation happens automatically in the default handler for the `SYSTEM_EVENT_STA_CONNECTED` event.

**Note** Application code does not usually need to call this function directly.

**Return**
- ESP_OK

**Parameters**
- **[in]** buffer: Received data
- **[in]** len: Length of the data frame
- **[in]** eb: Pointer to internal Wi-Fi buffer

### esp_err_t tcpip_adapter_ap_input

```c
void* buffer, uint16_t len, void* eb)
```

Receive an 802.11 data frame from the Wi-Fi AP interface.

This function should be installed by calling `esp_wifi_reg_rxcb()`. The Wi-Fi driver layer will then call this function to forward frames to the TCP/IP stack.

**Note** Installation happens automatically in the default handler for the `SYSTEM_EVENT_AP_START` event.

**Note** Application code does not usually need to call this function directly.

**Return**
- ESP_OK

**Parameters**
- **[in]** buffer: Received data
- **[in]** len: Length of the data frame
- **[in]** eb: Pointer to internal Wi-Fi buffer

### esp_interface_t tcpip_adapter_get_esp_if

```c
void* dev)
```

Get network interface index.

Get network interface from TCP/IP implementation-specific interface pointer.

**Return**
- ESP_IF_WIFI_STA
- ESP_IF_WIFI_AP
- ESP_IF_ETH
- ESP_IF_MAX - invalid parameter

**Parameters**
- **[in]** dev: Implementation-specific TCP/IP stack interface pointer.

### esp_err_t tcpip_adapter_get_sta_list

```c
const wifi_sta_list_t* wifi_sta_list,
tcip_adapter_sta_list_t* tcpip_sta_list)
```

Get IP information for stations connected to the Wi-Fi AP interface.

**Return**
- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_NO_MEM

- **ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS**

**Parameters**

- **[in]** wifi_sta_list: Wi-Fi station info list, returned from esp_wifi_ap_get_sta_list()
- **[out]** tcpip_sta_list: IP layer station info list, corresponding to MAC addresses provided in wifi_sta_list

**esp_err_t tcpip_adapter_set_hostname (tcpip_adapter_if_t tcpip_if, const char *hostname)**

Set the hostname of an interface.

**Return**

- ESP_OK - success
- ESP_ERR_TCPIP_ADAPTER_IF_NOT_READY - interface status error
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS - parameter error

**Parameters**

- **[in]** tcpip_if: Interface to set the hostname

**esp_err_t tcpip_adapter_get_hostname (tcpip_adapter_if_t tcpip_if, const char **hostname)**

Get interface hostname.

**Return**

- ESP_OK - success
- ESP_ERR_TCPIP_ADAPTER_IF_NOT_READY - interface status error
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS - parameter error

**Parameters**

- **[in]** tcpip_if: Interface to get the hostname
- **[out]** hostname: Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

**esp_err_t tcpip_adapter_get_netif (tcpip_adapter_if_t tcpip_if, void **netif)**

Get the TCP/IP stack-specific interface that is assigned to a given interface.

**Note** For lwIP, this returns a pointer to a netif structure.

**Return**

- ESP_OK - success
- ESP_ERR_TCPIP_ADAPTER_IF_NOT_READY - interface status error
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS - parameter error

**Parameters**

- **[in]** tcpip_if: Interface to get the implementation-specific interface
- **[out]** netif: Pointer to the implementation-specific interface

**bool tcpip_adapter_is_netif_up (tcpip_adapter_if_t tcpip_if)**

Test if supplied interface is up or down.

**Return**

- true - Interface is up
- false - Interface is down

**Parameters**

- **[in]** tcpip_if: Interface to test up/down status

**esp_err_t tcpip_adapter_test_start (uint8_t *mac, tcpip_adapter_ip_info_t *ip_info)**

Cause the TCP/IP stack to start the test interface with specified MAC and IP. Test interface is used to exercise network stack with injected packets from SW.

**Return**

- ESP_OK
- ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS
- ESP_ERR_NO_MEM

**Parameters**

- **[in]** mac: Set MAC address of this interface
- **[in]** ip_info: Set IP address of this interface

**esp_err_t tcpip_adapter_set_default_eth_handlers ()**

Install default event handlers for Ethernet interface.
Return
- ESP_OK on success
- one of the errors from esp_event on failure

```c
esp_err_t tcpip_adapter_clear_default_eth_handlers()
```
Uninstall default event handlers for Ethernet interface.

Return
- ESP_OK on success
- one of the errors from esp_event on failure

```c
esp_err_t tcpip_adapter_set_default_wifi_handlers()
```
Install default event handlers for Wi-Fi interfaces (station and AP)

Return
- ESP_OK on success
- one of the errors from esp_event on failure

```c
esp_err_t tcpip_adapter_clear_default_wifi_handlers()
```
Uninstall default event handlers for Wi-Fi interfaces (station and AP)

Return
- ESP_OK on success
- one of the errors from esp_event on failure

```c
int tcpip_adapter_get_netif_index(tcpip_adapter_if_t tcpip_if)
```
Search netif index through netif interface.

Return
- netif_index on success
- -1 if an invalid parameter is supplied

Parameters
- [in] tcpip_if: Interface to search for netif index

```c
void esp_netif_netstack_buf_ref(void* netstack_buf)
```
Increase the reference counter of net stack buffer

Parameters
- [in] netstack_buf: the net stack buffer

```c
void esp_netif_netstack_buf_free(void* netstack_buf)
```
Free the net stack buffer

Parameters
- [in] netstack_buf: the net stack buffer

Structures

```c
struct tcpip_adapter_dns_info_t
```
DNS server info.

Public Members

```c
ip_addr_t ip
```
IPV4 address of DNS server

```c
struct ip_event_got_ip_t
```
Event structure for IP_EVENT_STA_GOT_IP, IP_EVENT_ETH_GOT_IP events

Public Members

```c
tcpip_adapter_if_t if_index
```
Interface for which the event is received
Chapter 2. API Reference

tcpip_adapter_ip_info_t ip_info
   IP address, netmask, gateway IP address

bool ip_changed
   Whether the assigned IP has changed or not

struct ip_event_got_ip6_t
   Event structure for IP_EVENT_GOT_IP6 event

Public Members

tcpip_adapter_if_t if_index
   Interface for which the event is received
tcpip_adapter_ip6_info_t ip6_info
   IPv6 address of the interface

struct ip_event_ap_staipassigned_t
   Event structure for IP_EVENT_AP_STAIPASSIGNED event

Public Members

ip4_addr_t ip
   IP address which was assigned to the station

Macros

ESP_ERR_TCPIP_ADAPTER_BASE
ESP_ERR_TCPIP_ADAPTER_INVALID_PARAMS
ESP_ERR_TCPIP_ADAPTER_IF_NOT_READY
ESP_ERR_TCPIP_ADAPTER_DHCPC_START_FAILED
ESP_ERR_TCPIP_ADAPTER_DHCP_ALREADY_STARTED
ESP_ERR_TCPIP_ADAPTER_DHCP_ALREADY_STOPPED
ESP_ERR_TCPIP_ADAPTER_NO_MEM
ESP_ERR_TCPIP_ADAPTER_DHCP_NOT_STOPPED
TCPIP_HOSTNAME_MAX_SIZE

Type Definitions

typedef tcpip_adapter_dhcp_option_mode_t tcpip_adapter_option_mode_t
typedef tcpip_adapter_dhcp_option_id_t tcpip_adapter_option_id_t

Enumerations

denum tcpip_adapter_if_t
   Values:
   TCP/IP_ADAPTER_IF_STA = 0
      Wi-Fi STA (station) interface
   TCP/IP_ADAPTER_IF_AP
      Wi-Fi soft-AP interface
   TCP/IP_ADAPTER_IF_ETH
      Ethernet interface
   TCP/IP_ADAPTER_IF_TEST
      tcpip stack test interface
TCPIP_ADAPTER_IF_MAX

enum tcpip_adapter_dns_type_t
Type of DNS server.

Values:

TCPIP_ADAPTER_DNS_MAIN = 0
DNS main server address

TCPIP_ADAPTER_DNS_BACKUP
DNS backup server address (Wi-Fi STA and Ethernet only)

TCPIP_ADAPTER_DNS_FALLBACK
DNS fallback server address (Wi-Fi STA and Ethernet only)

TCPIP_ADAPTER_DNS_MAX

enum tcpip_adapter_dhcp_status_t
Status of DHCP client or DHCP server.

Values:

TCPIP_ADAPTER_DHCP_INIT = 0
DHCP client/server is in initial state (not yet started)

TCPIP_ADAPTER_DHCP_STARTED
DHCP client/server has been started

TCPIP_ADAPTER_DHCP_STOPPED
DHCP client/server has been stopped

TCPIP_ADAPTER_DHCP_STATUS_MAX

enum tcpip_adapter_dhcp_option_mode_t
Mode for DHCP client or DHCP server option functions.

Values:

TCPIP_ADAPTER_OP_START = 0

TCPIP_ADAPTER_OP_SET
Set option

TCPIP_ADAPTER_OP_GET
Get option

TCPIP_ADAPTER_OP_MAX

enum tcpip_adapter_dhcp_option_id_t
Supported options for DHCP client or DHCP server.

Values:

TCPIP_ADAPTER_DOMAIN_NAME_SERVER = 6
Domain name server

TCPIP_ADAPTER_ROUTER_SOLICITATION_ADDRESS = 32
Solicitation router address

TCPIP_ADAPTER_REQUESTED_IP_ADDRESS = 50
Request specific IP address

TCPIP_ADAPTER_IP_ADDRESS_LEASE_TIME = 51
Request IP address lease time

TCPIP_ADAPTER_IP_REQUEST_RETRY_TIME = 52
Request IP address retry counter

enum ip_event_t
IP event declarations
Chapter 2. API Reference

Values:

**IP_EVENT_STA_GOT_IP**
ESP32 station got IP from connected AP

**IP_EVENT_STA_LOST_IP**
ESP32 station lost IP and the IP is reset to 0

**IP_EVENT_AP_STAIPASSIGNED**
ESP32 soft-AP assign an IP to a connected station

**IP_EVENT_GOT_IP6**
ESP32 station or ap or ethernet interface v6 IP addr is preferred

**IP_EVENT_ETH_GOT_IP**
ESP32 ethernet got IP from connected AP

Code examples for TCP/IP socket APIs are provided in the protocols/sockets directory of ESP-IDF examples.

2.2.4 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application Protocols.

2.3 Peripherals API

2.3.1 Analog to Digital Converter

Overview

The ESP32 integrates two 12-bit SAR (Successive Approximation Register) ADCs supporting a total of 18 measurement channels (analog enabled pins).

The ADC driver API supports ADC1 (8 channels, attached to GPIOs 32 - 39), and ADC2 (10 channels, attached to GPIOs 0, 2, 4, 12 - 15 and 25 - 27). However, the usage of ADC2 has some restrictions for the application:

1. ADC2 is used by the Wi-Fi driver. Therefore the application can only use ADC2 when the Wi-Fi driver has not started.
2. Some of the ADC2 pins are used as strapping pins (GPIO 0, 2, 15) thus cannot be used freely. Such is the case in the following official Development Kits:
   - ESP32 DevKitC: GPIO 0 cannot be used due to external auto program circuits.
   - ESP-WROVER-KIT: GPIO 0, 2, 4 and 15 cannot be used due to external connections for different purposes.

Configuration and Reading ADC

The ADC should be configured before reading is taken.

- For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.
- For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.
### Note:
Since the ADC2 is shared with the WIFI module, which has higher priority, reading operation of `adc2_get_raw()` will fail between `esp_wifi_start()` and `esp_wifi_stop()`. Use the return code to see whether the reading is successful.

It is also possible to read the internal hall effect sensor via ADC1 by calling dedicated function `hall_sensor_read()`. Note that even the hall sensor is internal to ESP32, reading from it uses channels 0 and 3 of ADC1 (GPIO 36 and 39). Do not connect anything else to these pins and do not change their configuration. Otherwise it may affect the measurement of low value signal from the sensor.

This API provides convenient way to configure ADC1 for reading from ULP. To do so, call function `adc1_ulp_enable()` and then set precision and attenuation as discussed above.

There is another specific function `adc2_vref_to_gpio()` used to route internal reference voltage to a GPIO pin. It comes handy to calibrate ADC reading and this is discussed in section *Minimizing Noise*.

### Application Examples

**Reading voltage on ADC1 channel 0 (GPIO 36):**

```c
#include <driver/adc.h>
...
adc1_config_width(ADC_WIDTH_BIT_12);
adc1_config_channel_atten(ADC1_CHANNEL_0,ADC_ATTEN_DB_0);
int val = adc1_get_raw(ADC1_CHANNEL_0);
```

The input voltage in above example is from 0 to 1.1V (0 dB attenuation). The input range can be extended by setting higher attenuation, see `adc_atten_t`. An example using the ADC driver including calibration (discussed below) is available in esp-idf: *peripherals/adc*

**Reading voltage on ADC2 channel 7 (GPIO 27):**

```c
#include <driver/adc.h>
...

int read_raw;
adc2_config_channel_atten(ADC2_CHANNEL_7,ADC_ATTEN_0db);

esp_err_t r = adc2_get_raw(ADC2_CHANNEL_7,ADC_WIDTH_12Bit,&read_raw);
if ( r == ESP_OK ) {
    printf("%d\n",read_raw);
} else if ( r == ESP_ERR_TIMEOUT ) {
    printf("ADC2 used by Wi-Fi.\n");
}
```

The reading may fail due to collision with Wi-Fi, should check it. An example using the ADC2 driver to read the output of DAC is available in esp-idf: *peripherals/adc2*

**Reading the internal hall effect sensor:**

```c
#include <driver/adc.h>
...
adc1_config_width(ADC_WIDTH_BIT_12);
int val = hall_sensor_read();
```

The value read in both these examples is 12 bits wide (range 0-4095).
Minimizing Noise

The ESP32 ADC can be sensitive to noise leading to large discrepancies in ADC readings. To minimize noise, users may connect a 0.1uF capacitor to the ADC input pad in use. Multisampling may also be used to further mitigate the effects of noise.

![ADC Noise Comparison](image)

**Fig. 4:** Graph illustrating noise mitigation using capacitor and multisampling of 64 samples.

ADC Calibration

The `esp_adc_cal/include/esp_adc_cal.h` API provides functions to correct for differences in measured voltages caused by variation of ADC reference voltages (Vref) between chips. Per design the ADC reference voltage is 1100mV, however the true reference voltage can range from 1000mV to 1200mV amongst different ESP32s.

Correcting ADC readings using this API involves characterizing one of the ADCs at a given attenuation to obtain a characteristics curve (ADC-Voltage curve) that takes into account the difference in ADC reference voltage. The characteristics curve is in the form of \( y = \text{coeff}_a \times x + \text{coeff}_b \) and is used to convert ADC readings to voltages in mV. Calculation of the characteristics curve is based on calibration values which can be stored in eFuse or provided by the user.

**Calibration Values**

Calibration values are used to generate characteristic curves that account for the unique ADC reference voltage of a particular ESP32. There are currently three sources of calibration values. The availability of these calibration values will depend on the type and production date of the ESP32 chip/module.

- **Two Point** values represent each of the ADCs’ readings at 150mV and 850mV. To obtain more accurate calibration results these values should be measured by user and burned into eFuse `BLOCK3`.
- **eFuse Vref** represents the true ADC reference voltage. This value is measured and burned into eFuse `BLOCK0` during factory calibration.
- **Default Vref** is an estimate of the ADC reference voltage provided by the user as a parameter during characterization. If Two Point or eFuse Vref values are unavailable, **Default Vref** will be used.

Individual measurement and burning of the **eFuse Vref** has been applied to ESP32-D0WD and ESP32-D0WDQ6 chips produced on/after the 1st week of 2018. Such chips may be recognized by date codes on/later than 012018 (see Line 4 on figure below).
Fig. 5: Graph illustrating effect of differing reference voltages on the ADC voltage curve.

Fig. 6: ESP32 Chip Surface Marking
If you would like to purchase chips or modules with calibration, double check with distributor or Espressif directly.

If you are unable to check the date code (i.e. the chip may be enclosed inside a canned module, etc.), you can still verify if eFuse Vref is present by running `espefuse.py` tool with `adc_info` parameter:

```
$IDF_PATH/components/esptool_py/esptool/espefuse.py --port /dev/ttyUSB0 adc_info
```

Replace `/dev/ttyUSB0` with ESP32 board’s port name.

A chip that has specific eFuse Vref value programmed (in this case 1093mV) will be reported as follows:

```
ADC VRef calibration: 1093mV
```

In another example below the eFuse Vref is not programmed:

```
ADC VRef calibration: None (1100mV nominal)
```

For a chip with two point calibration the message will look similar to:

```
ADC VRef calibration: 1149mV
ADC readings stored in efuse BLK3:
  ADC1 Low reading (150mV): 306
  ADC1 High reading (850mV): 3153
  ADC2 Low reading (150mV): 389
  ADC2 High reading (850mV): 3206
```

**Application Example**  For a full example see esp-idf: `peripherals/adc`

Characterizing an ADC at a particular attenuation:

```c
#include "driver/adc.h"
#include "esp_adc_cal.h"
...

    //Characterize ADC at particular atten
    esp_adc_cal_characteristics_t *adc_chars = calloc(1, sizeof(esp_adc_cal_characteristics_t));
    esp_adc_cal_value_t val_type = esp_adc_cal_characterize(unit, atten, ADC_WIDTH_BIT_12, DEFAULT_VREF, adc_chars);
    //Check type of calibration value used to characterize ADC
    if (val_type == ESP_ADC_CAL_VAL_EFUSE_VREF) {
        printf("eFuse Vref");
    } else if (val_type == ESP_ADC_CAL_VAL_EFUSE_TP) {
        printf("Two Point");
    } else {
        printf("Default");
    }
```

Reading an ADC then converting the reading to a voltage:

```c
#include "driver/adc.h"
#include "esp_adc_cal.h"
...
uint32_t reading = adc1_get_raw(ADC1_CHANNEL_5);
uint32_t voltage = esp_adc_cal_raw_to_voltage(reading, adc_chars);
```

Routing ADC reference voltage to GPIO, so it can be manually measured (for Default Vref):

```c
#include "driver/adc.h"
```

(continues on next page)
... esp_err_t status = adc2_vref_to_gpio(GPIO_NUM_25);
if (status == ESP_OK) {
    printf("v_ref routed to GPIO\n");
} else {
    printf("failed to route v_ref\n");
}

GPIO Lookup Macros

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.
1. ADC1_CHANNEL_0_GPIO_NUM is the GPIO number of ADC1 channel 0 (36);
2. ADC1_GPIO32_CHANNEL is the ADC1 channel number of GPIO 32 (ADC1 channel 4).

API Reference

This reference covers three components:
- ADC driver
- ADC Calibration
- GPIO Lookup Macros

ADC driver

Header File
- driver/include/driver/adc.h

Functions

**esp_err_t adc1_pad_get_io_num(adc1_channel_t channel, gpio_num_t *gpio_num)**
- Get the gpio number of a specific ADC1 channel.
  - **Return**
    - ESP_OK if success
    - ESP_ERR_INVALID_ARG if channel not valid
  - **Parameters**
    - *channel*: Channel to get the gpio number
    - *gpio_num*: output buffer to hold the gpio number

**esp_err_t adc1_config_width(adc_bits_width_t width_bit)**
- Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.
  - **Return**
    - ESP_OK success
    - ESP_ERR_INVALID_ARG Parameter error
  - **Parameters**
    - *width_bit*: Bit capture width for ADC1

**esp_err_t adc_set_data_width(adc_unit_t adc_unit, adc_bits_width_t width_bit)**
- Configure ADC capture width.
  - **Return**
    - ESP_OK success
    - ESP_ERR_INVALID_ARG Parameter error
  - **Parameters**
    - *adc_unit*: ADC unit
    - *width_bit*: Bit capture width for ADC1
• `adc_unit`: ADC unit index
• `width_bit`: Bit capture width for ADC unit.

**`esp_err_t adc1_config_channel_atten(adc1_channel_t channel, adc_atten_t atten)`**

Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

The default ADC full-scale voltage is 1.1V. To read higher voltages (up to the pin maximum voltage, usually 3.3V) requires setting >0dB signal attenuation for that ADC channel.

**Note** For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

**Note** This function can be called multiple times to configure multiple ADC channels simultaneously. `adc1_get_raw()` can then be called for any configured channel.

When VDD_A is 3.3V:
- 0dB attenuation (ADC_ATTEN_DB_0) gives full-scale voltage 1.1V
- 2.5dB attenuation (ADC_ATTEN_DB_2_5) gives full-scale voltage 1.5V
- 6dB attenuation (ADC_ATTEN_DB_6) gives full-scale voltage 2.2V
- 11dB attenuation (ADC_ATTEN_DB_11) gives full-scale voltage 3.9V (see note below)

Due to ADC characteristics, most accurate results are obtained within the following approximate voltage ranges:

**Note** The full-scale voltage is the voltage corresponding to a maximum reading (depending on ADC1 configured bit width, this value is: 4095 for 12-bits, 2047 for 11-bits, 1023 for 10-bits, 511 for 9 bits.)

**Note** At 11dB attenuation the maximum voltage is limited by VDD_A, not the full scale voltage.

- 0dB attenuation (ADC_ATTEN_DB_0) between 100 and 950mV
- 2.5dB attenuation (ADC_ATTEN_DB_2_5) between 100 and 1250mV
- 6dB attenuation (ADC_ATTEN_DB_6) between 150 to 1750mV
- 11dB attenuation (ADC_ATTEN_DB_11) between 150 to 2450mV

For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `channel`: ADC1 channel to configure
- `atten`: Attenuation level

**int adc1_get_raw(adc1_channel_t channel)**

Take an ADC1 reading from a single channel.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue.

**Note** Call `adc1_config_width()` before the first time this function is called.

**Note** For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

**Return**
- -1: Parameter error
- Other: ADC1 channel reading.

**Parameters**
- `channel`: ADC1 channel to read

**void adc_power_on(void)**

Enable ADC power.

**void adc_power_off(void)**

Power off SAR ADC.
Chapter 2. API Reference

void **adc_power_acquire** (void)
Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0.
Call **adc_power_release** when done using the ADC.

void **adc_power_release** (void)
Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0.
Call this function when done using the ADC.

*esp_err_t adc_gpio_init (adc_unit_t adc_unit, adc_channel_t channel)*
Initialize ADC pad.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- adc_unit: ADC unit index
- channel: ADC channel index

*esp_err_t adc_set_data_inv (adc_unit_t adc_unit, bool inv_en)*
Set ADC data invert.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- adc_unit: ADC unit index
- inv_en: whether enable data invert

*esp_err_t adc_set_clk_div (uint8_t clk_div)*
Set ADC source clock.

Return
- ESP_OK success

Parameters
- clk_div: ADC clock divider, ADC clock is divided from APB clock

*esp_err_t adc_set_i2s_data_source (adc_i2s_source_t src)*
Set I2S data source.

Return
- ESP_OK success

Parameters
- src: I2S DMA data source, I2S DMA can get data from digital signals or from ADC.

*esp_err_t adc_i2s_mode_init (adc_unit_t adc_unit, adc_channel_t channel)*
Initialize I2S ADC mode.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- adc_unit: ADC unit index
- channel: ADC channel index

void **adc1_ulp_enable** ()
Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using **adc1_get_raw** function.

Note that **adc1_config_channel_atten**, **adc1_config_width** functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

int **hall_sensor_read** ()
Read Hall Sensor.
Chapter 2. API Reference

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ECO_and_Workarounds_for_Bugs_in_ESP32 for the description of this issue.

**Note** The Hall Sensor uses channels 0 and 3 of ADC1. Do not configure these channels for use as ADC channels.

**Note** The ADC1 module must be enabled by calling adc1_config_width() before calling hall_sensor_read(). ADC1 should be configured for 12 bit readings, as the hall sensor readings are low values and do not cover the full range of the ADC.

**Return** The hall sensor reading.

```c
esp_err_t adc2_pad_get_io_num(adc2_channel_t channel, gpio_num_t *gpio_num)
```

Get the gpio number of a specific ADC2 channel.

**Return**
- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

**Parameters**
- channel: Channel to get the gpio number
- gpio_num: output buffer to hold the gpio number

```c
esp_err_t adc2_config_channel_atten(adc2_channel_t channel, adc_atten_t atten)
```

Configure the ADC2 channel, including setting attenuation.

The default ADC full-scale voltage is 1.1V. To read higher voltages (up to the pin maximum voltage, usually 3.3V) requires setting >0dB signal attenuation for that ADC channel.

**Note** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling adc2_get_raw() for this channel.

When VDD_A is 3.3V:

- 0dB attenuation (ADC_ATTEN_0db) gives full-scale voltage 1.1V
- 2.5dB attenuation (ADC_ATTEN_2_5db) gives full-scale voltage 1.5V
- 6dB attenuation (ADC_ATTEN_6db) gives full-scale voltage 2.2V
- 11dB attenuation (ADC_ATTEN_11db) gives full-scale voltage 3.9V (see note below)

**Note** The full-scale voltage is the voltage corresponding to a maximum reading (depending on ADC2 configured bit width, this value is: 4095 for 12-bits, 2047 for 11-bits, 1023 for 10-bits, 511 for 9 bits.)

**Note** At 11dB attenuation the maximum voltage is limited by VDD_A, not the full scale voltage.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- channel: ADC2 channel to configure
- atten: Attenuation level

```c
esp_err_t adc2_get_raw(adc2_channel_t channel, adc_bits_width_t width_bit, int *raw_out)
```

Take an ADC2 reading on a single channel.

**Note** When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ECO_and_Workarounds_for_Bugs_in_ESP32 for the description of this issue.

**Note** For a given channel, adc2_config_channel_atten() must be called before the first time this function is called. If Wi-Fi is started via esp_wifi_start(), this function will always fail with ESP_ERR_TIME_OUT.

**Return**
- ESP_OK if success
- ESP_ERR_TIMEOUT the WIFI is started, using the ADC2

**Parameters**
- channel: ADC2 channel to read
- width_bit: Bit capture width for ADC2
• `raw_out`: the variable to hold the output data.

```c
esp_err_t adc2_vref_to_gpio(gpio_num_t gpio)
```

Output ADC2 reference voltage to gpio 25 or 26 or 27.

This function utilizes the testing mux exclusive to ADC 2 to route the reference voltage one of ADC2’s channels. Supported gpios are gpios 25, 26, and 27. This reference voltage can be manually read from the pin and used in the esp_adc_cal component.

**Return**

- ESP_OK: v_ref successfully routed to selected gpio
- ESP_ERR_INVALID_ARG: Unsupported gpio

**Parameters**

- `[in] gpio`: GPIO number (gpios 25, 26, 27 supported)

### Macros

- `ADC_ATTEN_0db`
- `ADC_ATTEN_2_5db`
- `ADC_ATTEN_6db`
- `ADC_ATTEN_11db`
- `ADC_WIDTH_9Bit`
- `ADC_WIDTH_10Bit`
- `ADC_WIDTH_11Bit`
- `ADC_WIDTH_12Bit`

### Enumerations

#### `enum adc_atten_t`

**Values:**

- `ADC_ATTEN_DB_0` = 0
  The input voltage of ADC will be reduced to about 1/1
- `ADC_ATTEN_DB_2_5` = 1
  The input voltage of ADC will be reduced to about 1/1.34
- `ADC_ATTEN_DB_6` = 2
  The input voltage of ADC will be reduced to about 1/2
- `ADC_ATTEN_DB_11` = 3
  The input voltage of ADC will be reduced to about 1/3.6

- `ADC_ATTEN_MAX`

#### `enum adc_bits_width_t`

**Values:**

- `ADC_WIDTH_BIT_9` = 0
  ADC capture width is 9Bit
- `ADC_WIDTH_BIT_10` = 1
  ADC capture width is 10Bit
- `ADC_WIDTH_BIT_11` = 2
  ADC capture width is 11Bit
- `ADC_WIDTH_BIT_12` = 3
  ADC capture width is 12Bit

- `ADC_WIDTH_MAX`

#### `enum adc1_channel_t`

**Values:**
ADC1_CHANNEL_0 = 0
ADC1 channel 0 is GPIO36

ADC1_CHANNEL_1
ADC1 channel 1 is GPIO37

ADC1_CHANNEL_2
ADC1 channel 2 is GPIO38

ADC1_CHANNEL_3
ADC1 channel 3 is GPIO39

ADC1_CHANNEL_4
ADC1 channel 4 is GPIO32

ADC1_CHANNEL_5
ADC1 channel 5 is GPIO33

ADC1_CHANNEL_6
ADC1 channel 6 is GPIO34

ADC1_CHANNEL_7
ADC1 channel 7 is GPIO35

ADC1_CHANNEL_MAX

enum adc2_channel_t
Values:

ADC2_CHANNEL_0 = 0
ADC2 channel 0 is GPIO4

ADC2_CHANNEL_1
ADC2 channel 1 is GPIO0

ADC2_CHANNEL_2
ADC2 channel 2 is GPIO2

ADC2_CHANNEL_3
ADC2 channel 3 is GPIO15

ADC2_CHANNEL_4
ADC2 channel 4 is GPIO13

ADC2_CHANNEL_5
ADC2 channel 5 is GPIO12

ADC2_CHANNEL_6
ADC2 channel 6 is GPIO14

ADC2_CHANNEL_7
ADC2 channel 7 is GPIO27

ADC2_CHANNEL_8
ADC2 channel 8 is GPIO25

ADC2_CHANNEL_9
ADC2 channel 9 is GPIO26

ADC2_CHANNEL_MAX

enum adc_channel_t
Values:

ADC_CHANNEL_0 = 0
ADC channel

ADC_CHANNEL_1
ADC channel
ADC_CHANNEL_2
  ADC channel
ADC_CHANNEL_3
  ADC channel
ADC_CHANNEL_4
  ADC channel
ADC_CHANNEL_5
  ADC channel
ADC_CHANNEL_6
  ADC channel
ADC_CHANNEL_7
  ADC channel
ADC_CHANNEL_8
  ADC channel
ADC_CHANNEL_9
  ADC channel
ADC_CHANNEL_MAX

enum adc_unit_t
  Values:
  ADC_UNIT_1 = 1
    SAR ADC 1
  ADC_UNIT_2 = 2
    SAR ADC 2, not supported yet
  ADC_UNIT_BOTH = 3
    SAR ADC 1 and 2, not supported yet
  ADC_UNIT_ALTER = 7
    SAR ADC 1 and 2 alternative mode, not supported yet
  ADC_UNIT_MAX

enum adc_i2s_encode_t
  Values:
  ADC_ENCODE_12BIT
    ADC to I2S data format, [15:12]-channel [11:0]-12 bits ADC data
  ADC_ENCODE_11BIT
    ADC to I2S data format, [15:1][14:11]-channel [10:0]-11 bits ADC data
  ADC_ENCODE_MAX

enum adc_i2s_source_t
  Values:
  ADC_I2S_DATA_SRC_IO_SIG = 0
    I2S data from GPIO matrix signal
  ADC_I2S_DATA_SRC_ADC = 1
    I2S data from ADC
  ADC_I2S_DATA_SRC_MAX

ADC Calibration
Chapter 2. API Reference

Header File

* esp_adc_cal/include/esp_adc_cal.h

Functions

**esp_err_t esp_adc_cal_check_efuse(esp_adc_cal_value_t value_type)**

Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

Return

- ESP_OK: The calibration mode is supported in eFuse
- ESP_ERR_NOT_SUPPORTED: Error, eFuse values are not burned
- ESP_ERR_INVALID_ARG: Error, invalid argument (ESP_ADC_CAL_VAL_DEFAULT_VREF)

Parameters

- **value_type**: Type of calibration value (ESP_ADC_CAL_VAL_EFUSE_VREF or ESP_ADC_CAL_VAL_EFUSE_TP)

**esp_adc_cal_characterize(adc_unit_t adc_num, adc_atten_t atten, adc_bits_width_t bit_width, uint32_t default_vref, esp_adc_cal_characteristics_t *chars)**

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of \(y = \text{coeff}_a \times x + \text{coeff}_b\). Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.

Note Two Point values and eFuse Vref can be enabled/disabled using menuconfig.

Return

- ESP_ADC_CAL_VAL_EFUSE_VREF: eFuse Vref used for characterization
- ESP_ADC_CAL_VAL_EFUSE_TP: Two Point value used for characterization (only in Linear Mode)
- ESP_ADC_CAL_VAL_DEFAULT_VREF: Default Vref used for characterization

Parameters

- **[in]** adc_num: ADC to characterize (ADC_UNIT_1 or ADC_UNIT_2)
- **[in]** atten: Attenuation to characterize
- **[in]** bit_width: Bit width configuration of ADC
- **[in]** default_vref: Default ADC reference voltage in mV (used if eFuse values is not available)
- **[out]** chars: Pointer to empty structure used to store ADC characteristics

**uint32_t esp_adc_cal_raw_to_voltage(uint32_t adc_reading, const esp_adc_cal_characteristics_t *chars)**

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC’s characteristics.

Note Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

Return Voltage in mV

Parameters

- **[in]** adc_reading: ADC reading
- **[in]** chars: Pointer to initialized structure containing ADC characteristics

**esp_err_t esp_adc_cal_get_voltage(adc_channel_t channel, const esp_adc_cal_characteristics_t *chars, uint32_t *voltage)**

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

Note The Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())
Return
- ESP_OK: ADC read and converted to mV
- ESP_ERR_TIMEOUT: Error, timed out attempting to read ADC
- ESP_ERR_INVALID_ARG: Error due to invalid arguments

Parameters
- [in] channel: ADC Channel to read
- [in] chars: Pointer to initialized ADC characteristics structure
- [out] voltage: Pointer to store converted voltage

Structures

struct esp_adc_cal_characteristics_t
Structure storing characteristics of an ADC.

Note Call esp_adc_cal_characterize() to initialize the structure

Public Members

adc_unit_t adc_num
ADC number

adc_atten_t atten
ADC attenuation

adc_bits_width_t bit_width
ADC bit width

uint32_t coeff_a
Gradient of ADC-Voltage curve

uint32_t coeff_b
Offset of ADC-Voltage curve

uint32_t vref
Vref used by lookup table

const uint32_t *low_curve
Pointer to low Vref curve of lookup table (NULL if unused)

const uint32_t *high_curve
Pointer to high Vref curve of lookup table (NULL if unused)

Enumerations

type esp_adc_cal_value_t
Type of calibration value used in characterization.

Values:

ESP_ADC_CAL_VAL_EFUSE_VREF = 0
Characterization based on reference voltage stored in eFuse

ESP_ADC_CAL_VAL_EFUSE_TP = 1
Characterization based on Two Point values stored in eFuse

ESP_ADC_CAL_VAL_DEFAULT_VREF = 2
Characterization based on default reference voltage

2.3.2 Controller Area Network (CAN)

Overview

The ESP32’s peripherals contains a CAN Controller that supports Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID) of the CAN2.0B specification.

**Warning:** The ESP32 CAN controller is not compatible with CAN FD frames and will interpret such frames as errors.

This programming guide is split into the following sections:

1. Basic CAN Concepts
2. Signals Lines and Transceiver
3. Configuration
4. Driver Operation
5. Examples

Basic CAN Concepts

**Note:** The following section only covers the basic aspects of CAN. For full details, see the CAN2.0B specification.

The CAN protocol is a multi-master, multi-cast communication protocol with error detection/signalling and inbuilt message prioritization. The CAN protocol is commonly used as a communication bus in automotive applications.

**Multi-master:** Any node in a CAN bus is allowed initiate the transfer of data.

**Multi-cast:** When a node transmits a message, all nodes are able to receive the message (broadcast). However some nodes can selective choose which messages to accept via the use of acceptance filtering (multi-cast).

**Error Detection and Signalling:** Every CAN node will constantly monitor the CAN bus. When any node detects an error, it will signal the error by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

**Message Priorities:** If two nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID will win arbitration. All other nodes will become receivers ensuring there is at most one transmitter at any time.

**CAN Message Frames** The CAN2.0B specification contains two frame formats known as Extended Frame and Standard Frame which contain 29-bit IDs and 11-bit IDs respectively. A CAN message consists of the following components:

- 29-bit or 11-bit ID
- Data Length Code (DLC) between 0 to 8
- Up to 8 bytes of data (should match DLC)

**Error States and Counters** The CAN2.0B specification implements fault confinement by requiring every CAN node to maintain two internal error counters known as the Transmit Error Counter (TEC) and the Receive Error Counter (REC). The two error counters are used to determine a CAN node’s error state, and the counters are incremented and decremented following a set of rules (see CAN2.0B specification). These error states are known as Error Active, Error Passive, and Bus-Off.

**Error Active:** A CAN node is Error Active when both TEC and REC are less than 128 and indicates a CAN node is operating normally. Error Active nodes are allowed to participate in CAN bus activities, and will actively signal any error conditions it detects by transmitting an Active Error Flag over the CAN bus.
**Error Passive:** A CAN node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in CAN bus activities, but will instead transmit a Passive Error Flag upon detection of an error.

**Bus-Off:** A CAN node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable to take part in CAN bus activity and will remain so until it undergoes bus recovery.

**Signals Lines and Transceiver**

The CAN controller does not contain a internal transceiver and therefore requires an external transceiver to operate. The type of external transceiver will depend on the application’s physical layer specification (e.g. using SN65HVD23X transceivers for ISO 11898-2 compatibility).

The CAN controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to GPIOs.

![Fig. 7: Signal lines of the CAN controller](image)

**TX and RX:** The TX and RX signal lines are required to interface with an external CAN transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is optional and is set to a low logic level (0V) whenever the CAN controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is optional and outputs a prescaled version of the CAN controller’s source clock (APB Clock).

**Note:** An external transceiver must internally tie the TX input and the RX output such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the CAN controller to interpret differences in logic levels between the two signal lines as a lost in arbitration or a bit error.

**Configuration**

**Operating Modes** The CAN driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the CAN controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another CAN node is required when transmitting message frames.
No Ack Mode: The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required when transmitting message frames. This mode is useful when self testing the CAN controller.

Listen Only Mode: This mode will prevent the CAN controller from taking part in bus activities. Therefore transmissions of messages/acknowledgement/error frames will be disabled. However the the CAN controller will still be able to receive messages (without acknowledging). This mode is suited for applications such as CAN bus monitoring.

Alerts The CAN driver contains an alert feature which is used to notify the application level of certain CAN driver events. Alerts are selectively enabled when the CAN driver is installed, but can be reconfigured during runtime by calling `can_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `can_read_alerts()`. The CAN driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAN_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>CAN_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>CAN_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>CAN_ALERT_ERR_ACTIVE</td>
<td>CAN controller has become error active</td>
</tr>
<tr>
<td>CAN_ALERT_RECOVERY_IN_PROGRES</td>
<td>CAN controller is undergoing bus recovery</td>
</tr>
<tr>
<td>CAN_ALERT_BUS_RECOVERED</td>
<td>CAN controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>CAN_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>CAN_ALERT_ABOVE_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>CAN_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error occurred on the bus</td>
</tr>
<tr>
<td>CAN_ALERT_TX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>CAN_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>CAN_ALERT_ERR_PASS</td>
<td>CAN controller has become error passive</td>
</tr>
<tr>
<td>CAN_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. CAN controller can no longer influence bus</td>
</tr>
</tbody>
</table>

Note: The error warning limit can be used to preemptively warn the application of bus errors before the error passive state is reached. By default the CAN driver sets the error warning limit to 96. The CAN_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The CAN_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

Note: When enabling alerts, the CAN_ALERT_AND_LOG flag can be used to cause the CAN driver to log any raised alerts to UART. However, alert logging is disabled and CAN_ALERT_AND_LOG if the CONFIG_CAN_ISR_IN_IRAM option is enabled (see Placing ISR into IRAM).

Note: The CAN_ALERT_ALL and CAN_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

Bit Timing The operating bit rate of the CAN controller is configured using the `can_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quanta is determined by a prescaled version of the CAN controller’s source clock. A single bit contains the following segments in the following order:

1. The Synchronization Segment consists of a single time quanta
2. Timing Segment 1 consists of 1 to 16 time quanta before sample point
3. Timing Segment 2 consists of 1 to 8 time quanta after sample point

The Baudrate Prescaler is used to determine the period of each time quanta by dividing the CAN controller’s source clock (80 MHz APB clock). The brp can be any even number from 2 to 128. If the ESP32 is a revision
2 or later chip, the \texttt{brp} will also support \textbf{any multiple of 4 from 132 to 256}, and can be enabled by setting the \texttt{CONFIG_ESP32_REV_MIN} to revision 2 or higher.

![Fig. 8: Bit timing configuration for 500kbit/s given BRP = 8](image)

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling \textbf{Triple Sampling} will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The \textbf{Synchronization Jump Width} is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. \texttt{sjw} can \textbf{range from 1 to 4}.

\textbf{Note:} Multiple combinations of \texttt{brp}, \texttt{tseg\textsubscript{1}}, \texttt{tseg\textsubscript{2}}, and \texttt{sjw} can achieve the same bit rate. Users should tune these values to the physical characteristics of their CAN bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing \textbf{macro initializers} are also available for commonly used CAN bus bit rates. The following macro initializers are provided by the CAN driver.

- \texttt{CAN\_TIMING\_CONFIG\_12\_5KBITS()}
- \texttt{CAN\_TIMING\_CONFIG\_16KBITS()}
- \texttt{CAN\_TIMING\_CONFIG\_20KBITS()}
- \texttt{CAN\_TIMING\_CONFIG\_25KBITS()}
- \texttt{CAN\_TIMING\_CONFIG\_50KBITS()}
- \texttt{CAN\_TIMING\_CONFIG\_100KBITS()}
- \texttt{CAN\_TIMING\_CONFIG\_125KBITS()}
- \texttt{CAN\_TIMING\_CONFIG\_250KBITS()}
- \texttt{CAN\_TIMING\_CONFIG\_500KBITS()}
- \texttt{CAN\_TIMING\_CONFIG\_800KBITS()}
- \texttt{CAN\_TIMING\_CONFIG\_1MBITS()}

\textbf{Note:} The macro initializers for 12.5K, 16K, and 20K bit rates are only available for ESP32 revision 2 or later.

\textbf{Acceptance Filter} The CAN controller contains a hardware acceptance filter which can be used to filter CAN messages of a particular ID. A node that filters out a message \textbf{will not receive the message, but will still acknowledge it}. Acceptances filters can make a node more efficient by filtering out messages sent over the CAN bus that are irrelevant to the CAN node in question. The CAN controller’s acceptance filter is configured using two 32-bit values within \texttt{can\_filter\_config\_t} known as the \textbf{acceptance code} and the \textbf{acceptance mask}.

The \textbf{acceptance code} specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the CAN controller. The \textbf{acceptance mask} is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under \textbf{Single or Dual Filter Mode}. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended CAN frames respectively).
Dual Filter Mode will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Dual Filter Mode (Note: The yellow and blue fields represent standard and extended CAN frames respectively).

Disabling TX Queue The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `can_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the CAN driver.

Placing ISR into IRAM The CAN driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the CAN driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the CAN driver’s ISR, users must do the following:

- Enable the `CONFIG_CAN_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `can_driver_install()`, the `intr_flags` member of `can_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

Note: When the `CONFIG_CAN_ISR_IN_IRAM` option is enabled, the CAN driver will no longer log any alerts (i.e., the `CAN_ALERT_AND_LOG` flag will not have any effect).

Driver Operation

The CAN driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.
Chapter 2. API Reference

![State transition diagram of the CAN driver](image)

Table 11: State transition diagram of the CAN driver (see table below)

**Driver States**

**Uninstalled**: In the uninstalled state, no memory is allocated for the driver and the CAN controller is powered OFF.

**Stopped**: In this state, the CAN controller is powered ON and the CAN driver has been installed. However the CAN controller will be unable to take part in any CAN bus activities such as transmitting, receiving, or acknowledging messages.

**Running**: In the running state, the CAN controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the CAN controller will be able to transmit error frames upon detection of errors on the CAN bus.

**Bus-Off**: The bus-off state is automatically entered when the CAN controller’s Transmit Error Counter becomes greater than or equal to 256 (see CAN2.0B specification regarding error counter rules). The bus-off state indicates the occurrence of severe errors on the CAN bus or in the CAN controller. Whilst in the bus-off state, the CAN controller will be unable to take part in any CAN bus activities. To exit the bus-off state, the CAN controller must undergo the bus recovery process.

**Recovering**: The recovering state is entered when the CAN driver undergoes bus recovery. The CAN driver/controller will remain in the recovering state until the 128 occurrences of the bus-free signal (see CAN2.0B specification) is observed on the CAN bus.

**Message Flags**

The CAN driver distinguishes different types of CAN messages by using the message flags in the `flags` field of `can_message_t`. These flags help distinguish whether a message is in standard or extended format, an RTR, and the type of transmission to use when transmitting such a message. The CAN driver supports the following flags:
<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAN_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>CAN_MSG_FLAG_RTR</td>
<td>Message is a Remote Transmit Request</td>
</tr>
</tbody>
</table>
| CAN_MSG_FLAG_SS   | Transmit message using Single Shot Transmission (Message will not be retransmit-
|                  | ted upon error or loss of arbitration)                                      |
| CAN_MSG_FLAG_SELF | Transmit message using Self Reception Request (Transmitted message will also
|                  | received by the same node)                                                 |
| CAN_MSG_FLAG_DLC_NON_COMP | Message’s Data length code is larger than 8. This will break compliance with
|                  | CAN2.0B                                                                      |

**Note:** The CAN_MSG_FLAG_NONE flag can be used for Standard Frame Format messages

### Examples

#### Configuration & Installation

The following code snippet demonstrates how to configure, install, and start the CAN driver via the use of the various configuration structures, macro initializers, the `can_driver_install()` function, and the `can_start()` function.

```c
#include "driver/gpio.h"
#include "driver/can.h"

void app_main() {
  //Initialize configuration structures using macro initializers
  can_general_config_t g_config = CAN_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_-
  _NUM_22, CAN_MODE_NORMAL);
  can_timing_config_t t_config = CAN_TIMING_CONFIG_500KBITS();
  can_filter_config_t f_config = CAN_FILTER_CONFIG_ACCEPT_ALL();

  //Install CAN driver
  if (can_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
    printf("Driver installed\n");
  } else {
    printf("Failed to install driver\n");
    return;
  }

  //Start CAN driver
  if (can_start() == ESP_OK) {
    printf("Driver started\n");
  } else {
    printf("Failed to start driver\n");
    return;
  }
  ...
}
```

The usage of macro initializers are not mandatory and each of the configuration structures can be manually.

#### Message Transmission

The following code snippet demonstrates how to transmit a message via the usage of the `can_message_t` type and `can_transmit()` function.

```c
#include "driver/can.h"
```

(continues on next page)
//Configure message to transmit
    can_message_t message;
    message.identifier = 0xAAAA;
    message.flags = CAN_MSG_FLAG_EXTD;
    message.data_length_code = 4;
    for (int i = 0; i < 4; i++) {
        message.data[i] = 0;
    }

//Queue message for transmission
    if (can_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
        printf("Message queued for transmission\n");
    } else {
        printf("Failed to queue message for transmission\n");
    }

Message Reception The following code snippet demonstrates how to receive a message via the usage of the
    can_message_t type and can_receive() function.

#include "driver/can.h"

...  

//Wait for message to be received
    can_message_t message;
    if (can_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
        printf("Message received\n");
    } else {
        printf("Failed to receive message\n");
        return;
    }

//Process received message
    if (message.flags & CAN_MSG_FLAG_EXTD) {
        printf("Message is in Extended Format\n");
    } else {
        printf("Message is in Standard Format\n");
    }
    printf("ID is \%d\n", message.identifier);
    if (! (message.flags & CAN_MSG_FLAG_RTR)) {
        for (int i = 0; i < message.data_length_code; i++) {
            printf("Data byte \%d = \%d\n", i, message.data[i]);
        }
    }

Reconfiguring and Reading Alerts The following code snippet demonstrates how to reconfigure and read CAN
    driver alerts via the use of the can_reconfigure_alerts() and can_read_alerts() functions.

#include "driver/can.h"

...  

//Reconfigure alerts to detect Error Passive and Bus-Off error states
    uint32_t alerts_to_enable = CAN_ALERT_ERR_PASS | CAN_ALERT_BUS_OFF;
    if (can_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
        printf("Alerts reconfigured\n");
    }

(continues on next page)
} else {
    printf("Failed to reconfigure alerts");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
can_read_alerts(&alerts_triggered, portMAX_DELAY);

Stop and Uninstall  The following code demonstrates how to stop and uninstall the CAN driver via the use of the `can_stop()` and `can_driver_uninstall()` functions.

```c
#include "driver/can.h"

//Stop the CAN driver
if (can_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the CAN driver
if (can_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration  The acceptance mask in `can_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

- **ID1** = 11'b101 1010 0000
- **ID2** = 11'b101 1010 0001
- **ID3** = 11'b101 1010 0100
- **ID4** = 11'b101 1010 1000
```
//Acceptance Mask
MASK = 11'b000 0000 1101
```

Application Examples  Network Example: The CAN Network example demonstrates communication between two ESP32s using the CAN driver API. One CAN node acts as a network master initiate and ceasing the transfer of a data from another CAN node acting as a network slave. The example can be found via `peripherals/can/can_network`.

Alert and Recovery Example: This example demonstrates how to use the CAN driver’s alert and bus recovery API. The example purposely introduces errors on the CAN bus to put the CAN controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via `peripherals/can/can_alert_and_recovery`.

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the CAN controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the CAN controller and the external transceiver are working correctly. The example can be found via `peripherals/can/can_self_test`.
Chapter 2. API Reference

**API Reference**

**Header File**
- driver/include/driver/can.h

**Functions**

```c
esp_err_t can_driver_install(const can_general_config_t *g_config, const can_timing_config_t *t_config, const can_filter_config_t *f_config)
```

Install CAN driver.

This function installs the CAN driver using three configuration structures. The required memory is allocated and the CAN driver is placed in the stopped state after running this function.

**Note** Macro initializers are available for the configuration structures (see documentation)

**Note** To reinstall the CAN driver, call `can_driver_uninstall()` first

**Return**
- ESP_OK: Successfully installed CAN driver
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed

```c
esp_err_t can_driver_uninstall()
```

Uninstall the CAN driver.

This function uninstalls the CAN driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Return**
- ESP_OK: Successfully uninstalled CAN driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

```c
esp_err_t can_start()
```

Start the CAN driver.

This function starts the CAN driver, putting the CAN driver into the running state. This allows the CAN driver to participate in CAN bus activities such as transmitting/receiving messages. The RX queue is reset in this function, clearing any unread messages. This function can only be called when the CAN driver is in the stopped state.

**Return**
- ESP_OK: CAN driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

```c
esp_err_t can_stop()
```

Stop the CAN driver.

This function stops the CAN driver, preventing any further message from being transmitted or received until `can_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the CAN driver is in the running state.

**Warning** A message currently being transmitted/received on the CAN bus will be ceased immediately. This may lead to other CAN nodes interpreting the unfinished message as an error.

**Return**
- ESP_OK: CAN driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed
esp_err_t can_transmit(const can_message_t *message, TickType_t ticks_to_wait)

Transmit a CAN message.

This function queues a CAN message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the CAN driver is in the running state and cannot be called under Listen Only Mode.

**Note** This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Return**
- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: CAN driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

**Parameters**
- [in] message: Message to transmit
- [in] ticks_to_wait: Number of FreeRTOS ticks to block on the TX queue

esp_err_t can_receive(can_message_t *message, TickType_t ticks_to_wait)

Receive a CAN message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

**Warning** The flags field of the received message should be checked to determine if the received message contains any data bytes.

**Return**
- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: CAN driver is not installed

**Parameters**
- [out] message: Received message
- [in] ticks_to_wait: Number of FreeRTOS ticks to block on RX queue

esp_err_t can_read_alerts(uint32_t *alerts, TickType_t ticks_to_wait)

Read CAN driver alerts.

This function will read the alerts raised by the CAN driver. If no alert has been when this function is called, this function will block until an alert occurs or until it timeouts.

**Note** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

**Return**
- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: CAN driver is not installed

**Parameters**
- [out] alerts: Bit field of raised alerts (see documentation for alert flags)
- [in] ticks_to_wait: Number of FreeRTOS ticks to block for alert

esp_err_t can_reconfigure_alerts(uint32_t alerts_enabled, uint32_t *current_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.
Return

- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: CAN driver is not installed

Parameters

- [in] alerts_enabled: Bit field of alerts to enable (see documentation for alert flags)
- [out] current_alerts: Bit field of currently raised alerts. Set to NULL if unused

`esp_err_t can_initiate_recovery()`

Start the bus recovery process.

This function initiates the bus recovery process when the CAN driver is in the bus-off state. Once initiated, the CAN driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the CAN bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note** The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

Return

- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: CAN driver is not in the bus-off state, or is not installed

`esp_err_t can_get_status_info(can_status_info_t *status_info)`

Get current status information of the CAN driver.

Return

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: CAN driver is not installed

Parameters

- [out] status_info: Status information

`esp_err_t can_clear_transmit_queue()`

Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note** The transmit queue is automatically cleared when can_stop() or can_initiate_recovery() is called.

Return

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: CAN driver is not installed or TX queue is disabled

`esp_err_t can_clear_receive_queue()`

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note** The receive queue is automatically cleared when can_start() is called.

Return

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: CAN driver is not installed

**Structures**

`struct can_general_config_t`

Structure for general configuration of the CAN driver.

**Note** Macro initializers are available for this structure

**Public Members**

`can_mode_t mode`

Mode of CAN controller
```c
#define gpio_num_t

#define tx_io
    Transmit GPIO number

#define rx_io
    Receive GPIO number

#define clkout_io
    CLKOUT GPIO number (optional, set to -1 if unused)

#define bus_off_io
    Bus off indicator GPIO number (optional, set to -1 if unused)

#define tx_queue_len
    Number of messages TX queue can hold (set to 0 to disable TX Queue)

#define rx_queue_len
    Number of messages RX queue can hold

#define alerts_enabled
    Bit field of alerts to enable (see documentation)

#define clkout_divider
    CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

#define intr_flags
    Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_CAN_ISR_IN_IRAM option should be enabled first.

struct can_timing_config_t
    Structure for bit timing configuration of the CAN driver.

    Note Macro initializers are available for this structure

Public Members

#define brp
    Baudrate prescaler (i.e., APB clock divider) can be any even number from 2 to 128. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

#define tseg_1
    Timing segment 1 (Number of time quanta, between 1 to 16)

#define tseg_2
    Timing segment 2 (Number of time quanta, 1 to 8)

#define sjw
    Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

#define triple_sampling
    Enables triple sampling when the CAN controller samples a bit

struct can_filter_config_t
    Structure for acceptance filter configuration of the CAN driver (see documentation)

    Note Macro initializers are available for this structure

Public Members

#define acceptance_code
    32-bit acceptance code

#define acceptance_mask
    32-bit acceptance mask

#define single_filter
    Use Single Filter Mode (see documentation)
**struct can_status_info_t**
Structure to store status information of CAN driver.

**Public Members**

*can_state_t* `state`
Current state of CAN controller (Stopped/Running/Bus-Off/Recovery)

`uint32_t msgs_to_tx`
Number of messages queued for transmission or awaiting transmission completion

`uint32_t msgs_to_rx`
Number of messages in RX queue waiting to be read

`uint32_t tx_error_counter`
Current value of Transmit Error Counter

`uint32_t rx_error_counter`
Current value of Receive Error Counter

`uint32_t tx_failed_count`
Number of messages that failed transmissions

`uint32_t rx_missed_count`
Number of messages that were lost due to a full RX queue

`uint32_t arb_lost_count`
Number of instances arbitration was lost

`uint32_t bus_error_count`
Number of instances a bus error has occurred

**struct can_message_t**
Structure to store a CAN message.

*Note* The flags member is used to control the message type, and transmission type (see documentation for message flags)

**Public Members**

`uint32_t flags`
Bit field of message flags indicates frame/transmission type (see documentation)

`uint32_t identifier`
11 or 29 bit identifier

`uint8_t data_length_code`
Data length code

`uint8_t data[CAN_MAX_DATA_LEN]`
Data bytes (not relevant in RTR frame)

**Enumerations**

*enum can_mode_t*
CAN driver operating modes.

*Values:*

*CAN_MODE_NORMAL*
Normal operating mode where CAN controller can send/receive/acknowledge messages

*CAN_MODE_NO_ACK*
Transmission does not require acknowledgment. Use this mode for self testing
Chapter 2. API Reference

### CAN_MODE_LISTEN_ONLY
The CAN controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

**enum can_state_t**
CAN driver states.

**Values:**

- **CAN_STATE_STOPPED**
  Stopped state. The CAN controller will not participate in any CAN bus activities

- **CAN_STATE_RUNNING**
  Running state. The CAN controller can transmit and receive messages

- **CAN_STATE_BUS_OFF**
  Bus-off state. The CAN controller cannot participate in bus activities until it has recovered

- **CAN_STATE_RECOVERING**
  Recovering state. The CAN controller is undergoing bus recovery

#### 2.3.3 Digital To Analog Converter

**Overview**

ESP32 has two 8-bit DAC (digital to analog converter) channels, connected to GPIO25 (Channel 1) and GPIO26 (Channel 2).

The DAC driver allows these channels to be set to arbitrary voltages.

The DAC channels can also be driven with DMA-style written sample data, via the **I2S** driver when using the “built-in DAC mode”.

For other analog output options, see the Sigma-delta Modulation module and the LED Control module. Both these modules produce high frequency PWM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.

**Application Example**

Setting DAC channel 1 (GPIO 25) voltage to approx 0.78 of VDD_A voltage (VDD * 200 / 255). For VDD_A 3.3V, this is 2.59V:

```c
#include <driver/dac.h>

...  
dac_output_enable(DAC_CHANNEL_1);
dac_output_voltage(DAC_CHANNEL_1, 200);
```

**API Reference**

**Header File**

- driver/include/driver/dac.h

**Functions**

- `esp_err_t dac_pad_get_io_num(dac_channel_t channel, gpio_num_t *gpio_num)`
  Get the gpio number of a specific DAC channel.

  **Return**
  - ESP_OK if success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG if channel not valid

**Parameters**
- channel: Channel to get the gpio number
- gpio_num: output buffer to hold the gpio number

```c
esp_err_t dac_output_voltage(dac_channel_t channel, uint8_t dac_value)
```

Set DAC output voltage.

DAC output is 8-bit. Maximum (255) corresponds to VDD.

**Note** Need to configure DAC pad before calling this function. DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- channel: DAC channel
- dac_value: DAC output value

```c
esp_err_t dac_output_enable(dac_channel_t channel)
```

DAC pad output enable.

**Note** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26 I2S left channel will be mapped to DAC channel 2 I2S right channel will be mapped to DAC channel 1

**Parameters**
- channel: DAC channel

```c
esp_err_t dac_output_disable(dac_channel_t channel)
```

DAC pad output disable.

**Note** DAC channel 1 is attached to GPIO25, DAC channel 2 is attached to GPIO26

**Parameters**
- channel: DAC channel

```c
esp_err_t dac_i2s_enable()
```

Enable DAC output data from I2S.

```c
esp_err_t dac_i2s_disable()
```

Disable DAC output data from I2S.

**Enumerations**

```c
enum dac_channel_t
```

**Values:**

- `DAC_CHANNEL_1 = 1`
  - DAC channel 1 is GPIO25
- `DAC_CHANNEL_2`
  - DAC channel 2 is GPIO26
- `DAC_CHANNEL_MAX`

**GPIO Lookup Macros**

Some useful macros can be used to specified the GPIO number of a DAC channel, or vice versa. e.g.

1. `DAC_CHANNEL_1_GPIO_NUM` is the GPIO number of channel 1 (25);
2. `DAC_GPIO26_CHANNEL` is the channel number of GPIO 26 (channel 2).

**Header File**

- `soc/esp32/include/soc/dac_channel.h`
2.3.4 GPIO & RTC GPIO

Overview

The ESP32 chip features 40 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package (refer to technical reference manual). Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal.

- Note that GPIO6-11 are usually used for SPI flash.
- GPIO34-39 can only be set as input mode and do not have software pullup or pulldown functions.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when in deep sleep, when the Ultra Low Power co-processor is running, or when analog functions such as ADC/DAC/etc are in use.

Application Example

GPIO output and input interrupt example: peripherals/gpio.

API Reference - Normal GPIO

Header File

- driver/include/driver/gpio.h

Functions

```c
esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)
```

GPIO common configuration.

Configure GPIO’s Mode, pull-up, PullDown, IntrType

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- pGPIOConfig: Pointer to GPIO configure struct

```c
esp_err_t gpio_reset_pin(gpio_num_t gpio_num)
```

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

Note This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

Return Always return ESP_OK.

Parameters

- gpio_num: GPIO number.

```c
esp_err_t gpio_set_intr_type(gpio_num_t gpio_num, gpio_int_type_t intr_type)
```

GPIO set interrupt trigger type.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
• **gpio_num**: GPIO number. If you want to set the trigger type of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• **intr_type**: Interrupt type, select from gpio_int_type_t

```c
esp_err_t gpio_intr_enable(gpio_num_t gpio_num)
```
Enable GPIO module interrupt signal.

**Note** Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi with sleep mode enabled. Please refer to the comments of adc1_get_raw. Please refer to section 3.11 of ECO_and_Workarounds_for_Bugs_in_ESP32 for the description of this issue. As a workaround, call adc_power_acquire() in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• **gpio_num**: GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

```c
esp_err_t gpio_intr_disable(gpio_num_t gpio_num)
```
Disable GPIO module interrupt signal.

**Return**
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• **gpio_num**: GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

```c
esp_err_t gpio_set_level(gpio_num_t gpio_num, uint32_t level)
```
GPIO set output level.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO number error

**Parameters**
• **gpio_num**: GPIO number. If you want to set the output level of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• **level**: Output level. 0: low; 1: high

```c
int gpio_get_level(gpio_num_t gpio_num)
```
GPIO get input level.

**Warning** If the pad is not configured for input (or input and output) the returned value is always 0.

**Return**
• 0 the GPIO input level is 0
• 1 the GPIO input level is 1

**Parameters**
• **gpio_num**: GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio_num should be GPIO_NUM_16 (16);

```c
esp_err_t gpio_set_direction(gpio_num_t gpio_num, gpio_mode_t mode)
```
GPIO set direction.

Configure GPIO direction, such as output_only,input_only,output_and_input

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO error

**Parameters**
• **gpio_num**: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
• **mode**: GPIO direction
**Chapter 2. API Reference**

**esp_err_t gpio_set_pull_mode** (*gpio_num_t gpio_num, gpio_pull_mode_t pull*)

Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

**Parameters**
- **gpio_num**: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **pull**: GPIO pull up/down mode.

**esp_err_t gpio_wakeup_enable** (*gpio_num_t gpio_num, gpio_int_type_t intr_type*)

Enable GPIO wake-up function.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **gpio_num**: GPIO number.
- **intr_type**: GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

**esp_err_t gpio_wakeup_disable** (*gpio_num_t gpio_num*)

Disable GPIO wake-up function.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **gpio_num**: GPIO number

**esp_err_t gpio_isr_register** (*void(*) fn, void* arg, int intr_alloc_flags, gpio_isr_handle_t* handle*)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the interrupt allocation functions.

**Parameters**
- **fn**: Interrupt handler function.
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **arg**: Parameter for handler function
- **handle**: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

**esp_err_t gpio_pullup_en** (*gpio_num_t gpio_num*)

Enable pull-up on GPIO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **gpio_num**: GPIO number
**esp_err_t gpio_pullup_dis(gpio_num_t gpio_num)**

Disable pull-up on GPIO.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number

**esp_err_t gpio_pulldown_en(gpio_num_t gpio_num)**

Enable pull-down on GPIO.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number

**esp_err_t gpio_pulldown_dis(gpio_num_t gpio_num)**

Disable pull-down on GPIO.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number

**esp_err_t gpio_install_isr_service(int intr_alloc_flags)**

Install the driver’s GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with gpio_isr_register() - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the gpio_isr_handler_add() function.

Return

- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

Parameters

- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**void gpio_uninstall_isr_service()**

Uninstall the driver’s GPIO ISR service, freeing related resources.

**esp_err_t gpio_isr_handler_add(gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)**

Add ISR handler for the corresponding GPIO pin.

Call this function after using gpio_install_isr_service() to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in gpio_install_isr_service().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- gpio_num: GPIO number
• *isr_handler*: ISR handler function for the corresponding GPIO number.
• *args*: parameter for ISR handler.

### `esp_err_t gpio_isr_handler_remove(gpio_num_t gpio_num)`
Remove ISR handler for the corresponding GPIO pin.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- *gpio_num*: GPIO number

### `esp_err_t gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)`
Set GPIO pad drive capability.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- *gpio_num*: GPIO number, only support output GPIOs
- *strength*: Drive capability of the pad

### `esp_err_t gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)`
Get GPIO pad drive capability.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- *gpio_num*: GPIO number, only support output GPIOs
- *strength*: Pointer to accept drive capability of the pad

### `esp_err_t gpio_hold_en(gpio_num_t gpio_num)`
Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

**Return**
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

**Parameters**
- *gpio_num*: GPIO number, only support output-capable GPIOs

### `esp_err_t gpio_hold_dis(gpio_num_t gpio_num)`
Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to hight level before calling `gpio_hold_dis`.

**Return**
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function
Parameters

- `gpio_num`: GPIO number, only support output-capable GPIOs

`void gpio_deep_sleep_hold_en(void)`

Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call `gpio_hold_dis` will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

`void gpio_deep_sleep_hold_dis(void)`

Disable all digital gpio pad hold function during Deep-sleep.

`void gpio_iomux_in(uint32_t gpio_num, uint32_t signal_idx)`

Set pad input to a peripheral signal through the IOMUX.

Parameters

- `gpio_num`: GPIO number of the pad.
- `signal_idx`: Peripheral signal id to input. One of the *IN_IDX signals in soc/gpio_sig_map.h.

`void gpio_iomux_out(uint8_t gpio_num, int func, bool oen_inv)`

Set peripheral output to an GPIO pad through the IOMUX.

Parameters

- `gpio_num`: gpio_num GPIO number of the pad.
- `func`: The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- `oen_inv`: True if the output enable needs to be inversed, otherwise False.

Structures

`struct gpio_config_t`:

Configuration parameters of GPIO pad for `gpio_config` function.

Public Members

- `uint64_t pin_bit_mask`: GPIO pin: set with bit mask, each bit maps to a GPIO
- `gpio_mode_t mode`: GPIO mode: set input/output mode
- `gpio_pullup_t pull_up_en`: GPIO pull-up
- `gpio_pulldown_t pull_down_en`: GPIO pull-down
- `gpio_int_type_t intr_type`: GPIO interrupt type

Macros

- `GPIO_SEL_0`: Pin 0 selected
- `GPIO_SEL_1`: Pin 1 selected
GPIO_SEL_2
Pin 2 selected

Note There are more macros like that up to pin 39, excluding pins 20, 24 and 28..31. They are not shown here to reduce redundant information.

GPIO_IS_VALID_GPIO (gpio_num)
Check whether it is a valid GPIO number

GPIO_IS_VALID_OUTPUT_GPIO (gpio_num)
Check whether it can be a valid GPIO number of output mode

Type Definitions
typedef void (*gpio_isr_t) (void *)
typedef intr_handle_t gpio_isr_handle_t

Enumerations
enum gpio_num_t
Values:

GPIO_NUM_NC = -1
Use to signal not connected to S/W

GPIO_NUM_0 = 0
GPIO0, input and output

GPIO_NUM_1 = 1
GPIO1, input and output

GPIO_NUM_2 = 2
GPIO2, input and output

Note There are more enumerations like that up to GPIO39, excluding GPIO20, GPIO24 and GPIO28..31. They are not shown here to reduce redundant information.

Note GPIO34..39 are input mode only.

enum gpio_int_type_t
Values:

GPIO_INTR_DISABLE = 0
Disable GPIO interrupt

GPIO_INTR_PPOSEDGE = 1
GPIO interrupt type : rising edge

GPIO_INTR_NEGEDGE = 2
GPIO interrupt type : falling edge

GPIO_INTR_ANYEDGE = 3
GPIO interrupt type : both rising and falling edge

GPIO_INTR_LOW_LEVEL = 4
GPIO interrupt type : input low level trigger

GPIO_INTR_HIGH_LEVEL = 5
GPIO interrupt type : input high level trigger

GPIO_INTR_MAX

enum gpio_mode_t
Values:

GPIO_MODE_DISABLE = GPIO_MODE_DEF_DISABLE
GPIO mode : disable input and output

GPIO_MODE_INPUT = GPIO_MODE_DEF_INPUT
GPIO mode : input only
Chapter 2. API Reference

GPIO_MODE_OUTPUT = GPIO_MODE_DEF_OUTPUT
GPIO mode: output only mode

GPIO_MODE_OUTPUT_OD = ((GPIO_MODE_DEF_OUTPUT) | (GPIO_MODE_DEF_OD))
GPIO mode: output only with open-drain mode

GPIO_MODE_INPUT_OUTPUT_OD = ((GPIO_MODE_DEF_INPUT) | (GPIO_MODE_DEF_OUTPUT) | (GPIO_MODE_DEF_OD))
GPIO mode: output and input with open-drain mode

GPIO_MODE_INPUT_OUTPUT = ((GPIO_MODE_DEF_INPUT) | (GPIO_MODE_DEF_OUTPUT))
GPIO mode: output and input mode

enum gpio_pullup_t
Values:

GPIO_PULLUP_DISABLE = 0x0
Disable GPIO pull-up resistor

GPIO_PULLUP_ENABLE = 0x1
Enable GPIO pull-up resistor

enum gpio_pulldown_t
Values:

GPIO_PULLDOWN_DISABLE = 0x0
Disable GPIO pull-down resistor

GPIO_PULLDOWN_ENABLE = 0x1
Enable GPIO pull-down resistor

enum gpio_pull_mode_t
Values:

GPIO_PULLUP_ONLY
Pad pull up

GPIO_PULLDOWN_ONLY
Pad pull down

GPIO_PULLUP_PULLDOWN
Pad pull up + pull down

GPIO_FLOATING
Pad floating

enum gpio_drive_cap_t
Values:

GPIO_DRIVE_CAP_0 = 0
Pad drive capability: weak

GPIO_DRIVE_CAP_1 = 1
Pad drive capability: stronger

GPIO_DRIVE_CAP_2 = 2
Pad drive capability: default value

GPIO_DRIVE_CAP_DEFAULT = 2
Pad drive capability: default value

GPIO_DRIVE_CAP_3 = 3
Pad drive capability: strongest

GPIO_DRIVE_CAP_MAX

API Reference - RTC GPIO

Header File
• driver/include/driver/rtc_io.h

Functions

**static bool rtc_gpio_is_valid_gpio (gpio_num_t gpio_num)**

Determine if the specified GPIO is a valid RTC GPIO.

**Return** true if GPIO is valid for RTC GPIO use. false otherwise.

**Parameters**
• gpio_num: GPIO number

**esp_err_t rtc_gpio_init (gpio_num_t gpio_num)**

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

**Return**
• ESP_OK success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

**esp_err_t rtc_gpio_deinit (gpio_num_t gpio_num)**

Init a GPIO as digital GPIO.

**Return**
• ESP_OK success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

**uint32_t rtc_gpio_get_level (gpio_num_t gpio_num)**

Get the RTC IO input level.

**Return**
• 1 High level
• 0 Low level
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

**esp_err_t rtc_gpio_set_level (gpio_num_t gpio_num, uint32_t level)**

Set the RTC IO output level.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• level: output level

**esp_err_t rtc_gpio_set_direction (gpio_num_t gpio_num, rtc_gpio_mode_t mode)**

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• mode: GPIO direction

**esp_err_t rtc_gpio_pullup_en (gpio_num_t gpio_num)**

RTC GPIO pullup enable.
This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal
GPIOs and RTC IOs.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
- `gpio_num`: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_pulldown_en(gpio_num_t gpio_num)`
RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal
GPIOs and RTC IOs.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
- `gpio_num`: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_pullup_dis(gpio_num_t gpio_num)`
RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal
GPIOs and RTC IOs.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
- `gpio_num`: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_pulldown_dis(gpio_num_t gpio_num)`
RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal
GPIOs and RTC IOs.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
- `gpio_num`: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_hold_en(gpio_num_t gpio_num)`
Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value,
function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the
pin configuration from changing.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
- `gpio_num`: GPIO number (e.g. GPIO_NUM_12)

`esp_err_t rtc_gpio_hold_dis(gpio_num_t gpio_num)`
Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value,
function, drive strength from RTC_IO peripheral.

**Return**
- ESP_OK Success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

```c
esp_err_t rtc_gpio_isolate (gpio_num_t gpio_num)
```

Helper function to disconnect internal circuits from an RTC IO. This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call rtc_gpio_isolate(GPIO_NUM_12) before entering deep sleep, to reduce deep sleep current.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if GPIO is not an RTC IO

**Parameters**
- gpio_num: GPIO number (e.g. GPIO_NUM_12).

```c
void rtc_gpio_force_hold_dis_all ()
```

Disable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

```c
esp_err_t rtc_gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)
```

Set RTC GPIO pad drive capability.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number, only support output GPIOs
- strength: Drive capability of the pad

```c
esp_err_t rtc_gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)
```

Get RTC GPIO pad drive capability.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number, only support output GPIOs
- strength: Pointer to accept drive capability of the pad

```c
esp_err_t rtc_gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)
```

Enable wakeup from sleep mode using specific GPIO.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

**Parameters**
- gpio_num: GPIO number
- intr_type: Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

```c
esp_err_t rtc_gpio_wakeup_disable (gpio_num_t gpio_num)
```

Disable wakeup from sleep mode using specific GPIO.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO

**Parameters**
- gpio_num: GPIO number
Macros

\texttt{RTC\_GPIO\_IS\_VALID\_GPIO}(gpio\_num)

Enumerations

\texttt{enum rtc\_gpio\_mode\_t}

\texttt{Values:}

\texttt{RTC\_GPIO\_MODE\_INPUT\_ONLY}
\hspace{1em} Pad input

\texttt{RTC\_GPIO\_MODE\_OUTPUT\_ONLY}
\hspace{1em} Pad output

\texttt{RTC\_GPIO\_MODE\_INPUT\_OUTPUT}
\hspace{1em} Pad pull input + output

\texttt{RTC\_GPIO\_MODE\_DISABLED}
\hspace{1em} Pad (output + input) disable

\subsection{2.3.5 I2C}

An I2C (Inter-Integrated Circuit) bus can be used for communication with several external devices connected to the same bus as ESP32. There are two I2C controllers on board of the ESP32, each of which can be set to master mode or slave mode.

Overview

The following sections will walk you through typical steps to configure and operate the I2C driver:

1. \textit{Configure Driver} - select driver’s parameters like master or slave mode, set specific GPIO pins to act as SDA and SCL, set the clock speed, etc.
2. \textit{Install Driver} - activate driver in master or slave mode to operate on one of the two I2C controllers available on ESP32.
3. \textit{Run Communication:}
   a) \textit{Master Mode} - run communication acting as a master
   b) \textit{Slave Mode} - get slave responding to messages from the master
5. \textit{Going Beyond Defaults} - adjust timing, pin configuration and other parameters of the I2C communication.
6. \textit{Error Handling} - how to recognize and handle driver configuration and communication errors.
7. \textit{Delete Driver} - on communication end to free resources used by the I2C driver.

The top level identification of an I2C driver is one of the two port numbers selected from \texttt{i2c\_port\_t}. The mode of operation for a given port is provided during driver configuration by selecting either “master” or “slave” from \texttt{i2c\_mode\_t}.

\textbf{Configure Driver} The first step to establishing I2C communication is to configure the driver. This is done by setting several parameters contained in \texttt{i2c\_config\_t} structure:

- \texttt{I2C mode} - select either slave or master from \texttt{i2c\_mode\_t}
- \texttt{Settings of the communication pins:}
  - GPIO pin numbers assigned to the SDA and SCL signals
  - Whether to enable ESP32’s internal pull up for respective pins
- \texttt{I2C clock speed}, if this configuration concerns the master mode
- If this configuration concerns the slave mode:
  - Whether \texttt{10 bit address mode} should be enabled
  - The \texttt{slave address}
Then, to initialize configuration for a given I2C port, call function \texttt{i2c\_param\_config()} with the port number and \texttt{i2c\_config\_t} structure as the function call parameters.

At this stage \texttt{i2c\_param\_config()} also sets “behind the scenes” couple of other I2C configuration parameters to commonly used default values. To check what are the values and how to change them, see \textit{Going Beyond Defaults}.

**Install Driver** Having the configuration initialized, the next step is to install the I2C driver by calling \texttt{i2c\_driver\_install()}. This function call requires the following parameters:

- The port number, one of the two ports available, selected from \texttt{i2c\_port\_t}
- The I2C mode, slave or master, selected from \texttt{i2c\_mode\_t}
- Sizes of buffers that will be allocated for sending and receiving data in the slave mode
- Flags used to allocate the interrupt

**Run Communication** With the I2C driver installed, ESP32 is ready to communicate with other I2C devices. Programming of communication depends on whether selected I2C port operates in a master or a slave mode.

**Master Mode** ESP32’s I2C port working in the master made is responsible for establishing communication with slave I2C devices and sending commands to trigger actions by slaves, like doing a measurement and sending back a result.

To organize this process the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write**

An example of building a command link for I2C master sending n bytes to slave is shown below:

![Fig. 12: I2C command link - master write example](image)

The following describes how the command link for a “master write” is set up and what comes inside:

1. The first step is to create a command link with \texttt{i2c\_cmd\_link\_create()}. Then the command link is populated with series of data to be sent to the slave:
   2. \texttt{Start bit - i2c\_master\_start()}  
   3. Single byte \texttt{slave address - i2c\_master\_write\_byte()} . The address is provided as an argument of this function call.  
   4. One or more bytes of \texttt{data} as an argument of \texttt{i2c\_master\_write()}.  
   5. \texttt{Stop bit - i2c\_master\_stop()}  

Both \texttt{i2c\_master\_write\_byte()} and \texttt{i2c\_master\_write()} commands have additional argument defining whether slave should acknowledge received data or not.
6. Execution of command link by I2C controller is triggered by calling `i2c_master_cmd_begin()`. 
7. As the last step, after sending of the commands is finished, the resources used by the command link are released by calling `i2c_cmd_link_delete()`.

**Master Read**

There is a similar sequence of steps for the master to read the data from a slave.

![Diagram](image)

When reading the data, instead of `i2c_master_read` and `o`, the command link is populated with `i2c_master_read_byte()` and / or `i2c_master_read()`. Also, the last read is configured for not providing an acknowledge by the master.

**Master Write or Read?**

After sending a slave’s address, see step 3 on pictures above, the master either writes to or reads from the slave. The information what the master will actually do is hidden in the least significant bit of the slave’s address.

Therefore the command link instructing the slave that the master will write the data contains the address like 

```
(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE
```

and looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_CHECK_EN)
```

By similar token the command link to read from the slave looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_CHECK_EN)
```

**Slave Mode**  The API provides functions to read and write data by the slave - *`i2c_slave_read_buffer()`* and *`i2c_slave_write_buffer()`*. An example of using these functions is provided in `peripherals/i2c`.

**Interrupt Handling**  To register an interrupt handler, call function `i2c_isr_register()`, to delete the handler call `i2c_isr_free()`. Description of interrupts triggered by I2C controller is provided in the ESP32 Technical Reference Manual (PDF).

**Going Beyond Defaults**  There are couple of I2C communication parameters setup during driver configuration (when calling `i2c_param_config()`, see *Configure Driver*), to some default commonly used values. Some parameters are also already configured in registers of the I2C controller. These parameters can be changed to user defined values by calling dedicated functions:

- Period of SCL pulses being high and low - `i2c_set_period()`
- SCL and SDA signal timing used during generation of start / stop signals - `i2c_set_start_timing()` / `i2c_set_stop_timing()`
• Timing relationship between SCL and SDA signals when sampling by slave, as well as when transmitting by master - `i2c_set_data_timing`
• I2C timeout - `i2c_set_timeout`

**Note:** The timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

• What bit, LSB or MSB, is transmitted / received first - `i2c_set_data_mode()` selectable out of modes defined in `i2c_trans_mode_t`

Each one of the above functions has a `_get` counterpart to check the currently set value.

To see the default values of parameters setup during driver configuration, please refer to file `driver/i2c.c` looking up defines with `_DEFAULT` suffix.

With function `i2c_set_pin()` it is also possible to select different SDA and SCL pins and alter configuration of pull ups, changing what has been already entered with `i2c_param_config()`.

**Note:** ESP32’s internal pull ups are in the range of some tens of kOhm, and as such in most cases insufficient for use as I2C pull ups by themselves. We suggest to add external pull ups as well, with values as described in the I2C standard.

**Error Handling**  Most of driver’s function return the ESP_OK on successful completion or a specific error code on a failure. It is a good practice to always check the returned values and implement the error handling. The driver is also printing out log messages, when e.g. checking the correctness of entered configuration, that contain explanation of errors. For details please refer to file `driver/i2c.c` looking up defines with `_ERR_STR` suffix.

Use dedicated interrupts to capture communication failures. For instance there is `I2C_TIME_OUT_INT` interrupt triggered when I2C takes too long to receive data. See `Interrupt Handling` for related information.

To reset internal hardware buffers in case of communication failure, you can use `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()`.

**Delete Driver**  If the I2C communication is established with `i2c_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `i2c_driver_delete()`.

**Application Example**

I2C master and slave example: `peripherals/i2c`.

**API Reference**

**Header File**

• `driver/include/driver/i2c.h`

**Functions**

`esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t sly_rx_buf_len, size_t sly_tx_buf_len, int intr_alloc_flags)`

I2C driver install.

**Note** Only slave mode will use this value, driver will ignore this value in master mode.

**Note** Only slave mode will use this value, driver will ignore this value in master mode.
Note In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, 
`ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from 
internal RAM in I2C read and write function, because we cannot access the psram (if psram is enabled) 
in interrupt handle function when cache is disabled.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver install error

**Parameters**
- `i2c_num`: I2C port number
- `mode`: I2C mode (master or slave)
- `slv_rx_buf_len`: receiving buffer size for slave mode

**Parameters**
- `slv_tx_buf_len`: sending buffer size for slave mode

**Parameters**
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) 
  `ESP_INTR_FLAG_` values. See esp_intr_alloc.h for more info.

```c
esp_err_t i2c_driver_delete(i2c_port_t i2c_num)
```
I2C driver delete.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2c_num`: I2C port number

```c
esp_err_t i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)
```
I2C parameter initialization.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2c_num`: I2C port number
- `i2c_conf`: pointer to I2C parameter settings

```c
esp_err_t i2c_reset_tx_fifo(i2c_port_t i2c_num)
```
reset I2C tx hardware fifo

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2c_num`: I2C port number

```c
esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)
```
reset I2C rx fifo

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2c_num`: I2C port number

```c
esp_err_t i2c_isr_register(i2c_port_t i2c_num, void(* fn)(void * arg), int intr_alloc_flags, intr_handle_t *handle)
```
isr handler register.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2c_num`: I2C port number
- `fn`: isr handler function
**Chapter 2. API Reference**

- **arg**: parameter for isr handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: handle return from esp_intr_alloc.

```c
esp_err_t i2c_isr_free(intr_handle_t handle)
```

to delete and free I2C isr.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **handle**: handle of isr.

```c
esp_err_t i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, gpio_pullup_t sda_pullup_en, gpio_pullup_t scl_pullup_en, i2c_mode_t mode)
```

Configure GPIO signal for I2C sck and sda.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **i2c_num**: I2C port number
- **sda_io_num**: GPIO number for I2C sda signal
- **scl_io_num**: GPIO number for I2C scl signal
- **sda_pullup_en**: Whether to enable the internal pullup for sda pin
- **scl_pullup_en**: Whether to enable the internal pullup for scl pin
- **mode**: I2C mode

```c
i2c_cmd_handle_t i2c_cmd_link_create()
```

Create and init I2C command link.

**Note** Before we build I2C command link, we need to call i2c_cmd_link_create() to create a command link.

After we finish sending the commands, we need to call i2c_cmd_link_delete() to release and return the resources.

**Return**
i2c command link handler

```c
void i2c_cmd_link_delete(i2c_cmd_handle_t cmd_handle)
```

Free I2C command link.

**Note** Before we build I2C command link, we need to call i2c_cmd_link_create() to create a command link.

After we finish sending the commands, we need to call i2c_cmd_link_delete() to release and return the resources.

**Parameters**
- **cmd_handle**: I2C command handle

```c
esp_err_t i2c_master_start(i2c_cmd_handle_t cmd_handle)
```

Queue command for I2C master to generate a start signal.

**Note** Only call this function in I2C master mode Call i2c_master_cmd_begin() to send all queued commands

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **cmd_handle**: I2C cmd link

```c
esp_err_t i2c_master_write_byte(i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)
```

Queue command for I2C master to write one byte to I2C bus.

**Note** Only call this function in I2C master mode Call i2c_master_cmd_begin() to send all queued commands

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• cmd_handle: I2C cmd link
• data: I2C one byte command to write to bus
• ack_en: enable ack check for master

```c
esp_err_t i2c_master_write(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, bool ack_en)
```
Queue command for I2C master to write buffer to I2C bus.

**Note** Only call this function in I2C master mode Call i2c_master_cmd_begin() to send all queued commands

**Note** If the psram is enabled and intr_flag is ESP_INTR_FLAG_IRAM, please use the memory allocated from internal RAM.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• cmd_handle: I2C cmd link
• data: data to send

```c
esp_err_t i2c_master_read_byte(i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)
```
Queue command for I2C master to read one byte from I2C bus.

**Note** Only call this function in I2C master mode Call i2c_master_cmd_begin() to send all queued commands

**Note** If the psram is enabled and intr_flag is ESP_INTR_FLAG_IRAM, please use the memory allocated from internal RAM.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• cmd_handle: I2C cmd link
• data: pointer accept the data byte

```c
esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)
```
Queue command for I2C master to read data from I2C bus.

**Note** Only call this function in I2C master mode Call i2c_master_cmd_begin() to send all queued commands

**Note** If the psram is enabled and intr_flag is ESP_INTR_FLAG_IRAM, please use the memory allocated from internal RAM.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• cmd_handle: I2C cmd link
• data: data buffer to accept the data from bus

```c
esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)
```
Queue command for I2C master to generate a stop signal.

**Note** Only call this function in I2C master mode Call i2c_master_cmd_begin() to send all queued commands

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• cmd_handle: I2C cmd link
**esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)**

I2C master send queued commands. This function will trigger sending all queued commands. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue.

**Note** Only call this function in I2C master mode

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave doesn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**
- i2c_num: I2C port number
- cmd_handle: I2C command handler
- ticks_to_wait: maximum wait ticks.

**int i2c_slave_write_buffer(i2c_port_t i2c_num, uint8_t* data, int size, TickType_t ticks_to_wait)**

I2C slave write data to internal ringbuffer, when tx fifo empty, isr will fill the hardware fifo from the internal ringbuffer.

**Note** Only call this function in I2C slave mode

**Return**
- ESP_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes that pushed to the I2C slave buffer.

**Parameters**
- i2c_num: I2C port number
- data: data pointer to write into internal buffer
- size: data size
- ticks_to_wait: Maximum waiting ticks

**int i2c_slave_read_buffer(i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)**

I2C slave read data from internal buffer. When I2C slave receive data, isr will copy received data from hardware rx fifo to internal ringbuffer. Then users can read from internal ringbuffer.

**Note** Only call this function in I2C slave mode

**Return**
- ESP_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes that read from I2C slave buffer.

**Parameters**
- i2c_num: I2C port number
- data: data pointer to accept data from internal buffer
- max_size: Maximum data size to read
- ticks_to_wait: Maximum waiting ticks

**esp_err_t i2c_set_period(i2c_port_t i2c_num, int high_period, int low_period)**

set I2C master clock period

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- high_period: clock cycle number during SCL is high level, high_period is a 14 bit value
- low_period: clock cycle number during SCL is low level, low_period is a 14 bit value

**esp_err_t i2c_get_period(i2c_port_t i2c_num, int *high_period, int *low_period)**

get I2C master clock period

**Return**
- ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- high_period: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- low_period: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

```c
esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)
```

Enable hardware filter on I2C bus. Sometimes the I2C bus is disturbed by high frequency noise (about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine broken. Enable hardware filter can filter out high frequency interference and make the master more stable.

Note Enable filter will slow the SCL clock.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- cyc_num: the APB cycles need to be filtered (0 <= cyc_num <= 7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

```c
esp_err_t i2c_filter_disable(i2c_port_t i2c_num)
```

Disable filter on I2C bus

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number

```c
esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
```

Set I2C master start signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- setup_time: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
- hold_time: clock number between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

```c
esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)
```

Get I2C master start signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- setup_time: pointer to get setup time
- hold_time: pointer to get hold time

```c
esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)
```

Set I2C master stop signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- setup_time: clock number between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
Chapter 2. API Reference

- hold_time: clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

```c
esp_err_t i2c_get_stopTiming(i2c_port_t i2c_num, int *setup_time, int *hold_time)
```

get I2C master stop signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- setup_time: pointer to get setup time.
- hold_time: pointer to get hold time.

```c
esp_err_t i2c_set_dataTiming(i2c_port_t i2c_num, int sample_time, int hold_time)
```

set I2C data signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- sample_time: clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value
- hold_time: clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

```c
esp_err_t i2c_get_dataTiming(i2c_port_t i2c_num, int *sample_time, int *hold_time)
```

get I2C data signal timing

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- sample_time: pointer to get sample time
- hold_time: pointer to get hold time

```c
esp_err_t i2c_set_timeout(i2c_port_t i2c_num, int timeout)
```

set I2C timeout value

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- timeout: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

```c
esp_err_t i2c_get_timeout(i2c_port_t i2c_num, int *timeout)
```

get I2C timeout value

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- timeout: pointer to get timeout value

```c
esp_err_t i2c_set_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)
```

set I2C data transfer mode

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Parameters

- `i2c_num`: I2C port number
- `tx_trans_mode`: I2C sending data mode
- `rx_trans_mode`: I2C receiving data mode

```c
esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)
```

get I2C data transfer mode

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `i2c_num`: I2C port number
- `tx_trans_mode`: pointer to get I2C sending data mode
- `rx_trans_mode`: pointer to get I2C receiving data mode

Structures

```c
struct i2c_config_t
```

I2C initialization parameters.

Public Members

```c
i2c_mode_t mode
```

I2C mode

```c
gpio_num_t sda_io_num
```

GPIO number for I2C sda signal

```c
gpio_pullup_t sda_pullup_en
```

Internal GPIO pull mode for I2C sda signal

```c
gpio_num_t scl_io_num
```

GPIO number for I2C scl signal

```c
gpio_pullup_t scl_pullup_en
```

Internal GPIO pull mode for I2C scl signal

```c
uint32_t clk_speed
```

I2C clock frequency for master mode, (no higher than 1MHz for now)

```c
uint8_t addr_10bit_en
```

I2C 10bit address mode enable for slave mode

```c
uint16_t slave_addr
```

I2C address for slave mode

Macros

```c
I2C_APB_CLK_FREQ
```

I2C source clock is APB clock, 80MHz

```c
I2C_FIFO_LEN
```

I2C hardware fifo length

Type Definitions

```c
typedef void *i2c_cmd_handle_t
```

I2C command handle
Enumerations

`enum i2c_mode_t`

Values:

- `I2C_MODE_SLAVE = 0`
  - I2C slave mode
- `I2C_MODE_MASTER`
  - I2C master mode
- `I2C_MODE_MAX`

`enum i2c_rw_t`

Values:

- `I2C_MASTER_WRITE = 0`
  - I2C write data
- `I2C_MASTER_READ`
  - I2C read data

`enum i2c_trans_mode_t`

Values:

- `I2C_DATA_MODE_MSB_FIRST = 0`
  - I2C data msb first
- `I2C_DATA_MODE_LSB_FIRST`
  - I2C data lsb first
- `I2C_DATA_MODE_MAX`

`enum i2c_opmode_t`

Values:

- `I2C_CMD_RESTART = 0`
  - I2C restart command
- `I2C_CMD_WRITE`
  - I2C write command
- `I2C_CMD_READ`
  - I2C read command
- `I2C_CMD_STOP`
  - I2C stop command
- `I2C_CMD_END`
  - I2C end command

`enum i2c_port_t`

Values:

- `I2C_NUM_0 = 0`
  - I2C port 0
- `I2C_NUM_1`
  - I2C port 1
- `I2C_NUM_MAX`

`enum i2c_addr_mode_t`

Values:

- `I2C_ADDR_BIT_7 = 0`
  - I2C 7bit address for slave mode
- `I2C_ADDR_BIT_10`
  - I2C 10bit address for slave mode
- `I2C_ADDR_BIT_MAX`
Chapter 2. API Reference

```c
enum i2c_ack_type_t
    Values:
    I2C_MASTER_ACK = 0x0
        I2C ack for each byte read
    I2C_MASTER_NACK = 0x1
        I2C nack for each byte read
    I2C_MASTER_LAST_NACK = 0x2
        I2C nack for the last byte
    I2C_MASTER_ACK_MAX
```

2.3.6 I2S

Overview

ESP32 contains two I2S peripherals. These peripherals can be configured to input and output sample data via the I2S driver.

The I2S peripheral supports DMA meaning it can stream sample data without requiring each sample to be read or written by the CPU.

I2S output can also be routed directly to the Digital/Analog Converter output channels (GPIO 25 & GPIO 26) to produce analog output directly, rather than via an external I2S codec.

**Note:** For high accuracy clock applications, APLL clock source can be used with `use_apll = true` and ESP32 will automatically calculate APLL parameter.

**Note:** If `use_apll = true` and `fixed_mclk > 0`, then the Master clock output for I2S is fixed and equal to the `fixed_mclk` value. The audio clock rate (LRCK) is always the MCLK divisor and $0 < \text{MCLK}/\text{LRCK}/\text{channels}/\text{bits_per_sample} < 64$

Application Example

A full I2S example is available in esp-idf: peripherals/i2s.

Short example of I2S configuration:

```c
#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = 16,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB,
    .intr_alloc_flags = 0, // default interrupt priority
    .dma_buf_count = 8,
    .dma_buf_len = 64,
    .use_apll = false
};

static const i2s_pin_config_t pin_config = {
```
(continues on next page)
.bck_io_num = 26,
.ws_io_num = 25,
data_out_num = 22,
data_in_num = I2S_PIN_NO_CHANGE
};
...

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s_
   driver

i2s_set_pin(i2s_num, &pin_config);

i2s_set_sample_rates(i2s_num, 22050); //set sample rates

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

Short example configuring I2S to use internal DAC for analog output:

#include "driver/i2s.h"
#include "freertos/queue.h"

static const int i2s_num = 0; // i2s port number

static const i2s_config_t i2s_config = {
 .mode = I2S_MODE_MASTER | I2S_MODE_TX | I2S_MODE_DAC_BUILT_IN,
 .sample_rate = 44100,
 .bits_per_sample = 16, /* the DAC module will only take the 8bits from MSB */
 .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
 .communication_format = I2S_COMM_FORMAT_I2S_MSB,
 .intr_alloc_flags = 0, // default interrupt priority
 .dma_buf_count = 8,
 .dma_buf_len = 64,
 .use_apll = false
};
...

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s_
   driver

i2s_set_pin(i2s_num, NULL); //for internal DAC, this will enable both of the_
   internal channels

//You can call i2s_set_dac_mode to set built-in DAC output mode.
//i2s_set_dac_mode(I2S_DAC_CHANNEL_BOTH_EN);

i2s_set_sample_rates(i2s_num, 22050); //set sample rates

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver

API Reference

Header File

- driver/include/driver/i2s.h

Functions

\texttt{esp_err_t }\texttt{i2s\_set\_pin(i2s\_port\_t i2s\_num, const i2s\_pin\_config\_t *pin)}

Set I2S pin number.
Inside the pin configuration structure, set I2S_PIN_NO_CHANGE for any pin where the current configuration should not be changed.

**Note** The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

**Parameters**
- `i2s_num`: I2S_NUM_0 or I2S_NUM_1
- `pin`: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

**Note** if `*pin` is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don’t want this to happen and you want to initialize only one of the DAC channels, you can call `i2s_set_dac_mode` instead.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL IO error

```c
esp_err_t i2s_set_pdm_rx_down_sample(i2s_port_t i2s_num, i2s_pdm_dsr_t dsr)
```

Set PDM mode down-sample rate In PDM RX mode, there would be 2 rounds of downsample process in hardware. In the first downsample process, the sampling number can be 16 or 8. In the second downsample process, the sampling number is fixed as 8. So the clock frequency in PDM RX mode would be \((f_{pcm} \times 64)\) or \((f_{pcm} \times 128)\) accordingly.

**Note** After calling this function, it would call `i2s_set_clk` inside to update the clock frequency. Please call this function after I2S driver has beeninitialized.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

**Parameters**
- `i2s_num`: I2S_NUM_0, I2S_NUM_1
- `dsr`: i2s RX down sample rate for PDM mode.

```c
esp_err_t i2s_set_dac_mode(i2s_dac_mode_t dac_mode)
```

Set I2S dac mode, I2S built-in DAC is disabled by default.

**Note** Built-in DAC functions are only supported on I2S0 for current ESP32 chip. If either of the built-in DAC channel are enabled, the other one cannot be used as RTC DAC function at the same time.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `dac_mode`: DAC mode configurations - see `i2s_dac_mode_t`

```c
esp_err_t i2s_driver_install(i2s_port_t i2s_num, const i2s_config_t *i2s_config, int queue_size, void *i2s_queue)
```

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

**Parameters**
- `i2s_num`: I2S_NUM_0, I2S_NUM_1
- `i2s_config`: I2S configurations - see `i2s_config_t` struct
- `queue_size`: I2S event queue size/depth.
- `i2s_queue`: I2S event queue handle, if set NULL, driver will not use an event queue.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

```c
esp_err_t i2s_driver_uninstall(i2s_port_t i2s_num)
```

Uninstall I2S driver.
Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S_NUM_0, I2S_NUM_1

```c
esp_err_t i2s_write(i2s_port_t i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)
```
Write data to I2S DMA transmit buffer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S_NUM_0, I2S_NUM_1
- src: Source address to write from
- size: Size of data in bytes
- [out] bytes_written: Number of bytes written, if timeout, the result will be less than the size passed in.
- ticks_to_wait: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_write_expand(i2s_port_t i2s_num, const void *src, size_t size, size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)
```
Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see `i2s_config_t`).

Parameters
- i2s_num: I2S_NUM_0, I2S_NUM_1
- src: Source address to write from
- size: Size of data in bytes
- src_bits: Source audio bit
- aim_bits: Bit wanted, no more than 32, and must be greater than src_bits
- [out] bytes_written: Number of bytes written, if timeout, the result will be less than the size passed in.
- ticks_to_wait: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2s_read(i2s_port_t i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)
```
Read data from I2S DMA receive buffer.

Note If the built-in ADC mode is enabled, we should call i2s_adc_start and i2s_adc_stop around the whole reading process, to prevent the data getting corrupted.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S_NUM_0, I2S_NUM_1
- dest: Destination address to read into
- size: Size of data in bytes
- [out] bytes_read: Number of bytes read, if timeout, bytes read will be less than the size passed in.
ticks_to_wait: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_set_sample_rates(i2s_port_t i2s_num, uint32_t rate)
```
Sets sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and i2s_config_t configuration parameters (number of channels, bits_per_sample).

```c
bit_clock = rate * (number of channels) * bits_per_sample
```

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters
- i2s_num: I2S_NUM_0, I2S_NUM_1
- rate: I2S sample rate (ex: 8000, 44100…)

```c
esp_err_t i2s_stop(i2s_port_t i2s_num)
```
Stop I2S driver.

Disables I2S TX/RX, until i2s_start() is called.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S_NUM_0, I2S_NUM_1

```c
esp_err_t i2s_start(i2s_port_t i2s_num)
```
Start I2S driver.

It is not necessary to call this function after i2s_driver_install() (it is started automatically), however it is necessary to call it after i2s_stop().

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S_NUM_0, I2S_NUM_1

```c
esp_err_t i2s_zero_dma_buffer(i2s_port_t i2s_num)
```
Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S_NUM_0, I2S_NUM_1

```c
esp_err_t i2s_set_clk(i2s_port_t i2s_num, uint32_t rate, i2s_bits_per_sample_t bits, i2s_channel_t ch)
```
Set clock & bit width used for I2S RX and TX.

Similar to i2s_set_sample_rates(), but also sets bit width.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters
- i2s_num: I2S_NUM_0, I2S_NUM_1
Chapter 2. API Reference

- **rate**: I2S sample rate (ex: 8000, 44100…)
- **bits**: I2S bit width (I2S_BITS_PER_SAMPLE_16BIT, I2S_BITS_PER_SAMPLE_24BIT, I2S_BITS_PER_SAMPLE_32BIT)
- **ch**: I2S channel, (I2S_CHANNEL_MONO, I2S_CHANNEL_STEREO)

```c
float i2s_get_clk(i2s_port_t i2s_num)
```

get clock set on particular port number.

**Return**
- actual clock set by i2s driver

**Parameters**
- i2s_num: I2S_NUM_0, I2S_NUM_1

```c
esp_err_t i2s_set_adc_mode(adc_unit_t adc_unit, adc1_channel_t adc_channel)
```

Set built-in ADC mode for I2S DMA, this function will initialize ADC pad, and set ADC parameters.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- adc_unit: SAR ADC unit index
- adc_channel: ADC channel index

```c
esp_err_t i2s_adc_enable(i2s_port_t i2s_num)
```

Start to use I2S built-in ADC mode.

**Note** This function would acquire the lock of ADC to prevent the data getting corrupted during the I2S peripheral is being used to do fully continuous ADC sampling.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver state error

**Parameters**
- i2s_num: i2s port index

```c
esp_err_t i2s_adc_disable(i2s_port_t i2s_num)
```

Stop to use I2S built-in ADC mode.

**Note** This function would release the lock of ADC so that other tasks can use ADC.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver state error

**Parameters**
- i2s_num: i2s port index

**Structures**

```c
struct i2s_config_t
```

I2S configuration parameters for i2s_param_config function.

**Public Members**

```c
i2s_mode_t mode
```

I2S work mode

```c
int sample_rate
```

I2S sample rate

```c
i2s_bits_per_sample_t bits_per_sample
```

I2S bits per sample
**Chapter 2. API Reference**

### `i2s_channel_fmt_t` channel_format
I2S channel format

### `i2s_comm_format_t` communication_format
I2S communication format

### `int intr_alloc_flags`
Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info

### `int dma_buf_count`
I2S DMA Buffer Count

### `int dma_buf_len`
I2S DMA Buffer Length

### `bool use_apll`
I2S using APLL as main I2S clock, enable it to get accurate clock

### `bool tx_desc_auto_clear`
I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

### `int fixed_mclk`
I2S using fixed MCLK output. If use_apll = true and fixed_mclk > 0, then the clock output for i2s is fixed and equal to the fixed_mclk value.

### `struct i2s_event_t`
Event structure used in I2S event queue.

**Public Members**

### `i2s_event_type_t` `type`
I2S event type

### `size_t size`
I2S data size for I2S_DATA event

### `struct i2s_pin_config_t`
I2S pin number for i2s_set_pin.

**Public Members**

### `int bck_io_num`
BCK in out pin

### `int ws_io_num`
WS in out pin

### `int data_out_num`
DATA out pin

### `int data_in_num`
DATA in pin

**Macros**

**I2S_PIN_NO_CHANGE**
Use in `i2s_pin_config_t` for pins which should not be changed

**Type Definitions**

```c
typedef intr_handle_t i2s_isr_handle_t
```
Enumerations

**enum i2s_bits_per_sample_t**
I2S bit width per sample.

*Values:*

- `I2S_BITS_PER_SAMPLE_8BIT` = 8
  - I2S bits per sample: 8-bits
- `I2S_BITS_PER_SAMPLE_16BIT` = 16
  - I2S bits per sample: 16-bits
- `I2S_BITS_PER_SAMPLE_24BIT` = 24
  - I2S bits per sample: 24-bits
- `I2S_BITS_PER_SAMPLE_32BIT` = 32
  - I2S bits per sample: 32-bits

**enum i2s_channel_t**
I2S channel.

*Values:*

- `I2S_CHANNEL_MONO` = 1
  - I2S 1 channel (mono)
- `I2S_CHANNEL_STEREO` = 2
  - I2S 2 channel (stereo)

**enum i2s_comm_format_t**
I2S communication standard format.

*Values:*

- `I2S_COMM_FORMAT_I2S` = 0x01
  - I2S communication format I2S
- `I2S_COMM_FORMAT_I2S_MSB` = 0x02
  - I2S format MSB
- `I2S_COMM_FORMAT_I2S_LSB` = 0x04
  - I2S format LSB
- `I2S_COMM_FORMAT_PCM` = 0x08
  - I2S communication format PCM
- `I2S_COMM_FORMAT_PCM_SHORT` = 0x10
  - PCM Short
- `I2S_COMM_FORMAT_PCM_LONG` = 0x20
  - PCM Long

**enum i2s_channel_fmt_t**
I2S channel format type.

*Values:*

- `I2S_CHANNEL_FMT_RIGHT_LEFT` = 0x00
- `I2S_CHANNEL_FMT_ALL_RIGHT`
- `I2S_CHANNEL_FMT_ALL_LEFT`
- `I2S_CHANNEL_FMT_ONLY_RIGHT`
- `I2S_CHANNEL_FMT_ONLY_LEFT`

**enum pdm_sample_rate_ratio_t**
PDM sample rate ratio, measured in Hz.

*Values:*

PDM_SAMPLE_RATE_RATIO_64
PDM_SAMPLE_RATE_RATIO_128

enum pdm_pcm_conv_t
PDM PCM converter enable/disable.

Values:

PDM_PCM_CONV_ENABLE
PDM_PCM_CONV_DISABLE

enum i2s_port_t
I2S Peripheral, 0 & 1.

Values:

I2S_NUM_0 = 0x0
   I2S 0
I2S_NUM_1 = 0x1
   I2S 1
I2S_NUM_MAX

enum i2s_mode_t
I2S Mode, default is I2S_MODE_MASTER | I2S_MODE_TX.

Note: PDM and built-in DAC functions are only supported on I2S0 for current ESP32 chip.

Values:

I2S_MODE_MASTER = 1
I2S_MODE_SLAVE = 2
I2S_MODE_TX = 4
I2S_MODE_RX = 8
I2S_MODE_DAC_BUILT_IN = 16
   Output I2S data to built-in DAC, no matter the data format is 16bit or 32 bit, the DAC module will only take the 8bits from MSB
I2S_MODE_ADC_BUILT_IN = 32
   Input I2S data from built-in ADC, each data can be 12-bit width at most
I2S_MODE_PDM = 64

enum i2s_event_type_t
I2S event types.

Values:

I2S_EVENT_DMA_ERROR
I2S_EVENT_TX_DONE
   I2S DMA finish sent 1 buffer
I2S_EVENT_RX_DONE
   I2S DMA finish received 1 buffer
I2S_EVENT_MAX
   I2S event max index

enum i2s_dac_mode_t
I2S DAC mode for i2s_set_dac_mode.

Note: PDM and built-in DAC functions are only supported on I2S0 for current ESP32 chip.

Values:
I2S_DAC_CHANNEL_DISABLE = 0
Disable I2S built-in DAC signals

I2S_DAC_CHANNEL_RIGHT_EN = 1
Enable I2S built-in DAC right channel, maps to DAC channel 1 on GPIO25

I2S_DAC_CHANNEL_LEFT_EN = 2
Enable I2S built-in DAC left channel, maps to DAC channel 2 on GPIO26

I2S_DAC_CHANNEL_BOTH_EN = 0x3
Enable both of the I2S built-in DAC channels.

I2S_DAC_CHANNEL_MAX = 0x4
I2S built-in DAC mode max index

enum i2s_pdm_dsr_t
I2S PDM RX downsample mode.
Values:

I2S_PDM_DSR_8S = 0
downsampling number is 8 for PDM RX mode

I2S_PDM_DSR_16S
downsampling number is 16 for PDM RX mode

I2S_PDM_DSR_MAX

2.3.7 LED Control

Introduction
The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes as well. It has 16 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

A half of LEDC’s channels operate in high speed mode. This mode is implemented in hardware and offers automatic and glitch-free changing of the PWM duty cycle. The other half of channels operate in low speed mode, where the moment of change depends on the application software. Each group of channels is also able to use different clock sources, but this feature is not yet supported in the LEDC driver.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

Functionality Overview

Getting LEDC to work on a specific channel in either high or low speed mode is done in three steps:

1. **Configure Timer** by specifying the PWM signal’s frequency and duty cycle resolution.
2. **Configure Channel** by associating it with the timer and GPIO to output the PWM signal.
3. **Change PWM Signal** that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on the fade end.

**Configure Timer** Setting the timer is done by calling the function `ledc_timer_config()` and passing to it a data structure `ledc_timer_config_t` that contains the following configuration settings:

- Timer number `ledc_timer_t`
- Speed mode `ledc_mode_t`
- PWM signal frequency
- Resolution of PWM duty
The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower duty resolution is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section Supported Range of Frequency and Duty Resolutions.

**Configure Channel**  When the timer is set up, configure a selected channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`. Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal**  Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section Change PWM Frequency.

**Change PWM Duty Cycle Using Software**  To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding get function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section Configure Channel.

The range of the duty cycle values passed to functions depends on selected duty_resolution and should be from 0 to \((2^{**\text{duty_resolution}}) - 1\). For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of \(\approx0.1\%\).
**Change PWM Duty Cycle using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Finally start fading with `ledc_fade_start()`.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency on the fly:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a “clean” startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

**LEDC High and Low Speed Mode**

Of the total 8 timers and 16 channels available in the LED PWM Controller, half of them are dedicated to operation in high speed mode and the other half in low speed mode. Selection of a low or high speed timer or channel is done with the parameter `ledc_mode_t` that can be found in applicable function calls.

The advantage of high speed mode is hardware-supported, glitch-free changeover of the timer settings. This means that if the timer settings are modified, the changes will be applied automatically on the next overflow interrupt of the timer. In contrast, when updating the low-speed timer, the change of settings should be explicitly triggered by software. The LEDC driver handles it in the background, e.g., when `ledc_timer_config()` or `ledc_timer_set()` is called.

For additional details regarding speed modes, refer to ESP32 Technical Reference Manual (PDF). Please note that the support for `SLOW_CLOCK` mentioned in this manual is not yet supported in the LEDC driver.

**Supported Range of Frequency and Duty Resolutions**

The LED PWM Controller is designed primarily to drive LEDs. It provides a wide resolution for PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. It means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% (2 ** 13 = 8192 discrete levels of the LED intensity).
The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

**Application Example**

The LEDC change duty cycle and fading control example: peripherals/ledc.

**API Reference**

**Header File**

- driver/include/driver/ledc.h

**Functions**

`esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `ledc_conf`: Pointer of LEDC channel configure struct

`esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

**Parameters**

- `timer_conf`: Pointer of LEDC timer configure struct

`esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)`

LEDC update channel parameters.

**Note** Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings.
Chapter 2. API Reference

**Note** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode,
- `channel`: LEDC channel (0-7), select from ledc_channel_t

`esp_err_t ledc_set_pin` (int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)

Set LEDC output gpio.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: The LEDC output gpio
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode
- `ledc_channel`: LEDC channel (0-7), select from ledc_channel_t

`esp_err_t ledc_stop` (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)

LEDC stop. Disable LEDC output, and set idle level.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode
- `channel`: LEDC channel (0-7), select from ledc_channel_t
- `idle_level`: Set output idle level after LEDC stops.

`esp_err_t ledc_set_freq` (ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)

LEDC set channel frequency (Hz)

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

**Parameters**
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode
- `timer_num`: LEDC timer index (0-3), select from ledc_timer_t
- `freq_hz`: Set the LEDC frequency

`uint32_t ledc_get_freq` (ledc_mode_t speed_mode, ledc_timer_t timer_num)

LEDC get channel frequency (Hz)

**Return**
- 0 error
- Others Current LEDC frequency

**Parameters**
- `speed_mode`: Select the LEDC speed_mode, high-speed mode and low-speed mode
- `timer_num`: LEDC timer index (0-3), select from ledc_timer_t

`esp_err_t ledc_set_duty_with_hpoint` (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)

LEDC set duty and hpoint value Only after calling ledc_update_duty will the duty update.

**Note** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.
Note: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- channel: LEDC channel (0-7), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- hpoint: Set the LEDC hpoint value (max: 0xfffff)

int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)

LEDC get hpoint value, the counter value when the output is set high level.

Return

- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- channel: LEDC channel (0-7), select from ledc_channel_t

esp_err_t ledc_set_duty (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

Note: ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

Note: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- channel: LEDC channel (0-7), select from ledc_channel_t

uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)

LEDC get duty.

Return

- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- channel: LEDC channel (0-7), select from ledc_channel_t

esp_err_t ledc_setFade (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)

LEDC set gradient Set LEDC gradient. After the function calls the ledc_update_duty function, the function can take effect.

Note: If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- channel: LEDC channel (0-7), select from ledc_channel_t
• duty: Set the start of the gradient duty, the range of duty setting is \([0, (2^{duty\_resolution})]\)
• fade\_direction: Set the direction of the gradient
• step\_num: Set the number of the gradient
• duty\_cycle\_num: Set how many LEDC tick each time the gradient lasts
• duty\_scale: Set gradient change amplitude

\texttt{esp\_err\_t \textit{ledc\_isr\_register} (void (*\textit{fn}) void *, void \*\textit{arg}, int \textit{intr\_alloc\_flags}, \textit{ledc\_isr\_handle\_t} \*\textit{handle})}

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

\textbf{Return}
- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Function pointer error.

\textbf{Parameters}
- \textit{fn}: Interrupt handler function.
- \textit{arg}: User-supplied argument passed to the handler function.
- \textit{intr\_alloc\_flags}: Flags used to allocate the interrupt. One or multiple (ORed) ESP\_INTR\_FLAG\_* values. See esp\_intr\_alloc.h for more info.
- \textit{arg}: Parameter for handler function
- \textit{handle}: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

\texttt{esp\_err\_t \textit{ledc\_timer\_set} (\textit{ledc\_mode\_t} \textit{speed\_mode}, \textit{ledc\_timer\_t} \textit{timer\_sel}, uint32\_t \textit{clock\_divider}, uint32\_t \textit{duty\_resolution}, \textit{ledc\_clk\_src\_t} \textit{clk\_src})}

Configure LEDC settings.

\textbf{Return}
- (-1) Parameter error
- Other Current LEDC duty

\textbf{Parameters}
- \textit{speed\_mode}: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- \textit{timer\_sel}: Timer index (0-3), there are 4 timers in LEDC module
- \textit{clock\_divider}: Timer clock divide value, the timer clock is divided from the selected clock source
- \textit{duty\_resolution}: Resolution of duty setting in number of bits. The range of duty values is \([0, (2^{duty\_resolution})]\)
- \textit{clk\_src}: Select LEDC source clock.

\texttt{esp\_err\_t \textit{ledc\_timer\_rst} (\textit{ledc\_mode\_t} \textit{speed\_mode}, uint32\_t \textit{timer\_sel})}

Reset LEDC timer.

\textbf{Return}
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

\textbf{Parameters}
- \textit{speed\_mode}: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- \textit{timer\_sel}: LEDC timer index (0-3), select from ledc\_timer\_t

\texttt{esp\_err\_t \textit{ledc\_timer\_pause} (\textit{ledc\_mode\_t} \textit{speed\_mode}, uint32\_t \textit{timer\_sel})}

Pause LEDC timer counter.

\textbf{Return}
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

\textbf{Parameters}
- \textit{speed\_mode}: Select the LEDC speed\_mode, high-speed mode and low-speed mode
- \textit{timer\_sel}: LEDC timer index (0-3), select from ledc\_timer\_t

\texttt{esp\_err\_t \textit{ledc\_timer\_resume} (\textit{ledc\_mode\_t} \textit{speed\_mode}, uint32\_t \textit{timer\_sel})}

Resume LEDC timer.

\textbf{Return}
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success
Chapter 2. API Reference

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

```
esp_err_t ledc_bind_channel_timer(ledc_mode_t speed_mode, uint32_t channel, uint32_t timer_idx)
```

Bind LEDC channel with the selected timer.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- channel: LEDC channel index (0-7), select from ledc_channel_t
- timer_idx: LEDC timer index (0-3), select from ledc_timer_t

```
esp_err_t ledc_set_fade_with_step(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)
```

Set LEDC fade function.

Note Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

Note ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode,
- channel: LEDC channel index (0-7), select from ledc_channel_t
- target_duty: Target duty of fading [0, (2**duty_resolution) - 1]
- scale: Controls the increase or decrease step scale.
- cycle_num: increase or decrease the duty every cycle_num cycles

```
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)
```

Set LEDC fade function, with a limited time.

Note Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

Note ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters

- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode,
- channel: LEDC channel index (0-7), select from ledc_channel_t
- target_duty: Target duty of fading(0 - (2 ** duty_resolution - 1))
- max_fade_time_ms: The maximum time of the fading (ms)

```
esp_err_t ledc_fade_func_install(int intr_alloc_flags)
```

Espressif Systems 628 Release v4.0.3-189-g7c4f5fa

Submit Document Feedback
Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function already installed.

**Parameters**
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

```c
void ledc_fade_func_uninstall()
```

Uninstall LEDC fade function.

```c
esp_err_t ledc_fade_start (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)
```

Start LEDC fading.

**Note** Call ledc_fade_func_install() once before calling this function. Call this API right after ledc_set_fade_with_time or ledc_set_fade_with_step before to start fading.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped.

Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

**Parameters**
- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- channel: LEDC channel number
- fade_mode: Whether to block until fading done.

```c
esp_err_t ledc_set_duty_and_update (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped.

Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode
- channel: LEDC channel index (0-7), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- hpoint: Set the LEDC hpoint value (max: 0xfffff)

```c
esp_err_t ledc_set_fade_time_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function, with a limited time.

**Note** Call ledc_fade_func_install() once, before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped.

Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- speed_mode: Select the LEDC speed_mode, high-speed mode and low-speed mode,
- channel: LEDC channel index (0-7), select from ledc_channel_t
- target_duty: Target duty of fading.\(^{\text{(0 - (2 \times \text{duty_resolution} - 1))}}\)
- max_fade_time_ms: The maximum time of the fading (ms).
- fade_mode: choose blocking or non-blocking mode
esp_err_t ledc_set.fade.step_and.start(ledc_mode_t speed.mode, ledc_channel_t channel, uint32_t target.duty, uint32_t scale, uint32_t cycle_num, ledc.fade_mode_t fade.mode)

A thread-safe API to set and start LEDC fade function.

Note Call ledc.fade_func_install() once before calling this function.
Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP.ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters
- speed.mode: Select the LEDC speed_mode, high-speed mode and low-speed mode,
- channel: LEDC channel index (0-7), select from ledc_channel_t
- target.duty: Target duty of fading [0, (2**duty_resolution) - 1]
- scale: Controls the increase or decrease step scale.
- cycle_num: increase or decrease the duty every `cycle_num` cycles
- fade.mode: choose blocking or non-blocking mode

Structures
struct ledc_channel_config_t
Configuration parameters of LEDC channel for ledc_channel_config function.

Public Members

int gpio_num
the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

ledc_mode_t speed.mode
LEDC speed speed_mode, high-speed mode or low-speed mode

ledc_channel_t channel
LEDC channel (0 - 7)

ledc_intr_type_t intr.type
configure interrupt, Fade interrupt enable or Fade interrupt disable

ledc_timer_t timer.sel
Select the timer source of channel (0 - 3)

uint32_t duty
LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

int hpoint
LEDC channel hpoint value, the max value is 0xffff

struct ledc_timer_config_t
Configuration parameters of LEDC Timer timer for ledc_timer_config function.

Public Members

ledc_mode_t speed.mode
LEDC speed speed_mode, high-speed mode or low-speed mode

ledc_timer_bit_t duty.resolution
LEDC channel duty resolution

ledc_timer_t timer.num
The timer source of channel (0 - 3)
Chapter 2. API Reference

uint32_t freq_hz
  LEDC timer frequency (Hz)

ledc_clkCfg_t clk_cfg
Configure LEDC source clock. For low speed channels and high speed channels, you can specify the
source clock using LEDC_USE_REF_TICK, LEDC_USE_APB_CLK or LEDC_AUTO_CLK. For low
speed channels, you can also specify the source clock using LEDC_USE_RTC8M_CLK, in this case, all
low speed channel’s source clock must be RTC8M_CLK

Macros
LEDC_APB_CLK_HZ
LEDC_REF_CLK_HZ

    LEDC high speed speed_mode
  LEDC_LOW_SPEED_MODE
    LEDC low speed speed_mode
  LEDC_SPEED_MODE_MAX
    LEDC speed limit

enum ledc_intr_type_t
Values:
  LEDC_INTR_DISABLE = 0
    Disable LEDC interrupt
  LEDC_INTR_FADE_END
    Enable LEDC interrupt

enum ledc_duty_direction_t
Values:
  LEDC_DUTY_DIR_DECREASE = 0
    LEDC duty decrease direction
  LEDC_DUTY_DIR_INCREASE = 1
    LEDC duty increase direction
  LEDC_DUTY_DIR_MAX

enum ledc_clk_cfg_t
Values:
  LEDC_AUTO_CLK
    The driver will automatically select the source clock(REF_TICK or APB) based on the giving resolution
    and duty parameter when init the timer
  LEDC_USE_REF_TICK
    LEDC timer select REF_TICK clock as source clock
  LEDC_USE_APB_CLK
    LEDC timer select APB clock as source clock
LED Caye TIE Close
LDCC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels.

enum ledc_clk_src_t
Values:

LED Ref Tick = LEDC_USE_REF_TICK
LED timer clock divided from reference tick (1Mhz)

LED Apb Clk = LEDC_USE_APB_CLK
LED timer clock divided from APB clock (80Mhz)

enum ledc_timer_t
Values:

LEDC_TIMER_0 = 0

enum ledc_timer_bit_t
Values:

LEDC_TIMER_1_BIT = 1
LEDC PWM duty resolution of 1 bits

LEDC_TIMER_2_BIT
LEDC PWM duty resolution of 2 bits

LEDC_TIMER_3_BIT
LEDC PWM duty resolution of 3 bits
LEDC_TIMER_4_BIT
LEDC PWM duty resolution of 4 bits

LEDC_TIMER_5_BIT
LEDC PWM duty resolution of 5 bits

LEDC_TIMER_6_BIT
LEDC PWM duty resolution of 6 bits

LEDC_TIMER_7_BIT
LEDC PWM duty resolution of 7 bits

LEDC_TIMER_8_BIT
LEDC PWM duty resolution of 8 bits

LEDC_TIMER_9_BIT
LEDC PWM duty resolution of 9 bits

LEDC_TIMER_10_BIT
LEDC PWM duty resolution of 10 bits

LEDC_TIMER_11_BIT
LEDC PWM duty resolution of 11 bits

LEDC_TIMER_12_BIT
LEDC PWM duty resolution of 12 bits

LEDC_TIMER_13_BIT
LEDC PWM duty resolution of 13 bits

LEDC_TIMER_14_BIT
LEDC PWM duty resolution of 14 bits

LEDC_TIMER_15_BIT
LEDC PWM duty resolution of 15 bits

LEDC_TIMER_16_BIT
LEDC PWM duty resolution of 16 bits

LEDC_TIMER_17_BIT
LEDC PWM duty resolution of 17 bits

LEDC_TIMER_18_BIT
LEDC PWM duty resolution of 18 bits

LEDC_TIMER_19_BIT
LEDC PWM duty resolution of 19 bits

LEDC_TIMER_20_BIT
LEDC PWM duty resolution of 20 bits

LEDC_TIMER_BIT_MAX

enum ledc_fade_mode_t
  Values:

  LEDC_FADE_NO_WAIT = 0
  LEDC fade function will return immediately

  LEDC_FADE_WAIT_DONE
  LEDC fade function will block until fading to the target duty

  LEDC_FADE_MAX

2.3.8 MCPWM

ESP32 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.
Further in documentation the outputs of a single unit are labeled PWMxA / PWMxB.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as SYNC SIGNALS, detect FAULT SIGNALS like motor overcurrent or overvoltage, as well as obtain feedback with CAPTURE SIGNALS on e.g. a rotor position.

Description of this API starts with configuration of MCPWM’s Timer and Operator submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a Fault Handler, signal Capture, Carrier and Interrupts.

Contents

- **Configure** a basic functionality of the outputs
- **Operate** the outputs to drive a motor
- **Adjust** how the motor is driven
- **Capture** external signals to provide additional control over the outputs
- **Use** Fault Handler to detect and manage faults
- **Add** a higher frequency Carrier, if output signals are passed through an isolation transformer
- **Configuration and handling of Interrupts.**

**Configure**

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM’s resources. An example circuit is shown below. It includes a H-Bridge to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

Configuration covers the following steps:

1. Selection of a MPWN unit that will be used to drive the motor. There are two units available on-board of ESP32 and enumerated in mcpwm_unit_t.
2. Initialization of two GPIOs as output signals within selected unit by calling mcpwm_gpio_init(). The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in mcpwm_io_signals_t. To set more than a single pin at a time, use function mcpwm_set_pin() together with mcpwm_pin_config_t.
Fig. 16: MCPWM Block Diagram

Fig. 17: Example of Brushed DC Motor Control with MCPWM
3. Selection of a timer. There are three timers available within the unit. The timers are listed in \texttt{mcpwm_timer_t}.
4. Setting of the timer frequency and initial duty within \texttt{mcpwm_config_t} structure.
5. Calling of \texttt{mcpwm_init()} with the above parameters to make the configuration effective.

**Operate**

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit’s outputs. The outputs are organized into three pairs. Within a pair they are labeled “A” and “B” and driven by a submodule called an “Operator”. To provide a PWM signal, the Operator itself should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function \texttt{mcpwm_set_signal_high()} or \texttt{mcpwm_set_signal_low()}. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling \texttt{mcpwm_start()} or \texttt{mcpwm_stop()}. The motor speed will be proportional to the PWM duty.
- To vary PWM’s duty call \texttt{mcpwm_set_duty()} and provide the duty value in \%. Optionally, you may call \texttt{mcpwm_set_duty_in_us()}, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling \texttt{mcpwm_get_duty()}. Phase of the PWM signal may be altered by calling \texttt{mcpwm_set_duty_type()}. The duty is set individually for each A and B output using \texttt{mcpwm_operator_t} in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling \texttt{mcpwm_init()}, as discussed in section Configure, and selecting one of options from \texttt{mcpwm_duty_type_t}.

**Note:** Call function \texttt{mcpwm_set_duty_type()} every time after \texttt{mcpwm_set_signal_high()} or \texttt{mcpwm_set_signal_low()} to resume with previously set duty cycle.

**Adjust**

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling \texttt{mcpwm_set_frequency()}. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function \texttt{mcpwm_get_frequency()}.  
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in \texttt{mcpwm_deadtime_type_t} and enabled by calling \texttt{mcpwm_deadtime_enable()}. To disable this functionality call \texttt{mcpwm_deadtime_disable()}.  
- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the block diagram of the MCPWM above, and defined in \texttt{mcpwm_sync_signal_t}. To attach the signal to a GPIO call \texttt{mcpwm_gpio_init()}. You can then enable synchronization with function \texttt{mcpwm_sync_enable()}. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

**Note:** Synchronization signals are referred to using two different enumerations. First one \texttt{mcpwm_io_signals_t} is used together with function \texttt{mcpwm_gpio_init()} when selecting a GPIO as the signal input source. The second one \texttt{mcpwm_sync_signal_t} is used when enabling or disabling synchronization with \texttt{mcpwm_sync_enable()} or \texttt{mcpwm_sync_disable()}.

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling \texttt{mcpwm_init()}.  

as discussed in section `Configure`, and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated please refer to ESP32 Technical Reference Manual.

**Capture**

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal’s edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

![Fig. 18: Example of Brushless DC Motor Control with MCPWM](image)

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section `Configure`.
2. Enabling of the functionality itself by invoking `mcpwm_capture_enable()`, selecting desired signal input from `mcpwm_capture_signal_t`, setting the signal edge with `mcpwm_capture_on_edge_t` and the signal count prescaler.

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer’s value is stored in time-stamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`.

If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable()`.

**Fault Handler**

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output
Chapter 2. API Reference

- set the output low
- set the output high
- toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.

2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
   - State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
   - The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

   The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`.

   Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

Carrier

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then alerted at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the career with `mcpwm_carrier_oneshot_mode_enable()`. For more details please refer to “PWM Carrier Submodule” section of the ESP32 Technical Reference Manual.

To disable carrier functionality call `mcpwm_carrier_disable()`.

Interrupts

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`.

Application Example

Examples of using MCPWM for motor control: peripherals/mcpwm:

- Demonstration how to use each submodule of the MCPWM - peripherals/mcpwm/mcpwm_basic_config
- Control of BLDC (brushless DC) motor with hall sensor feedback - peripherals/mcpwm/mcpwm_bldc_control
- Brushed DC motor control - peripherals/mcpwm/mcpwm_brushed_dc_control
- Servo motor control - peripherals/mcpwm/mcpwm_servo_control
API Reference

Header File

```c
• driver/include/driver/mcpwm.h
```

Functions

```c
esp_err_t mcpwm_gpio_init(mcpwm_unit_t mcpwm_num, mcpwm_io_signals_t io_signal, int gpio_num)
```

This function initializes each gpio signal for MCPWM.

**Note** This function initializes one gpio at a time.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `io_signal`: set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(Sync_X, Fault_X, Cap_X) ‘X’ is timer_num(0-2)
- `gpio_num`: set this to configure gpio for MCPWM, if you want to use gpio16, gpio_num = 16

```c
esp_err_t mcpwm_set_pin(mcpwm_unit_t mcpwm_num, const mcpwm_pin_config_t *mcpwm_pin)
```

Initialize MCPWM gpio structure.

**Note** This function can be used to initialize more then one gpio at a time.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `mcpwm_pin`: MCPWM pin structure

```c
esp_err_t mcpwm_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_config_t *mcpwm_conf)
```

Initialize MCPWM parameters.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `mcpwm_conf`: configure structure `mcpwm_config_t`

```c
esp_err_t mcpwm_set_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint32_t frequency)
```

Set frequency(in Hz) of MCPWM timer.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `frequency`: set the frequency in Hz of each timer

```c
esp_err_t mcpwm_set_duty(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t op_num, float duty)
```

Set duty cycle of each operator(MCPWMXA/MCPWMXB)

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Parameters
  • mcpwm_num: set MCPWM unit(0-1)
  • timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
  • op_num: set the operator(MCPWMXA/MCPWMXB), ‘X’ is timer number selected
  • duty: set duty cycle in % (i.e. for 62.3% duty cycle, duty = 62.3) of each operator

```c
esp_err_t mcpwm_set_duty_in_us(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t op_num, uint32_t duty)
```

Set duty cycle of each operator(MCPWMXA/MCPWMXB) in us.

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error

Parameters
  • mcpwm_num: set MCPWM unit(0-1)
  • timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
  • op_num: set the operator(MCPWMXA/MCPWMXB), ‘X’ is timer number selected
  • duty: set duty value in microseconds of each operator

```c
esp_err_t mcpwm_set_duty_type(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t op_num, mcpwm_duty_type_t duty_num)
```

Set duty either active high or active low(out of phase/inverted)

Note Call this function every time after mcpwm_set_signal_high or mcpwm_set_signal_low to resume with previously set duty cycle

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error

Parameters
  • mcpwm_num: set MCPWM unit(0-1)
  • timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
  • op_num: set the operator(MCPWMXA/MCPWMXB), ‘X’ is timer number selected
  • duty_num: set active low or active high duty type

```c
uint32_t mcpwm_get_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Get frequency of timer.

Return
  • frequency of timer

Parameters
  • mcpwm_num: set MCPWM unit(0-1)
  • timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
float mcpwm_get_duty(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t op_num)
```

Get duty cycle of each operator.

Return
  • duty cycle in % of each operator(56.7 means duty is 56.7%) 

Parameters
  • mcpwm_num: set MCPWM unit(0-1)
  • timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
  • op_num: set the operator(MCPWMXA/MCPWMXB), ‘X’ is timer number selected

```c
esp_err_t mcpwm_set_signal_high(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t op_num)
```

Use this function to set MCPWM signal high.

Return
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error

Parameters
  • mcpwm_num: set MCPWM unit(0-1)
  • timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
Chapter 2. API Reference

- **op_num**: set the operator (MCPWMXA/MCPWMXB), ‘x’ is timer number selected

```c
esp_err_t mcpwm_set_signal_low(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t op_num)
```

Use this function to set MCPWM signal low.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- op_num: set the operator (MCPWMXA/MCPWMXB), ‘x’ is timer number selected

```c
esp_err_t mcpwm_start(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Start MCPWM signal on timer ‘x’.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_stop(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Start MCPWM signal on timer ‘x’.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_carrier_config_t *carrier_conf)
```

Initialize carrier configuration.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier_conf: configure structure mcpwm_carrier_config_t

```c
esp_err_t mcpwm_carrier_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Enable MCPWM carrier submodule, for respective timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Disable MCPWM carrier submodule, for respective timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_set_period(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_period)
```

Set period of carrier.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier_period: set the carrier period of each timer, carrier period = (carrier_period + 1)*800ns (carrier_period <= 15)

```c
esp_err_t mcpwm_carrier_set_duty_cycle(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_duty)
```

Set duty_cycle of carrier.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier_duty: set duty_cycle of carrier, carrier duty cycle = carrier_duty*12.5% (chop_duty <= 7)

```c
esp_err_t mcpwm_carrier_oneshot_mode_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t pulse_width)
```

Enable and set width of first pulse in oneshot mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- pulse_width: set pulse width of first pulse in oneshot mode, width = (carrier period)*(pulse_width +1) (pulse_width <= 15)

```c
esp_err_t mcpwm_carrier_oneshot_mode_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Disable oneshot mode, width of first pulse = carrier period.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_output_invert(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_carrier_out_ivt_t carrier_ivt_mode)
```

Enable or disable carrier output inversion.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier_ivt_mode: enable or disable carrier output inversion
Enable and initialize deadtime for each MCPWM timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- dt_mode: set deadtime mode
- red: set rising edge delay = red*100ns
- fed: set rising edge delay = fed*100ns

Disable deadtime on MCPWM timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

Initialize fault submodule, currently low level triggering is not supported.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- input_level: set fault signal level, which will cause fault to occur
- faultSig: set the fault pin, which needs to be enabled

Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

**Note** currently low level triggering is not supported

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- faultSig: set the fault pin, which needs to be enabled for oneshot mode
- action_on_pwmxa: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- action_on_pwmxb: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.
Note currently low level triggering is not supported

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- fault_sig: set the fault pin, which needs to be enabled for cyc mode
- action_on_pwmxa: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- action_on_pwmxb: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

`esp_err_t mcpwm_fault_deinit(mcpwm_unit_t mcpwm_num, mcpwm_fault_signal_t fault_sig)`

Disable fault signal.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- fault_sig: fault pin, which needs to be disabled

`esp_err_t mcpwm_capture_enable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig, mcpwm_capture_on_edge_t cap_edge, uint32_t num_of_pulse)`

Initialize capture submodule.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- cap_edge: set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- cap_sig: capture pin, which needs to be enabled
- num_of_pulse: count time between rising/falling edge between 2 *(pulses mentioned), counter uses APB_CLK

`esp_err_t mcpwm_capture_disable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)`

Disable capture signal.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- cap_sig: capture pin, which needs to be disabled

`uint32_t mcpwm_capture_signal_get_value(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)`

Get capture value.

Return Captured value

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- cap_sig: capture pin on which value is to be measured

`uint32_t mcpwm_capture_signal_get_edge(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)`

Get edge of capture signal.

Return Capture signal edge: 1 - positive edge, 2 - negative edge

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- cap_sig: capture pin of whose edge is to be determined
### Chapter 2. API Reference

**esp_err_t mcpwm_sync_enable**

```c
def mcpwm_sync_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_sync_signal_t sync_sig, uint32_t phase_val)
```

Initializes sync submodule.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `sync_sig`: set the synchronization pin, which needs to be enabled
- `phase_val`: phase value in 1/1000 (for 86.7%, phase_val = 867) which timer moves to on sync signal

**esp_err_t mcpwm_sync_disable**

```c
def mcpwm_sync_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Disables sync submodule on given timer.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**esp_err_t mcpwm_isr_register**

```c
def mcpwm_isr_register(mcpwm_unit_t mcpwm_num, void(* fn)(void * arg), int intr_alloc_flags, intr_handle_t * handle)
```

Register MCPWM interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**

- `mcpwm_num`: set MCPWM unit(0-1)
- `fn`: interrupt handler function.
- `arg`: user-supplied argument passed to the handler function.
- `intr_alloc_flags`: flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- `arg`: parameter for handler function
- `handle`: pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Set type of duty cycle

mcpwm_counter_type_t counter_mode  
Set type of MCPWM counter

struct mcpwm_carrier_config_t  
MCPWM config carrier structure.

Public Members

uint8_t carrier_period  
Set carrier period = (carrier_period + 1)*800ns, carrier_period should be < 16

uint8_t carrier_duty  
Set carrier duty cycle, carrier_duty should be less than 8 (increment every 12.5%)

uint8_t pulse_width_in_os  
Set pulse width of first pulse in one shot mode = (carrier period)*(pulse_width_in_os + 1), should be less then 16
\textit{mcpwm\_carrier\_os\_t carrier\_os\_mode}
Enable or disable carrier oneshot mode

\textit{mcpwm\_carrier\_out\_ivt\_t carrier\_ivt\_mode}
Invert output of carrier

\textbf{Enumerations}

\textbf{enum mcpwm\_io\_signals\_t}
IO signals for the MCPWM.
- 6 MCPWM output pins that generate PWM signals
- 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
- 3 MCPWM sync input pins to synchronize MCPWM outputs signals
- 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

\textit{Values:}

\texttt{MCPWM0A = 0}
PWM0A output pin

\texttt{MCPWM0B}
PWM0B output pin

\texttt{MCPWM1A}
PWM1A output pin

\texttt{MCPWM1B}
PWM1B output pin

\texttt{MCPWM2A}
PWM2A output pin

\texttt{MCPWM2B}
PWM2B output pin

\texttt{MCPWM\_SYNC\_0}
SYNC0 input pin

\texttt{MCPWM\_SYNC\_1}
SYNC1 input pin

\texttt{MCPWM\_SYNC\_2}
SYNC2 input pin

\texttt{MCPWM\_FAULT\_0}
FAULT0 input pin

\texttt{MCPWM\_FAULT\_1}
FAULT1 input pin

\texttt{MCPWM\_FAULT\_2}
FAULT2 input pin

\texttt{MCPWM\_CAP\_0 = 84}
CAP0 input pin

\texttt{MCPWM\_CAP\_1}
CAP1 input pin

\texttt{MCPWM\_CAP\_2}
CAP2 input pin

\textbf{enum mcpwm\_unit\_t}
Select MCPWM unit.

\textit{Values:}
Chapter 2. API Reference

MCPWM_UNIT_0 = 0
MCPWM unit 0 selected

MCPWM_UNIT_1
MCPWM unit 1 selected

MCPWM_UNIT_MAX
Num of MCPWM units on ESP32

def mcpwm_timer_t
Select MCPWM timer.
Values:

MCPWM_TIMER_0 = 0
Select MCPWM timer 0

MCPWM_TIMER_1
Select MCPWM timer 1

MCPWM_TIMER_2
Select MCPWM timer 2

MCPWM_TIMER_MAX
Num of MCPWM timers on ESP32

def mcpwm_operator_t
Select MCPWM operator.
Values:

MCPWM_OPR_A = 0
Select MCPWMX A, where \( X \) is timer number

MCPWM_OPR_B
Select MCPWMX B, where \( X \) is timer number

MCPWM_OPR_MAX
Num of operators to each timer of MCPWM

def mcpwm_counter_type_t
Select type of MCPWM counter.
Values:

MCPWM_UP_COUNTER = 1
For asymmetric MCPWM

MCPWM_DOWN_COUNTER
For asymmetric MCPWM

MCPWM_UP_DOWN_COUNTER
For symmetric MCPWM, frequency is half of MCPWM frequency set

MCPWM_COUNTER_MAX
Maximum counter mode

def mcpwm_duty_type_t
Select type of MCPWM duty cycle mode.
Values:

MCPWM_DUTY_MODE_0 = 0
Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM

MCPWM_DUTY_MODE_1
Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM
Chapter 2. API Reference

MCPWM_DUTY_MODE_MAX
Num of duty cycle modes

enum mcpwm_carrier_os_t
MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.

Values:

MCPWM_ONESHOT_MODE_DIS = 0
Enable oneshot mode

MCPWM_ONESHOT_MODE_EN
Disable oneshot mode

enum mcpwm_carrier_out_ivt_t
MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.

Values:

MCPWM_CARRIER_OUT_IVT_DIS = 0
Enable carrier output inversion

MCPWM_CARRIER_OUT_IVT_EN
Disable carrier output inversion

enum mcpwm_sync_signal_t
MCPWM select sync signal input.

Values:

MCPWM_SELECT_SYNC0 = 4
Select SYNC0 as input

MCPWM_SELECT_SYNC1
Select SYNC1 as input

MCPWM_SELECT_SYNC2
Select SYNC2 as input

enum mcpwm_fault_signal_t
MCPWM select fault signal input.

Values:

MCPWM_SELECT_F0 = 0
Select F0 as input

MCPWM_SELECT_F1
Select F1 as input

MCPWM_SELECT_F2
Select F2 as input

enum mcpwm_fault_input_level_t
MCPWM select triggering level of fault signal.

Values:

MCPWM_LOW_LEVEL_TGR = 0
Fault condition occurs when fault input signal goes from high to low, currently not supported

MCPWM_HIGH_LEVEL_TGR
Fault condition occurs when fault input signal goes low to high

enum mcpwm_action_on_pwmxa_t
MCPWM select action to be taken on MCPWMXA when fault occurs.

Values:

MCPWM_NO_CHANGE_IN_MCPWMXA = 0
No change in MCPWMXA output
MCPWM_FORCE_MCPWMXA_LOW
Make MCPWMXA output low

MCPWM_FORCE_MCPWMXA_HIGH
Make MCPWMXA output high

MCPWM_TOG_MCPWMXA
Make MCPWMXA output toggle

enum mcpwm_action_on_pwmxb_t
MCPWM select action to be taken on MCPWMxB when fault occurs.
Values:
MCPWM_NO_CHANGE_IN_MCPWMXB = 0
No change in MCPWMXB output

MCPWM_FORCE_MCPWMXB_LOW
Make MCPWMXB output low

MCPWM_FORCE_MCPWMXB_HIGH
Make MCPWMXB output high

MCPWM_TOG_MCPWMXB
Make MCPWMXB output toggle

enum mcpwm_capture_signal_t
MCPWM select capture signal input.
Values:
MCPWM_SELECT_CAP0 = 0
Select CAP0 as input

MCPWM_SELECT_CAP1
Select CAP1 as input

MCPWM_SELECT_CAP2
Select CAP2 as input

enum mcpwm_capture_on_edge_t
MCPWM select capture starts from which edge.
Values:
MCPWM_NEG_EDGE = 0
Capture starts from negative edge

MCPWM_POS_EDGE
Capture starts from positive edge

enum mcpwm_deadtime_type_t
MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.
Values:
MCPWM_BYPASS_RED = 0
MCPWMXA Out = MCPWMXA In with no delay, MCPWMXB Out = MCPWMXA In with falling edge delay

MCPWM_BYPASS_FED
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXB In with no delay

MCPWM_ACTIVE_HIGH_MODE
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay
MCPWM_ACTIVE_LOW_MODE
MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMB Out = MCPWMXIn with compliment of falling edge delay

MCPWM_ACTIVE_HIGH_COMPLIMENT_MODE
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMB = MCPWMXA In with compliment of falling edge delay

MCPWM_ACTIVE_LOW_COMPLIMENT_MODE
MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMB Out = MCPWMXIn with falling edge delay

MCPWM_ACTIVE_RED_FED_FROM_PWMXA
MCPWMXA Out = MCPWMB Out = MCPWMXA In with rising edge delay as well as falling edge delay

MCPWM_ACTIVE_RED_FED_FROM_PWMXB
MCPWMXA Out = MCPWMB Out = MCPWMXB In with rising edge delay as well as falling edge delay

MCPWM_DEADTIME_TYPE_MAX

2.3.9 Pulse Counter

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

Functionality Overview

Description of functionality of this API has been broken down into four sections:

- **Configuration** - describes counter’s configuration parameters and how to setup the counter.
- **Operating the Counter** - provides information on control functions to pause, measure and clear the counter.
- **Filtering Pulses** - describes options to filtering pulses and the counter control signals.
- **Using Interrupts** - presents how to trigger interrupts on specific states of the counter.

Configuration

The PCNT module has eight independent counting “units” numbered from 0 to 7. In the API they are referred to using `pcnt_unit_t`. Each unit has two independent channels numbered as 0 and 1 and specified with `pcnt_channel_t`.

The configuration is provided separately per unit’s channel using `pcnt_config_t` and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.

Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.
To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

**Operating the Counter**

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`. There are couple of functions that allow to control the counter’s operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`. It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`. If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`. To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

**Note:** For the counter not to miss any pulses, the pulse duration should be longer than one APB_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a filter.

**Filtering Pulses**

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals. The length of ignored pulses is provided in APB_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB_CLK clock is running at 80 MHz. The filter is put into operation / suspended by calling `pcnt_filter_enable() / pcnt_filter_disable()`.

**Using Interrupts**

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in *Configuration*
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`, and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`. In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

**Application Example**

Pulse counter with control signal and event interrupt example: peripherals/pcnt.
Chapter 2. API Reference

API Reference

Header File

- driver/include/driver/pcnt.h

Functions

`esp_err_t pcnt_unit_config(const pcnt_config_t *pcnt_config)`
Configure Pulse Counter unit.

**Note** This function will disable three events: PCNT_EVT_L_LIM, PCNT_EVT_H_LIM, PCNT_EVT_ZERO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_config: Pointer of Pulse Counter unit configure parameter

`esp_err_t pcnt_get_counter_value(pcnt_unit_t pcnt_unit, int16_t *count)`
Get pulse counter value.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_unit: Pulse Counter unit number
- count: Pointer to accept counter value

`esp_err_t pcnt_counter_pause(pcnt_unit_t pcnt_unit)`
Pause PCNT counter of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_unit: PCNT unit number

`esp_err_t pcnt_counter_resume(pcnt_unit_t pcnt_unit)`
Resume counting for PCNT counter.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_unit: PCNT unit number, select from pcnt_unit_t

`esp_err_t pcnt_counter_clear(pcnt_unit_t pcnt_unit)`
Clear and reset PCNT counter value to zero.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- pcnt_unit: PCNT unit number, select from pcnt_unit_t

`esp_err_t pcnt_intr_enable(pcnt_unit_t pcnt_unit)`
Enable PCNT interrupt for PCNT unit.

**Note** Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with pcnt_event_enable() and pcnt_event_disable()

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
• pcnt_unit: PCNT unit number

\texttt{esp_err_t pcnt_intr_disable (pcnt_unit_t pcnt_unit)}

Disable PCNT interrupt for PCNT unit.

\textbf{Return}

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}

• pcnt_unit: PCNT unit number

\texttt{esp_err_t pcnt_event_enable (pcnt_unit_t unit, pcnt_evt_type_t evt_type)}

Enable PCNT event of PCNT unit.

\textbf{Return}

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}

• unit: PCNT unit number
• evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

\texttt{esp_err_t pcnt_event_disable (pcnt_unit_t unit, pcnt_evt_type_t evt_type)}

Disable PCNT event of PCNT unit.

\textbf{Return}

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}

• unit: PCNT unit number
• evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

\texttt{esp_err_t pcnt_set_event_value (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t value)}

Set PCNT event value of PCNT unit.

\textbf{Return}

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}

• unit: PCNT unit number
• evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
• value: Counter value for PCNT event

\texttt{esp_err_t pcnt_get_event_value (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t *value)}

Get PCNT event value of PCNT unit.

\textbf{Return}

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}

• unit: PCNT unit number
• evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
• value: Pointer to accept counter value for PCNT event

\texttt{esp_err_t pcnt_isr_register (void (*fn))(void *arg, int intr_alloc_flags, pcnt_isr_handle_t *handle)}

Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use pcnt_isr_service_install if this function was called.

\textbf{Return}

• ESP_OK Success
• ESP_ERR_NOT_FOUND Can not find the interrupt that matches the flags.
• ESP_ERR_INVALID_ARG Function pointer error.

Parameters
• fn: Interrupt handler function.
• arg: Parameter for handler function
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.
Calling esp_intr_free to unregister this ISR service if needed, but only if the handle is not NULL.

\[
\text{esp_err_t} \ pcnt\_set\_pin (pcnt\_unit\_t \ unit, \ pcnt\_channel\_t \ channel, \ int \ pulse\_io, \ int \ ctrl\_io) \\
\]
Configure PCNT pulse signal input pin and control input pin.

Note Set the signal input to PCNT_PIN_NOT_USED if unused.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• unit: PCNT unit number
• channel: PCNT channel number
• pulse_io: Pulse signal input GPIO
• ctrl_io: Control signal input GPIO

\[
\text{esp_err_t} \ pcnt\_filter\_enable (pcnt\_unit\_t \ unit) \\
\]
Enable PCNT input filter.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• unit: PCNT unit number

\[
\text{esp_err_t} \ pcnt\_filter\_disable (pcnt\_unit\_t \ unit) \\
\]
Disable PCNT input filter.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• unit: PCNT unit number

\[
\text{esp_err_t} \ pcnt\_set\_filter\_value (pcnt\_unit\_t \ unit, \ uint16\_t \ filter\_val) \\
\]
Set PCNT filter value.

Note filter_val is a 10-bit value, so the maximum filter_val should be limited to 1023.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• unit: PCNT unit number
• filter_val: PCNT signal filter value, counter in APB_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

\[
\text{esp_err_t} \ pcnt\_get\_filter\_value (pcnt\_unit\_t \ unit, \ uint16\_t* \ filter\_val) \\
\]
Get PCNT filter value.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• unit: PCNT unit number
• filter_val: Pointer to accept PCNT filter value.
Set PCNT counter mode.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- channel: PCNT channel number
- pos_mode: Counter mode when detecting positive edge
- neg_mode: Counter mode when detecting negative edge
- hctrl_mode: Counter mode when control signal is high level
- lctrl_mode: Counter mode when control signal is low level

Call this function after using pcnt_isr_service_install() to install the PCNT driver’s ISR handler service.

The ISR handlers do not need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in pcnt_isr_service_install().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number
- isr_handler: Interrupt handler function.
- args: Parameter for handler function

Install PCNT ISR service.

Note We can manage different interrupt service for each unit. This function will use the default ISR handle service. Calling pcnt_isr_service_uninstall to uninstall the default service if needed. Please do not use pcnt_isr_register if this function was called.

Return

- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed

Parameters

- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_IRAM * values. See esp_intr_alloc.h for more info.

Uninstall PCNT ISR service, freeing related resources.

Delete ISR handler for specified unit.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- unit: PCNT unit number

Structures
struct pcnt_config_t
  Pulse Counter configuration for a single channel.

Public Members

int pulse_gpio_num
  Pulse input GPIO number, if you want to use GPIO16, enter pulse_gpio_num = 16, a negative value will be ignored

int ctrl_gpio_num
  Control signal input GPIO number, a negative value will be ignored

pcnt_ctrl_mode_t lctrl_mode
  PCNT low control mode

pcnt_ctrl_mode_t hctrl_mode
  PCNT high control mode

pcnt_count_mode_t pos_mode
  PCNT positive edge count mode

pcnt_count_mode_t neg_mode
  PCNT negative edge count mode

int16_t counter_h_lim
  Maximum counter value

int16_t counter_l_lim
  Minimum counter value

pcnt_unit_t unit
  PCNT unit number

pcnt_channel_t channel
  the PCNT channel

Macros

PCNT_PIN_NOT_USED
  When selected for a pin, this pin will not be used

Type Definitions
typedef intr_handle_t pcnt_isr_handle_t

Enumerations
enum pcnt_ctrl_mode_t
  Selection of available modes that determine the counter’s action depending on the state of the control signal’s input GPIO.

Note  Configuration covers two actions, one for high, and one for low level on the control input.

Values:

PCNT_MODE_KEEP = 0
  Control mode: won’t change counter mode

PCNT_MODE_REVERSE = 1
  Control mode: invert counter mode(increase -> decrease, decrease -> increase)

PCNT_MODE_DISABLE = 2
  Control mode: Inhibit counter(counter value will not change in this condition)

2.3.10 RMT

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT’s transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

![Fig. 19: RMT Transmitter Overview](image)

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

![Fig. 20: RMT Receiver Overview](image)

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. Configure Driver
2. Transmit Data or Receive Data
3. Change Operation Parameters
4. Use Interrupts

The RMT has eight channels numbered from zero to seven. Each channel is able to independently transmit or receive data. They are referred to using indexes defined in structure `rmt_channel_t`.

## Configure Driver

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

### Common Parameters

- **The channel** to be configured, select one from the `rmt_channel_t` enumerator.
- **The RMT operation mode** - whether this channel is used to transmit or receive data, selected by setting a `rmt_mode` member to one of the values from `rmt_mode_t`.
- **What is the pin number** to transmit or receive RMT signals, selected by setting `gpio_num`.
- **How many memory blocks** will be used by the channel, set with `mem_block_num`.
- **A clock divider**, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting `clk_div` to a value within [1 .. 255] range. The RMT source clock is typically APB CLK, 80Mhz by default.

Note: The period of a square wave after the clock divider is called a ‘tick’. The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’.

There are also couple of specific parameters that should be set up depending if selected channel is configured in **Transmit Mode** or **Receive Mode**:

### Transmit Mode

When configuring channel in transmit mode, set `tx_config` and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - `loop_en`
- Enable the RMT carrier signal - `carrier_en`
- Frequency of the carrier in Hz - `carrier_freq_hz`
- Duty cycle of the carrier signal in percent (%) - `carrier_duty_percent`
- Level of the RMT output, when the carrier is applied - `carrier_level`
- Enable the RMT output if idle - `idle_output_en`
- Set the signal level on the RMT output if idle - `idle_level`

### Receive Mode

In receive mode, set `rx_config` and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - `filter_en`
- A threshold of the filter, set in the number of ticks - `filter_ticks_thresh`. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - `idle_threshold`. The receiver will ignore pulses longer than this setting.

### Finalize Configuration

Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is > 0, then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in **Use Interrupts**.
Now, depending on how the channel is configured, we are ready to either Transmit Data or Receive Data. This is described in next two sections.

**Transmit Data**

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure `rmt_item32_t`, see `soc/esp32/include/soc/rmt_struct.h`. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

![Fig. 21: Structure of RMT items (L - signal level)](image)

For a simple example how to define a block of items see `peripherals/rmt_tx`.

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see `rmt_set_mem_block_num()`.

**Receive Data**

Before starting the receiver we need some storage for incoming items. The RMT controller has 512 x 32-bits of internal RAM shared between all eight channels. In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what’s inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in `peripherals/rmt_nec_tx_rx`.

To stop the receiver, call `rmt_rx_stop()`.
Change Operation Parameters

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have _get_ counterpart to read back the currently configured value.

Parameters Common to Transmit and Receive Mode

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_pin()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

Transmit Mode Parameters

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`

Receive Mode Parameters

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT’s memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

Use Interrupts

Registering of an interrupt handler for the RMT controller is done be calling `rmt_isr_register()`.

Note: When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

The RMT controller triggers interrupts on four specific events describes below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
- The number of events the transmitter has sent matches a threshold value - `rmt_set_tx_thr_intr_en()`
- Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling `rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as `RMT.int_clr.val.chN_event_name` and defined as a volatile struct in `soc/esp32/include/soc/rmt_struct.h`, where N is the RMT channel number [0, 7] and the `event_name` is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function `rmt_isr_deregister()`.
Chapter 2. API Reference

Uninstall Driver

If the RMT driver has been installed with \texttt{rmt\_driver\_install()} for some specific period of time and then not required, the driver may be removed to free allocated resources by calling \texttt{rmt\_driver\_uninstall()}.

Application Examples

- A simple RMT TX example: \texttt{peripherals/rmt\_tx}.
- NEC remote control TX and RX example: \texttt{peripherals/rmt\_nec\_tx\_rx}.

API Reference

Header File

- \texttt{driver/include/driver/rmt.h}

Functions

\texttt{esp\_err\_t rmt\_set\_clk\_div}(rmt\_channel\_t channel, uint8\_t div\_cnt)
Set RMT clock divider, channel clock is divided from source clock.

\texttt{Return}
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

\texttt{Parameters}
- \texttt{channel}: RMT channel (0-7)
- \texttt{div\_cnt}: RMT counter clock divider

\texttt{esp\_err\_t rmt\_get\_clk\_div}(rmt\_channel\_t channel, uint8\_t* div\_cnt)
Get RMT clock divider, channel clock is divided from source clock.

\texttt{Return}
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

\texttt{Parameters}
- \texttt{channel}: RMT channel (0-7)
- \texttt{div\_cnt}: pointer to accept RMT counter divider

\texttt{esp\_err\_t rmt\_set\_rx\_idle\_thresh}(rmt\_channel\_t channel, uint16\_t thresh)
Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle\_thres channel clock cycles, the receive process is finished.

\texttt{Return}
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

\texttt{Parameters}
- \texttt{channel}: RMT channel (0-7)
- \texttt{thresh}: RMT RX idle threshold

\texttt{esp\_err\_t rmt\_get\_rx\_idle\_thresh}(rmt\_channel\_t channel, uint16\_t* thresh)
Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle\_thres channel clock cycles, the receive process is finished.

\texttt{Return}
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

\texttt{Parameters}
- \texttt{channel}: RMT channel (0-7)
Chapter 2. API Reference

- thresh: pointer to accept RMT RX idle threshold value

```c
esp_err_t rmt_set_mem_block_num(rmt_channel_t channel, uint8_t rmt_mem_num)
```

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start_addr_CHn to end_addr_CHn, which are defined by: Memory block start address is RMT_CHANNEL_MEM(n) (in soc/rmt_reg.h), that is, start_addr_chn = RMT base address + 0x800 + 64 * 4 * n, and end_addr_chn = RMT base address + 0x800 + 64 * 4 * n + 64 * 4 * \( RMT\_MEM\_SIZE\_CHn \mod 512 \times 4 \), where n = 0, 1, ..., 7.

Note: If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

Return:
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters:
- channel: RMT channel (0-7)
- rmt_mem_num: RMT RX memory block number, one block has 64 * 32 bits.

```c
esp_err_t rmt_get_mem_block_num(rmt_channel_t channel, uint8_t* rmt_mem_num)
```

Get RMT memory block number.

Return:
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters:
- channel: RMT channel (0-7)
- rmt_mem_num: Pointer to accept RMT RX memory block number

```c
esp_err_t rmt_set_tx_carrier(rmt_channel_t channel, bool carrier_en, uint16_t high_level, uint16_t low_level, rmt_carrier_level_t carrier_level)
```

Configure RMT carrier for TX signal.

Set different values for carrier_high and carrier_low to set different frequency of carrier. The unit of carrier_high/low is the source clock tick, not the divided channel counter clock.

Return:
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters:
- channel: RMT channel (0-7)
- carrier_en: Whether to enable output carrier.
- high_level: High level duration of carrier
- low_level: Low level duration of carrier.
- carrier_level: Configure the way carrier wave is modulated for channel 0-7.
  - 1'b1: transmit on low output level
  - 1'b0: transmit on high output level

```c
esp_err_t rmt_set_mem_pd(rmt_channel_t channel, bool pd_en)
```

Set RMT memory in low power mode.

Reduce power consumed by memory. 1'memory is in low power state.

Return:
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters:
- channel: RMT channel (0-7)
- pd_en: RMT memory low power enable.
**esp_err_t rmt_get_mem_pd** *(rmt_channel_t channel, bool *pd_en)*
Get RMT memory low power mode.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel (0-7)
- pd_en: Pointer to accept RMT memory low power mode.

**esp_err_t rmt_tx_start** *(rmt_channel_t channel, bool tx_idx_rst)*
Set RMT start sending data from memory.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel (0-7)
- tx_idx_rst: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

**esp_err_t rmt_tx_stop** *(rmt_channel_t channel)*
Set RMT stop sending.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel (0-7)

**esp_err_t rmt_rx_start** *(rmt_channel_t channel, bool rx_idx_rst)*
Set RMT start receiving data.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel (0-7)
- rx_idx_rst: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.

**esp_err_t rmt_rx_stop** *(rmt_channel_t channel)*
Set RMT stop receiving data.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel (0-7)

**esp_err_t rmt_memory_rw_rst** *(rmt_channel_t channel)*
Reset RMT TX/RX memory index.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel (0-7)

**esp_err_t rmt_set_memory_owner** *(rmt_channel_t channel, rmt_mem_owner_t owner)*
Set RMT memory owner.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
Chapter 2. API Reference

Parameters
- channel: RMT channel (0-7)
- owner: To set when the transmitter or receiver can process the memory of channel.

```c
esp_err_t rmt_get_memory_owner(rmt_channel_t channel, rmt_mem_owner_t *owner)
```
Get RMT memory owner.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel (0-7)
- owner: Pointer to get memory owner.

```c
esp_err_t rmt_set_tx_loop_mode(rmt_channel_t channel, bool loop_en)
```
Set RMT tx loop mode.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel (0-7)
- loop_en: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel 0-7 over and over again in a loop.

```c
esp_err_t rmt_get_tx_loop_mode(rmt_channel_t channel, bool *loop_en)
```
Get RMT tx loop mode.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel (0-7)
- loop_en: Pointer to accept RMT transmitter loop sending mode.

```c
esp_err_t rmt_set_rx_filter(rmt_channel_t channel, bool rx_filter_en, uint8_t thresh)
```
Set RMT RX filter.

In receive mode, channel 0-7 will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel (0-7)
- rx_filter_en: To enable RMT receiver filter.
- thresh: Threshold of pulse width for receiver.

```c
esp_err_t rmt_set_source_clk(rmt_channel_t channel, rmt_source_clk_t base_clk)
```
Set RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel (0-7)
- base_clk: To choose source clock for RMT module.
esp_err_t rmt_get_source_clk (rmt_channel_t channel, rmt_source_clk_t *src_clk)
Get RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel (0-7)
- src_clk: Pointer to accept source clock for RMT module.

esp_err_t rmt_set_idle_level (rmt_channel_t channel, bool idle_out_en, rmt_idle_level_t level)
Set RMT idle output level for transmitter.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel (0-7)
- idle_out_en: To enable idle level output.
- level: To set the output signal’s level for channel 0-7 in idle state.

esp_err_t rmt_get_idle_level (rmt_channel_t channel, bool *idle_out_en, rmt_idle_level_t *level)
Get RMT idle output level for transmitter.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel (0-7)
- idle_out_en: Pointer to accept value of enable idle.
- level: Pointer to accept value of output signal’s level in idle state for specified channel.

esp_err_t rmt_get_status (rmt_channel_t channel, uint32_t *status)
Get RMT status.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel (0-7)
- status: Pointer to accept channel status. Please refer to RMT_CHnSTATUS_REG(n=0-7) in rmt_reg.h for more details of each field.

void rmt_set_intr_enable_mask (uint32_t mask)
Set mask value to RMT interrupt enable register.

Parameters
- mask: Bit mask to set to the register

void rmt_clr_intr_enable_mask (uint32_t mask)
Clear mask value to RMT interrupt enable register.

Parameters
- mask: Bit mask to clear the register

esp_err_t rmt_set_rx_intr_en (rmt_channel_t channel, bool en)
Set RMT RX interrupt enable.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
### esp_err_t rmt_set_err_intr_en (rmt_channel_t channel, bool en)
Set RMT RX error interrupt enable.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel (0 - 7)
- en: enable or disable RX error interrupt.

### esp_err_t rmt_set_tx_intr_en (rmt_channel_t channel, bool en)
Set RMT TX interrupt enable.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel (0 - 7)
- en: enable or disable TX interrupt.

### esp_err_t rmt_set_tx_thr_intr_en (rmt_channel_t channel, bool en, uint16_t evt_thresh)
Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel (0 - 7)
- en: enable or disable TX event interrupt.
- evt_thresh: RMT event interrupt threshold value

### esp_err_t rmt_set_pin (rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num)
Set RMT pin.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel (0 - 7)
- mode: TX or RX mode for RMT
- gpio_num: GPIO number to transmit or receive the signal.

### esp_err_t rmt_config (const rmt_config_t *rmt_param)
Configure RMT parameters.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- rmt_param: RMT parameter struct

### esp_err_t rmt_isr_register (void (*fn) void *, void *arg, int intr_alloc_flags, rmt_isr_handle_t *handle)
Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

**Note** If you already called rmt_driver_install to use system RMT driver, please do not register ISR handler again.
Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.
- ESP_FAIL System driver installed, can not register ISR handler for RMT

Parameters
- fn: Interrupt handler function.
- arg: Parameter for the handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (OR red) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: If non-zero, a handle to later clean up the ISR gets stored here.

`esp_err_t rmt_isr_deregister (rmt_isr_handle_t handle)`
Deregister previously registered RMT interrupt handler.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Handle invalid

Parameters
- handle: Handle obtained from rmt_isr_register

`esp_err_t rmt_fill_tx_items (rmt_channel_t channel, const rmt_item32_t *item, uint16_t item_num, uint16_t mem_offset)`
Fill memory data of channel with given RMT items.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel (0 - 7)
- item: Pointer of items.
- item_num: RMT sending items number.
- mem_offset: Index offset of memory.

`esp_err_t rmt_driver_install (rmt_channel_t channel, size_t rx_buf_size, int intr_alloc_flags)`
Initialize RMT driver.

Return
- ESP_ERR_INVALID_STATE Driver is already installed, call rmt_driver_uninstall first.
- ESP_ERR_NO_MEM Memory allocation failure
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel (0 - 7)
- rx_buf_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
- intr_alloc_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp_intr_alloc.h for details. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.

`esp_err_t rmt_driver_uninstall (rmt_channel_t channel)`
Uninstall RMT driver.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel (0 - 7)

`esp_err_t rmt_get_channel_status (rmt_channel_status_result_t *channel_status)`
Get the current status of eight channels.

Note Do not call this function if it is possible that rmt_driver_uninstall will be called at the same time.

Return
Chapter 2. API Reference

- **ESP_ERR_INVALID_ARG** Parameter is NULL
- **ESP_OK** Success

**Parameters**
- `channel_status` [out]: store the current status of each channel

```c
esp_err_t rmt_write_items(rmt_channel_t channel, const rmt_item32_t *rmt_item, int item_num, bool wait_tx_done)
```
RMT send waveform from rmt_item array.

This API allows user to send waveform with any length.

**Note** This function will not copy data, instead, it will point to the original items, and send the waveform items. If `wait_tx_done` is set to true, this function will block and will not return until all items have been sent out. If `wait_tx_done` is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

**Return**
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_OK** Success

**Parameters**
- `channel`: RMT channel (0-7)
- `rmt_item`: head point of RMT items array. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.
- `item_num`: RMT data item number.
- `wait_tx_done`:
  - If set 1, it will block the task and wait for sending done.
  - If set 0, it will not wait and return immediately.

```c
esp_err_t rmt_wait_tx_done(rmt_channel_t channel, TickType_t wait_time)
```
Wait RMT TX finished.

**Return**
- **ESP_OK** RMT Tx done successfully
- **ESP_ERR_TIMEOUT** Exceeded the ‘wait_time’ given
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_FAIL** Driver not installed

**Parameters**
- `channel`: RMT channel (0-7)
- `wait_time`: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP_ERR_TIMEOUT if TX is busy (polling).

```c
esp_err_t rmt_get_ringbuf_handle(rmt_channel_t channel, RingbufHandle_t *buf_handle)
```
Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

**Return**
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_OK** Success

**Parameters**
- `channel`: RMT channel (0-7)
- `buf_handle`: Pointer to buffer handle to accept RX ringbuffer handle.

```c
esp_err_t rmt_translator_init(rmt_channel_t channel, sample_to_rmt_t fn)
```
Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, that user callback will be replaced by the later.

**Return**
- **ESP_FAIL** Init fail.
- **ESP_OK** Init success.

**Parameters**
- `channel`: RMT channel (0-7).
- `fn`: Point to the data conversion function.
`esp_err_t rmt_write_sample(rmt_channel_t channel, const uint8_t *src, size_t src_size, bool wait_tx_done)`

Translate uint8_t type of data into RMT format and send it out. Requires rmt_translator_init to init the translator first.

**Return**
- ESP_FAIL - Send fail
- ESP_OK - Send success

**Parameters**
- `channel`: RMT channel (0 - 7).
- `src`: Pointer to the raw data.
- `src_size`: The size of the raw data.
- `wait_tx_done`: Set true to wait all data send done.

`rmt_tx_end_callback_t rmt_register_tx_end_callback(rmt_tx_end_fn_t function, void *arg)`

Registers a callback that will be called when transmission ends.

Called by rmt_driver_isr_default in interrupt context.

**Note** Requires rmt_driver_install to install the default ISR handler.

**Return** the previous callback settings (members will be set to NULL if there was none)

**Parameters**
- `function`: Function to be called from the default interrupt handler or NULL.
- `arg`: Argument which will be provided to the callback when it is called.

**Structures**

`struct rmt_channel_status_result_t`

Data struct of RMT channel status.

**Public Members**

- `rmt_channel_status_t status[RMT_CHANNEL_MAX]`
  
  Store the current status of each channel

`struct rmt_tx_config_t`

Data struct of RMT TX configure parameters.

**Public Members**

- `bool loop_en`
  
  Enable sending RMT items in a loop

- `uint32_t carrier_freq_hz`
  
  RMT carrier frequency

- `uint8_t carrier_duty_percent`
  
  RMT carrier duty (%)

- `rmt_carrier_level_t carrier_level`
  
  Level of the RMT output, when the carrier is applied

- `bool carrier_en`
  
  RMT carrier enable

- `rmt_idle_level_t idle_level`
  
  RMT idle level

- `bool idle_output_en`
  
  RMT idle level output enable

`struct rmt_rx_config_t`

Data struct of RMT RX configure parameters.
Public Members

bool filter_en
   RMT receiver filter enable

uint8_t filter_ticks_thresh
   RMT filter tick number

uint16_t idle_threshold
   RMT RX idle threshold

struct rmt_config_t
   Data struct of RMT configure parameters.

Public Members

rmt_mode_t rmt_mode
   RMT mode: transmitter or receiver

rmt_channel_t channel
   RMT channel

uint8_t clk_div
   RMT channel counter divider

gpio_num_t gpio_num
   RMT GPIO number

uint8_t mem_block_num
   RMT memory block number

rmt_tx_config_t tx_config
   RMT TX parameter

rmt_rx_config_t rx_config
   RMT RX parameter

struct rmt_tx_end_callback_t
   Structure encapsulating a RMT TX end callback.

Public Members

rmt_tx_end_fn_t function
   Function which is called on RMT TX end

void *arg
   Optional argument passed to function

Macros

RMT_MEM_BLOCK_BYTE_NUM
RMT_MEM_ITEM_NUM

Type Definitions

typedef intr_handler_t rmt_isr_handle_t

typedef void (^rmt_tx_end_fn_t)(rmt_channel_t channel, void *arg)

typedef void (^sample_to_rmt_t)(const void *src, rmt_item32_t *dest, size_t src_size, size_t wanted_num, size_t *translated_size, size_t *item_num)

User callback function to convert uint8_t type data to rmt format(rmt_item32_t).

This function may be called from an ISR, so, the code should be short and efficient.
Note In fact, item_num should be a multiple of translated_size, e.g. : When we convert each byte of uint8_t type data to rmt format data, the relation between item_num and translated_size should be item_num = translated_size*8.

Parameters
- **src**: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
- **[out] dest**: Pointer to the buffer storing the rmt format data.
- **src_size**: The raw data size.
- **wanted_num**: The number of rmt format data that wanted to get.
- **[out] translated_size**: The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
- **[out] item_num**: The number of the rmt format data that actually converted to, it can be less than wanted_num if there is not enough raw data, but cannot exceed wanted_num. it should return 0 if no data was converted.

Enumerations

```c
enum rmt_channel_t
```

* Values:
  - `RMT_CHANNEL_0 = 0` RMT Channel 0
  - `RMT_CHANNEL_1`
  - `RMT_CHANNEL_2`
  - `RMT_CHANNEL_3`
  - `RMT_CHANNEL_4`
  - `RMT_CHANNEL_5`
  - `RMT_CHANNEL_6`
  - `RMT_CHANNEL_7`
  - `RMT_CHANNEL_MAX`

```c
enum rmt_mem_owner_t
```

* Values:
  - `RMT_MEM_OWNER_TX = 0` RMT RX mode, RMT transmitter owns the memory block
  - `RMT_MEM_OWNER_RX = 1` RMT RX mode, RMT receiver owns the memory block
  - `RMT_MEM_OWNER_MAX`

```c
enum rmt_source_clk_t
```

* Values:
  - `RMT_BASECLK_REF = 0` RMT source clock system reference tick, 1MHz by default (not supported in this version)
  - `RMT_BASECLK_APB`
  - `RMT_BASECLK_MAX`
enum rmt_data_mode_t
Values:
RMT_DATA_MODE_FIFO = 0
RMT_DATA_MODE_MEM = 1
RMT_DATA_MODE_MAX

enum rmt_mode_t
Values:
RMT_MODE_TX = 0
RMT TX mode
RMT_MODE_RX
RMT RX mode
RMT_MODE_MAX

enum rmt_idle_level_t
Values:
RMT_IDLE_LEVEL_LOW = 0
RMT TX idle level: low Level
RMT_IDLE_LEVEL_HIGH
RMT TX idle level: high Level
RMT_IDLE_LEVEL_MAX

enum rmt_carrier_level_t
Values:
RMT_CARRIER_LEVEL_LOW = 0
RMT carrier wave is modulated for low Level output
RMT_CARRIER_LEVEL_HIGH
RMT carrier wave is modulated for high Level output
RMT_CARRIER_LEVEL_MAX

enum rmt_channel_status_t
Values:
RMT_CHANNEL_UNINIT = 0
RMT channel uninitialized
RMT_CHANNEL_IDLE = 1
RMT channel status idle
RMT_CHANNEL_BUSY = 2
RMT channel status busy

2.3.11 SDMMC Host Driver

Overview

ESP32’s SDMMC host peripheral has two slots:

• Slot 0 (SDMMC_HOST_SLOT_0) is an 8-bit slot. It uses HS1_* signals in the PIN MUX.
• Slot 1 (SDMMC_HOST_SLOT_1) is a 4-bit slot. It uses HS2_* signals in the PIN MUX.

Pin mappings of these slots are given in the table below.
The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the \texttt{gpio_cd} and \texttt{gpio_wp} members of the \texttt{sdmmc_slot_config_t} structure before calling \texttt{sdmmc_host_init_slot()}. Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**Warning:** Pins used by Slot 0 (\texttt{HS1_*}) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

### Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- **Default Speed (20 MHz), 4-line/1-line (with SD cards), and 8-line (with 3.3 V eMMC)**
- **High Speed (40 MHz), 4-line/1-line (with SD cards), and 8-line (with 3.3 V eMMC)**
- **High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)**

Speed modes not supported at present:

- **High Speed DDR mode, 8-line eMMC**
- **UHS-I 1.8 V modes, 4-line SD cards**

### Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- \texttt{sdmmc_host_init()}
- \texttt{sdmmc_host_init_slot()}
- \texttt{sdmmc_host_deinit()}

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the \texttt{sdmmc_host_t} structure:

- \texttt{sdmmc_host_set_bus_width()}
- \texttt{sdmmc_host_set_card_clk()}
- \texttt{sdmmc_host_do_transaction()}

### Configuring Bus Width and Frequency

With the default initializers for \texttt{sdmmc_host_t} and \texttt{sdmmc_slot_config_t} (\texttt{SDMMC_HOST_DEFAULT} and \texttt{SDMMC_SLOT_CONFIG_DEFAULT}), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.
In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```c
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

**See also**

See [SD/SDIO/MMC Driver](#) for the higher level driver which implements the protocol layer.

See [SD SPI Host Driver](#) for a similar driver which uses the SPI controller and is limited to SD protocol’s SPI mode.

See [SD Pullup Requirements](#) for pullup support and compatibilities of modules and development kits.

**API Reference**

**Header File**

- `driver/include/driver/sdmmc_host.h`

**Functions**

**esp_err_t sdmmc_host_init()**

Initialize SDMMC host peripheral.

- **Note** This function is not thread safe
- **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if `sdmmc_host_init` was already called
  - ESP_ERR_NO_MEM if memory cannot be allocated

**esp_err_t sdmmc_host_init_slot (int slot, const sdmmc_slot_config_t *slot_config)**

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

- **Note** This function is not thread safe
- **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if host has not been initialized using `sdmmc_host_init`

**Parameters**

- `slot`: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- `slot_config`: additional configuration for the slot

**esp_err_t sdmmc_host_set_bus_width (int slot, size_t width)**

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

- **Note** This function is not thread safe
- **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if slot number or width is not valid
### Parameters

- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **width**: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

### size_t sdmmc_host_get_slot_width(int slot)
Get bus width configured in sdmmc_host_init_slot to be used for data transfer.

**Return** configured bus width of the specified slot.

**Parameters**
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

### esp_err_t sdmmc_host_set_card_clk(int slot, uint32_t freq_khz)
Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- other error codes may be returned in the future

**Parameters**
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **freq_khz**: card clock frequency, in kHz

### esp_err_t sdmmc_host_set_bus_ddr_mode(int slot, bool ddr_enabled)
Enable or disable DDR mode of SD interface.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

**Parameters**
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **ddr_enabled**: enable or disable DDR mode

### esp_err_t sdmmc_host_do_transaction(int slot, sdmmc_command_t *cmdinfo)
Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.

**Attention** Data buffer passed in cmdinfo->data must be in DMA capable memory

**Return**
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
- ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
- ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

**Parameters**
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **cmdinfo**: pointer to structure describing command and data to transfer

### esp_err_t sdmmc_host_io_int_enable(int slot)
Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**Return** returns ESP_OK, other errors possible in the future

**Parameters**
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
**esp_err_t sdmmc_host_io_int_wait**(int slot, TickType_t timeout_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

**Return**
- ESP_OK on success (interrupt received)
- ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks

**Parameters**
- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- timeout_ticks: number of RTOS ticks to wait for the interrupt

**esp_err_t sdmmc_host_deinit()**

Disable SDMMC host and release allocated resources.

**Note**
This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

**esp_err_t sdmmc_host_pullup_en**(int slot, int width)

Enable the pull-ups of sd pins.

**Note**
You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

**Return**
- ESP_OK: if success
- ESP_ERR_INVALID_ARG: if configured width larger than maximum the slot can support

**Parameters**
- slot: Slot to use, normally set it to 1.
- width: Bit width of your configuration, 1 or 4.

**Structures**

**struct sdmmc_slot_config_t**

Extra configuration for SDMMC peripheral slot

**Public Members**

**gio_num_t gpio_cd**

GPIO number of card detect signal.

**gio_num_t gpio_wp**

GPIO number of write protect signal.

**uint8_t width**

Bus width used by the slot (might be less than the max width supported)

**uint32_t flags**

Features used by this slot.

**Macros**

**SDMMC_HOST_SLOT_0**

SDMMC slot 0.

**SDMMC_HOST_SLOT_1**

SDMMC slot 1.

**SDMMC_HOST_DEFAULT()**

Default sdmmc_host_t structure initializer for SDMMC peripheral.

Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz
SDMMC_SLOT_FLAG_INTERNAL_PULLUP
Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

SDMMC_SLOT_NO_CD
indicates that card detect line is not used

SDMMC_SLOT_NO_WP
indicates that write protect line is not used

SDMMC_SLOT_WIDTH_DEFAULT
use the default width for the slot (8 for slot 0, 4 for slot 1)

SDMMC SLOT_CONFIG_DEFAULT()
Macro defining default configuration of SDMMC host slot

2.3.12 SD SPI Host Driver

Overview

SPI controllers accessible via spi_master driver (HSPI, VSPI) can be used to work with SD cards. The driver which provides this capability is called “SD SPI Host”, due to its similarity with the SDMMC Host driver.

In SPI mode, SD driver has lower throughput than in 1-line SD mode. However SPI mode makes pin selection more flexible, as SPI peripheral can be connected to any ESP32 pins using GPIO Matrix. SD SPI driver uses software controlled CS signal. Currently SD SPI driver assumes that it can use the SPI controller exclusively, so applications which need to share SPI bus between SD cards and other peripherals need to make sure that SD card and other devices are not used at the same time from different tasks.

SD SPI driver is represented using an sdmmc_host_t structure initialized using SDSPI_HOST_DEFAULT macro. For slot initialization, SDSPI_SLOT_CONFIG_DEFAULT can be used to fill in default pin mapping, which is the same as the pin mapping in SD mode.

SD SPI driver APIs are very similar to SDMMC host APIs. As with the SDMMC host driver, only sd-spi_host_init(), sdspi_host_init_slot(), and sdspi_host_deinit() functions are normally used by the applications. Other functions are called by the protocol level driver via function pointers in sd-mmc_host_t structure.

See SD/SDIO/MMC Driver for the higher level driver which implements the protocol layer.

API Reference

Header File

- driver/include/driver/sdspi_host.h

Functions

esp_err_t sdspi_host_init()
Initialize SD SPI driver.

Note This function is not thread safe

Return
- ESP_OK on success
- other error codes may be returned in future versions

esp_err_t sdspi_host_init_slot (int slot, const sdspi_slot_config_t *slot_config)
Initialize SD SPI driver for the specific SPI controller.

Note This function is not thread safe
Note The SDIO over sdspi needs an extra interrupt line. Call gpio_install_isr_service() before this function.

Return
API Reference

- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_init_slot has invalid arguments
- ESP_ERR_NO_MEM if memory cannot be allocated
- other errors from the underlying spi_master and gpio drivers

Parameters
- slot: SPI controller to use (HSPI_HOST or VSPI_HOST)
- slot_config: pointer to slot configuration structure

`esp_err_t sdspi_host_do_transaction(int slot, sdmmc_command_t *cmdinfo)`

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_* functions are not called.

Return
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

Parameters
- slot: SPI controller (HSPI_HOST or VSPI_HOST)
- cmdinfo: pointer to structure describing command and data to transfer

`esp_err_t sdspi_host_set_card_clk(int slot, uint32_t freq_khz)`

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note** This function is not thread safe

Return
- ESP_OK on success
- other error codes may be returned in the future

Parameters
- slot: SPI controller (HSPI_HOST or VSPI_HOST)
- freq_khz: card clock frequency, in kHz

`esp_err_t sdspi_host_deinit()`

Release resources allocated using sdspi_host_init.

**Note** This function is not thread safe

Return
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

`esp_err_t sdspi_host_io_int_enable(int slot)`

Enable SDIO interrupt.

Return
- ESP_OK on success

Parameters
- slot: SPI controller to use (HSPI_HOST or VSPI_HOST)

`esp_err_t sdspi_host_io_int_wait(int slot, TickType_t timeout_ticks)`

Wait for SDIO interrupt until timeout.

Return
- ESP_OK on success

Parameters
- slot: SPI controller to use (HSPI_HOST or VSPI_HOST)
- timeout_ticks: Ticks to wait before timeout.
Chapter 2. API Reference

Structures

struct sdspi_slot_config_t
    Extra configuration for SPI host

Public Members

  gpio_num_t gpio_miso
    GPIO number of MISO signal.
  gpio_num_t gpio_mosi
    GPIO number of MOSI signal.
  gpio_num_t gpio_sck
    GPIO number of SCK signal.
  gpio_num_t gpio_cs
    GPIO number of CS signal.
  gpio_num_t gpio_cd
    GPIO number of card detect signal.
  gpio_num_t gpio_wp
    GPIO number of write protect signal.
  gpio_num_t gpio_int
    GPIO number of interrupt line (input) for SDIO card.

  int dma_channel
    DMA channel to be used by SPI driver (1 or 2)

Macros

SDSPI_HOST_DEFAULT()
    Default sdmmc_host_t structure initializer for SD over SPI driver.
    Uses SPI mode and max frequency set to 20MHz
    ‘slot’ can be set to one of HSPI_HOST, VSPI_HOST.
SDSPI_SLOT_NO_CD
    indicates that card detect line is not used
SDSPI_SLOT_NO_WP
    indicates that write protect line is not used
SDSPI_SLOT_NO_INT
    indicates that interrupt line is not used
SDSPI_SLOT_CONFIG_DEFAULT()
    Macro defining default configuration of SPI host

2.3.13 SDIO Card Slave Driver

Overview

The ESP32 SDIO Card peripherals (Host, Slave) shares two sets of pins as below table. The first set is usually occupied by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only runs on the second set of pins while SDIO host is not using it.
The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit or SPI mode. Then the host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, while initialize the slave into SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.

**Note:** CMD and DATA lines D0-D3 of the card should be pulled up by 50KOhm resistor even in 1-bit mode or SPI mode. Most official devkits don’t meet the pullup requirements by default, and there are conflicts on strapping pins as well. Please refer to **SD Pullup Requirements** to see how to setup your system correctly.

**SD Pullup Requirements**  CMD and DATA lines D0-D3 of the slave should be pulled up by 50KOhm resistor even in 1-bit mode or SPI mode. The pullups of the slave cards should be connected even if they’re not connected to the host.

The MTDI strapping pin is incompatible with DAT2 line pull-up by default when the code flash is 3.3V. See **MTDI strapping pin** below.

**Pullup inside Official Modules**  For Espressif official modules, different weak pullups / pulldowns are connected to CMD, and DATA pins as below. To use these modules, these pins are required to be pulled up by 50KOhm resistors, since internal weak pullups are insufficient.

<table>
<thead>
<tr>
<th>GPIO</th>
<th>15</th>
<th>2</th>
<th>4</th>
<th>12</th>
<th>13</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>CMD</td>
<td>DAT0</td>
<td>DAT1</td>
<td>DAT2</td>
<td>DAT3</td>
</tr>
<tr>
<td>At startup</td>
<td>WPU</td>
<td>WPD</td>
<td>WPD</td>
<td>PU for 1.8v flash; WPD for 3.3v flash</td>
<td>WPU</td>
</tr>
<tr>
<td>Strapping requirement</td>
<td>Low to download to flash</td>
<td>High for 1.8v flash; Low for 3.3v flash</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

- WPU: Weak pullup
- WPD: Weak pulldown
- PU: Pullup inside the module

For Wrover modules, they use 1.8v flash, and have pullup on GPIO12 inside. For Wroom-32 Series, PICO-D4 modules, they use 3.3v flash, and is weakly pulldown internally. See **MTDI strapping pin** below.

### Pullup on Official Devkit (WroverKit)

For official Wrover Kit (till version 3), some of the pullups are provided on the board as the table below. For other devkits that don’t have pullups, please connect them yourselves.

<table>
<thead>
<tr>
<th>GPIO</th>
<th>15</th>
<th>2</th>
<th>4</th>
<th>12</th>
<th>13</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>CMD</td>
<td>DAT0</td>
<td>DAT1</td>
<td>DAT2</td>
<td>DAT3</td>
</tr>
<tr>
<td>Pullup on the Kit</td>
<td>PU</td>
<td>PU</td>
<td>PU</td>
<td>PU &amp; PD</td>
<td></td>
</tr>
</tbody>
</table>

- PU: Pullup
- PD: Pulldown

The DAT3 pullup conflicts with JTAG pulldown in WroverKit v3 and earlier, please either:
1. pull it up by resistor less than 5KOhm (2kOhm suggested) in 4-bit mode.
2. pull it up or drive it high by host or VDD3.3V in 1-bit mode.

**MTDI strapping pin**  
MTDI (GPIO12) is used as a bootstrapping pin to select output voltage of an internal regulator which powers the flash chip (VDD_SDIO). This pin has an internal pulldown so if left unconnected it will read low at reset (selecting default 3.3V operation). When adding a pullup to this pin for SD card operation, consider the following:

- For boards which don’t use the internal regulator (VDD_SDIO) to power the flash, GPIO12 can be pulled high.
- For boards which use 1.8V flash chip, GPIO12 needs to be pulled high at reset. This is fully compatible with SD card operation.
- On boards which use the internal regulator and a 3.3V flash chip, GPIO12 must be low at reset. This is incompatible with SD card operation. Please check the table below to see whether your modules/kits use 3.3v flash.

<table>
<thead>
<tr>
<th>Module</th>
<th>Flash voltage</th>
<th>DAT2 connections</th>
</tr>
</thead>
<tbody>
<tr>
<td>PICO-D4</td>
<td>3.3V</td>
<td>Internal PD, change EFUSE and pullup or disable DAT2 line*</td>
</tr>
<tr>
<td>Wroom-32 Series</td>
<td>1.8V</td>
<td>Internal PU, pullup suggested</td>
</tr>
</tbody>
</table>

Official devkits of different types and version mount different types of modules, please refer to the table below to see whether your devkit can support SDIO slave without steps above.

<table>
<thead>
<tr>
<th>Devkit</th>
<th>Module</th>
<th>Flash voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>PICO Kit</td>
<td>PICO-D4</td>
<td>3.3V (see steps below)</td>

<td></td>
</tr>
<tr>
<td>Wrover Kit v2 and earlier</td>
<td>Wrover</td>
<td>1.8V</td>
</tr>
<tr>
<td>Wrover Kit v3</td>
<td>Wrover</td>
<td></td>
</tr>
</tbody>
</table>

If your board requires internal regulator with 3.3v output, to make it compatible with SD pullup, you can either:

- **In the case using ESP32 host only**, external pullup can be omitted and an internal pullup can be enabled using a `gpio_pullup_en(GPIO_NUM_12);` call. Most SD cards work fine when an internal pullup on GPIO12 line is enabled. Note that if ESP32 experiences a power-on reset while the SD card is sending data, high level on GPIO12 can be latched into the bootstrapping register, and ESP32 will enter a boot loop until external reset with correct GPIO12 level is applied.

- **In the case using ESP32 slave in 1-bit mode**, specify `SDIO_SLAVE_FLAG_DAT2_DISABLED` in the slave to avoid slave detecting on DAT2 line. Note the host will not know 4-bit mode is not supported any more by the standard CCCR register. You have to tell the host use 1-bit only.

- **For ESP32 host or slave**, another option is to burn the flash voltage selection efuses. This will permanently select 3.3V output voltage for the internal regulator, and GPIO12 will not be used as a bootstrapping pin. Then it is safe to connect a pullup resistor to GPIO12. This option is suggested for production use. NOTE this cannot be reverted once the EFUSE is burnt.

  The following command can be used to program flash voltage selection efuses to 3.3V:

  ```
  components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
  ```

  This command will burn the `XPD_SDIO_TIEH`, `XPD_SDIO_FORCE`, and `XPD_SDIO_REG` efuses. With all three burned to value 1, the internal VDD_SDIO flash voltage regulator is permanently enabled at 3.3V. See the technical reference manual for more details.

  `espefuse.py` has a `--do-not-confirm` option if running from an automated flashing script.

**GPIO2 Strapping pin**  
GPIO2 pin is used as a bootstrapping pin, and should be low to enter UART download mode. You may find it unable to enter the UART download mode if you correctly connect the pullup of SD on GPIO2. For WroverKit v3, there are dedicated circuits to pulldown the GPIO2 when downloading. For other boards, one way to do this is to connect GPIO0 and GPIO2 using a jumper, and then the auto-reset circuit on most development boards will pull GPIO2 low along with GPIO0, when entering download mode.
Some boards have pull-down and/or LED on GPIO2. LED is usually ok, but pulldown will interfere with D0 signals and must be removed. Check the schematic of your development board for anything connected to GPIO2.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

**Terminology**  The SDIO slave driver uses the following terms:

- **Transfer**: A transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- **Sending**: slave to host transfers.
- **Receiving**: host to slave transfers.

**Note**: Register names in ESP Technical Reference Manual are oriented from the point of view of the host, i.e. ‘rx’ registers refer to sending, while ‘tx’ registers refer to receiving. We’re not using tx or rx in the driver to avoid ambiguities.

- **FIFO**: specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The address is related to the length requested to read from/write to the slave in a single transfer: \[ \text{requested length} = 0x1F800 - \text{address} \].
- **Ownership**: When the driver takes ownership of a buffer, it means the driver can randomly read/write the buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- **Requested length**: The length requested in one transfer determined by the FIFO address.
- **Transfer length**: The length requested in one transfer determined by the CMD53 byte/block count field.

**Note**: Requested length is different from the transfer length. ESP32 slave DMA base on the **requested length** rather than the **transfer length**. The **transfer length** should be no shorter than the **requested length**, and the rest part will be filled with 0 (sending) or discard (receiving).

- **Receiving buffer size**: The buffer size is pre-defined between the host and the slave before communication starts. Slave application has to set the buffer size during initialization by the recv_buffer_size member of sdio_slave_config_t.
- **Interrupts**: the esp32 slave support interrupts in two directions: from host to slave (called slave interrupts below) and from slave to host (called host interrupts below). See more in **Interrupts**.
- **Registers**: specific address in Function 1 access by CMD52 or CMD53.

**Communication with ESP SDIO Slave**  The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of SDIO Simplified Specification), which is described briefly in **ESP SDIO slave initialization**.

However, there’s an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func 1. Please refer to **ESP SDIO slave protocol**, or example peripherals/sdio when programming your host.

**Communication with ESP SDIO Slave**

**ESP SDIO slave initialization**  The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of SDIO Simplified Specification). In this specification and below, the SDIO slave
Chapter 2. API Reference

is also called an (SD)IO card. All the initialization CMD52 and CMD53 are sent to Func 0 (CIA region). Here is an brief example on how to do this:

1. **SDIO reset** CMD52 (Write 0x6=0x8)
2. **SD reset** CMD0
3. **Check whether IO card (optional)** CMD8
4. **Send SDIO op cond and wait for card ready** CMD5 arg = 0x00000000
   CMD5 arg = 0x00ff8000 (according to the response above, poll until ready)
   **Example:** Arg of R4 after first CMD5 (arg=0x00000000) is 0xXXFFFF00.
   Keep sending CMD5 with arg=0x00FF0000 until the R4 shows card ready (arg bit 31=1).
5. **Set address** CMD3
6. **Select card** CMD7 (arg address according to CMD3 response)
   **Example:** Arg of R6 after CMD3 is 0x0001xxxx.
   Arg of CMD7 should be 0x00010000.
7. **Select 4-bit mode (optional)** CMD52 (Write 0x07=0x02)
8. **Enable func1** CMD52 (Write 0x02=0x02)
9. **Enable SDIO interrupt (required if interrupt line (DAT1) is used)** CMD52 (Write 0x04=0x03)
10. **Set Func0 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x10~0x11)
    CMD52/53 (Write 0x10=0x00)
    CMD52/53 (Write 0x11=0x02)
    CMD52/53 (Read 0x10~0x11, read to check the final value)
11. **Set Func1 blocksize (optional, default value is 512 (0x200))** CMD52/53 (Read 0x110~0x111)
    CMD52/53 (Write 0x110=0x00)
    CMD52/53 (Write 0x111=0x02)
    CMD52/53 (Read 0x110~0x111, read to check the final value)

**ESP SDIO slave protocol** The protocol is based on Function 1 access by CMD52 and CMD53, offering 3 services: (1) sending and receiving FIFO, (2) 52 8-bit R/W register shared by host and slave, (3) 8 general purpose interrupt sources from host to slave and 8 in the opposite direction.

The host should access the registers below as described to communicate with slave.

**Slave register table**

**32-bit**
- 0x044 (TOKEN_RDATA): in which bit 27-16 holds the receiving buffer number.
- 0x058 (INT_ST): holds the interrupt source bits from slave to host.
- 0x060 (PKT_LEN): holds the accumulated length (by byte) to be sent from slave to host.
- 0x0D4 (INT_CLR): write 1 to clear interrupt bits corresponding to INT_ST.
- 0x0DC (INT_ENA): mask bits for interrupts from slave to host.

**8-bit** Shared general purpose registers:
- 0x06C-0x077: R/W registers 0-11 shared by slave and host.
- 0x07A-0x07B: R/W registers 14-15 shared by slave and host.
- 0x07E-0x07F: R/W registers 18-19 shared by slave and host.
- 0x088-0x08B: R/W registers 24-27 shared by slave and host.
- 0x09C-0x0BB: R/W registers 32-63 shared by slave and host.

Interrupt Registers: - 0x08D (SLAVE_INT): bits for host to interrupt slave. auto clear.

**FIFO (sending and receiving)** 0x090 - 0x1F7FF are reserved for FIFOs.

The address of CMD53 is related to the length requested to read from/write to the slave in a single transfer:

requested length = 0x1F800-address
The slave will respond with the length according to the length field in CMD53, with the data longer than requested length filled with 0 (sending) or discard (receiving).

**Note:** This includes both the block and the byte mode of CMD53.

The function number should be set to 1, OP Code should be set to 1 (for CMD53).

It is allowed to use CMD53 mode combination of block+byte to get higher efficiency when accessing the FIFO by arbitrary length. E.g. The block size is set to 512 by default, you can write/get 1031 bytes of data to/from the FIFO by:

1. Send CMD53 in block mode, block count=2 (1024 bytes) to address 0x1F3F9=0x1F800-1031.
2. Then send CMD53 in byte mode, byte count=8 (or 7 if your controller supports that) to address 0x1F7F9=0x1F800-7.

**Interrupts** For the host interrupts, the slave raise the interrupt by pulling DAT1 line down at a proper time (level sensitive). The host detect this and read the INT_ST register to see the source. Then the host can clear it by writing the INT_CLR register and do something with the interrupt. The host can also mask unneeded sources by clearing the bits in INT_ENA register corresponding to the sources. If all the sources are cleared (or masked), the DAT1 line goes inactive.

`sdio_slave_hostint_t` *(SDIO Card Slave Driver)* shows the bit definition corresponding to host interrupt sources.

For the slave interrupts, the host send transfers to write the SLAVE_INT register. Once a bit is written from 0 to 1, the slave hardware and driver will detect it and inform the app.

**Receiving FIFO** To write the receiving FIFO in the slave, host should work in the following steps:

1. Read the TOKEN1 field (bits 27-16) of TOKEN_RDATA (0x044) register. The buffer number remaining is TOKEN1 minus the number of buffers used by host.
2. Make sure the buffer number is sufficient (*buffer_size* * buffer_num is greater than data to write, *buffer_size* is pre-defined between the host and the slave before the communication starts). Or go back to step 1 until the buffer is enough.
3. Write to the FIFO address with CMD53. Note that the requested length should not be larger than calculated in step 2, and the FIFO address is related to requested length.
4. Calculate used buffers, note that non-full buffer at the tail should be seen as one that is used.

**Sending FIFO** To read the sending FIFO in the slave, host should work in the following steps:

1. Wait for the interrupt line to be active (optional, low by default).
2. Read (poll) the interrupt bits in INT_ST register to see whether new packets exists.
3. If new packets are ready, reads the PKT_LEN reg. The data length to read from slave is PKT_LEN minus the length that has been read from the host. If the PKT_LEN is not larger than used, wait and poll until the slave is ready and update the PKT_LEN.
4. Read from the FIFO with CMD53. Note that the requested length should not be larger than calculated in step 3, and the FIFO address is related to requested length.
5. Recored read length.

**Interrupts** There are interrupts from host to slave, and from slave to host to help communicating conveniently.

**Slave Interrupts** The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the `slave_intr_cb` member in the `sdio_slave_config_t` structure.
**Note:** The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

There’s another set of functions can be used. You can call `sdio_slave_wait_int` to wait for an interrupt within a certain time, or call `sdio_slave_clear_int` to clear interrupts from host. The callback function can work with the wait functions perfectly.

**Host Interrupts** The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see `sdio_slave_hostint_t` for more information.

**Shared Registers** There are 52 8-bit R/W shared registers to share information between host and slave. The slave can write or read the registers at any time by `sdio_slave_read_reg` and `sdio_slave_write_reg`. The host can access (R/W) the register by CMD52 or CMD53.

**Receiving FIFO** When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling `sdio_slave_recv_register_buf`, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware.
2. Load buffers onto the driver by passing the buffer handle to `sdio_slave_recv_load_buf`.
3. Call `sdio_slave_recv` to get the received data. If non-blocking call is needed, set `wait=0`.
4. Pass the handle of processed buffer back to the driver by `sdio_recv_load_buf` again.

**Note:** To avoid overhead from copying data, the driver itself doesn’t have any buffer inside, the application is responsible to offer new buffers in time. The DMA will automatically store received data to the buffer.

**Sending FIFO** Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- **Stream Mode:** when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.
- **Packet Mode:** the packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.

**Note:** To avoid overhead from copying data, the driver itself doesn’t have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished.

The sending mode can be set in the `sending_mode` member of `sdio_slave_config_t`, and the buffer numbers can be set in the `send_queue_size`. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call `sdio_slave_transmit` to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:
1. Pass buffer information (address, length, as well as an arg indicating the buffer) to `sdio_slave_send_queue`. If non-blocking call is needed, set `wait=0`. If the `wait` is not `portMAX_DELAY` (wait until success), application has to check the result to know whether the data is put in to the queue or discard.

2. Call `sdio_slave_send_get_finished` to get and deal with a finished transfer. A buffer should be keep unmodified until returned from `sdio_slave_send_get_finished`. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the arg in the queue parameter:

1. Directly point `arg` to a dynamic-allocated buffer, and use the `arg` to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point `arg` to the structure. You can use the structure to do more things like:

```c
typedef struct {
    uint8_t *buffer;
    size_t size;
    int id;
} sdio_transfer_t;

// and send as:
sdio_transfer_t trans = {
    .buffer = ADDRESS_TO_SEND,
    .size = 8,
    .id = 3, //the 3rd transfer so far
};
sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);

//... maybe more transfers are sent here

// and deal with finished transfer as:
sdio_transfer_t *arg = NULL;
sdio_slave_send_get_finished((void**)arg, portMAX_DELAY);
ESP_LOGI("tag", "\$(d) successfully send \$d bytes of \$p", arg->id, arg->size, ...
    arg->buffer);
some_post_callback(arg); //do more things
```

3. Working with the receiving part of this driver, point `arg` to the receive buffer handle of this buffer. So that we can directly use the buffer to receive data when it’s sent:

```c
uint8_t buffer[256]={1,2,3,4,5,6,7,8};
sdio_slave_bufHandle_t handle = sdio_slave_recv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

//... maybe more transfers are sent here

// and load finished buffer to receive as
sdio_slave_bufHandle_t handle = NULL;
sdio_slave_send_get_finished((void**)handle, portMAX_DELAY);
sdio_slave_recv_load_buf(handle);
```

More about this, see `peripherals/sdio`.

**Application Example**

Slave/master communication: `peripherals/sdio`.

**API Reference**

**Header File**

- `driver/include/driver/sdio_slave.h`
### Functions

**esp_err_t sdio_slave_initialize** *(sdio_slave_config_t *config)*

Initialize the sdio slave driver

**Return**

- ESP_ERR_NOT_FOUND if no free interrupt found.
- ESP_ERR_INVALID_STATE if already initialized.
- ESP_ERR_NO_MEM if fail due to memory allocation failed.
- ESP_OK if success

**Parameters**

- **config**: Configuration of the sdio slave driver.

**void sdio_slave_deinit** *

De-initialize the sdio slave driver to release the resources.

**esp_err_t sdio_slave_start** *

Start hardware for sending and receiving, as well as set the IOREADY1 to 1.

**Note** The driver will continue sending from previous data and PKT_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See **sdio_slave_reset**.

**Return**

- ESP_ERR_INVALID_STATE if already started.
- ESP_OK otherwise.

**void sdio_slave_stop** *

Stop hardware from sending and receiving, also set IOREADY1 to 0.

**Note** this will not clear the data already in the driver, and also not reset the PKT_LEN and TOKEN1 counting. Call **sdio_slave_reset** to do that.

**esp_err_t sdio_slave_reset** *

Clear the data still in the driver, as well as reset the PKT_LEN and TOKEN1 counting.

**Return** always return ESP_OK.

**sdio_slave_buf_handle_t sdio_slave_recv_register_buf** *(uint8_t *start)*

Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

**Note** The driver will use and only use the amount of space specified in the recv_buffer_size member set in the **sdio_slave_config_t**. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

**Return** The buffer handle if success, otherwise NULL.

**Parameters**

- **start**: The start address of the buffer.

**esp_err_t sdio_slave_recv_unregister_buf** *(sdio_slave_buf_handle_t handle)*

Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

**Return** ESP_OK if success, ESP_ERR_INVALID_ARG if the handle is NULL or the buffer is being used.

**Parameters**

- **handle**: Handle to the buffer to release.

**esp_err_t sdio_slave_recv_load_buf** *(sdio_slave_buf_handle_t handle)*

Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by **sdio_slave_send_get_finished** after the transaction is finished.

**Return**

- ESP_ERR_INVALID_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returned by **sdio_slave_recv** can you load it again.
- ESP_OK if success

**Parameters**

- **handle**: Handle to the buffer ready to receive data.
```c
esp_err_t sdio_slave_recv(sdio_slave_buf_handle_t *handle_ret, uint8_t **out_addr, size_t *out_len, TickType_t wait)

Get received data if exist. The driver returns the ownership of the buffer to the app.

**Note** Call sdio_slave_load_buf with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from sdio_slave_get_buffer.

**Return**
- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_OK if success

**Parameters**
- **handle_ret**: Handle to the buffer holding received data. Use this handle in sdio_slave_recv_load_buf to receive in the same buffer again.
- **[out] out_addr**: Output of the start address, set to NULL if not needed.
- **[out] out_len**: Actual length of the data in the buffer, set to NULL if not needed.
- **wait**: Time to wait before data received.

```uint8_t *sdio_slave_recv_get_buf(sdio_slave_buf_handle_t handle, size_t *len_o)```

Retrieve the buffer corresponding to a handle.

**Return** buffer address if success, otherwise NULL.

**Parameters**
- **handle**: Handle to get the buffer.
- **len_o**: Output of buffer length

```c
esp_err_t sdio_slave_send_queue(uint8_t *addr, size_t len, void *arg, TickType_t wait)

Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by sdio_slave_send_get_finished after the transaction is finished.

**Return**
- ESP_ERR_INVALID_ARG if the length is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is still full until timeout.
- ESP_OK if success.

**Parameters**
- **addr**: Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- **len**: Length of data, should not be longer than 4092 bytes (may support longer in the future).
- **arg**: Argument to returned in sdio_slave_send_get_finished. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
- **wait**: Time to wait if the buffer is full.

```c
esp_err_t sdio_slave_send_get_finished(void **out_arg, TickType_t wait)

Return the ownership of a finished transaction.

**Return** ESP_ERR_TIMEOUT if no transaction finished, or ESP_OK if succeed.

**Parameters**
- **out_arg**: Argument of the finished transaction. Set to NULL if unused.
- **wait**: Time to wait if there’s no finished sending transaction.

```c
esp_err_t sdio_slave_transmit(uint8_t *addr, size_t len)

Start a new sending transfer, and wait for it (blocked) to be finished.

**Return**
- ESP_ERR_INVALID_ARG if the length of descriptor is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is full or host do not start a transfer before timeout.
- ESP_OK if success.

**Parameters**
- **addr**: Start address of the buffer to send
- **len**: Length of buffer to send.

```c
uint8_t sdio_slave_read_reg(int pos)

Read the spi slave register shared with host.
Chapter 2. API Reference

Note register 28 to 31 are reserved for interrupt vector.
Return value of the register.
Parameters
• pos: register address, 0-27 or 32-63.

void sdio_slave_write_reg (int pos, uint8_t reg)
Write the spi slave register shared with host.
Note register 29 and 31 are used for interrupt vector.
Return ESP_ERR_INVALID_ARG if address wrong, otherwise ESP_OK.
Parameters
• pos: register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
  • reg: the value to write.

sdio_slave_hostint_t sdio_slave_get_host_intena ()
Get the interrupt enable for host.
Return the interrupt mask.

void sdio_slave_set_host_intena (sdio_slave_hostint_t ena)
Set the interrupt enable for host.
Parameters
• ena: Enable mask for host interrupt.

esp_err_t sdio_slave_send_host_int (uint8_t pos)
Interrupt the host by general purpose interrupt.
Return
• ESP_ERR_INVALID_ARG if interrupt num error
• ESP_OK otherwise
Parameters
• pos: Interrupt num, 0-7.

void sdio_slave_clear_host_int (uint8_t mask)
Clear general purpose interrupt to host.
Parameters
• mask: Interrupt bits to clear, by bit mask.

esp_err_t sdio_slave_wait_int (int pos, TickType_t wait)
Wait for general purpose interrupt from host.
Note this clears the interrupt at the same time.
Return ESP_OK if success, ESP_ERR_TIMEOUT if timeout.
Parameters
• pos: Interrupt source number to wait for. is set.
  • wait: Time to wait before interrupt triggered.

Structures
struct sdio_slave_config_t
Configuration of SDIO slave.

Public Members

sdio_slave_timing_t timing
timing of sdio_slave. see sdio_slave_timing_t.

sdio_slave_sending_mode_t sending_mode
mode of sdio_slave. SDIO_SLAVE_MODE_STREAM if the data needs to be sent as much as possible; SDIO_SLAVE_MODE_PACKET if the data should be sent in packets.

int send_queue_size
max buffers that can be queued before sending.
size_t recv_buffer_size
If buffer_size is too small, it costs more CPU time to handle larger number of buffers. If buffer_size is
too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers
are easily run out. Should be set according to length of data really transferred. All data that do not fully
fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per
buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive
buffer given to the driver should be larger than this.

sdio_event_cb_t event_cb
when the host interrupts slave, this callback will be called with interrupt number (0-7).

uint32_t flags
Features to be enabled for the slave, combinations of SDIO_SLAVE_FLAG_*.

Macros
SDIO_SLAVE_RECV_MAX_BUFFER
SDIO_SLAVE_FLAG_DAT2_DISABLED
It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or
SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note
that the host cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at
your own risk.

SDIO_SLAVE_FLAG_HOST_INTR_DISABLED
The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this
flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt
registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we
don’t support 4-bit mode anymore, please do this at your own risk.

SDIO_SLAVE_FLAG_INTERNAL_PULLUP
Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should
be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable
communication, please do connect external pull-ups on the bus. This is only for example and debug use.

Type Definitions
typedef void (*sdio_event_cb_t)(uint8_t event)
typedef void *sdio_slave_buf_handle_t
Handle of a receive buffer, register a handle by calling sdio_slave_recv_register_buf. Use the
handle to load the buffer to the driver, or call sdio_slave_recv_unregister_buf if it is no longer
used.

Enumerations
enum sdio_slave_hostint_t
Mask of interrupts sending to the host.

Values:
SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET = HOST_SLC0_RX_NEW_PACKET_INT_ENA
New packet available.

SDIO_SLAVE_HOSTINT_RECV_OVF = HOST_SLC0_TX_OVF_INT_ENA
Slave receive buffer overflow.

SDIO_SLAVE_HOSTINT_SEND_UDF = HOST_SLC0_RX_UDF_INT_ENA
Slave sending buffer underflow (this case only happen when the host do not request for packet according
to the packet len).

SDIO_SLAVE_HOSTINT_BIT7 = HOST_SLC0_TOHOST_BIT7_INT_ENA
General purpose interrupt bits that can be used by the user.

SDIO_SLAVE_HOSTINT_BIT6 = HOST_SLC0_TOHOST_BIT6_INT_ENA
Chapter 2. API Reference

\[
\begin{align*}
  &\text{SDIO_SLAVE_HOSTINT_BIT5} = \text{HOST_SLC0_TOHOST_BIT5_INT_ENA} \\
  &\text{SDIO_SLAVE_HOSTINT_BIT4} = \text{HOST_SLC0_TOHOST_BIT4_INT_ENA} \\
  &\text{SDIO_SLAVE_HOSTINT_BIT3} = \text{HOST_SLC0_TOHOST_BIT3_INT_ENA} \\
  &\text{SDIO_SLAVE_HOSTINT_BIT2} = \text{HOST_SLC0_TOHOST_BIT2_INT_ENA} \\
  &\text{SDIO_SLAVE_HOSTINT_BIT1} = \text{HOST_SLC0_TOHOST_BIT1_INT_ENA} \\
  &\text{SDIO_SLAVE_HOSTINT_BIT0} = \text{HOST_SLC0_TOHOST_BIT0_INT_ENA} \\
\end{align*}
\]

\textbf{enum sdio_slave_timing_t}  
Timing of SDIO slave.

\textit{Values:}

\[
\begin{align*}
  &\text{SDIO_SLAVE_TIMING_PSEND_PSAMPLE} = 0 \\
    &\text{Send at posedge, and sample at posedge. Default value for HS mode. Normally there’s no problem using this to work in DS mode.} \\
  &\text{SDIO_SLAVE_TIMING_NSEND_PSAMPLE} \\
    &\text{Send at negedge, and sample at posedge. Default value for DS mode and below.} \\
  &\text{SDIO_SLAVE_TIMING_PSEND_NSAMPLE} \\
    &\text{Send at posedge, and sample at negedge.} \\
  &\text{SDIO_SLAVE_TIMING_NSEND_NSAMPLE} \\
    &\text{Send at negedge, and sample at negedge.} \\
\end{align*}
\]

\textbf{enum sdio_slave_sending_mode_t}  
Configuration of SDIO slave mode.

\textit{Values:}

\[
\begin{align*}
  &\text{SDIO_SLAVE_SEND_STREAM} = 0 \\
    &\text{Stream mode, all packets to send will be combined as one if possible.} \\
  &\text{SDIO_SLAVE_SEND_PACKET} = 1 \\
    &\text{Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).} \\
\end{align*}
\]

2.3.14 Sigma-delta Modulation

\textbf{Introduction}

ESP32 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

\textbf{Functionality Overview}

There are eight independent sigma-delta modulation channels identified with \texttt{sigmadelta_channel_t}. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in \texttt{sigmadelta_config_t} and then applying this configuration with \texttt{sigmadelta_config()}. Another option is to call individual functions, that will configure all required parameters one by one:

- \textbf{Prescaler} of the sigma-delta generator - \texttt{sigmadelta_set_prescale()}
- \textbf{Duty} of the output signal - \texttt{sigmadelta_set_duty()}
- \textbf{GPIO pin} to output modulated signal - \texttt{sigmadelta_set_pin()}

The range of the ‘duty’ input parameter of \texttt{sigmadelta_set_duty()} is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal’s duty will be about 50%, see description of \texttt{sigmadelta_set_duty()}.
Application Example

Sigma-delta Modulation example: peripherals/sigmadelta.

API Reference

Header File

- driver/include/driver/sigmadelta.h

Functions

```c
esp_err_t sigmadelta_config(const sigmadelta_config_t *config)
```
Configure Sigma-delta channel.

- **Return**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

- **Parameters**
  - `config`: Pointer of Sigma-delta channel configuration struct

```c
esp_err_t sigmadelta_set_duty(sigmadelta_channel_t channel, int8_t duty)
```
Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty. If you add a capacitor between the output pin and ground, the average output voltage will be \( V_{dc} = \frac{VDDIO}{256} \times \text{duty} + \frac{VDDIO}{2} \), where VDDIO is the power supply voltage.

- **Return**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

- **Parameters**
  - `channel`: Sigma-delta channel number
  - `duty`: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

```c
esp_err_t sigmadelta_set_prescale(sigmadelta_channel_t channel, uint8_t prescale)
```
Set Sigma-delta channel’s clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP_CLK / prescale.

- **Return**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

- **Parameters**
  - `channel`: Sigma-delta channel number
  - `prescale`: The divider of source clock, ranges from 0 to 255

```c
esp_err_t sigmadelta_set_pin(sigmadelta_channel_t channel, gpio_num_t gpio_num)
```
Set Sigma-delta signal output pin.

- **Return**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

- **Parameters**
  - `channel`: Sigma-delta channel number
  - `gpio_num`: GPIO number of output pin.

Structures

```c
struct sigmadelta_config_t
```
Sigma-delta configure struct.
Public Members

`sigmadelta_channel_t channel`
Sigma-delta channel number

`int8_t sigmadelta_duty`
Sigma-delta duty, duty ranges from -128 to 127.

`uint8_t sigmadelta_prescale`
Sigma-delta prescale, prescale ranges from 0 to 255.

`uint8_t sigmadelta_gpio`
Sigma-delta output io number, refer to gpio.h for more details.

Enumerations

`enum sigmadelta_channel_t`
Sigma-delta channel list.

Values:

- `SIGMADELTA_CHANNEL_0 = 0`
  Sigma-delta channel 0
- `SIGMADELTA_CHANNEL_1 = 1`
  Sigma-delta channel 1
- `SIGMADELTA_CHANNEL_2 = 2`
  Sigma-delta channel 2
- `SIGMADELTA_CHANNEL_3 = 3`
  Sigma-delta channel 3
- `SIGMADELTA_CHANNEL_4 = 4`
  Sigma-delta channel 4
- `SIGMADELTA_CHANNEL_5 = 5`
  Sigma-delta channel 5
- `SIGMADELTA_CHANNEL_6 = 6`
  Sigma-delta channel 6
- `SIGMADELTA_CHANNEL_7 = 7`
  Sigma-delta channel 7
- `SIGMADELTA_CHANNEL_MAX`

2.3.15 SPI Master driver

Overview

The ESP32 has four SPI peripheral devices, called SPI0, SPI1, HSPI and VSPI. SPI0 is entirely dedicated to the flash cache the ESP32 uses to map the SPI flash device it is connected to into memory. SPI1 is connected to the same hardware lines as SPI0 and is used to write to the flash chip. HSPI and VSPI are free to use. SPI1, HSPI and VSPI all have three chip select lines, allowing them to drive up to three SPI devices each as a master.

The *spi_master* driver    The *spi_master* driver allows easy communicating with SPI slave devices, even in a multi-threaded environment. It fully transparently handles DMA transfers to read and write data and automatically takes care of multiplexing between different SPI slaves on the same master.

Note: Notes about thread safety
The SPI driver API is thread safe when multiple SPI devices on the same bus are accessed from different tasks. However, the driver is not thread safe if the same SPI device is accessed from multiple tasks.

In this case, it is recommended to either refactor your application so only a single task accesses each SPI device, or to add mutex locking around access of the shared device.

**Terminology**  
The spi_master driver uses the following terms:

- **Host**: The SPI peripheral inside the ESP32 initiating the SPI transmissions. One of SPI, HSPI or VSPI. (For now, only HSPI or VSPI are actually supported in the driver; it will support all 3 peripherals somewhere in the future.)
- **Bus**: The SPI bus, common to all SPI devices connected to one host. In general the bus consists of the miso, mosi, sclk and optionally quadwp and quadhd signals. The SPI slaves are connected to these signals in parallel.
  - miso - Also known as q, this is the input of the serial stream into the ESP32
  - mosi - Also known as d, this is the output of the serial stream from the ESP32
  - sclk - Clock signal. Each data bit is clocked out or in on the positive or negative edge of this signal
  - quadwp - Write Protect signal. Only used for 4-bit (qio/qout) transactions.
  - quadhd - Hold signal. Only used for 4-bit (qio/qout) transactions.
- **Device**: A SPI slave. Each SPI slave has its own chip select (CS) line, which is made active when a transmission to/from the SPI slave occurs.
- **Transaction**: One instance of CS going active, data transfer from and/or to a device happening, and CS going inactive again. Transactions are atomic, as in they will never be interrupted by another transaction.

**SPI transactions**  
A transaction on the SPI bus consists of five phases, any of which may be skipped:

- The command phase. In this phase, a command (0-16 bit) is clocked out.
- The address phase. In this phase, an address (0-64 bit) is clocked out.
- The write phase. The master sends data to the slave.
- The dummy phase. The phase is configurable, used to meet the timing requirements.
- The read phase. The slave sends data to the master.

In full duplex mode, the read and write phases are combined, and the SPI host reads and writes data simultaneously. The total transaction length is decided by \(\text{command_bits} + \text{address_bits} + \text{trans_conf.length}\), while the \(\text{trans_conf.rx_length}\) only determines length of data received into the buffer.

While in half duplex mode, the host have independent write and read phases. The length of write phase and read phase are decided by \(\text{trans_conf.length}\) and \(\text{trans_conf.rx_length}\) respectively.

The command and address phase are optional in that not every SPI device will need to be sent a command and/or address. This is reflected in the device configuration: when the \(\text{command_bits}\) or \(\text{address_bits}\) fields are set to zero, no command or address phase is done.

Something similar is true for the read and write phase: not every transaction needs both data to be written as well as data to be read. When \(\text{rx_buffer}\) is NULL (and SPI_TRANS_USE_RXDATA is not set) the read phase is skipped. When \(\text{tx_buffer}\) is NULL (and SPI_TRANS_USE_TXDATA is not set) the write phase is skipped.

The driver offers two different kinds of transactions: the interrupt transactions and the polling transactions. Each device can choose one kind of transaction to send. See *Notes to send mixed transactions to the same device* if your device do require both kinds of transactions.

**Interrupt transactions**  
The interrupt transactions use an interrupt-driven logic when the transactions are in-flight. The routine will get blocked, allowing the CPU to run other tasks, while it is waiting for a transaction to be finished.

Interrupt transactions can be queued into a device, the driver automatically send them one-by-one in the ISR. A task can queue several transactions, and then do something else before the transactions are finished.

**Polling transactions**  
The polling transactions don’t rely on the interrupt, the routine keeps polling the status bit of the SPI peripheral until the transaction is done.
All the tasks that do interrupt transactions may get blocked by the queue, at which point they need to wait for the ISR to run twice before the transaction is done. Polling transactions save the time spent on queue handling and context switching, resulting in a smaller transaction interval smaller. The disadvantage is that the the CPU is busy while these transactions are in flight.

The `spi_device_polling_end` routine spends at least 1us overhead to unblock other tasks when the transaction is done. It is strongly recommended to wrap a series of polling transactions inside of `spi_device_acquire_bus` and `spi_device_release_bus` to avoid the overhead. (See Bus acquiring)

Command and address phases During the command and address phases, `cmd` and `addr` field in the `spi_transaction_t` struct are sent to the bus, while nothing is read at the same time. The default length of command and address phase are set in the `spi_device_interface_config_t` and by `spi_bus_add_device`. When the the flag `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` are not set in the `spi_transaction_t`, the driver automatically set the length of these phases to the default value as set when the device is initialized respectively.

If the length of command and address phases needs to be variable, declare a `spi_transaction_ext_t` descriptor, set the flag `SPI_TRANS_VARIABLE_CMD` or/and `SPI_TRANS_VARIABLE_ADDR` in the flags of base member and configure the rest part of base as usual. Then the length of each phases will be `command_bits` and `address_bits` set in the `spi_transaction_ext_t`.

Write and read phases Normally, data to be transferred to or from a device will be read from or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the transaction structure. When DMA is enabled for transfers, these buffers are highly recommended to meet the requirements as below:

1. allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`;
2. 32-bit aligned (start from the boundary and have length of multiples of 4 bytes).

If these requirements are not satisfied, efficiency of the transaction will suffer due to the allocation and memcpy of temporary buffers.

**Note:** Half duplex transactions with both read and write phases are not supported when using DMA. See Known Issues for details and workarounds.

Bus acquiring Sometimes you may want to send spi transactions exclusively, continuously, to make it as fast as possible. You may use `spi_device_acquire_bus` and `spi_device_release_bus` to realize this. When the bus is acquired, transactions to other devices (no matter polling or interrupt) are pending until the bus is released.

Using the spi_master driver

- Initialize a SPI bus by calling `spi_bus_initialize`. Make sure to set the correct IO pins in the `bus_config` struct. Take care to set signals that are not needed to 1.
- Tell the driver about a SPI slave device connected to the bus by calling `spi_bus_add_device`. Make sure to configure any timing requirements the device has in the `dev_config` structure. You should now have a handle for the device, to be used when sending it a transaction.
- To interact with the device, fill one or more `spi_transaction_t` structure with any transaction parameters you need. Then send them either in a polling way or the interrupt way:
  - **Interrupt** Either queue all transactions by calling `spi_device_queue_trans`, and at a later time query the result using `spi_device_get_trans_result`, or handle all requests synchronously by feeding them into `spi_device_transmit`.
  - **Polling** Call the `spi_device_polling_transmit` to send polling transactions. Alternatively, you can send a polling transaction by `spi_device_polling_start` and `spi_device_polling_end` if you want to insert something between them.
- Optional: to do back-to-back transactions to a device, call `spi_device_acquire_bus` before and `spi_device_release_bus` after the transactions.
• Optional: to unload the driver for a device, call `spi_bus_remove_device` with the device handle as an argument
• Optional: to remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free`.

**Tips**

1. **Transactions with small amount of data:** Sometimes, the amount of data is very small making it less than optimal allocating a separate buffer for it. If the data to be transferred is 32 bits or less, it can be stored in the transaction struct itself. For transmitted data, use the `tx_data` member for this and set the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`.

2. **Transactions with integers other than uint8_t** The SPI peripheral reads and writes the memory byte-by-byte. By default, the SPI works at MSB first mode, each byte is sent or received from the MSB to the LSB. However, if you want to send data with length which is not multiples of 8 bits, unused bits are sent. E.g. you write `uint8_t data = 0x15` (00010101B), and set length to only 5 bits, the sent data is 00010B rather than expected 10101B. Moreover, ESP32 is a little-endian chip whose lowest byte is stored at the very beginning address for `uint16_t` and `uint32_t` variables. Hence if a `uint16_t` is stored in the memory, it’s bit 7 is first sent, then bit 6 to 0, then comes its bit 15 to bit 8.

To send data other than `uint8_t` arrays, macros `SPI_SWAP_DATA_TX` is provided to shift your data to the MSB and swap the MSB to its correct place.

**GPIO matrix and IOMUX** Most peripheral signals in ESP32 can connect directly to a specific GPIO, which is called its IOMUX pin. When a peripheral signal is routed to a pin other than its IOMUX pin, ESP32 uses the less direct GPIO matrix to make this connection.

If the driver is configured with all SPI signals set to their specific IOMUX pins (or left unconnected), it will bypass the GPIO matrix. If any SPI signal is configured to a pin other than its IOMUX pin, the driver will automatically route all the signals via the GPIO Matrix. The GPIO matrix samples all signals at 80MHz and sends them between the GPIO and the peripheral.

When the GPIO matrix is used, signals faster than 40MHz cannot propagate and the setup time of MISO is more easily violated, since the input delay of MISO signal is increased. The maximum clock frequency with GPIO Matrix is 40MHz or less, whereas using all IOMUX pins allows 80MHz.

**Note:** More details about influence of input delay on the maximum clock frequency, see *Timing considerations* below.

IOMUX pins for SPI controllers are as below:

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>HSPI</th>
<th>VSPI</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO Number</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>CS0*</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>SCLK</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

note * Only the first device attaching to the bus can use CS0 pin.

**Notes to send mixed transactions to the same device** Though we suggest to send only one type (interrupt or polling) of transactions to one device to reduce coding complexity, it is supported to send both interrupt and polling transactions alternately. Notes below is to help you do this.
The polling transactions should be started when all the other transactions are finished, no matter they are polling or interrupt.

An unfinished polling transaction forbid other transactions from being sent. Always call `spi_device_polling_end` after `spi_device_polling_start` to allow other device using the bus, or allow other transactions to be started to the same device. You can use `spi_device_polling_transmit` to simplify this if you don’t need to do something during your polling transaction.

An in-flight polling transaction would get disturbed by the ISR operation caused by interrupt transactions. Always make sure all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start`. To do that, you can call `spi_device_get_trans_result` until all the transactions are returned.

It is strongly recommended to send mixed transactions to the same device in only one task to control the calling sequence of functions.

**Speed and Timing Considerations**

**Transferring speed** There’re three factors limiting the transferring speed: (1) The transaction interval, (2) The SPI clock frequency used. (3) The cache miss of SPI functions including callbacks. When large transactions are used, the clock frequency determines the transferring speed; while the interval effects the speed a lot if small transactions are used.

1. **Transaction interval**: It takes time for the software to setup spi peripheral registers as well as copy data to FIFOs, or setup DMA links. When the interrupt transactions are used, an extra overhead is appended, from the cost of FreeRTOS queues and the time switching between tasks and the ISR.
   1. For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the interval. See Interrupt transactions. For polling transactions, it does not block the task but allows to do polling when the transaction is in progress. For more information, see Polling transactions.
   2. When the DMA is enabled, it needs about 2us per transaction to setup the linked list. When the master is transferring, it automatically read data from the linked list. If the DMA is not enabled, CPU has to write/read each byte to/from the FIFO by itself. Usually this is faster than 2us, but the transaction length is limited to 64 bytes for both write and read.

   Typical transaction interval with one byte data is as below:

<table>
<thead>
<tr>
<th></th>
<th>Typical Transaction Time (us)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Interrupt</td>
</tr>
<tr>
<td>DMA</td>
<td>24</td>
</tr>
<tr>
<td>No DMA</td>
<td>22</td>
</tr>
</tbody>
</table>

2. **SPI clock frequency**: Each byte transferred takes 8 times of the clock period $8/f_{spi}$. If the clock frequency is too high, some functions may be limited to use. See Timing considerations.

3. **The cache miss**: the default config puts only the ISR into the IRAM. Other SPI related functions including the driver itself and the callback may suffer from the cache miss and wait for some time while reading code from the flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM, and put the entire callback(s) and its callee functions into IRAM to prevent this.

For an interrupt transaction, the overall cost is $20+8n/f_{spi}[MHz][\text{us}]$ for n bytes transferred in one transaction. Hence the transferring speed is $n/(20+8n/f_{spi})$. Example of transferring speed under 8MHz clock speed:

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (kBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>
When the length of transaction is short, the cost of transaction interval is really high. Please try to squash data into one transaction if possible to get higher transfer speed.

BTW, the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the `intr_flags` member of `spi_bus_config_t`. Then all the transactions queued before the flash operations will be handled by the ISR continuously during flash operation. Note that the callback of each devices, and their callee functions, should be in the IRAM in this case, or your callback will crash due to cache miss.

**Timing considerations**  As shown in the figure below, there is a delay on the MISO signal after SCLK launch edge and before its latched by the internal register. As a result, the MISO pin setup time is the limiting factor for SPI clock speed. When the delay is too large, setup slack is < 0 and the setup timing requirement is violated, leads to the failure of reading correctly.

![Timing Diagram](image)

The maximum frequency allowed is related to the *input delay* (maximum valid time after SCLK on the MISO bus), as well as the usage of GPIO matrix. The maximum frequency allowed is reduced to about 33~77% (related to existing *input delay*) when the GPIO matrix is used. To work at higher frequency, you have to use the IOMUX pins or the dummy bit workaround. You can get the maximum reading frequency of the master by `spi_get_freq_limit`.

**Dummy bit workaround:** We can insert dummy clocks (during which the host does not read data) before the read phase actually begins. The slave still sees the dummy clocks and gives out data, but the host does not read until the read phase. This compensates the lack of setup time of MISO required by the host, allowing the host reading at higher frequency.

In the ideal case (the slave is so fast that the input delay is shorter than an apb clock, 12.5ns), the maximum frequency host can read (or read and write) under different conditions is as below:

<table>
<thead>
<tr>
<th>Frequency Limit (MHz)</th>
<th>Dummy Bits Used By Driver</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO matrix</td>
<td>IOMUX pins</td>
<td></td>
</tr>
<tr>
<td>26.6</td>
<td>80</td>
<td>No</td>
</tr>
<tr>
<td>40</td>
<td>--</td>
<td>Yes</td>
</tr>
</tbody>
</table>

And if the host only writes, the *dummy bit workaround* is not used and the frequency limit is as below:
The spi master driver can work even if the \textit{input delay} in the \texttt{spi_device_interface_config_t} is set to 0. However, setting a accurate value helps to: (1) calculate the frequency limit in full duplex mode, and (2) compensate the timing correctly by dummy bits in half duplex mode. You may find the maximum data valid time after the launch edge of SPI clock in the AC characteristics chapter of the device specifications, or measure the time on a oscilloscope or logic analyzer.

As shown in the figure above, the input delay is usually:

\[ \text{input delay} = \text{sample delay} + \text{slave output delay} \]

1. The sample delay is the maximum random delay due to the asynchronization of SCLK and peripheral clock of the slave. It’s usually 1 slave peripheral clock if the clock is asynchron with SCLK, or 0 if the slave just use the SCLK to latch the SCLK and launch MISO data. e.g. for ESP32 slaves, the delay is 12.5ns (1 apb clock), while it is reduced to 0 if the slave is in the same chip as the master.

2. The slave output delay is the time for the MOSI to be stable after the launch edge. e.g. for ESP32 slaves, the output delay is 37.5ns (3 apb clocks) when IOMUX pins in the slave is used, or 62.5ns (5 apb clocks) if through the GPIO matrix.

Some typical delays are shown in the following table:

<table>
<thead>
<tr>
<th>Device</th>
<th>Input delay (ns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ideal device</td>
<td>0</td>
</tr>
<tr>
<td>ESP32 slave IOMUX*</td>
<td>50</td>
</tr>
<tr>
<td>ESP32 slave GPIO*</td>
<td>75</td>
</tr>
<tr>
<td>ESP32 slave is on an independent chip, 12.5ns sample delay included.</td>
<td></td>
</tr>
</tbody>
</table>

The MISO path delay(\(tv\)), consists of slave \textit{input delay} and master \textit{GPIO matrix delay}, finally determines the frequency limit, above which the full duplex mode will not work, or dummy bits are used in the half duplex mode. The frequency limit is:

\[ \text{Freq limit}[MHz] = 80 / (\text{floor}(\text{MISO delay[ns]}/12.5) + 1) \]

The figure below shows the relations of frequency limit against the input delay. 2 extra apb clocks should be counted into the MISO delay if the GPIO matrix in the master is used.
Corresponding frequency limit for different devices with different input delay are shown in the following table:

<table>
<thead>
<tr>
<th>Master</th>
<th>Input delay (ns)</th>
<th>MISO path delay (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOMUX (0ns)</td>
<td>0</td>
<td>0</td>
<td>80</td>
</tr>
<tr>
<td></td>
<td>50</td>
<td>50</td>
<td>16</td>
</tr>
<tr>
<td></td>
<td>75</td>
<td>75</td>
<td>11.43</td>
</tr>
<tr>
<td>GPIO (25ns)</td>
<td>0</td>
<td>25</td>
<td>26.67</td>
</tr>
<tr>
<td></td>
<td>50</td>
<td>75</td>
<td>11.43</td>
</tr>
<tr>
<td></td>
<td>75</td>
<td>100</td>
<td>8.89</td>
</tr>
</tbody>
</table>

**Known Issues**

1. Half duplex mode is not compatible with DMA when both writing and reading phases exist. If such transactions are required, you have to use one of the alternative solutions:
   1. use full-duplex mode instead.
   2. disable the DMA by setting the last parameter to 0 in bus initialization function just as below:
      ```c
      ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
      ```
      this may prohibit you from transmitting and receiving data longer than 64 bytes.
   3. try to use command and address field to replace the write phase.
2. Full duplex mode is not compatible with the dummy bit workaround, hence the frequency is limited. See dummy bit speed-up workaround.
3. cs_ena_pretrans is not compatible with command, address phases in full duplex mode.

**Application Example**

Display graphics on the 320x240 LCD of WROVER-Kits: peripherals/spi_master.
API Reference - SPI Common

Header File

- soc/include/hal/spi_types.h

Macros

- SPI_HOST
- HSPI_HOST
- VSPI_HOST

Enumerations

```c
enum spi_host_device_t
{
    SPI1_HOST = 0,
    SPI1,
    SPI2_HOST = 1,
    SPI2,
    SPI3_HOST = 2,
    SPI3,
};
```

Header File

- driver/include/driver/spi_common.h

Functions

```c
esp_err_t spi_bus_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config, int dma_chan)
```

Initialize a SPI bus.

**Warning** For now, only supports HSPI and VSPI.

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Return**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already in use
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**

- host: SPI peripheral that controls this bus
- bus_config: Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- dma_chan: Either channel 1 or 2, or 0 in the case when no DMA is required. Selecting a DMA channel for a SPI bus allows transfers on the bus to have sizes only limited by the amount of internal memory. Selecting no DMA channel (by passing the value 0) limits the amount of bytes transferred to a maximum of 64. Set to 0 if only the SPI flash uses this bus.

```c
esp_err_t spi_bus_free(spi_host_device_t host)
```

Free a SPI bus.

**Warning** In order for this to succeed, all devices have to be removed first.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed

Submit Document Feedback
• ESP_OK on success

Parameters
• host: SPI peripheral to free

Structures
struct spi_bus_config_t
This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

Note Be advised that the slave driver does not use the quadwp/quadhd lines and fields in spi_bus_config_t refering to these lines will be ignored and can thus safely be left uninitialed.

Public Members

int mosi_io_num
GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

int miso_io_num
GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

int sclk_io_num
GPIO pin for Spi CLocK signal, or -1 if not used.

int quadwp_io_num
GPIO pin for WP (Write Protect) signal which is used as D2 in 4-bit communication modes, or -1 if not used.

int quadhd_io_num
GPIO pin for HD (HolD) signal which is used as D3 in 4-bit communication modes, or -1 if not used.

int max_transfer_sz
Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.

uint32_t flags
Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.

int intr_flags
Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros
SPI_MAX_DMA_LEN
SPI_SWAP_DATA_TX(DATA, LEN)
Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to &data.

Parameters
• DATA: Data to be sent, can be uint8_t, uint16_t or uint32_t.
• LEN: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.
SPI_SWAP_DATA_RX (DATA, LEN)
Transform received data of length <= 32 bits to the format of an unsigned integer.
E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX((uint32_t*)t->rx_data, 15);
```

Parameters

- **DATA**: Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
- **LEN**: Length of data received, since the SPI peripheral writes from the MSB, this helps shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE
Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER
Initialize I/O in master mode.

SPICOMMON_BUSFLAG_IOMUX_PINS
Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

SPICOMMON_BUSFLAG_SCLK
Check existing of SCLK pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_MISO
Check existing of MISO pin. Or indicates MISO line initialized.

SPICOMMON_BUSFLAG_MOSI
Check existing of MOSI pin. Or indicates CLK line initialized.

SPICOMMON_BUSFLAG_DUAL
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

SPICOMMON_BUSFLAG_WPHD
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

SPICOMMON_BUSFLAG_QUAD
Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

SPICOMMON_BUSFLAG_NATIVE_PINS

API Reference - SPI Master

Header File

- driver/include/driver/spi_master.h

Functions

*esp_err_t* spi_bus_add_device (spi_host_device_t host, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)*

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

Note While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters
• host: SPI peripheral to allocate device on
• dev_config: SPI interface protocol config for the device
• handle: Pointer to variable to hold the device handle

**esp_err_t spi_bus_remove_device(spi_device_handle_t handle)**

Remove a device from the SPI bus.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

**Parameters**
- handle: Device handle to free

**esp_err_t spi_device_queue_trans(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)**

Queue a SPI transaction for interrupt transaction execution. Get the result by **spi_device_get_trans_result**.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if there was no room in the queue before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using **spi_host_add_dev**
- trans_desc: Description of transaction to execute
- ticks_to_wait: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

**esp_err_t spi_device_get_trans_result(spi_device_handle_t handle, spi_transaction_t **trans_desc, TickType_t ticks_to_wait)**

Get the result of a SPI transaction queued earlier by **spi_device_queue_trans**.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if there was no completed transaction before ticks_to_wait expired
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using **spi_host_add_dev**
- trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by **spi_device_get_trans_result**.
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

**esp_err_t spi_device_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)**

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling **spi_device_queue_trans()** followed by **spi_device_get_trans_result()**. Do not use this when there is still a transaction separately queued (started) from **spi_device_queue_trans()** or polling_start/transmit that hasn’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success
Parameters

- **handle**: Device handle obtained using `spi_host_add_dev`
- **trans_desc**: Description of transaction to execute

```c
esp_err_t spi_device_polling_start(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Immediately start a polling transaction.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Return**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the device cannot get control of the bus before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

```c
esp_err_t spi_device_polling_end(spi_device_handle_t handle, TickType_t ticks_to_wait)
```

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Return**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_TIMEOUT` if the transaction cannot finish before `ticks_to_wait` expired
- `ESP_OK` on success

```c
esp_err_t spi_device_polling_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

```c
esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)
```

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

**Note** The function will wait until all the existing transactions have been sent.

**Return**

- `ESP_ERR_INVALID_ARG` if `wait` is not set to `portMAX_DELAY`
- `ESP_OK` : Success.

**Parameters**

- **device**: The device to occupy the bus.
Chapter 2. API Reference

- wait: Time to wait before the bus is occupied by the device. Currently MUST set to port-MAX_DELAY.

```c
void spi_device_release_bus (spi_device_handle_t dev)
```

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters**

- dev: The device to release the bus.

```c
int spi_cal_clock (int fapb, int hz, int duty_cycle, uint32_t *reg_o)
```

Calculate the working frequency that is most close to desired frequency, and also the register value.

**Parameters**

- fapb: The frequency of apb clock, should be APB_CLK_FREQ.
- hz: Desired working frequency
- duty_cycle: Duty cycle of the spi clock
- reg_o: Output of value to be set in clock register, or NULL if not needed.

**Return** Actual working frequency that most fit.

```c
int spi_get_actual_clock (int fapb, int hz, int duty_cycle)
```

Calculate the working frequency that is most close to desired frequency.

**Parameters**

- fapb: The frequency of apb clock, should be APB_CLK_FREQ.
- hz: Desired working frequency
- duty_cycle: Duty cycle of the spi clock

**Return** Actual working frequency that most fit.

```c
void spi_get_timing (bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```

Calculate the timing settings of specified frequency and settings.

**Note** If **dummy_o** is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

**Parameters**

- gpio_is_used: True if using GPIO matrix, or False if iomux pins are used.
- input_delay_ns: Input delay from SCLK launched geto MISO data valid.
- eff_clk: Effective clock frequency (in Hz) from spi_cal_clock.
- dummy_o: Address of dummy bits used output. Set to NULL if not needed.
- cycles_remain_o: Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

```c
int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Return** Frequency limit of current configurations.

**Parameters**

- gpio_is_used: True if using GPIO matrix, or False if native pins are used.
- input_delay_ns: Input delay from SCLK launch edge to MISO data valid.

**Structures**

```c
struct spi_device_interface_config_t
```

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

```c
uint8_t command_bits
```

Default amount of bits in command phase (0-16), used when SPI_TRANS_VARIABLE_CMD is not
Chapter 2. API Reference

used, otherwise ignored.

`uint8_t address_bits`
Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

`uint8_t dummy_bits`
Amount of dummy bits to insert between address and data phase.

`uint8_t mode`
SPI mode (0-3)

`uint8_t duty_cycle_pos`
Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

`uint8_t cs_ena_pretrans`
Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

`uint8_t cs_ena_posttrans`
Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

`int clock_speed_hz`
Clock speed, divisors of 80MHz, in Hz. See `SPI_MASTER_FREQ_*`.

`int input_delay_ns`
Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.

`int spics_io_num`
CS GPIO pin for this device, or -1 if not used.

`uint32_t flags`
Bitwise OR of SPI_DEVICE_* flags.

`int queue_size`
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

`transaction_cb_t pre_cb`
Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

`transaction_cb_t post_cb`
Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with `ESP_INTR_FLAG_IRAM`.

`struct spi_transaction_t` This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

**Public Members**

`uint32_t flags`
Bitwise OR of SPI_TRANS_* flags.
Chapter 2. API Reference

uint16_t cmd
Command data, of which the length is set in the command_bits of spi_device_interface_config_t.

NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).

uint64_t addr
Address data, of which the length is set in the address_bits of spi_device_interface_config_t.

NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t length
Total data length, in bits.

size_t rxlength
Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

void *user
User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]
If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer
Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes unit if DMA is used.

uint8_t rx_data[4]
If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t
This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct spi_transaction_t base
Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits
The command length in this transaction, in bits.

uint8_t address_bits
The address length in this transaction, in bits.

uint8_t dummy_bits
The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M
SPI master clock is divided by 80MHz apbclock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).

8MHz

SPI_MASTER_FREQ_9M
8.89MHz
**Chapter 2. API Reference**

**SPI_MASTER_FREQ_10M**
10MHz

**SPI_MASTER_FREQ_11M**
11.43MHz

**SPI_MASTER_FREQ_13M**
13.33MHz

**SPI_MASTER_FREQ_16M**
16MHz

**SPI_MASTER_FREQ_20M**
20MHz

**SPI_MASTER_FREQ_26M**
26.67MHz

**SPI_MASTER_FREQ_40M**
40MHz

**SPI_MASTER_FREQ_80M**
80MHz

**SPI_DEVICE_TXBIT_LSBFIRST**
Transmit command/address/data LSB first instead of the default MSB first.

**SPI_DEVICE_RXBIT_LSBFIRST**
Receive data LSB first instead of the default MSB first.

**SPI_DEVICE_BIT_LSBFIRST**
Transmit and receive LSB first.

**SPI_DEVICE_3WIRE**
Use MOSI (=spid) for both sending and receiving data.

**SPI_DEVICE_POSITIVE_CS**
Make CS positive during a transaction instead of negative.

**SPI_DEVICE_HALFDUPLEX**
Transmit data before receiving it, instead of simultaneously.

**SPIDEVICE_CLK_AS_CS**
Output clock on CS line if CS is active.

**SPI_DEVICE_NO_DUMMY**
There are timing issues when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).
- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPI_TRANS_MODE_DIO**
Transmit/receive data in 2-bit mode.

**SPI_TRANS_MODE_QIO**
Transmit/receive data in 4-bit mode.

**SPI_TRANS_USE_RXDATA**
Receive into rx_data member of `spi_transaction_t` instead into memory at rx_buffer.

**SPI_TRANS_USE_TXDATA**
Transmit tx_data member of `spi_transaction_t` instead of data at tx_buffer. Do not set tx_buffer when using this.
Chapter 2. API Reference

SPI_TRANS_MODE_DIOQIO_ADDR
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

SPI_TRANS_VARIABLE_CMD
Use the command_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_VARIABLE_ADDR
Use the address_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_VARIABLE_DUMMY
Use the dummy_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

Type Definitions
typedef struct spi_transaction_t spi_transaction_t
typedef void (* transaction_cb_t)(spi_transaction_t *trans)
typedef struct spi_device_t *spi_device_handle_t
Handle for a device on a SPI bus.

2.3.16 SPI Slave driver

Overview
The ESP32 has four SPI peripheral devices, called SPI0, SPI1, HSPI and VSPI. SPI0 is entirely dedicated to the flash cache the ESP32 uses to map the SPI flash device it is connected to into memory. SPI1 is connected to the same hardware lines as SPI0 and is used to write to the flash chip. HSPI and VSPI are free to use, and with the spi_slave driver, these can be used as a SPI slave, driven from a connected SPI master.

The spi_slave driver The spi_slave driver allows using the HSPI and/or VSPI peripheral as a full-duplex SPI slave. It can send/receive transactions within 64 bytes, or make use of DMA to send/receive transactions longer than that. However, there are some known issues when the DMA is enabled.

Terminology The spi_slave driver uses the following terms:
• Host: The SPI peripheral inside the ESP32 initiating the SPI transmissions. One of HSPI or VSPI.
• Bus: The SPI bus, common to all SPI devices connected to a master. In general the bus consists of the miso, mosi, sclk and optionally quadwp and quadhd signals. The SPI slaves are connected to these signals in parallel. Each SPI slave is also connected to one CS signal.
  • miso - Also known as q, this is the output of the serial stream from the ESP32 to the SPI master
  • mosi - Also known as d, this is the output of the serial stream from the SPI master to the ESP32
  • sclk - Clock signal. Each data bit is clocked out or in on the positive or negative edge of this signal
  • cs - Chip Select. An active Chip Select delineates a single transaction to/from a slave.
• Transaction: One instance of CS going active, data transfer from and to a master happening, and CS going inactive again. Transactions are atomic, as in they will never be interrupted by another transaction.

SPI transactions A full-duplex SPI transaction starts with the master pulling CS low. After this happens, the master starts sending out clock pulses on the CLK line: every clock pulse causes a data bit to be shifted from the master to the slave on the MOSI line and vice versa on the MISO line. At the end of the transaction, the master makes CS high again.

Note: The SPI slave peripheral relies on the control of software very much. The master shouldn’t start a transaction when the slave hasn’t prepared for it. Using one more GPIO as the handshake signal to sync is a good idea. For more details, see Transaction interval.
**GPIO matrix and IOMUX**  Most peripheral signals in ESP32 can connect directly to a specific GPIO, which is called its IOMUX pin. When a peripheral signal is routed to a pin other than its IOMUX pin, ESP32 uses the less direct GPIO matrix to make this connection.

If the driver is configured with all SPI signals set to their specific IOMUX pins (or left unconnected), it will bypass the GPIO matrix. If any SPI signal is configured to a pin other than its IOMUX pin, the driver will automatically route all the signals via the GPIO Matrix. The GPIO matrix samples all signals at 80MHz and sends them between the GPIO and the peripheral.

When the GPIO matrix is used, setup time of MISO is more easily violated, since the output delay of MISO signal is increased.

**Note:** More details about influence of output delay on the maximum clock frequency, see *Timing considerations* below.

IOMUX pins for SPI controllers are as below:

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>HSPI GPIO Number</th>
<th>VSPI GPIO Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>
<td>14</td>
<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

*note* Only the first device attaching to the bus can use CS0 pin.

**Using the spi_slave driver**

- Initialize a SPI peripheral as a slave by calling `spi_slave_initialize`. Make sure to set the correct IO pins in the `bus_config` struct. Take care to set signals that are not needed to -1. A DMA channel (either 1 or 2) must be given if transactions will be larger than 32 bytes, if not the `dma_chan` parameter may be 0.
- To set up a transaction, fill one or more `spi_transaction_t` structure with any transaction parameters you need. Either queue all transactions by calling `spi_slave_queue_trans`, later quering the result using `spi_slave_get_trans_result`, or handle all requests synchronously by feeding them into `spi_slave_transmit`. The latter two functions will block until the master has initiated and finished a transaction, causing the queued data to be sent and received.
- Optional: to unload the SPI slave driver, call `spi_slave_free`.

**Transaction data and master/slave length mismatches**  Normally, data to be transferred to or from a device will be read from or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the transaction structure. The SPI driver may decide to use DMA for transfers, so these buffers should be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data written to the buffers is limited by the `length` member of the transaction structure: the driver will never read/write more data than indicated there. The `length` cannot define the actual length of the SPI transaction; this is determined by the master as it drives the clock and CS lines. The actual length transferred can be read from the `trans_len` member of the `spi_slave_transaction_t` structure after transaction. In case the length of the transmission is larger than the buffer length, only the start of the transmission will be sent and received, and the `trans_len` is set to `length` instead of the actual length. It’s recommended to set `length` longer than the maximum length expected if the `trans_len` is required. In case the transmission length is shorter than the buffer length, only data up to the length of the buffer will be exchanged.

**Warning:** Due to a design peculiarity in the ESP32, if the amount of bytes sent by the master or the length of the transmission queues in the slave driver, in bytes, is not both larger than eight and dividable by four, the SPI hardware can fail to write the last one to seven bytes to the receive buffer.
Chapter 2. API Reference

Speed and Timing considerations

Transaction interval  The SPI slave is designed as a general purpose device controlled by the CPU. Different from dedicated devices, CPU-based SPI slave doesn’t have too much pre-defined registers. All transactions should be triggered by the CPU, which means the response speed would not be real-time, and there’ll always be noticeable intervals between transfers.

During the transaction intervals, the device is not prepared for transactions, the response is not meaningful at all. It is suggested to use `spi_slave_queue_trans()` with `spi_slave_get_trans_result()` to shorten the interval to half the case when using `spi_slave_transmit()`.

The master should always wait for the slave to be ready to start new transactions. Suggested way is to use a gpio by the slave to indicate whether it’s ready. The example is in `peripherals/spi_slave`.

SCLK frequency requirement  The spi slave is designed to work under 10MHz or lower. The clock and data cannot be recognized or received correctly if the clock is too fast or doesn’t have a 50% duty cycle.

Moreover, there are more requirements if the data meets the timing requirement:

- **Read (MOSI):** Given that the MOSI is valid right at the launch edge, the slave can read data correctly. Luckily, it’s usually the case for most masters.
- **Write (MISO):** To meet the requirement that MISO is stable before the next latch edge of SPI clock, the output delay of MISO signal should be shorter than half a clock. The output delay and frequency limitation (given that the clock is balanced) of different cases are as below:

<table>
<thead>
<tr>
<th>MISO (ns)</th>
<th>Freq limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IOMUX</td>
<td>43.75</td>
</tr>
<tr>
<td>GPIO matrix</td>
<td>68.75</td>
</tr>
</tbody>
</table>

**Note:**

1. Random error will happen if the frequency exactly equals the limitation
2. The clock uncertainty between master and slave (12.5ns) is included.
3. The output delay is measured under ideal case (free of load). When the loading of MISO pin is too heavy, the output delay will be longer, and the maximum allowed frequency will be lower.

There is an exceptions: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g. latch data at the next edge than expected, or configurable latching time.

Restrictions and Known issues

1. If the DMA is enabled, the rx buffer should be WORD aligned, i.e. Start from the boundary of 32-bit and have length of multiples of 4 bytes. Or the DMA may write incorrectly or out of the boundary. The driver will check for this.

   Also, master should write lengths which are a multiple of 4 bytes. Data longer than that will be discarded.

2. Furthermore, the DMA requires a spi mode 1/3 timing. When using spi mode 0/2, the MISO signal has to output half a clock earlier to meet the timing. The new timing is as below:

   ![Timing Diagram](image)

   The hold time after the latch edge is 68.75ns (when GPIO matrix is bypassed), no longer half a SPI clock. The master should sample immediately at the latch edge, or communicate in mode 1/3. Or just initial the spi slave without DMA.
Application Example

Slave/master communication: peripherals/spi_slave.

API Reference

Header File

- driver/include/driver/spi_slave.h

Functions

**esp_err_t spi_slave_initialize**(spi_host_device_t host, const spi_bus_config_t *bus_config, const spi_slave_interface_config_t *slave_config, int dma_chan)

Initialize a SPI bus as a slave interface.

**Warning** For now, only supports HSPI and VSPI.

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Return**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**

- **host**: SPI peripheral to use as a SPI slave interface
- **bus_config**: Pointer to a spi_bus_config_t struct specifying how the host should be initialized
- **slave_config**: Pointer to a spi_slave_interface_config_t struct specifying the details for the slave interface
- **dma_chan**: Either 1 or 2. A SPI bus used by this driver must have a DMA channel associated with it. The SPI hardware has two DMA channels to share. This parameter indicates which one to use.

**esp_err_t spi_slave_free**(spi_host_device_t host)

Free a SPI bus claimed as a SPI slave interface.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**Parameters**

- **host**: SPI peripheral to free

**esp_err_t spi_slave_queue_trans**(spi_host_device_t host, const spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via spi_slave_initialize.) This function may block if the queue is full (depending on the ticks_to_wait parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in trans_desc to the SPI slave driver; the application is not to access this memory until spi_slave_queue_trans is called to hand ownership back to the application.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- **host**: SPI peripheral that is acting as a slave
• **trans_desc**: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
• **ticks_to_wait**: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

```c
esp_err_t spi_slave_get_trans_result(spi_host_device_t host, spi_slave_transaction_t **trans_desc, TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with spi_slave_queue_trans) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by spi_slave_queue_trans.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- **host**: SPI peripheral to that is acting as a slave
- [out] **trans_desc**: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

```c
esp_err_t spi_slave_transmit(spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Do a SPI transaction.

Essentially does the same as spi_slave_queue_trans followed by spi_slave_get_trans_result. Do not use this when there is still a transaction queued that hasn’t been finalized using spi_slave_get_trans_result.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- **host**: SPI peripheral to that is acting as a slave
- **trans_desc**: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

**Structures**

```c
struct spi_slave_interface_config_t
```

This is a configuration for a SPI host acting as a slave device.

**Public Members**

```c
int spics_io_num
```

CS GPIO pin for this device.

```c
uint32_t flags
```

Bitwise OR of SPI_SLAVE_* flags.

```c
int queue_size
```

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

```c
uint8_t mode
```

SPI mode (0-3)
slave_transaction_cb_t post_setup_cb
Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

slave_transaction_cb_t post_trans_cb
Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_slave_transaction_t
This structure describes one SPI transaction

Public Members

size_t length
Total data length, in bits.

size_t trans_len
Transaction data length, in bits.

const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer
Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (rx_buffer % 4 == 0), and has length of a multiple of 4 bytes.

void *user
User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST
Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST
Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST
Transmit and receive LSB first.

Type Definitions

typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

2.3.17 Timer

Introduction

The ESP32 chip contains two hardware timer groups. Each group has two general-purpose hardware timers. They are all 64-bit generic timers based on 16-bit prescalers and 64-bit up / down counters which are capable of being auto-reloaded.
Functional Overview

The following sections of this document cover the typical steps to configure and operate a timer:

- **Timer Initialization** - covers which parameters should be set up to get the timer working, and also what specific functionality is provided depending on the timer configuration.
- **Timer Control** - describes how to read a timer’s value, pause or start a timer, and change how it operates.
- **Alarms** - shows how to set and use alarms.
- **Interrupts** - explains how to enable and use interrupts.

**Timer Initialization**  The two ESP32 timer groups, with two timers in each, provide the total of four individual timers for use. An ESP32 timer group should be identified using `timer_group_t`. An individual timer in a group should be identified with `timer_idx_t`.

First of all, the timer should be initialized by calling the function `timer_init()` and passing a structure `timer_config_t` to it to define how the timer should operate. In particular, the following timer parameters can be set:

- **Divider**: Sets how quickly the timer’s counter is “ticking”. The setting `divider` is used as a divisor of the incoming 80 MHz APB_CLK clock.
- **Mode**: Sets if the counter should be incrementing or decrementing. It can be defined using `counter_dir` by selecting one of the values from `timer_count_dir_t`.
- **Counter Enable**: If the counter is enabled, it will start incrementing / decrementing immediately after calling `timer_init()`. You can change the behavior with `counter_en` by selecting one of the values from `timer_start_t`.
- **Alarm Enable**: Can be set using `alarm_en`.
- **Auto Reload**: Sets if the initial counter value should be loaded on the timer’s alarm or continue incrementing or decrementing.
- **Interrupt Type**: Select which interrupt type should be triggered on the timer’s alarm. Set the value defined in `timer_intr_mode_t`.

To get the current values of the timer’s settings, use the function `timer_get_config()`.

**Timer Control**  Once the timer is enabled, its counter starts running. To enable the timer, call the function `timer_init()` with `counter_en` set to true, or call `timer_start()`. You can specify the timer’s initial counter value by calling `timer_set_counter_value()`. To check the timer’s current value, call `timer_get_counter_value()` or `timer_get_counter_time_sec()`.

To pause the timer at any time, call `timer_pause()`. To resume it, call `timer_start()`.

To reconfigure the timer, you can call `timer_init()`. This function is described in Section **Timer Initialization**.

You can also reconfigure the timer by using dedicated functions to change individual settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Dedicated Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Divider</td>
<td><code>timer_set_divider()</code></td>
<td>Change the rate of ticking. To avoid unpredictable results, the timer should be paused when changing the divider. If the timer is running, <code>timer_set_divider()</code> pauses it, change the setting, and start the timer again.</td>
</tr>
<tr>
<td>Mode</td>
<td><code>timer_set_counter_mode()</code></td>
<td>Set if the counter should be incrementing or decrementing</td>
</tr>
<tr>
<td>Auto Reload</td>
<td><code>timer_set_auto_reload()</code></td>
<td>Set if the initial counter value should be reloaded on the timer’s alarm</td>
</tr>
</tbody>
</table>

**Alarms**  To set an alarm, call the function `timer_set_alarm_value()` and then enable the alarm using `timer_set_alarm()`. The alarm can also be enabled during the timer initialization stage, when `timer_init()` is called.

After the alarm is enabled, and the timer reaches the alarm value, the following two actions can occur depending on the configuration:
• An interrupt will be triggered if previously configured. See Section Interrupts on how to configure interrupts.

• When `auto_reload` is enabled, the timer’s counter will automatically be reloaded to start counting again from a previously configured value. This value should be set in advance with `timer_set_counter_value()`.

**Note:**

• If an alarm value is set and the timer has already reached this value, the alarm is triggered immediately.

• Once triggered, the alarm is disabled automatically and needs to be re-enabled to trigger again.

To check the specified alarm value, call `timer_get_alarm_value()`.

**Interrupts**  Registration of the interrupt handler for a specific timer or a timer group can be done by calling `timer_isr_register()`.

To enable interrupts for a timer group, call `timer_group_intr_enable()`, for a specific timer call `timer_enable_intr()`. To disable interrupts for a timer group, call `timer_group_intr_disable()`, for a specified timer, call `timer_disable_intr()`.

When handling an interrupt within an interrupt service routine (ISR), the interrupt status bit needs to be explicitly cleared. To do that, set the `TIMERGN.int_clr_timers.tM` structure, defined in `soc/esp32/include/soc/timer_group_struct.h`. In this structure, `N` is the timer group number [0, 1], `M` is the timer number [0, 1]. For example, to clear an interrupt status bit for the timer 1 in the timer group 0, call the following:

```
TIMERG0.int_clr_timers.t1 = 1
```

For more information on how to use interrupts, please see the application example below.

**Application Example**

The 64-bit hardware timer example: `peripherals/timer_group`.

**API Reference**

**Header File**

- `driver/include/driver/timer.h`

**Functions**

- `esp_err_t timer_get_counter_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *timer_val)`

  Read the counter value of hardware timer.

  **Return**
  
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

  **Parameters**
  
  - `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
  - `timer_num`: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
  - `timer_val`: Pointer to accept timer counter value.

- `esp_err_t timer_get_counter_time_sec(timer_group_t group_num, timer_idx_t timer_num, double *time)`

  Read the counter value of hardware timer, in unit of a given scale.

  **Return**
  
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

  **Parameters**
  
  - `group_num`: Timer group, 0 for TIMERG0 or 1 for TIMERG1
  - `timer_num`: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
**Chapter 2. API Reference**

- **group_num**: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **time**: Pointer, type of double*, to accept timer counter value, in seconds.

```c
esp_err_t timer_set_counter_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t load_val)
```

Set counter value to hardware timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **load_val**: Counter value to write to the hardware timer.

```c
esp_err_t timer_start(timer_group_t group_num, timer_idx_t timer_num)
```

Start the counter of hardware timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

```c
esp_err_t timer_pause(timer_group_t group_num, timer_idx_t timer_num)
```

Pause the counter of hardware timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

```c
esp_err_t timer_set_counter_mode(timer_group_t group_num, timer_idx_t timer_num, timer_count_dir_t counter_dir)
```

Set counting mode for hardware timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **counter_dir**: Counting direction of timer, count-up or count-down

```c
esp_err_t timer_set_auto_reload(timer_group_t group_num, timer_idx_t timer_num, timer_autoreload_t reload)
```

Enable or disable counter reload function when alarm event occurs.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **reload**: Counter reload mode.

```c
esp_err_t timer_set_divider(timer_group_t group_num, timer_idx_t timer_num, uint32_t divider)
```

Set hardware timer source clock divider. Timer group's clock are divider from APB clock.

**Return**
- ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number, 0 for TIMEG0 or 1 for TIMEG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• divider: Timer clock divider value. The divider’s range is from 2 to 65536.

```c
esp_err_t timer_set_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t alarm_value)
```
Set timer alarm value.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group, 0 for TIMEG0 or 1 for TIMEG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• alarm_value: A 64-bit value to set the alarm value.

```c
esp_err_t timer_get_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *alarm_value)
```
Get timer alarm value.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group, 0 for TIMEG0 or 1 for TIMEG1
• timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• alarm_en: To enable or disable timer alarm function.

```c
esp_err_t timer_set_alarm(timer_group_t group_num, timer_idx_t timer_num, timer_alarm_t alarm_en)
```
Enable or disable generation of timer alarm events.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number
• timer_num: Timer index of timer group
• fn: Interrupt handler function.
• arg: Parameter for handler function
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

```c
esp_err_t timer_isr_register(timer_group_t group_num, timer_idx_t timer_num, void (*fn)(void *arg, int intr_alloc Flags, timer_isr_handle_t *handle) void *fn, int intr_alloc Flags, timer_isr_handle_t *handle)
```
Register Timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

*Note* If the intr_alloc_flags value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• group_num: Timer group number
• timer_num: Timer index of timer group
• fn: Interrupt handler function.
• arg: Parameter for handler function
• intr_alloc Flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

```c
esp_err_t timer_init(timer_group_t group_num, timer_idx_t timer_num, const timer_config_t *config)
```
Initializes and configures the timer.
Chapter 2. API Reference

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMEG0 or 1 for TIMEG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- config: Pointer to timer initialization parameters.

`esp_err_t timer_get_config(timer_group_t group_num, timer_idx_t timer_num, timer_config_t *config)`

Get timer configure value.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMEG0 or 1 for TIMEG1
- timer_num: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- config: Pointer of struct to accept timer parameters.

`esp_err_t timer_group_intr_enable(timer_group_t group_num, uint32_t en_mask)`

Enable timer group interrupt, by enable mask.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMEG0 or 1 for TIMEG1
- en_mask: Timer interrupt enable mask. Use TIMG_T0_INT_ENA_M to enable t0 interrupt Use TIMG_T1_INT_ENA_M to enable t1 interrupt

`esp_err_t timer_group_intr_disable(timer_group_t group_num, uint32_t disable_mask)`

Disable timer group interrupt, by disable mask.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMEG0 or 1 for TIMEG1
- disable_mask: Timer interrupt disable mask. Use TIMG_T0_INT_ENA_M to disable t0 interrupt Use TIMG_T1_INT_ENA_M to disable t1 interrupt

`esp_err_t timer_enable_intr(timer_group_t group_num, timer_idx_t timer_num)`

Enable timer interrupt.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMEG0 or 1 for TIMEG1
- timer_num: Timer index.

`esp_err_t timer_disable_intr(timer_group_t group_num, timer_idx_t timer_num)`

Disable timer interrupt.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- group_num: Timer group number, 0 for TIMEG0 or 1 for TIMEG1
- timer_num: Timer index.

Structures
struct timer_config_t
   
   Data structure with timer’s configuration settings.

   **Public Members**

   bool alarm_en
      Timer alarm enable

   bool counter_en
      Counter enable

   timer_intr_mode_t intr_type
      Interrupt mode

   timer_count_dir_t counter_dir
      Counter direction

   bool auto_reload
      Timer auto-reload

   uint32_t divider
      Counter clock divider. The divider’s range is from 2 to 65536.

   **Macros**

   TIMER_BASE_CLK
      Frequency of the clock on the input of the timer groups

   **Type Definitions**

   typedef intr_handle_t timer_isr_handle_t
      Interrupt handle, used in order to free the isr after use. Aliases to an int handle for now.

   **Enumerations**

   enum timer_group_t
      Selects a Timer-Group out of 2 available groups.

      *Values:

      TIMER_GROUP_0 = 0
         Hw timer group 0

      TIMER_GROUP_1 = 1
         Hw timer group 1

      TIMER_GROUP_MAX

   enum timer_idx_t
      Select a hardware timer from timer groups.

      *Values:

      TIMER_0 = 0
         Select timer0 of GROUPx

      TIMER_1 = 1
         Select timer1 of GROUPx

      TIMER_MAX

   enum timer_count_dir_t
      Decides the direction of counter.

      *Values:
Chapter 2. API Reference

TIMER_COUNT_DOWN = 0
Descending Count from cnt.high\|cnt.low

TIMER_COUNT_UP = 1
Ascending Count from Zero

enum timer_start_t
Decides whether timer is on or paused.

Values:

TIMER_PAUSE = 0
Pause timer counter

TIMER_START = 1
Start timer counter

enum timer_alarm_t
Decides whether to enable alarm mode.

Values:

TIMER_ALARM_DIS = 0
Disable timer alarm

TIMER_ALARM_EN = 1
Enable timer alarm

enum timer_intr_mode_t
Select interrupt type if running in alarm mode.

Values:

TIMER_INTR_LEVEL = 0
Interrupt mode: level mode

TIMER_INTR_MAX

enum timer_autoreload_t
Select if Alarm needs to be loaded by software or automatically reload by hardware.

Values:

TIMER_AUTORELOAD_DIS = 0
Disable auto-reload: hardware will not load counter value after an alarm event

TIMER_AUTORELOAD_EN = 1
Enable auto-reload: hardware will load counter value after an alarm event

TIMER_AUTORELOAD_MAX

2.3.18 Touch Sensor

Introduction

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When a user touches the surface, the capacitance variation is used to evaluate if the touch was valid.

ESP32 can handle up to 10 capacitive touch pads / GPIOs. The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.
Design, operation, and control registers of a touch sensor are discussed in ESP32 Technical Reference Manual (PDF). Please refer to this manual for additional details on how this subsystem works.

In-depth design details of touch sensors and firmware development guidelines for ESP32 are available in Touch Sensor Application Note. If you want to test touch sensors in various configurations without building them on your own, check the Guide for ESP32-Sense Development Kit.

Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section API Reference. Practical implementation of this API is covered in Section Application Examples.

Initialization Before using a touch pad, you need to initialize the touch pad driver by calling the function touch_pad_init(). This function sets several DEFAULT driver parameters listed in API Reference under Macros. It also removes the information about which pads have been touched before, if any, and disables interrupts.

If the driver is not required anymore, deinitialize it by calling touch_pad_deinit().

Configuration Enabling the touch sensor functionality for a particular GPIO is done with touch_pad_config().

Use the function touch_pad_set_fsm_mode() to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use touch_pad_sw_start() to start the FSM.

Touch State Measurements The following two functions come in handy to read raw or filtered measurements from the sensor:

- touch_pad_read()
- touch_pad_read_filtered()

They can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

Note: Before using touch_pad_read_filtered(), you need to initialize and configure the filter by calling specific filter functions described in Section Filtering of Measurements.

For the demonstration of how to use both read functions, check the application example peripherals/touch_pad_read.

Optimization of Measurements A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged / discharged. The high and low reference voltages are set using the function touch_pad_set_voltage().

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained
readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with \texttt{touch_pad_set_meas_time()}. 

The following list summarizes available measurement parameters and corresponding ‘set’ functions:

- Touch pad charge / discharge parameters:
  - voltage range: \texttt{touch_pad_set_voltage()}
  - speed (slope): \texttt{touch_pad_set_cnt_mode()}

- Measurement time: \texttt{touch_pad_set_meas_time()}

Relationship between the voltage range (high / low reference voltages), speed (slope), and measurement time is shown in the figure below.

![Fig. 22: Touch pad - relationship between measurement parameters](image)

The last chart \textit{Output} represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

All functions are provided in pairs to set a specific parameter and to get the current parameter’s value, e.g., \texttt{touch_pad_set_voltage()} and \texttt{touch_pad_get_voltage()}.

**Filtering of Measurements** If measurements are noisy, you can filter them with provided API functions. Before using the filter, please start it by calling \texttt{touch_pad_filter_start()}. The filter type is IIR (infinite impulse response), and it has a configurable period that can be set with the function \texttt{touch_pad_set_filter_period()}. You can stop the filter with \texttt{touch_pad_filter_stop()}. If not required anymore, the filter can be deleted by invoking \texttt{touch_pad_filter_delete()}. 

**Touch Detection** Touch detection is implemented in ESP32’s hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions \texttt{touch_pad_get_status()} to check which pads have been touched and \texttt{touch_pad_clear_status()} to clear the touch status information. 

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection / provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see \texttt{peripherals/touch_pad_interrupt}.

Release v4.0.3-189-g7c4f5fa
Chapter 2. API Reference

Touch Triggered Interrupts  Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in Touch State Measurements to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with touch_pad_config() or at the runtime with touch_pad_set_thresh().

In the next step, configure how interrupts are triggered. They can be triggered below or above the threshold, which is set with the function touch_pad_set_trigger_mode().

Finally, configure and manage interrupt calls using the following functions:

- touch_pad_isr_register() / touch_pad_isr_deregister()
- touch_pad_intr_enable() / touch_pad_intr_disable()

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking touch_pad_get_status() and clear the pad status with touch_pad_clear_status().

Note: Interrupts on touch detection operate on raw / unfiltered measurements checked against user established threshold and are implemented in hardware. Enabling the software filtering API (see Filtering of Measurements) does not affect this process.

Wakeup from Sleep Mode  If touch pad interrupts are used to wake up the chip from a sleep mode, you can select a certain configuration of pads (SET1 or both SET1 and SET2) that should be touched to trigger the interrupt and cause the subsequent wakeup. To do so, use the function touch_pad_set_trigger_source().

Configuration of required bit patterns of pads may be managed for each ‘SET’ with:

- touch_pad_set_group_mask() / touch_pad_get_group_mask()
- touch_pad_clear_group_mask()

Application Examples

- Touch sensor read example: peripherals/touch_pad_read.
- Touch sensor interrupt example: peripherals/touch_pad_interrupt.

API Reference

Header File

- driver/include/driver/touch_pad.h

Functions

esp_err_t touch_pad_init ()
Initialize touch module.

Note  The default FSM mode is ‘TOUCH_FSM_MODE_SW’. If you want to use interrupt trigger mode, then set it using function ‘touch_pad_set_fsm_mode’ to ‘TOUCH_FSM_MODE_TIMER’ after calling ‘touch_pad_init’.

Return
- ESP_OK Success
- ESP_FAIL Touch pad init error

esp_err_t touch_pad_deinit ()
Un-install touch pad driver.

Note  After this function is called, other touch functions are prohibited from being called.

Return
Chapter 2. API Reference

- ESP_OK Success
- ESP_FAIL Touch pad driver not initialized

```c
esp_err_t touch_pad_config(touch_pad_t touch_num, uint16_t threshold)
```

Configure touch pad interrupt threshold.

**Note** If FSM mode is set to TOUCH_FSM_MODE_TIMER, this function will be blocked for one measurement cycle and wait for data to be valid.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG if argument wrong
- ESP_FAIL if touch pad not initialized

**Parameters**
- touch_num: touch pad index
- threshold: interrupt threshold,

```c
esp_err_t touch_pad_read(touch_pad_t touch_num, uint16_t* touch_value)
```

get touch sensor counter value. Each touch sensor has a counter to count the number of charge/discharge cycles. When the pad is not ‘touched’, we can get a number of the counter. When the pad is ‘touched’, the value in counter will get smaller because of the larger equivalent capacitance.

**Note** This API requests hardware measurement once. If IIR filter mode is enabled, please use ‘touch_pad_read_raw_data’ interface instead.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

**Parameters**
- touch_num: touch pad index
- touch_value: pointer to accept touch sensor value

```c
esp_err_t touch_pad_read_filtered(touch_pad_t touch_num, uint16_t* touch_value)
```

get filtered touch sensor counter value by IIR filter.

**Note** touch_pad_filter_start has to be called before calling touch_pad_read_filtered. This function can be called from ISR

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

**Parameters**
- touch_num: touch pad index
- touch_value: pointer to accept touch sensor value

```c
esp_err_t touch_pad_read_raw_data(touch_pad_t touch_num, uint16_t* touch_value)
```

get raw data (touch sensor counter value) from IIR filter process. Need not request hardware measurements.

**Note** touch_pad_filter_start has to be called before calling touch_pad_read_raw_data. This function can be called from ISR

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

**Parameters**
- touch_num: touch pad index
- touch_value: pointer to accept touch sensor value
\textbf{esp_err_t touch_pad_set_filter_read_cb} (filter_cb_t read_cb)
Register the callback function that is called after each IIR filter calculation.
\linebreak \textbf{Note} The ‘read_cb’ callback is called in timer task in each filtering cycle.
\textbf{Return}
- ESP_OK Success
- ESP_ERR_INVALID_ARG set error
\textbf{Parameters}
- \textbf{read_cb}: Pointer to filtered callback function. If the argument passed in is NULL, the callback will stop.

\textbf{esp_err_t touch_pad_isr_register} (intr_handler_t fn, void *arg)
Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.
\textbf{Return}
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NO_MEM No memory
\textbf{Parameters}
- \textbf{fn}: Pointer to ISR handler
- \textbf{arg}: Parameter for ISR

\textbf{esp_err_t touch_pad_isr_deregister} (void (*fn)) void *
\textbf{Return}
- ESP_OK on success
- ESP_ERR_INVALID_STATE if a handler matching both fn and arg isn’t registered
\textbf{Parameters}
- \textbf{fn}: handler function to call (as passed to touch_pad_isr_handler_register)
- \textbf{arg}: argument of the handler (as passed to touch_pad_isr_handler_register)

\textbf{esp_err_t touch_pad_set_meas_time} (uint16_t sleep_cycle, uint16_t meas_cycle)
Set touch sensor measurement and sleep time.
\textbf{Return}
- ESP_OK on success
\textbf{Parameters}
- \textbf{sleep_cycle}: The touch sensor will sleep after each measurement. sleep_cycle decide the interval between each measurement. \textit{t}\_sleep = sleep_cycle / (RTC\_SLOW\_CLK frequency). The approximate frequency value of RTC\_SLOW\_CLK can be obtained using rtc\_clk\_slow\_freq\_get_hz function.
- \textbf{meas_cycle}: The duration of the touch sensor measurement. \textit{t}\_meas = meas_cycle / 8M, the maximum measure time is 0xffff / 8M = 8.19 ms

\textbf{esp_err_t touch_pad_get_meas_time} (uint16_t *sleep_cycle, uint16_t *meas_cycle)
Get touch sensor measurement and sleep time.
\textbf{Return}
- ESP_OK on success
\textbf{Parameters}
- \textbf{sleep_cycle}: Pointer to accept sleep cycle number
- \textbf{meas_cycle}: Pointer to accept measurement cycle count.

\textbf{esp_err_t touch_pad_set_voltage} (touch_high_volt_t refh, touch_low_volt_t refl, touch_volt_atten_t atten)
Set touch sensor reference voltage, if the voltage gap between high and low reference voltage get less, the charging and discharging time would be faster, accordingly, the counter value would be larger. In the case of detecting very slight change of capacitance, we can narrow down the gap so as to increase the sensitivity. On the other hand, narrow voltage gap would also introduce more noise, but we can use a software filter to pre-process the counter value.
\textbf{Return}
- ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- `refh`: the value of DREFH
- `refl`: the value of DREFL
- `atten`: the attenuation on DREFH

```
esp_err_t touch_pad_get_voltage(touch_high_vol_t *refh, touch_low_vol_t *refl, touch_volt_atten_t *atten)
```

Get touch sensor reference voltage.

**Return**
- ESP_OK on success

**Parameters**
- `refh`: pointer to accept DREFH value
- `refl`: pointer to accept DREFL value
- `atten`: pointer to accept the attenuation on DREFH

```
esp_err_t touch_pad_set_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t slope, touch_tie_opt_t opt)
```

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly, the counter value would be small. If the slope is set 7, which is the maximum value, the charging and discharging would be fast, accordingly, the counter value would be larger.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- `touch_num`: touch pad index
- `slope`: touch pad charge/discharge speed
- `opt`: the initial voltage

```
esp_err_t touch_pad_get_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t slope, touch_tie_opt_t *opt)
```

Get touch sensor charge/discharge speed for each pad.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- `touch_num`: touch pad index
- `slope`: pointer to accept touch pad charge/discharge slope
- `opt`: pointer to accept the initial voltage

```
esp_err_t touch_pad_io_init(touch_pad_t touch_num)
```

Initialize touch pad GPIO.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- `touch_num`: touch pad index

```
esp_err_t touch_pad_set_fsm_mode(touch_fsm_mode_t mode)
```

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
- `mode`: FSM mode

```
esp_err_t touch_pad_get_fsm_mode(touch_fsm_mode_t *mode)
```

Get touch sensor FSM mode.
Return
- ESP_OK on success

Parameters
- mode: pointer to accept FSM mode

`esp_err_t touch_pad_sw_start()`
Trigger a touch sensor measurement, only support in SW mode of FSM.

Return
- ESP_OK on success

`esp_err_t touch_pad_set_thresh(touch_pad_t touch_num, uint16_t threshold)`
Set touch sensor interrupt threshold.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters
- touch_num: touch pad index
- threshold: threshold of touchpad count, refer to `touch_pad_set_trigger_mode` to see how to set trigger mode.

`esp_err_t touch_pad_get_thresh(touch_pad_t touch_num, uint16_t *threshold)`
Get touch sensor interrupt threshold.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters
- touch_num: touch pad index
- threshold: pointer to accept threshold

`esp_err_t touch_pad_set_trigger_mode(touch_trigger_mode_t mode)`
Set touch sensor interrupt trigger mode. Interrupt can be triggered either when counter result is less than threshold or when counter result is more than threshold.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters
- mode: touch sensor interrupt trigger mode

`esp_err_t touch_pad_get_trigger_mode(touch_trigger_mode_t *mode)`
Get touch sensor interrupt trigger mode.

Return
- ESP_OK on success

Parameters
- mode: pointer to accept touch sensor interrupt trigger mode

`esp_err_t touch_pad_set_trigger_source(touch_trigger_src_t src)`
Set touch sensor interrupt trigger source. There are two sets of touch signals. Set1 and set2 can be mapped to several touch signals. Either set will be triggered if at least one of its touch signal is ‘touched’. The interrupt can be configured to be generated if set1 is triggered, or only if both sets are triggered.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters
- src: touch sensor interrupt trigger source

`esp_err_t touch_pad_get_trigger_source(touch_trigger_src_t *src)`
Get touch sensor interrupt trigger source.

Return
Chapter 2. API Reference

- ESP_OK on success

Parameters
- src: pointer to accept touch sensor interrupt trigger source

**esp_err_t touch_pad_set_group_mask** (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)

Set touch sensor group mask. Touch pad module has two sets of signals, ‘Touched’ signal is triggered only if at least one of touch pad in this group is “touched”. This function will set the register bits according to the given bitmask.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters
- set1_mask: bitmask of touch sensor signal group1, it’s a 10-bit value
- set2_mask: bitmask of touch sensor signal group2, it’s a 10-bit value
- en_mask: bitmask of touch sensor work enable, it’s a 10-bit value

**esp_err_t touch_pad_get_group_mask** (uint16_t *set1_mask, uint16_t *set2_mask, uint16_t *en_mask)

Get touch sensor group mask.

Return
- ESP_OK on success

Parameters
- set1_mask: pointer to accept bitmask of touch sensor signal group1, it’s a 10-bit value
- set2_mask: pointer to accept bitmask of touch sensor signal group2, it’s a 10-bit value
- en_mask: pointer to accept bitmask of touch sensor work enable, it’s a 10-bit value

**esp_err_t touch_pad_clear_group_mask** (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)

Clear touch sensor group mask. Touch pad module has two sets of signals, Interrupt is triggered only if at least one of touch pad in this group is “touched”. This function will clear the register bits according to the given bitmask.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

Parameters
- set1_mask: bitmask touch sensor signal group1, it’s a 10-bit value
- set2_mask: bitmask touch sensor signal group2, it’s a 10-bit value
- en_mask: bitmask of touch sensor work enable, it’s a 10-bit value

**esp_err_t touch_pad_clear_status** ()

To clear the touch status register, usually use this function in touch ISR to clear status.

Return
- ESP_OK on success

uint32_t **touch_pad_get_status** ()

Get the touch sensor status, usually used in ISR to decide which pads are ‘touched’.

Return
- touch status

**esp_err_t touch_pad_intr_enable** ()

To enable touch pad interrupt.

Return
- ESP_OK on success

**esp_err_t touch_pad_intr_disable** ()

To disable touch pad interrupt.

Return
- ESP_OK on success
**esp_err_t** touch_pad_set_filter_period(uint32_t new_period_ms)

set touch pad filter calibration period, in ms. Need to call touch_pad_filter_start before all touch filter APIs

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- new_period_ms: filter period, in ms

**esp_err_t** touch_pad_get_filter_period(uint32_t* p_period_ms)

get touch pad filter calibration period, in ms Need to call touch_pad_filter_start before all touch filter APIs

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- p_period_ms: pointer to accept period

**esp_err_t** touch_pad_filter_start(uint32_t filter_period_ms)

start touch pad filter function This API will start a filter to process the noise in order to prevent false triggering when detecting slight change of capacitance. Need to call touch_pad_filter_start before all touch filter APIs

**Note** This filter uses FreeRTOS timer, which is dispatched from a task with priority 1 by default on CPU 0. So if some application task with higher priority takes a lot of CPU 0 time, then the quality of data obtained from this filter will be affected. You can adjust FreeRTOS timer task priority in menuconfig.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter error
- ESP_ERR_NO_MEM No memory for driver
- ESP_ERR_INVALID_STATE driver state error

**Parameters**
- filter_period_ms: filter calibration period, in ms

**esp_err_t** touch_pad_filter_stop()

stop touch pad filter function Need to call touch_pad_filter_start before all touch filter APIs

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error

**esp_err_t** touch_pad_filter_delete()

delete touch pad filter driver and release the memory Need to call touch_pad_filter_start before all touch filter APIs

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error

**esp_err_t** touch_pad_get_wakeup_status(touch_pad_t* pad_num)

Get the touch pad which caused wakeup from sleep.

**Return**
- ESP_OK Success
- ESP_FAIL get status error

**Parameters**
- pad_num: pointer to touch pad which caused wakeup

**Macros**

**TOUCH_PAD_SLEEP_CYCLE_DEFAULT**

The timer frequency is RTC_SLOW_CLK (can be 150k or 32k depending on the options), max value is 0xffff
Chapter 2. API Reference

**TOUCH_PAD_MEASURE_CYCLE_DEFAULT**
The timer frequency is 8Mhz, the max value is 0x7fff

**TOUCH_PAD_MEASURE_WAIT_DEFAULT**
The timer frequency is 8Mhz, the max value is 0xff

**TOUCH_FSM_MODE_DEFAULT**
The touch FSM may be started by the software or timer

**TOUCH_TRIGGER_MODE_DEFAULT**
Interrupts can be triggered if sensor value gets below or above threshold

**TOUCH_TRIGGER_SOURCE_DEFAULT**
The wakeup trigger source can be SET1 or both SET1 and SET2

**TOUCH_PAD_BIT_MASK_MAX**

### Type Definitions

typedef `intr_handle_t` touch_isr_handle_t

typedef `void(*filter_cb_t)(uint16_t*raw_value, uint16_t*filtered_value)`

Callback function that is called after each IIR filter calculation.

*Note* This callback is called in timer task in each filtering cycle.

*Note* This callback should not be blocked.

**Parameters**

- `raw_value`: The latest raw data (touch sensor counter value) that points to all channels(raw_value[0..TOUCH_PAD_MAX-1]).
- `filtered_value`: The latest IIR filtered data (calculated from raw data) that points to all channels(filtered_value[0..TOUCH_PAD_MAX-1]).

### Enumerations

enum touch_pad_t

**Values:**

- **TOUCH_PAD_NUM0 = 0**
  Touch pad channel 0 is GPIO4

- **TOUCH_PAD_NUM1**
  Touch pad channel 1 is GPIO0

- **TOUCH_PAD_NUM2**
  Touch pad channel 2 is GPIO2

- **TOUCH_PAD_NUM3**
  Touch pad channel 3 is GPIO15

- **TOUCH_PAD_NUM4**
  Touch pad channel 4 is GPIO13

- **TOUCH_PAD_NUM5**
  Touch pad channel 5 is GPIO12

- **TOUCH_PAD_NUM6**
  Touch pad channel 6 is GPIO14

- **TOUCH_PAD_NUM7**
  Touch pad channel 7 is GPIO27

- **TOUCH_PAD_NUM8**
  Touch pad channel 8 is GPIO33

- **TOUCH_PAD_NUM9**
  Touch pad channel 9 is GPIO32

- **TOUCH_PAD_MAX**
enum touch_high_volt_t
Values:

TOUCH_HVOLT_KEEP = -1
Touch sensor high reference voltage, no change

TOUCH_HVOLT_2V4 = 0
Touch sensor high reference voltage, 2.4V

TOUCH_HVOLT_2V5
Touch sensor high reference voltage, 2.5V

TOUCH_HVOLT_2V6
Touch sensor high reference voltage, 2.6V

TOUCH_HVOLT_2V7
Touch sensor high reference voltage, 2.7V

TOUCH_HVOLT_MAX

enum touch_low_volt_t
Values:

TOUCH_LVOLT_KEEP = -1
Touch sensor low reference voltage, no change

TOUCH_LVOLT_0V5 = 0
Touch sensor low reference voltage, 0.5V

TOUCH_LVOLT_0V6
Touch sensor low reference voltage, 0.6V

TOUCH_LVOLT_0V7
Touch sensor low reference voltage, 0.7V

TOUCH_LVOLT_0V8
Touch sensor low reference voltage, 0.8V

TOUCH_LVOLT_MAX

enum touch_volt_atten_t
Values:

TOUCH_HVOLT_ATTEN_KEEP = -1
Touch sensor high reference voltage attenuation, no change

TOUCH_HVOLT_ATTEN_1V5 = 0
Touch sensor high reference voltage attenuation, 1.5V attenuation

TOUCH_HVOLT_ATTEN_1V
Touch sensor high reference voltage attenuation, 1.0V attenuation

TOUCH_HVOLT_ATTEN_0V5
Touch sensor high reference voltage attenuation, 0.5V attenuation

TOUCH_HVOLT_ATTEN_0V
Touch sensor high reference voltage attenuation, 0V attenuation

TOUCH_HVOLT_ATTEN_MAX

enum touch_cnt_slope_t
Values:

TOUCH_PAD_SLOPE_0 = 0
Touch sensor charge / discharge speed, always zero

TOUCH_PAD_SLOPE_1 = 1
Touch sensor charge / discharge speed, slowest
**Chapter 2. API Reference**

```c
#define TOUCH_PAD_SLOPE_2 2
   Touch sensor charge / discharge speed
#define TOUCH_PAD_SLOPE_3 3
   Touch sensor charge / discharge speed
#define TOUCH_PAD_SLOPE_4 4
   Touch sensor charge / discharge speed
#define TOUCH_PAD_SLOPE_5 5
   Touch sensor charge / discharge speed
#define TOUCH_PAD_SLOPE_6 6
   Touch sensor charge / discharge speed
#define TOUCH_PAD_SLOPE_7 7
   Touch sensor charge / discharge speed, fast
#define TOUCH_PAD_SLOPE_MAX
```

**enum touch_trigger_mode_t**

Values:

- `TOUCH_TRIGGER_BELOW` = 0
  Touch interrupt will happen if counter value is less than threshold.
- `TOUCH_TRIGGER_ABOVE` = 1
  Touch interrupt will happen if counter value is larger than threshold.

**enum touch_trigger_src_t**

Values:

- `TOUCH_TRIGGER_SOURCE_BOTH` = 0
  Wakeup interrupt is generated if both SET1 and SET2 are “touched”
- `TOUCH_TRIGGER_SOURCE_SET1` = 1
  Wakeup interrupt is generated if SET1 is “touched”

**enum touch_tie_opt_t**

Values:

- `TOUCH_PAD_TIE_OPT_LOW` = 0
  Initial level of charging voltage, low level
- `TOUCH_PAD_TIE_OPT_HIGH` = 1
  Initial level of charging voltage, high level

**enum touch_fsm_mode_t**

Values:

- `TOUCH_FSM_MODE_TIMER` = 0
  To start touch FSM by timer
- `TOUCH_FSM_MODE_SW` = 1
  To start touch FSM by software trigger

**GPIO Lookup Macros**

Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.

1. `TOUCH_PAD_NUM5_GPIO_NUM` is the GPIO number of channel 5 (12);
2. `TOUCH_PAD_GPIO4_CHANNEL` is the channel number of GPIO 4 (channel 0).
Chapter 2. API Reference

2.3.19 UART

Overview
A Universal Asynchronous Receiver/Transmitter (UART) is a component known to handle the timing requirements for a variety of widely-adapted interfaces (RS232, RS485, RS422, …). A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

There are three UART controllers available on the ESP32 chip. They are compatible with UART-enabled devices from various manufacturers. All UART controllers integrated in the ESP32 feature an identical set of registers for ease of programming and flexibility. In this documentation, these controllers are referred to as UART0, UART1, and UART2.

Functional Overview

The following overview describes functions and data types used to establish communication between ESP32 and some other UART device. The overview reflects a typical workflow when programming ESP32’s UART driver and is broken down into the following sections:

1. Setting Communication Parameters - baud rate, data bits, stop bits, etc,
2. Setting Communication Pins - pins the other UART is connected to
3. Driver Installation - allocate ESP32’s resources for the UART driver
4. **Running UART Communication** - send / receive the data
5. **Using Interrupts** - trigger interrupts on specific communication events
6. **Deleting Driver** - release ESP32’s resources, if UART communication is not required anymore

The minimum to make the UART working is to complete the first four steps, the last two steps are optional.

The driver is identified by `uart_port_t`, that corresponds to one of the three UART controllers. Such identification is present in all the following function calls.

### Setting Communication Parameters

There are two ways to set the communications parameters for UART. One is to do it in one shot by calling `uart_param_config()` provided with configuration parameters in `uart_config_t` structure.

The alternate way is to configure specific parameters individually by calling dedicated functions:

- **Baud rate** - `uart_set_baudrate()`
- **Number of transmitted bits** - `uart_set_word_length()` selected out of `uart_word_length_t`
- **Parity control** - `uart_set_parity()` selected out of `uart_parity_t`
- **Number of stop bits** - `uart_set_stop_bits()` selected out of `uart_stop_bits_t`
- **Hardware flow control mode** - `uart_set_hw_flow_ctrl()` selected out of `uart_hw_flowcontrol_t`
- **Communication mode** - `uart_set_mode()` selected out of `uart_mode_t`

**Configuration example:**

```c
const int uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

All the above functions have a _get_ equivalent to retrieve the current setting, e.g. `uart_get_baudrate()`.

### Setting Communication Pins

In next step, after configuring communication parameters, we are setting physical GPIO pin numbers the other UART will be connected to. This is done in a single step by calling function `uart_set_pin()` and providing it with GPIO numbers, that driver should use for the Tx, Rx, RTS and CTS signals.

Instead of GPIO pin number we can enter a macro `UART_PIN_NO_CHANGE` and the currently allocated pin will not be changed. The same macro should be entered if certain pin will not be used.

```c
// Set UART pins(TX: IO16 (UART2 default), RX: IO17 (UART2 default), RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, UART_PIN_NO_CHANGE, UART_PIN_NO_CHANGE, UART_PIN_NO_CHANGE, UART_PIN_NO_CHANGE, UART_PIN_NO_CHANGE));
```

### Driver Installation

Once configuration of driver is complete, we can install it by calling `uart_driver_install()`. As result several resources required by the UART will be allocated. The type / size of resources are specified as function call parameters and concern:

- size of the send buffer
- size of the receive buffer
- the event queue handle and size
- flags to allocate an interrupt

**Example:**
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, 
  uart_buffer_size, 10, &uart_queue, 0));

If all above steps have been complete, we are ready to connect the other UART device and check the communication.

**Running UART Communication**  The processes of serial communication are under control of UART’s hardware FSM. The data to be sent should be put into Tx FIFO buffer, FSM will serialize them and sent out. A similar process, but in reverse order, is done to receive the data. Incoming serial stream is processed by FSM and moved to the Rx FIFO buffer. Therefore the task of API’s communication functions is limited to writing and reading the data to/from the respective buffer. This is reflected in some function names, e.g.: `uart_write_bytes()` to transmit the data out, or `uart_read_bytes()` to read the incoming data.

**Transmitting**  The basic API function to write the data to Tx FIFO buffer is `uart_tx_chars()`. If the buffer contains not sent characters, this function will write what fits into the empty space and exit reporting the number of bytes actually written.

There is a ‘companion’ function `uart_wait_tx_done()` that waits until all the data are transmitted out and the Tx FIFO is empty.

```c
// Wait for packet to be sent
const int uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```

An easier to work with function is `uart_write_bytes()`. It sets up an intermediate ring buffer and exits after copying the data to this buffer. When there is an empty space in the FIFO, the data are moved from the ring buffer to the FIFO in the background by an ISR. The code below demonstrates using of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

There is a similar function as above that adds a serial break signal after sending the data - `uart_write_bytes_with_break()`. The ‘serial break signal’ means holding TX line low for period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

**Receiving**  To retrieve the data received by UART and saved in Rx FIFO, use function `uart_read_bytes()`. You can check in advance what is the number of bytes available in Rx FIFO by calling `uart_get_buffered_data_len()`. Below is the example of using this function:

```c
// Read data from UART.
const int uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in Rx FIFO is not required and should be discarded, call `uart_flush()`.

**Software Flow Control**  When the hardware flow control is disabled, then use `uart_set_rts()` and `uart_set_dtr()` to manually set the levels of the RTS and DTR signals.
Communication Mode Selection  
The UART controller supports set of communication modes. The selection of mode can be performed using function `uart_set_mode()`. Once the specific mode is selected the UART driver will handle behavior of external peripheral according to mode. As an example it can control RS485 driver chip over RTS line to allow half-duplex RS485 communication.

```c
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

Using Interrupts  
There are nineteen interrupts reported on specific states of UART or on detected errors. The full list of available interrupts is described in ESP32 Technical Reference Manual (PDF). To enable specific interrupts call `uart_enable_intr_mask()`, to disable call `uart_disable_intr_mask()`. The mask of all interrupts is available as `UART_INTR_MASK`. Registration of an handler to service interrupts is done with `uart_isr_register()`, freeing the handler with `uart_isr_free()`. To clear the interrupt status bits once the handler is called use `uart_clear_intr_status()`.

The API provides a convenient way to handle specific interrupts discussed above by wrapping them into dedicated functions:

- **Event detection** - there are several events defined in `uart_event_type_t` that may be reported to user application using FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in Driver Installation. Example how to use it is covered in peripherals/uart_events.

- **FIFO space threshold or transmission timeout reached** - the interrupts on TX or Rx FIFO buffer being filled with specific number of characters or on a timeout of sending or receiving data. To use these interrupts, first configure respective threshold values of the buffer length and the timeout by entering them in `uart_intr_config_t` structure and calling `uart_intr_config()`. Then enable interrupts with functions `uart_enable_rx_intr()` and `uart_enable_tx_intr()`. To disable these interrupts there are corresponding functions `uart_disable_rx_intr()` or `uart_disable_tx_intr()`.

- **Pattern detection** - an interrupt triggered on detecting a ‘pattern’ of the same character being sent number of times. The functions that allow to configure, enable and disable this interrupt are `uart_enable_pattern_det_intr()` and `uart_disable_pattern_det_intr()`.

Macros  
The API provides several macros to define configuration parameters, e.g. `UART_FIFO_LEN` to define the length of the hardware FIFO buffers, `UART_BITRATE_MAX` that gives the maximum baud rate supported by UART, etc.

Deleting Driver  
If communication is established with `uart_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `uart_driver_delete()`.

Overview of RS485 specific communication options

**Note:** Here and below the notation UART_REGISTER.UART_OPTION_BIT will be used to describe register options of UART. See the ESP32 Technical Reference Manual for more information.

- UART_RS485_CONF_REG.UART_RS485_EN = 1, enable RS485 communication mode support.
- UART_RS485_CONF_REG.UART_RS485TX_RX_EN, transmitter’s output signal loop back to the receiver’s input signal when this bit is set.
- UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN, when bit is set the transmitter should send data when its receiver is busy (remove collisions automatically by hardware).

The on chip RS485 UART hardware is able to detect signal collisions during transmission of datagram and generate an interrupt UART_RS485_CLASH_INT when it is enabled. The term collision means that during transmission of datagram the received data is different with what has been transmitted out or framing errors exist. Data collisions are usually associated with the presence of other active devices on the bus or due to bus errors. The collision detection feature
allows suppressing the collisions when its interrupt is activated and triggered. The UART_RS485_FRM_ERR_INT and UART_RS485_PARITY_ERR_INT interrupts can be used with collision detection feature to control frame errors and parity errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used with selected UART_MODE_RS485_A mode (see uart_set_mode() function). The collision detection option can work with circuit A and circuit C (see below) which allow collision detection. In case of using circuit number A or B, control of RTS pin connected to DE pin of bus driver should be provided manually by application. The function uart_get_collision_flag() allows to get collision detection flag from driver.

The ESP32 UART hardware is not able to control automatically the RTS pin connected to ~RE/DE input of RS485 bus driver to provide half duplex communication. This can be done by UART driver software when UART_MODE_RS485_HALF_DUPLEX mode is selected using uart_set_mode() function. The UART driver software automatically asserts the RTS pin (logic 1) once the host writes data to the transmit FIFO, and deasserts RTS pin (logic 0) once the last bit of the data has been transmitted. To use this mode the software would have to disable the hardware flow control function. This mode works with any of used circuit showed below.

**Overview of RS485 interface connection options**

**Note:** The example schematics below are prepared for just demonstration of basic aspects of RS485 interface connection for ESP32 and may not contain all required elements. The Analog Devices ADM483 & ADM2483 are examples of common RS485 transceivers and other similar transceivers can also be used.

### The circuit A: Collision detection circuit

```
VCC  ---------------+  
|                    |  
|  +----------------+  |
RXD  <--------| R  |  |
|            B|<--------> B  |
TXD  -------> D  ADM483  |  RS485 bus side  |
|            DE |  |
|              |  A|<--------> A  |
|            /RE |  |
|            +----|  |
|            |  |
GND  GND  
```

This circuit is preferred because it allows collision detection and is simple enough. The receiver in the line driver is constantly enabled that allows UART to monitor the RS485 bus. Echo suppression is done by the ESP32 chip hardware when the UART_RS485_CONF_REG.UART_RS485TX_RX_EN bit is enabled.

### The circuit B: manual switching of transmitter/receiver without collision detection

```
VCC  ---------------+  
|                    |  
|  +----------------+  |
RXD  <--------| R  |  |
|            B|<--------> B  |
TXD  -------> D  ADM483  |  RS485 bus side  |
|            DE |  |
|              |  A|<--------> A  |
|            /RE |  |
|            +----|  |
|            |  |
GND  GND  
```

This circuit does not allow collision detection. It suppresses the null bytes receive by hardware when UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.
**The circuit C: auto switching of transmitter/receiver**

This galvanic isolated circuit does not require RTS pin control by software application or driver because it controls transceiver direction automatically. However, it requires removing null bytes during transmission by setting UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN = 1, UART_RS485_CONF_REG.UART_RS485_TX_RX_EN = 0. This variant can work in any RS485 UART mode or even in UART_MODE_UART.

**Application Examples**

Configure UART settings and install UART driver to read/write using UART1 interface: peripherals/uart/uart_echo.

Demonstration of how to report various communication events and how to use pattern detection interrupts: peripherals/uart/uart_events.

Transmitting and receiving with the same UART in two separate FreeRTOS tasks: peripherals/uart/uart_async_rxtxtasks.

Using synchronous I/O multiplexing for UART file descriptors: peripherals/uart/uart_select.

Setup of UART driver to communicate over RS485 interface in half-duplex mode: peripherals/uart/uart_echo_rs485.

This example is similar to uart_echo but provide communication through RS485 interface chip connected to ESP32 pins.

Demonstration of how to get GPS information by parsing NMEA0183 statements received from GPS via UART peripheral: peripherals/uart/nmea0183_parser.

**API Reference**

**Header File**

- driver/include/driver/uart.h

**Functions**

bool **uart_is_driver_installed**(uart_port_t uart_num)

Checks whether the driver is installed or not.

**Return**

- true driver is installed
- false driver is not installed

**Parameters**
uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).

**esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)**
Set UART data bits.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- data_bit: UART data bits

**esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)**
Get UART data bits.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

Parameters
- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- data_bit: Pointer to accept value of UART data bits.

**esp_err_t uart_set_stop_bits(uart_port_t uart_num, uart_stop_bits_t stop_bits)**
Set UART stop bits.

Return
- ESP_OK Success
- ESP_FAIL Fail

Parameters
- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- stop_bits: UART stop bits

**esp_err_t uart_get_stop_bits(uart_port_t uart_num, uart_stop_bits_t *stop_bits)**
Get UART stop bits.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

Parameters
- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- stop_bits: Pointer to accept value of UART stop bits.

**esp_err_t uart_set_parity(uart_port_t uart_num, uart_parity_t parity_mode)**
Set UART parity mode.

Return
- ESP_FAIL Parameter error
- ESP_OK Success

Parameters
- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- parity_mode: the enum of uart parity configuration

**esp_err_t uart_get_parity(uart_port_t uart_num, uart_parity_t *parity_mode)**
Get UART parity mode.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

Parameters
- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- parity_mode: Pointer to accept value of UART parity mode.

**esp_err_t uart_set_baudrate(uart_port_t uart_num, uint32_t baudrate)**
Set UART baud rate.

Return
• ESP_FAIL Parameter error
• ESP_OK Success

Parameters
  • uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
  • baudrate: UART baud rate.

\texttt{esp_err_t uart_get_baudrate (uart_port_t uart_num, uint32_t *baudrate)}

Get UART baud rate.

Return
  • ESP_FAIL Parameter error
  • ESP_OK Success, result will be put in (*baudrate)

Parameters
  • uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
  • baudrate: Pointer to accept value of UART baud rate

\texttt{esp_err_t uart_set_line_inverse (uart_port_t uart_num, uint32_t inverse_mask)}

Set UART line inverse mode.

Return
  • ESP_OK Success
  • ESP_FAIL Parameter error

Parameters
  • uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
  • inverse_mask: Choose the wires that need to be inverted. Inverse_mask should be chosen from UART_INVERSE_RXD / UART_INVERSE_TXD / UART_INVERSE_RTS / UART_INVERSE_CTS, combined with OR operation.

\texttt{esp_err_t uart_set_hw_flow_ctrl (uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)}

Set hardware flow control.

Return
  • ESP_OK Success
  • ESP_FAIL Parameter error

Parameters
  • uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
  • flow_ctrl: Hardware flow control mode
  • rx_thresh: Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

\texttt{esp_err_t uart_set_sw_flow_ctrl (uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)}

Set software flow control.

Return
  • ESP_OK Success
  • ESP_FAIL Parameter error

Parameters
  • uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
  • enable: switch on or off
  • rx_thresh_xon: low water mark
  • rx_thresh_xoff: high water mark

\texttt{esp_err_t uart_get_hw_flow_ctrl (uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)}

Get hardware flow control mode.

Return
  • ESP_FAIL Parameter error
  • ESP_OK Success, result will be put in (*flow_ctrl)

Parameters
  • uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
  • flow_ctrl: Option for different flow control mode.
**esp_err_t uart_clear_intr_status** (uart_port_t uart_num, uint32_t clr_mask)

Clear UART interrupt status.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **clr_mask**: Bit mask of the interrupt status to be cleared. The bit mask should be composed from the fields of register UART_INT_CLR_REG.

**esp_err_t uart_enable_intr_mask** (uart_port_t uart_num, uint32_t enable_mask)

Set UART interrupt enable.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **enable_mask**: Bit mask of the enable bits. The bit mask should be composed from the fields of register UART_INT_ENA_REG.

**esp_err_t uart_disable_intr_mask** (uart_port_t uart_num, uint32_t disable_mask)

Clear UART interrupt enable bits.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **disable_mask**: Bit mask of the disable bits. The bit mask should be composed from the fields of register UART_INT_ENA_REG.

**esp_err_t uart_enable_rx_intr** (uart_port_t uart_num)

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2

**esp_err_t uart_disable_rx_intr** (uart_port_t uart_num)

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2

**esp_err_t uart_disable_tx_intr** (uart_port_t uart_num)

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2

**esp_err_t uart_enable_tx_intr** (uart_port_t uart_num, int enable, int thresh)

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

**Return**
- ESP_OK Success
Chapter 2. API Reference

- **ESP_FAIL Parameter error**

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **enable**: 1: enable; 0: disable
- **thresh**: Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

```c
esp_err_t uart_isr_register(uart_port_t uart_num, void (*fn)(void), void *arg, int intr_alloc_flags, uart_isr_handle_t *handle)
```
Register UART interrupt handler (ISR).

**Note** UART ISR handler will be attached to the same CPU core that this function is running on.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **fn**: Interrupt handler function.
- **arg**: parameter for handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

```c
esp_err_t uart_isr_free(uart_port_t uart_num)
```
Free UART interrupt handler registered by uart_isr_register. Must be called on the same core as uart_isr_register was called.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2

```c
esp_err_t uart_set_pin(uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)
```
Set UART pin number.

**Note** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

**Note** Instead of GPIO number a macro `UART_PIN_NO_CHANGE` may be provided to keep the currently allocated pin.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **tx_io_num**: UART TX pin GPIO number.
- **rx_io_num**: UART RX pin GPIO number.
- **rts_io_num**: UART RTS pin GPIO number.
- **cts_io_num**: UART CTS pin GPIO number.

```c
esp_err_t uart_set_rts(uart_port_t uart_num, int level)
```
Manually set the UART RTS pin level.

**Note** UART must be configured with hardware flow control disabled.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **level**: 1: RTS output low (active); 0: RTS output high (block)

```c
esp_err_t uart_set_dtr(uart_port_t uart_num, int level)
```
Manually set the UART DTR pin level.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error
### Chapter 2. API Reference

- ESP_OK Success
- ESP_FAIL Parameter error

#### Parameters
- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `level`: 1: DTR output low; 0: DTR output high

#### esp_err_t uart_set_tx_idle_num(uart_port_t uart_num, uint16_t idle_num)
Set UART idle interval after tx FIFO is empty.

- Return
  - ESP_OK Success
  - ESP_FAIL Parameter error

#### Parameters
- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `idle_num`: idle interval after tx FIFO is empty (unit: the time it takes to send one bit under current baudrate)

#### esp_err_t uart_param_config(uart_port_t uart_num, const uart_config_t *uart_config)
Set UART configuration parameters.

- Return
  - ESP_OK Success
  - ESP_FAIL Parameter error

#### Parameters
- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `uart_config`: UART parameter settings

#### esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)
Configure UART interrupts.

- Return
  - ESP_OK Success
  - ESP_FAIL Parameter error

#### Parameters
- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `intr_conf`: UART interrupt settings

#### esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)
Install UART driver.

- UART ISR handler will be attached to the same CPU core that this function is running on.

- **Note** Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

- Return
  - ESP_OK Success
  - ESP_FAIL Parameter error

#### Parameters
- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `rx_buffer_size`: UART RX ring buffer size.
- `tx_buffer_size`: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- `queue_size`: UART event queue size/depth.
- `uart_queue`: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

#### esp_err_t uart_driver_delete(uart_port_t uart_num)
Uninstall UART driver.

- Return
Chapter 2. API Reference

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**

- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2

```c
esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)
```

Wait until UART TX FIFO is empty.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

**Parameters**

- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- ticks_to_wait: Timeout, count in RTOS ticks

```c
int uart_tx_chars(uart_port_t uart_num, const char *buffer, uint32_t len)
```

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

**Note** This function should only be used when UART TX buffer is not enabled.

**Return**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**

- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- buffer: data buffer address
- len: data length to send

```c
int uart_write_bytes(uart_port_t uart_num, const char *src, size_t size)
```

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

**Return**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**

- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- src: data buffer address
- size: data length to send

```c
int uart_write_bytes_with_break(uart_port_t uart_num, const char *src, size_t size, int brk_len)
```

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Return**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**

- uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- src: data buffer address
Chapter 2. API Reference

- **size**: data length to send
- **brk_len**: break signal duration (unit: the time it takes to send one bit at current baudrate)

```c
int uart_read_bytes(uart_port_t uart_num, uint8_t *buf, uint32_t length, TickType_t ticks_to_wait)
```

UART read bytes from UART buffer.

**Return**
- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **buf**: pointer to the buffer.
- **length**: data length
- **ticks_to_wait**: sTimeout, count in RTOS ticks

```c
esp_err_t uart_flush(uart_port_t uart_num)
```

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2

```c
esp_err_t uart_flush_input(uart_port_t uart_num)
```

Clear input buffer, discard all the data is in the ring-buffer.

**Note** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2

```c
esp_err_t uart_get_buffered_data_len(uart_port_t uart_num, size_t *size)
```

UART get RX ring buffer cached data length.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART port number.
- **size**: Pointer of size_t to accept cached data length

```c
esp_err_t uart_disable_pattern_det_intr(uart_port_t uart_num)
```

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART port number.

```c
esp_err_t uart_enable_pattern_det_intr(uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)
```

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error
Parameters

- \texttt{uart_num}: UART port number.
- \texttt{pattern_chr}: character of the pattern
- \texttt{chr_num}: number of the character, 8bit value.
- \texttt{chr_tout}: timeout of the interval between each pattern characters, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take this data as at_cmd char
- \texttt{post_idle}: idle time after the last pattern character, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take the previous data as the last at_cmd char
- \texttt{pre_idle}: idle time before the first pattern character, 24bit value, unit is APB (80Mhz) clock cycle. When the duration is less than this value, it will not take this data as the first at_cmd char

\begin{verbatim}
def uart_pattern_pop_pos(uart_port_t uart_num)
    Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.
    The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.
    Note If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.
    Return
    - (-1) No pattern found for current index or parameter error
    - others the pattern position in rx buffer.

    Parameters
    - \texttt{uart_num}: UART port number
\end{verbatim}

\begin{verbatim}
def uart_pattern_get_pos(uart_port_t uart_num)
    Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function do nothing to the queue.
    The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.
    Note If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.
    Return
    - (-1) No pattern found for current index or parameter error
    - others the pattern position in rx buffer.

    Parameters
    - \texttt{uart_num}: UART port number
\end{verbatim}

\begin{verbatim}
def uart_pattern_queue_reset(uart_port_t uart_num, int queue_length)
    Allocate a new memory with the given length to save record the detected pattern position in rx buffer.
    Return
    - ESP.ERR.NO_MEM No enough memory
    - ESP.ERR.INVALID_STATE Driver not installed
    - ESP.FAIL Parameter error
    - ESP.OK Success

    Parameters
    - \texttt{uart_num}: UART port number
    - \texttt{queue_length}: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.
\end{verbatim}

\begin{verbatim}
def uart_set_mode(uart_port_t uart_num, uart_mode_t mode)
    UART set communication mode.
\end{verbatim}
Note  This function must be executed after uart_driver_install(), when the driver object is initialized.

Return  
• ESP_OK Success  
• ESP_ERR_INVALID_ARG Parameter error

Parameters  
• uart_num: Uart number to configure  
• mode: UART UART mode to set

eesp_err_t uart_set_rx_timeout (uart_port_t uart_num, const uint8_t tout_thresh)  
UART set threshold timeout for TOUT feature.

Return  
• ESP_OK Success  
• ESP_ERR_INVALID_ARG Parameter error  
• ESP_ERR_NOT_SUPPORTED Driver is not installed

Parameters  
• uart_num: Uart number to configure  
• tout_thresh: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

eesp_err_t uart_get_collision_flag (uart_port_t uart_num, bool *collision_flag)  
Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

Return  
• ESP_OK Success  
• ESP_ERR_INVALID_ARG Parameter error

Parameters  
• uart_num: Uart number to configure  
• collision_flag: Pointer to variable of type bool to return collision flag.

eesp_err_t uart_set_wakeup_threshold (uart_port_t uart_num, int wakeup_threshold)  
Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting use_ref_tick field in uart_config_t to true.

Note in ESP32, the wakeup signal can only be input via IQ_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

Return  
• ESP_OK on success  
• ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

Parameters  
• uart_num: UART number  
• wakeup_threshold: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.
**esp_err_t uart_get_wakeup_threshold (uart_port_t uart_num, int *out_wakeup_threshold)**

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `out_wakeup_threshold` is NULL

**Parameters**

- **uart_num**: UART number
- **[out]** `out_wakeup_threshold`: output, set to the current value of wakeup threshold for the given UART.

**Structures**

**struct uart_config_t**

UART configuration parameters for `uart_param_config` function.

**Public Members**

- **int baud_rate**: UART baud rate
- **uart_word_length_t data_bits**: UART byte size
- **uart_parity_t parity**: UART parity mode
- **uart_stop_bits_t stop_bits**: UART stop bits
- **uart_hw_flowcontrol_t flow_ctrl**: UART HW flow control mode (cts/rts)
- **uint8_t rx_flow_ctrl_thresh**: UART HW RTS threshold
- **bool use_ref_tick**: Set to true if UART should be clocked from REF_TICK

**struct uart_intr_config_t**

UART interrupt configuration parameters for `uart_intr_config` function.

**Public Members**

- **uint32_t intr_enable_mask**: UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under UART_INT_ENA_REG(i), connect with bit-or operator
- **uint8_t rx_timeout_thresh**: UART timeout interrupt threshold (unit: time of sending one byte)
- **uint8_t txfifo_empty_intr_thresh**: UART TX empty interrupt threshold.
- **uint8_t rxfifo_full_thresh**: UART RX full interrupt threshold.

**struct uart_event_t**

Event structure used in UART event queue.
Chapter 2. API Reference

Public Members

`uart_event_type_t` type
  UART event type

size_t size
  UART data size for UART_DATA event

Macros

UART_FIFO_LEN
  Length of the hardware FIFO buffers

UART_INTR_MASK
  Mask of all UART interrupts

UART_LINE_INV_MASK
  TBD

UART_BITRATE_MAX
  Max bit rate supported by UART

UART_PIN_NO_CHANGE
  Constant for uart_set_pin function which indicates that UART pin should not be changed

UART_INVERSE_DISABLE
  Disable UART signal inverse

UART_INVERSE_RXD
  UART RXD input inverse

UART_INVERSE_CTS
  UART CTS input inverse

UART_INVERSE_TXD
  UART TXD output inverse

UART_INVERSE_RTS
  UART RTS output inverse

Type Definitions

typedef `intr_handle_t` uart_isr_handle_t

Enumerations

enum uart_mode_t
  UART mode selection.

Values:

UART_MODE_UART = 0x00
  mode: regular UART mode

UART_MODE_RS485_HALF_DUPLEX = 0x01
  mode: half duplex RS485 UART mode control by RTS pin

UART_MODE_IRDA = 0x02
  mode: IRDA UART mode

UART_MODE_RS485_COLLISION_DETECT = 0x03
  mode: RS485 collision detection UART mode (used for test purposes)

UART_MODE_RS485_APP_CTRL = 0x04
  mode: application control RS485 UART mode (used for test purposes)
enum uart_word_length_t
UART word length constants.

Values:

UART_DATA_5_BITS = 0x0
word length: 5bits
UART_DATA_6_BITS = 0x1
word length: 6bits
UART_DATA_7_BITS = 0x2
word length: 7bits
UART_DATA_8_BITS = 0x3
word length: 8bits
UART_DATA_BITS_MAX = 0x4

enum uart_stop_bits_t
UART stop bits number.

Values:

UART_STOP_BITS_1 = 0x1
stop bit: 1bit
UART_STOP_BITS_1_5 = 0x2
stop bit: 1.5bits
UART_STOP_BITS_2 = 0x3
stop bit: 2bits
UART_STOP_BITS_MAX = 0x4

enum uart_port_t
UART peripheral number.

Values:

UART_NUM_0 = 0x0
UART base address 0x3ff40000
UART_NUM_1 = 0x1
UART base address 0x3ff50000
UART_NUM_MAX

enum uart_parity_t
UART parity constants.

Values:

UART_PARITY_DISABLE = 0x0
Disable UART parity
UART_PARITY_EVEN = 0x2
Enable UART even parity
UART_PARITY_ODD = 0x3
Enable UART odd parity

enum uart_hw_flowcontrol_t
UART hardware flow control modes.

Values:

UART_HW_FLOWCTRL_DISABLE = 0x0
disable hardware flow control
UART_HW_FLOWCTRL_RTS = 0x1
   enable RX hardware flow control (rts)

UART_HW_FLOWCTRL_CTS = 0x2
   enable TX hardware flow control (cts)

UART_HW_FLOWCTRL_CTS_RTS = 0x3
   enable hardware flow control

UART_HW_FLOWCTRL_MAX = 0x4

enum uart_event_type_t
   UART event types used in the ring buffer.
   Values:

   UART_DATA
      UART data event

   UART_BREAK
      UART break event

   UART_BUFFER_FULL
      UART RX buffer full event

   UART_FIFO_OVF
      UART FIFO overflow event

   UART_FRAME_ERR
      UART RX frame error event

   UART_PARITY_ERR
      UART RX parity event

   UART_DATA_BREAK
      UART TX data and break event

   UART_PATTERN_DET
      UART pattern detected

   UART_EVENT_MAX
      UART event max index

**GPIO Lookup Macros**  You can use macros to specify the direct GPIO (UART module connected to pads through direct IO mux without the GPIO mux) number of a UART channel, or vice versa. The pin name can be omitted if the channel of a GPIO number is specified, e.g.:

1. UART_NUM_2_TXD_DIRECT_GPIO_NUM is the GPIO number of UART channel 2 TXD pin (17);
2. UART_GPIO19_DIRECT_CHANNEL is the UART channel number of GPIO 19 (channel 0);
3. UART_CTS_GPIO19_DIRECT_CHANNEL is the UART channel number of GPIO 19, and GPIO 19 must be a CTS pin (channel 0).

**Header File**

- soc/esp32/include/soc/uart_channel.h

**Macros**

- UART_GPIO1_DIRECT_CHANNEL
- UART_NUM_0_TXD_DIRECT_GPIO_NUM
- UART_GPIO3_DIRECT_CHANNEL
- UART_NUM_0_RXD_DIRECT_GPIO_NUM
- UART_GPIO19_DIRECT_CHANNEL
Chapter 2. API Reference

UART_NUM_0_CTS_DIRECT_GPIO_NUM
UART_GPIO22_DIRECT_CHANNEL
UART_NUM_0_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO1_DIRECT_CHANNEL
UART_RXD_GPIO3_DIRECT_CHANNEL
UART_CTS_GPIO19_DIRECT_CHANNEL
UART_RTS_GPIO22_DIRECT_CHANNEL
UART_GPIO10_DIRECT_CHANNEL
UART_NUM_1_TXD_DIRECT_GPIO_NUM
UART_GPIO9_DIRECT_CHANNEL
UART_NUM_1_RXD_DIRECT_GPIO_NUM
UART_GPIO6_DIRECT_CHANNEL
UART_NUM_1_CTS_DIRECT_GPIO_NUM
UART_GPIO11_DIRECT_CHANNEL
UART_NUM_1_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO10_DIRECT_CHANNEL
UART_RXD_GPIO9_DIRECT_CHANNEL
UART_CTS_GPIO6_DIRECT_CHANNEL
UART_RTS_GPIO11_DIRECT_CHANNEL
UART_GPIO17_DIRECT_CHANNEL
UART_NUM_2_TXD_DIRECT_GPIO_NUM
UART_GPIO16_DIRECT_CHANNEL
UART_NUM_2_RXD_DIRECT_GPIO_NUM
UART_GPIO8_DIRECT_CHANNEL
UART_NUM_2_CTS_DIRECT_GPIO_NUM
UART_GPIO7_DIRECT_CHANNEL
UART_NUM_2_RTS_DIRECT_GPIO_NUM
UART_TXD_GPIO17_DIRECT_CHANNEL
UART_RXD_GPIO16_DIRECT_CHANNEL
UART_CTS_GPIO8_DIRECT_CHANNEL
UART_RTS_GPIO7_DIRECT_CHANNEL

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.

2.4 Application Protocols

2.4.1 mDNS Service

Overview

mDNS is a multicast UDP service that is used to provide local network service and host discovery.
mDNS is installed by default on most operating systems or is available as separate package. On Mac OS it is installed by default and is called Bonjour. Apple releases an installer for Windows that can be found on Apple’s support page. On Linux, mDNS is provided by avahi and is usually installed by default.

**mDNS Properties**

- **hostname**: the hostname that the device will respond to. If not set, the hostname will be read from the interface. Example: my-esp32 will resolve to my-esp32.local
- **default_instance**: friendly name for your device, like Jhon’s ESP32 Thing. If not set, hostname will be used.

Example method to start mDNS for the STA interface and set hostname and default_instance:

```c
void start_mdns_service()
{
    //initialize mDNS service
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }
    //set hostname
    mdns_hostname_set("my-esp32");
    //set default instance
    mdns_instance_name_set("Jhon's ESP32 Thing");
}
```

**mDNS Services**  mDNS can advertise information about network services that your device offers. Each service is defined by a few properties.

- **instance_name**: friendly name for your service, like Jhon’s ESP32 Web Server. If not defined, default_instance will be used.
- **service_type**: (required) service type, prepended with underscore. Some common types can be found here.
- **proto**: (required) protocol that the service runs on, prepended with underscore. Example: _tcp or _udp
- **port**: (required) network port that the service runs on
- **txt**: {var, val} array of strings, used to define properties for your service

Example method to add a few services and different properties:

```c
void add_mdns_services()
{
    //add our services
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    //NOTE: services must be added before their properties can be set
    //use custom instance for the web server
    mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board", "esp32"},
        {"u", "user"},
        {"p", "password"}
    };
    //set txt data for service (will free and replace current data)
    mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

    //change service port
    (continues on next page)
```
mdns_service_port_set("_myservice", "_udp", 4321);
}

**mDNS Query**

mDNS provides methods for browsing for services and resolving host’s IP/IPv6 addresses.

Results for services are returned as a linked list of `mdns_result_t` objects.

Example method to resolve host IPs:

```c
void resolve_mdns_host(const char *host_name)
{
    printf("Query A: %s.local\n", host_name);

    struct ip4_addr addr;
    addr.addr = 0;

    esp_err_t err = mdns_query_a(host_name, 2000, &addr);
    if(err){
        if(err == ESP_ERR_NOT_FOUND){
            printf("Host was not found!\n");
            return;
        }
        printf("Query Failed\n");
        return;
    }
    printf(IPSTR, IP2STR(&addr));
}
```

Example method to resolve local services:

```c
static const char *if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char *ip_protocol_str[] = {"V4", "V6", "MAX"};

void mdns_print_results(mdns_result_t *results){
    mdns_result_t *r = results;
    mdns_ip_addr_t *a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_protocol_str[r->ip_protocol]);
        if(r->instance_name){
            printf(" PTR : %s\n", r->instance_name);
        }
        if(r->hostname){
            printf(" SRV : %s.local:%u\n", r->hostname, r->port);
        }
        if(r->txt_count){
            printf(" TXT : [%u ]", r->txt_count);
            for(t=0; t<r->txt_count; t++){
                printf("%s=%s; ", r->txt[t].key, r->txt[t].value);
            }
            printf("\n");
        }
        a = r->addr;
        while(a){
            if(a->addr.type == IPADDR_TYPE_V6){
                printf(" AAAA: " IPv6STR "\n", IPv62STR(a->addr.u_addr.ip6));
            } else {
                printf(" A : " IPSTR "\n", IP2STR(a->addr.u_addr.ip4));
            }
        }
    }
}
```

(continues on next page)
void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local", service_name, proto);
    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if(err){
        ESP_LOGE(TAG, "Query Failed");
        return;
    }
    if(!results){
        ESP_LOGW(TAG, "No results found!");
        return;
    }
    mdns_print_results(results);
    mdns_query_results_free(results);
}

Example of using the methods above:

void my_app_some_method(){
    //search for esp32-mdns.local
    resolve_mdns_host("esp32-mdns");

    //search for HTTP servers
    find_mdns_service("._http", "_tcp");
    //or file servers
    find_mdns_service("._smb", "_tcp");  //windows sharing
    find_mdns_service("._afpovertcp", "_tcp");  //apple sharing
    find_mdns_service("._nfs", "_tcp");  //NFS server
    find_mdns_service("._ftp", "_tcp");  //FTP server
    //or networked printer
    find_mdns_service("._printer", "_tcp");
    find_mdns_service("._ipp", "_tcp");
}

Application Example

mDNS server/scanner example: protocols/mdns.

API Reference

Header File

- mdns/include/mdns.h

Functions

esp_err_t mdns_init()
Initialize mDNS on given interface.
void mdns_free()  
Stop and free mDNS server.

**esp_err_t mdns_hostname_set(const char *hostname)**
Set the hostname for mDNS server required if you want to advertise services.

- **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE when failed to register event handler
  - ESP_ERR_NO_MEM on memory error
  - ESP_FAIL when failed to start mdns task

- **Parameters**
  - hostname: Hostname to set

**esp_err_t mdns_instance_name_set(const char *instance_name)**
Set the default instance name for mDNS server.

- **Return**
  - ESP_OK success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_ERR_NO_MEM memory error

- **Parameters**
  - instance_name: Instance name to set

**esp_err_t mdns_service_add(const char *instance_name, const char *service_type, const char *proto, uint16_t port, mdns_txt_item_t txt[], size_t num_items)**
Add service to mDNS server.

- **Return**
  - ESP_OK success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_ERR_NO_MEM memory error
  - ESP_FAIL failed to add service

- **Parameters**
  - instance_name: instance name to set. If NULL, global instance name or hostname will be used
  - service_type: service type ( _http, _ftp, etc)
  - proto: service protocol ( _tcp, _udp)
  - port: service port
  - txt: string array of TXT data (eg. {{ “var” ,” val” },{ “other” ,” 2” }})
  - num_items: number of items in TXT data

**esp_err_t mdns_service_remove(const char *service_type, const char *proto)**
Remove service from mDNS server.

- **Return**
  - ESP_OK success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_ERR_NOT_FOUND Service not found
  - ESP_ERR_NO_MEM memory error

- **Parameters**
  - service_type: service type ( _http, _ftp, etc)
  - proto: service protocol ( _tcp, _udp)

**esp_err_t mdns_service_instance_name_set(const char *service_type, const char *proto, const char *instance_name)**
Set instance name for service.

- **Return**
  - ESP_OK success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `service_type`: service type (http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `instance_name`: instance name to set

```c
esp_err_t mdns_service_port_set(const char *service_type, const char *proto, uint16_t port)
```

Set service port.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `service_type`: service type (http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `port`: service port

```c
esp_err_t mdns_service_txt_set(const char *service_type, const char *proto, mdns_txt_item_t txt[], uint8_t num_items)
```

Replace all TXT items for service.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `service_type`: service type (http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `txt`: array of TXT data (eg. [{ "var", "val" }, { "other", 2 }])
- `num_items`: number of items in TXT data

```c
esp_err_t mdns_service_txt_item_set(const char *service_type, const char *proto, const char *key, const char *value)
```

Set/Add TXT item for service TXT record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `service_type`: service type (http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `key`: the key that you want to add/update
- `value`: the new value of the key

```c
esp_err_t mdns_service_txt_item_remove(const char *service_type, const char *proto, const char *key)
```

Remove TXT item for service TXT record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `service_type`: service type (http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
Chapter 2. API Reference

- **key**: the key that you want to remove

```c
esp_err_t mdns_service_remove_all()
```
Remove and free all services from mDNS server.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mdns_query(const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, mdns_result_t **results)
```
Query mDNS for host or service All following query methods are derived from this one.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG timeout was not given

**Parameters**
- **name**: service instance or host name (NULL for PTR queries)
- **service_type**: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
- **proto**: service protocol (_tcp, _udp, etc.) (NULL for host queries)
- **type**: type of query (MDNS_TYPE_*)
- **timeout**: time in milliseconds to wait for answers.
- **max_results**: maximum results to be collected
- **results**: pointer to the results of the query results must be freed using mdns_query_results_free below

```c
void mdns_query_results_free(mdns_result_t *results)
```
Free query results.

**Parameters**
- **results**: linked list of results to be freed

```c
esp_err_t mdns_query_ptr(const char *service_type, const char *proto, uint32_t timeout, size_t max_results, mdns_result_t **results)
```
Query mDNS for service.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **service_type**: service type (_http, _arduino, _ftp etc.)
- **proto**: service protocol (_tcp, _udp, etc.)
- **timeout**: time in milliseconds to wait for answer.
- **max_results**: maximum results to be collected
- **results**: pointer to the results of the query

```c
esp_err_t mdns_query_srv(const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)
```
Query mDNS for SRV record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **instance_name**: service instance name
- **service_type**: service type (_http, _arduino, _ftp etc.)
- **proto**: service protocol (_tcp, _udp, etc.)
- **timeout**: time in milliseconds to wait for answer.
• result: pointer to the result of the query

```c
esp_err_t mdns_query_txt(const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)
```

Query mDNS for TXT record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- instance_name: service instance name
- service_type: service type (http, _arduino, _ftp etc.)
- proto: service protocol (_tcp, _udp, etc.)
- timeout: time in milliseconds to wait for answer.
- result: pointer to the result of the query

```c
esp_err_t mdns_query_a(const char *host_name, uint32_t timeout, ip4_addr_t *addr)
```

Query mDNS for A record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- host_name: host name to look for
- timeout: time in milliseconds to wait for answer.
- addr: pointer to the resulting IP4 address

```c
esp_err_t mdns_query_aaaa(const char *host_name, uint32_t timeout, ip6_addr_t *addr)
```

Query mDNS for A record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- host_name: host name to look for
- timeout: time in milliseconds to wait for answer. If 0, max_results needs to be defined
- addr: pointer to the resulting IP6 address

```c
esp_err_t mdns_handle_system_event(void *ctx, system_event_t *event)
```

System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

**Parameters**
- ctx: The system event context
- event: The system event

**Structures**

```c
struct mdns_txt_item_t
```

mDNS basic text item structure Used in mdns_service_add()

**Public Members**

```c
const char *key
```

item key name
**Chapter 2. API Reference**

```c
const char *value

item value string
```

```c
struct mdns_ip_addr_s

mDNS query linked list IP item
```

**Public Members**

```c
ip_addr_t addr

IP address
```

```c
struct mdns_ip_addr_s *next

next IP, or NULL for the last IP in the list
```

```c
struct mdns_result_s

mDNS query result structure
```

**Public Members**

```c
struct mdns_result_s *next

next result, or NULL for the last result in the list
```

```c
tcpip_adapter_if_t tcpip_if

interface on which the result came (AP/STA/ETH)
```

```c
mdns_ip_protocol_t ip_protocol

ip_protocol type of the interface (v4/v6)
```

```c
char *instance_name

instance name
```

```c
char *hostname

hostname
```

```c
uint16_t port

service port
```

```c
mdns_txt_item_t *txt

txt record
```

```c
size_t txt_count

number of txt items
```

```c
mdns_ip_addr_t *addr

linked list of IP addresses found
```

**Macros**

```c
MDNS_TYPE_A
MDNS_TYPE_PTR
MDNS_TYPE_TXT
MDNS_TYPE_AAAA
MDNS_TYPE_SRV
MDNS_TYPE_OPT
MDNS_TYPE_NSEC
MDNS_TYPE_ANY
```
Chapter 2. API Reference

Type Definitions

```c
typedef struct mdns_ip_addr_s mdns_ip_addr_t
mDNS query linked list IP item
```

```c
typedef struct mdns_result_s mdns_result_t
mDNS query result structure
```

Enumerations

```c
enum mdns_ip_protocol_t
  mDNS enum to specify the ip_protocol type
```

```c
Values:

  MDNS_IP_PROTOCOL_V4
  MDNS_IP_PROTOCOL_V6
  MDNS_IP_PROTOCOL_MAX
```

2.4.2 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_conn_new()`: for opening a new TLS connection
- `esp_tls_conn_read/write()`: for reading/writing from the connection
- `esp_tls_conn_delete()`: for freeing up the connection

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: protocols/https_request.

API Reference

Header File

- esp-tls/esp_tls.h

Functions

```c
esp_tls_t *esp_tls_init()
Create TLS connection.
```

```c
This function allocates and initializes esp-tls structure handle.
```

```c
Return
```

tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

```c
esp_tls_t *esp_tls_conn_new(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg)
Create a new blocking TLS/SSL connection.
```

```c
This function establishes a TLS/SSL connection with the specified host in blocking manner.
```

```c
Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is esp_tls_conn_new_sync (and its asynchronous version esp_tls_conn_new_async)
```

```c
Return
```

pointer to esp_tls_t, or NULL if connection couldn’t be opened.

Parameters

- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
Chapter 2. API Reference

**int esp_tls_conn_new_sync(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)**

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

**Return**

-1 If connection establishment fails.
1 If connection establishment is successful.
0 If connection state is in progress.

**Parameters**

- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
- [in] tls: Pointer to esp-tls as esp-tls handle.

**esp_tls_t **esp_tls_conn_http_new(const char *url, const esp_tls_cfg_t *cfg)**

Create a new blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

**Return** pointer to esp_tls_t, or NULL if connection couldn’t be opened.

**Parameters**

- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.

**int esp_tls_conn_new_async(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)**

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

**Return**

-1 If connection establishment fails.
0 If connection establishment is in progress.
1 If connection establishment is successful.

**Parameters**

- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
- [in] tls: Pointer to esp-tls as esp-tls handle.

**int esp_tls_conn_http_new_async(const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)**

Create a new non-blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

**Return**

-1 If connection establishment fails.
0 If connection establishment is in progress.
1 If connection establishment is successful.

**Parameters**

- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
Chapter 2. API Reference

- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t.
- [in] tls: pointer to esp-tls as esp-tls handle.

```c
static ssize_t esp_tls_conn_write(esp_tls_t *tls, const void *data, size_t datalen)
```
Write from buffer ‘data’ into specified tls connection.

Return
- >0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- 0 if write operation was not successful. The underlying connection was closed.
- <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.

Parameters
- [in] tls: pointer to esp-tls as esp-tls handle.
- [in] data: Buffer from which data will be written.
- [in] datalen: Length of data buffer.

```c
static ssize_t esp_tls_conn_read(esp_tls_t *tls, void *data, size_t datalen)
```
Read from specified tls connection into the buffer ‘data’.

Return
- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

Parameters
- [in] tls: pointer to esp-tls as esp-tls handle.
- [in] data: Buffer to hold read data.
- [in] datalen: Length of data buffer.

```c
void esp_tls_conn_delete(esp_tls_t *tls)
```
Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new() or esp_tls_conn_http_new() APIs.

Parameters
- [in] tls: pointer to esp-tls as esp-tls handle.

```c
ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls)
```
Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls’s mbedtls_ssl_get_bytes_avail() API.

Return
- -1 in case of invalid arg
- bytes available in the application data record read buffer

Parameters
- [in] tls: pointer to esp-tls as esp-tls handle.

```c
esp_err_t esp_tls_init_global_ca_store()
```
Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

Return
- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedtls resources.
**esp_err_t esp_tls_set_global_ca_store**(const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

**Return**
- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

**Parameters**
- [in] cacert_pem_buf: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.

mbedtls_x509_crt *esp_tls_get_global_ca_store()

Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than esp_tls.

**Note** Modifying the pointer might cause a failure in verifying the certificates.

**Return**
- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

void esp_tls_free_global_ca_store()

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

**esp_err_t esp_tls_get_and_clear_last_error**(esp_tls_error_handle_t h, int *mbedtls_code, int *mbedtls_flags)

Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Return**
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

**Parameters**
- [in] h: esp-tls error handle.
- [out] mbedtls_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about mbedtls_code
- [out] mbedtls_flags: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about mbedtls_flags

**Structures**

**struct esp_tls_last_error**

Error structure containing relevant errors in case tls error occurred.

**Public Members**

**esp_err_t last_error**

error code (based on ESP_ERR_ESP_TLS_BASE) of the last occurred error

int mbedtls_error_code

mbedtls error code from last mbedtls failed api
int mbedtls_flags
   last certification verification flags

struct tls_keep_alive_cfg
   Keep alive parameters structure.

Public Members

bool keep_alive_enable
   Enable keep-alive timeout

int keep_alive_idle
   Keep-alive idle time (second)

int keep_alive_interval
   Keep-alive interval time (second)

int keep_alive_count
   Keep-alive packet retry send count

struct esp_tls_cfg
   ESP-TLS configuration parameters.

Public Members

const char **alpn_protos
   Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that
   should be negotiated. The format is length followed by protocol name. For the most common cases the
   following is ok: const char **alpn_protos = {“h2”, NULL};
   • where ‘h2’ is the protocol name

const unsigned char *cacert_pem_buf
   Certificate Authority’s certificate in a buffer. This buffer should be NULL terminated

unsigned int cacert_pem_bytes
   Size of Certificate Authority’s certificate pointed to by cacert_pem_buf

const unsigned char *clientcert_pem_buf
   Client certificate in a buffer. This buffer should be NULL terminated

unsigned int clientcert_pem_bytes
   Size of client certificate pointed to by clientcert_pem_buf

const unsigned char *clientkey_pem_buf
   Client key in a buffer. This buffer should be NULL terminated

unsigned int clientkey_pem_bytes
   Size of client key pointed to by clientkey_pem_buf

const unsigned char *clientkey_password
   Client key decryption password string

unsigned int clientkey_password_len
   String length of the password pointed to by clientkey_password

bool non_block
   Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking
   mode after tls session is established

int timeout_ms
   Network timeout in milliseconds

bool use_global_ca_store
   Use a global ca_store for all the connections in which this bool is set.

```cpp
const char *common_name
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.
bool skip_common_name
Skip any validation of server certificate CN field

tls_keep_alive_cfg_t *keep_alive_cfg
Enable TCP keep-alive timeout for SSL connection

struct esp_tls
ESP-TLS Connection Handle.

Public Members

mbedtls_ssl_context *ssl
TLS/SSL context
mbedtls_entropy_context *entropy
mbedTLS entropy context structure
mbedtls_ctr_drbg_context *ctr_drbg
mbedTLS ctr drbg context structure. CTR_DRBG is deterministic random bit generation based on AES-256
mbedtls_ssl_config *conf
TLS/SSL configuration to be shared between mbedtls_ssl_context structures
mbedtls_net_context *server_fd
mbedTLS wrapper type for sockets
mbedtls_x509_crt *cacert
Container for the X.509 CA certificate
mbedtls_x509_crt *cacert_ptr
Pointer to the cacert being used.

mbedtls_x509_crt *clientcert
Container for the X.509 client certificate
mbedtls_pk_context *clientkey
Container for the private key of the client certificate

int sockfd
Underlying socket file descriptor.

ssize_t (*read)(struct esp_tls *tls, char *data, size_t datalen)
Callback function for reading data from TLS/SSL connection.

ssize_t (*write)(struct esp_tls *tls, const char *data, size_t datalen)
Callback function for writing data to TLS/SSL connection.

esp_tls_conn_state_t *conn_state
ESP-TLS Connection state

fd_set *rset
read file descriptors

fd_set wset
write file descriptors

bool is_tls
indicates connection type (TLS or NON-TLS)

esp_tls_role_t *role
esp-tls role
```
• ESP_TLS_CLIENT
• ESP_TLS_SERVER

esp_tls_error_handle_t error_handle
handle to error descriptor

**Macros**

ESP_ERR_ESP_TLS_BASE
Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME
Error if hostname couldn’t be resolved upon tls connection

ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET
Failed to create socket

ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY
Unsupported protocol family

ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST
Failed to connect to host

ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED
Failed to set socket option

ESP_ERR_MBEDTLS_CERT_PARTLY_OK
mbedtls parse certificates was partly successful

ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_X509_CRT_PARSE_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_OWN_CERT_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SETUP_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_WRITE_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_PK_PARSE_KEY_FAILED
mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_HANDSHAKE_FAILED
mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_CONF_PSK_FAILED
mbedtls api returned failed

ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT
new connection in esp_tls_low_level_conn connection timeouted
Type Definitions

typedef struct esp_tls_last_error *esp_tls_error_handle_t

typedef struct esp_tls_last_error esp_tls_last_error_t

Error structure containing relevant errors in case TLS error occurred.

typedef enum esp_tls_conn_state esp_tls_conn_state_t

ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t

typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t

Keep alive parameters structure.

typedef struct esp_tls_cfg esp_tls_cfg_t

ESP-TLS configuration parameters.

typedef struct esp_tls esp_tls_t

ESP-TLS Connection Handle.

Enumerations

enum esp_tls_conn_state

ESP-TLS Connection State.

Values:

ESP_TLS_INIT = 0

ESP_TLS_CONNECTING

ESP_TLS_HANDSHAKE

ESP_TLS_FAIL

ESP_TLS_DONE

enum esp_tls_role

Values:

ESP_TLS_CLIENT = 0

ESP_TLS_SERVER

2.4.3 ESP HTTP Client

Overview

esp_http_client provides an API for making HTTP/S requests from ESP-IDF programs. The steps to use this API for an HTTP request are:

- esp_http_client_init(): To use the HTTP client, the first thing we must do is create an esp_http_client by pass into this function with the esp_http_client_config_t configurations. Which configuration values we do not define, the library will use default.

- esp_http_client_perform(): The esp_http_client argument created from the init function is needed. This function performs all operations of the esp_http_client, from opening the connection, sending data, downloading data and closing the connection if necessary. All related events will be invoked in the event_handle (defined by esp_http_client_config_t). This function performs its job and blocks the current task until it’s done.

- esp_http_client_cleanup(): After completing our esp_http_client’s task, this is the last function to be called. It will close the connection (if any) and free up all the memory allocated to the HTTP client.
Application Example

```c
esp_err_t _http_event_handle(esp_http_client_event_t *evt)
{
    switch(evt->event_id) {
    case HTTP_EVENT_ERROR:
        ESP_LOGI(TAG, "HTTP_EVENT_ERROR");
        break;
    case HTTP_EVENT_ON_CONNECTED:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_CONNECTED");
        break;
    case HTTP_EVENT_HEADER_SENT:
        ESP_LOGI(TAG, "HTTP_EVENT_HEADER_SENT");
        break;
    case HTTP_EVENT_ON_HEADER:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_HEADER");
        printf("%.s", evt->data_len, (char*)evt->data);
        break;
    case HTTP_EVENT_ON_DATA:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_DATA, len=%d", evt->data_len);
        if (!esp_http_client_is_chunked_response(evt->client)) {
            printf("%.s", evt->data_len, (char*)evt->data);
        }
        break;
    case HTTP_EVENT_ON_FINISH:
        ESP_LOGI(TAG, "HTTP_EVENT_ON_FINISH");
        break;
    case HTTP_EVENT_DISCONNECTED:
        ESP_LOGI(TAG, "HTTP_EVENT_DISCONNECTED");
        break;
    }
    return ESP_OK;
}
```

```c
esp_http_client_config_t config = {
    .url = "http://httpbin.org/redirect/2",
    .event_handler = _http_event_handle,
};
esp_http_client_handle_t client = esp_http_client_init(&config);
esp_err_t err = esp_http_client_perform(client);
if (err == ESP_OK) {
    ESP_LOGI(TAG, "Status = %d, content_length = %d",
            esp_http_client_get_status_code(client),
            esp_http_client_get_content_length(client));
}
esp_http_client_cleanup(client);
```

Persistent Connections

Persistent connections mean that the HTTP client can re-use the same connection for several transfers. If the server does not request to close the connection with the Connection: close header, the new transfer with sample ip address, port, and protocol.

To allow the HTTP client to take full advantage of persistent connections, you should do as many of your file transfers as possible using the same handle.

Persistent Connections example
esp_err_t err;
esp_http_client_config_t config = {
    .url = "http://httpbin.org/get",
};
esp_http_client_handle_t client = esp_http_client_init(&config);
// first request
err = esp_http_client_perform(client);

// second request
esp_http_client_set_url(client, "http://httpbin.org/anything")
esp_http_client_set_method(client, HTTP_METHOD_DELETE);
esp_http_client_set_header(client, "HeaderKey", "HeaderValue");
err = esp_http_client_perform(client);
esp_http_client_cleanup(client);

HTTPS

The HTTP client supports SSL connections using mbedtls, with the url configuration starting with https scheme (or transport_type = HTTP_TRANSPORT_OVER_SSL). HTTPS support can be configured via :ref:CONFIG_ENABLE_HTTPS (enabled by default).

Note: By providing information using HTTPS, the library will use the SSL transport type to connect to the server. If you want to verify server, then need to provide additional certificate in PEM format, and provide to cert_pem in esp_http_client_config_t

HTTPS example

```c
static void https()
{
    esp_http_client_config_t config = {
        .url = "https://www.howsmyssl.com",
        .cert_pem = howsmyssl_com_root_cert_pem_start,
    };
    esp_http_client_handle_t client = esp_http_client_init(&config);
    esp_err_t err = esp_http_client_perform(client);

    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Status = %d, content_length = %d", 
            esp_http_client_get_status_code(client),
            esp_http_client_get_content_length(client));
    }
    esp_http_client_cleanup(client);
}
```

HTTP Stream

Some applications need to open the connection and control the reading of the data in an active manner. The HTTP client supports some functions to make this easier, of course, once you use these functions you should not use the esp_http_client_perform() function with that handle, and esp_http_client_init() alway called first to get the handle. Perform that functions in the order below:

- **esp_http_client_init()**: to create and handle
- **esp_http_client_set_*** or **esp_http_client_delete_***: to modify the http connection information (optional)
- **esp_http_client_open()**: Open the http connection with write_len parameter, write_len=0 if we only need read
Chapter 2. API Reference

- `esp_http_client_write()`: Upload data, max length equal to `write_len` of `esp_http_client_open()` function. We may not need to call it if `write_len=0`
- `esp_http_client_fetch_headers()`: After sending the headers and write data (if any) to the server, this function will read the HTTP Server response headers. Calling this function will return the `content-length` from the Server, and we can call `esp_http_client_get_status_code()` for the HTTP status of the connection.
- `esp_http_client_read()`: Now, we can read the HTTP stream by this function.
- `esp_http_client_close()`: We should the connection after finish
- `esp_http_client_cleanup()`: And release the resources

Perform HTTP request as Stream reader Check the example function http_perform_as_stream_reader at protocols/esp_http_client.

HTTP Authentication

The HTTP client supports both Basic and Digest Authentication. By providing usernames and passwords in `url` or in the `username, password` of config entry. And with `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only 1 perform to pass the authentication process. If `auth_type = HTTP_AUTH_TYPE_NONE`, but there are `username` and `password` in the configuration, the HTTP client takes 2 performs. The first time it connects to the server and receives the UNAUTHORIZED header. Based on this information, it will know which authentication method to choose, and perform it on the second.

Config authentication example with URI

```c
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

Config authentication example with username, password entry

```c
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

HTTP Client example: protocols/esp_http_client.

API Reference

Header File

- `esp_http_client/include/esp_http_client.h`

Functions

`esp_http_client_init(const esp_http_client_config_t *config)`

Start a HTTP session This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

Return

- `esp_http_client_handle_t`
- NULL if any errors

Parameters

- [in] config: The configurations, see `http_client_config_t`
**esp_err_t esp_http_client_perform(esp_http_client_handle_t client)**

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_**` between the invokes to set options for the following `esp_http_client_perform`.

**Note** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include:

```c
esp_http_client_open
-> esp_http_client_write
-> esp_http_client_fetch_headers
-> esp_http_client_read (and option) esp_http_client_close.
```

**Return**
- ESP_OK on successful
- ESP_FAIL on error

**Parameters**
- `client`: The `esp_http_client` handle

**esp_err_t esp_http_client_set_url(esp_http_client_handle_t client, const char *url)**

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- `[in]` `client`: The `esp_http_client` handle
- `[in]` `url`: The URL

**esp_err_t esp_http_client_set_post_field(esp_http_client_handle_t client, const char *data, int len)**

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- `[in]` `client`: The `esp_http_client` handle
- `[in]` `data`: post data pointer
- `[in]` `len`: post length

**int esp_http_client_get_post_field(esp_http_client_handle_t client, char **data)**

Get current post field information.

**Return** Size of post data

**Parameters**
- `[in]` `client`: The client
- `[out]` `data`: Point to post data pointer

**esp_err_t esp_http_client_set_header(esp_http_client_handle_t client, const char *key, const char *value)**

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

**Return**
• ESP_OK
• ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [in] key: The header key
- [in] value: The header value

```c
esp_err_t esp_http_client_get_header(esp_http_client_handle_t client, const char *key, char **value)
```

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [in] key: The header key
- [out] value: The header value

```c
esp_err_t esp_http_client_get_username(esp_http_client_handle_t client, char **value)
```

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [out] value: The username value

```c
esp_err_t esp_http_client_set_username(esp_http_client_handle_t client, const char *username)
```

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [in] username: The username value

```c
esp_err_t esp_http_client_get_password(esp_http_client_handle_t client, char **value)
```

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [out] value: The password value

```c
esp_err_t esp_http_client_set_password(esp_http_client_handle_t client, char *password)
```

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
**Chapter 2. API Reference**

- **[in] password**: The password value

  *esp_err_t* _esp_http_client_set_method_( *esp_http_client_handle_t* client, *esp_http_client_method_t* method)

  Set http request method.

  **Return**
  - ESP_OK
  - ESP_ERR_INVALID_ARG

  **Parameters**
  - **[in]** client: The esp_http_client handle
  - **[in]** method: The method

  *esp_err_t* _esp_http_client_delete_header_( *esp_http_client_handle_t* client, *const char* key)

  Delete http request header.

  **Return**
  - ESP_OK
  - ESP_FAIL

  **Parameters**
  - **[in]** client: The esp_http_client handle
  - **[in]** key: The key

  *esp_err_t* _esp_http_client_open_( *esp_http_client_handle_t* client, *int* write_len)

  This function will be open the connection, write all header strings and return.

  **Return**
  - ESP_OK
  - ESP_FAIL

  **Parameters**
  - **[in]** client: The esp_http_client handle
  - **[in]** write_len: HTTP Content length need to write to the server

  *int* _esp_http_client_write_( *esp_http_client_handle_t* client, *const char* buffer, *int* len)

  This function will write data to the HTTP connection previously opened by esp_http_client_open().

  **Return**
  - (-1) if any errors
  - Length of data written

  **Parameters**
  - **[in]** client: The esp_http_client handle
  - buffer: The buffer
  - **[in]** len: This value must not be larger than the write_len parameter provided to esp_http_client_open()

  *int* _esp_http_client_fetch_headers_( *esp_http_client_handle_t* client)

  This function need to call after esp_http_client_open(), it will read from http stream, process all receive headers.

  **Return**
  - (0) if stream doesn’t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
  - (-1: ESP_FAIL) if any errors
  - Download data length defined by content-length header

  **Parameters**
  - **[in]** client: The esp_http_client handle

  *bool* _esp_http_client_is_chunked_response_( *esp_http_client_handle_t* client)

  Check response data is chunked.

  **Return** true or false

  **Parameters**
  - **[in]** client: The esp_http_client handle

  *int* _esp_http_client_read_( *esp_http_client_handle_t* client, *char* buffer, *int len)

  Read data from http stream.
Return
• (-1) if any errors
• Length of data was read

Parameters
• [in] client: The esp_http_client handle
• buffer: The buffer
• [in] len: The length

int esp_http_client_get_status_code (esp_http_client_handle_t client)
Get http response status code, the valid value if this function invoke after esp_http_client_perform

Return
Status code

Parameters
• [in] client: The esp_http_client handle

int esp_http_client_get_content_length (esp_http_client_handle_t client)
Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

Return
• (-1) Chunked transfer
• Content-Length value as bytes

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_close (esp_http_client_handle_t client)
Close http connection, still kept all http request resources.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_cleanup (esp_http_client_handle_t client)
This function must be the last function to call for an session. It is the opposite of the esp_http_client_init function and must be called with the same handle as input that a esp_http_client_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

esp_http_client_transport_t esp_http_client_get_transport_type (esp_http_client_handle_t client)
Get transport type.

Return
• HTTP_TRANSPORT_UNKNOWN
• HTTP_TRANSPORT_OVER_TCP
• HTTP_TRANSPORT_OVER_SSL

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_set_redirection (esp_http_client_handle_t client)
Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

Return
• ESP_OK
Chapter 2. API Reference

- ESP_FAIL

Parameters
- [in] client: The esp_http_client handle

void esp_http_client_add_auth (esp_http_client_handle_t client)
On receiving HTTP Status code 401, this API can be invoked to add authorization information.

Note: There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

Parameters
- [in] client: The esp_http_client handle

bool esp_http_client_is_complete_data_received (esp_http_client_handle_t client)
Checks if entire data in the response has been read without any error.

Return
- true
- false

Parameters
- [in] client: The esp_http_client handle

Structures

struct esp_http_client_event
  HTTP Client events data.

Public Members

esp_http_client_event_id_t event_id
  event_id, to know the cause of the event

esp_http_client_handle_t client
  esp_http_client_handle_t context

void *data
  data of the event

int data_len
  data length of data

void *user_data
  user_data context, from esp_http_client_config_t user_data

char *header_key
  For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key

char *header_value
  For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value

struct esp_http_client_config_t
  HTTP configuration.

Public Members

const char *url
  HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char *host
  Domain or IP as string

int port
  Port to connect, default depend on esp_http_client_transport_t (80 or 443)
Chapter 2. API Reference

```c
const char *username
    Using for Http authentication

const char *password
    Using for Http authentication

esp_http_client_auth_type_t auth_type
    Http authentication type, see esp_http_client_auth_type_t

const char *path
    HTTP Path, if not set, default is /

const char *query
    HTTP query

const char *cert_pem
    SSL server certification, PEM format as string, if the client requires to verify server

const char *client_cert_pem
    SSL client certification, PEM format as string, if the server requires to verify client

const char *client_key_pem
    SSL client key, PEM format as string, if the server requires to verify client

const char *user_agent
    The User Agent string to send with HTTP requests

esp_http_client_method_t method
    HTTP Method

int timeout_ms
    Network timeout in milliseconds

bool disable_auto_redirect
    Disable HTTP automatic redirects

int max_redirection_count
    Max redirection number, using default value if zero

http_event_handle_cb event_handler
    HTTP Event Handle

esp_http_client_transport_t transport_type
    HTTP transport type, see esp_http_client_transport_t

int buffer_size
    HTTP receive buffer size

int buffer_size_tx
    HTTP transmit buffer size

void *user_data
    HTTP user_data context

bool is_async
    Set asynchronous mode, only supported with HTTPS for now

bool use_global_ca_store
    Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
    Skip any validation of server certificate CN field

bool keep_alive_enable
    Enable keep-alive timeout

int keep_alive_idle
    Keep-alive idle time. Default is 5 (second)
```
int keep_alive_interval
   Keep-alive interval time. Default is 5 (second)

int keep_alive_count
   Keep-alive packet retry send count. Default is 3 counts

Macros
DEFAULT_HTTP_BUF_SIZE
ESP_ERR_HTTP_BASE
   Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT
   The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT
   Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA
   Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER
   Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT
   There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING
   HTTP connection hasn’t been established yet

ESP_ERR_HTTP_EAGAIN
   Mapping of errno EAGAIN to esp_err_t

Type Definitions
typedef struct esp_http_client *esp_http_client_handle_t
typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
   HTTP Client events data.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

Enumerations
eenum esp_http_client_event_id_t
   HTTP Client events id.

   Values:

   HTTP_EVENT_ERROR = 0
      This event occurs when there are any errors during execution

   HTTP_EVENT_ON_CONNECTED
      Once the HTTP has been connected to the server, no data exchange has been performed

   HTTP_EVENT_HEADERS_SENT
      After sending all the headers to the server

   HTTP_EVENT_HEADER_SENT = HTTP_EVENT_HEADERS_SENT
      This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

   HTTP_EVENT_ON_HEADER
      Occurs when receiving each header sent from the server

   HTTP_EVENT_ON_DATA
      Occurs when receiving data from the server, possibly multiple portions of the packet
HTTP_EVENT_ON_FINISH
Occurs when finish a HTTP session

HTTP_EVENT_DISCONNECTED
The connection has been disconnected

enum esp_http_client_transport_t
HTTP Client transport.
Values:

HTTP_TRANSPORT_UNKNOWN = 0x0
Unknown

HTTP_TRANSPORT_OVER_TCP
Transport over tcp

HTTP_TRANSPORT_OVER_SSL
Transport over ssl

enum esp_http_client_method_t
HTTP method.
Values:

HTTP_METHOD_GET = 0
HTTP GET Method

HTTP_METHOD_POST
HTTP POST Method

HTTP_METHOD_PUT
HTTP PUT Method

HTTP_METHOD_PATCH
HTTP PATCH Method

HTTP_METHOD_DELETE
HTTP DELETE Method

HTTP_METHOD_HEAD
HTTP HEAD Method

HTTP_METHOD_NOTIFY
HTTP NOTIFY Method

HTTP_METHOD_SUBSCRIBE
HTTP SUBSCRIBE Method

HTTP_METHOD_UNSUBSCRIBE
HTTP UNSUBSCRIBE Method

HTTP_METHOD_OPTIONS
HTTP OPTIONS Method

HTTP_METHOD_MAX

enum esp_http_client_auth_type_t
HTTP Authentication type.
Values:

HTTP_AUTH_TYPE_NONE = 0
No authention

HTTP_AUTH_TYPE_BASIC
HTTP Basic authentication

HTTP_AUTH_TYPE_DIGEST
HTTP Digest authentication
enum HttpStatus_Code
    Enum for the HTTP status codes.
    Values:
    HttpStatus_Ok = 200
    HttpStatus_MultipleChoices = 300
    HttpStatus_MovedPermanently = 301
    HttpStatus_Found = 302
    HttpStatus_Unauthorized = 401

2.4.4 ESP WebSocket Client

Overview
The ESP WebSocket client is an implementation of WebSocket protocol client for ESP32

Features
- supports WebSocket over TCP, SSL with mbedtls
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

Configuration

URI
- Supports ws, wss schemes
- WebSocket samples:
  - ws://websocket.org: WebSocket over TCP, default port 80
  - wss://websocket.org: WebSocket over SSL, default port 443
- Minimal configurations:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
};
```

- If there are any options related to the URI in esp_websocket_client_config_t, the option defined by the URI will be overridden. Sample:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567
```

SSL
- Get certificate from server, example: websocket.org openssl s_client -showcerts -connect websocket.org:443</dev/null 2>/dev/null|openssl x509 -outform PEM >websocket_org.pem
- Configuration:
```c
const esp_websocket_client_config_t ws_cfg = {
  .uri = "wss://websocket.org",
  .cert_pem = (const char *)websocket_org_pem_start,
};
```

For more options on `esp_websocket_client_config_t`, please refer to API reference below

**Application Example**

Simple WebSocket example that uses `esp_websocket_client` to establish a websocket connection and send/receive data with the `websocket.org` Server: `protocols/websocket`.

**API Reference**

**Header File**

- `esp_websocket_client/include/esp_websocket_client.h`

**Functions**

```c
esp_websocket_client_handle_t esp_websocket_client_init(const esp_websocket_client_config_t *config)
```

Start a Websocket session This function must be the first function to call, and it returns a `esp_websocket_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_websocket_client_destroy` when the operation is complete.

**Return**

- `esp_websocket_client_handle_t`
- `NULL` if any errors

**Parameters**

- `[in]` `config`: The configuration

```c
esp_err_t esp_websocket_client_set_uri(esp_websocket_client_handle_t client, const char *uri)
```

Set URL for client, when performing this behavior, the options in the URL will replace the old ones Must stop the WebSocket client before set URI if the client has been connected.

**Return** `esp_err_t`

**Parameters**

- `[in]` `client`: The client
- `[in]` `uri`: The uri

```c
esp_err_t esp_websocket_client_start(esp_websocket_client_handle_t client)
```

Open the WebSocket connection.

**Return** `esp_err_t`

**Parameters**

- `[in]` `client`: The client

```c
esp_err_t esp_websocket_client_stop(esp_websocket_client_handle_t client)
```

Close the WebSocket connection.

**Notes:**

- Cannot be called from the websocket event handler

**Return** `esp_err_t`

**Parameters**

- `[in]` `client`: The client

```c
esp_err_t esp_websocket_client_destroy(esp_websocket_client_handle_t client)
```

Destroy the WebSocket connection and free all resources. This function must be the last function to call for an
session. It is the opposite of the esp_websocket_client_init function and must be called with the same handle as input that a esp_websocket_client_init call returned. This might close all connections this handle has used.

Notes:
- Cannot be called from the websocket event handler

**Return** esp_err_t

**Parameters**
- [in] client: The client

```c
int esp_websocket_client_send(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)
```

Generic write data to the WebSocket connection; defaults to binary send.

**Return**
- Number of data was sent
- (-1) if any errors

**Parameters**
- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout

```c
int esp_websocket_client_send_bin(esp_websocket_client_handle_t client, const char* data, int len, TickType_t timeout)
```

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

**Return**
- Number of data was sent
- (-1) if any errors

**Parameters**
- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout

```c
int esp_websocket_client_send_text(esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)
```

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

**Return**
- Number of data was sent
- (-1) if any errors

**Parameters**
- [in] client: The client
- [in] data: The data
- [in] len: The length
- [in] timeout: Write data timeout

```c
bool esp_websocket_client_is_connected(esp_websocket_client_handle_t client)
```

Check the WebSocket connection status.

**Return**
- true
- false

**Parameters**
- [in] client: The client handle

```c
esp_err_t esp_websocket_register_events(esp_websocket_client_handle_t client,
                                        esp_websocket_event_id_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register the Websocket Events.

**Return** esp_err_t
Parameters
- **client**: The client handle
- **event**: The event id
- **event_handler**: The callback function
- **event_handler_arg**: User context

Structures

```c
struct esp_websocket_event_data_t
Websocket event data.
```

**Public Members**

```c
const char *data_ptr
Data pointer
```

```c
int data_len
Data length
```

```c
uint8_t op_code
Received opcode
```

```c
esp_websocket_client_handle_t client
esp_websocket_client_handle_t context
```

```c
void *user_context
user_data context, from esp_websocket_client_config_t user_data
```

```c
int payload_len
Total payload length, payloads exceeding buffer will be posted through multiple events
```

```c
int payload_offset
Actual offset for the data associated with this event
```

```c
struct esp_websocket_client_config_t
Websocket client setup configuration.
```

**Public Members**

```c
const char *uri
Websocket URI, the information on the URI can be overrides the other fields below, if any
```

```c
const char *host
Domain or IP as string
```

```c
int port
Port to connect, default depend on esp_websocket_transport_t (80 or 443)
```

```c
const char *username
Using for Http authentication - Not supported for now
```

```c
const char *password
Using for Http authentication - Not supported for now
```

```c
const char *path
HTTP Path, if not set, default is /
```

```c
bool disable_auto_reconnect
Disable the automatic reconnect function when disconnected
```

```c
void *user_context
HTTP user data context
```

```c
int task_prio
Websocket task priority
```
Chapter 2. API Reference

```
int task_stack
    Websocket task stack

int buffer_size
    Websocket buffer size

const char *cert_pem
    SSL Certification, PEM format as string, if the client requires to verify server

esp_websocket_transport_t transport
    Websocket transport type, see `esp_websocket_transport_t`

char *subprotocol
    Websocket subprotocol

bool keep_alive_enable
    Enable keep-alive timeout

int keep_alive_idle
    Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
    Keep-alive interval time. Default is 5 (second)

int keep_alive_count
    Keep-alive packet retry send count. Default is 3 counts
```

**Type Definitions**

typedef struct esp_websocket_client *esp_websocket_client_handle_t

**Enumerations**

enum esp_websocket_event_id_t
    Websocket Client events id.
    
    Values:
    
    WEBSOCKET_EVENT_ANY = -1
    WEBSOCKET_EVENT_ERROR = 0
        This event occurs when there are any errors during execution
    WEBSOCKET_EVENT_CONNECTED
        Once the Websocket has been connected to the server, no data exchange has been performed
    WEBSOCKET_EVENT_DISCONNECTED
        The connection has been disconnected
    WEBSOCKET_EVENT_DATA
        When receiving data from the server, possibly multiple portions of the packet

enum esp_websocket_transport_t
    Websocket Client transport.
    
    Values:
    
    WEBSOCKET_TRANSPORT_UNKNOWN = 0x0
        Transport unknown
    WEBSOCKET_TRANSPORT_OVER_TCP
        Transport over tcp
    WEBSOCKET_TRANSPORT_OVER_SSL
        Transport over ssl
2.4.5 HTTP Server

Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32. Following are detailed steps to use the API exposed by HTTP Server:

• **httpd_start()**: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing httpd_config_t structure to httpd_start(). TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

• **httpd_stop()**: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.

• **httpd_register_uri_handler()**: A URI handler is registered by passing object of type httpd_uri_t structure which has members including uri name, method type (eg. HTTPD_GET/HTTPD_POST/HTTPD_PUT etc.), function pointer of type esp_err_t *handler (httpd_req_t *req) and user_ctx pointer to user context data.

Application Example

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char[] resp = "URI GET Response";
    httpd_resp_send(req, resp, strlen(resp));
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request. *
    * httpd_req_recv() accepts char* only, but content could *
    * as well be any binary data (needs type casting). *
    * In case of string data, null termination will be absent, and *
    * content length would give length of string */
    char[100] content;
    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));
    int ret = httpd_req_recv(req, content, recv_size);
    if (ret == 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling
               * httpd_req_recv(), but to keep it simple, here we *
               * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
    }
    /* In case of error, returning ESP_FAIL will *
    * ensure that the underlying socket is closed */
    return ESP_FAIL;
}
```
(continues on next page)
/* Send a simple response */
const char[] resp = "URI POST Response";
httpd_resp_send(req, resp, strlen(resp));
return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }

    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

**Simple HTTP server example**  
Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.
Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

```c
/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session’s context if not already available */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /* Pointer to context data */
        req->free_ctx = free_ctx_func; /* Function to free context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;

    /* Respond */
    ...............
    ...............
    ...............
    return ESP_OK;
}
```

Check the example under protocols/http_server/persistent_sockets.

API Reference

Header File

- esp_http_server/include/esp_http_server.h

Functions

- `esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)`
  Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t *req)
{
    // Recv, Process and Send
    ....
    ....
    ....

    // Fail condition
    if (...) {
        /* Handle failure */
    }
}
```
// Return fail to close session //
    return ESP_FAIL;
}

// On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri = "/my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}

Note: URI handlers can be registered in real time as long as the server handle is valid.

Return
- ESP_OK: On successfully registering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL: If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS: If handler with same URI and method is already registered

Parameters
- [in] handle: handle to HTTPD server instance
- [in] uri_handler: pointer to handler that needs to be registered

esp_err_t httpd_unregister_uri_handler(httpd_handle_t handle, const char *uri, httpd_method_t method)

Unregister a URI handler.

Return
- ESP_OK: On successfully deregistering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_FOUND: Handler with specified URI and method not found

Parameters
- [in] handle: handle to HTTPD server instance
- [in] uri: URI string
- [in] method: HTTP method

esp_err_t httpd_unregister_uri(httpd_handle_t handle, const char *uri)

Unregister all URI handlers with the specified uri string.

Return
- ESP_OK: On successfully deregistering all such handlers
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_FOUND: No handler registered with specified uri string

Parameters
- [in] handle: handle to HTTPD server instance
- [in] uri: uri string specifying all handlers that need to be deregistered

esp_err_t httpd_sess_set_recv_override(httpd_handle_t hd, int sockfd, httpd_recv_func_t recv_func)

Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request
packets.

**Note** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Return**
- **ESP_OK**: On successfully registering override
- **ESP_ERR_INVALID_ARG**: Null arguments

**Parameters**
- **[in]** hd: HTTPD instance handle
- **[in]** sockfd: Session socket FD
- **[in]** recv_func: The receive function to be set for this session

```c
esp_err_t httpd_sess_set_send_override(httpd_handle_t hd, int sockfd, httpd_send_func_t send_func)
```

Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

**Note** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Return**
- **ESP_OK**: On successfully registering override
- **ESP_ERR_INVALID_ARG**: Null arguments

**Parameters**
- **[in]** hd: HTTPD instance handle
- **[in]** sockfd: Session socket FD
- **[in]** send_func: The send function to be set for this session

```c
esp_err_t httpd_sess_set_pending_override(httpd_handle_t hd, int sockfd, httpd_pending_func_t pending_func)
```

Override web server’s pending function (by session FD)

This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

**Note** This API is supposed to be called either from the context of
- an http session APIs where sockfd is a valid parameter
- a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Return**
- **ESP_OK**: On successfully registering override
- **ESP_ERR_INVALID_ARG**: Null arguments

**Parameters**
- **[in]** hd: HTTPD instance handle
- **[in]** sockfd: Session socket FD
- **[in]** pending_func: The receive function to be set for this session

```c
int httpd_req_to_sockfd(httpd_req_t *r)
```

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, i.e. **httpd_sess_get_ctx(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().**

**Note** This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

**Return**
- Socket descriptor: The socket descriptor for this request
- -1: Invalid/NULL request pointer

**Parameters**
- **[in]** r: The request whose socket descriptor should be found
**Chapter 2. API Reference**

**int httpd_req_recv (httpd_req_t *r, char *buf, size_t buf_len)**

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching ‘buf_len’ number of bytes, while the pointer to content data is incremented internally by the same number.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

**Return**
- Bytes: Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

**Parameters**
- [in] r: The request being responded to
- [in] buf: Pointer to a buffer that the data will be read into
- [in] buf_len: Length of the buffer

**size_t httpd_req_get_hdr_value_len (httpd_req_t *r, const char *field)**

Search for a field in request headers and return the string length of it’s value.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

**Parameters**
- [in] r: The request being responded to
- [in] field: The header field to be searched in the request

**esp_err_t httpd_req_get_hdr_value_str (httpd_req_t *r, const char *field, char *val, size_t val_size)**

Get the value string of a field from the request headers.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use httpd_req_get_hdr_value_len() to know the right buffer length

**Return**
- ESP_OK : Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

**Parameters**
- [in] r: The request being responded to
- [in] field: The field to be searched in the header
Chapter 2. API Reference

- [out] val: Pointer to the buffer into which the value will be copied if the field is found
- [in] val_size: Size of the user buffer “val”

size_t httpd_req_get_url_query_len(httpd_req_t *r)
Get Query string length from the request URL.

Note  This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

Return
- Length: Query is found in the request URL
- Zero: Query not found / Null arguments / Invalid request

Parameters
- [in] r: The request being responded to

esp_err_t httpd_req_get_url_query_str(httpd_req_t *r, char* buf, size_t buf_len)
Get Query string from the request URL.

Note
- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using httpd_req_get_hdr_value_str() to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use httpd_req_get_url_query_len() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

Return
- ESP_OK: Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND: Query not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC: Query string truncated

Parameters
- [in] r: The request being responded to
- [out] buf: Pointer to the buffer into which the query string will be copied (if found)
- [in] buf_len: Length of output buffer

esp_err_t httpd_query_key_value(const char* qry, const char* key, char* val, size_t val_size)
Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

Note
- The components of URL query string (keys and values) are not URLdecoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URLeencoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

Return
- ESP_OK: Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated

Parameters
- [in] qry: Pointer to query string
- [in] key: The key to be searched in the query string
- [out] val: Pointer to the buffer into which the value will be copied if the key is found
- [in] val_size: Size of the user buffer “val”

bool httpd_uri_matchWildcard(const char* uri_template, const char* uri_to_match, size_t match_until)

Submit Document Feedback
Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “?*” to make the previous character optional, and if present, allow anything to follow.

Example:

- * matches everything
- /foo/? matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?* or /foo/*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

Return true if a match was found

Parameters

- [in] uri_template: URITemplate (pattern)
- [in] uri_to_match: URITo be matched
- [in] match_upto: how many characters of the URI buffer to test (there may be trailing query string etc.)

```
esp_err_t httpd_resp_send(httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use httpd_resp_send_chunk() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

- httpd_resp_set_status() - for setting the HTTP status string
- httpd_resp_set_type() - for setting the Content Type
- httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

Parameters

- [in] r: The request being responded to
- [in] buf: Buffer from where the content is to be fetched
- [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

```
esp_err_t httpd_resp_send_chunk(httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use httpd_resp_send() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

- httpd_resp_set_status() - for setting the HTTP status string
- httpd_resp_set_type() - for setting the Content Type
- httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note
This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

When you are finished sending all your chunks, you must call this function with buf_len as 0.

Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**

- ESP_OK : On successfully sending the response packet chunk
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**

- [in] r: The request being responded to
- [in] buf: Pointer to a buffer that stores the data
- [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

```c
static esp_err_t httpd_resp_sendstr(httpd_req_t *r, const char *str)
```

API to send a complete string as HTTP response.

This API simply calls http_resp_send with buffer length set to string length assuming the buffer contains a null terminated string.

**Return**

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

**Parameters**

- [in] r: The request being responded to
- [in] str: String to be sent as response body

```c
static esp_err_t httpd_resp_sendstr_chunk(httpd_req_t *r, const char *str)
```

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string.

**Return**

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

**Parameters**

- [in] r: The request being responded to
- [in] str: String to be sent as response body (NULL to finish response packet)

```c
esp_err_t httpd_resp_set_status(httpd_req_t *r, const char *status)
```

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

**Note**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the status string is valid till send function is called.

**Return**

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
Chapter 2. API Reference

- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

**Parameters**

- [in] r: The request being responded to
- [in] status: The HTTP status code of this response

```c
esp_err_t httpd_resp_set_type(httpd_req_t *r, const char *type)
```

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

**Note**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

**Return**

- ESP_OK : On success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**

- [in] r: The request being responded to
- [in] type: The Content Type of the response

```c
esp_err_t httpd_resp_set_hdr(httpd_req_t *r, const char *field, const char *value)
```

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

**Note**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- The header isn’t sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

**Return**

- ESP_OK : On successfully appending new header
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_HDR : Total additional headers exceed max allowed
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**

- [in] r: The request being responded to
- [in] field: The field name of the HTTP header
- [in] value: The value of this HTTP header

```c
esp_err_t httpd_resp_send_err(httpd_req_t *req, httpd_err_code_t error, const char *msg)
```

For sending out error code in response to HTTP request.

**Note**

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Return**

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
Chapter 2. API Reference

- [in] req: Pointer to the HTTP request for which the response needs to be sent
- [in] error: Error type to send
- [in] msg: Error message string (pass NULL for default message)

**static esp_err_t httpd_resp_send_404 (httpd_req_t *r)**

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to

**static esp_err_t httpd_resp_send_408 (httpd_req_t *r)**

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to

**static esp_err_t httpd_resp_send_500 (httpd_req_t *r)**

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to

**int httpd_send (httpd_req_t *r, const char *buf, size_t buf_len)**

Raw HTTP send.
Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimeters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of : httpd_resp_send(), httpd_resp_send_chunk()

**Return**
- Bytes : Number of bytes that were sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

**Parameters**
- [in] r: The request being responded to
- [in] buf: Buffer from where the fully constructed packet is to be read
- [in] buf_len: Length of the buffer

```c
esp_err_t httpd_register_err_handler(httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)
```

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by httpd_err_code_t. See prototype httpd_err_handler_func_t above for details.

**Return**
- ESP_OK : handler registered successfully
- ESP_ERR_INVALID_ARG : invalid error code or server handle

**Parameters**
- [in] handle: HTTP server handle
- [in] error: Error type
- [in] handler_fn: User implemented handler function (Pass NULL to unset any previously set handler)

```c
esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)
```

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

**Example usage:**

```c
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }

    // If server failed to start, handle will be NULL
}
```

(continues on next page)
Return

- ESP_OK: Instance created successfully
- ESP_ERR_INVALID_ARG: Null argument(s)
- ESP_ERR_HTTPD_ALLOC_MEM: Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK: Failed to launch server task

Parameters

- [in] config: Configuration for new instance of the server
- [out] handle: Handle to newly created instance of the server. NULL on error

esp_err_t httpd_stop(httpd_handle_t handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle cannot be used for accessing the instance.

Example usage:

```c
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server) {
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

Return

- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Handle argument is NULL

Parameters

- [in] handle: Handle to server returned by httpd_start
- [in] work: Pointer to the function to be executed in the HTTPD’s context
- [in] arg: Pointer to the arguments that should be passed to this function

This API queues a work function for asynchronous execution

Note Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Return

- ESP_OK: On successfully queueing the work
- ESP_FAIL: Failure in ctrl socket
- ESP_ERR_INVALID_ARG: Null arguments

Parameters

- [in] handle: Handle to server returned by httpd_start
- [in] work: Pointer to the function to be executed in the HTTPD’s context
- [in] arg: Pointer to the arguments that should be passed to this function

void *httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Return

- void*: Pointer to the context associated with this session
Chapter 2. API Reference

- **NULL**: Empty context / Invalid handle / Invalid socket fd

### Parameters
- **[in]** handle: Handle to server returned by `httpd_start`
- **[in]** sockfd: The socket descriptor for which the context should be extracted.

#### void `httpd_sess_set_ctx` (httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)

Set session context by socket descriptor.

**Parameters**
- **[in]** handle: Handle to server returned by `httpd_start`
- **[in]** sockfd: The socket descriptor for which the context should be extracted.
- **[in]** ctx: Context object to assign to the session
- **[in]** free_fn: Function that should be called to free the context

#### void *`httpd_sess_get_transport_ctx` (httpd_handle_t handle, int sockfd)

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

**See** `httpd_sess_get_ctx()`

**Return**
- **void**: Pointer to the transport context associated with this session
- **NULL**: Empty context / Invalid handle / Invalid socket fd

**Parameters**
- **[in]** handle: Handle to server returned by `httpd_start`
- **[in]** sockfd: The socket descriptor for which the context should be extracted.

#### void `httpd_sess_set_transport_ctx` (httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)

Set session ‘transport’ context by socket descriptor.

**See** `httpd_sess_set_ctx()`

**Parameters**
- **[in]** handle: Handle to server returned by `httpd_start`
- **[in]** sockfd: The socket descriptor for which the context should be extracted.
- **[in]** ctx: Transport context object to assign to the session
- **[in]** free_fn: Function that should be called to free the transport context

#### void *`httpd_get_global_user_ctx` (httpd_handle_t handle)

Get HTTPD global user context (it was set in the server config struct)

**Return** global user context

**Parameters**
- **[in]** handle: Handle to server returned by `httpd_start`

#### void *`httpd_get_global_transport_ctx` (httpd_handle_t handle)

Get HTTPD global transport context (it was set in the server config struct)

**Return** global transport context

**Parameters**
- **[in]** handle: Handle to server returned by `httpd_start`

**esp_err_t** `httpd_sess_trigger_close` (httpd_handle_t handle, int sockfd)

Trigger an httpd session close externally.

**Note** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

**Return**
- **ESP_OK**: On successfully initiating closure
- **ESP_FAIL**: Failure to queue work
- **ESP_ERR_NOT_FOUND**: Socket fd not found
- **ESP_ERR_INVALID_ARG**: Null arguments

**Parameters**
- **[in]** handle: Handle to server returned by `httpd_start`
Chapter 2. API Reference

- [in] sockfd: The socket descriptor of the session to be closed

```c
esp_err_t httpd_sess_update_lru_counter(httpd_handle_t handle, int sockfd)
```

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note** Calling this API is only necessary if the LRU Purge Enable option is enabled.

**Return**
- ESP_OK : Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND : Socket not found
- ESP_ERR_INVALID_ARG : Null arguments

**Parameters**
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor of the session for which LRU counter is to be updated

**Structures**

```c
struct httpd_config
```

HTTP Server Configuration Structure.

**Note** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

**Public Members**

- unsigned **task_priority**: Priority of FreeRTOS task which runs the server
- size_t **stack_size**: The maximum stack size allowed for the server task
- BaseType_t **core_id**: The core the HTTP server task will run on
- uint16_t **server_port**: TCP Port number for receiving and transmitting HTTP traffic
- uint16_t **ctrl_port**: UDP Port number for asynchronously exchanging control signals between various components of the server
- uint16_t **max_open_sockets**: Max number of sockets/clients connected at any time
- uint16_t **max_uri_handlers**: Maximum allowed uri handlers
- uint16_t **max_resp_headers**: Maximum allowed additional headers in HTTP response
- uint16_t **backlog_conn**: Number of backlog connections
- bool **lru_purge_enable**: Purge “Least Recently Used” connection
Chapter 2. API Reference

**uint16_t recv_wait_timeout**
Timeout for recv function (in seconds)

**uint16_t send_wait_timeout**
Timeout for send function (in seconds)

**void *global_user_ctx**
Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

**httpd_free_ctx_fn_t global_user_ctx_free_fn**
Free function for global user context

**void *global_transport_ctx**
Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

**httpd_free_ctx_fn_t global_transport_ctx_free_fn**
Free function for global transport context

**httpd_open_func_t open_fn**
Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the send/recv/pending session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`.

Returning a value other than ESP_OK will immediately close the new socket.

**httpd_close_func_t close_fn**
Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

**httpd_uri_match_func_t uri_match_fn**
URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`.

Available options are: 1) NULL : Internally do basic matching using `strncpy()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

**struct httpd_req**
HTTP Request Data Structure.
Public Members

`httpd_handle_t handle`  
Handle to server instance

`int method`  
The type of HTTP request, -1 if unsupported method

`const char uri[HTTPD_MAX_URI_LEN + 1]`  
The URI of this request (1 byte extra for null termination)

`size_t content_len`  
Length of the request body

`void *aux`  
Internally used members

`void *user_ctx`  
User context pointer passed during URI registration.

`void *sess_ctx`  
Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

`httpd_free_ctx_fn_t free_ctx`  
Pointer to free context hook

Function to free session context

If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member.
If you wish to use a custom function for freeing the session context, please specify that here.

`bool ignore_sess_ctx_changes`  
Flag indicating if Session Context changes should be ignored

By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

`struct httpd_uri`  
Structure for URI handler.

Public Members

`const char *uri`  
The URI to handle

`httpd_method_t method`  
Method supported by the URI

`esp_err_t (*handler)(httpd_req_t *r)`  
Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

`void *user_ctx`  
Pointer to user context data which will be available to handler
Macros

HTTPD_MAX_REQ_HDR_LEN
HTTPD_MAX_URI_LEN
HTTPD_SOCK_ERR_FAIL
HTTPD_SOCK_ERR_INVALID

  HTTP Content type JSON
HTTPD_TYPE_TEXT
  HTTP Content type text/HTML
HTTPD_TYPE_OCTET
  HTTP Content type octet-stream
HTTPD_DEFAULT_CONFIG()
ESP_ERR_HTTPD_BASE
  Starting number of HTTPD error codes
ESP_ERR_HTTPD_HANDLERS_FULL
  All slots for registering URI handlers have been consumed
ESP_ERR_HTTPD_HANDLER_EXISTS
  URI handler with same method and target URI already registered
ESP_ERR_HTTPD_INVALID_REQ
  Invalid request pointer
ESP_ERR_HTTPD_RESULT_TRUNC
  Result string truncated
ESP_ERR_HTTPD_RESP_HDR
  Response header field larger than supported
ESP_ERR_HTTPD_RESP_SEND
  Error occurred while sending response packet
ESP_ERR_HTTPD_ALLOC_MEM
  Failed to dynamically allocate memory for resource
ESP_ERR_HTTPD_TASK
  Failed to launch server task/thread
HTTPD_RESP_USE_STRLEN
Type Definitions

typedef struct httpd_req httpd_req_t
HTTP Request Data Structure.

typedef struct httpd_uri httpd_uri_t
Structure for URI handler.

typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
Prototype for HTTPD's low-level send function.

Note User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function.

Return
- Bytes: The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
Prototype for HTTPD's low-level recv function.

Note User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function.

Return
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
Prototype for HTTPD's low-level "get pending bytes" function.

Note User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

Return
- Bytes: The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket pending()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor

typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
Function prototype for HTTP error handling.
This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

**Note**
- If implemented, the server will not automatically send out HTTP error response codes, therefore, `httpd_res_send_err()` must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of `uri`, `method`, `content_len` and `user_ctx` fields of the `httpd_req_t` parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type `HTTPD_500_INTERNAL_SERVER_ERROR` and the socket closed anyway.

**Return**
- ESP_OK : error handled successful
- ESP_FAIL : failure indicates that the underlying socket needs to be closed

**Parameters**
- `[in] req`: HTTP request for which the error needs to be handled
- `[in] error`: Error type

```c
typedef void *httpd_handle_t
HTTP Server Instance Handle.
```

Every instance of the server will have a unique handle.

```c
typedef enum http_method httpd_method_t
HTTP Method Type wrapper over "enum http_method" available in "http_parser" library.
```

```c
typedef void (*httpd_free_ctx_fn_t)(void *ctx)
Prototype for freeing context data (if any)
```

**Parameters**
- `[in] ctx`: object to free

```c
typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for opening a session.
```

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Return**
- ESP_OK : On success
- Any value other than ESP_OK will signal the server to close the socket immediately

**Parameters**
- `[in] hd`: server instance
- `[in] sockfd`: session socket file descriptor

```c
typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for closing a session.
```

**Note** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

**Parameters**
- `[in] hd`: server instance
- `[in] sockfd`: session socket file descriptor

```c
typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
Function prototype for URI matching.
```

**Return** true on match

**Parameters**
- `[in] reference_uri`: URI/template with respect to which the other URI is matched
- `[in] uri_to_match`: URI/template being matched to the reference URI/template
• [in] match_upto: For specifying the actual length of uri_to_match up to which the matching algorithm is to be applied (The maximum value is strlen(uri_to_match), independent of the length of reference_uri)

```c
typedef struct httpd_config httpd_config_t
    HTTP Server Configuration Structure.
```

**Note** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

```c
typedef void(*httpd_work_fn_t)(void *arg)
    Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.
```

**Parameters**
• [in] arg: The arguments for this work function

**Enumerations**

```c
defined httpd_err_code_t
    Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.
```

**Values:**

- HTTPD_500_INTERNAL_SERVER_ERROR = 0
- HTTPD_501_METHOD_NOT_IMPLEMENTED
- HTTPD_505_VERSION_NOT_SUPPORTED
- HTTPD_400_BAD_REQUEST
- HTTPD_404_NOT_FOUND
- HTTPD_405_METHOD_NOT_ALLOWED
- HTTPD_408_REQ_TIMEOUT
- HTTPD_411_LENGTH_REQUIRED
- HTTPD_414_URI_TOO_LONG
- HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE
- HTTPD_ERR_CODE_MAX

### 2.4.6 HTTPS server

**Overview**

This component is built on top of esp_http_server. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for esp_http_server applies also to a server you create this way.

**Used APIs**

The following API of esp_http_server should not be used with esp_https_server, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
  - httpd_sess_set_send_override()
  - httpd_sess_set_recv_override()
  - httpd_sess_set_pending_override()
- “transport context” - both global and session
  - httpd_sess_get_transport_ctx() - returns SSL used for the session
  - httpd_sess_set_transport_ctx()
Chapter 2. API Reference

- `httpd_get_global_transport_ctx()` - returns the shared SSL context
- `httpd_config_t.global_transport_ctx`
- `httpd_config_t.global_transport_ctx_free_fn`
- `httpd_config_t.open_fn` - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example `protocols/https_server` to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config.transport_mode`. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

- `esp_https_server/include/esp_https_server.h`

Functions

```c
esp_err_t httpd_ssl_start(httpd_handle_t *handle, httpd_ssl_config_t *config)
```

Create a SSL capable HTTP server (secure mode may be disabled in config)

**Return** success

**Parameters**

- [inout] config: - server config, must not be const. Does not have to stay valid after calling this function.
- [out] handle: - storage for the server handle, must be a valid pointer

```c
void httpd_ssl_stop(httpd_handle_t handle)
```

Stop the server. Blocks until the server is shut down.

**Parameters**

- [in] handle:

Structures

```c
struct httpd_ssl_config
```

HTTPS server config struct

Please use `HTTPD_SSL_CONFIG_DEFAULT()` to initialize it.

Public Members

```c
httpd_config_t httpd
```

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.
Chapter 2. API Reference

```c
const uint8_t *cacert_pem
    CA certificate
size_t cacert_len
    CA certificate byte length
const uint8_t *prvtkey_pem
    Private key
size_t prvtkey_len
    Private key byte length
httpd_ssl_transport_mode_t transport_mode
    Transport Mode (default secure)
uint16_t port_secure
    Port used when transport mode is secure (default 443)
uint16_t port_insecure
    Port used when transport mode is insecure (default 80)
```

**Macros**

HTTPD_SSL_CONFIG_DEFAULT ()

Default config struct init

(http_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to `transport_mode`
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

**Type Definitions**

typedef struct httpd_ssl_config httpd_ssl_config_t

**Enumerations**

derive httpd_ssl_transport_mode_t

Values:

`HTTPD_SSL_TRANSPORT_SECURE`

`HTTPD_SSL_TRANSPORT_INSECURE`

2.4.7 ASIO port

**Overview**

Asio is a cross-platform C++ library, see [https://think-async.com](https://think-async.com). It provides a consistent asynchronous model using a modern C++ approach.

**ASIO documentation** Please refer to the original asio documentation at [https://think-async.com/Asio/Documentation](https://think-async.com/Asio/Documentation). Asio also comes with a number of examples which could be find under Documentation/Examples on that web site.
Supported features  ESP platform port currently supports only network asynchronous socket operations; does not support serial port and ssl. Internal asio settings for ESP include - EXCEPTIONS: Supported, choice in menuconfig - SIGNAL, SIGACTION: Not supported - EPOLL, EVENTFD: Not supported - TYPEID: Disabled by default, but supported in toolchain and asio (provided stdlib recompiled with -frtti)

Application Example

ESP examples are based on standard asio examples examples/protocols/asio: - udp_echo_server - tcp_echo_server - chat_client - chat_server Please refer to the specific example README.md for details

2.4.8 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

- supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

- protocols/mqtt/tcp: MQTT over tcp, default port 1883
- protocols/mqtt/ssl: MQTT over tcp, default port 8883
- protocols/mqtt/ws: MQTT over Websocket, default port 80
- protocols/mqtt/wss: MQTT over Websocket Secure, default port 443

Configuration

URI

- Currently support mqtt, mqtts, ws, wss schemes
- MQTT over TCP samples:
  - mqtt://mqtt.eclipse.org: MQTT over TCP, default port 1883:
  - mqtt://mqtt.eclipse.org:1884 MQTT over TCP, port 1884:
  - mqtt://username:password@mqtt.eclipse.org:1884 MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - mqtts://mqtt.eclipse.org: MQTT over SSL, port 8883
  - mqtts://mqtt.eclipse.org:8884: MQTT over SSL, port 8884
- MQTT over Websocket samples:
  - ws://mqtt.eclipse.org:80/mqtt
- MQTT over Websocket Secure samples:
  - wss://mqtt.eclipse.org:443/mqtt
- Minimal configurations:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipse.org",
    // .user_context = (void *)your_context
};
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler, ...
+-client);
esp_mqtt_client_start(client);
```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)
- If there are any options related to the URI in esp_mqtt_client_config_t, the option defined by the URI will be overridden. Sample:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipse.org:1234",
    .port = 4567,
};
//MQTT client will connect to mqtt.eclipse.org using port 4567
```

SSL

- Get certificate from server, example: mqtt.eclipse.org openssl s_client -showcerts -connect mqtt.eclipse.org:8883 </dev/null 2>/dev/null |openssl x509 -outform PEM >mqtt_eclipse_org.pem
- Check the sample application: examples/mqtt_ssl
- Configuration:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtts://mqtt.eclipse.org:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char*)mqtt_eclipse_org_pem_start,
};
```

For more options on esp_mqtt_client_config_t, please refer to API reference below

**Change settings in Project Configuration Menu**
```
:: idf.py menuconfig -> Component config -> ESP-MQTT Configuration
```
- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL, CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

**API Reference**

**Header File**
```
- mqtt/esp-mqtt/include/mqtt_client.h
```

**Functions**

- `esp_mqtt_client_handle_t esp_mqtt_client_init (const esp_mqtt_client_config_t *config)`
  Creates mqtt client handle based on the configuration.

  **Return** mqtt_client_handle if successfully created, NULL on error

  **Parameters**
  - *config: mqtt configuration structure

- `esp_err_t esp_mqtt_client_set_uri (esp_mqtt_client_handle_t client, const char *uri)`
  Sets mqtt connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.
Return ESP_FAIL if URI parse error, ESP_OK on success

Parameters
- client: mqtt client handle
- uri:

```c
esp_err_t esp_mqtt_client_start (esp_mqtt_client_handle_t client)
```

Starts mqtt client with already created client handle.

Return ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

Parameters
- client: mqtt client handle

```c
esp_err_t esp_mqtt_client_reconnect (esp_mqtt_client_handle_t client)
```

This api is typically used to force reconnection upon a specific event.

Return ESP_OK on success ESP_FAIL if client is in invalid state

Parameters
- client: mqtt client handle

```c
esp_err_t esp_mqtt_client_disconnect (esp_mqtt_client_handle_t client)
```

This api is typically used to force disconnection from the broker.

Return ESP_OK on success

Parameters
- client: mqtt client handle

```c
esp_err_t esp_mqtt_client_stop (esp_mqtt_client_handle_t client)
```

Stops mqtt client tasks.

Notes:
- Cannot be called from the mqtt event handler

Return ESP_OK on success ESP_FAIL if client is in invalid state

Parameters
- client: mqtt client handle

```c
int esp_mqtt_client_subscribe (esp_mqtt_client_handle_t client, const char *topic, int qos)
```

Subscribe the client to defined topic with defined qos.

Notes:
- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

Return message_id of the subscribe message on success -1 on failure

Parameters
- client: mqtt client handle
- topic:
- qos:

```c
int esp_mqtt_client_unsubscribe (esp_mqtt_client_handle_t client, const char *topic)
```

Unsubscribe the client from defined topic.

Notes:
- Client must be connected to send unsubscribe message
- It is thread safe, please refer to esp_mqtt_client_subscribe for details

Return message_id of the subscribe message on success -1 on failure

Parameters
- client: mqtt client handle
- topic:

```c
int esp_mqtt_client_publish (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)
```

Client to send a publish message to the broker.
Notes:
- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation).
- Client doesn’t have to be connected for this API to work, enqueuing the messages with qos=1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to esp_mqtt_client_subscribe for details.

Return message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

Parameters
- client: mqtt client handle
- topic: topic string
- data: payload string (set to NULL, sending empty payload message)
- len: data length, if set to 0, length is calculated from payload string
- qos: qos of publish message
- retain: retain flag

int esp_mqtt_client_enqueue (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

Return message_id if queued successfully, -1 otherwise

Parameters
- client: mqtt client handle
- topic: topic string
- data: payload string (set to NULL, sending empty payload message)
- len: data length, if set to 0, length is calculated from payload string
- qos: qos of publish message
- retain: retain flag
- store: if true, all messages are enqueued; otherwise only qos1 and qos 2 are enqueued

esp_err_t esp_mqtt_client_destroy (esp_mqtt_client_handle_t client)

Destroys the client handle.

Notes:
- Cannot be called from the mqtt event handler

Return ESP_OK

Parameters
- client: mqtt client handle

esp_err_t esp_mqtt_set_config (esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event).

Return ESP_ERR_NO_MEM if failed to allocate ESP_OK on success

Parameters
- client: mqtt client handle
- config: mqtt configuration structure

esp_err_t esp_mqtt_client_register_event (esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)

Registers mqtt event.

Return ESP_ERR_NO_MEM if failed to allocate ESP_OK on success
**Parameters**

- **client**: mqtt client handle
- **event**: event type
- **event_handler**: handler callback
- **event_handler_arg**: handlers context

```
int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)
```

Get outbox size.

**Return**

outbox size

**Parameters**

- **client**: mqtt client handle

---

**Structures**

**struct esp_mqtt_error_codes**

MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
<th>source</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>esp_tls_last esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno</td>
<td>Error reported from tcp_transport/esp-tls</td>
<td>Internal error reported from MQTT broker on connection</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Error reported from MQTTbroker on connection</td>
<td></td>
</tr>
</tbody>
</table>

**Public Members**

- **esp_err_t esp_tls_last_err**: last esp_err code reported from esp-tls component
- **int esp_tls_stack_err**: tls specific error code reported from underlying tls stack
- **int esp_tls_cert_verify_flags**: tls flags reported from underlying tls stack during certificate verification
- **esp_mqtt_error_type_t error_type**: error type referring to the source of the error
- **esp_mqtt_connect_return_code_t connect_return_code**: connection refused error code reported from MQTT broker on connection
- **int esp_transport_sock_errno**: errno from the underlying socket

**struct esp_mqtt_event_t**

MQTT event configuration structure

**Public Members**

- **esp_mqtt_event_id_t event_id**: MQTT event type
- **esp_mqtt_client_handle_t client**: MQTT client handle for this event
- **void *user_context**: User context passed from MQTT client config
char *data
Data associated with this event

int data_len
Length of the data for this event

int total_data_len
Total length of the data (longer data are supplied with multiple events)

int current_data_offset
Actual offset for the data associated with this event

char *topic
Topic associated with this event

int topic_len
Length of the topic for this event associated with this event

int msg_id
MQTT message id of message

int session_present
MQTT session_present flag for connection event

.esp_mqtt_error_codes_t *error_handle
esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

struct esp_mqtt_client_config_t
MQTT client configuration structure

Public Members

mqtt_event_callback_t event_handle
handle for MQTT events as a callback in legacy mode

esp_event_loop_handle_t event_loop_handle
handle for MQTT event loop library

const char *host
MQTT server domain (ipv4 as string)

const char *uri
Complete MQTT broker URI

uint32_t port
MQTT server port

const char *client_id
default client id is ESP32_CHIPID\% where CHIPID\% are last 3 bytes of MAC address in hex format

const char *username
MQTT username

const char *password
MQTT password

const char *lwt_topic
LWT (Last Will and Testament) message topic (NULL by default)

const char *lwt_msg
LWT message (NULL by default)

int lwt_qos
LWT message qos

int lwt_retain
LWT retained message flag
int lwt_msg_len
    LWT message length

int disable_clean_session
    mqtt clean session, default clean_session is true

int keepalive
    mqtt keepalive, default is 120 seconds

bool disable_auto_reconnect
    this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

void *user_context
    pass user context to this option, then can receive that context in event->user_context

int task_prio
    MQTT task priority, default is 5, can be changed in make menuconfig

int task_stack
    MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig

int buffer_size
    size of MQTT send/receive buffer, default is 1024 (only receive buffer size if out_buffer_size defined)

const char *cert_pem
    Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
    Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t client_cert_len
    Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
    Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len

size_t client_key_len
    Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_mqtt_transport_t transport
    overrides URI transport

int refresh_connection_after_ms
    Refresh connection after this value (in milliseconds)

const struct psk_key_hint *psk_hint_key
    Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

bool use_global_ca_store
    Use a global ca_store for all the connections in which this bool is set.

int reconnect_timeout_ms
    Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)
**Chapter 2. API Reference**

```c
const char **alpn_protos
    NULL-terminated list of supported application protocols to be used for ALPN

const char *clientkey_password
    Client key decryption password string

int clientkey_password_len
    String length of the password pointed to by clientkey_password

esp_mqtt_protocol_ver_t protocol_ver
    MQTT protocol version used for connection, defaults to value from menuconfig

int out_buffer_size
    size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as buffer_size

bool skip_cert_common_name_check
    Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

bool use_secure_element
    enable secure element for enabling SSL connection

void *ds_data
    carrier of handle for digital signature parameters

int network_timeout_ms
    Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

bool disable_keepalive
    Set disable_keepalive=true to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period
```

**Macros**

```c
MQTT_ERROR_TYPE_ESP_TLS
    MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility
```

**Type Definitions**

```c
typedef struct esp_mqtt_client *esp_mqtt_client_handle_t

typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
    MQTT error code structure to be passed as a contextual information into ERROR event.

    Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

    Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

    | error_type | related member variables | note | | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_error, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from tcp_transport/esp-tls | | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |
```

```c
typedef esp_mqtt_event_t *esp_mqtt_event_handle_t

typedef esp_err_t (*esp_mqtt_event_callback_t)(esp_mqtt_event_handle_t event)
```
Enumerations

enum esp_mqtt_event_id_t
MQTT event types.

User event handler receives context data in `esp_mqtt_event_t` structure with

- `user_context` - user data from `esp_mqtt_client_config_t`
- `client` - mqtt client handle
- various other data depending on event type

Values:

**MQTT_EVENT_ANY** = -1

**MQTT_EVENT_ERROR** = 0
on error event, additional context: connection return code, error handle from `esp_tls` (if supported)

**MQTT_EVENT_CONNECTED**
connected event, additional context: session_present flag

**MQTT_EVENT_DISCONNECTED**
disconnected event

**MQTT_EVENT_SUBSCRIBED**
subscribed event, additional context: msg_id

**MQTT_EVENT_UNSUBSCRIBED**
unsubscribed event

**MQTT_EVENT_PUBLISHED**
published event, additional context: msg_id

**MQTT_EVENT_DATA**
data event, additional context:

- `msg_id` message id
- `topic` pointer to the received topic
- `topic_len` length of the topic
- `data` pointer to the received data
- `data_len` length of the data for this event
- `current_data_offset` offset of the current data for this event
- `total_data_len` total length of the data received Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

**MQTT_EVENT_BEFORE_CONNECT**
The event occurs before connecting

**MQTT_EVENT_DELETED**
Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
- Additional context: msg_id (id of the deleted message).

enum esp_mqtt_connect_return_code_t
MQTT connection error codes propagated via ERROR event

Values:

**MQTT_CONNECTION_ACCEPTED** = 0
Connection accepted

**MQTT_CONNECTION_REFUSE_PROTOCOL**
MQTT connection refused reason: Wrong protocol

**MQTT_CONNECTION_REFUSE_ID_REJECTED**
MQTT connection refused reason: ID rejected
MQTT\_CONNECTION\_REFUSE\_SERVER\_UNAVAILABLE
MQTT connection refused reason: Server unavailable

MQTT\_CONNECTION\_REFUSE\_BAD\_USERNAME
MQTT connection refused reason: Wrong user

MQTT\_CONNECTION\_REFUSE\_NOT\_AUTHORIZED
MQTT connection refused reason: Wrong username or password

enum esp\_mqtt\_error\_type\_t
MQTT connection error codes propagated via ERROR event

Values:

MQTT\_ERROR\_TYPE\_NONE = 0

MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT

MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED

enum esp\_mqtt\_transport\_t
Values:

MQTT\_TRANSPORT\_UNKNOWN = 0x0

MQTT\_TRANSPORT\_OVER\_TCP
MQTT over TCP, using scheme: mqtt

MQTT\_TRANSPORT\_OVER\_SSL
MQTT over SSL, using scheme: mqtts

MQTT\_TRANSPORT\_OVER\_WS
MQTT over Websocket, using scheme: ws

MQTT\_TRANSPORT\_OVER\_WSS
MQTT over Websocket Secure, using scheme: wss

enum esp\_mqtt\_protocol\_ver\_t
MQTT protocol version used for connection

Values:

MQTT\_PROTOCOL\_UNDEFINED = 0

MQTT\_PROTOCOL\_V\_3\_1

MQTT\_PROTOCOL\_V\_3\_1\_1

2.4.9 ESP-Modbus

Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:

- **Modbus RTU** —This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.
• Modbus ASCII — This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon (":" ) and trailing newline (CR/LF).
• Modbus TCP/IP or Modbus TCP — This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.

Modbus common interface API overview The API functions below provide common functionality to setup Modbus stack for slave and master implementation accordingly. ISP-IDF supports Modbus serial slave and master protocol stacks and provides modbus_controller interface API to interact with user application.

**esp_err_t mbc_slave_init (mb_port_type_t port_type, void **handler)**
Initialize Modbus controller and stack.

Return
• ESP_OK Success
• ESP_ERR_NO_MEM Parameter error

Parameters
• [out] handler: handler(pointer) to master data structure
• [in] port_type: type of stack

**esp_err_t mbc_master_init (mb_port_type_t port_type, void **handler)**
Initialize Modbus controller and stack.

Return
• ESP_OK Success
• ESP_ERR_NO_MEM Parameter error

Parameters
• [out] handler: handler(pointer) to master data structure
• [in] port_type: the type of port

The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

**esp_err_t mbc_slave_setup (void *comm_info)**
Set Modbus communication parameters for the controller.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Incorrect parameter data

Parameters
• comm_info: Communication parameters structure.

**esp_err_t mbc_master_setup (void *comm_info)**
Set Modbus communication parameters for the controller.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Incorrect parameter data

Parameters
• comm_info: Communication parameters structure.

The function is used to setup communication parameters of the Modbus stack. See the Modbus controller API documentation for more information.

**mbc_slave_set_descriptor();** Initialization of slave descriptor.

**mbc_master_set_descriptor();** Initialization of master descriptor.

The Modbus stack uses parameter description tables (descriptors) for communication. These are different for master and slave implementation of stack and should be assigned by the API call before start of communication.

**esp_err_t mbc_slave_start (void)**
Start Modbus communication stack.
Chapter 2. API Reference

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Modbus stack start error

`esp_err_t mbc_master_start (void)`
Start Modbus communication stack.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Modbus stack start error

Modbus controller start function. Starts stack and interface and allows communication.

`esp_err_t mbc_slave_destroy (void)`
Destroy Modbus controller and stack.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE Parameter error

`esp_err_t mbc_master_destroy (void)`
Destroy Modbus controller and stack.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE Parameter error

This function stops Modbus communication stack and destroys controller interface.

There are some configurable parameters of modbus_controller interface and Modbus stack that can be configured using KConfig values in “Modbus configuration” menu. The most important option in KConfig menu is “Selection of Modbus stack support mode” that allows to select master or slave stack for implementation. See the examples for more information about how to use these API functions.

Modbus serial slave interface API overview

The slave stack requires the user defined structures which represent Modbus parameters accessed by stack. These structures should be prepared by user and be assigned to the modbus_controller interface using `mbc_slave_set_descriptor()` API call before start of communication. The interface API functions below are used for Modbus slave application:

`esp_err_t mbc_slave_set_descriptor (mb_register_area_descriptor_t descr_data)`
Set Modbus area descriptor.

Return
- ESP_OK: The appropriate descriptor is set
- ESP_ERR_INVALID_ARG: The argument is incorrect

Parameters
- `descr_data`: Modbus registers area descriptor structure

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the `mbc_slave_start()` API is called the Modbus stack can access the data in user data structures by request from master. See the `mb_register_area_descriptor_t` and example for more information.

`mb_event_group_t mbc_slave_check_event (mb_event_group_t group)`
Wait for specific event on parameter change.

Return
- `mb_event_group_t` event bits triggered

Parameters
- `group`: Group event bit mask to wait for change

The blocking call to function waits for event specified in the input parameter as event mask. Once master access the parameter and event mask matches the parameter the application task will be unblocked and function will return ESP_OK. See the `mb_event_group_t` for more information about Modbus event masks.
Chapter 2. API Reference

`esp_err_t mbc_slave_get_param_info(mb_param_info_t *reg_info, uint32_t timeout)`

Get parameter information.

**Return**
- ESP_OK Success
- ESP_ERR_TIMEOUT Can not get data from parameter queue or queue overflow

**Parameters**
- [out] reg_info: parameter info structure
- timeout: Timeout in milliseconds to read information from parameter queue

The function gets information about accessed parameters from modbus controller event queue. The KConfig ‘CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE’ key can be used to configure the notification queue size. The timeout parameter allows to specify timeout for waiting notification. The `mb_param_info_t` structure contains information about accessed parameter.

**Modbus serial master interface API overview**

The Modbus master implementation requires parameter description table to be defined before start of stack. This table describes characteristics (physical parameters like temperature, humidity, etc.) and links them to Modbus registers in specific slave device in the Modbus segment. The table has to be assigned to the modbus_controller interface using `mbc_master_set_descriptor()` API call before start of communication.

Below are the interface API functions that are used to setup and use Modbus master stack from user application and can be executed in next order:

`esp_err_t mbc_master_set_descriptor(const mb_parameter_descriptor_t *descriptor, const uint16_t num_elements)`

Assign parameter description table for Modbus controller interface.

**Return**
- esp_err_t ESP_OK - set descriptor successfully
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument in function call

**Parameters**
- [in] descriptor: pointer to parameter description table
- num_elements: number of elements in the table

Assigns parameter description table for Modbus controller interface. The table has to be prepared by user according to particular

`esp_err_t mbc_master_send_request(mb_param_request_t *request, void *data_ptr)`

Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.

**Return**
- esp_err_t ESP_OK - request was successful
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
- esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
- esp_err_t ESP_ERR_TIMEOUT - operation timeout or no response from slave
- esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP_FAIL - slave returned an exception or other failure

**Parameters**
- [in] request: pointer to request structure of type `mb_param_request_t`
- [in] data_ptr: pointer to data buffer to send or received data (dependent of command field in request)

This function sends data request as defined in parameter request, waits response from corresponded slave and returns status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

`esp_err_t mbc_master_get_cid_info(uint16_t cid, const mb_parameter_descriptor_t **param_info)`

Get information about supported characteristic defined as cid. Uses parameter description table to get this information. The function will check if characteristic defined as a cid parameter is supported and returns its description in param_info. Returns ESP_ERR_NOT_FOUND if characteristic is not supported.
### Return

- `esp_err_t ESP_OK` - request was successful and buffer contains the supported characteristic name
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function
- `esp_err_t ESP_ERR_NOT_FOUND` - the characteristic (cid) not found
- `esp_err_t ESP_FAIL` - unknown error during lookup table processing

### Parameters

- `[in] cid`: characteristic id
- `[param_info]`: pointer to pointer of characteristic data.

The function gets information about supported characteristic defined as cid. It will check if characteristic is supported and returns its description.

### `esp_err_t mbc_master_get_parameter` (uint16_t cid, char *name, uint8_t *value, uint8_t *type)

Read parameter from modbus slave device whose name is defined by name and has cid. The additional data for request is taken from parameter description (lookup) table.

#### Return

- `esp_err_t ESP_OK` - request was successful and value buffer contains representation of actual parameter data from slave
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function or parameter descriptor
- `esp_err_t ESP_ERR_INVALID_RESPONSE` - an invalid response from slave
- `esp_err_t ESP_ERR_INVALID_STATE` - invalid state during data processing or allocation failure
- `esp_err_t ESP_ERR_TIMEOUT` - operation timed out and no response from slave
- `esp_err_t ESP_ERR_NOT_SUPPORTED` - the request command is not supported by slave
- `esp_err_t ESP_ERR_NOT_FOUND` - the parameter is not found in the parameter description table
- `esp_err_t ESP_FAIL` - slave returned an exception or other failure

#### Parameters

- `[in] cid`: id of the characteristic for parameter
- `[in] name`: pointer into string name (key) of parameter (null terminated)
- `[out] value`: pointer to data buffer of parameter
- `[out] type`: parameter type associated with the name returned from parameter description table.

The function reads data of characteristic defined in parameters from Modbus slave device and returns its data. The additional data for request is taken from parameter description table.

### `esp_err_t mbc_master_set_parameter` (uint16_t cid, char *name, uint8_t *value, uint8_t *type)

Set characteristic`s value defined as a name and cid parameter. The additional data for cid parameter request is taken from master parameter lookup table.

#### Return

- `esp_err_t ESP_OK` - request was successful and value was saved in the slave device registers
- `esp_err_t ESP_ERR_INVALID_ARG` - invalid argument of function or parameter descriptor
- `esp_err_t ESP_ERR_INVALID_RESPONSE` - an invalid response from slave during processing of parameter
- `esp_err_t ESP_ERR_INVALID_STATE` - invalid state during data processing or allocation failure
- `esp_err_t ESP_ERR_TIMEOUT` - operation timed out and no response from slave
- `esp_err_t ESP_ERR_NOT_SUPPORTED` - the request command is not supported by slave
- `esp_err_t ESP_FAIL` - slave returned an exception or other failure

#### Parameters

- `[in] cid`: id of the characteristic for parameter
- `[in] name`: pointer into string name (key) of parameter (null terminated)
- `[out] value`: pointer to data buffer of parameter (actual representation of json value field in binary form)
- `[out] type`: pointer to parameter type associated with the name returned from parameter lookup table.

The function writes characteristic`s value defined as a name and cid parameter in corresponded slave device. The additional data for parameter request is taken from master parameter description table.
Chapter 2. API Reference

Application Example

The examples below use the FreeModbus library port for slave and master implementation accordingly. The selection of stack is performed through KConfig menu “Selection of Modbus stack support mode” and related configuration keys.

protocols/modbus_slave
protocols/modbus_master

Please refer to the specific example README.md for details.

Modbus Readme File

# Modbus assumptions, dependencies and constraints

1. Current implementation of Modbus has limitation: maximum frame size should be less than 120 bytes (default UART receive FIFO full threshold value). This limitation is removed in ESP-IDF v4.2.

2. The only one instance of Modbus port can be initialized at the same time.

2.4.10 ESP Local Control

Overview

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
  .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
  .transport_config = {
    .ble = & (protocomm_ble_config_t) { 
      .device_name = SERVICE_NAME,
      .service_uuid = {
        /* LSB <---------------------------------------
          * ---------------------------------------> MSB */
        0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
        0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
      }
    },
    .handlers = {
      /* User defined handler functions */
      .get_prop_values = get_property_values,
      .set_prop_values = set_property_values,
      .usr_ctx = NULL,
      .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
  }
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```

Similarly for HTTPS transport:
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_-start");
extern const unsigned char cacert_pem_end[] asm("_binary_cacert_pem_-end");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_-start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_-end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

2.4.11 Creating a property

Now that we know how to start the esp_local_ctrl service, let’s add a property to it. Each property must have a unique name (string), a type (e.g. enum), flags (bit fields) and size.

The size is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the size field to the right value, helps esp_local_ctrl to perform internal checks on arguments received with write requests.

The interpretation of type and flags fields is totally up to the application, hence they may be used as enumerations, bitfields, or even simple integers. One way is to use type values to classify properties, while flags to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines TYPE_TIMESTAMP and READONLY, which are used for setting the type and flags fields here.

/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name = "timestamp",
    .type = TYPE_TIMESTAMP,
    .size = sizeof(int32_t),
    .flags = READONLY,
    .ctx = func_get_time,
}

(continues on next page)
Also notice that there is a ctx field, which is set to point to some custom `func_get_time()`. This can be used inside the property get/set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_, void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;
            /* Use static variable for saving the value. 
               * This is essential because the value has to be 
               * valid even after this function returns. 
               * Alternative is to use dynamic allocation 
               * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_, void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", props[i].name);
            return ESP_ERR_INVALID_ARG;
        }
        ESP_LOGI(TAG, "Setting %s", props[i].name);
        /* For keeping it simple, lets only log the incoming data */
        ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data, prop_values[i].size, ESP_LOG_INFO);
    }
    return ESP_OK;
}
```

For complete example see `protocols/esp_local_ctrl`
2.4.12 Client Side Implementation

The client-side implementation will have established a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the esp_local_ctrl service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the esp_local_ctrl service:

1. `get_prop_count`: This should simply return the total number of properties supported by the service.
2. `get_prop_values`: This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices.
3. `set_prop_values`: This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices.

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by esp_local_ctrl are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending / receiving control messages</td>
</tr>
</tbody>
</table>

### API Reference

#### Header File

- `esp_local_ctrl/include/esp_local_ctrl.h`

#### Functions

- `const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble()` Function for obtaining BLE transport mode.
- `const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd()` Function for obtaining HTTPD transport mode.

```c
esp_err_t esp_local_ctrl_start(const esp_local_ctrl_config_t *config)
```

Start local control service.

**Return**

- ESP_OK : Success
- ESP_FAIL : Failure

**Parameters**

- `[in]` config: Pointer to configuration structure

```c
esp_err_t esp_local_ctrl_stop(void)
```

Stop local control service.

---

Submit Document Feedback

Espressif Systems 829 Release v4.0.3-189-g7c4f5fa
esp_err_t esp_local_ctrl_add_property(const esp_local_ctrl_prop_t *prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`.

Return

- ESP_OK : Success
- ESP_FAIL : Failure

Parameters

- [in] prop: Property description structure

esp_err_t esp_local_ctrl_remove_property(const char *name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

Return

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Failure

Parameters

- [in] name: Name of the property to remove

const esp_local_ctrl_prop_t *esp_local_ctrl_get_property(const char *name)

Get property description structure by name.

This API may be used to get a property’s context structure `esp_local_ctrl_prop_t` when its name is known.

Return

- Pointer to property
- NULL if not found

Parameters

- [in] name: Name of the property to find

esp_err_t esp_local_ctrl_set_handler(const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

Note In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

Return

- ESP_OK : Success
- ESP_FAIL : Failure

Parameters

- [in] ep_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user_ctx: User data

Unions

union esp_local_ctrl_transport_config_t

#include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t *ble

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.
**Structures**

**struct esp_local_ctrl_prop**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

**Public Members**

- **char *name**
  - Unique name of property

- **uint32_t type**
  - Type of property. This may be set to application defined enums

- **size_t size**
  - Size of the property value, which:
    - if zero, the property can have values of variable size
    - if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

- **uint32_t flags**
  - Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

- **void *ctx**
  - Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

- **void (*ctx_free_fn)(void *ctx)**
  - Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

**struct esp_local_ctrl_prop_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

**Public Members**

- **void *data**
  - Pointer to memory holding property value

- **size_t size**
  - Size of property value

- **void (*free_fn)(void *data)**
  - This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

**struct esp_local_ctrl_handlers**

Handlers for receiving and responding to local control commands for getting and setting properties.
Public Members

```c
esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[],
    esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
```
Handler function to be implemented for retrieving current values of properties.

**Note** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: InvalidArgument
- ESP_ERR_INVALID_STATE: InvalidProto
- All other error codes: InternalError

**Parameters**
- `[in] props_count`: Total elements in the props array
- `[in] props`: Array of properties, the current values for which have been requested by the client
- `[out] prop_values`: Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument
- `[in] usr_ctx`: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

```c
esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[],
    const esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
```
Handler function to be implemented for changing values of properties.

**Note** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: InvalidArgument
- ESP_ERR_INVALID_STATE: InvalidProto
- All other error codes: InternalError

**Parameters**
- `[in] props_count`: Total elements in the props array
- `[in] props`: Array of properties, the values for which the client requests to change
- `[in] prop_values`: Array of property values, the elements of which need to be used for updating those properties specified by props argument
- `[in] usr_ctx`: This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

```c
void *usr_ctx
```
Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

```c
void (*usr_ctx_free_fn)(void *usr_ctx)
```
Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

```c
struct esp_local_ctrl_config
```
Configuration structure to pass to `esp_local_ctrl_start()`

**Public Members**

```c
const esp_local_ctrl_transport_t *transport
```
Transport layer over which service will be provided
**Chapter 2. API Reference**

*esp_local_ctrl_transport_config_t* `transport_config`
Transport layer over which service will be provided

*esp_local_ctrl_handlers_t* `handlers`
Register handlers for responding to get/set requests on properties

`size_t max_properties`
This limits the number of properties that are available at a time

**Macros**

`ESP_LOCAL_CTRL_TRANSPORT_BLE`
`ESP_LOCAL_CTRL_TRANSPORT_HTTPD`

**Type Definitions**

```
typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t
    Property description data structure, which is to be populated and passed to the
    esp_local_ctrl_add_property() function.
```

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

```
typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
    Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.
```

```
typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
    Handlers for receiving and responding to local control commands for getting and setting properties.
```

```
typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
    Transport mode (BLE / HTTPD) over which the service will be provided.
```

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`

```
typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
    Configuration for transport mode BLE.
```

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`

```
typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t
    Configuration for transport mode HTTPD.
```

This is a forward declaration for `httpd_ssl_config_t`. To use this, application must set `CONFIG_ESP_HTTPS_SERVER_ENABLE` and include `esp_https_server.h`

```
typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
    Configuration structure to pass to `esp_local_ctrl_start()`
```

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.

### 2.4.13 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in Networking APIs.

### 2.5 Provisioning API

#### 2.5.1 Unified Provisioning
Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. **Extensible Protocol**: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.

2. **Transport Flexibility**: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.

3. **Security Scheme Flexibility**: It’s understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that’s WPA2 protected or BLE with “just-works” security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.

4. **Compact Data Representation**: The protocol uses Google Protobufs as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

Typical Provisioning Process

Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.

2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app.

3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.

4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.

5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases.

6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provisions the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

Wi-Fi ApplyConfig cmd

Wi-Fi ApplyConfig resp

Wi-Fi GetStatus cmd (repeated)

Wi-Fi GetStatus resp (repeated)

4. Close connection

Close Connection
Chapter 2. API Reference

1. **Transport Security:** SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.

2. **Application Security:** The unified provisioning subsystem provides application level security \( (\text{security}_1) \) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

**Device Discovery**

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

**Architecture**

The below diagram shows architecture of unified provisioning.

![Unified Provisioning Architecture](image)

Fig. 24: Unified Provisioning Architecture

It relies on the base layer called Protocol Communication (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi
configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

**Security Schemes**

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:

a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram

**Sample Code**

Please refer to Protocol Communication and Wi-Fi Provisioning for API guides and code snippets on example usage. Various use case implementations can be found as examples under provisioning.

**Provisioning Tools**

Provisioning applications are available for various platforms, along with source code:

- Android: esp-idf-provisioning-android
- iOS: esp-idf-provisioning-ios
- Linux/MacOS/Windows: tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

### 2.5.2 Protocol Communication

**Overview**

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

**Following features are available for provisioning:**

- **Communication security at application level** -
  - protocomm_security0 (no security)
  - protocomm_security1 (curve25519 key exchange + AES-CTR encryption)
- **Proof-of-possession** (support with protocomm_security1 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for protocomm_security1) by performing the two way handshake. See Unified Provisioning for more details about the secure handshake logic.

Fig. 25: Security
Transport Example (SoftAP + HTTP) with Security 1

For complete example see provisioning/softap_prov

```c
/* Endpoint handler to be registered with protocomm.
 * This simply echoes back the received data. */

esp_err_t echo_req_handler(uint32_t session_id,
const uint8_t *inbuf, ssize_t inlen,
uint8_t **outbuf, ssize_t *outlen,
void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen;  /* Output data length updated */
    *outbuf = malloc(inlen);  /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
        .data = {
            .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
        }
    };

    /* Start protocomm server on top of HTTP */
    protocomm_httpd_start(pc, &pc_config);

    /* Create Proof of Possession object from pop_string. It must be valid
    * throughout the scope of protocomm endpoint. This need not be
    * static,
    * i.e. could be dynamically allocated and freed at the time of
    * endpoint
    * removal */
    const static protocomm_security_pop_t pop_obj = {
        .data = (const uint8_t *) strdup(pop_string),
        .len = strlen(pop_string)
    };

    /* Set security for communication at application level. Just like for
    * request handlers, setting security creates an endpoint and
    * registers
    * the handler provided by protocomm_security1. One can similarly use
    * protocomm_security0. Only one type of security can be set for a
    * protocomm instance at a time. */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security1,
        &pop_obj);
```
(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
/* Private data passed to the endpoint must be valid throughout the... */
static uint32_t priv_data = 1234;

/* Add a new endpoint for the protocomm instance, identified by a... */
protocomm_add_endpoint(pc, "echo_req_endpoint",
                       echo_req_handler, (void *) &priv_data);

return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
 /* Remove endpoint identified by its unique name */
 protocomm_remove_endpoint(pc, "echo_req_endpoint");

 /* Remove security endpoint identified by its name */
 protocomm_unset_security(pc, "security_endpoint");

 /* Stop HTTP server */
 protocomm_httpd_stop(pc);

 /* Delete (deallocate) the protocomm instance */
 protocomm_delete(pc);
}

Transport Example (BLE) with Security 0

For complete example see provisioning/ble_prov

```
API Reference

Header File

- protocomm/include/common/protocomm.h

Functions

```c
protocomm_t* protocomm_new()
```
Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t structure initialized to NULL.

**Return**

- protocomm_t*: On success
- NULL: No memory for allocating new instance

```c
void protocomm_delete (protocomm_t* pc)
```
Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using protocomm_new().

**Parameters**

- [in] pc: Pointer to the protocomm instance to be deleted

```c
esp_err_t protocomm_add_endpoint (protocomm_t* pc, const char *ep_name, protocomm_req_handler_t h, void *priv_data)
```
Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().
• This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the `protocomm_t` instance structure.

**Return**
- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

**Parameters**
- `[in] pc` : Pointer to the `protocomm` instance
- `[in] ep_name` : Endpoint identifier (name) string
- `[in] h` : Endpoint handler function
- `[in] priv_data` : Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

```c
esp_err_t protocomm_remove_endpoint (protocomm_t *pc, const char *ep_name)
```

Remove endpoint request handler for a `protocomm` instance.

This API will remove a registered endpoint handler identified by an endpoint name.

**Note**
- This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.

**Return**
- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**
- `[in] pc` : Pointer to the `protocomm` instance
- `[in] ep_name` : Endpoint identifier (name) string

```c
esp_err_t protocomm_open_session (protocomm_t *pc, uint32_t session_id)
```

Allocates internal resources for new transport session.

**Note**
- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.

**Return**
- ESP_OK : Request handled successfully
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**
- `[in] pc` : Pointer to the `protocomm` instance
- `[in] session_id` : Unique ID for a communication session

```c
esp_err_t protocomm_close_session (protocomm_t *pc, uint32_t session_id)
```

Frees internal resources used by a transport session.

**Note**
- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.

**Return**
- ESP_OK : Request handled successfully
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**
- `[in] pc` : Pointer to the `protocomm` instance
- `[in] session_id` : Unique ID for a communication session

```c
esp_err_t protocomm_req_Handle (protocomm_t *pc, const char *ep_name, uint32_t session_id,
                               const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
```

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note**
- An endpoint must be bound to a valid `protocomm` instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.
Return

- ESP_OK : Request handled successfully
- ESP_FAIL : Internal error in execution of registered handler
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters

- [in] pc : Pointer to the protocomm instance
- [in] ep_name : Endpoint identifier(name) string
- [in] session_id : Unique ID for a communication session
- [in] inbuf : Input buffer contains input request data which is to be processed by the registered handler
- [in] inlen : Length of the input buffer
- [out] outbuf : Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- [out] outlen : Buffer length of the allocated output buffer

```c
esp_err_t protocomm_set_security (protocomm_t *pc, const char *ep_name, const protocomm_security_t *sec, const protocomm_security_pop_t *pop)
```

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

Note

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.

Return

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Security endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

Parameters

- [in] pc : Pointer to the protocomm instance
- [in] ep_name : Endpoint identifier(name) string
- [in] sec : Pointer to endpoint security instance
- [in] pop : Pointer to proof of possession for authenticating a client

```c
esp_err_t protocomm_unset_security (protocomm_t *pc, const char *ep_name)
```

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

Return

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters

- [in] pc : Pointer to the protocomm instance
- [in] ep_name : Endpoint identifier(name) string

```c
esp_err_t protocomm_set_version (protocomm_t *pc, const char *ep_name, const char *version)
```

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

Note

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
• ESP_OK : Success
• ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
• ESP_ERR_INVALID_STATE : Version endpoint already set
• ESP_ERR_NO_MEM : Error allocating endpoint resource
• ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

Parameters
• [in] pc: Pointer to the protocomm instance
• [in] ep_name: Endpoint identifier(name) string
• [in] version: Version identifier(name) string

`esp_err_t protocomm_unset_version (protocomm_t *pc, const char *ep_name)`

Remove version verification endpoint from a protocomm instance.
This API will remove a registered version endpoint identified by an endpoint name.

Return
• ESP_OK : Success
• ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
• ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters
• [in] pc: Pointer to the protocomm instance
• [in] ep_name: Endpoint identifier(name) string

Type Definitions

`typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)`

Function prototype for protocomm endpoint handler.

`typedef struct protocomm_t`

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

Note Structure of the protocomm object is kept private

Header File

• protocomm/include/security/protocomm_security.h

Structures

`struct protocomm_security_pop`

Proof Of Possession for authenticating a secure session.

Public Members

`const uint8_t *data`

Pointer to buffer containing the proof of possession data

`uint16_t len`

Length (in bytes) of the proof of possession data

`struct protocomm_security`

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note This structure should not have any dynamic members to allow re-entrancy
Public Members

```c
int ver
    Unique version number of security implementation

esp_err_t (*init) (protocomm_security_handle_t *handle)
    Function for initializing/allocating security infrastructure

esp_err_t (*cleanup) (protocomm_security_handle_t handle)
    Function for deallocating security infrastructure

esp_err_t (*new_transport_session) (protocomm_security_handle_t handle, uint32_t session_id)
    Starts new secure transport session with specified ID

esp_err_t (*close_transport_session) (protocomm_security_handle_t handle, uint32_t session_id)
    Closes a secure transport session with specified ID

esp_err_t (*security_req_handler) (protocomm_security_handle_t handle, const protocomm_security_pop_t *pop, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
    Handler function for authenticating connection request and establishing secure session

esp_err_t (*encrypt) (protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)
    Function which implements the encryption algorithm

esp_err_t (*decrypt) (protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)
    Function which implements the decryption algorithm
```

Type Definitions

```c
typedef struct protocomm_security_pop protocomm_security_pop_t
    Proof Of Possession for authenticating a secure session.

typedef void *protocomm_security_handle_t
    Protocomm security object structure.
```

The member functions are used for implementing secure protocomm sessions.

**Note**  This structure should not have any dynamic members to allow re-entry

Header File

- protocomm/include/security/protocomm_security0.h

Header File

- protocomm/include/security/protocomm_security1.h

Header File

- protocomm/include/transports/protocomm_httpd.h

Functions

```c
esp_err_t protocomm_httpd_start (protocomm_t *pc, const protocomm_httpd_config_t *config)
    Start HTTPD protocomm transport.
```

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.
Chapter 2. API Reference

**Note** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

**Return**
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_SUPPORTED : Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE : Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM : Memory allocation for server resource failed
- ESP_ERR_HTTPD_* : HTTP server error on start

**Parameters**
- [in] pc: Protocomm instance pointer obtained from protocomm_new()
- [in] config: Pointer to config structure for initializing HTTP server

```c
esp_err_t protocomm_httpd_stop(protocomm_t *pc)
```

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**Return**
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

**Parameters**
- [in] pc: Same protocomm instance that was passed to protocomm_httpd_start()

---

**Unions**

```c
union protocomm_httpd_config_data_t
```

Protocomm HTTPD Configuration Data

**Public Members**

```c
void *handle
```

HTTP Server Handle, if ext_handle_provided is set to true

```c
protocomm_http_server_config_t config
```

HTTP Server Configuration, if a server is not already active

---

**Structures**

```c
struct protocomm_http_server_config_t
```

Config parameters for protocomm HTTP server.

**Public Members**

```c
uint16_t port
```

Port on which the HTTP server will listen

```c
size_t stack_size
```

Stack size of server task, adjusted depending upon stack usage of endpoint handler

```c
unsigned task_priority
```

Priority of server task

```c
struct protocomm_httpd_config_t
```

Config parameters for protocomm HTTP server.

**Public Members**

```c
bool ext_handle_provided
```

Flag to indicate of an external HTTP Server Handle has been provided. In such case, protocomm will use the same HTTP Server and not start a new one internally.
Chapter 2. API Reference

protocomm_httpd_config_data_t data
Protocomm HTTPD Configuration Data

Macros

PROTOCOMM_HTTPD_DEFAULT_CONFIG()

Header File

• protocomm/include/transports/protocomm_ble.h

Functions

esp_err_t protocomm_ble_start (protocomm_t *pc, const protocomm_ble_config_t *config)
Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

Return

• ESP_OK : Success
• ESP_FAIL : Simple BLE start error
• ESP_ERR_NO_MEM : Error allocating memory for internal resources
• ESP_ERR_INVALID_STATE : Error in ble config
• ESP_ERR_INVALID_ARG : Null arguments

Parameters

• [in] pc: Protocomm instance pointer obtained from protocomm_new()
• [in] config: Pointer to config structure for initializing BLE

esp_err_t protocomm_ble_stop (protocomm_t *pc)
Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

Note You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of esp_bt_mem_release in that case.

Return

• ESP_OK : Success
• ESP_FAIL : Simple BLE stop error
• ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance

Parameters

• [in] pc: Same protocomm instance that was passed to protocomm_ble_start()

Structures

struct name_uuid
This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

Public Members

const char *name
Name of the handler, which is passed to protocomm layer

uint16_t uuid
UUID to be assigned to the BLE characteristic which is mapped to the handler

struct protocomm_ble_config
Config parameters for protocomm BLE service.
Public Members

char device_name[MAX_BLE_DEVNAME_LEN]
BLE device name being broadcast at the time of provisioning

uint8_t service_uuid[BLE_UUID128_VAL_LENGTH]
128 bit UUID of the provisioning service

ssize_t nu_lookup_count
Number of entries in the Name-UUID lookup table

protoComm_ble_name_uuid_t *nu_lookup
Pointer to the Name-UUID lookup table

Macros

MAX_BLE_DEVNAME_LEN
BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

BLE_UUID128_VAL_LENGTH

Type Definitions

typedef struct name_uuid protocomm_ble_name_uuid_t
This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct protocomm_ble_config protocomm_ble_config_t
Config parameters for protocomm BLE service.

2.5.3 Wi-Fi Provisioning

Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure Protocol Communication (protocomm) sessions. The set of wifi_prov_mgr_ APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

Initialization wifi_prov_mgr_init() is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other wifi_prov_mgr_ APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to wifi_prov_mgr_deinit().

```c
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERR_CHECK( wifi_prov_mgr_init(config ) );
```

The configuration structure wifi_prov_mgr_config_t has a few fields to specify the behavior desired of the manager:

- scheme : This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options:
  - wifi_prov_scheme_ble: BLE transport and GATT Server for handling provisioning commands
  - wifi_prov_scheme_softap: Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
• **scheme_event_handler**: An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:

- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn’t require Bluetooth at all.
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only BLE memory. Used when main application requires classic BT.
- `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
- `WIFI_PROV_EVENT_HANDLER_NONE` - Don’t use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.

• **app_event_handler** (Deprecated): It is now recommended to catch `WIFI_PROV_EVENT`s that are emitted to the default event loop handler. See definition of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV:
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t *)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials\nSSID : %s\nPassword : %s\n", wifi_sta_cfg->ssid,
                        wifi_sta_cfg->password);
                break;
            case WIFI_PROV_CRED_FAIL:
                wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_reason_t *)event_data;
                ESP_LOGE(TAG, "Provisioning failed!\nReason : %s\nPlease reset to factory and retry\naccess-point not found\n", "Wi-Fi station authentication failed": "Wi-Fi_
"> provisioning",
                        "reason == WIFI_PROV_STA_AUTH_ERROR")?
                    "Wi-Fi station authentication failed": "Wi-Fi_
">
                break;
            case WIFI_PROV_CRED_SUCCESS:
                ESP_LOGI(TAG, "Provisioning successful");
                break;
            case WIFI_PROV_END:
                break;
        }
    }
}
```

(continues on next page)
The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

### Check Provisioning State

Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken:

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```c
bool provisioned = false;
ESP_ERR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

### Start Provisioning Service

At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to:

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (`pop`), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the `pop` is simply ignored

See `Provisioning` for details about the security features.

```c
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );
```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**Note:** If the device fails to connect with the provided credentials, it won’t accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will...
again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in Check Provisioning State.

**Waiting For Completion**  Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```c
// Start provisioning service
ESP_ERR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_--name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch WIFI_PROV_EVENT’s and call `cpp:func:`wifi_prov_mgr_deinit()`` when event ID is `WIFI_PROV_END`:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

**User Side Implementation**  When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to _esp_wifi_prov.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn’t be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocol endpoints can be identified as follows:
<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (SoftAP + HTTP Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>Endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>Endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>Endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version / capabilities information from the `proto-ver` endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like:

```json
```

Here label `prov` provides provisioning service version (`ver`) and capabilities (`cap`). For now, only `no_pop` capability is supported, which indicates that the service doesn’t require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like `my_app` in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

Userside applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the .proto files found under `protocomm/proto`, which define the Protobuf message structures supported by `prov-session` endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of `wifi_config` commands, serialized as Protobuf messages (the corresponding .proto files can be found under `wifi_provisioning/proto`):

- **get_status** - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response;
- **set_config** - For setting the Wi-Fi connection credentials
- **apply_config** - For applying the credentials saved during `set_config` and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands:

- **scan_start** - For starting Wi-Fi scan with various options:
  - **blocking** (input) - If true, the command returns only when the scanning is finished
  - **passive** (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - **group_channels** (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when Transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for at least 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting group_channels to 4, will create 5 groups, with each group having 3 channels, except the last one which will have 14 % 3 = 2 channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been
scanned. One may need to adjust this parameter as having only few channels in a group may slow down
the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should
work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and
hence achieve the fastest overall scanning time.

- **period_ms** (input) - Scan parameter specifying how long to wait on each channel

- **scan_status** - Gives the status of scanning process:
  - **scan_finished** (output) - When scan has finished this returns true
  - **result_count** (output) - This gives the total number of results obtained till now. If scan is yet happening
  this number will keep on updating

- **scan_result** - For fetching scan results. This can be called even if scan is still on going
  - **start_index** (input) - Starting index from where to fetch the entries from the results list
  - **count** (input) - Number of entries to fetch from the starting index
  - **entries** (output) - List of entries returned. Each entry consists of ssid, channel and rssi information

### Additional Endpoints

In case users want to have some additional protocomm endpoints customized to their re-
quirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is
the registration of a handler for this endpoint. See [protocomm](#) for the function signature of an endpoint handler.

A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the
protocomm handler is registered for this endpoint only after starting the provisioning service.

```c
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_
/key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler,
--custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint
at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

### When / How To Stop Provisioning Service?

The default behavior is that once the device successfully connects
using the Wi-Fi credentials set by the `apply_config` command, the provisioning service will be stopped (and BLE
/ SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not
received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID /
passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for
disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials
will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now
the provisioning service will only be stopped after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping
the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified
by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some
time after the Wi-Fi connection is successfully established. For example, if the application requires the device
to connect to some cloud service and obtain another set of credentials, and exchange this credentials
over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay
ensures that the transport resources are freed only after the response from the protocomm handler reaches the
client side application.

### Application Examples

For complete example implementation see [provisioning/manager](#)
Chapter 2. API Reference

API Reference

Header File

- wifi_provisioning/include/wifi_provisioning/manager.h

Functions

`esp_err_t wifi_prov_mgr_init (wifi_prov_mgr_config_t config)`

- Initialize provisioning manager instance.
- Configures the manager and allocates internal resources.
- Configuration specifies the provisioning scheme (transport) and event handlers.
- Event WIFI_PROV_INIT is emitted right after initialization is complete.

**Return**

- ESP_OK : Success
- ESP_FAIL : Fail

**Parameters**

- [in] config: Configuration structure

`void wifi_prov_mgr_deinit (void)`

- Stop provisioning (if running) and release resource used by the manager.
- Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished.
- If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization.

`esp_err_t wifi_prov_mgr_is_provisioned (bool *provisioned)`

- Checks if device is provisioned.
- This checks if Wi-Fi credentials are present on the NVS.
- The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component.
- If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned).

**Note** Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

**Return**

- ESP_OK : Retrieved provision state successfully
- ESP_FAIL : Wi-Fi not initialized
- ESP_ERR_INVALID_ARG : Null argument supplied
- ESP_ERR_INVALID_STATE : Manager not initialized

**Parameters**

- [out] provisioned: True if provisioned, else false

`esp_err_t wifi_prov_mgr_start_provisioning (wifi_prov_security_t security, const char *pop, const char *service_name, const char *service_key)`

- Start provisioning service.
- This starts the provisioning service according to the scheme configured at the time of initialization. For scheme:
  - `wifi_prov_scheme_ble`: This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests.
  - `wifi_prov_scheme_softap`: This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp).

- Event WIFI_PROV_START is emitted right after provisioning starts without failure.
### Note
This API will start provisioning service even if device is found to be already provisioned, i.e. `wifi_prov_mgr_is_provisioned()` yields true

### Return
- ESP_OK : Provisioning started successfully
- ESP_FAIL : Failed to start provisioning service
- ESP_ERR_INVALID_STATE : Provisioning manager not initialized or already started

### Parameters
- **[in]** `security` : Specify which protocomm security scheme to use:
  - WIFI_PROV_SECURITY_0 : For no security
  - WIFI_PROV_SECURITY_1 : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- **[in]** `pop` : Pointer to proof of possession string (NULL if not needed). This is relevant only for protocomm security 1, in which case it is used for authenticating secure session
- **[in]** `service_name` : Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- **[in]** `service_key` : Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

```c
void wifi_prov_mgr_stop_provisioning (void)
```

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleanup_delay is set when calling `wifi_prov_mgr_disable_auto_stop()`. If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

```c
void wifi_prov_mgr_wait (void)
```

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.

This will not block if provisioning is not started or not initialized.

```c
esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)
```

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is up to the main application to explicitly call `wifi_prov_mgr_stop_provisioning()` later when the device is fully configured and the provisioning service is no longer required.

**Note** This must be called before executing `wifi_prov_mgr_start_provisioning()`
• ESP_OK : Success
• ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started

Parameters
• [in] cleanup_delay: Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

```c
esp_err_t wifi_prov_mgr_set_app_info(const char *label, const char *version, const char *capabilities, size_t total_capabilities)
```

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

Note This must be called before executing wifi_prov_mgr_start_provisioning()

Return
• ESP_OK : Success
• ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started
• ESP_ERR_NO_MEM: Failed to allocate memory for version string
• ESP_ERR_INVALID_ARG: Null argument

Parameters
• [in] label: String indicating the application name.
• [in] version: String indicating the application version. There is no constraint on format.
• [in] capabilities: Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
• [in] total_capabilities: Size of capabilities array

```c
esp_err_t wifi_prov_mgr_endpoint_create(const char *ep_name)
```

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using wifi_prov_mgr_endpoint_register() after provisioning has started.

Note This API can only be called BEFORE provisioning is started

Note Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

Note After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Return
• ESP_OK : Success
• ESP_FAIL : Failure

Parameters
• [in] ep_name: unique name of the endpoint

```c
esp_err_t wifi_prov_mgr_endpoint_register(const char *ep_name, proto_comm_req_handler_t handler, void *user_ctx)
```

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using wifi_prov_mgr_endpoint_create().

Note This API can only be called AFTER provisioning has started

Note Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

Note After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service
is stopped and hence all endpoints are unregistered

Return
• ESP_OK : Success
• ESP_FAIL : Failure

Parameters
• [in] ep_name: Name of the endpoint
• [in] handler: Endpoint handler function
• [in] user_ctx: User data

void wifi_prov_mgr_endpoint_unregister (const char * ep_name)
Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters
• [in] ep_name: Name of the endpoint

esp_err_t wifi_prov_mgr_event_handler (void * ctx, system_event_t * event)
Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager’s internal state machine depending on incoming Wi-Fi events

Note : This function is DEPRECATED, because events are now handled internally using the event loop library, esp_event. Calling this will do nothing and simply return ESP_OK.

Return
• ESP_OK : Event handled successfully

Parameters
• [in] ctx: Event context data
• [in] event: Event info

esp_err_t wifi_prov_mgr_get_wifi_state (wifi_prov_sta_state_t * state)
Get state of Wi-Fi Station during provisioning.

Return
• ESP_OK : Successfully retrieved Wi-Fi state
• ESP_FAIL : Provisioning app not running

Parameters
• [out] state: Pointer to wifi_prov_sta_state_t variable to be filled

esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason (wifi_prov_sta_fail_reason_t * reason)
Get reason code in case of Wi-Fi station disconnection during provisioning.

Return
• ESP_OK : Successfully retrieved Wi-Fi disconnect reason
• ESP_FAIL : Provisioning app not running

Parameters
• [out] reason: Pointer to wifi_prov_sta_fail_reason_t variable to be filled

esp_err_t wifi_prov_mgr_configure_sta (wifi_config_t * wifi_cfg)
Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started.

Return
• ESP_OK: Wi-Fi configured and started successfully
• ESP_FAIL: Failed to set configuration

**Parameters**

- [in] wifi_cfg: Pointer to Wi-Fi configuration structure

**Structures**

```c
struct wifi_prov_event_handler_t
event_cb

Callback function to be executed on provisioning events
```

```c
void *user_data

User context data to pass as parameter to callback function
```

```c
struct wifi_prov_scheme

Structure for specifying the provisioning scheme to be followed by the manager.
```

**Note**

Ready to use schemes are available:

- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

**Public Members**

```c
esp_err_t (*prov_start)(protocomm_t *pc, void *config)

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration
```

```c
esp_err_t (*prov_stop)(protocomm_t *pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance
```

```c
void *(*new_config)(void)

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to prov_start()
```

```c
void *(*delete_config)(void *config)

Function which is to be called by the manager to delete a configuration generated using new_config()
```

```c
esp_err_t (*set_config_service)(void *config, const char *service_name, const char *service_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure
```

```c
esp_err_t (*set_config_endpoint)(void *config, const char *endpoint_name, uint16_t uuid)

Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure
```

```c
wifi_mode_t wifi_mode

Sets mode of operation of Wi-Fi during provisioning. This is set to:

- WIFI_MODE_APSTA for SoftAP transport
- WIFI_MODE_STA for BLE transport
```

```c
struct wifi_prov_mgr_config_t

Structure for specifying the manager configuration.
```
Public Members

\texttt{wifi_prov_scheme_t \_scheme}

Provisioning scheme to use. Following schemes are already available:

- \texttt{wifi_prov_scheme_ble} : for provisioning over BLE transport + GATT server
- \texttt{wifi_prov_scheme_softap} : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- \texttt{wifi_prov_scheme_console} : for provisioning over Serial UART transport + Console (for debugging)

\texttt{wifi_prov_event_handler_t \_scheme\_event\_handler}

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use \texttt{WIFI_PROV_EVENT_HANDLER_NONE} when not used. When using scheme \texttt{wifi_prov_scheme_ble}, the following options are available:

- \texttt{WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM}
- \texttt{WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE}
- \texttt{WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT}

\texttt{wifi_prov_event_handler_t \_app\_event\_handler}

Event handler that can be set for the purpose of incorporating application specific behavior. Use \texttt{WIFI_PROV_EVENT_HANDLER_NONE} when not used.

Macros

\texttt{WIFI_PROV_EVENT_HANDLER_NONE}

Event handler can be set to none if not used.

Type Definitions

\texttt{typedef void (*\_wifi\_prov\_cb\_func\_t)} (void \texttt{*user\_data, wifi\_prov\_cb\_event\_t event, void \_event\_data})

\texttt{typedef struct wifi\_prov\_scheme wifi\_prov\_scheme\_t}

Structure for specifying the provisioning scheme to be followed by the manager.

Note

Ready to use schemes are available:

- \texttt{wifi\_prov\_scheme\_ble} : for provisioning over BLE transport + GATT server
- \texttt{wifi\_prov\_scheme\_softap} : for provisioning over SoftAP transport + HTTP server
- \texttt{wifi\_prov\_scheme\_console} : for provisioning over Serial UART transport + Console (for debugging)

\texttt{typedef enum wifi\_prov\_security wifi\_prov\_security\_t}

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

Enumerations

\texttt{enum wifi\_prov\_cb\_event\_t}

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:

- \texttt{WIFI_PROV_INIT} : Emitted when the manager is initialized
- \texttt{WIFI_PROV_START} : Indicates that provisioning has started
- \texttt{WIFI_PROV_CRED_RECV} : Emitted when Wi-Fi AP credentials are received via protocomm endpoint \texttt{wifi_config}. The event data in this case is a pointer to the corresponding \texttt{wifi\_sta\_config\_t} structure
WIFI_PROV_CRED_FAIL
Emitted when device fails to connect to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code with type wifi_prov_sta_fail_reason_t.

WIFI_PROV_CRED_SUCCESS
Emitted when device successfully connects to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV.

WIFI_PROV_END
Signals that provisioning service has stopped.

WIFI_PROV_DEINIT
Signals that manager has been de-initialized.

enum wifi_prov_security
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm.
Values:
WIFI_PROV_SECURITY_0 = 0
No security (plain-text communication)
WIFI_PROV_SECURITY_1
This secure communication mode consists of X25519 key exchange
• proof of possession (pop) based authentication
• AES-CTR encryption

Header File
• wifi_provisioning/include/wifi_provisioning/scheme_ble.h

Functions
void wifi_prov_scheme_ble_event_cb_free_btdm(void *user_data, wifi_prov_cb_event_t event, void *event_data)
void wifi_prov_scheme_ble_event_cb_free_ble(void *user_data, wifi_prov_cb_event_t event, void *event_data)
void wifi_prov_scheme_ble_event_cb_free_bt(void *user_data, wifi_prov_cb_event_t event, void *event_data)

esp_err_t wifi_prov_scheme_ble_set_service_uuid(uint8_t *uuid128)
Set the 128 bit GATT service UUID used for provisioning.
This API is used to override the default 128 bit provisioning service UUID, which is 0000fff0-0000-1000-8000-00805f9b34fb.
This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

Note The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwords.

Return
• ESP_OK : Success
• ESP_ERR_INVALID_ARG : Null argument

Parameters
• [in] uuid128: A custom 128 bit UUID

Macros
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
Chapter 2. API Reference

WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

Header File
- wifi_provisioning/include/wifi_provisioning/scheme_softap.h

Functions
void wifi_prov_scheme_softap_set_httpd_handle (void *handle)
   Provide HTTPD Server handle externally.
   Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi
   provisioning component to start/stop a new instance.

   Note This API should be called before wifi_prov_mgr_start_provisioning()

Parameters
- [in] handle: Handle to HTTPD server instance

Header File
- wifi_provisioning/include/wifi_provisioning/scheme_console.h

Header File
- wifi_provisioning/include/wifi_provisioning/wifi_config.h

Functions
esp_err_t wifi_prov_config_data_handler (uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
   Handler for receiving and responding to requests from master.
   This is to be registered as the wifi_config endpoint handler (protocomm proto-
   comm_req_handler_t) using protocomm_add_endpoint()

Structures
struct wifi_prov_sta_conn_info_t
   WiFi STA connected status information.

Public Members
- char ip_addr[IP4ADDR_STRLEN_MAX]
   IP Address received by station
- char bssid[6]
   BSSID of the AP to which connection was established
- char ssid[33]
   SSID of the to which connection was established
- uint8_t channel
   Channel of the AP
- uint8_t auth_mode
   Authorization mode of the AP
struct wifi_prov_config_get_data_t
   WiFi status data to be sent in response to get_status request from master.
Public Members

\texttt{wifi_prov_sta_state_t wifi_state}

WiFi state of the station

\texttt{wifi_prov_sta_fail_reason_t fail_reason}

Reason for disconnection (valid only when \texttt{wifi_state} is \texttt{WIFI\_STATION\_DISCONNECTED})

\texttt{wifi_prov_sta_conn_info_t conn_info}

Connection information (valid only when \texttt{wifi_state} is \texttt{WIFI\_STATION\_CONNECTED})

\textbf{struct wifi_prov_config_set_data_t}

WiFi config data received by slave during \texttt{set_config} request from master.

Public Members

\textbf{char ssid[33]}

SSID of the AP to which the slave is to be connected

\textbf{char password[64]}

Password of the AP

\textbf{char bssid[6]}

BSSID of the AP

\textbf{uint8_t channel}

Channel of the AP

\textbf{struct wifi_prov_config_handlers}

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as \texttt{priv_data} for protocomm request handler (refer to \texttt{wifi_prov_config_data_handler()}) when calling \texttt{protocomm_add_endpoint()}.  

Public Members

\textbf{esp_err_t (*get_status_handler)(wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)}

Handler function called when connection status of the slave (in WiFi station mode) is requested

\textbf{esp_err_t (*set_config_handler)(const wifi_prov_config_set_data_t *req_data, wifi_prov_ctx_t **ctx)}

Handler function called when WiFi connection configuration (e.g. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

\textbf{esp_err_t (*apply_config_handler)(wifi_prov_ctx_t **ctx)}

Handler function for applying the configuration that was set in \texttt{set_config_handler}. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when \texttt{get_status_handler} is invoked again by the master.

\textbf{wifi_prov_ctx_t *ctx}

Context pointer to be passed to above handler functions upon invocation

Type Definitions

\textbf{typedef struct wifi_prov_ctx wifi_prov_ctx_t}

Type of context data passed to each get/set/apply handler function set in \texttt{wifi_prov_config_handlers} structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

\textbf{typedef struct wifi_prov_config_handlers wifi_prov_config_handlers_t}

Internal handlers for receiving and responding to protocomm requests from master.
This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler() when calling protocomm_add_endpoint()

Enumerations

enum wifi_prov_sta_state_t
  WiFi STA status for conveying back to the provisioning master.

  Values:
  WiFi_PROV_STA_CONNECTING
  WiFi_PROV_STA_CONNECTED
  WiFi_PROV_STA_DISCONNECTED

enum wifi_prov_sta_fail_reason_t
  WiFi STA connection fail reason.

  Values:
  WiFi_PROV_STA_AUTH_ERROR
  WiFi_PROV_STA_AP_NOT_FOUND

Code examples for this API section are provided in the provisioning directory of ESP-IDF examples.

2.6 Storage API

2.6.1 SPI Flash API

Overview

The spi_flash component contains API functions related to reading, writing, erasing, memory mapping for data in the external flash. The spi_flash component also has higher-level API functions which work with partitions defined in the partition table.

Different from the API before IDF v4.0, the functionality is not limited to the “main” SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access to external flashes chips on not only SPI0/1 but also HSPI/VSPI buses.

Note: Flash APIs after IDF v4.0 are no longer atomic. A writing operation during another on-going read operation, on the overlapped flash address, may cause the return data from the read operation to be partly same as before, and partly updated as new written.

Kconfig option CONFIG_SPI_FLASH_USE_LEGACY_IMPL can be used to switch spi_flash_* functions back to the implementation before IDF v4.0. However, the code size may get bigger if you use the new API and the old API the same time.

Encrypted reads and writes use the old implementation, even if CONFIG_SPI_FLASH_USE_LEGACY_IMPL is not enabled. As such, encrypted flash operations are only supported with the main flash chip (and not with other flash chips on SPI1 with different CS).

Initializing a flash device

To use esp_flash_* APIs, you need to have a chip initialized on a certain SPI bus.

1. Call spi_bus_initialize() to properly initialize an SPI bus. This functions initialize the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call spi_bus_add_flash_device() to attach the flash device onto the bus. This allocates memory, and fill the members for the esp_flash_t structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This will also detect the chip type, and influence the following operations.

**Note:** Multiple flash chips can be attached to the same bus now. However, using `esp_flash_*` devices and `spi_device_*` devices on the same SPI bus is not supported yet.

**SPI flash access API**

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp.flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of partition-specific functions.

**SPI Flash Size**

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000. By default, the SPI flash size is detected by esptool.py when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

**Concurrency Constraints for flash on SPI1**

Because the SPI1 flash is also used for firmware execution via the instruction & data caches, these caches must be disabled while reading/writing/erasing. This means that both CPUs must be running code from IRAM and must only be reading data from DRAM while flash write operations occur.

If you use the API functions documented here, then these constraints are applied automatically and transparently. However, note that it will have some performance impact on other tasks in the system.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between IRAM, DRAM, and flash cache, please refer to the application memory layout documentation.

To avoid reading flash cache accidentally, when one CPU initiates a flash write or erase operation, the other CPU is put into a blocked state, and all non-IRAM-safe interrupts are disabled on both CPUs until the flash operation completes.

If one CPU initiates a flash write or erase operation, the other CPU is put into a blocked state to avoid reading flash cache accidentally. All interrupts not safe for IRAM are disabled on both CPUs until the flash operation completes.

**IRAM-Safe Interrupt Handlers** If you have an interrupt handler that you want to execute while a flash operation is in progress (for example, for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the interrupt handler is registered.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM.
Use the IRAM_ATTR attribute for functions:

```c
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void* arg)
{
    // ...
}
```

Use the DRAM_ATTR and DRAM_STR attributes for constant data:

```c
void IRAM_ATTR gpio_isr_handler(void* arg)
{
    const static DRAM_ATTR uint8_t INDEX_DATA[] = {45, 33, 12, 0};
    const static char *MSG = DRAM_STR("I am a string stored in RAM");
}
```

Note that knowing which data should be marked with DRAM_ATTR can be hard, the compiler will sometimes recognize that a variable or expression is constant (even if it is not marked const) and optimize it into flash, unless it is marked with DRAM_ATTR.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

### Partition table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information on partition tables can be found [here](#).

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find`.
- `esp_partition_find_first()` - a convenience function which returns the structure describing the first partition found by `esp_partition_find`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `spi_flash_read()`, `spi_flash_write()`, `spi_flash_erase_range()`, but operate within partition boundaries.

**Note:** Application code should mostly use these `esp_partition_*` API functions instead of lower level `spi_flash_*` API functions. Partition table API functions do bounds checking and calculate correct offsets in flash, based on data stored in a partition table.

### SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the [Flash Encryption documentation](#) for more details.

### Memory mapping API

ESP32 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.
Mapping happens in 64KB pages. Memory mapping hardware can map up to four megabytes of flash into data address space and up to 16 megabytes of flash into instruction address space. See the technical reference manual for more details about memory mapping hardware.

Note that some 64KB pages are used to map the application itself into memory, so the actual number of available 64KB pages may be less.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when flash encryption is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in esp_spi_flash.h and esp_partition.h:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition, it will adjust the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in 64KB blocks, it may be possible to read data outside of the partition provided to `esp_partition_mmap`.

**Implementation**

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provides support of some OS functions (e.g. lock, delay) in different stages (1st/2st boot, or the app).

**Host driver** The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_host_drv.h` (in the `soc/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32 memory-spi functionalities. However due to the speed limitations of ESP32, the HAL layer can’t provide high-speed implementations to some reading commands (So we didn’t do it at all). The files (memspi_host_driver.h and .c) implement the high-speed version of these commands with the common_command function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the esp_flash API can access to the flash regardless of the low-level hardware.

**Chip driver** The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status after. Some chips need different command or value, or need special communication ways.

There is a type of chip called generic chip which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.
**OS functions** Currently the OS function layer provides a lock and a delay entries.

The lock is used to resolve the conflicts between the SPI chip access and other functions. E.g. the cache (used for the code and PSRAM data fetch) should be disabled when the flash chip on the SPI0/1 is being accessed. Also, some devices which don’t have CS wire, or the wire is controlled by the software (e.g. SD card via SPI interface), requires the bus to be monopolized during a period.

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

**See also**

- [Partition Table documentation](#)
- **Over The Air Update (OTA) API** provides high-level API for updating app firmware stored in flash.
- **Non-Volatile Storage (NVS) API** provides a structured API for storing small pieces of data in SPI flash.

**Implementation details**

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation: - In a single-core setup, the SDK does it by disabling interrupts/scheduler before performing the flash operation. - In a dual-core setup, this is slightly more complicated as the SDK needs to make sure that the other CPU is not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call API`. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment ([CONFIG_FREERTOS_UNICORE](#) enabled), you need to disable both caches, so that no inter-CPU communication can take place.

**API Reference - SPI Flash**

**Header File**

- `spi_flash/include/esp_flash_spi_init.h`

**Functions**

```c
esp_err_t spi_bus_add_flash_device(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)
```

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

**Return**

- ESP_ERR_INVALID_ARG: `out_chip` is NULL, or some field in the config is invalid.
- ESP_ERR_NO_MEM: failed to allocate memory for the chip structures.
- ESP_OK: success.
Parameters
- `out_chip`: Pointer to hold the initialized chip.
- `config`: Configuration of the chips to initialize.

`esp_err_t spi_bus_remove_flash_device(esp_flash_t *chip)`
Remove a SPI Flash device from the SPI bus.

Return
- `ESP_ERR_INVALID_ARG`: The chip is invalid.
- `ESP_OK`: success.

Parameters
- `chip`: The flash device to remove.

Structures
`struct esp_flash_spi_device_config_t`
Configurations for the SPI Flash to init.

Public Members
- `spi_host_device_t host_id`
  Bus to use.
- `int cs_id`
  CS pin (signal) to use.
- `int cs_io_num`
  GPIO pin to output the CS signal.
- `esp_flash_io_mode_t io_mode`
  IO mode to read from the Flash.
- `esp_flash_speed_t speed`
  Speed of the Flash clock.
- `int input_delay_ns`
  Input delay of the data pins, in ns. Set to 0 if unknown.

Header File
- `spi_flash/include/esp_flash.h`

Functions
- `esp_err_t esp_flash_init(esp_flash_t *chip)`
  Initialise SPI flash chip interface.
  This function must be called before any other API functions are called for this chip.
  
  **Note** Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.
  
  **Note** If the chip->drv pointer is NULL, chip chip_drv will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.
  
  Return `ESP_OK` on success, or a flash error code if initialisation fails.

  Parameters
  - `chip`: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

- `bool esp_flash_chip_driver_initialized(const esp_flash_t *chip)`
  Check if appropriate chip driver is set.
  
  Return true if set, otherwise false.

  Parameters
  - `chip`: Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.
esp_err_t esp_flash_read_id(esp_flash_t *chip, uint32_t *out_id)
    Read flash ID via the common “RDID” SPI flash command. ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

    Parameters
    • chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
    • [out] out_id: Pointer to receive ID value.

    Return ESP_OK on success, or a flash error code if operation failed.

esp_err_t esp_flash_get_size(esp_flash_t *chip, uint32_t *out_size)
    Detect flash size based on flash ID.

    Note Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

    Return ESP_OK on success, or a flash error code if operation failed.

    Parameters
    • chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
    • [out] out_size: Detected size in bytes.

esp_err_t esp_flash_erase_chip(esp_flash_t *chip)
    Erase flash chip contents.

    Return ESP_OK on success, or a flash error code if operation failed.

    Parameters
    • chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()

esp_err_t esp_flash_erase_region(esp_flash_t *chip, uint32_t start, uint32_t len)
    Erase a region of the flash chip. Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

    Parameters
    • chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
    • start: Address to start erasing flash. Must be sector aligned.
    • len: Length of region to erase. Must also be sector aligned.

    Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

    Return ESP_OK on success, or a flash error code if operation failed.

esp_err_t esp_flash_get_chip_write_protect(esp_flash_t *chip, bool *write_protected)
    Read if the entire chip is write protected.

    Note A correct result for this flag depends on the SPI flash chip model and chipDrv in use (via the ‘chip->drv’ field).

    Return ESP_OK on success, or a flash error code if operation failed.

    Parameters
    • chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
    • [out] write_protected: Pointer to boolean, set to the value of the write protect flag.

esp_err_t esp_flash_set_chip_write_protect(esp_flash_t *chip, bool write_protect)
    Set write protection for the SPI flash chip.

    Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

    Note Correct behaviour of this function depends on the SPI flash chip model and chipDrv in use (via the ‘chip->drv’ field).

    Parameters
    • chip: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
    • write_protect: Boolean value for the write protect flag
Return ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_protectable_regions(const esp_flash_t *chip, const esp_flash_region_t **out_regions, uint32_t *out_num_regions)
```

Read the list of individually protectable regions of this SPI flash chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Return** ESP_OK on success, or a flash error code if operation failed.

**Parameters**
- `chip`: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- `[out]` `out_regions`: Pointer to receive a pointer to the array of protectable regions of the chip.
- `[out]` `out_num_regions`: Pointer to an integer receiving the count of protectable regions in the array returned in ‘regions’.

```c
esp_err_t esp_flash_get_protected_region(esp_flash_t *chip, const esp_flash_region_t *region, bool *out_protected)
```

Detect if a region of the SPI flash chip is protected.

**Note** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Return** ESP_OK on success, or a flash error code if operation failed.

**Parameters**
- `chip`: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- `region`: Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- `[out]` `out_protected`: Pointer to a flag which is set based on the protected status for this region.

```c
esp_err_t esp_flash_set_protected_region(esp_flash_t *chip, const esp_flash_region_t *region, bool protect)
```

Update the protected status for a region of the SPI flash chip.

**Note** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

**Note** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Return** ESP_OK on success, or a flash error code if operation failed.

**Parameters**
- `chip`: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- `region`: Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- `protect`: Write protection flag to set.

```c
esp_err_t esp_flash_read(esp_flash_t *chip, void *buffer, uint32_t address, uint32_t length)
```

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**
- `chip`: Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- `buffer`: Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- `address`: Address on flash to read from. Must be less than chip->size field.
- `length`: Length (in bytes) of data to read.

**Note** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

**Return**
- ESP_OK: success
• ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
• or a flash error code if operation failed.

\[\text{esp_err_t} \ \text{esp\_flash\_write}\left(\text{esp\_flash\_t}*\text{chip}, \text{const void}^*\text{buffer}, \text{uint32\_t address}, \text{uint32\_t length}\right)\]

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**
- \text{chip}: Pointer to identify flash chip. Must have been successfully initialised via \text{esp\_flash\_init()}
- \text{address}: Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- \text{buffer}: Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- \text{length}: Length (in bytes) of data to write.

**Return** ESP_OK on success, or a flash error code if operation failed.

\[\text{esp_err_t} \ \text{esp\_flash\_write\_encrypted}\left(\text{esp\_flash\_t}*\text{chip}, \text{uint32\_t address}, \text{const void}^*\text{buffer}, \text{uint32\_t length}\right)\]

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**Note** Both address & length must be 16 byte aligned, as this is the encryption block size

**Return**
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
- or other flash error code from \text{spi\_flash\_write\_encrypted()}

**Parameters**
- \text{chip}: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- \text{address}: Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- \text{buffer}: Pointer to a buffer with the data to write.
- \text{length}: Length (in bytes) of data to write. 16 byte aligned.

\[\text{esp_err_t} \ \text{esp\_flash\_read\_encrypted}\left(\text{esp\_flash\_t}*\text{chip}, \text{uint32\_t address}, \text{void}^*\text{out\_buffer}, \text{uint32\_t length}\right)\]

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

**Return**
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.
- or other flash error code from \text{spi\_flash\_read\_encrypted()}

**Parameters**
- \text{chip}: Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- \text{address}: Address on flash to read from.
- \text{out\_buffer}: Pointer to a buffer for the data to read to.
- \text{length}: Length (in bytes) of data to read.

\[\text{static bool} \ \text{esp\_flash\_is\_quad\_mode}\left(\text{const esp\_flash\_t}*\text{chip}\right)\]

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Return** true if flash works in quad mode, otherwise false

**Parameters**
- \text{chip}: Pointer to SPI flash chip to use. If NULL, \text{esp\_flash\_default\_chip} is substituted.

**Structures**

\[\text{struct esp\_flash\_region\_t}\]

Structure for describing a region of flash.
Chapter 2. API Reference

Public Members

uint32_t offset
Start address of this region.

uint32_t size
Size of the region.

struct esp_flash_os_functions_t
OS-level integration hooks for accessing flash chips inside a running OS

Public Members

esp_err_t (*start) (void *arg)
Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).

esp_err_t (*end) (void *arg)
Called after completing any flash operation.

esp_err_t (*region_protected) (void *arg, size_t start_addr, size_t size)
Called before any erase/write operations to check whether the region is limited by the OS

esp_err_t (*delay_us) (void *arg, unsigned us)
Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’.

esp_err_t (*yield) (void *arg)
Yield to other tasks. Called during erase operations.

struct esp_flash_t
Structure to describe a SPI flash chip connected to the system.
Structure must be initialized before use (passed to esp_flash_init()).

Public Members

spi_flash_host_driver_t *host
Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

const spi_flash_chip_t *chip_drv
Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

const esp_flash_os_functions_t *os_func
Pointer to os-specific hook structure. Call esp_flash_init_os_functions() to setup this field, after the host is properly initialized.

void *os_func_data
Pointer to argument for os-specific hooks. Left NULL and will be initialized with os_func.

esp_flash_io_mode_t read_mode
Configured SPI flash read mode. Set before esp_flash_init is called.

uint32_t size
Size of SPI flash in bytes. If 0, size will be detected during initialisation.

uint32_t chip_id
Detected chip id.

Type Definitions

typedef struct spi_flash_chip_t spi_flash_chip_t
typedef struct esp_flash_t esp_flash_t
Chapter 2. API Reference

Header File

- soc/include/hal/spi_flash_types.h

Structures

struct spi_flash_trans_t

Definition of a common transaction. Also holds the return value.

Public Members

uint8_t command
Command to send, always 8bits.

uint8_t mosi_len
Output data length, in bits.

uint8_t miso_len
Input data length, in bits.

uint32_t mosi_data
Output data to slave.

uint32_t miso_data[2]
[out] Input data from slave, little endian

struct spi_flash_host_driver_t

Host driver configuration and context structure.

Public Members

void *driver_data
Configuration and static data used by the specific host driver. The type is determined by the host driver.

esp_err_t (*dev_config)(spi_flash_host_driver_t *driver)
Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

esp_err_t (*common_command)(spi_flash_host_driver_t *driver, spi_flash_trans_t *t)
Send an user-defined spi transaction to the device.

esp_err_t (*read_id)(spi_flash_host_driver_t *driver, uint32_t *id)
Read flash ID.

void (*erase_chip)(spi_flash_host_driver_t *driver)
Erase whole flash chip.

void (*erase_sector)(spi_flash_host_driver_t *driver, uint32_t start_address)
Erase a specific sector by its start address.

void (*erase_block)(spi_flash_host_driver_t *driver, uint32_t start_address)
Erase a specific block by its start address.

esp_err_t (*read_status)(spi_flash_host_driver_t *driver, uint8_t *out_sr)
Read the status of the flash chip.

esp_err_t (*set_write_protect)(spi_flash_host_driver_t *driver, bool wp)
Disable write protection.

void (*program_page)(spi_flash_host_driver_t *driver, const void *buffer, uint32_t address, uint32_t length)
Program a page of the flash. Check max_write_bytes for the maximum allowed writing length.

bool (*supports_direct_write)(spi_flash_host_driver_t *driver, const void *p)
Check whether need to allocate new buffer to write
bool (*supports_direct_read)(spi_flash_host_driver_t *driver, const void *p)
    Check whether need to allocate new buffer to read

int max_write_bytes
    maximum length of program page

esp_err_t (*read)(spi_flash_host_driver_t *driver, void *buffer, uint32_t address, uint32_t read_len)
    Read data from the flash. Check max_read_bytes for the maximum allowed reading length.

int max_read_bytes
    maximum length of read

bool (*host_idle)(spi_flash_host_driver_t *driver)
    Check whether the host is idle to perform new operations.

esp_err_t (*configure_host_io_mode)(spi_flash_host_driver_t *driver, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, esp_flash_io_mode_t io_mode)
    Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (*poll_cmd_done)(spi_flash_host_driver_t *driver)
    Internal use, poll the HW until the last operation is done.

esp_err_t (*flush_cache)(spi_flash_host_driver_t *driver, uint32_t addr, uint32_t size)
    For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

Macros
ESP_FLASH_SPEED_MIN
    Lowest speed supported by the driver, currently 5 MHz.

SPI_FLASH_READ_MODE_MIN
    Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions
typedef struct spi_flash_host_driver_t spi_flash_host_driver_t

Enumerations
enum esp_flash_speed_t
    SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).
    A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.
    Values:
    ESP_FLASH_5MHZ = 0
        The flash runs under 5MHz.
    ESP_FLASH_10MHZ
        The flash runs under 10MHz.
    ESP_FLASH_20MHZ
        The flash runs under 20MHz.
    ESP_FLASH_26MHZ
        The flash runs under 26MHz.
    ESP_FLASH_40MHZ
        The flash runs under 40MHz.
    ESP_FLASH_80MHZ
        The flash runs under 80MHz.
Chapter 2. API Reference

ESP_FLASH_SPEED_MAX
The maximum frequency supported by the host is ESP_FLASH_SPEED_MAX-1.

enum esp_flash_io_mode_t
Mode used for reading from SPI flash.

Values:

SPI_FLASH_SLOWRD = 0
Data read using single I/O, some limits on speed.

SPI_FLASH_FASTRD
Data read using single I/O, no limit on speed.

SPI_FLASH_DOUT
Data read using dual I/O.

SPI_FLASH_DIO
Both address & data transferred using dual I/O.

SPI_FLASH_QOUT
Data read using quad I/O.

SPI_FLASH_QIO
Both address & data transferred using quad I/O.

SPI_FLASH_READ_MODE_MAX
The fastest io mode supported by the host is ESP_FLASH_READ_MODE_MAX-1.

API Reference - Partition Table

Header File

- spi_flash/include/esp_partition.h

Functions

esp_partition_iterator_t esp_partition_find(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)

Find partition based on one or more parameters.

Return iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found. Iterator obtained through this function has to be released using esp_partition_iterator_release when not used any more.

Parameters

- type: Partition type, one of esp_partition_type_t values
- subtype: Partition subtype, one of esp_partition_subtype_t values. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- label: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

const esp_partition_t *esp_partition_find_first(esp_partition_type_t type,
esp_partition_subtype_t subtype, const char *label)

Find first partition based on one or more parameters.

Return pointer to esp_partition_t structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

Parameters

- type: Partition type, one of esp_partition_type_t values
- subtype: Partition subtype, one of esp_partition_subtype_t values. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- label: (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.
const esp_partition_t *esp_partition_get (esp_partition_iterator_t iterator)
Get esp_partition_t structure for given partition.

Return pointer to esp_partition_t structure. This pointer is valid for the lifetime of the application.

Parameters
• iterator: Iterator obtained using esp_partition_find. Must be non-NULL.

esp_partition_iterator_t esp_partition_next (esp_partition_iterator_t iterator)
Move partition iterator to the next partition found.

Return NULL if no partition was found, valid esp_partition_iterator_t otherwise.

Parameters
• iterator: Iterator obtained using esp_partition_find. Must be non-NULL.

void esp_partition_iterator_release (esp_partition_iterator_t iterator)
Release partition iterator.

Parameters
• iterator: Iterator obtained using esp_partition_find. Must be non-NULL.

const esp_partition_t *esp_partition_verify (const esp_partition_t *partition)
Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)
This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to
the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from
esp_partition_get(), as a test for equality.

Return
• If partition not found, returns NULL.
• If found, returns a pointer to the esp_partition_t structure in flash. This pointer is always valid for
the lifetime of the application.

Parameters
• partition: Pointer to partition data to verify. Must be non-NULL. All fields of this structure
must match the partition table entry in flash for this function to return a successful match.

esp_err_t esp_partition_read (const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)
Read data from the partition.

Return ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition
size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes
from lower-level flash driver.

Parameters
• partition: Pointer to partition structure obtained using esp_partition_find_first or
esp_partition_get. Must be non-NULL.
• dst: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must
be at least ‘size’ bytes long.
• src_offset: Address of the data to be read, relative to the beginning of the partition.
• size: Size of data to be read, in bytes.

esp_err_t esp_partition_write (const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using
esp_partition_erase_range function.

Partitions marked with an encryption flag will automatically be written via the spi_flash_write_encrypted() function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the spi_flash_write_encrypted() function for more details. Unencrypted partitions do not have this restriction.
Note Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

Return ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

Parameters
- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- dst_offset: Address where the data should be written, relative to the beginning of the partition.
- src: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- size: Size of data to be written, in bytes.

\[ \text{esp_err_t} \ esp\_partition\_erase\_range (\text{const esp\_partition\_t} \* \text{partition}, \text{size_t} \text{offset}, \text{size_t} \text{size}) \]

Erase part of the partition.

Return ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or dst are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

Parameters
- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- offset: Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- size: Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

\[ \text{esp_err_t} \ esp\_partition\_mmap (\text{const esp\_partition\_t} \* \text{partition}, \text{size_t} \text{offset}, \text{size_t} \text{size}, \text{spi\_flash\_mmap\_memory\_t} \text{memory}, \text{const void **out\_ptr}, \text{spi\_flash\_mmap\_handle\_t}* \text{out\_handle}) \]

Configure MMU to map partition into data memory.

Unlike spi_flash_mmap function, which requires a 64kB aligned base address, this function doesn’t impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via out_ptr argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via out_handle argument to spi_flash_munmap function.

Return ESP_OK, if successful.

Parameters
- partition: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- offset: Offset from the beginning of partition where mapping should start.
- size: Size of the area to be mapped.
- memory: Memory space where the region should be mapped.
- out_ptr: Output, pointer to the mapped memory region.
- out_handle: Output, handle which should be used for spi_flash_munmap call.

\[ \text{esp_err_t} \ esp\_partition\_get\_sha256 (\text{const esp\_partition\_t} \* \text{partition}, \text{uint8\_t} \* \text{sha\_256}) \]

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

Return
- ESP_OK: In case of successful operation.
- ESP_ERR_INVALID_ARG: The size was 0 or the sha_256 was NULL.
- ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
- ESP_ERR_IMAGE_INVALID: App partition doesn’t contain a valid app image.
- ESP_FAIL: An allocation error occurred.

Parameters
• [in] partition: Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
• [out] sha_256: Returned SHA-256 digest for a given partition.

bool esp_partition_check_identity(const esp_partition_t *partition_1, const esp_partition_t *partition_2)

Check for the identity of two partitions by SHA-256 digest.

Return
• True: In case of the two firmware is equal.
• False: Otherwise

Parameters
• [in] partition_1: Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
• [in] partition_2: Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

esp_err_t esp_partition_register_external(esp_flash_t *flash_chip, size_t offset, size_t size, const char *label, esp_partition_type_t type, esp_partition_subtype_t subtype, const esp_partition_t **out_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the esp_flash_t structure) as partitions. This allows using them with components which access SPI flash through the esp_partition API.

Return
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if CONFIG_CONFIG_SPI_FLASH_USE_LEGACY_IMPL is enabled
• ESP_ERR_NO_MEM if memory allocation has failed
• ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
• ESP_ERR_INVALID_SIZE if the partition doesn’t fit into the flash chip size

Parameters
• flash_chip: Pointer to the structure identifying the flash chip
• offset: Address in bytes, where the partition starts
• size: Size of the partition in bytes
• label: Partition name
• type: One of the partition types (ESP_PARTITION_TYPE_*) Note that applications cannot be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
• subtype: One of the partition subtypes (ESP_PARTITION_SUBTYPE_*)
• [out] out_partition: Output, if non-NULL, receives the pointer to the resulting esp_partition_t structure

esp_err_t esp_partition_deregister_external(const esp_partition_t *partition)

Deregister the partition previously registered using esp_partition_register_external.

Return
• ESP_OK on success
• ESP_ERR_NOT_FOUND if the partition pointer is not found
• ESP_ERR_INVALID_ARG if the partition comes from the partition table
• ESP_ERR_INVALID_ARG if the partition was not registered using esp_partition_register_external function.

Parameters
• partition: pointer to the partition structure obtained from esp_partition_register_external.

Structures

struct esp_partition_t

partition information structure

This is not the format in flash, that format is esp_partition_info_t.
However, this is the format used by this API.

**Public Members**

- `esp_flash_t *flash_chip`
  SPI flash chip on which the partition resides
- `esp_partition_type_t type`
  partition type (app/data)
- `esp_partition_subtype_t subtype`
  partition subtype
- `uint32_t address`
  starting address of the partition in flash
- `uint32_t size`
  size of the partition, in bytes
- `char label[17]`
  partition label, zero-terminated ASCII string
- `bool encrypted`
  flag is set to true if partition is encrypted

**Macros**

`ESP_PARTITION_SUBTYPE_OTA (i)`
Convenience macro to get `esp_partition_subtype_t` value for the i-th OTA partition.

**Type Definitions**

`typedef struct esp_partition_iterator_opaque_ *esp_partition_iterator_t`
Opaque partition iterator type.

**Enumerations**

- `enum esp_partition_type_t`
  Partition type.
  
  **Note** Keep this enum in sync with `PartitionDefinition` class `gen_esp32part.py`
  
  **Values:**
  
  - `ESP_PARTITION_TYPE_APP` = 0x00
    Application partition type.
  - `ESP_PARTITION_TYPE_DATA` = 0x01
    Data partition type.

- `enum esp_partition_subtype_t`
  Partition subtype.
  
  **Note** Keep this enum in sync with `PartitionDefinition` class `gen_esp32part.py`
  
  **Values:**
  
  - `ESP_PARTITION_SUBTYPE_APP_FACTORY` = 0x00
    Factory application partition.
  - `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` = 0x10
    Base for OTA partition subtypes.
  - `ESP_PARTITION_SUBTYPE_APP_OTA_0` = `ESP_PARTITION_SUBTYPE_APP_OTA_MIN` + 0
    OTA partition 0.
ESP_PARTITION_SUBTYPE_APP_OTA_1 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 1
OTA partition 1.

ESP_PARTITION_SUBTYPE_APP_OTA_2 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 2
OTA partition 2.

ESP_PARTITION_SUBTYPE_APP_OTA_3 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 3
OTA partition 3.

ESP_PARTITION_SUBTYPE_APP_OTA_4 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 4
OTA partition 4.

ESP_PARTITION_SUBTYPE_APP_OTA_5 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 5
OTA partition 5.

ESP_PARTITION_SUBTYPE_APP_OTA_6 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 6
OTA partition 6.

ESP_PARTITION_SUBTYPE_APP_OTA_7 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 7
OTA partition 7.

ESP_PARTITION_SUBTYPE_APP_OTA_8 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 8
OTA partition 8.

ESP_PARTITION_SUBTYPE_APP_OTA_9 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 9
OTA partition 9.

ESP_PARTITION_SUBTYPE_APP_OTA_10 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 10
OTA partition 10.

ESP_PARTITION_SUBTYPE_APP_OTA_11 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 11
OTA partition 11.

ESP_PARTITION_SUBTYPE_APP_OTA_12 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 12
OTA partition 12.

ESP_PARTITION_SUBTYPE_APP_OTA_13 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 13
OTA partition 13.

ESP_PARTITION_SUBTYPE_APP_OTA_14 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 14
OTA partition 14.

ESP_PARTITION_SUBTYPE_APP_OTA_15 = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 15
OTA partition 15.

ESP_PARTITION_SUBTYPE_APP_OTA_MAX = ESP_PARTITION_SUBTYPE_APP_OTA_MIN + 16
Max subtype of OTA partition.

ESP_PARTITION_SUBTYPE_APP_TEST = 0x20
Test application partition.

ESP_PARTITION_SUBTYPE_DATA_OTA = 0x00
OTA selection partition.

ESP_PARTITION_SUBTYPE_DATA_PHY = 0x01
PHY init data partition.

ESP_PARTITION_SUBTYPE_DATA_NVS = 0x02
NVS partition.

ESP_PARTITION_SUBTYPE_DATA_COREDUMP = 0x03
COREDUMP partition.

ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS = 0x04
Partition for NVS keys.

ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM = 0x05
Partition for emulate eFuse bits.
ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD = 0x80
ESPHTTPD partition.

ESP_PARTITION_SUBTYPE_DATA_FAT = 0x81
FAT partition.

ESP_PARTITION_SUBTYPE_DATA_SPIFFS = 0x82
SPIFFS partition.

ESP_PARTITION_SUBTYPE_ANY = 0xff
Used to search for partitions with any subtype.

API Reference - Flash Encrypt

Header File
- bootloader_support/include/esp_flash_encrypt.h

Functions

static bool esp_flash_encryption_enabled (void)
Is flash encryption currently enabled in hardware?
Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.
Return true if flash encryption is enabled.

esp_err_t esp_flash_encrypt_check_and_update (void)

esp_err_t esp_flash_encrypt_region (uint32_t src_addr, size_t data_length)
Encrypt-in-place a block of flash sectors.
Note This function resets RTC_WDT between operations with sectors.
Return ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails,
ESP_ERR_FLASH_OP_TIMEOUT if flash times out.
Parameters
- src_addr: Source offset in flash. Should be multiple of 4096 bytes.
- data_length: Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

void esp_flash_write_protect_crypt_cnt ()
Write protect FLASH_CRYPT_CNT.
Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This
should protect against serial re-flashing of an unauthorised code in absence of secure boot.
Note On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

esp_flash_enc_mode_t esp_get_flash_encryption_mode ()
Return the flash encryption mode.
The API is called during boot process but can also be called by application to check the current flash encryption
mode of ESP32

Return

void esp_flash_encryption_init_checks (void)
Check the flash encryption mode during startup.
Verifies the flash encryption config during startup:
Note This function is called automatically during app startup, it doesn’t need to be called from the app.
- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn’t match the project config in any way.
Enumerations
enum esp_flash_enc_mode_t

Values:
   ESP_FLASH_ENC_MODE_DISABLED
   ESP_FLASH_ENC_MODE_DEVELOPMENT
   ESP_FLASH_ENC_MODE_RELEASE

2.6.2 SD/SDIO/MMC Driver

Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level
driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers (driver/include/driver/sdmmc_host.h) provide API functions for:

• Sending commands to slave devices
• Sending and receiving data
• Handling error conditions within the bus

For functions used to initialize and configure:

• SDMMC host, see SDMMC Host API
• SD SPI host, see SD SPI Host API

The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card
initialization and data transfer commands.

The protocol layer works with the host via the sdmmc_host_t structure. This structure contains pointers to various
functions of the host.

Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the storage/sd_card
directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library
APIs. See README.md file in the example directory for more information.

Protocol layer API

The protocol layer is given the sdmmc_host_t structure. This structure describes the SD/MMC host driver, lists
its capabilities, and provides pointers to functions of the driver. The protocol layer stores card-specific information in
the sdmmc_card_t structure. When sending commands to the SD/MMC host driver, the protocol layer uses the
sdmmc_command_t structure to describe the command, arguments, expected return values, and data to transfer if
there is any.

Using API with SD memory cards

1. To initialize the host, call the host driver functions, e.g., sdmmc_host_init(), sdmmc_host_init_slot().
2. To initialize the card, call sdmmc_card_init() and pass to it the parameters host - the host driver
   information, and card - a pointer to the structure sdmmc_card_t which will be filled with information
   about the card when the function completes.
3. To read and write sectors of the card, use sdmmc_read_sectors() and sdmmc_write_sectors() respectively and pass to it the parameter card - a pointer to the card information structure.
4. If the card is not used anymore, call the host driver function - e.g., sdmmc_host_deinit() - to disable
   the host peripheral and free the resources allocated by the driver.
Using API with eMMC chips  From the protocol layer’s perspective, eMMC memory chips behave exactly like SD memory cards. Even though eMMCs are chips and do not have a card form factor, the terminology for SD cards can still be applied to eMMC due to the similarity of the protocol (sdmmc_card_t, sdmmc_card_init). Note that eMMC chips cannot be used over SPI, which makes them incompatible with the SD SPI host driver.

To initialize eMMC memory and perform read/write operations, follow the steps listed for SD cards in the previous section.

Using API with SDIO cards  Initialization and the probing process is the same as with SD memory cards. The only difference is in data transfer commands in SDIO mode.

During the card initialization and probing, performed with sdmmc_card_init(), the driver only configures the following registers of the IO card:

1. The IO portion of the card is reset by setting RES bit in the I/O Abort (0x06) register.
2. If 4-line mode is enabled in host and slot configuration, the driver attempts to set the Bus width field in the Bus Interface Control (0x07) register. If setting the filed is successful, which means that the slave supports 4-line mode, the host is also switched to 4-line mode.
3. If high-speed mode is enabled in the host configuration, the SHS bit is set in the High Speed (0x13) register.

In particular, the driver does not set any bits in (1) I/O Enable and Int Enable registers, (2) I/O block sizes, etc. Applications can set them by calling sdmmc_io_write_byte().

For card configuration and data transfer, choose the pair of functions relevant to your case from the table below.

<table>
<thead>
<tr>
<th>Action</th>
<th>Read Function</th>
<th>Write Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read and write a single byte using IO_RW_DIRECT (CMD52)</td>
<td>sdmmc_io_read_byte()</td>
<td>sdmmc_io_write_byte()</td>
</tr>
<tr>
<td>Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode</td>
<td>sdmmc_io_read_bytes()</td>
<td>sdmmc_io_write_bytes()</td>
</tr>
<tr>
<td>Read and write blocks of data using IO_RW_EXTENDED (CMD53) in block mode</td>
<td>sdmmc_io_read_blocks()</td>
<td>sdmmc_io_write_blocks()</td>
</tr>
</tbody>
</table>

SDIO interrupts can be enabled by the application using the function sdmmc_io_enable_int(). When using SDIO in 1-line mode, the D1 line also needs to be connected to use SDIO interrupts.

If you want the application to wait until the SDIO interrupt occurs, use sdmmc_io_wait_int().

Combo (memory + IO) cards  The driver does not support SD combo cards. Combo cards are treated as IO cards.

Thread safety  Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the sdmmc_card_t structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.

API Reference

Header File

- sdmmc/include/sdmmc_cmd.h

Functions

esp_err_t sdmmc_card_init(const sdmmc_host_t *host, sdmmc_card_t *out_card)

Probe and initialize SD/MMC card using given host

Note  Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

Return  
- ESP_OK on success

Submit Document Feedback
Chapter 2. API Reference

- One of the error codes from SDMMC host controller

**Parameters**
- `host`: pointer to structure defining host controller
- `out_card`: pointer to structure which will receive information about the card when the function completes

`void sdmmc_card_print_info (FILE *stream, const sdmmc_card_t *card)`

Print information about the card to a stream.

**Parameters**
- `stream`: stream obtained using fopen or fdopen
- `card`: card information structure initialized using sdmmc_card_init

**esp_err_t sdmmc_write_sectors (sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)**

Write given number of sectors to SD/MMC card

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- `card`: pointer to card information structure previously initialized using sdmmc_card_init
- `src`: pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
- `start_sector`: sector where to start writing
- `sector_count`: number of sectors to write

**esp_err_t sdmmc_read_sectors (sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)**

Write given number of sectors to SD/MMC card

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- `card`: pointer to card information structure previously initialized using sdmmc_card_init
- `dst`: pointer to data buffer to write into; buffer size must be at least sector_count * card->csd.sector_size
- `start_sector`: sector where to start reading
- `sector_count`: number of sectors to read

**esp_err_t sdmmc_io_read_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)**

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- `card`: pointer to card information structure previously initialized using sdmmc_card_init
- `function`: IO function number
- `reg`: byte address within IO function
- `out_byte`: output, receives the value read from the card

**esp_err_t sdmmc_io_write_byte (sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)**

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

**Return**
- ESP_OK on success
- One of the error codes from SDMMC host controller

**Parameters**
- `card`: pointer to card information structure previously initialized using sdmmc_card_init
- `function`: IO function number
Chapter 2. API Reference

- **reg**: byte address within IO function
- **in_byte**: value to be written
- [out] **out_byte**: if not NULL, receives new byte value read from the card (read-after-write).

```c
esp_err_t sdmmc_io_read_bytes(sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see `sdmmc_io_read_blocks`.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using `sdmmc_card_init`
- **function**: IO function number
- **addr**: byte address within IO function where reading starts
- **dst**: buffer which receives the data read from card
- **size**: number of bytes to read

```c
esp_err_t sdmmc_io_write_bytes(sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using `sdmmc_card_init`
- **function**: IO function number
- **addr**: byte address within IO function where writing starts
- **src**: data to be written
- **size**: number of bytes to write

```c
esp_err_t sdmmc_io_read_blocks(sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

**Parameters**
- **card**: pointer to card information structure previously initialized using `sdmmc_card_init`
- **function**: IO function number
- **addr**: byte address within IO function where writing starts
- **dst**: buffer which receives the data read from card
- **size**: number of bytes to read, must be divisible by the card block size.

```c
esp_err_t sdmmc_io_write_blocks(sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see `sdmmc_io_write_bytes`. 
Return

- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

Parameters

- card: pointer to card information structure previously initialized using sdmmc_card_init
- function: IO function number
- addr: byte address within IO function where writing starts
- src: data to be written
- size: number of bytes to read, must be divisible by the card block size.

```c
esp_err_t sdmmc_io_enable_int (sdmmc_card_t *card)
```

Enable SDIO interrupt in the SDMMC host

Return

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

Parameters

- card: pointer to card information structure previously initialized using sdmmc_card_init

```c
esp_err_t sdmmc_io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)
```

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

Return

- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in timeout_ticks

Parameters

- card: pointer to card information structure previously initialized using sdmmc_card_init
- timeout_ticks: time to wait for the interrupt, in RTOS ticks

```c
esp_err_t sdmmc_io_get_cis_data (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)
```

Get the data of CIS region of a SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this functions store as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

Return

- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but buffer_size is less than required size, which is stored in the inout_cis_size then.
- ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of inout_cis_size or set it to 0, if you still want to search for the end; output value of inout_cis_size is invalid in this case.
- and other error code return from sdmmc_io_read_bytes

Parameters

- card: pointer to card information structure previously initialized using sdmmc_card_init
- out_buffer: Output buffer of the CIS data
- buffer_size: Size of the buffer.
- inout_cis_size: Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than buffer_size. The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if CIS_CODE_END is found.

```c
esp_err_t sdmmc_io_print_cis_info (uint8_t *buffer, size_t buffer_size, FILE *fp)
```

Parse and print the CIS information of a SDIO card.

Note Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in sdmmc_io.c and contribute to the IDF through the Github repository.
using sdmmc_card_init

Return
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP_ERR_INVALID_SIZE: if the CIS size fields are not correct.

Parameters
- buffer: Buffer to parse
- buffer_size: Size of the buffer.
- fp: File pointer to print to, set to NULL to print to stdout.

Header File
- driver/include/driver/sdmmc_types.h

Structures
struct sdmmc_csd_t
Decoded values from SD card Card Specific Data register

Public Members
int csd_ver
CSD structure format
int mmc_ver
MMC version (for CID format)
int capacity
total number of sectors
int sector_size
sector size in bytes
int read_block_len
block length for reads
int card_command_class
Card Command Class for SD
int tr_speed
Max transfer speed

struct sdmmc_cid_t
Decoded values from SD card Card IDentification register

Public Members
int mfg_id
manufacturer identification number
int oem_id
OEM/product identification number
char name[8]
product name (MMC v1 has the longest)
int revision
product revision
int serial
product serial number
Chapter 2. API Reference

```c
int date
  manufacturing date

struct sdmmc_scr_t
  Decoded values from SD Configuration Register

Public Members

int sd_spec
  SD Physical layer specification version, reported by card

int bus_width
  bus widths supported by card: BIT(0) — 1-bit bus, BIT(2) — 4-bit bus

struct sdmmc_ext_csd_t
  Decoded values of Extended Card Specific Data

Public Members

uint8_t power_class
  Power class used by the card

struct sdmmc_switch_func_rsp_t
  SD SWITCH_FUNC response buffer

Public Members

uint32_t data[512 / 8 / sizeof(uint32_t)]
  response data

struct sdmmc_command_t
  SD/MMC command information

Public Members

uint32_t opcode
  SD or MMC command index

uint32_t arg
  SD/MMC command argument

sdmmc_response_t response
  response buffer

void *data
  buffer to send or read into

size_t datalen
  length of data buffer

size_t blklen
  block length

int flags
  see below

esp_err_t error
  error returned from transfer

int timeout_ms
  response timeout, in milliseconds
```
struct sdmmc_host_t
SD/MMC Host description
This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

Public Members

uint32_t flags
flags defining host properties
int slot
slot number, to be passed to host functions
int max_freq_khz
max frequency supported by the host
float io_voltage
I/O voltage used by the controller (voltage switching is not supported)

esp_err_t (*init) (void)
Host function to initialize the driver

esp_err_t (*set_bus_width) (int slot, size_t width)
host function to set bus width

size_t (*get_bus_width) (int slot)
host function to get bus width

esp_err_t (*set_bus_ddr_mode) (int slot, bool ddr_enable)
host function to set DDR mode

esp_err_t (*set_card_clk) (int slot, uint32_t freq_khz)
host function to set card clock frequency

esp_err_t (*do_transaction) (int slot, sdmmc_command_t *cmdinfo)
host function to do a transaction

esp_err_t (*deinit) (void)
host function to deinitialize the driver

esp_err_t (*io_int_enable) (int slot)
Host function to enable SDIO interrupt line

esp_err_t (*io_int_wait) (int slot, TickType_t timeout_ticks)
Host function to wait for SDIO interrupt line to be active

int command_timeout_ms
timeout, in milliseconds, of a single command. Set to 0 to use the default value.

struct sdmmc_card_t
SD/MMC card information structure

Public Members

sdmmc_host_t host
Host with which the card is associated

uint32_t ocr
OCR (Operation Conditions Register) value

sdmmc_cid_t cid
decoded CID (Card IDentification) register value

sdmmc_response_t raw_cid
raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode
**sdmmc_csd_t**
decoded CSD (Card-Specific Data) register value

**sdmmc_scr_t**
decoded SCR (SD card Configuration Register) value

**sdmmc_ext_csd_t**
decoded EXT_CSD (Extended Card Specific Data) register value

```c
uint16_t rca
    RCA (Relative Card Address)

uint16_t max_freq_khz
    Maximum frequency, in kHz, supported by the card

uint32_t is_mem : 1
    Bit indicates if the card is a memory card

uint32_t is_sdio : 1
    Bit indicates if the card is an IO card

uint32_t is_mmc : 1
    Bit indicates if the card is MMC

uint32_t num_io_functions : 3
    If is_sdio is 1, contains the number of IO functions on the card

uint32_t log_bus_width : 2
    log2(bus width supported by card)

uint32_t is_ddr : 1
    Card supports DDR mode

uint32_t reserved : 23

2.6.3 Non-volatile storage library

Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

Underlying storage Currently, NVS uses a portion of main flash memory through spi_flash_{read|write|erase} APIs. The library uses all the partitions with data type and nvs subtype. The application can choose to use the partition with the label nvs through the nvs_open API function or any other partition by specifying its name using the nvs_open_from_part API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

Note: if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a idf.py erase_flash target to erase all contents of the flash chip.

Note: NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

Keys and values NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types:  uint8_t, int8_t, uint16_t, int16_t, uint32_t, int32_t, uint64_t, int64_t
- zero-terminated string
- variable length binary data (blob)

Note: String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

Additional types, such as float and double might be added later.

Keys are required to be unique. Assigning a new value to an existing key works as follows:

- if the new value is of the same type as the old one, value is updated
- if the new value has a different data type, an error is returned

Data type check is also performed when reading a value. An error is returned if the data type of the read operation does not match the data type of the value.

Namespaces To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Namespace name is specified in the nvs_open or nvs_open_from_part call. This call returns an opaque handle, which is used in subsequent calls to the nvs_read_* , nvs_write_* , and nvs_commit functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.
Security, tampering, and robustness  NVS is not directly compatible with the ESP32 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32 flash encryption. Please refer to NVS Encryption for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

Internals

Log of key-value pairs  NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

Pages and entries  NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a sequence number associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

Empty/uninitialized  Flash storage for the page is empty (all bytes are $0xff$). Page is not used to store any data at this point and does not have a sequence number.

Active  Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.

Full  Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.

Erasing  Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.

Corrupted  Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in uninitialized state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

```
+--------+ +--------+ +--------+ +--------+ <- states
| Page 1 | | Page 2 | | Page 3 | | Page 4 | |
| Full | +--> | Full | +--> | Active | | Empty | <- states
| #11 | | #12 | | #14 | | | |
+--------+ +--------+ +--------+ +--------+ <- sequence numbers
```

```
+-----+ +-----+ +-----+ +-----+ <- physical sectors
| Sector 3 | | Sector 0 | | Sector 2 | | Sector 1 |
```

Structure of a page  For now, we assume that flash sector size is 4096 bytes and that ESP32 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).
Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32 flash encryption, entry size is 32 bytes. For integer types, entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

![Page structure diagram](image)

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the erased state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

**Entry and entry state bitmap** Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

- **Empty (2’b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).
- **Written (2’b10)** A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.
- **Erased (2’b00)** A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

**Structure of entry** For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called “blob index”. Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

(continues on next page)
Individual fields in entry structure have the following meanings:

**NS** Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

**Type** One byte indicating the value data type. See the `ItemType` enumeration in `nvs_types.h` for possible values.

**Span** Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

**ChunkIndex** Used to store the index of a blob-data chunk for blob types. For other types, this should be 0xff.

**CRC32** Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

**Key** Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

**Data** For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with 0xff.

For “blob index” entries, these 8 bytes hold the following information about data-chunks:

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart** (Only for blob index.) ChunkIndex of the first blob-data chunk of this blob. Subsequent chunks have chunkIndex incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The **Span** field of the first entry indicates how many entries are used.

**Namespaces** As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.

| NS-0 Type-uint8_t Key="wifi" Value=1 | Entry describing namespace "wifi" |
| NS-1 Type-uint32_t Key="channel" Value=6 | Key "channel" in namespace "wifi" |
| NS-0 Type-uint8_t Key="pwm" Value=2 | Entry describing namespace "pwm" |
| NS-2 Type-uint16_t Key="channel" Value=20 | Key "channel" in namespace "pwm" |

**Item hash list** To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, `Page::findItem` first performs a search for the item hash in the hash list. This
Chapter 2. API Reference

gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item will be found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

NVS Encryption

Data stored in NVS partitions can be encrypted using AES-XTS in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one sector and relative address of the entry (w.r.t. partition-start) is fed to the encryption algorithm as sector-number. The keys required for NVS encryption are stored in yet another partition, which is protected using Flash Encryption. Therefore, enabling Flash Encryption is a prerequisite for NVS encryption.

NVS key partition An application requiring NVS encryption support needs to be compiled with a key-partition of the type data and subtype key. This partition should be marked as encrypted. Refer to Partition Tables for more details. The size of the partition should be 4096 bytes (minimum partition size). The structure of this partition is depicted below.

```
+--------------------------+
| XTS encryption key(32)   |
+--------------------------+
| XTS tweak key (32)       |
+--------------------------+
| CRC32 (4)                |
```

This partition can be generated using nvs partition generator utility and flashed onto the device. Since the partition is marked encrypted and Flash Encryption is enabled, bootloader will encrypt this partition using flash encryption key on the first boot. Alternatively, the keys can be generated after startup using the nvs flash generate keys API function provided by nvs_flash.h, which will then write those keys onto the key-partition in encrypted form.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide correct key-partition/keys for the purpose of encryption/decryption.

Encrypted Read/Write The same NVS API functions nvs_read_* or nvs_write_* can be used for reading of, and writing to an encrypted nvs partition as well. However, the API functions for initialising NVS partitions are different: nvs_flash_secure_init and nvs_flash_secure_init_partition instead of nvs_flash_init and nvs_flash_init_partition respectively. The nvs_sec_cfg_t structure required for these API functions can be populated using nvs_flash_generate_keys or nvs_flash_read_securityCfg.

Applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled.

1. Find key partition and NVS data partition using esp_partition_find* API functions.
2. Populate the nvs_sec_cfg_t struct using the nvs_flash_read_security_cfg or nvs_flash_generate_keys API functions.
3. Initialise NVS flash partition using the nvs_flash_secure_init or nvs_flash_secure_init_partition API functions.
4. Open a namespace using the nvs_open or nvs_open_from_part API functions.
5. Perform NVS read/write operations using nvs_read_* or nvs_write_*.
6. Deinitialise an NVS partition using nvs_flash_deinit.
NVS iterators  Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find` returns an opaque handle, which is used in subsequent calls to the `nvs_entry_next` and `nvs_entry_info` functions.
- `nvs_entry_next` returns iterator to the next key-value pair.
- `nvs_entry_info` returns information about each key-value pair

If none or no other key-value pair was found for given criteria, `nvs_entry_find` and `nvs_entry_next` return NULL. In that case, the iterator does not have to be released. If the iterator is no longer needed, you can release it by using the function `nvs_release_iterator`.

NVS Partition Generator Utility

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to `NVS Partition Generator Utility`.

Application Example

You can find two code examples in the `storage` directory of ESP-IDF examples:

- `storage/nvs_rw_value`  
  Demonstrates how to read a single integer value from, and write it to NVS.  
  The value checked in this example holds the number of the ESP32 module restarts. The value’s function as a counter is only possible due to its storing in NVS.
  
  The example also shows how to check if a read / write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

- `storage/nvs_rw_blob`  
  Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32 module restarts.
  
  - value - tracks the number of the ESP32 module soft and hard restarts.
  - blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.
  
  The example also shows how to implement the diagnostic procedure to check if the read / write operation was successful.

API Reference

Header File

- `nvs_flash/include/nvs_flash.h`

Functions

```c
esp_err_t nvs_flash_init (void)
```

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

Return
Chapter 2. API Reference

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- one of the error codes from the underlying flash storage driver

`esp_err_t nvs_flash_init_partition(const char *partition_label)`

Initialize NVS flash storage for the specified partition.

**Return**

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- one of the error codes from the underlying flash storage driver

**Parameters**

- [in] partition_label: Label of the partition. Note that internally a reference to passed value is kept and it should be accessible for future operations

`esp_err_t nvs_flash_init_partition_ptr(const esp_partition_t *partition)`

Initialize NVS flash storage for the partition specified by partition pointer.

**Return**

- ESP_OK if storage was successfully initialized
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

**Parameters**

- [in] partition: pointer to a partition obtained by the ESP partition API.

`esp_err_t nvs_flash_deinit(void)`

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

**Return**

- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

`esp_err_t nvs_flash_deinit_partition(const char *partition_label)`

Deinitialize NVS storage for the given NVS partition.

**Return**

- ESP_OK on success
- ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

**Parameters**

- [in] partition_label: Label of the partition

`esp_err_t nvs_flash_erase(void)`

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be de-initialized again to be used.

**Return**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
- different error in case de-initialization fails (shouldn’t happen)

`esp_err_t nvs_flash_erase_partition(const char *part_name)`

Erase specified NVS partition.

Erase all content of a specified NVS partition
**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn’t happen)

**Parameters**
- [in] `part_name`: Name (label) of the partition which should be erased

```c
esp_err_t nvs_flash_erase_partition_ptr(const esp_partition_t *partition)
```
Erase custom partition.

Erase all content of specified custom partition.

**Note** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

**Parameters**
- [in] `partition`: pointer to a partition obtained by the ESP partition API.

```c
esp_err_t nvs_flash_secure_init(nvs_sec_cfg_t *cfg)
```
Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Return**
- ESP_OK if storage was successfully initialized.
- ESP_ERR_NV_E_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- one of the error codes from the underlying flash storage driver

**Parameters**
- [in] `cfg`: Security configuration (keys) to be used for NVS encryption/decryption. If `cfg` is NULL, no encryption is used.

```c
esp_err_t nvs_flash_secure_init_partition(const char *partition_label, nvs_sec_cfg_t *cfg)
```
Initialize NVS flash storage for the specified partition.

**Return**
- ESP_OK if storage was successfully initialized.
- ESP_ERR_NV_E_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- one of the error codes from the underlying flash storage driver

**Parameters**
- [in] `partition_label`: Label of the partition. Note that internally a reference to passed value is kept and it should be accessible for future operations
- [in] `cfg`: Security configuration (keys) to be used for NVS encryption/decryption. If `cfg` is null, no encryption/decryption is used.

```c
esp_err_t nvs_flash_generate_keys(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)
```
Generate and store NVS keys in the provided esp partition.

**Return**
- ESP_OK, if `cfg` was read successfully; - or error codes from esp_partition_write/erase APIs.

**Parameters**
- [in] `partition`: Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
• [out] cfg: Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

eesp_err_t nvs_flash_read_security_cfg(const esp_partition_t *partition, nvs_sec_cfg_t *cfg)
  Read NVS security configuration from a partition.

Note  Provided partition is assumed to be marked ‘encrypted’.

Return  -ESP_OK, if cfg was read successfully; -ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition
  is not yet written with keys. -ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing
  keys is found to be corrupt -or error codes from esp_partition_read API.

Parameters
  • [in] partition: Pointer to partition structure obtained using esp_partition_find_first or
    esp_partition_get. Must be non-NULL.
  • [out] cfg: Pointer to nvs security configuration structure. Pointer must be non-NULL.

Structures
struct nvs_sec_cfg_t
  Key for encryption and decryption.

Public Members

tuint8_t ek[y][NVS_KEY_SIZE]
  XTS encryption and decryption key

tuint8_t tky[NVS_KEY_SIZE]
  XTS tweak key

Macros
NVS_KEY_SIZE

Header File
  • nvs_flash/include/nvs.h

Functions

eesp_err_t nvs_set_i8 (nvs_handle_t handle, const char *key, int8_t value)
  set value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until
nvs_commit function is called.

Return  
  • ESP_OK if value was set successfully
  • ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
  • ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
  • ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
  • ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage
to save the value
  • ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation
    has failed. The value was written however, and update will be finished after re-initialization of nvs,
    provided that flash operation doesn’t fail again.
  • ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

Parameters
  • [in] handle: Handle obtained from nvs_open function. Handles that were opened read only
    cannot be used.
  • [in] key: Key name. Maximal length is determined by the underlying implementation, but is
guaranteed to be at least 15 characters. Shouldn’t be empty.
• [in] value: The value to set. For strings, the maximum length (including null character) is 4000 bytes.

  `esp_err_t nvs_set_u8 (nvs_handle_t handle, const char *key, uint8_t value)`

  `esp_err_t nvs_set_i16 (nvs_handle_t handle, const char *key, int16_t value)`

  `esp_err_t nvs_set_u16 (nvs_handle_t handle, const char *key, uint16_t value)`

  `esp_err_t nvs_set_i32 (nvs_handle_t handle, const char *key, int32_t value)`

  `esp_err_t nvs_set_u32 (nvs_handle_t handle, const char *key, uint32_t value)`

  `esp_err_t nvs_set_i64 (nvs_handle_t handle, const char *key, int64_t value)`

  `esp_err_t nvs_set_u64 (nvs_handle_t handle, const char *key, uint64_t value)`

  `esp_err_t nvs_set_str (nvs_handle_t handle, const char *key, const char *value)`

get value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.

All functions expect out_value to be a pointer to an already allocated variable of the given type.

```c
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

Return

• ESP_OK if the value was retrieved successfully

• ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist

• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL

• ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints

• ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

Parameters

• [in] handle: Handle obtained from nvs_open function.

• [in] key: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.

• out_value: Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.

  `esp_err_t nvs_get_u8 (nvs_handle_t handle, const char *key, uint8_t *out_value)`

  `esp_err_t nvs_get_i16 (nvs_handle_t handle, const char *key, int16_t *out_value)`

  `esp_err_t nvs_get_u16 (nvs_handle_t handle, const char *key, uint16_t *out_value)`

  `esp_err_t nvs_get_i32 (nvs_handle_t handle, const char *key, int32_t *out_value)`

  `esp_err_t nvs_get_u32 (nvs_handle_t handle, const char *key, uint32_t *out_value)`

  `esp_err_t nvs_get_i64 (nvs_handle_t handle, const char *key, int64_t *out_value)`

  `esp_err_t nvs_get_u64 (nvs_handle_t handle, const char *key, uint64_t *out_value)`

  `esp_err_t nvs_get_str (nvs_handle_t handle, const char *key, const char *out_value, size_t *length)`

get value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, out_value is not modified.
All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

`nvs_get_str` and `nvs_get_blob` functions support WinAPI-style length queries. To get the size necessary to store the value, call `nvs_get_str` or `nvs_get_blob` with zero `out_value` and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For `nvs_get_str`, this length includes the zero terminator. When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, length has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get/set_str` is used for zero-terminated C strings, and `nvs_get/set_blob` used for arbitrary data structures.

```c
// Example (without error checking) of using nvs_get_str to get a string into...-dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

Return

- ESP_OK if the value was retrieved successfully
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

Parameters

- `[in] handle`: Handle obtained from `nvs_open` function.
- `[in] key`: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.
- `[out] out_value`: Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.
- `[inout] length`: A non-zero pointer to the variable holding the length of `out_value`. In case `out_value` a zero, will be set to the length required to hold the value. In case `out_value` is not zero, will be set to the actual length of the value written. For `nvs_get_str` this includes zero terminator.

```c
esp_err_t nvs_get_blob (nvs_handle_t handle, const char* key, void* out_value, size_t* length)
```

```c
esp_err_t nvs_open (const char* name, nvs_open_mode_t open_mode, nvs_handle_t* out_handle)
```

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

Return

- ESP_OK if storage handle was opened successfully
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “nvs” is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- other error codes from the underlying storage driver

Parameters

- `[in] name`: Namespace name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.
- `[in] open_mode`: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- `[out] out_handle`: If successful (return code is zero), handle will be returned in this argument.

```c
esp_err_t nvs_open_from_partition (const char* part_name, const char* name, nvs_open_mode_t open_mode, nvs_handle_t* out_handle)
```
Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.

**Return**
- ESP_OK if storage handle was opened successfully
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- other error codes from the underlying storage driver

**Parameters**
- [in] part_name: Label (name) of the partition of interest for object read/write/erase
- [in] name: Namespace name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.
- [in] open_mode: NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- [out] out_handle: If successful (return code is zero), handle will be returned in this argument.

`esp_err_t nvs_set_blob(nvs_handle_t handle, const char* key, const void* value, size_t length)`

Set variable length binary value for given key.

This family of functions set value for the key, given its name. Note that actual storage will not be updated until nvs_commit function is called.

**Return**
- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

**Parameters**
- [in] handle: Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is 15 characters. Shouldn’t be empty.
- [in] value: The value to set.
- [in] length: length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

`esp_err_t nvs_erase_key(nvs_handle_t handle, const char* key)`

Erase key-value pair with given key name.

Note that actual storage may not be updated until nvs_commit function is called.

**Return**
- ESP_OK if erase operation was successful
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- other error codes from the underlying storage driver

**Parameters**
- [in] handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.
- [in] key: Key name. Maximal length is determined by the underlying implementation, but is guaranteed to be at least 15 characters. Shouldn’t be empty.
**esp_err_t nvs_erase_all (nvs_handle_t handle)**

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until nvs_commit function is called.

**Return**
- ESP_OK if erase operation was successful
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

**Parameters**
- **[in]** handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

**esp_err_t nvs_commit (nvs_handle_t handle)**

Write any pending changes to non-volatile storage.

After setting any values, nvs_commit() must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

**Return**
- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

**Parameters**
- **[in]** handle: Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

**void nvs_close (nvs_handle_t handle)**

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with nvs_open once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using nvs_commit function. Once this function is called on a handle, the handle should no longer be used.

**Parameters**
- **[in]** handle: Storage handle to close

**esp_err_t nvs_get_stats (const char *part_name, nvs_stats_t *nvs_stats)**

Fill structure nvs_stats_t. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```c
// Example of nvs_get_stats() to get the number of used entries and free_entries:
const char *part_name = "partition_name";
const nvs_stats_t *nvs_stats = NULL;

nvs_get_stats(part_name, nvs_stats);

printf("Count: Used Entries = (%d), Free Entries = (%d), All Entries = (%d)\n",
       nvs_stats->used_entries, nvs_stats->free_entries, nvs_stats->total_entries);
```

**Return**
- ESP_OK if the changes have been written successfully. Return param nvs_stats will be filled.
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “name” is not found. Return param nvs_stats will be filled 0.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param nvs_stats will be filled 0.
- ESP_ERR_INVALID_ARG if nvs_stats equal to NULL.
- ESP_ERR_INVALID_STATE if there is page with the status of INVALID. Return param nvs_stats will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

**Parameters**
Chapter 2. API Reference

- **[in]** `part_name`: Partition name NVS in the partition table. If pass a NULL than will use `NVS_DEFAULT_PART_NAME` ("nvs").
- **[out]** `nvs_stats`: Returns filled structure `nvs_states_t`. It provides info about used memory the partition.

```c
esp_err_t nvs_get_used_entry_count(nvs_handle_t handle, size_t* used_entries)
```

Calculate all entries in a namespace.

Note that to find out the total number of records occupied by the namespace, add one to the returned value `used_entries` (if err is equal to `ESP_OK`). Because the name space entry takes one entry.

```c
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs...
--in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
  // the total number of records occupied by the namespace
  total_entries_namespace = used_entries + 1;
}
```

**Return**

- ESP_OK if the changes have been written successfully. Return param `used_entries` will be filled valid value.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param `used_entries` will be filled 0.
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param `used_entries` will be filled 0.
- ESP_ERR_INVALID_ARG if `nvs_stats` equal to NULL.
- Other error codes from the underlying storage driver. Return param `used_entries` will be filled 0.

**Parameters**

- **[in]** `handle`: Handle obtained from `nvs_open` function.
- **[out]** `used_entries`: Returns amount of used entries from a namespace.

```c
nvs_iterator_t nvs_entry_find(const char *part_name, const char *namespace_name, nvs_type_t type)
```

Create an iterator to enumerate NVS entries based on one or more parameters.

```c
// Example of listing all the key-value pairs of any type under specified...
--partition and namespace
nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);
while (it != NULL) {
  nvs_entry_info_t info;
  nvs_entry_info(it, &info);
  it = nvs_entry_next(it);
  printf("key '%s', type '%d' \n", info.key, info.type);
}
```

**Return** Iterator used to enumerate all the entries found, or NULL if no entry satisfying criteria was found. Iterator obtained through this function has to be released using `nvs_release_iterator` when not used any more.

**Parameters**

- **[in]** `part_name`: Partition name
- **[in]** `namespace_name`: Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
• [in] type: One of nvs_type_t values.

**nvs_iterator_t nvs_entry_next (nvs_iterator_t iterator)**

Returns next item matching the iterator criteria, NULL if no such item exists.

Note that any copies of the iterator will be invalid after this call.

**Return** NULL if no entry was found, valid nvs_iterator_t otherwise.

**Parameters**

• [in] iterator: Iterator obtained from nvs_entry_find function. Must be non-NULL.

**void nvs_entry_info (nvs_iterator_t iterator, nvs_entry_info_t *out_info)**

Fills nvs_entry_info_t structure with information about entry pointed to by the iterator.

**Parameters**

• [in] iterator: Iterator obtained from nvs_entry_find or nvs_entry_next function. Must be non-NULL,

• [out] out_info: Structure to which entry information is copied.

**void nvs_release_iterator (nvs_iterator_t iterator)**

Release iterator.

**Parameters**

• [in] iterator: Release iterator obtained from nvs_entry_find function. NULL argument is allowed.

**Structures**

**struct nvs_entry_info_t**

Information about entry obtained from nvs_entry_info function

**Public Members**

- char namespace_name[16]
  Namespace to which key-value belong

- char key[16]
  Key of stored key-value pair

- nvs_type_t type
  Type of stored key-value pair

**struct nvs_stats_t**

**Note** Info about storage space NVS.

**Public Members**

- size_t used_entries
  Amount of used entries.

- size_t free_entries
  Amount of free entries.

- size_t total_entries
  Amount all available entries.

- size_t namespace_count
  Amount name space.
Chapter 2. API Reference

Macros

**ESP_ERR_NVS_BASE**
Starting number of error codes

**ESP_ERR_NVS_NOT_INITIALIZED**
The storage driver is not initialized

**ESP_ERR_NVS_NOT_FOUND**
Id namespace doesn’t exist yet and mode is NVS_READONLY

**ESP_ERR_NVS_TYPE_MISMATCH**
The type of set or get operation doesn’t match the type of value stored in NVS

**ESP_ERR_NVS_READ_ONLY**
Storage handle was opened as read only

**ESP_ERR_NVS_NOT_ENOUGH_SPACE**
There is not enough space in the underlying storage to save the value

**ESP_ERR_NVS_INVALID_NAME**
Namespace name doesn’t satisfy constraints

**ESP_ERR_NVS_INVALID_HANDLE**
Handle has been closed or is NULL

**ESP_ERR_NVS_REMOVE_FAILED**
The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**ESP_ERR_NVS_KEY_TOO_LONG**
Key name is too long

**ESP_ERR_NVS_PAGE_FULL**
Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_STATE**
NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH**
String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES**
NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG**
String or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND**
Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND**
NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED**
XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED**
XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED**
XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND**
XTS configuration not found

**ESP_ERR_NVS_ENCR_NOT_SUPPORTED**
NVS encryption is not supported in this version
Chapter 2. API Reference

ESP_ERR_NVS_KEYS_NOT_INITIALIZED
NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART
NVS key partition is corrupt

ESP_ERR_NVS_CONTENT_DIFFERS
Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME
Default partition name of the NVS partition in the partition table

Type Definitions

typedef uint32_t nvs_handle_t
Opaque pointer type representing non-volatile storage handle

typedef nvs_handle_t nvs_handle

typedef nvs_open_mode_t nvs_open_mode

typedef struct nvs_opaque_iterator_t *nvs_iterator_t
Opaque pointer type representing iterator to nvs entries

Enumerations

enum nvs_open_mode_t
Mode of opening the non-volatile storage.
Values:

NVS_READONLY
Read only

NVS_READWRITE
Read and write

enum nvs_type_t
Types of variables.
Values:

NVS_TYPE_U8 = 0x01
Type uint8_t

NVS_TYPE_I8 = 0x11
Type int8_t

NVS_TYPE_U16 = 0x02
Type uint16_t

NVS_TYPE_I16 = 0x12
Type int16_t

NVS_TYPE_U32 = 0x04
Type uint32_t

NVS_TYPE_I32 = 0x14
Type int32_t

NVS_TYPE_U64 = 0x08
Type uint64_t

NVS_TYPE_I64 = 0x18
Type int64_t

NVS_TYPE_STR = 0x21
Type string
Chapter 2. API Reference

NVS_TYPE_BLOB = 0x42
Type blob
NVS_TYPE_ANY = 0xff
Must be last

2.6.4 NVS Partition Generator Utility

Introduction

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file based on key-value pairs provided in a CSV file. The binary file is compatible with NVS architecture defined in Non-Volatile Storage. This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

Prerequisites

To use this utility in encryption mode, install the following packages:

- cryptography package

All the required packages are included in `requirements.txt` in the root of the esp-idf directory.

CSV file format

Each line of a .csv file should contain 4 parameters, separated by a comma. The table below provides the description for each of these parameters.

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key</td>
<td>Key of the data. The data can be accessed later from an application using this key.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Type</td>
<td>Supported values are file, data and namespace.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Encoding</td>
<td>Supported values are: u8, i8, u16, i32, string, hex2bin, base64 and binary. This specifies how actual data values are encoded in the resulting binary file. The difference between the string and binary encoding is that string data is terminated with a NULL character, whereas binary data is not.</td>
<td>As of now, for the file type, only hex2bin, base64, string, and binary encoding is supported.</td>
</tr>
<tr>
<td>4</td>
<td>Value</td>
<td>Data value.</td>
<td>Encoding and Value cells for the namespace field type should be empty. Encoding and Value of namespace is fixed and is not configurable. Any values in these cells are ignored.</td>
</tr>
</tbody>
</table>

Note: The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:
Chapter 2. API Reference

<table>
<thead>
<tr>
<th>key, type, encoding, value</th>
<th>column header</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace_name, namespace,</td>
<td>First entry should be of type &quot;namespace&quot;</td>
</tr>
<tr>
<td>key1, data, u8,</td>
<td></td>
</tr>
<tr>
<td>key2, file, string, /path/to/file</td>
<td></td>
</tr>
</tbody>
</table>

**Note:**

Make sure there are no spaces:
- before and after `,`
- at the end of each line in a CSV file

**NVS Entry and Namespace association**

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

**Note:** First entry in a CSV file should always be a namespace entry.

**Multipage Blob Support**

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section Structure of entry. If you intend to use an older format, the utility provides an option to disable this feature.

**Encryption Support**

The NVS Partition Generator utility also allows you to create an encrypted binary file. The utility uses the AES-XTS encryption. Please refer to *NVS Encryption* for more details.

**Decryption Support**

This utility allows you to decrypt an encrypted NVS binary file. The utility uses an NVS binary file encrypted using AES-XTS encryption. Please refer to *NVS Encryption* for more details.

**Running the utility**

**Usage:**

```
python nvs_partition_gen.py [-h] (generate, generate-key, encrypt, decrypt) ...
```

Optional Arguments:

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
</tbody>
</table>

Commands:

(continues on next page)
Run `nvs_partition_gen.py {command} -h` for additional help

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
<tr>
<td>3</td>
<td>encrypt</td>
<td>Generate NVS encrypted partition</td>
</tr>
<tr>
<td>4</td>
<td>decrypt</td>
<td>Decrypt NVS encrypted partition</td>
</tr>
</tbody>
</table>

To generate NVS partition (Default):

**Usage:**

```
python nvs_partition_gen.py generate [-h] [--version (1,2)] [--outdir OUTDIR]  
  input output size
```

**Positional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>Show this help message and exit</td>
</tr>
</tbody>
</table>
To generate encrypted NVS partition:

Usage:

```python
python nvs_partition_gen.py generate
```

You can run the utility to generate NVS partition using the command below: A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

To generate only encryption keys:

Usage:

```python
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--version {1,2}</td>
<td>Set multipage blob version.</td>
</tr>
<tr>
<td>version 1</td>
<td>Version 1 - Multipage blob support disabled.</td>
</tr>
<tr>
<td>version 2</td>
<td>Version 2 - Multipage blob support enabled.</td>
</tr>
<tr>
<td>Default: Version 2</td>
<td></td>
</tr>
<tr>
<td>outdir OUTDIR</td>
<td>Output directory to store files created.</td>
</tr>
<tr>
<td>(Default: current directory)</td>
<td></td>
</tr>
</tbody>
</table>

You can run the utility to generate only encryption keys using the command below:

```
python nvs_partition_gen.py generate-key
```

To generate encrypted NVS partition:

Usage:

```python
python nvs_partition_gen.py generate
```
## API Reference

```python
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen] [--keyfile KEYFILE] [--inputkey INPUTKEY] [--outdir OUTDIR]
```

**Positional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>--version {1,2}</td>
<td>Set multipage blob version.</td>
</tr>
<tr>
<td></td>
<td>Version 1 - Multipage blob support disabled.</td>
</tr>
<tr>
<td></td>
<td>Version 2 - Multipage blob support enabled.</td>
</tr>
<tr>
<td></td>
<td>Default: Version 2</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created</td>
</tr>
</tbody>
</table>
```

(continues on next page)
You can run the utility to encrypt NVS partition using the command below: A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin --0x3000 --keygen
```

**Note**: Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin --0x3000 --keygen --keyfile sample_keys.bin
```

**Note**: Encryption key of the following format `<outdir>/keys/sample_keys.bin` is created.

**Note**: This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to *NVS key partition* for more details.

- Encrypt by providing the encryption keys as input binary file:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin --0x3000 --inputkey sample_keys.bin
```

**To decrypt encrypted NVS partition:**

**Usage:**

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key... output
```

**Positional Arguments:**

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to encrypted NVS partition file to parse</td>
</tr>
<tr>
<td>key</td>
<td>Path to file having keys for decryption</td>
</tr>
<tr>
<td>output</td>
<td>Path to output decrypted binary file</td>
</tr>
</tbody>
</table>
```

(continues on next page)
Caveats

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

Note: Minimum NVS Partition Size needed is 0x3000 bytes.

Note: When flashing the binary onto the device, make sure it is consistent with the application’s sdkconfig.

Optional Arguments:

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>-v</td>
<td></td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created</td>
</tr>
<tr>
<td></td>
<td>(Default: current directory)</td>
</tr>
</tbody>
</table>
```

You can run the utility to decrypt encrypted NVS partition using the command below:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

You can also provide the format version number:
- Multipage Blob Support Disabled (Version 1)
- Multipage Blob Support Enabled (Version 2)

Multipage Blob Support Disabled (Version 1): You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --version 1
```

Multipage Blob Support Enabled (Version 2): You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --version 2
```
2.6.5 Virtual filesystem component

Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as fopen and fprintf, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the /fat prefix and call fopen("/fat/file.txt", "w"). The VFS component will then call the function open of the FAT driver and pass the argument /file.txt to it together with appropriate mode flags. All subsequent calls to C library functions for the returned FILE* stream will also be forwarded to the FAT driver.

FS registration

To register an FS driver, an application needs to define an instance of the esp_vfs_t structure and populate it with function pointers to FS APIs:

```c
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way how the FS driver declares its API functions, either read, write, etc., or read_p, write_p, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```c
ssize_t myfs_write(int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```c
ssize_t myfs_write(myfs_t* fs, int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));
```

(continues on next page)
// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));

Synchronous input/output multiplexing  Synchronous input/output multiplexing by select() is supported in the VFS component. The implementation works in the following way.

1. select() is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by start_select() described later on this page. This function represents the driver-specific implementation of select() for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by socket_select() described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals socket_select() to exit.
5. Results are collected from each VFS driver and all drivers are stopped by deinitialization of the environment for checking events.
6. The select() call ends and returns the appropriate results.

Non-socket VFS drivers  If you want to use select() with a file descriptor belonging to a non-socket VFS driver then you need to register the driver with functions start_select() and end_select() similarly to the following example:

```c
// In definition of esp_vfs_t:
 .start_select = &uart_start_select,
 .end_select = &uart_end_select,  
// ... other members initialized
```

start_select() is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

end_select() is called to stop/deinitialize/free the environment which was setup by start_select().

Note:  end_select() might be called without a previous start_select() call in some rare circumstances. end_select() should fail gracefully if this is the case.

Please refer to the reference implementation for the UART peripheral in vfs/vfs_uart.c and most particularly to the functions esp_vfs_dev_uart_register(), uart_start_select(), and uart_end_select() for more information.

Please check the following examples that demonstrate the use of select() with VFS file descriptors:

- peripherals/uart/uart_select
- system/select

Socket VFS drivers  A socket VFS driver is using its own internal implementation of select() and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```c
// In definition of esp_vfs_t:
 .socket_select = &lwip_select,  
 .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,  
 .stop_socket_select = &lwip_stop_socket_select,
```
socket_select() is the internal implementation of select() for the socket driver. It works only with file descriptors belonging to the socket VFS.

get_socket_select_semaphore() returns the signalization object (semaphore) which will be used in non-socket drivers to stop the waiting in socket_select().

stop_socket_select() call is used to stop the waiting in socket_select() by passing the object returned by get_socket_select_semaphore().

stop_socket_select_isr() has the same functionality as stop_socket_select() but it can be used from ISR.

Please see lwip/port/esp32/vfs_lwip.c for a reference socket driver implementation using LWIP.

**Note:** If you use select() for socket file descriptors only then you can enable the CONFIG_LWIP_USE_ONLY_LWIP_SELECT option to reduce the code size and improve performance.

**Note:** Don’t change the socket driver during an active select() call or you might experience some undefined behavior.

**Paths**

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS1 on /data
- FS2 on /data/static

Then:

- FS 1 will be used when opening a file called /data/log.txt
- FS 2 will be used when opening a file called /data/static/index.html
- Even if /index.html" does not exist in FS 2, FS 1 will not be searched for /static/index.html.

As a general rule, mount point names must start with the path separator (/) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (.) in path names in any special way. VFS does not treat .. as a reference to the parent directory. In the above example, using a path /data/static/../log.txt will not result in a call to FS 1 to open /log.txt. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The myfs driver is registered with /data as a path prefix.
2. The application calls fopen("/data/config.json", ...).
3. The VFS component calls myfs_open("/config.json", ...).
4. The myfs driver opens the /config.json file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to ESP_VFS_PATH_MAX characters. Individual FS drivers may have their own filename length limitations.
File descriptors

File descriptors are small positive integers from 0 to FD_SETSIZE - 1, where FD_SETSIZE is defined in newlib’s sys/types.h. The largest file descriptors (configured by CONFIG_LWIP_MAX_SOCKETS) are reserved for sockets. The VFS component contains a lookup-table called s_fd_table for mapping global file descriptors to VFS driver indexes registered in the s_vfs array.

Standard IO streams (stdin, stdout, stderr)

If the menuconfig option UART for console output is not set to None, then stdin, stdout, and stderr are configured to read from, and write to, a UART. It is possible to use UART0 or UART1 for standard IO. By default, UART0 is used with 115200 baud rate; TX pin is GPIO1; RX pin is GPIO3. These parameters can be changed in menuconfig.

Writing to stdout or stderr will send characters to the UART transmit FIFO. Reading from stdin will retrieve characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as fscanf("%d\n", &var);, might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver’s interrupt driven, blocking read and write functions instead. This can be done using a call to the esp_vfs_dev_uart_use_driver function. It is also possible to revert to the basic non-blocking functions using a call to esp_vfs_dev_uart_use_nonblocking.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF (\n) character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via menuconfig, or by calls to the functions esp_vfs_dev_uart_port_set_rx_line_endings and esp_vfs_dev_uart_port_set_tx_line_endings.

Standard streams and FreeRTOS tasks  FILE objects for stdin, stdout, and stderr are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task struct _reent.

The following code is transferred to fprintf(__getreent()->stderr, "42\n"); by the preprocessor:

```c
fprintf(stderr, "42\n");
```

The __getreent() function returns a per-task pointer to struct _reent (newlib/include/sys/reent.h#L370-L417). This structure is allocated on the TCB of each task. When a task is initialized, _stdin, _stdout, and _stderr members of struct _reent are set to the values of _stdin, _stdout, and _stderr of _GLOBAL_REENT (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set stdin, stdout, and stderr for any given task without affecting other tasks, e.g., by doing stdin = fopen("/dev/uart/1", "r").
- Closing default stdin, stdout, or stderr using fclose will close the FILE stream object, which will affect all other tasks.
- To change the default stdin, stdout, stderr streams for new tasks, modify _GLOBAL_REENT->_stdin(_stdout, _stderr) before creating the task.

Application Example

Instructions
Chapter 2. API Reference

API Reference

Header File

- vs/include/esp_vfs.h

Functions

ssize_t esp_vfs_write (struct _reent *r, int fd, const void *data, size_t size)

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

off_t esp_vfs_lseek (struct _reent *r, int fd, off_t size, int mode)

ssize_t esp_vfs_read (struct _reent *r, int fd, void *dst, size_t size)

int esp_vfs_open (struct _reent *r, const char *path, int flags, int mode)

int esp_vfs_close (struct _reent *r, int fd)

int esp_vfs_fstat (struct _reent *r, int fd, struct stat *st)

int esp_vfs_stat (struct _reent *r, const char *path, struct stat *st)

int esp_vfs_link (struct _reent *r, const char *n1, const char *n2)

int esp_vfs_unlink (struct _reent *r, const char *path)

int esp_vfs_rename (struct _reent *r, const char *src, const char *dst)

int esp_vfs_utime (const char *path, const struct utimbuf *times)

esp_err_t esp_vfs_register (const char *base_path, const esp_vfs_t *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

Parameters

- base_path: file path prefix associated with the filesystem. Must be a zero-terminated C string, up to ESP_VFS_PATH_MAX characters long, and at least 2 characters long. Name must start with a “/” and must not end with “/” . For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi/0” .
- vfs: Pointer to esp_vfs_t, a structure which maps syscalls to the filesystem driver functions. VFS component doesn’t assume ownership of this pointer.
- ctx: If vfs->flags has ESP_VFS_FLAG_CONTEXT_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.

esp_err_t esp_vfs_register_fd_range (const esp_vfs_t *vfs, void *ctx, int min_fd, int max_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min_fd; max_fd).

This is a special-purpose function intended for registering LWIP sockets to VFS.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

Parameters

- vfs: Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
- ctx: Pointer to context structure. Meaning is the same as for esp_vfs_register().
- min_fd: The smallest file descriptor this VFS will use.
- max_fd: Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

esp_err_t esp_vfs_register_with_id (const esp_vfs_t *vfs, void *ctx, esp_vfs_id_t vfs_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn’t pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp_vfs_register_fd.

Return ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

Parameters

- vfs: Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
- ctx: Pointer to context structure. Meaning is the same as for esp_vfs_register().
- min_fd: The smallest file descriptor this VFS will use.
- max_fd: Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).
Chapter 2. API Reference

- **vfs**: Pointer to `esp_vfs_t`. Meaning is the same as for `esp_vfs_register()`.
- **ctx**: Pointer to context structure. Meaning is the same as for `esp_vfs_register()`.
- **vfs_id**: Here will be written the VFS ID which can be passed to `esp_vfs_register_fd` for registering file descriptors.

```c
esp_err_t esp_vfs_unregister(const char *base_path)
```

Unregister a virtual filesystem for given path prefix

**Return**
- ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

**Parameters**
- **base_path**: file prefix previously used in `esp_vfs_register` call

```c
esp_err_t esp_vfs_register_fd(esp_vfs_id_t vfs_id, int *fd)
```

Special function for registering another file descriptor for a VFS registered by `esp_vfs_register_with_id`.

**Return**
- ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

**Parameters**
- **vfs_id**: VFS identifier returned by `esp_vfs_register_with_id`.
- **fd**: The registered file descriptor will be written to this address.

```c
esp_err_t esp_vfs_unregister_fd(esp_vfs_id_t vfs_id, int fd)
```

Special function for unregistering a file descriptor belonging to a VFS registered by `esp_vfs_register_with_id`.

**Return**
- ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

**Parameters**
- **vfs_id**: VFS identifier returned by `esp_vfs_register_with_id`.
- **fd**: File descriptor which should be unregistered.

```c
int esp_vfs_select(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)
```

Synchronous I/O multiplexing which implements the functionality of POSIX `select()` for VFS.

**Return**
The number of descriptors set in the descriptor sets, or -1 when an error (specified by `errno`) have occurred.

**Parameters**
- **nfds**: Specifies the range of descriptors which should be checked. The first `nfds` descriptors will be checked in each set.
- **readfds**: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- **writefds**: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- **errorfds**: If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- **timeout**: If not NULL, then points to `timeval` structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out.

```c
void esp_vfs_select_triggered(esp_vfs_select_sem_t sem)
```

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.

**Parameters**
- **sem**: semaphore structure which was passed to the driver by the `start_select` call

```c
void esp_vfs_select_triggered_isr(esp_vfs_select_sem_t sem, BaseType_t *woken)
```

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.  

Submit Document Feedback
Parameters

- **sem**: semaphore structure which was passed to the driver by the start_select call
- **woken**: is set to true if the function wakes up a task with higher priority

```c
int esp_vfs_poll(struct pollfd *fds, nfds_t nfds, int timeout)
```

The implementation is based on esp_vfs_select. The parameters and return values are compatible with POSIX poll().

**Return** A positive return value indicates the number of file descriptors that have been selected. The 0 return value indicates a timed-out poll. -1 is return on failure and errno is set accordingly.

Parameters

- **fds**: Pointer to the array containing file descriptors and events poll() should consider.
- **nfds**: Number of items in the array fds.
- **timeout**: Poll() should wait at least timeout microseconds. If the value is 0 then it should return immediately. If the value is -1 then it should wait (block) until the event occurs.

```c
ssize_t esp_vfs_pread(int fd, void *dst, size_t size, off_t offset)
```

 Implements the VFS layer of POSIX pread()

**Return** A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

Parameters

- **fd**: File descriptor used for read
- **dst**: Pointer to the buffer where the output will be written
- **size**: Number of bytes to be read
- **offset**: Starting offset of the read

```c
ssize_t esp_vfs_pwrite(int fd, const void *src, size_t size, off_t offset)
```

 Implements the VFS layer of POSIX pwrite()

**Return** A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

Parameters

- **fd**: File descriptor used for write
- **src**: Pointer to the buffer from where the output will be read
- **size**: Number of bytes to write
- **offset**: Starting offset of the write

Structures

```c
struct esp_vfs_select_sem_t
```

VFS semaphore type for select()

**Public Members**

```c
bool is_sem_local
```

Type of "sem" is SemaphoreHandle_t when true, defined by socket driver otherwise

```c
void *sem
```

Semaphore instance

```c
struct esp_vfs_t
```

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g., pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have _p suffix, set flags member to ESP_VFS_FLAG_CONTEXT_PTR and provide the context pointer to esp_vfs_register function. If the
implementation doesn’t use this extra argument, populate the members without _p suffix and set flags member to ESP_VFS_FLAG_DEFAULT.

If the FS driver doesn’t provide some of the functions, set corresponding members to NULL.

**Public Members**

```c
int flags
    ESP_VFS_FLAG_CONTEXT_PTR or ESP_VFS_FLAG_DEFAULT

esp_err_t (*start_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds, esp_vfs_select_sem_t sem, void **end_select_args)

int (*socket_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)

void (*stop_socket_select)(void *sem)
    called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (*stop_socket_select_isr)(void *sem, BaseType_t *woken)
    stop_socket_select which can be called from ISR; set only for the socket driver

void *(*get_socket_select_semaphore)()
    end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select for the given VFS

esp_err_t (*end_select)(void *end_select_args)
```

**Macros**

```c
MAX_FDS
    Maximum number of (global) file descriptors.

ESP_VFS_PATH_MAX
    Maximum length of path prefix (not including zero terminator)

ESP_VFS_FLAG_DEFAULT
    Default value of flags member in esp_vfs_t structure.

ESP_VFS_FLAG_CONTEXT_PTR
    Flag which indicates that FS needs extra context pointer in syscalls.
```

**Type Definitions**

```c
typedef int esp_vfs_id_t
```

**Header File**

- `vfs/include/esp_vfs_dev.h`

**Functions**

```c
void esp_vfs_dev_uart_register()
    add /dev/uart virtual filesystem driver

This function is called from startup code to enable serial output
```
void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)
Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines (\n, LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification

Note this function is not thread safe w.r.t. reading from UART

Parameters
- mode: line endings expected on UART

void esp_vfs_dev_uart_set_tx_line_endings (esp_line_endings_t mode)
Set the line endings to sent to UART.

This specifies the conversion between newlines (\n, LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

Note this function is not thread safe w.r.t. writing to UART

Parameters
- mode: line endings to send to UART

int esp_vfs_dev_uart_port_set_rx_line_endings (int uart_num, esp_line_endings_t mode)
Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines (\n, LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification

Note this function is not thread safe w.r.t. reading from UART

Return 0 if succeeded, or -1 when an error (specified by errno) have occurred.

Parameters
- uart_num: the UART number
- mode: line endings to send to UART

int esp_vfs_dev_uart_port_set_tx_line_endings (int uart_num, esp_line_endings_t mode)
Set the line endings to sent to specified UART.

This specifies the conversion between newlines (\n, LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

Note this function is not thread safe w.r.t. writing to UART

Return 0 if succeeded, or -1 when an error (specified by errno) have occurred.

Parameters
- uart_num: the UART number
- mode: line endings to send to UART

void esp_vfs_dev_uart_use_nonblocking (int uart_num)
set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

Parameters
- uart_num: UART peripheral number

void esp_vfs_dev_uart_use_driver (int uart_num)
set VFS to use UART driver for reading and writing
Note application must configure UART driver before calling these functions. With these functions, read and write are blocking and interrupt-driven.

**Parameters**
- `uart_num`: UART peripheral number

**Enumerations**

```c
enum esp_line_endings_t
```

Line ending settings.

**Values:**

- `ESP_LINE_ENDINGS_CRLF`: CR + LF.
- `ESP_LINE_ENDINGS_CR`: CR.
- `ESP_LINE_ENDINGS_LF`: LF.

### 2.6.6 FAT Filesystem Support

ESP-IDF uses the FatFs library to work with FAT filesystems. FatFs resides in the `fatfs` component. Although the library can be used directly, many of its features can be accessed via VFS, using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.

#### Using FatFs with VFS

The header file `fatfs/vfs/esp_vfs_fat.h` defines the functions for connecting FatFs and VFS.

The function `esp_vfs_fat_register()` allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs. The function `esp_vfs_fat_unregister_path()` deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with `esp_vfs_fat_` functions:

1. **Call `esp_vfs_fat_register()` to specify:**
   - Path prefix where to mount the filesystem (e.g. `"/sdcard"`, `"/spiflash"`)
   - FatFs drive number
   - A variable which will receive the pointer to the FATFS structure
2. **Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.**
3. **Call the FatFs function `f_mount`, and optionally `f_mkdir`, `f_cd`, to mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`**. For more information, see FatFs documentation [http://www.elm-chan.org/fsw/ff/doc/mount.html].
4. **Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc.** Use paths starting with the path prefix passed to `esp_vfs_fat_register()` (for example, `"/sdcard/hello.txt"`).
5. **Optionally, call the FatFs library functions directly.** In this case, use paths without a VFS prefix (for example, `"/hello.txt"`).
6. **Close all open files.**
7. **Call the FatFs function `f_mount` for the same drive number, with NULL `FATFS*` argument, to unmount the filesystem.**
8. **Call the FatFs function `ff_diskio_unregister()` with NULL `ff_diskio_impl_t*` argument and the same drive number to unregister the disk I/O driver.**
9. **Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.**
The convenience functions `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_sdmmc_unmount` wrap the steps described above and also handle SD card initialization. These two functions are described in the next section.

```c
esp_err_t esp_vfs_fat_register(const char *base_path, const char *fat_drive, size_t max_files, FATFS **out_fs)
```

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, `fat_drive` argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for `f_mount` call.

**Note** This function doesn’t mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_register` was already called
- ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

**Parameters**
- `base_path`: path prefix where FATFS should be registered
- `fat_drive`: FATFS drive specification; if only one drive is used, can be an empty string
- `max_files`: maximum number of files which can be open at the same time
- `[out] out_fs`: pointer to FATFS structure which can be used for FATFS `f_mount` call is returned via this argument.

```c
esp_err_t esp_vfs_fat_unregister_path(const char *base_path)
```

Un-register FATFS from VFS.

**Note** FATFS structure returned by `esp_vfs_fat_register` is destroyed after this call. Make sure to call `f_mount` function to unmount it before calling `esp_vfs_fat_unregister_ctx`. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

**Parameters**
- `base_path`: path prefix where FATFS is registered. This is the same used when `esp_vfs_fat_register` was called

### Using FatFs with VFS and SD cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()` and `esp_vfs_fat_sdmmcUnmount()`. These function perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmcUnmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmcMount()`.  

```c
esp_err_t esp_vfs_fat_sdmmc_mount(const char *base_path, const sdmmc_host_t *host_config, const void *slot_config, const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:
- initializes SDMMC driver or SPI driver with configuration in `host_config`
- initializes SD card with configuration in `slot_config`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.
Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

Parameters

- `base_path`: path where partition should be registered (e.g. “/sdcard”)
- `host_config`: Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using `SDMMC_HOST_DEFAULT()` macro. When using SPI peripheral, this structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- `slot_config`: Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to `sdmmc_slot_config_t` structure initialized using `SDMMC_SLOT_CONFIG_DEFAULT`. For SPI peripheral, pass a pointer to `sdspi_slot_config_t` structure initialized using `SDSPI_SLOT_CONFIG_DEFAULT`.
- `mount_config`: pointer to structure with extra parameters for mounting FATFS
- `[out] out_card`: if not NULL, pointer to the card information structure will be returned via this argument

```c
struct esp_vfs_fat_mount_config_t
```

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount` functions.

Public Members

```c
bool format_if_mount_failed
```

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

```c
int max_files
```

Max number of open files.

```c
size_t allocation_unit_size
```

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear_levelling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

```c
esp_err_t esp_vfs_fat_sdmmcUnmount()
```

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount`.

Return

- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` hasn’t been called

Using FatFs with VFS in read-only mode

The header file `fatfs/vfs/esp_vfs_fat.h` also defines the convenience functions `esp_vfs_fat_rawflash_mount()` and `esp_vfs_fat_rawflash_unmount()`. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning which will not be changed by production application throughout the lifetime of the hardware.

```c
esp_err_t esp_vfs_fat_rawflash_mount(const char *base_path, const char *partition_label, const esp_vfs_fat_mount_config_t *mount_config)
```

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:
Chapter 2. API Reference

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base_prefix variable

**Note** Wear levelling is not used when FAT is mounted in read-only mode using this function.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_rawflash_mount was already called for the same partition
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from SPI flash driver, or FATFS drivers

**Parameters**
- base_path: path where FATFS partition should be mounted (e.g. “/spiflash”)
- partition_label: label of the partition which should be used
- mount_config: pointer to structure with extra parameters for mounting FATFS

```
esp_err_t esp_vfs_fat_rawflash_unmount(const char *base_path, const char *partition_label)
```

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_rawflash_mount.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount has not been called

**Parameters**
- base_path: path where partition should be registered (e.g. “/spiflash”)
- partition_label: label of partition to be unmounted

**FatFs disk IO layer**

FatFs has been extended with API functions that register the disk I/O driver at runtime.

They provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmmc()`.  

```
void ff_diskio_register(BYTE pdrv, const ff_diskio_impl_t *disco_impl)
```

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in disco_impl for given pdrv will be called.

**Parameters**
- pdrv: drive number
- disco_impl: pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

**struct ff_diskio_impl_t**

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

**Public Members**

- DSTATUS (*init)(unsigned char pdrv)  
  disk initialization function
- DSTATUS (*status)(unsigned char pdrv)  
  disk status check function
- DRESULT (*read)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)  
  sector read function
2.6.7 Wear Levelling API

Overview

Most of flash memory and especially SPI flash that is used in ESP32 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in FAT filesystem.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

- **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.
- **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows: - Sector size is 512 bytes - Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

Wear Levelling access API functions

This is the set of API functions for working with data in flash:
Chapter 2. API Reference

- `wl_mount` - initialises the wear levelling module and mounts the specified partition
- `wlUnmount` - unmounts the partition and deinitialises the wear levelling module
- `wlEraseRange` - erases a range of addresses in flash
- `wlWrite` - writes data to a partition
- `wlRead` - reads data from a partition
- `wlSize` - returns the size of available memory in bytes
- `wlSectorSize` - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

**Memory Size**

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.

**See also**

- FAT Filesystem
- Partition Table documentation

**Application Example**

An example which combines the wear levelling driver with the FATFS library is provided in the `storage/wear_levelling` directory. This example initializes the wear levelling driver, mounts FATFS partition, as well as writes and reads data from it using POSIX and C library APIs. See the `storage/wear_levelling/README.md` file for more information.

**High level API Reference**

**Header Files**

- `fatfs/src/esp_vfs_fat.h`

**Functions**

```c
esp_err_t esp_vfs_fat_spiflash_mount(const char *base_path, const char *partition_label,
                                   const esp_vfs_fat_mount_config_t *mount_config,
                                   wl_handle_t *wl_handle)
```

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

**Return**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

**Parameters**

- `base_path`: path where FATFS partition should be mounted (e.g. “/spiflash” )
- `partition_label`: label of the partition which should be used
- `mount_config`: pointer to structure with extra parameters for mounting FATFS
Chapter 2. API Reference

• [out] wl_handle: wear levelling driver handle

struct esp_vfs_fat_mount_config_t
Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount functions.

Public Members

bool format_if_mount_failed
If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int max_files
Max number of open files.

size_t allocation_unit_size
If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

esp_err_t esp_vfs_fat_spiflashUnmount (const char *base_path, wl_handle_t wl_handle)
Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount.

Return
• ESP_OK on success
• ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount hasn’t been called

Parameters
• base_path: path where partition should be registered (e.g. “/spiflash”)
• wl_handle: wear levelling driver handle returned by esp_vfs_fat_spiflash_mount

Mid level API Reference

Header File
• wear_levelling/include/wear_levelling.h

Functions

esp_err_t wl_mount (const esp_partition_t *partition, wl_handle_t *out_handle)
Mount WL for defined partition.

Return
• ESP_OK, if the allocation was successfully;
• ESP_ERR_INVALID_ARG, if WL allocation was unsuccessful;
• ESP_ERR_NO_MEM, if there was no memory to allocate WL components;

Parameters
• partition: that will be used for access
• out_handle: handle of the WL instance

esp_err_t wl_unmount (wl_handle_t handle)
Unmount WL for defined partition.

Return
• ESP_OK, if the operation completed successfully;
• or one of error codes from lower-level flash driver.

Parameters
• handle: WL partition handle

esp_err_t wl_erase_range (wl_handle_t handle, size_t start_addr, size_t size)
Erase part of the WL storage.
Return

- ESP_OK, if the range was erased successfully;
- ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
- ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

Parameters

- handle: WL handle that are related to the partition
- start_addr: Address where erase operation should start. Must be aligned to the result of function wl_sector_size(...).
- size: Size of the range which should be erased, in bytes. Must be divisible by result of function wl_sector_size(...).

\[ \text{esp_err_t} \ 	ext{wl_erase_range}(\text{wl_handle_t} \ handle, \text{size_t} \ start_addr, \text{const} \ void* \ src, \text{size_t} \ size) \]

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using \text{wl_erase_range} function.

Note Prior to writing to WL storage, make sure it has been erased with \text{wl_erase_range} call.

Return

- ESP_OK, if data was written successfully;
- ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

Parameters

- handle: WL handle that are related to the partition
- dest_addr: Address where the data should be written, relative to the beginning of the partition.
- src: Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- size: Size of data to be written, in bytes.

\[ \text{esp_err_t} \ 	ext{wl_write}(\text{wl_handle_t} \ handle, \text{size_t} \ dest_addr, \text{const} \ 	ext{void*} \ src, \text{size_t} \ size) \]

Read data from the WL storage.

Return

- ESP_OK, if data was read successfully;
- ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

Parameters

- handle: WL module instance that was initialized before
- src_addr: Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- size: Size of data to be read, in bytes.

\[ \text{size_t} \ 	ext{wl_read}(\text{wl_handle_t} \ handle, \text{size_t} \ src_addr, \text{void*} \ dest, \text{size_t} \ size) \]

Get size of the WL storage.

Return usable size, in bytes

Parameters

- handle: WL module handle that was initialized before

\[ \text{size_t} \ 	ext{wl_size}(\text{wl_handle_t} \ handle) \]

Get sector size of the WL instance.

Return sector size, in bytes

Parameters

- handle: WL module handle that was initialized before

\[ \text{size_t} \ 	ext{wl_sector_size}(\text{wl_handle_t} \ handle) \]

Macros

\[ \text{WL_INVALID_HANDLE} \]
Chapter 2. API Reference

2.6.8 SPIFFS Filesystem

Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

Notes

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under /spiffs, then creating a file with the path /spiffs/tmp/myfile.txt will create a file called /tmp/myfile.txt in SPIFFS, instead of myfile.txt in the directory /spiffs/tmp.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.

Tools

spiffsgen.py is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use spiffsgen.py, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base_dir**: directory for which the SPIFFS image needs to be created.
- **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool’s help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using `esptool.py` or `parttool.py`.

Aside from invoking the `spiffsgen.py` standalone by manually running it from the command line or a script, it is also possible to invoke `spiffsgen.py` directly from the build system by calling `spiffs_create_partition_image`.

Make:

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := ...
SPIFFS_IMAGE_DEPENDS := ...
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

CMake:

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS...
  #dep dep dep...])
```
This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the `image_size` is required for the standalone invocation, only the `partition` name is required when using `spiffs_create_partition_image` - the image size is automatically obtained from the project’s partition table.

Due to the differences in structure between Make and CMake, it is important to note that: - for Make `spiffs_create_partition_image` must be called from the project Makefile - for CMake `spiffs_create_partition_image` must be called from one of the component CMakeLists.txt files

Optionally, user can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash` or `make flash` by specifying `FLASH_IN_PROJECT`. For example,

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := 1
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

in Make:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

in CMake:

If `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py`, `parttool.py`, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use `DEPENDS/SPIFFS_IMAGE_DEPENDS` to specify targets that should be executed before generating the image.

```
dep:
  ...
SPIFFS_IMAGE_DEPENDS := dep
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

in Make:

```
add_custom_target(dep COMMAND ...
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

+For an example, see `examples/storage/spiffsgen>`.

**mkspiffs** Another tool for creating SPIFFS partition images is **mkspiffs**. Similar to `spiffsgen.py`, it can be used to create an image from a given folder and then flash that image using `esptool.py`

For that, you need to obtain the following parameters:

- **Block Size**: 4096 (standard for SPI Flash)
- **Page Size**: 256 (standard for SPI Flash)
- **Image Size**: Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset**: Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32 at offset 0x110000, run:

```
python esptool.py --chip esp32 --port [port] --baud [baud] write_flash -z 0x110000 -n spiffs.bin
```
Notes on which SPIFFS tool to use  
The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use `spiffsgen.py` in the following cases: 1. If you want to simply generate a SPIFFS image during the build. `spiffsgen.py` makes it very convenient by providing functions/commands from the build system itself. 2. If the host has no C/C++ compiler available, because `spiffsgen.py` does not require compilation.

Use `mkspiffs` in the following cases: 1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiffsgen.py`. 2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiffs` binary can do the job. However, there is no build system integration for `mkspiffs` and the user has to do the corresponding work: compiling `mkspiffs` during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

- Partition Table documentation

Application Example

An example of using SPIFFS is provided in the `storage/spiffs` directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.

High-level API Reference

Header File

- `spiffs/include/esp_spiffs.h`

Functions

```c
esp_err_t esp_vfs_spiffs_register(const esp_vfs_spiffs_conf_t *conf)
```

Register and mount SPIFFS to VFS with given path prefix.

**Return**

- ESP_OK if success
- ESP_ERR_NO_MEM if objects could not be allocated
- ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
- ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
- ESP_FAIL if mount or format fails

**Parameters**

- `conf`: Pointer to `esp_vfs_spiffs_conf_t` configuration structure

```c
esp_err_t esp_vfs_spiffs_unregister(const char *partition_label)
```

Unregister and unmount SPIFFS from VFS

**Return**

- ESP_OK if successful
- ESP_ERR_INVALID_STATE already unregistered

**Parameters**

- `partition_label`: Optional, label of the partition to unregister. If not specified, first partition with subtype=spiffs is used.

```c
bool esp_spiffs Mounted(const char *partition_label)
```

Check if SPIFFS is mounted

**Return**

- true if mounted
- false if not mounted

**Parameters**
• partition_label: Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

`esp_err_t esp_spiffs_format(const char *partition_label)`
Format the SPIFFS partition

Return
• ESP_OK if successful
• ESP_FAIL on error

Parameters
• partition_label: Optional, label of the partition to format. If not specified, first partition with subtype=spiffs is used.

`esp_err_t esp_spiffs_info(const char *partition_label, size_t *total_bytes, size_t *used_bytes)`
Get information for SPIFFS

Return
• ESP_OK if success
• ESP_ERR_INVALID_STATE if not mounted

Parameters
• partition_label: Optional, label of the partition to get info for. If not specified, first partition with subtype=spiffs is used.
• [out] total_bytes: Size of the file system
• [out] used_bytes: Current used bytes in the file system

Structures
`struct esp_vfs_spiffs_conf_t`  
Configuration structure for esp_vfs_spiffs_register.

Public Members

`const char *base_path`
File path prefix associated with the filesystem.

`const char *partition_label`
Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

`size_t max_files`
Maximum files that could be open at the same time.

`bool format_if_mount_failed`
If true, it will format the file system if it fails to mount.

### 2.6.9 Manufacturing Utility

#### Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- esptool.py
- Flash Download tool (available on Windows only)
- Direct flash programming
Chapter 2. API Reference

Prerequisites

This utility is dependent on esp-idf’s NVS partition utility.

- Operating System requirements:
  - Linux / MacOS / Windows (standard distributions)
- The following packages are needed to use this utility:
  - Python: <https://www.python.org/downloads/>

Note:

Before using this utility, please make sure that:

- The path to Python is added to the PATH environment variable.
- You have installed the packages from requirement.txt, the file in the root of the esp-idf directory.

Workflow

CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the REPEAT tag is optional):

```
name1,namespace, key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

Note: The first line in this file should always be the namespace entry.

Each line should have three parameters: key, type, encoding, separated by a comma. If the REPEAT tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

Please refer to README of the NVS Partition Generator utility for detailed description of each parameter.

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

Note:

Make sure there are no spaces:

- before and after ‘,’
- at the end of each line in a CSV file
Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

<table>
<thead>
<tr>
<th>key1, key2, key3,.....</th>
</tr>
</thead>
<tbody>
<tr>
<td>value1, value2, value3,.....</td>
</tr>
</tbody>
</table>

**Note:** The first line in the file should always contain the key names. All the keys from the configuration file should be present here in the same order. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

Each line should contain the value of the corresponding keys, separated by a comma. If the key has the REPEAT tag, its corresponding value must be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

**value** Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

<table>
<thead>
<tr>
<th>id, firmware_key, serial_no, device_no</th>
</tr>
</thead>
<tbody>
<tr>
<td>1,1a2b3c4d5e6faabb,A1,101</td>
</tr>
<tr>
<td>2,1a2b3c4d5e6fccccd,,102</td>
</tr>
<tr>
<td>3,1a2b3c4d5e6fеeff,,103</td>
</tr>
</tbody>
</table>

**Note:** If the ‘REPEAT’ tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the ‘REPEAT’ tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

<table>
<thead>
<tr>
<th>key, type, encoding, value</th>
</tr>
</thead>
<tbody>
<tr>
<td>key, namespace, ,</td>
</tr>
<tr>
<td>key1, type1, encoding1, value1</td>
</tr>
<tr>
<td>key2, type2, encoding2, value2</td>
</tr>
</tbody>
</table>

An instance of an intermediate CSV file will be created for each device on an individual basis.

Running the utility

**Usage:**

```python
cmp_gen.py [-h] {generate,generate-key} ...
```

<table>
<thead>
<tr>
<th>Optional Arguments:</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
</tr>
<tr>
<td>------</td>
</tr>
</tbody>
</table>

(continues on next page)
To generate factory images for each device (Default): Usage:

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
       [--keyfile KEYFILE] [--inputkey INPUTKEY]
       [--outdir OUTDIR]
       conf values prefix size
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf</td>
<td>Path to configuration csv file to parse</td>
</tr>
<tr>
<td>values</td>
<td>Path to values csv file to parse</td>
</tr>
<tr>
<td>prefix</td>
<td>Unique name for each output filename prefix</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes</td>
</tr>
</tbody>
</table>

Optiona1 Arguments:

```
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
</tbody>
</table>
```

(continues on next page)
To generate encrypted factory images for each device:

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the `file` type relative to the directory from which you are running the utility.

**To generate encrypted factory images for each device:**

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_singlepage_blob.csv Sample 0x3000 --keygen
```

**Note:** Encryption key of the following format `<outdir>/keys/keys--<prefix>--<fileid>.bin` is created.

- Encrypt by providing the encryption keys as input binary file:
Chapter 2. API Reference

To generate only encryption keys: Usage:

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created. (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate only encryption keys using the command below:

```
python mfg_gen.py generate-key
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: %m-%d_%H-%M.

**Note:** To provide custom target filename use the `--keyfile` argument.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis. The default numeric value: 1,2,3... of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

Code examples for this API section are provided in the `storage` directory of ESP-IDF examples.

### 2.7 System API

#### 2.7.1 FreeRTOS
Chapter 2. API Reference

Overview

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

Note: ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v8.2.0, however some functions of FreeRTOS v9.0.0 have been backported. See the Backported Features for more information.

For more information about FreeRTOS features specific to ESP-IDF, see ESP-IDF FreeRTOS SMP Changes and ESP-IDF FreeRTOS Additions.

Task API

Header File

- freertos/include/freertos/task.h

Functions

`BaseType_t xTaskCreatePinnedToCore(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask, const BaseType_t xCoreID)`

Create a new task with a specified affinity.

This function is similar to xTaskCreate, but allows setting task affinity in SMP system.

Return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Parameters

- `pvTaskCode`: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- `pcName`: A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- `usStackDepth`: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- `pvParameters`: Pointer that will be used as the parameter for the task being created.
- `uxPriority`: The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- `pvCreatedTask`: Used to pass back a handle by which the created task can be referenced.
- `xCoreID`: If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Other values indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

`static BaseType_t xTaskCreate(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t usStackDepth, void *const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask)`

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see http://www.freertos.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

See xTaskCreateStatic() for a version that does not use any dynamic memory allocation.
xTaskCreate() can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using xTaskCreateRestricted().

Example usage:

```
// Task to be created.
void vTaskCode( void *pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter...
    &ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared...
    static. If it was just an
    // an automatic stack variable it might no longer exist, or at least have....
    // been corrupted, by the time
    // the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
    // PRIORITY, &xHandle );
    configASSERT( xHandle );

    // Use the handle to delete the task.
    if( xHandle != NULL )
    {
        vTaskDelete( xHandle );
    }
}
```

Return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Note If program uses thread local variables (ones specified with “__thread” keyword) then storage for them will be allocated on the task’s stack.

Parameters
- pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- pcName: A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- usStackDepth: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- pvParameters: Pointer that will be used as the parameter for the task being created.
- uxPriority: The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- pvCreatedTask: Used to pass back a handle by which the created task can be referenced.
TaskHandle_t xTaskCreateStaticPinnedToCore(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)

Create a new task with a specified affinity.

This function is similar to xTaskCreateStatic, but allows specifying task affinity in an SMP system.

Return If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and error COULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

Parameters

- pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- pcName: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- ulStackDepth: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- pvParameters: Pointer that will be used as the parameter for the task being created.
- uxPriority: The priority at which the task will run.
- pxStackBuffer: Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- pxTaskBuffer: Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the stack to be allocated dynamically.
- xCoreID: If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Other values indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

static TaskHandle_t xTaskCreateStatic(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see http://www.freertos.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```c
#define STACK_SIZE 200

// Dimensions the buffer that the task being created will use as its stack.
// NOTE: This is the number of bytes the stack will hold, not the number of
// words as found in vanilla FreeRTOS.
#define STACK_SIZE 200

StaticTask_t xTaskBuffer;

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];
```

(continues on next page)
Function that implements the task being created.

```c
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );
    for( ;; )
    {
        // Task code goes here.
    }
}
```

Function that creates a task.

```c
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;
    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic( vTaskCode,  // Function that implements the task.
        "NAME",  // Text name for the task.
        STACK_SIZE,  // Stack size in bytes, not words.
        ( void * ) 1,  // Parameter passed into the task.
        tskIDLE_PRIORITY, // Priority at which the task is created.
        xStack,  // Array to use as the task's stack.
        &xTaskBuffer ); // Variable to hold the task's data...
}
```

Return If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errorCould_Not_Allocate_Required_Memory is returned.

Note If program uses thread local variables (ones specified with __thread keyword) then storage for them will be allocated on the task’s stack.

Parameters

- pvTaskCode: Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- pcName: A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- ulStackDepth: The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- pvParameters: Pointer that will be used as the parameter for the task being created.
- uxPriority: The priority at which the task will run.
- pxStackBuffer: Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- pxTaskBuffer: Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

```c
void vTaskDelete( TaskHandle_t xTaskToDelete )
{
    Remove a task from the RTOS real time kernel’s management.
    The task being deleted will be removed from all ready, blocked, suspended and event lists.
    INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section
```
for more information.

See the demo application file death.c for sample code that utilises vTaskDelete().

**Note** The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete(). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

Example usage:

```c
void vOtherFunction( void )
{
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    vTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // Use the handle to delete the task.
    vTaskDelete( xHandle);
}
```

**Parameters**
- **xTaskToDelete**: The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

```c
void vTaskDelay( const TickType_t xTicksToDelay)
```

Delay a task for a given number of ticks.

The actual time that the task remains blocked depends on the tick rate. The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

**INCLUDE_vTaskDelay** must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See vTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```c
void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay);
    }
}
```

**Parameters**
- **xTicksToDelay**: The amount of time, in tick periods, that the calling task should block.

```c
void vTaskDelayUntil( const TickType_t * const pxPreviousWakeTime, const TickType_t xTimeIncre-
ment)
```

Delay a task until a specified time.
INCLUDE_vTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.

This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from vTaskDelay() in one important aspect: vTaskDelay() will cause a task to block for the specified number of ticks from the time vTaskDelay() is called. It is therefore difficult to use vTaskDelay() by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling vTaskDelay() may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas vTaskDelay() specifies a wake time relative to the time at which the function is called, vTaskDelayUntil() specifies the absolute (exact) time at which it wishes to unblock.

The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

Example usage:

```c
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount();
    for( ;; )
    {
        // Wait for the next cycle.
        vTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here.
    }
}
```

Parameters

- **pxPreviousWakeTime**: Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within vTaskDelayUntil().
- **xTimeIncrement**: The cycle time period. The task will be unblocked at time *pxPreviousWakeTime + xTimeIncrement*. Calling vTaskDelayUntil with the same xTimeIncrement parameter value will cause the task to execute with a fixed interface period.

**UBaseType_t uxTaskPriorityGet(TaskHandle_t xTask)**

Obtain the priority of any task.

INCLUDE_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed
}(continues on next page)```
// it itself.
if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
{
    // The task has changed it's priority.
}

// ...

// Is our priority higher than the created task?
if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
{
    // Our priority (obtained using NULL handle) is higher.
}

Return  The priority of xTask.

Parameters
• xTask: Handle of the task to be queried. Passing a NULL handle results in the priority of the
calling task being returned.

UBaseType_t uxTaskPriorityGetFromISR( TaskHandle_t xTask )
A version of uxTaskPriorityGet() that can be used from an ISR.

Return  The priority of xTask.

Parameters
• xTask: Handle of the task to be queried. Passing a NULL handle results in the priority of the
calling task being returned.

eTaskState eTaskGetState( TaskHandle_t xTask )
Obtain the state of any task.

States are encoded by the eTaskState enumerated type.

INCLUDE_eTaskGetState must be defined as 1 for this function to be available. See the configuration section
for more information.

Return  The state of xTask at the time the function was called. Note the state of the task might change between
the function being called, and the functions return value being tested by the calling task.

Parameters
• xTask: Handle of the task to be queried.

void vTaskPrioritySet( TaskHandle_t xTask, UBaseType_t uxNewPriority )
Set the priority of any task.

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

A context switch will occur before the function returns if the priority being set is higher than the currently
executing task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle... );
    // ...

    // Use the handle to raise the priority of the created task.
```
vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

// ...

// Use a NULL handle to raise our priority to the same value.
vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );

Parameters

- xTask: Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- uxNewPriority: The priority to which the task will be set.

void vTaskSuspend( TaskHandle_t xTaskToSuspend )

Suspend a task.

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

When suspended, a task will never get any microcontroller processing time, no matter what its priority.

Calls to vTaskSuspend are not accumulative - i.e. calling vTaskSuspend () twice on the same task still only requires one call to vTaskResume ( ) to ready the suspended task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle...~);

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).
    // ...

    // Suspend ourselves.
    vTaskSuspend( NULL );

    // We cannot get here unless another task calls vTaskResume
    // with our handle as the parameter.
}
```

Parameters

- xTaskToSuspend: Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

void vTaskResume( TaskHandle_t xTaskToResume )

Resumes a suspended task.

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.
A task that has been suspended by one or more calls to vTaskSuspend() will be made available for running again by a single call to vTaskResume().

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle);

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).

    // ...

    // Resume the suspended task ourselves.
    vTaskResume( xHandle );

    // The created task will once again get microcontroller processing
    // time in accordance with its priority within the system.
}
```

**Parameters**

- `xTaskToResume`: Handle to the task being readied.

**BaseType_t xTaskResumeFromISR (TaskHandle_t xTaskToResume)**

An implementation of vTaskResume() that can be called from within an ISR.

INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

A task that has been suspended by one or more calls to vTaskSuspend() will be made available for running again by a single call to xTaskResumeFromISR().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

**Return** pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

**Parameters**

- `xTaskToResume`: Handle to the task being readied.

void vTaskSuspendAll (void)

Suspends the scheduler without disabling interrupts.

Context switches will not occur while the scheduler is suspended.

After calling vTaskSuspendAll() the calling task will continue to execute without risk of being swapped out until a call to xTaskResumeAll() has been made.

API functions that have the potential to cause a context switch (for example, vTaskDelayUntil(), xQueueSend(), etc.) must not be called while the scheduler is suspended.

Example usage:
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the kernel
        // tick count will be maintained.
        // ...

        // The operation is complete. Restart the kernel.
        xTaskResumeAll ();
    }
}

BaseType_t xTaskResumeAll ( void )
Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().
xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by
a call to vTaskSuspend().

Example usage:

void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the real
        // time kernel tick count will be maintained.
        // ...

        // The operation is complete. Restart the kernel. We want to force
        (continues on next page)
// a context switch - but there is no point if resuming the scheduler
// caused a context switch already.
if( !xTaskResumeAll () )
{
    taskYIELD ();
}
}

Return If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise pdFALSE is returned.

TickType_t xTaskGetTickCount (void)
Get tick count

Return The count of ticks since vTaskStartScheduler was called.

TickType_t xTaskGetTickCountFromISR (void)
Get tick count from ISR

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being used.

Return The count of ticks since vTaskStartScheduler was called.

UBaseType_t uxTaskGetNumberOfTasks (void)
Get current number of tasks

Return The number of tasks that the real time kernel is currently managing. This includes all ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle task will also be included in the count.

char *pcTaskGetTaskName (TaskHandle_t xTaskToQuery)
Get task name

Return The text (human readable) name of the task referenced by the handle xTaskToQuery. A task can query its own name by either passing in its own handle, or by setting xTaskToQuery to NULL. INCLUDE_pcTaskGetTaskName must be set to 1 in FreeRTOSConfig.h for pcTaskGetTaskName() to be available.

UBaseType_t uxTaskGetStackHighWaterMark (TaskHandle_t xTask)
Returns the high water mark of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be available.

High water mark is the minimum free stack space there has been (in bytes rather than words as found in vanilla FreeRTOS) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

Return The smallest amount of free stack space there has been (in bytes rather than words as found in vanilla FreeRTOS) since the task referenced by xTask was created.

Parameters
• xTask: Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

uint8_t *pxTaskGetStackStart (TaskHandle_t xTask)
Returns the start of the stack associated with xTask.

INCLUDE_pxTaskGetStackStart must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the highest stack memory address on architectures where the stack grows down from high memory, and the lowest memory address on architectures where the stack grows up from low memory.

Return A pointer to the start of the stack.
Chapter 2. API Reference

Parameters

- `xTask`: Handle of the task associated with the stack returned. Set `xTask` to NULL to return the stack of the calling task.

```c
void vTaskSetApplicationTaskTag(TaskHandle_t xTask, TaskHookFunction_t pxHookFunction)
```

Sets `pxHookFunction` to be the task hook function used by the task `xTask`.

Parameters

- `xTask`: Handle of the task to set the hook function for. Passing `xTask` as NULL has the effect of setting the calling tasks hook function.
- `pxHookFunction`: Pointer to the hook function.

```c
TaskHookFunction_t xTaskGetApplicationTaskTag(TaskHandle_t xTask)
```

Get the hook function assigned to given task.

Return The `pxHookFunction` value assigned to the task `xTask`.

Parameters

- `xTask`: Handle of the task to get the hook function for. Passing `xTask` as NULL has the effect of getting the calling tasks hook function.

```c
void vTaskSetThreadLocalStoragePointer(TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue)
```

Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Parameters

- `xTaskToSet`: Task to set thread local storage pointer for.
- `xIndex`: The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
- `pvValue`: Pointer value to set.

```c
void *pvTaskGetThreadLocalStoragePointer(TaskHandle_t xTaskToQuery, BaseType_t xIndex)
```

Get local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Return Pointer value

Parameters

- `xTaskToQuery`: Task to get thread local storage pointer for.
- `xIndex`: The index of the pointer to get, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

```c
void vTaskSetThreadLocalStoragePointerAndDelCallback(TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue, TlsDeleteCallbackFunction_t pvDelCallback)
```

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to `vTaskSetThreadLocalStoragePointer`, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

Parameters

- `xTaskToSet`: Task to set thread local storage pointer for.
• xIndex: The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
• pvValue: Pointer value to set.
• pvDelCallback: Function to call to dispose of the local storage pointer when the task is deleted.

 BaseType_t xTaskCallApplicationTaskHook(TaskHandle_t xTask, void * pvParameter)
Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running
tasks (the calling task) hook function.
Parameters
• xTask: Handle of the task to call the hook for.
• pvParameter: Parameter passed to the hook function for the task to interpret as it wants. The
return value is the value returned by the task hook function registered by the user.

 BaseType_t xTaskGetIdleTaskHandle(void)
Get the handle of idle task for the current CPU.
xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.
Return The handle of the idle task. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has
been started.

 BaseType_t xTaskGetIdleTaskHandleForCPU(UBaseType_t cpuid)
Get the handle of idle task for the given CPU.
xTaskGetIdleTaskHandleForCPU() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.
Return Idle task handle of a given cpu. It is not valid to call xTaskGetIdleTaskHandleForCPU() before the
scheduler has been started.
Parameters
• cpuid: The CPU to get the handle for

 UBaseType_t uxTaskGetSystemState(TaskStatus_t *const pxTaskStatusArray, const UBaseType_t uxArraySize, uint32_t * const pulTotalRunTime)
Get the state of tasks in the system.
configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to
be available.
uxTaskGetSystemState() populates a TaskStatus_t structure for each task in the system. TaskStatus_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total
amount of run time consumed by the task. See the TaskStatus_t structure definition in this file for the full
member list.
Example usage:

// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer.
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
TaskStatus_t * pxTaskStatusArray;
volatile UBaseType_t uxArraySize, x;
uint32_t ulTotalRunTime, ulStatsAsPercentage;

// Make sure the write buffer does not contain a string.
*pcWriteBuffer = 0x00;

// Take a snapshot of the number of tasks in case it changes while this
// function is executing.
uxArraySize = uxTaskGetNumberOfTasks();

// Allocate a TaskStatus_t structure for each task. An array could be

(continues on next page)
// allocated statically at compile time.
pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

if( pxTaskStatusArray != NULL )
{
    // Generate raw status information about each task.
    uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &ulTotalRunTime );

    // For percentage calculations.
    ulTotalRunTime /= 100UL;

    // Avoid divide by zero errors.
    if( ulTotalRunTime > 0 )
    {
        // For each populated position in the pxTaskStatusArray array,
        // format the raw data as human readable ASCII data
        for( x = 0; x < uxArraySize; x++ )
        {
            // What percentage of the total run time has the task used?
            // This will always be rounded down to the nearest integer.
            // ulTotalRunTimeDiv100 has already been divided by 100.
            ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter /
            /*ulTotalRunTime*/;

            if( ulStatsAsPercentage > 0UL )
            {
                sprintf( pcWriteBuffer, "%s		%lu		%lu\%
", pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter, ulStatsAsPercentage );
            }
            else
            {
                // If the percentage is zero here then the task has
                // consumed less than 1% of the total run time.
                sprintf( pcWriteBuffer, "%s		%lu		<1\%
", pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
            }
            pcWriteBuffer += strlen( (char *) pcWriteBuffer );
        }
    }

    // The array is no longer needed, free the memory it consumes.
    vPortFree( pxTaskStatusArray );
}

Note  This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

Return  The number of TaskStatus_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberOfTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.

Parameters

- pxTaskStatusArray: A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.
- uxArraySize: The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.
• **pulTotalRunTime**: If config\_GENERATE\_RUN\_TIME\_STATS is set to 1 in FreeRTOS\_Config.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see http://www.freertos.org/rtos-run-time-stats.html) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

```c
void vTaskList (char *pcWriteBuffer)

List all the current tasks.

configUSE\_TRACE\_FACILITY and configUSE\_STATS\_FORMATTING\_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

Lists all the current tasks, along with their current state and stack usage high water mark.

**Note** This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Tasks are reported as blocked (‘B’), ready (‘R’), deleted (‘D’) or suspended (‘S’).

vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task names, states and stack usage.

**Note** This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskList() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

**Parameters**

- **pcWriteBuffer**: A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

```c
void vTaskGetRunTimeStats (char *pcWriteBuffer)

Get the state of running tasks as a string

config\_GENERATE\_RUN\_TIME\_STATS and configUSE\_STATS\_FORMATTING\_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for port\_CONFIGURE\_TIMER\_FOR\_RUN\_TIME\_STATS() and port\_GET\_RUN\_TIME\_COUNTER\_VALUE() to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting config\_GENERATE\_RUN\_TIME\_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the port\_CONFIGURE\_TIMER\_FOR\_RUN\_TIME\_STATS() macro. Calling vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

**Note** This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

vTaskGetRunTimeStats() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

**Note** This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskGetRunTimeStats() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).
Chapter 2. API Reference

It is recommended that production systems call `uxTaskGetSystemState()` directly to get access to raw stats data, rather than indirectly through a call to `vTaskGetRunTimeStats()`.

**Parameters**
- `pcWriteBuffer`: A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

BaseType_t `xTaskNotify` (TaskHandle_t `xTaskToNotify`, uint32_t `ulValue`, eNotifyAction `eAction`)

Send task notification.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

When `configUSE_TASK_NOTIFICATIONS` is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (`uint32_t`).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWait()` or `ulTaskNotifyTake()`. If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use `xTaskNotifyWait()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTake()` to [optionally] block to wait for its notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

**Return**
Dependent on the value of `eAction`. See the description of the `eAction` parameter.

**Parameters**
- `xTaskToNotify`: The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- `ulValue`: Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.
- `eAction`: Specifies how the notification updates the task’s notification value, if at all. Valid values for `eAction` are as follows:
  - `eSetValueWithOverwrite`: The task’s notification value is set to the value of `ulValue`, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). `xTaskNotify()` always returns `pdPASS` in this case.
  - `eSetValueWithoutOverwrite`: If the task being notified did not already have a notification pending then the task’s notification value is set to `ulValue` and `xTaskNotify()` will return `pdPASS`. If the task being notified already had a notification pending then no action is performed and `pdFAIL` is returned.
  - `eNoAction`: The task receives a notification without its notification value being updated. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.

BaseType_t `xTaskNotifyFromISR` (TaskHandle_t `xTaskToNotify`, uint32_t `ulValue`, eNotifyAction `eAction`, BaseType_t *`pxHigherPriorityTaskWoken`)

Send task notification from an ISR.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.
When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private "notification value", which is a 32-bit unsigned integer (uint32_t).

A version of xTaskNotify() that can be used from an interrupt service routine (ISR).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWait() or ulTaskNotifyTake(). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWait() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTake() to [optionally] block to wait for its notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

Return Dependent on the value of eAction. See the description of the eAction parameter.

Parameters

- xTaskToNotify: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- ulValue: Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.
- eAction: Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:
  - eSetBits: The task’s notification value is bitwise ORed with ulValue. xTaskNotify() always returns pdPASS in this case.
  - elIncrement: The task’s notification value is incremented. ulValue is not used and xTaskNotify() always returns pdPASS in this case.
  - eSetValueWithOverwrite: The task’s notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). xTaskNotify() always returns pdPASS in this case.
  - eSetValueWithoutOverwrite: If the task being notified did not already have a notification pending then the task’s notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.
  - eNoAction: The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.
- pxHigherPriorityTaskWoken: xTaskNotifyFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If xTaskNotifyFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

BaseType_t xTaskNotifyWait(uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t *pulNotificationValue, TickType_t xTicksToWait)

Wait for task notification

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private “notification value”, which is a 32-bit unsigned integer (uint32_t).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the
need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWait() or ulTaskNotifyTake(). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWait() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTake() to [optionally] block to wait for its notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

**Return** If a notification was received (including notifications that were already pending when xTaskNotifyWait was called) then pdPASS is returned. Otherwise pdFAIL is returned.

**Parameters**

- `ulBitsToClearOnEntry`: Bits that are set in ulBitsToClearOnEntry value will be cleared in the calling task’s notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting ulBitsToClearOnEntry to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0. Setting ulBitsToClearOnEntry to 0 will leave the task’s notification value unchanged.

- `ulBitsToClearOnExit`: If a notification is pending or received before the calling task exits the xTaskNotifyWait() function then the task’s notification value (see the xTaskNotify() API function) is passed out using the pulNotificationValue parameter. Then any bits that are set in ulBitsToClearOnExit will be cleared in the task’s notification value (note *pulNotificationValue is set before any bits are cleared). Setting ulBitsToClearOnExit to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0 before the function exits. Setting ulBitsToClearOnExit to 0 will leave the task’s notification value unchanged when the function exits (in which case the value passed out in pulNotificationValue will match the task’s notification value).

- `pulNotificationValue`: Used to pass the task’s notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by ulBitsToClearOnExit being non-zero.

- `xTicksToWait`: The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when xTaskNotifyWait() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS( value_in_ms ) can be used to convert a time specified in milliseconds to a time specified in ticks.

```c
void vTaskNotifyGiveFromISR( TaskHandle_t xTaskToNotify, BaseType_t *pxHigherPriorityTaskWoken )
```

Simplified macro for sending task notification from ISR.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this macro to be available.

When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private “notification value” , which is a 32-bit unsigned integer (uint32_t).

A version of xTaskNotifyGive() that can be called from an interrupt service routine (ISR).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

vTaskNotifyGiveFromISR() is intended for use when task notifications are used as light weight and faster
binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the xSemaphoreGiveFromISR() API function, the equivalent action that instead uses a task notification is vTaskNotifyGiveFromISR().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTake() API function rather than the xTaskNotifyWait() API function.

Parameters

- xTaskToNotify: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- pxHigherPriorityTaskWoken: vTaskNotifyGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If vTaskNotifyGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

uint32_t ulTaskNotifyTake ( BaseType_t xClearCountOnExit, TickType_t xTicksToWait )

Simplified macro for receiving task notification.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private notification value, which is a 32-bit unsigned integer (uint32_t).

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

ulTaskNotifyTake() is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the xSemaphoreTake() API function, the equivalent action that instead uses a task notification is ulTaskNotifyTake().

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the xTaskNotifyGive() macro, or xTaskNotify() function with the eAction parameter set to eIncrement.

ulTaskNotifyTake() can either clear the task’s notification value to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the task’s notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use ulTaskNotifyTake() to [optionally] block to wait for a the task’s notification value to be non-zero. The task does not consume any CPU time while it is in the Blocked state.

Where as xTaskNotifyWait() will return when a notification is pending, ulTaskNotifyTake() will return when the task’s notification value is not zero.

Return The task’s notification count before it is either cleared to zero or decremented (see the xClearCountOnExit parameter).

Parameters

- xClearCountOnExit: if xClearCountOnExit is pdFALSE then the task’s notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If xClearCountOnExit is not pdFALSE then the task’s notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.
- xTicksToWait: The maximum amount of time that the task should wait in the Blocked state for the task’s notification value to be greater than zero, should the count not already be greater than
zero when ulTaskNotifyTake() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(value_in_ms) can be used to convert a time specified in milliseconds to a time specified in ticks.

**Structures**

**struct xTASK_STATUS**

Used with the uxTaskGetSystemState() function to return the state of each task in the system.

**Public Members**

```
TaskHandle_t xHandle
```

The handle of the task to which the rest of the information in the structure relates.

```
const char* pcTaskName
```

A pointer to the task’s name. This value will be invalid if the task was deleted since the structure was populated!

```
UBaseType_t xTaskNumber
```

A number unique to the task.

```
eTaskState eCurrentState
```

The state in which the task existed when the structure was populated.

```
UBaseType_t uxCurrentPriority
```

The priority at which the task was running (may be inherited) when the structure was populated.

```
UBaseType_t uxBasePriority
```

The priority to which the task will return if the task’s current priority has been inherited to avoid unbounded priority inversion when obtaining a mutex. Only valid if configUSE_MUTEXES is defined as 1 in FreeRTOSConfig.h.

```
uint32_t ulRunTimeCounter
```

The total run time allocated to the task so far, as defined by the run time stats clock. See [http://www.freertos.org/rtos-run-time-stats.html](http://www.freertos.org/rtos-run-time-stats.html). Only valid when configGENERATE_RUN_TIME_STATS is defined as 1 in FreeRTOSConfig.h.

```
StackType_t* pxStackBase
```

Points to the lowest address of the task’s stack area.

```
uint32_t usStackHighWaterMark
```

The minimum amount of stack space that has remained for the task since the task was created. The closer this value is to zero the closer the task has come to overflowing its stack.

```
BaseType_t xCoreID
```

Core this task is pinned to. This field is present if CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID is set.

**struct xTASK_SNAPSHOT**

Used with the uxTaskGetSnapshotAll() function to save memory snapshot of each task in the system. We need this struct because TCB_t is defined (hidden) in tasks.c.

**Public Members**

```
void* pxTCB
```

Address of task control block.

```
StackType_t* pxTopOfStack
```

Points to the location of the last item placed on the tasks stack.

```
StackType_t* pxEndOfStack
```

Points to the end of the stack. pxTopOfStack < pxEndOfStack, stack grows hi2lo pxTopOfStack > pxEndOfStack, stack grows lo2hi
Chapter 2. API Reference

Macros

tskKERNEL_VERSIONNUMBER

tskKERNEL_VERSION_MAJOR

tskKERNEL_VERSION_MINOR

tskKERNEL_VERSION_BUILD

tskNO_AFFINITY
  Argument of xTaskCreatePinnedToCore indicating that task has no affinity.

tskIDLE_PRIORITY
  Defines the priority used by the idle task. This must not be modified.

taskYIELD()

  task. h

  Macro for forcing a context switch.

taskENTER_CRITICAL(mux)

  task. h

  Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

  Note: This may alter the stack (depending on the portable implementation) so must be used with care!

taskENTER_CRITICAL_ISR(mux)

taskEXIT_CRITICAL(mux)

  Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

  Note: This may alter the stack (depending on the portable implementation) so must be used with care!

taskEXIT_CRITICAL_ISR(mux)

taskDISABLE_INTERRUPTS()

  task. h

  Macro to disable all maskable interrupts.

taskENABLE_INTERRUPTS()

  task. h

  Macro to enable microcontroller interrupts.

taskSCHEDULER_SUSPENDED

taskSCHEDULER_NOT_STARTED

taskSCHEDULER_RUNNING

xTaskNotifyGive(xTaskToNotify)

  Simplified macro for sending task notification.

  configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this macro to be available.

  When configUSE_TASK_NOTIFICATIONS is set to one each task has its own private “notification value” , which is a 32-bit unsigned integer (uint32_t).

  Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

  A notification sent to a task can optionally perform an action, such as update, overwrite or increment the task’ s notification value. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.
xTaskNotifyGive() is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the xSemaphoreGive() API function, the equivalent action that instead uses a task notification is xTaskNotifyGive().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTake() API function rather than the xTaskNotifyWait() API function.

**Return** xTaskNotifyGive() is a macro that calls xTaskNotify() with the eAction parameter set to eIncrement - so pdPASS is always returned.

**Parameters**
- xTaskToNotify: The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().

**Type Definitions**

```c
typedef void *TaskHandle_t

TaskHandle_t
```

Type by which tasks are referenced. For example, a call to xTaskCreate returns (via a pointer parameter) an TaskHandle_t variable that can then be used as a parameter to vTaskDelete to delete the task.

```c
typedef BaseType_t(*TaskHookFunction_t)(void *)
```

Defines the prototype to which the application task hook function must conform.

```c
typedef struct xTASK_STATUS TaskStatus_t
```

Used with the uxTaskGetSystemState() function to return the state of each task in the system.

```c
typedef struct xTASK_SNAPSHOT TaskSnapshot_t
```

Used with the uxTaskGetSnapshotAll() function to save memory snapshot of each task in the system. We need this struct because TCB_t is defined (hidden) in tasks.c.

```c
typedef void (*TlsDeleteCallbackFunction_t)(int,void *)
```

Prototype of local storage pointer deletion callback.

**Enumerations**

```c
enum eTaskState
```

Task states returned by eTaskGetState.

**Values:**

- **eRunning** = 0
  - A task is querying the state of itself, so must be running.

- **eReady**
  - The task being queried is in a read or pending ready list.

- **eBlocked**
  - The task being queried is in the Blocked state.

- **eSuspended**
  - The task being queried is in the Suspended state, or is in the Blocked state with an infinite time out.

- **eDeleted**
  - The task being queried has been deleted, but its TCB has not yet been freed.

```c
enum eNotifyAction
```

Actions that can be performed when vTaskNotify() is called.

**Values:**

- **eNoAction** = 0
  - Notify the task without updating its notify value.
eSetBits
  Set bits in the task’s notification value.

eIncrement
  Increment the task’s notification value.

eSetValueWithOverwrite
  Set the task’s notification value to a specific value even if the previous value has not yet been read by the task.

eSetValueWithoutOverwrite
  Set the task’s notification value if the previous value has been read by the task.

enum eSleepModeStatus
  Possible return values for eTaskConfirmSleepModeStatus().
  Values:
    eAbortSleep = 0
      A task has been made ready or a context switch pended since portSUPPORESS_TICKS_AND_SLEEP() was called - abort entering a sleep mode.
    eStandardSleep
      Enter a sleep mode that will not last any longer than the expected idle time.
    eNoTasksWaitingTimeout
      No tasks are waiting for a timeout so it is safe to enter a sleep mode that can only be exited by an external interrupt.

Queue API

Header File
  • freertos/include/freertos/queue.h

Functions

BaseType_t xQueueGenericSendFromISR( QueueHandle_t xQueue, const void * const pvItemToQueue, BaseType_t * const pxHigherPriorityTaskWoken, const BaseType_t xCopyPosition )

It is preferred that the macros xQueueSendFromISR(), xQueueSendToFrontFromISR() and xQueueSendToBackFromISR() be used in place of calling this function directly. xQueueGiveFromISR() is an equivalent for use by semaphores that don’t actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
  char cIn;
  BaseType_t xHigherPriorityTaskWokenByPost;

  // We have not woken a task at the start of the ISR.
  xHigherPriorityTaskWokenByPost = pdFALSE;

  // Loop until the buffer is empty.
  do {
    // Obtain a byte from the buffer.
    cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );
  }
  // ...
Post each byte.

```c
xQueueGenericSendFromISR( xRxQueue, &cIn, &
~xHigherPriorityTaskWokenByPost, queueSEND_TO_BACK );

while( portINPUT_BYTE( BUFFER_COUNT ) );
```

Now the buffer is empty we can switch context if necessary. Note that the name of the yield function required is port specific.

```c
if( xHigherPriorityTaskWokenByPost )
{
    taskYIELD_YIELD_FROM_ISR();
}
```

Return pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

**Parameters**

- `xQueue`: The handle to the queue on which the item is to be posted.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `[out] pxHigherPriorityTaskWoken`: `xQueueGenericSendFromISR()` will set `pxHigherPriorityTaskWoken` to `pdTRUE` if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueGenericSendFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.
- `xCopyPosition`: Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

```c
BaseType_t xQueueGiveFromISR( QueueHandle_t xQueue, BaseType_t *const pxHigherPriorityTaskWoken );
```

Utilities to query queues that are safe to use from an ISR. These utilities should be used only from within an ISR, or within a critical section.

```c
BaseType_t xQueueIsQueueEmptyFromISR( const QueueHandle_t xQueue );
```

```c
UBaseType_t uxQueueMessagesWaitingFromISR( const QueueHandle_t xQueue );
```

```c
BaseType_t xQueueGenericSend( QueueHandle_t xQueue, const void *const pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition )
```

It is preferred that the macros `xQueueSend()`, `xQueueSendToFront()` and `xQueueSendToBack()` are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR()` for an alternative which may be used in an ISR.

**Example usage:**

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage pxMessage;
```
Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

Create a queue capable of containing 10 pointers to AMessage structures. These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
    if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10, queueSEND_TO_BACK ) != pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
    pxMessage = &xMessage;
    xQueueGenericSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0, queueSEND_TO_BACK );
}

// ... Rest of task code.

Return pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters
- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- xTicksToWait: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.
- xCopyPosition: Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

BaseType_t xQueuePeekFromISR(QueueHandle_t xQueue, void *const pvBuffer)

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters
- xQueue: The handle to the queue from which the item is to be received.
- pvBuffer: Pointer to the buffer into which the received item will be copied.
**BaseType_t** **xQueueGenericReceive**(*QueueHandle_t* **xQueue**, *void* **const** **pvBuffer**, *TickType_t* **xTicksToWait**, **const** *BaseType_t* **xJustPeek**)

It is preferred that the macro **xQueueReceive()** be used rather than calling this function directly.

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

This function must not be used in an interrupt service routine. See **xQueueReceiveFromISR** for an alternative that can.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 )
    {
        // Receive a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if( xQueueGenericReceive( xQueue, & pxRxedMessage ), ( TickType_t ) 10 )
        {
            // pcRxedMessage now points to the struct AMessage variable posted
            // by vATask.
        }
    }
    // ... Rest of task code.
}
```

**Return** **pdTRUE** if an item was successfully received from the queue, otherwise **pdFALSE**.
### Parameters
- **xQueue**: The handle to the queue from which the item is to be received.
- **pvBuffer**: Pointer to the buffer into which the received item will be copied.
- **xTicksToWait**: The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. 
  xQueueGenericReceive() will return immediately if the queue is empty and xTicksToWait is 0.
- **xJustPeek**: When set to true, the item received from the queue is not actually removed from the queue - meaning a subsequent call to xQueueReceive() will return the same item. When set to false, the item being received from the queue is also removed from the queue.

**UBaseType_t** `uxQueueMessagesWaiting(const QueueHandle_t xQueue)`

Return The number of messages available in the queue.

**Parameters**
- **xQueue**: A handle to the queue being queried.

**UBaseType_t** `uxQueueSpacesAvailable(const QueueHandle_t xQueue)`

Return The number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

**Parameters**
- **xQueue**: A handle to the queue being queried.

**void** `vQueueDelete(QueueHandle_t xQueue)`

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

**Parameters**
- **xQueue**: A handle to the queue to be deleted.

**BaseType_t** `xQueueReceiveFromISR(QueueHandle_t xQueue, void *const pvBuffer, BaseType_t *const pxHigherPriorityTaskWoken)`

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

```c
QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction( void *pvParameters )
{
    char cValueToPost;
    const TickType_t xTicksToWait = ( TickType_t )0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate( 10, sizeof( char ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ... 

    // Post some characters that will be used within an ISR. If the queue is full then this task will block for xTicksToWait ticks.
    cValueToPost = 'a';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
    cValueToPost = 'b';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

    // ... keep posting characters ... this task may block when the queue becomes full.

    // ... (continues on next page)
```
Chapter 2. API Reference

(continued from previous page)

```c
    cValueToPost = 'c';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

    // ISR that outputs all the characters received on the queue.
    void vISR_Routine( void )
    {
        BaseType_t xTaskWokenByReceive = pdFALSE;
        char cRxedChar;

        while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxedChar, &
                                     xTaskWokenByReceive ) )
        {
            // A character was received. Output the character now.
            vOutputCharacter( cRxedChar );

            // If removing the character from the queue woke the task that was
            // posting onto the queue cTaskWokenByReceive will have been set to
            // pdTRUE. No matter how many times this loop iterates only one
            // task will be woken.
        }

        if( cTaskWokenByPost != ( char ) pdFALSE;)
        {
            taskYIELD();
        }
    }
```

Return  pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters

- **xQueue**: The handle to the queue from which the item is to be received.
- **pvBuffer**: Pointer to the buffer into which the received item will be copied.
- **[out] pxHigherPriorityTaskWoken**: A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock *pxTaskWoken will get set to pdTRUE, otherwise *pxTaskWoken will remain unchanged.

void **vQueueAddToRegistry** ( **QueueHandle_t xQueue**, **const char** *pcName*)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

`configQUEUE_REGISTRY_SIZE` defines the maximum number of handles the registry can hold. `configQUEUE_REGISTRY_SIZE` must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not effect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

Parameters

- **xQueue**: The handle of the queue being added to the registry. This is the handle returned by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.
- **pcName**: The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

void **vQueueUnregisterQueue** ( **QueueHandle_t xQueue**)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and vQueueUnregisterQueue() to remove the queue, semaphore or mutex from the register. If you are not using a kernel aware debugger then this function can be ignored.

Parameters
• `xQueueGetHandle()`: The handle of the queue being removed from the registry.

```c
const char* pcQueueGetName(QueueHandle_t xQueue)
```

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `pcQueueGetName()` to look up and return the name of a queue in the queue registry from the queue’s handle.

**Note** This function has been back ported from FreeRTOS v9.0.0

**Return** If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

**Parameters**

- `xQueue`: The handle of the queue the name of which will be returned.

```c
QueueHandle_t xQueueGenericCreate(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, const uint8_t ucQueueType)
```

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

```c
QueueHandle_t xQueueGenericCreateStatic(const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, uint8_t *pucQueueStorage, StaticQueue_t *pxStaticQueue, const uint8_t ucQueueType)
```

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

```c
QueueSetHandle_t xQueueCreateSet(const UBaseType_t uxEventQueueLength)
```

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to `xQueueCreateSet()` before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to `xQueueAddToSet()`. `xQueueSelectFromSet()` is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

**Note 1:** See the documentation on [http://www.FreeRTOS.org/RTOS-queue-sets.html](http://www.FreeRTOS.org/RTOS-queue-sets.html) for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

**Note 2:** Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

**Note 3:** An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

**Note 4:** A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

**Return** If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

**Parameters**

- `uxEventQueueLength`: Queue sets store events that occur on the queues and semaphores contained in the set. `uxEventQueueLength` specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost `uxEventQueueLength` should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:
  - If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then `uxEventQueueLength` should be set to `(5 + 12 + 1)`, or 18.
  - If a queue set is to hold three binary semaphores then `uxEventQueueLength` should be set to `(1 + 1 + 1)`, or 3.

Submit Document Feedback
If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then `uxEventQueueLength` should be set to \((5 + 3)\), or 8.

```c
BaseType_t xQueueAddToSet(QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)
```
Adds a queue or semaphore to a queue set that was previously created by a call to `xQueueCreateSet()`.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**Note 1:** A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

**Return** If the queue or semaphore was successfully added to the queue set then `pdPASS` is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then `pdFAIL` is returned.

**Parameters**
- `xQueueOrSemaphore`: The handle of the queue or semaphore being added to the queue set (cast to an `QueueSetMemberHandle_t` type).
- `xQueueSet`: The handle of the queue set to which the queue or semaphore is being added.

```c
BaseType_t xQueueRemoveFromSet(QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)
```
Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**Return** If the queue or semaphore was successfully removed from the queue set then `pdPASS` is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then `pdFAIL` is returned.

**Parameters**
- `xQueueOrSemaphore`: The handle of the queue or semaphore being removed from the queue set (cast to an `QueueSetMemberHandle_t` type).
- `xQueueSet`: The handle of the queue set in which the queue or semaphore is included.

```c
QueueSetMemberHandle_t xQueueSelectFromSet(QueueHandle_t xQueueSet, const TickType_t xTicksToWait)
```
xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet() effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**Note 1:** See the documentation on [http://www.FreeRTOS.org/RTOS-queue-sets.html](http://www.FreeRTOS.org/RTOS-queue-sets.html) for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

**Note 2:** Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

**Note 3:** A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

**Return** xQueueSelectFromSet() will return the handle of a queue (cast to a `QueueSetMemberHandle_t` type) contained in the queue set that contains data, or the handle of a semaphore (cast to a `QueueSetMemberHandle_t` type) contained in the queue set that is available, or `NULL` if no such queue or semaphore exists before before the specified block time expires.

**Parameters**
- `xQueueSet`: The queue set on which the task will (potentially) block.
- `xTicksToWait`: The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.
QueueSetMemberHandle_t xQueueSelectFromSetFromISR (QueueSetHandle_t xQueueSet)
A version of xQueueSelectFromSet() that can be used from an ISR.

Macros

xQueueCreate (uxQueueLength, uxItemSize)
Creates a new queue instance. This allocates the storage required by the new queue and returns a handle for the queue.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue2 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // ... Rest of task code.
}
```

Return If the queue is successfully create then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

Parameters
- uxQueueLength: The maximum number of items that the queue can contain.
- uxItemSize: The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

xQueueCreateStatic (uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)
Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see http://www.freertos.org/a00111.html). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

Example usage:

```c
struct AMessage
{
    // (continues on next page)
```
Chapter 2. API Reference

(continued from previous page)

```c
char ucMessageID;
char ucData[ 20 ];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [(queue length) * ( queue item size)] bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can...
        ITEM_SIZE, // The size of each item in the queue
        &ucQueueStorage[ 0 ], // The buffer that will...
        &xQueueBuffer ); // The buffer that will hold the...

    // The queue is guaranteed to be created successfully as no dynamic memory
    // allocation is used. Therefore xQueue1 is now a handle to a valid queue.
    // ... Rest of task code. }

Return If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL
then NULL is returned.

Parameters
• uxQueueLength: The maximum number of items that the queue can contain.
• uxItemSize: The number of bytes each item in the queue will require. Items are queued by copy,
not by reference, so this is the number of bytes that will be copied for each posted item. Each item
on the queue must be the same size.
• pucQueueStorage: If uxItemSize is not zero then pucQueueStorage must point to a
uint8_t array that is at least large enough to hold the maximum number of items that can be in
the queue at any one time - which is ( uxQueueLength * uxItemSize ) bytes. If uxItemSize is zero
then pucQueueStorageBuffer can be NULL.
• pxQueueBuffer: Must point to a variable of type StaticQueue_t, which will be used to hold the
queue’s data structure.

xQueueSendToFront ( xQueue, pvItemToQueue, xTicksToWait )
This is a macro that calls xQueueGenericSend().

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be
called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in
an ISR.

Example usage:

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;
```

(continues on next page)
uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
        if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
        pxMessage = &xMessage;
        xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.
}

Return: pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters:
- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items
  the queue will hold was defined when the queue was created, so this many bytes will be copied from
  pvItemToQueue into the queue storage area.
- xTicksToWait: The maximum amount of time the task should block waiting for space to become
  available on the queue, should it already be full. The call will return immediately if this is set to 0
  and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS
  should be used to convert to real time if this is required.

xQueueSendToBack (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not
be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in
an ISR.

Example usage:

struct AMessage
{
char ucMessageID;
char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) !--pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.
}

Return pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters
- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items
  the queue will hold was defined when the queue was created, so this many bytes will be copied from
  pvItemToQueue into the queue storage area.
- xTicksToWait: The maximum amount of time the task should block waiting for space to become
  available on the queue, should it already be full. The call will return immediately if this is set to 0
  and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS
  should be used to convert to real time if this is required.

Example usage:
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don’t block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueSend( xQueue2, ( void * ) pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.
}

Return pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Parameters
- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items
  the queue will hold was defined when the queue was created, so this many bytes will be copied from
  pvItemToQueue into the queue storage area.
- xTicksToWait: The maximum amount of time the task should block waiting for space to become
  available on the queue, should it already be full. The call will return immediately if this is set to 0
  and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS
  should be used to convert to real time if this is required.

xQueueOverwrite (xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is
queued by copy, not by reference.

This function must not be called from an interrupt service routine. See xQueueOverwriteFromISR () for an
alternative which may be used in an ISR.
Example usage:

```c
void vFunction( void *pvParameters )
{
    QueueHandle_t xQueue;
    uint32_t ulVarToSend, ulValReceived;

    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwrite() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

    // Write the value 10 to the queue using xQueueOverwrite().
    ulVarToSend = 10;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // Peeking the queue should now return 10, but leave the value 10 in
    // the queue. A block time of zero is used as it is known that the
    // queue holds a value.
    ulValReceived = 0;
    xQueuePeek( xQueue, &ulValReceived, 0 );

    if( ulValReceived != 10 )
    {
        // Error unless the item was removed by a different task.
    }

    // The queue is still full. Use xQueueOverwrite() to overwrite the
    // value held in the queue with 100.
    ulVarToSend = 100;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // This time read from the queue, leaving the queue empty once more.
    // A block time of 0 is used again.
    xQueueReceive( xQueue, &ulValReceived, 0 );

    // The value read should be the last value written, even though the
    // queue was already full when the value was written.
    if( ulValReceived != 100 )
    {
        // Error!
    }
    // ...
}
```

**Return** xQueueOverwrite() is a macro that calls xQueueGenericSend(), and therefore has the same return values as xQueueSendToFront(). However, pdPASS is the only value that can be returned because xQueueOverwrite() will write to the queue even when the queue is already full.

**Parameters**
- `xQueue`: The handle of the queue to which the data is being sent.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.

**xQueuePeek** (xQueue, pvBuffer, xTicksToWait)
This is a macro that calls the xQueueGenericReceive() function.

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.
Successfully received items remain on the queue so will be returned again by the next call, or a call to `xQueueReceive()`.

This macro must not be used in an interrupt service routine. See `xQueuePeekFromISR()` for an alternative that can be called from an interrupt service routine.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;
    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ...

    // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
    pxQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );
    // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;
    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a message is not immediately available.
        if( xQueuePeek( xQueue, &pxRxedMessage, ( TickType_t ) 10 ) )
        {
            // pcRxedMessage now points to the struct AMessage variable posted by vATask, but the item still remains on the queue.
        }
        // ... Rest of task code.
    }
}
```

**Return** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

**Parameters**
- `xQueue`: The handle to the queue from which the item is to be received.
- `pvBuffer`: Pointer to the buffer into which the received item will be copied.
- `xTicksToWait`: The maximum amount of time the task should block waiting for an item to
receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

**xQueueReceive** (xQueue, pvBuffer, xTicksToWait)

This is a macro that calls the xQueueGenericReceive() function.

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;
    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ...
    // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
    pxMessage = &xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );
    // ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 )
    {
        // Receive a message on the created queue. Block for 10 ticks if a message is not immediately available.
        if( xQueueReceive( xQueue, &pxRxedMessage, ( TickType_t ) 10 ) )
        {
            // pcRxedMessage now points to the struct AMessage variable posted by vATask.
        }
    }
}```

(continues on next page)
Return pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

Parameters

- `xQueue`: The handle to the queue from which the item is to be received.
- `pvBuffer`: Pointer to the buffer into which the received item will be copied.
- `xTicksToWait`: The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. `xQueueReceive()` will return immediately if `xTicksToWait` is zero and the queue is empty. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

```
xQueueSendToFrontFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)
```

This is a macro that calls `xQueueGenericSendFromISR()`.

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        portYIELD_FROM_ISR ();
    }
}
```

Return pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters

- `xQueue`: The handle to the queue on which the item is to be posted.
- `pvItemToQueue`: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `[out] pxHigherPriorityTaskWoken`: `xQueueSendToFrontFromISR()` will set *pxHigherPriorityTaskWoken* to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueSendToFrontFromISR()` sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

```
xQueueSendToBackFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)
```
This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        portYIELD_FROM_ISR ( );
    }
}
```

Return pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters

- **xQueue**: The handle to the queue on which the item is to be posted.
- **pvItemToQueue**: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **[out] pxHigherPriorityTaskWoken**: xQueueSendToBackFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**xQueueOverwriteFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```c
QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
    // Create a queue to hold one uint32_t value. It is strongly
    // recommended ‘not’ to use xQueueOverwriteFromISR() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
```
xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}
void vAnInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    uint32_t ulVarToSend, ulValReceived;

    // Write the value 10 to the queue using xQueueOverwriteFromISR().
    ulVarToSend = 10;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // The queue is full, but calling xQueueOverwriteFromISR() again will still pass because the value held in the queue will be overwritten with the new value.
    ulVarToSend = 100;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // Reading from the queue will now return 100.
    //...

    if( xHigherPriorityTaskWoken == pdTRUE )
    {
        // Writing to the queue caused a task to unblock and the unblocked task has a priority higher than or equal to the priority of the currently executing task (the task this interrupt interrupted). Perform a context switch so this interrupt returns directly to the unblocked task.
        portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
    }
}

Return xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

Parameters

- xQueue: The handle to the queue on which the item is to be posted.
- pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- [out] pxHigherPriorityTaskWoken: xQueueOverwriteFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

xQueueSendFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):
void vBufferISR( void )
{
  char cIn;
  BaseType_t xHigherPriorityTaskWoken;

  // We have not woken a task at the start of the ISR.
  xHigherPriorityTaskWoken = pdFALSE;

  // Loop until the buffer is empty.
  do
  {
    // Obtain a byte from the buffer.
    cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

    // Post the byte.
    xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
  }
  while( portINPUT_BYTE( BUFFER_COUNT ) );

  // Now the buffer is empty we can switch context if necessary.
  if( xHigherPriorityTaskWoken )
  {
    // Actual macro used here is port specific.
    portYIELD_FROM_ISR ( );
  }
}

Return pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

Parameters
  • xQueue: The handle to the queue on which the item is to be posted.
  • pvItemToQueue: A pointer to the item that is to be placed on the queue. The size of the item
    the queue will hold was defined when the queue was created, so this many bytes will be copied from
    pvItemToQueue into the queue storage area.
  • [out] pxHigherPriorityTaskWoken: xQueueSendFromISR() will set *pxHigherPriorityTaskWoken
    to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task
    has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to
    pdTRUE then a context switch should be requested before the interrupt is exited.

xQueueReset( xQueue )

Reset a queue back to its original empty state. pdPASS is returned if the queue is successfully reset. pdFAIL is
returned if the queue could not be reset because there are tasks blocked on the queue waiting to either receive
from the queue or send to the queue.

Return always returns pdPASS

Parameters
  • xQueue: The queue to reset

Type Definitions

typedef void *QueueHandle_t

Type by which queues are referenced. For example, a call to xQueueCreate() returns an QueueHandle_t
variable that can then be used as a parameter to xQueueSend(), xQueueReceive(), etc.

typedef void *QueueSetHandle_t

Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an QueueSet
variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.

typedef void *QueueSetMemberHandle_t

Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle_t is defined as a type to
be used where a parameter or return value can be either an QueueHandle_t or an SemaphoreHandle_t.
Semaphore API

Header File

- freertos/include/freertos/semphr.h

Macros

- semBINARY_SEMAPHORE_QUEUE_LENGTH
- semSEMAPHORE_QUEUE_ITEM_LENGTH
- semGIVE_BLOCK_TIME

xSemaphoreCreateBinary()

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced. In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [http://www.freertos.org/RTOS-task-notifications.html](http://www.freertos.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old vSemaphoreCreateBinary() macro is now deprecated in favour of this xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the semaphore must first be ‘given’ before it can be ‘taken’.

Function that creates a semaphore by using the existing queue mechanism. The queue length is 1 as this is a binary semaphore. The data size is 0 as nothing is actually stored - all that is important is whether the queue is empty or full (the binary semaphore is available or not).

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

Return Handle to the created semaphore.

xSemaphoreCreateBinaryStatic(pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.
NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! http://www.freertos.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see http://www.freertos.org/a00111.html). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary().
    // The semaphore's data structures will be placed in the xSemaphoreBuffer
    // variable, the address of which is passed into the function. The
    // function's parameter is not NULL, so the function will not attempt any
    // dynamic memory allocation, and therefore the function will not return
    // return NULL.
    xSemaphore = xSemaphoreCreateBinary( &xSemaphoreBuffer );

    // Rest of task code goes here.
}
```

**Return** If the semaphore is created then a handle to the created semaphore is returned. If pxSemaphoreBuffer is NULL then NULL is returned.

**Parameters**
- pxStaticSemaphore: Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

**xSemaphoreTake** (xSemaphore, xBlockTime)

*Macro* to obtain a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xSemaphore != NULL )
    {
```

(continues on next page)
See if we can obtain the semaphore. If the semaphore is not available, wait 10 ticks to see if it becomes free.

```c
if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
{
    // We were able to obtain the semaphore and can now access the
    // shared resource.
    
    // ...

    // We have finished accessing the shared resource. Release the
    // semaphore.
    xSemaphoreGive( xSemaphore );
}
else
{
    // We could not obtain the semaphore and can therefore not access
    // the shared resource safely.
}
```

Return pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

Parameters
- xSemaphore: A handle to the semaphore being taken - obtained when the semaphore was created.
- xBlockTime: The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

```c
xSemaphoreTakeRecursive( xMutex, xBlockTime )
```

Macro to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

```c
SemaphoreHandle_t xMutex = NULL;
```

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```c
// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xMutex != NULL )
    {
        // ...
    }
}
See if we can obtain the mutex. If the mutex **is not** available
// wait 10 ticks to see if it becomes free.
    if ( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
    {
        // We were able to obtain the mutex **and** can now access the
        // shared resource.
        // ...
        // For some reason due to the nature of the code further calls to
        // xSemaphoreTakeRecursive() are made on the same mutex. In real
        // code these would **not** be just sequential calls **as** this would make
        // no sense. Instead the calls are likely to be buried inside
        // a more complex call structure.
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
        xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

        // The mutex has now been 'taken' three times, so will **not** be
        // available to another task until it has also been given back
        // three times. Again it **is** unlikely that real code would have
        // these calls sequentially, but instead buried in a more complex
        // call structure. This **is** just for illustrative purposes.
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );

        // Now the mutex can be taken by other tasks.
    }
    else
    {
        // We could **not** obtain the mutex **and** can therefore **not** access
        // the shared resource safely.
    }
}

Return pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore
becoming available.

Parameters
* xMutex: A handle to the mutex being obtained. This is the handle returned by xSemaphoreCreateRecursiveMutex();
* xBlockTime: The time in ticks to wait for the semaphore to become available. The macro
  portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used
to poll the semaphore. If the task already owns the semaphore then xSemaphoreTakeRecursive() will
return immediately no matter what the value of xBlockTime.

xSemaphoreGive(xSemaphore)
*Macro* to release a semaphore. The semaphore must have previously been created with a call to
vSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting(). and obtained using
xSemaphoreTake().

This macro must not be used from an ISR. See xSemaphoreGiveFromISR () for an alternative which can be
used from an ISR.

This macro must also not be used on semaphores created using xSemaphoreCreateRecursiveMutex().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;
void vATask( void * pvParameters )
{...
(continues on next page)
```
// Create the semaphore to guard a shared resource.
void vSemaphoreCreateBinary( xSemaphore )
{
if ( xSemaphore != NULL )
{
    if ( xSemaphoreGive( xSemaphore ) != pdTRUE )
    {
        // We would expect this call to fail because we cannot give
        // a semaphore without first "taking" it!
    }

    // Obtain the semaphore - don't block if the semaphore is not
    // immediately available.
    if ( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
    {
        // We now have the semaphore and can access the shared resource.
        // ...  

        // We have finished accessing the shared resource so can free the
        // semaphore.
        if ( xSemaphoreGive( xSemaphore ) != pdTRUE )
        {
            // We would not expect this call to fail because we must have
            // obtained the semaphore to get here.
        }
    }
}
}

Return pdTRUE if the semaphore was released. pdFALSE if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

Parameters

• xSemaphore: A handle to the semaphore being released. This is the handle returned when the semaphore was created.

xSemaphoreGiveRecursive(xMutex)

Macro to recursively release, or ‘give’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available. This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.
            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, it would be more likely that the calls
            // to xSemaphoreGiveRecursive() would be called as a call stack
            // unwound. This is just for demonstrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}

Return  pdTRUE if the semaphore was given.

Parameters
    • xMutex: A handle to the mutex being released, or ‘given’. This is the handle returned by
      xSemaphoreCreateMutex();

xSemaphoreGiveFromISR( xSemaphore, pxHigherPriorityTaskWoken )
Macro to release a semaphore. The semaphore must have previously been created with a call to
vSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this
macro.

This macro can be used from an ISR.

Example usage:

```c
#define LONG_TIME 0xffffffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;
```
// Repetitive task.
void vATask( void * pvParameters )
{
    for( ;; )
    {
        // We want this task to run every 10 ticks of a timer. The semaphore
        // was created before this task was started.

        // Block waiting for the semaphore to become available.
        if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
        {
            // It is time to execute.

            // ...

            // We have finished our task. Return to the top of the loop where
            // we will block on the semaphore until it is time to execute
            // again. Note when using the semaphore for synchronisation with an
            // ISR in this manner there is no need to 'give' the semaphore back.
        }
    }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;

    // A timer tick has occurred.

    // ... Do other time functions.

    // Is it time for vATask () to run?
    xHigherPriorityTaskWoken = pdFALSE;
    ucLocalTickCount++;
    if( ucLocalTickCount >= TICKS_TO_WAIT )
    {
        // Unblock the task by releasing the semaphore.
        xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

        // Reset the count so we release the semaphore again in 10 ticks time.
        ucLocalTickCount = 0;
    }

    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // We can force a context switch here. Context switching from an
        // ISR uses port specific syntax. Check the demo task for your port
        // to find the syntax required.
    }
}

Return  pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.

Parameters

- xSemaphore: A handle to the semaphore being released. This is the handle returned when the
  semaphore was created.
- [out] pxHigherPriorityTaskWoken: xSemaphoreGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.
xSemaphoreTakeFromISR (xSemaphore, pxHigherPriorityTaskWoken)

*Macro* to take a semaphore from an ISR. The semaphore must have previously been created with a call to vSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

**Return** pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

**Parameters**

- xSemaphore: A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- [out] pxHigherPriorityTaskWoken: xSemaphoreTakeFromISR() will set *pxHigherPriorityTaskWoken* to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

xSemaphoreCreateMutex ()

*Macro* that implements a mutex semaphore by using the existing queue mechanism.

 Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See vSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Return** If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.

xSemaphoreCreateMutexStatic (pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.
Chapter 2. API Reference

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see http://www.freertos.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

Return If the mutex was successfully created then a handle to the created mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

Parameters
- `pxMutexBuffer`: Must point to a variable of type StaticSemaphore_t, which will be used to hold the mutex’s data structure, removing the need for the memory to be allocated dynamically.

`xSemaphoreCreateRecursiveMutex()`

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see http://www.freertos.org/a00111.html). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.
See vSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Return** xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle_t.

**xSemaphoreCreateRecursiveMutexStatic**(pxStaticSemaphore)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a
    // recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold
    // the mutexes data structures - so no dynamic memory allocation will be
    // attempted.
}
```
xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

// As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
// so there is no need to check it.
}

**Return** If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

**Parameters**
- pxStaticSemaphore: Must point to a variable of type StaticSemaphore_t, which will then be used to hold the recursive mutex’s data structure, removing the need for the memory to be allocated dynamically.

**xSemaphoreCreateCounting** (uxMaxCount, uxInitialCount)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! [http://www.freertos.org/RTOS-task-notifications.html](http://www.freertos.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCounting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateCounting() function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer can instead optionally provide the memory that will get used by the counting semaphore. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

**Example usage:**

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
    // The max value to which the semaphore can count should be 10, and the
    // initial value assigned to the count should be 0.
    xSemaphore = xSemaphoreCreateCounting( 10, 0 );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
    }
}
```
The semaphore can now be used.

Return Handle to the created semaphore. Null if the semaphore could not be created.

Parameters

• **uxMaxCount**: The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
• **uxInitialCount**: The count value assigned to the semaphore when it is created.

**xSemaphoreCreateCountingStatic**(uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! [http://www.freertos.org/RTOS-task-notifications.html](http://www.freertos.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using **xSemaphoreCreateCounting()** then the required memory is automatically dynamically allocated inside the **xSemaphoreCreateCounting()** function. (see [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If a counting semaphore is created using **xSemaphoreCreateCountingStatic()** then the application writer must provide the memory. **xSemaphoreCreateCountingStatic()** therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;
void vATask( void * pvParameters )
{
SemaphoreHandle_t xSemaphore = NULL;

// Counting semaphore cannot be used before they have been created. Create
// a counting semaphore using xSemaphoreCreateCountingStatic(). The max
// value to which the semaphore can count is 10, and the initial value
// assigned to the count will be 0. The address of xSemaphoreBuffer is
// passed in and will be used to hold the semaphore structure, so no dynamic
// memory allocation will be used.
// xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

// No memory allocation was attempted so xSemaphore cannot be NULL, so there
// is no need to check its value.
}
```
Return If the counting semaphore was successfully created then a handle to the created counting semaphore is returned. If pxSemaphoreBuffer was NULL then NULL is returned.

Parameters
- uxMaxCount: The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- uxInitialCount: The count value assigned to the semaphore when it is created.
- pxSemaphoreBuffer: Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

vSemaphoreDelete (xSemaphore)
Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore if the mutex is held by a task.

Parameters
- xSemaphore: A handle to the semaphore to be deleted.

xSemaphoreGetMutexHolder (xSemaphore)
If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of determining the identity of the mutex holder as the holder may change between the function exiting and the returned value being tested.

uxSemaphoreGetCount (xSemaphore)
If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

Type Definitions
typedef QueueHandle_t SemaphoreHandle_t

Timer API

Header File
- freertos/include/freertos/timers.h

Functions
TimerHandle_t xTimerCreate (const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction)
Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see http://www.freertos.org/a00111.html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:
#define NUM_TIMERS 5

// An array to hold handles to the created timers.
TimerHandle_t xTimers[ NUM_TIMERS ];

// An array to hold a count of the number of times each timer expires.
int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };

// Define a callback function that will be used by multiple timer instances.
// The callback function does nothing but count the number of times the
// associated timer expires, and stop the timer once the timer has expired
// 10 times.
void vTimerCallback( TimerHandle_t pxTimer )
{
    int32_t lArrayIndex;
    const int32_t xMaxExpiryCountBeforeStopping = 10;

    // Optionally do something if the pxTimer parameter is NULL.
    configASSERT( pxTimer );

    // Which timer expired?
    lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );

    // Increment the number of times that pxTimer has expired.
    lExpireCounters[ lArrayIndex ] += 1;

    // If the timer has expired 10 times then stop it from running.
    if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
    {
        // Do not use a block time if calling a timer API function from a
        // timer callback function, as doing so could cause a deadlock!
        xTimerStop( pxTimer, 0 );
    }
}

void main( void )
{
    int32_t x;

    // Create then start some timers. Starting the timers before the scheduler
    // has been started means the timers will start running immediately that
    // the scheduler starts.
    for( x = 0; x < NUM_TIMERS; x++ )
    {
        xTimers[ x ] = xTimerCreate( "Timer", // Just a text name,
                                    ( 100 * x ), // The timer period in...
                                    pdTRUE, // The timers will auto-
                                    ( void * ) x, // Assign each timer a...
                                    vTimerCallback // Each timer calls the...
                                    );

        if( xTimers[ x ] == NULL )
        {
            // The timer was not created.
        }
    else
    {
(continues on next page)
// Start the timer. No block time is specified, and even if one...

if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
{
    // The timer could not be set into the Active state.
}

// Create tasks here.

// Starting the scheduler will start the timers running as they have...

vTaskStartScheduler();

// Should not reach here.
for( ;; );

Return If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created (because either there is insufficient FreeRTOS heap remaining to allocate the timer structures, or the timer period was set to 0) then NULL is returned.

Parameters

- pcTimerName: A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- xTimerPeriodInTicks: The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to ( 500 / portTICK_PERIOD_MS ) provided configTICK_RATE_HZ is less than or equal to 1000.
- uxAutoReload: If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- pvTimerID: An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is called with more than one timer.
- pxCallbackFunction: The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is “void vCallbackFunction( TimerHandle_t xTimer );”.

TimerHandle_t xTimerCreateStatic(const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction, StaticTimer_t *pxTimerBuffer)

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see http://www.freertos.org/a00111.html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used...
to transition a timer into the active state.

Example usage:

```c
// The buffer used to hold the software timer's data structure.
static StaticTimer_t xTimerBuffer;

// A variable that will be incremented by the software timer's callback function.
UBaseType_t uxVariableToIncrement = 0;

// A software timer callback function that increments a variable passed to it when the software timer was created. After the 5th increment the callback function stops the software timer.
static void prvTimerCallback( TimerHandle_t xExpiredTimer )
{
    UBaseType_t *puxVariableToIncrement;
    BaseType_t xReturned;

    // Obtain the address of the variable to increment from the timer ID.
    puxVariableToIncrement = ( UBaseType_t * ) pvTimerGetTimerID( xExpiredTimer );

    // Increment the variable to show the timer callback has executed.
    ( *puxVariableToIncrement )++;

    // If this callback has executed the required number of times, stop the timer.
    if( ( *puxVariableToIncrement == 5 ) )
    {
        // This is called from a timer callback so must not block.
        xTimerStop( xExpiredTimer, staticDONT_BLOCK );
    }
}

void main( void )
{
    // Create the software time. xTimerCreateStatic() has an extra parameter than the normal xTimerCreate() API function. The parameter is a pointer to the StaticTimer_t structure that will hold the software timer structure. If the parameter is passed as NULL then the structure will be allocated dynamically, just as if xTimerCreate() had been called.
    xTimer = xTimerCreateStatic( "T1", // Text name for the task. Helps debugging only. Not used by FreeRTOS.
                              xTimerPeriod, // The period of the timer in ticks.
                              pdTRUE, // This is an auto-reload.
                              timer.
                              ( void * ) &uxVariableToIncrement, // A variable incremented by the software timer's callback function
                              prvTimerCallback, // The function to execute when the timer expires.
                              &xTimerBuffer ); // The buffer that will hold the software timer structure.

    // The scheduler has not started yet so a block time is not used.
    xReturned = xTimerStart( xTimer, 0 );

    // ...
    // Create tasks here.
    // ...
```

Chapter 2. API Reference

(continued from previous page)

```c
// Starting the scheduler will start the timers running as they have
// already
// been set into the active state.
vTaskStartScheduler();

// Should not reach here.
for (;;) {
}
```

**Return** If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

**Parameters**

- **pcTimerName**: A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks**: The timer period. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to `(500 / portTICK_PERIOD_MS)` if `configTICK_RATE_HZ` is less than or equal to 1000.
- **uxAutoReload**: If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID**: An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction**: The function to call when the timer expires. Callback functions must have the prototype defined by `TimerCallbackFunction_t`, which is “void vCallbackFunction(TimerHandle_t xTimer);”.
- **pxTimerBuffer**: Must point to a variable of type `StaticTimer_t`, which will be then be used to hold the software timer’s data structures, removing the need for the memory to be allocated dynamically.

```c
void *pvTimerGetTimerID(TimerHandle_t xTimer)
```

Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to `xTimerCreated()` that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used within the callback function to identify which timer actually expired.

Example usage:

**Return** The ID assigned to the timer being queried.

**Parameters**

- **xTimer**: The timer being queried.

See the `xTimerCreate()` API function example usage scenario.

```c
void vTimerSetTimerID(TimerHandle_t xTimer, void *pvNewID)
```

Sets the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to `xTimerCreated()` that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

**Parameters**

- **xTimer**: The timer being updated.
• pvNewID: The ID to assign to the timer.

See the xTimerCreate() API function example usage scenario.

BaseType_t xTimerIsTimerActive(TimerHandle_t xTimer)
Queries a timer to see if it is active or dormant.

A timer will be dormant if:

1) It has been created but **not** started, or
2) It **is** an expired one-shot timer that has **not** been restarted.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```c
// This function assumes xTimer has already been created.
void vAFunction( TimerHandle_t xTimer )
{
    if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply **and**
        equivalently "if( xTimerIsTimerActive( xTimer ) )"
    {
        // xTimer **is** active, do something.
    }
    else
    {
        // xTimer **is not** active, do something **else**.
    }
}
```

**Return** pdFALSE will be returned if the timer is dormant. A value other than pdFALSE will be returned if the timer is active.

**Parameters**
• xTimer: The timer being queried.

TaskHandle_t xTimerGetTimerDaemonTaskHandle(void)
xTimerGetTimerDaemonTaskHandle() is only available if INCLUDE_xTimerGetTimerDaemonTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the timer service/daemon task. It it not valid to call xTimerGetTimerDaemonTaskHandle() before the scheduler has been started.

TickType_t xTimerGetPeriod(TimerHandle_t xTimer)
Returns the period of a timer.

**Return** The period of the timer in ticks.

**Parameters**
• xTimer: The handle of the timer being queried.

TickType_t xTimerGetExpiryTime(TimerHandle_t xTimer)
Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

**Return** If the timer is running then the time in ticks at which the timer will next expire is returned. If the timer is not running then the return value is undefined.

**Parameters**
• xTimer: The handle of the timer being queried.

BaseType_t xTimerPendFunctionCallFromISR(PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken)
Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).
Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases xTimerPendFunctionCallFromISR() can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

```c
// The callback function that will execute in the context of the daemon task.
// Note callback functions must all use this same prototype.
void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
{
    BaseType_t xInterfaceToService;

    // The interface that requires servicing is passed in the second
    // parameter. The first parameter is not used in this case.
    xInterfaceToService = ( BaseType_t ) ulParameter2;

    // ...Perform the processing here...
}

// An ISR that receives data packets from multiple interfaces
void vAnISR( void )
{
    BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;

    // Query the hardware to determine which interface needs processing.
    xInterfaceToService = prvCheckInterfaces();

    // The actual processing is to be deferred to a task. Request the
    // vProcessInterface() callback function is executed, passing in the
    // number of the interface that needs processing. The interface to
    // service is passed in the second parameter. The first parameter is
    // not used in this case.
    xHigherPriorityTaskWoken = pdFALSE;
    xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )
        xInterfaceToService, &xHigherPriorityTaskWoken );

    // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
    // switch should be requested. The macro used is port specific and will
    // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
    // the documentation page for the port being used.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

Return pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

Parameters
- **xFunctionToPend**: The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
- **pvParameter1**: The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2**: The value of the callback function’s second parameter.
- **pxHigherPriorityTaskWoken**: As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER_TASK_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then *pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch.
should be requested before the interrupt exits. For that reason *pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

**BaseType_t xTimerPendFunctionCall (PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait)**

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

**Return** pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

**Parameters**
- **xFunctionToPend**: The function to execute from the timer service/daemon task. The function must conform to the PendedFunction_t prototype.
- **pvParameter1**: The value of the callback function’s first parameter. The parameter has a void * type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void *, or the void * can be used to point to a structure.
- **ulParameter2**: The value of the callback function’s second parameter.
- **xTicksToWait**: Calling this function will result in a message being sent to the timer daemon task on a queue. xTicksToWait is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

**const char* pcTimerGetTimerName (TimerHandle_t xTimer)**

Returns the name that was assigned to a timer when the timer was created.

**Return** The name assigned to the timer specified by the xTimer parameter.

**Parameters**
- **xTimer**: The handle of the timer being queried.

**Macros**

- `tmrCOMMAND_EXECUTE_CALLBACK_FROM_ISR`
- `tmrCOMMAND_EXECUTE_CALLBACK`
- `tmrCOMMAND_START_DONT_TRACE`
- `tmrCOMMAND_START`
- `tmrCOMMAND_RESET`
- `tmrCOMMAND_STOP`
- `tmrCOMMAND_CHANGE_PERIOD`
- `tmrCOMMAND_DELETE`
- `tmrFIRST_FROM_ISR_COMMAND`
- `tmrCOMMAND_START_FROM_ISR`
- `tmrCOMMAND_RESET_FROM_ISR`
- `tmrCOMMAND_STOP_FROM_ISR`
- `tmrCOMMAND_CHANGE_PERIOD_FROM_ISR`

**xTimerStart** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.
Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean
time, the callback function associated with the timer will get called ‘n’ ticks after xTimerStart() was called,
where ‘n’ is the timers defined period.

It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not
actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is
started, not relative to when xTimerStart() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.

Example usage:

Return pdFAIL will be returned if the start command could not be sent to the timer command queue even
after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to
the timer command queue. When the command is actually processed will depend on the priority of the
timer service/daemon task relative to other tasks in the system, although the timers expiry time is
relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the
configTIMER_TASK_PRIORITY configuration constant.

Parameters
• xTimer: The handle of the timer being started/restarted.
• xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked
state to wait for the start command to be successfully sent to the timer command queue, should the
queue already be full when xTimerStart() was called. xTicksToWait is ignored if xTimerStart() is
called before the scheduler is started.

See the xTimerCreate() API function example usage scenario.

xTimerStop(xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API
functions send commands to the timer service task through a queue called the timer command queue. The
timer command queue is private to the kernel itself and is not directly accessible to application code. The
length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStop() stops a timer that was previously started using either of the The xTimerStart(), xTimerReset(),
xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() or xTimerChangePeriodFromISR()
API functions.

Stopping a timer ensures the timer is not in the active state.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStop() to be available.

Example usage:

Return pdFAIL will be returned if the stop command could not be sent to the timer command queue even
after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to
the timer command queue. When the command is actually processed will depend on the priority of the
timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is
set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters
• xTimer: The handle of the timer being stopped.
• xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked
state to wait for the stop command to be successfully sent to the timer command queue, should the
queue already be full when xTimerStop() was called. xTicksToWait is ignored if xTimerStop() is
called before the scheduler is started.

See the xTimerCreate() API function example usage scenario.

xTimerChangePeriod(xTimer, xNewPeriod, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API
functions send commands to the timer service task through a queue called the timer command queue. The
timer command queue is private to the kernel itself and is not directly accessible to application code. The
length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerChangePeriod() changes the period of a timer that was previously created using the xTimerCreate() API function.
**xTimerChangePeriod()** can be called to change the period of an active or dormant state timer.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerChangePeriod() to be available.

Example usage:

```c
// This function assumes xTimer has already been created. If the timer
// referenced by xTimer is already active when it is called, then the timer
// is deleted. If the timer referenced by xTimer is not active when it is
// called, then the period of the timer is set to 500ms and the timer is
// started.
void vAFunction( TimerHandle_t xTimer )
{
    if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and...
        // xTimer is already active - delete it.
        xTimerDelete( xTimer );
    else
    {
        // xTimer is not active, change its period to 500ms. This will also
        // cause the timer to start. Block for a maximum of 100 ticks if the
        // change period command cannot immediately be sent to the timer
        // command queue.
        if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) == pdPASS )
            // The command was successfully sent.
        else
            // The command could not be sent, even after waiting for 100 ticks
            // to pass. Take appropriate action here.
    }
}
```

**Return**  pdFAIL will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed.  pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**Parameters**

- **xTimer**: The handle of the timer that is having its period changed.
- **xNewPeriod**: The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to ( 500 / portTICK_PERIOD_MS ) provided configTICK_RATE_HZ is less than or equal to 1000.
- **xTicksToWait**: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when xTimerChangePeriod() was called. xTicksToWait is ignored if xTimerChangePeriod() is called before the scheduler is started.

**xTimerDelete()** (xTimer, xTicksToWait)

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerDelete() deletes a timer that was previously created using the xTimerCreate() API function.
The configUSE_TIMERS configuration constant must be set to 1 for xTimerDelete() to be available.

Example usage:

Return  pdFAIL will be returned if the delete command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters

• xTimer: The handle of the timer being deleted.
• xTicksToWait: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when xTimerDelete() was called. xTicksToWait is ignored if xTimerDelete() is called before the scheduler is started.

See the xTimerChangePeriod() API function example usage scenario.

xTimerReset (xTimer, xTicksToWait)
Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerReset() re-starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerReset() will cause the timer to re-evaluate its expiry time so that it is relative to when xTimerReset() was called. If the timer was in the dormant state then xTimerReset() has equivalent functionality to the xTimerStart() API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after xTimerReset() was called, where ‘n’ is the timers defined period.

It is valid to call xTimerReset() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerReset() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerReset() to be available.

Example usage:

```c
// When a key is pressed, an LCD back-light is switched on. If 5 seconds pass
// without a key being pressed, then the LCD back-light is switched off. In
// this case, the timer is a one-shot timer.
TimerHandle_t xBacklightTimer = NULL;

// The callback function assigned to the one-shot timer. In this case the
// parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key
    // was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}

// The key press event handler.
void vKeyPressEventHandler( char cKey )
{
    // Ensure the LCD back-light is on, then reset the timer that is
    // responsible for turning the back-light off after 5 seconds of
    // key inactivity. Wait 10 ticks for the command to be successfully sent
    // if it cannot be sent immediately.
    vSetBacklightState( BACKLIGHT_ON );
}
```

(continues on next page)
if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
{
    // The reset command was not executed successfully. Take appropriate
    // action here.
}

// Perform the rest of the key processing here.

void main( void )
{
    int32_t x;

    // Create then start the one-shot timer that is responsible for turning
    // the back-light off if no keys are pressed within a 5 second period.
    xBacklightTimer = xTimerCreate( "BacklightTimer",                  // Just a text
        &name, not used by the kernel.
        5000 / portTICK_PERIOD_MS), // The timer
        &period in ticks.
        pdFALSE,                   // The timer
        &is a one-shot timer.
        0,                        // The id is
        &not used by the callback so can take any value.
        vBacklightTimerCallback   // The
        &callback function that switches the LCD back-light off.
    )
;

    if( xBacklightTimer == NULL )
    {
        // The timer was not created.
    }
    else
    {
        // Start the timer. No block time is specified, and even if one was
        // it would be ignored because the scheduler has not yet been
        // started.
        if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
        {
            // The timer could not be set into the Active state.
        }
    }

    // ...
    // Create tasks here.
    // ...

    // Starting the scheduler will start the timer running as it has already
    // been set into the active state.
    xTaskStartScheduler();

    // Should not reach here.
    for( ;; );
}

Return  pdFAIL will be returned if the reset command could not be sent to the timer command queue even
after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent
to the timer command queue. When the command is actually processed will depend on the priority of
the timer service/daemon task relative to other tasks in the system, although the timers expiry time is
relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the
configTIMER_TASK_PRIORITY configuration constant.

Parameters
• **xTimer**: The handle of the timer being reset/started/restarted.

• **xTicksToWait**: Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when `xTimerReset()` was called. `xTicksToWait` is ignored if `xTimerReset()` is called before the scheduler is started.

### `xTimerStartFromISR(xTimer, pxHigherPriorityTaskWoken)`

A version of `xTimerStart()` that can be called from an interrupt service routine.

**Example usage:**

```c
// This scenario assumes xBacklightTimer has already been created. When a
// key is pressed, an LCD back-light is switched on. If 5 seconds pass
// without a key being pressed, then the LCD back-light is switched off. In
// this case, the timer is a one-shot timer, and unlike the example given for
// the `xTimerReset()` function, the key press event handler is an interrupt
// service routine.

// The callback function assigned to the one-shot timer. In this case the
// parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key
    // was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}

// The key press interrupt service routine.
void vKeyPressEventInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // Ensure the LCD back-light is on, then restart the timer that is
    // responsible for turning the back-light off after 5 seconds of
    // key inactivity. This is an interrupt service routine so can only
    // call FreeRTOS API functions that end in "FromISR".
    vSetBacklightState( BACKLIGHT_ON );

    // `xTimerStartFromISR()` or `xTimerResetFromISR()` could be called here
    // as both cause the timer to re-calculate its expiry time.
    // `xHigherPriorityTaskWoken` was initialised to `pdFALSE` when it was
    // declared (in this function).
    if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The start command was not executed successfully. Take appropriate
        // action here.
    }

    // Perform the rest of the key processing here.

    // If `xHigherPriorityTaskWoken` equals `pdTRUE`, then a context switch
    // should be performed. The syntax required to perform a context switch
    // from inside an ISR varies from port to port, and from compiler to
    // compiler. Inspect the demos for the port you are using to find the
    // actual syntax required.
    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // Call the interrupt safe `yield` function here (actual function
        // depends on the FreeRTOS port being used).
    }
}

Return `pdFAIL` will be returned if the start command could not be sent to the timer command queue. `pdPASS`
Chapter 2. API Reference

will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStartFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters

- **xTimer**: The handle of the timer being started/restarted.
- **pxHigherPriorityTaskWoken**: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerStartFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStartFromISR() function. If xTimerStartFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

xTimerStopFromISR (xTimer, pxHigherPriorityTaskWoken)

A version of xTimerStop() that can be called from an interrupt service routine.

Example usage:

```c
// This scenario assumes xTimer has already been created and started. When
// an interrupt occurs, the timer should be simply stopped.

// The interrupt service routine that stops the timer.
void vAnExampleInterruptServiceRoutine ( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // The interrupt has occurred - simply stop the timer.
    // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
    // (within this function). As this is an interrupt service routine, only
    // FreeRTOS API functions that end in "FromISR" can be used.
    if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The stop command was not executed successfully. Take appropriate
        // action here.
    }

    // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
    // should be performed. The syntax required to perform a context switch
    // from inside an ISR varies from port to port, and from compiler to
    // compiler. Inspect the demos for the port you are using to find the
    // actual syntax required.
    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // Call the interrupt safe yield function here (actual function
        // depends on the FreeRTOS port being used).
    }
}
```

Return  pdFAIL will be returned if the stop command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

Parameters

- **xTimer**: The handle of the timer being stopped.
- **pxHigherPriorityTaskWoken**: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStopFromISR() writes a message to the timer command queue, so has the potential to transition
the timer service/daemon task out of the Blocked state. If calling xTimerStopFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerStopFromISR() function. If xTimerStopFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

**xTimerChangePeriodFromISR(xTimer, xNewPeriod, pxHigherPriorityTaskWoken)**

A version of xTimerChangePeriod() that can be called from an interrupt service routine.

**Example usage:**

```c
// This scenario assumes xTimer has already been created and started. When an interrupt occurs, the period of xTimer should be changed to 500ms.

// The interrupt service routine that changes the period of xTimer.
void vAnExampleInterruptServiceRoutine( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    // The interrupt has occurred - change the period of xTimer to 500ms.
    // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
    // (within this function). As this is an interrupt service routine, only
    // FreeRTOS API functions that end in "FromISR" can be used.
    if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The command to change the timers period was not executed
        // successfully. Take appropriate action here.
    }

    // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
    // should be performed. The syntax required to perform a context switch
    // from inside an ISR varies from port to port, and from compiler to
    // compiler. Inspect the demos for the port you are using to find the
    // actual syntax required.
    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // Call the interrupt safe yield function here (actual function
        // depends on the FreeRTOS port being used).
    }
}
```

**Return** pdFAIL will be returned if the command to change the timers period could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**Parameters**

- **xTimer**: The handle of the timer that is having its period changed.
- **xNewPeriod**: The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to ( 500 / portTICK_PERIOD_MS ) provided configTICK_RATE_HZ is less than or equal to 1000.
- **pxHigherPriorityTaskWoken**: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerChangePeriodFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerChangePeriodFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within
the xTimerChangePeriodFromISR() function. If xTimerChangePeriodFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

**xTimerResetFromISR(xTimer, pxHigherPriorityTaskWoken)**

A version of xTimerReset() that can be called from an interrupt service routine.

Example usage:

```c
// This scenario assumes xBacklightTimer has already been created. When a
// key is pressed, an LCD back-light is switched on. If 5 seconds pass
// without a key being pressed, then the LCD back-light is switched off. In
// this case, the timer is a one-shot timer, and unlike the example given for
// the xTimerReset() function, the key press event handler is an interrupt
// service routine.

// The callback function assigned to the one-shot timer. In this case the
// parameter is not used.
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // The timer expired, therefore 5 seconds must have passed since a key
    // was pressed. Switch off the LCD back-light.
    vSetBacklightState( BACKLIGHT_OFF );
}

// The key press interrupt service routine.
void vKeyPressEventInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    // Ensure the LCD back-light is on, then reset the timer that is
    // responsible for turning the back-light off after 5 seconds of
    // key inactivity. This is an interrupt service routine so can only
    // call FreeRTOS API functions that end in "FromISR".
    vSetBacklightState( BACKLIGHT_ON );
    // xTimerStartFromISR() or xTimerResetFromISR() could be called here
    // as both cause the timer to re-calculate its expiry time.
    // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
    // declared (in this function).
    if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS )
    {
        // The reset command was not executed successfully. Take appropriate
        // action here.
    }
    // Perform the rest of the key processing here.
    
    // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
    // should be performed. The syntax required to perform a context switch
    // from inside an ISR varies from port to port, and from compiler to
    // compiler. Inspect the demos for the port you are using to find the
    // actual syntax required.
    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // Call the interrupt safe yield function here (actual function
        // depends on the FreeRTOS port being used).
    }
}
```

**Return**

pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerResetFromISR() is actually called.
The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**Parameters**
- `xTimer`: The handle of the timer that is to be started, reset, or restarted.
- `pxHigherPriorityTaskWoken`: The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerResetFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerResetFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `pxHigherPriorityTaskWoken` will get set to `pdTRUE` internally within the xTimerResetFromISR() function. If xTimerResetFromISR() sets this value to `pdTRUE` then a context switch should be performed before the interrupt exits.

**Type Definitions**

```c
typedef void* TimerHandle_t
```

Type by which software timers are referenced. For example, a call to xTimerCreate() returns a TimerHandle_t variable that can then be used to reference the subject timer in calls to other software timer API functions (for example, xTimerStart(), xTimerReset(), etc.).

```c
typedef void(*TimerCallbackFunction_t)(TimerHandle_t xTimer)
```

Defines the prototype to which timer callback functions must conform.

```c
typedef void(*PendedFunction_t)(void*, uint32_t)
```

Defines the prototype to which functions used with the xTimerPendFunctionCallFromISR() function must conform.

**Event Group API**

**Header File**

- `freertos/include/freertos/event_groups.h`

**Functions**

```c
EventGroupHandle_t xEventGroupCreate(void)
```

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group’s structure is stored. If an event group is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (See [http://www.freertos.org/a00111.html](http://www.freertos.org/a00111.html)). If an event group is created using xEventGroupCreateStatic() then the application writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```c
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
```

(continues on next page)
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
} else
{
    // The event group was created.
}

Return If the event group was created then a handle to the event group is returned. If there was insufficient
FreeRTOS heap available to create the event group then NULL is returned. See http://www.freertos.org/a00111.html

EventGroupHandle_t xEventGroupCreateStatic(StaticEventGroup_t* pxEventGroupBuffer)
Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the
event group’s structure is stored. If an event groups is created using xEventGroupCreate() then the required
memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see http://www.
freertos.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then the application
writer must instead provide the memory that will get used by the event group. xEventGroupCreateStatic() therefor allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available
for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```c
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group’s data structures
StaticEventGroup_t xEventGroupBuffer;

StaticEventGroup_t is a publicly accessible structure that has the same
size and alignment requirements as the real event group structure. It is
provided as a mechanism for applications to know the size of the event
group (which is dependent on the architecture and configuration file
settings) without breaking the strict data hiding policy by exposing the
real event group internals. This StaticEventGroup_t variable is passed
into the xSemaphoreCreateEventGroupStatic() function and is used to store
the event group’s data structures

// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );
```

Return If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer
was NULL then NULL is returned.

Parameters
• pxEventGroupBuffer: pxEventGroupBuffer must point to a variable of type StaticEventGroup_t, which will be then be used to hold the event group’s data structures, removing the need
for the memory to be allocated dynamically.

EventBits_t xEventGroupWaitBits( EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToWaitFor, const BaseType_t xClearOnExit, const BaseType_t xWaitForAllBits, TickType_t xTicksToWait)
[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0   ( 1 << 0 )
#define BIT_4   ( 1 << 4 )
```
void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;
    // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
    // the event group. Clear the bits before exiting.
    uxBits = xEventGroupWaitBits( xEventGroup,     // The event group being tested.
        BIT_0 | BIT_4,     // The bits within the event group to wait...
        --for.
        pdTRUE,     // BIT_0 and BIT_4 should be cleared before...
        --returning.
        pdFALSE,     // Don't wait for both bits, either bit will...
        --do.
        xTicksToWait ); // Wait a maximum of 100ms for either bit to...
    --be set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // xEventGroupWaitBits() returned because both bits were set.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_0 was set.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_4 was set.
    }
    else
    {
        // xEventGroupWaitBits() returned because xTicksToWait ticks passed
        // without either BIT_0 or BIT_4 becoming set.
    }
}

[c]

Return The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupWaitBits() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupWaitBits() returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that xClearOnExit parameter was set to pdTRUE.

Parameters

- **xEventGroup**: The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
- **uxBitsToWaitFor**: A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and/or bit 1 and/or bit 2 set uxBitsToWaitFor to 0x07. Etc.
- **xClearOnExit**: If xClearOnExit is set to pdTRUE then any bits within uxBitsToWaitFor that are set within the event group will be cleared before xEventGroupWaitBits() returns if the wait condition was met (if the function returns for a reason other than a timeout). If xClearOnExit is set to pdFALSE then the bits set in the event group are not altered when the call to xEventGroupWaitBits() returns.
- **xWaitForAllBits**: If xWaitForAllBits is set to pdTRUE then xEventGroupWaitBits() will return when either all the bits in uxBitsToWaitFor are set or the specified block time expires. If xWaitForAllBits is set to pdFALSE then xEventGroupWaitBits() will return when any one of the bits set in uxBitsToWaitFor is set or the specified block time expires. The block time is specified by
the xTicksToWait parameter.
• xTicksToWait: The maximum amount of time (specified in ‘ticks’) to wait for one/all (de-
  pending on the xWaitForAllBits value) of the bits specified by uxBitsToWaitFor to become set.

**EventBits_t xEventGroupClearBits (EventGroupHandle_t xEventGroup, const EventBits_t uxBitsTo-
  Clear)**

Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    // Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits( xEventGroup, BIT_0 | BIT_4 );
    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 were set before xEventGroupClearBits() was called. Both will now be clear (not set).
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 was set before xEventGroupClearBits() was called. It will now be clear.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 was set before xEventGroupClearBits() was called. It will now be clear.
    }
    else
    {
        // Neither bit 0 nor bit 4 were set in the first place.
    }
}
```

**Return** The value of the event group before the specified bits were cleared.

**Parameters**
• xEventGroup: The event group in which the bits are to be cleared.
• uxBitsToClear: A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

**EventBits_t xEventGroupSetBits (EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet)**

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBits-
FromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    // (continues on next page)
```
// Set bit 0 and bit 4 in xEventGroup.
uxBits = xEventGroupSetBits{
    xEventGroup, // The event group being updated.
    BIT_0 | BIT_4 }; // The bits being set.

if{ ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) }
{
    // Both bit 0 and bit 4 remained set when the function returned.
}
else if{ ( uxBits & BIT_0 ) != 0 }
{
    // Bit 0 remained set when the function returned, but bit 4 was
    // cleared. It might be that bit 4 was cleared automatically as a
    // task that was waiting for bit 4 was removed from the Blocked
    // state.
}
else if{ ( uxBits & BIT_4 ) != 0 }
{
    // Bit 4 remained set when the function returned, but bit 0 was
    // cleared. It might be that bit 0 was cleared automatically as a
    // task that was waiting for bit 0 was removed from the Blocked
    // state.
}
else
{
    // Neither bit 0 nor bit 4 remained set. It might be that a task
    // was waiting for both of the bits to be set, and the bits were
    // cleared as the task left the Blocked state.
}
}

Return The value of the event group at the time the call to xEventGroupSetBits() returns. There are two
reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First,
if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the
bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Sec-
ond, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called
xEventGroupSetBits() will execute and may change the event group value before the call to xEvent-
GroupSetBits() returns.

Parameters
- xEventGroup: The event group in which the bits are to be set.
- uxBitsToSet: A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set
  uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

EventBits_t xEventGroupSync (EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToSet,
const EventBits_t uxBitsToWaitFor, TickType_t xTicksToWait)

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event
group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the
other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the uxBitsToWait parameter are
set, or become set within that time. In this case all the bits specified by uxBitsToWait will be automatically
cleared before the function returns.

Example usage:

// Bits used by the three tasks.
#define TASK_0_BIT ( 1 << 0 )
#define TASK_1_BIT ( 1 << 1 )
#define TASK_2_BIT ( 1 << 2 )
#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event
// group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
    EventBits_t uxReturn;
    TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;
    for( ;; )
    {
        // Perform task functionality here.
        // Set bit 0 in the event flag to note this task has reached the
        // sync point. The other two tasks will set the other two bits defined
        // by ALL_SYNC_BITS. All three tasks have reached the synchronisation
        // point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms
        // for this to happen.
        uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS, xTicksToWait );
        if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
        {
            // All three tasks reached the synchronisation point before the call
            // to xEventGroupSync() timed out.
        }
    }
}

void vTask1( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.
        // Set bit 1 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );
        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}

void vTask2( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.
        // Set bit 2 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
// bits defined by ALL_SYNC_BITS. All three tasks have reached the
// synchronisation point when all the ALL_SYNC_BITS are set. Wait
// indefinitely for this to happen.
xEventGroupSync ( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );

// xEventGroupSync() was called with an indefinite block time, so
// this task will only reach here if the synchronisation was made by all
// three tasks, so there is no need to test the return value.
}
}

Return

The value of the event group at the time either the bits being waited for became set, or the block time
expired. Test the return value to know which bits were set. If xEventGroupSync() returned because its
timeout expired then not all the bits being waited for will be set. If xEventGroupSync() returned because
all the bits it was waiting for were set then the returned value is the event group value before any bits were
automatically cleared.

Parameters

- xEventGroup: The event group in which the bits are being tested. The event group must have
  previously been created using a call to xEventGroupCreate().
- uxBitsToSet: The bits to set in the event group before determining if, and possibly waiting for,
  all the bits specified by the uxBitsToWait parameter are set.
- uxBitsToWaitFor: A bitwise value that indicates the bit or bits to test inside the event group.
  For example, to wait for bit 0 and bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and bit 1
  and bit 2 set uxBitsToWaitFor to 0x07. Etc.
- xTicksToWait: The maximum amount of time (specified in ‘ticks’) to wait for all of the bits
  specified by uxBitsToWaitFor to become set.

EventBits_t xEventGroupGetBitsFromISR ( EventGroupHandle_t xEventGroup )

A version of xEventGroupGetBits() that can be called from an ISR.

Return

The event group bits at the time xEventGroupGetBitsFromISR() was called.

Parameters

- xEventGroup: The event group being queried.

void vEventGroupDelete ( EventGroupHandle_t xEventGroup )

Delete an event group that was previously created by a call to xEventGroupCreate(). Tasks that are blocked on
the event group will be unblocked and obtain 0 as the event group’s value.

Parameters

- xEventGroup: The event group being deleted.

Macros

xEventGroupClearBitsFromISR ( xEventGroup, uxBitsToClear )

A version of xEventGroupClearBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks
that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be
performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending
the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an
interrupt service routine. Therefore xEventGroupClearBitsFromISR() sends a message to the timer task to
have the clear operation performed in the context of the timer task.

Example usage:

#define BIT_0   ( 1 << 0 )
#define BIT_4   ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;
void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(
        xEventGroup, // The event group being updated.
        BIT_0 | BIT_4 ); // The bits being set.

    if( xResult == pdPASS )
    {
        // The message was posted successfully.
    }
}

Return If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

Parameters
- xEventGroup: The event group in which the bits are to be cleared.
- uxBitsToClear: A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

xEventGroupSetBitsFromISR (xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)
A version of xEventGroupSetBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore xEventGroupSetBitFromISR() sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken, xResult;

    // xHigherPriorityTaskWoken must be initialised to pdFALSE.
    xHigherPriorityTaskWoken = pdFALSE;

    // Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR(
        xEventGroup, // The event group being updated.
        BIT_0 | BIT_4 // The bits being set.
        &xHigherPriorityTaskWoken );

    // Was the message posted successfully?
    if( xResult == pdPASS )
    {
        // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
        // switch should be requested. The macro used is port specific and
        // will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
        // refer to the documentation page for the port being used.
        portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
    }
}
```
Return: If the request to execute the function was posted successfully then `pdPASS` is returned, otherwise `pdFALSE` is returned. `pdFALSE` will be returned if the timer service queue was full.

Parameters:
- `xEventGroup`: The event group in which the bits are to be set.
- `uxBitsToSet`: A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set `uxBitsToSet` to `0x08`. To set bit 3 and bit 0 set `uxBitsToSet` to `0x09`.
- `pxHigherPriorityTaskWoken`: As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then `pxHigherPriorityTaskWoken` will be set to `pdTRUE` by `xEventGroupSetBitsFromISR()`, indicating that a context switch should be requested before the interrupt exits. For that reason `pxHigherPriorityTaskWoken` must be initialised to `pdFALSE`. See the example code below.

`xEventGroupGetBits(xEventGroup)`
Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

Return: The event group bits at the time `xEventGroupGetBits()` was called.

Parameters:
- `xEventGroup`: The event group being queried.

**Type Definitions**

```c
typedef void* EventGroupHandle_t
```

An event group is a collection of bits to which an application can assign a meaning. For example, an application may create an event group to convey the status of various CAN bus related events in which bit 0 might mean “A CAN message has been received and is ready for processing”, bit 1 might mean “The application has queued a message that is ready for sending onto the CAN network”, and bit 2 might mean “It is time to send a SYNC message onto the CAN network” etc. A task can then test the bit values to see which events are active, and optionally enter the Blocked state to wait for a specified bit or a group of specified bits to be active. To continue the CAN bus example, a CAN controlling task can enter the Blocked state (and therefore not consume any processing time) until either bit 0, bit 1 or bit 2 are active, at which time the bit that was actually active would inform the task which action it had to take (process a received message, send a message, or send a SYNC).

The event groups implementation contains intelligence to avoid race conditions that would otherwise occur were an application to use a simple variable for the same purpose. This is particularly important with respect to when a bit within an event group is to be cleared, and when bits have to be set and then tested atomically - as is the case where event groups are used to create a synchronisation point between multiple tasks (a ‘rendezvous’). `event_groups.h`

Type by which event groups are referenced. For example, a call to `xEVENTGroupCreate()` returns an `EventGroupHandle_t` variable that can then be used as a parameter to other event group functions.

```c
typedef TickType_t EventBits_t
```

2.7.2 FreeRTOS Additions

**Overview**

ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v8.2.0 with significant modifications for SMP compatibility (see [ESP-IDF FreeRTOS SMP Changes](https://docs.espressif.com/projects/esp-idf/en/latest/api-reference/kernel/smp.html)). However various features specific to ESP-IDF FreeRTOS have been added. The features are as follows:

- **Ring Buffers**: Ring buffers were added to provide a form of buffer that could accept entries of arbitrary lengths.

- **Hooks**: ESP-IDF FreeRTOS hooks provides support for registering extra Idle and Tick hooks at run time. Moreover, the hooks can be asymmetric amongst both CPUs.
Ring Buffers

The ESP-IDF FreeRTOS ring buffer is a strictly FIFO buffer that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items. You may apply for a piece of memory on the ring buffer to send an item, or just use the API to copy your data and send (according to the send API you call). For efficiency reasons, items are always retrieved from the ring buffer by reference. As a result, all retrieved items must also be returned in order for them to be removed from the ring buffer completely. The ring buffers are split into the three following types:

No-Split buffers will guarantee that an item is stored in contiguous memory and will not attempt to split an item under any circumstances. Use no-split buffers when items must occupy contiguous memory. Only this buffer type allows you getting the data item address and writing to the item by yourself.

Allow-Split buffers will allow an item to be split when wrapping around if doing so will allow the item to be stored. Allow-split buffers are more memory efficient than no-split buffers but can return an item in two parts when retrieving.

Byte buffers do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes and be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained (e.g. a byte stream).

Note: No-split/allow-split buffers will always store items at 32-bit aligned addresses. Therefore when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

Note: Each item stored in no-split/allow-split buffers will require an additional 8 bytes for a header. Item sizes will also be rounded up to a 32-bit aligned size (multiple of 4 bytes), however the true item size is recorded within the header. The sizes of no-split/allow-split buffers will also be rounded up when created.

Usage The following example demonstrates the usage of `xRingbufferCreate()` and `xRingbufferSend()` to create a ring buffer then send an item to it.

```c
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";
...

    //Create ring buffer
    RingbufHandle_t buf_handle;
    buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
    if (buf_handle == NULL) {
        printf("Failed to create ring buffer\n");
    }

    //Send an item
    UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_TO_TICKS(1000));
    if (!pdTRUE) {
        printf("Failed to send item\n");
    }
```

The following example demonstrates the usage of `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` instead of `xRingbufferSend()` to apply for the memory on the ring buffer (of type `RINGBUF_TYPE_NOSPLIT`) and then send an item to it. This way adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.
Chapter 2. API Reference

```c
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+(((N)+3)&(~3)))
...

//Retrieve space for DMA descriptor and corresponding data buffer
//This has to be done with SendAcquire, or the address may be different when _copy

dma_item_t item;
UBaseType_t res = xRingbufferSendAcquire(buf_handle, &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to acquire memory for item\n");
}
item->dma_desc = (lldesc_t) {
    .size = buffer_size,
    .length = buffer_size,
    .eof = 0,
    .owner = 1,
    .buf = &item->buf,
};
//Actually send to the ring buffer for consumer to use
res = xRingbufferSendComplete(buf_handle, &item);
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

The following example demonstrates retrieving and returning an item from a no-split ring buffer using xRingbufferReceive() and vRingbufferReturnItem()
...

//Receive an item from no-split ring buffer
size_t item_size;
char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_TICKS(1000));

//Check received item
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

The following example demonstrates retrieving and returning an item from an allow-split ring buffer using xRingbufferReceiveSplit() and vRingbufferReturnItem()
... //Receive an item from allow-split ring buffer
data_t item_size1, item_size2;
char *item1, *item2;
BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)&item1, (void**)&item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

//Check received item
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
    //Check if item was split
    if (item2 != NULL) {
        for (int i = 0; i < item_size2; i++) {
            printf("%c", item2[i]);
        }
        vRingbufferReturnItem(buf_handle, (void *)item2);
    }
    printf("\n");
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

The following example demonstrates retrieving and returning an item from a byte buffer using xRingbufferReceiveUpTo() and vRingbufferReturnItem()...

... //Receive data from byte buffer
data_t item_size;
char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_TICKS(1000), sizeof(tx_item));

//Check received data
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

For ISR safe versions of the functions used above, call xRingbufferSendFromISR(), xRingbufferReceiveFromISR(), xRingbufferReceiveSplitFromISR(), xRingbufferReceiveUpToFromISR(), and vRingbufferReturnItemFromISR().

Sending to Ring Buffer  The following diagrams illustrate the differences between no-split/allow-split buffers and byte buffers with regards to sending items/data. The diagrams assume that three items of sizes 18, 3, and 27 bytes are sent respectively to a buffer of 128 bytes.

For no-split/allow-split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is rounded up to the nearest 32-bit aligned size in order to maintain overall 32-bit alignment. However
Fig. 26: Sending items to no-split/allow-split ring buffers

Referring to the diagram above, the 18, 3, and 27 byte items are rounded up to 20, 4, and 28 bytes respectively. An 8 byte header is then added in front of each item.

Fig. 27: Sending items to byte buffers

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and merged into a single item of 48 bytes.

Using SendAcquire and SendComplete  Items in no-split buffers are acquired (by SendAcquire) in strict FIFO order and must be sent to the buffer by SendComplete for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling SendComplete, and the items do not necessarily need to be completed in the order they were acquired. However the receiving of data items must occur in FIFO order, therefore not calling SendComplete the earliest acquired item will prevent the subsequent items from being received.

The following diagrams illustrate what will happen when SendAcquire/SendComplete don’t happen in the same order. At the beginning, there is already an data item of 16 bytes sent to the ring buffer. Then SendAcquire is called to acquire space of 20, 8, 24 bytes on the ring buffer.

Fig. 28: SendAcquire/SendComplete items in no-split ring buffers

After that, we fill (use) the buffers, and send them to the ring buffer by SendComplete in the order of 8, 24, 20. When
8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Due to the usage if 20 bytes item is not complete, it’s not available, nor the following data items.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-split/byte buffers do not allow using SendAcquire/SendComplete since acquired buffers are required to be complete (not wrapped).

**Wrap around** The following diagrams illustrate the differences between no-split, allow-split, and byte buffers when a sent item requires a wrap around. The diagrams assumes a buffer of 128 bytes with 56 bytes of free space that wraps around and a sent item of 28 bytes.

![Fig. 29: Wrap around in no-split buffers](image)

No-split buffers will **only store an item in continuous free space and will not split an item under any circumstances**. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be marked as dummy data. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

![Fig. 30: Wrap around in allow-split buffers](image)

Allow-split buffers will attempt to **split the item into two parts** when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers (therefore incurring an extra 8 bytes of overhead).

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

**Note:** Allow-split buffers treats the both parts of the split item as two separate items, therefore call `xRingbufferReceiveSplit()` instead of `xRingbufferReceive()` to receive both parts of a split item in a thread safe manner.

Byte buffers will **store as much data as possible into the free space at the tail of buffer**. The remaining data will then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.
Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore the 16 bytes of free space is filled with data, and the remaining 12 bytes are written to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each part continuous will be treated as a separate item by the byte buffer.

**Retrieving/Returning** The following diagrams illustrates the differences between no-split/allow-split and byte buffers in retrieving and returning data.

Referring to the diagram above, the 16, 20, and 8 byte items are retrieved in FIFO order. However the items are not returned in the order they were retrieved (20, 8, 16). As such, the space is not freed until the first item (16 byte) is returned.

Byte buffers do not allow multiple retrievals before returning (every retrieval must be followed by a return...
before another retrieval is permitted). When using `xRingbufferReceive()` or `xRingbufferReceiveFromISR()`, all continuous stored data will be retrieved. `xRingbufferReceiveUpTo()` or `xRingbufferReceiveUpToFromISR()` can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space will be freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to `xRingbufferReceive()` or `xRingbufferReceiveFromISR()` then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.

**Ring Buffers with Queue Sets**  Ring buffers can be added to FreeRTOS queue sets using `xRingbufferAddToQueueSetRead()` such that every time a ring buffer receives an item or data, the queue set is notified. Once added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to `xQueueSelectFromSet()`. To check whether the selected queue set member is the ring buffer, call `xRingbufferCanRead()`.

The following example demonstrates queue set usage with ring buffers.

```c
#include "freertos/queue.h"
#include "freertos/ringbuf.h"
...

//Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

//Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}
...

//Block on queue set
xQueueSetMemberHandle member = xQueueSelectFromSet(queue_set, pdMS_TO_TICKS(1000));

//Check if member is ring buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);

    //Handle item...
}
else {
    ...
}
```

**Ring Buffers with Static Allocation**  The `xRingbufferCreateStatic()` can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand then passed to the `xRingbufferCreateStatic()` to be initialized as a ring buffer. These blocks include the following:

- The ring buffer’s data structure of type `StaticRingbuffer_t`
- The ring buffer’s storage area of size `xBufferSize`. Note that `xBufferSize` must be 32-bit aligned for no-split/allow-split buffers.

The manner in which these blocks are allocated will depend on the users requirements (e.g. all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).
Note: The `CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION` option must be enabled in `menuconfig` for statically allocated ring buffers to be available.

Note: When deleting a ring buffer created via `xRingbufferCreateStatic()`, the function `vRingbufferDelete()` will not free any of the memory blocks. This must be done manually by the user after `vRingbufferDelete()` is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.

```c
#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"

#define BUFFER_SIZE 400  //32-bit aligned size
#define BUFFER_TYPE RINGBUF_TYPE_NOSPLIT
...

//Allocate ring buffer data structure and storage area into external RAM
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t)*BUFFER_SIZE, MALLOC_CAP_SPIRAM);

//Create a ring buffer with manually allocated memory
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_, storage, buffer_struct);
...

//Delete the ring buffer after used
vRingbufferDelete(handle);

//Manually free all blocks of memory
free(buffer_struct);
free(buffer_storage);
```

Ring Buffer API Reference

Note: Ideally, ring buffers can be used with multiple tasks in an SMP fashion where the highest priority task will always be serviced first. However due to the usage of binary semaphores in the ring buffer’s underlying implementation, priority inversion may occur under very specific circumstances.

The ring buffer governs sending by a binary semaphore which is given whenever space is freed on the ring buffer. The highest priority task waiting to send will repeatedly take the semaphore until sufficient free space becomes available or until it times out. Ideally this should prevent any lower priority tasks from being serviced as the semaphore should always be given to the highest priority task.

However in between iterations of acquiring the semaphore, there is a gap in the critical section which may permit another task (on the other core or with an even higher priority) to free some space on the ring buffer and as a result give the semaphore. Therefore the semaphore will be given before the highest priority task can re-acquire the semaphore. This will result in the semaphore being acquired by the second highest priority task waiting to send, hence causing priority inversion.

This side effect will not affect ring buffer performance drastically given if the number of tasks using the ring buffer simultaneously is low, and the ring buffer is not operating near maximum capacity.
Chapter 2. API Reference

Header File

- esp_ringbuf/include/freertos/ringbuf.h

Functions

`RingbufHandle_t xRingbufferCreate (size_t xBufferSize, RingbufferType_t xBufferType)`
Create a ring buffer.

**Note** xBufferSize of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

**Return** A handle to the created ring buffer, or NULL in case of error.

**Parameters**
- **[in]** xBufferSize: Size of the buffer in bytes. Note that items require space for overhead in no-split/allow-split buffers
- **[in]** xBufferType: Type of ring buffer, see documentation.

`RingbufHandle_t xRingbufferCreateNoSplit (size_t xItemSize, size_t xItemNum)`
Create a ring buffer of type RINGBUF_TYPE_NOSPLIT for a fixed item_size.

This API is similar to xRingbufferCreate(), but it will internally allocate additional space for the headers.

**Return** A RingbufHandle_t handle to the created ring buffer, or NULL in case of error.

**Parameters**
- **[in]** xItemSize: Size of each item to be put into the ring buffer
- **[in]** xItemNum: Maximum number of items the buffer needs to hold simultaneously

`RingbufHandle_t xRingbufferCreateStatic (size_t xBufferSize, RingbufferType_t xBufferType, uint8_t * pucRingbufferStorage, StaticRingbuffer_t * pxStaticRingbuffer)`
Create a ring buffer but manually provide the required memory.

**Note** The CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION option must be enabled for this to be available

**Note** xBufferSize of no-split/allow-split buffers MUST be 32-bit aligned.

**Return** A handle to the created ring buffer

**Parameters**
- **[in]** xBufferSize: Size of the buffer in bytes.
- **[in]** xBufferType: Type of ring buffer, see documentation
- **[in]** pucRingbufferStorage: Pointer to the ring buffer’s storage area. Storage area must of the same size as specified by xBufferSize
- **[in]** pxStaticRingbuffer: Pointed to a struct of type StaticRingbuffer_t which will be used to hold the ring buffer’s data structure

` BaseType_t xRingbufferSend (RingbufHandle_t xRingbuffer, const void * pvItem, size_t xItemSize, TickType_t xTicksToWait)`
Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.

**Note** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Return**
- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

**Parameters**
- **[in]** xRingbuffer: Ring buffer to insert the item into
- **[in]** pvItem: Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **[in]** xItemSize: Size of data to insert.
- **[in]** xTicksToWait: Ticks to wait for room in the ring buffer.

` BaseType_t xRingbufferSendFromISR (RingbufHandle_t xRingbuffer, const void * pvItem, size_t xItemSize, BaseType_t * pxHigherPriorityTaskWoken)`
Insert an item into the ring buffer in an ISR.
Chapter 2. API Reference

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

**Note** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Return**
- pdTRUE if succeeded
- pdFALSE when the ring buffer does not have space.

**Parameters**
- [in] xRingbuffer: Ring buffer to insert the item into
- [in] pvItem: Pointer to data to insert. NULL is allowed if xItemSize is 0.
- [in] xItemSize: Size of data to insert.
- [out] pxHigherPriorityTaskWoken: Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

```c
BaseType_t xRingbufferSendAcquire (RingbufHandle_t xRingbuffer, void **ppvItem, size_t xItemSize, TickType_t xTicksToWait)
```

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items SendAcquire or Send after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

**Note** Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Return**
- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

**Parameters**
- [in] xRingbuffer: Ring buffer to allocate the memory
- [out] ppvItem: Double pointer to memory acquired (set to NULL if no memory were retrieved)
- [in] xItemSize: Size of item to acquire.
- [in] xTicksToWait: Tick to wait for room in the ring buffer.

```c
BaseType_t xRingbufferSendComplete (RingbufHandle_t xRingbuffer, void *pvItem)
```

Actually send an item into the ring buffer allocated before by xRingbufferSendAcquire.

**Note** Only applicable for no-split ring buffers. Only call for items allocated by xRingbufferSendAcquire.

**Return**
- pdTRUE if succeeded
- pdFALSE if fail for some reason.

**Parameters**
- [in] xRingbuffer: Ring buffer to insert the item into
- [in] pvItem: Pointer to item in allocated memory to insert.

```c
void *xRingbufferReceive (RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait)
```

Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

**Note** A call to vRingbufferReturnItem() is required after this to free the item retrieved.

**Return**
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

**Parameters**
- [in] xRingbuffer: Ring buffer to retrieve the item from
Chapter 2. API Reference

• [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.
• [in] xTicksToWait: Ticks to wait for items in the ring buffer.

void *xRingbufferReceiveFromISR(RingbufHandle_t xRingbuffer, size_t *pxItemSize)
Retrieve an item from the ring buffer in an ISR.

Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval

Note A call to vRingbufferReturnItemFromISR() is required after this to free the item retrieved.
Note Byte buffers do not allow multiple retrievals before returning an item

Return • Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
• NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

Parameters
• [in] xRingbuffer: Ring buffer to retrieve the item from
• [out] pxItemSize: Pointer to a variable to which the size of the retrieved item will be written.

BaseType_t xRingbufferReceiveSplit(RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t pxHeadItemSize, size_t pxTailItemSize, TickType_t xTicksToWait)
Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

Note Call(s) to vRingbufferReturnItem() is required after this to free up the item(s) retrieved.
Note This function should only be called on allow-split buffers

Return • pdTRUE if an item (split or unsplit) was retrieved
• pdFALSE when no item was retrieved

Parameters
• [in] xRingbuffer: Ring buffer to retrieve the item from
• [out] ppvHeadItem: Double pointer to first part (set to NULL if no items were retrieved)
• [out] ppvTailItem: Double pointer to second part (set to NULL if item is not split)
• [out] pxHeadItemSize: Pointer to size of first part (unmodified if no items were retrieved)
• [out] pxTailItemSize: Pointer to size of second part (unmodified if item is not split)
• [in] xTicksToWait: Ticks to wait for items in the ring buffer.

BaseType_t xRingbufferReceiveSplitFromISR(RingbufHandle_t xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t pxHeadItemSize, size_t pxTailItemSize)
Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval

Note Calls to vRingbufferReturnItemFromISR() is required after this to free up the item(s) retrieved.
Note This function should only be called on allow-split buffers

Return • pdTRUE if an item (split or unsplit) was retrieved
• pdFALSE when no item was retrieved

Parameters
• [in] xRingbuffer: Ring buffer to retrieve the item from
• [out] ppvHeadItem: Double pointer to first part (set to NULL if no items were retrieved)
• [out] ppvTailItem: Double pointer to second part (set to NULL if item is not split)
• [out] pxHeadItemSize: Pointer to size of first part (unmodified if no items were retrieved)
• [out] pxTailItemSize: Pointer to size of second part (unmodified if item is not split)

void *xRingbufferReceiveUpTo(RingbufHandle_t xRingbuffer, size_t pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)
Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Espressif Systems 1030 Release v4.0.3-189-g7c4f5fa
Chapter 2. API Reference

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

**Note** A call to `vRingbufferReturnItem()` is required after this to free up the data retrieved.

**Note** This function should only be called on byte buffers

**Note** Byte buffers do not allow multiple retrievals before returning an item

**Return**

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL on timeout, *pxItemSize is untouched in that case.

**Parameters**

- [in] `xRingbuffer`: Ring buffer to retrieve the item from
- [out] `pxItemSize`: Pointer to a variable to which the size of the retrieved item will be written.
- [in] `xTicksToWait`:Ticks to wait for items in the ring buffer.
- [in] `xMaxSize`: Maximum number of bytes to return.

```c
void *xRingbufferReceiveUpToFromISR(RingbufHandle_t xRingbuffer, size_t *pxItemSize, size_t xMaxSize);
```

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

**Note** A call to `vRingbufferReturnItemFromISR()` is required after this to free up the data received.

**Note** This function should only be called on byte buffers

**Note** Byte buffers do not allow multiple retrievals before returning an item

**Return**

- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

**Parameters**

- [in] `xRingbuffer`: Ring buffer to retrieve the item from
- [out] `pxItemSize`: Pointer to a variable to which the size of the retrieved item will be written.
- [in] `xMaxSize`: Maximum number of bytes to return.

```c
void vRingbufferReturnItem(RingbufHandle_t xRingbuffer, void *pvItem);
```

Return a previously-retrieved item to the ring buffer.

**Note** If a split item is retrieved, both parts should be returned by calling this function twice

**Parameters**

- [in] `xRingbuffer`: Ring buffer the item was retrieved from
- [in] `pvItem`: Item that was received earlier

```c
void vRingbufferReturnItemFromISR(RingbufHandle_t xRingbuffer, void *pvItem, BaseType_t *pxHigherPriorityTaskWoken);
```

Return a previously-retrieved item to the ring buffer from an ISR.

**Note** If a split item is retrieved, both parts should be returned by calling this function twice

**Parameters**

- [in] `xRingbuffer`: Ring buffer the item was retrieved from
- [in] `pvItem`: Item that was received earlier
- [out] `pxHigherPriorityTaskWoken`: Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

```c
void vRingbufferDelete(RingbufHandle_t xRingbuffer);
```

Delete a ring buffer.

**Note** This function will not deallocate any memory if the ring buffer was created using `xRingbufferCreateStatic()`. Deallocation must be done manually by the user.

**Parameters**

- [in] `xRingbuffer`: Ring buffer to delete

```c
size_t xRingbufferGetMaxItemSize(RingbufHandle_t xRingbuffer);
```

Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.
Note  The max item size for a no-split buffer is limited to \((\text{buffer_size}/2) - \text{header_size}\). This limit is imposed so that an item of max item size can always be sent to the an empty no-split buffer regardless of the internal positions of the buffer’s read/write/free pointers.

Return  Maximum size, in bytes, of an item that can be placed in a ring buffer.

Parameters
- \([\text{in}]\) xRingbuffer: Ring buffer to query

size_t xRingbufferGetCurFreeSize(RingbufHandle_t xRingbuffer)

Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

Warning  This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application’s responsibility to ensure atomic access to this API and the subsequent Send

Note  An empty no-split buffer has a max current free size for an item that is limited to \((\text{buffer_size}/2) - \text{header_size}\). See API reference for xRingbufferGetMaxItemSize().

Return  Current free size, in bytes, available for an entry

Parameters
- \([\text{in}]\) xRingbuffer: Ring buffer to query

BaseType_t xRingbufferAddToQueueSetRead(RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)

Add the ring buffer’s read semaphore to a queue set.

The ring buffer’s read semaphore indicates that data has been written to the ring buffer. This function adds the ring buffer’s read semaphore to a queue set.

Return
- pdTRUE on success, pdFALSE otherwise

Parameters
- \([\text{in}]\) xRingbuffer: Ring buffer to add to the queue set
- \([\text{in}]\) xQueueSet: Queue set to add the ring buffer’s read semaphore to

BaseType_t xRingbufferCanRead(RingbufHandle_t xRingbuffer, QueueSetMemberHandle_t xMember)

Check if the selected queue set member is the ring buffer’s read semaphore.

This API checks if queue set member returned from xQueueSelectFromSet() is the read semaphore of this ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

Return
- pdTRUE when semaphore belongs to ring buffer
- pdFALSE otherwise

Parameters
- \([\text{in}]\) xRingbuffer: Ring buffer which should be checked
- \([\text{in}]\) xMember: Member returned from xQueueSelectFromSet

BaseType_t xRingbufferRemoveFromQueueSetRead(RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)

Remove the ring buffer’s read semaphore from a queue set.

This specifically removes a ring buffer’s read semaphore from a queue set. The read semaphore is used to indicate when data has been written to the ring buffer

Return
- pdTRUE on success
- pdFALSE otherwise

Parameters
- \([\text{in}]\) xRingbuffer: Ring buffer to remove from the queue set
- \([\text{in}]\) xQueueSet: Queue set to remove the ring buffer’s read semaphore from

void vRingbufferGetInfo(RingbufHandle_t xRingbuffer, UBaseType_t *uxFree, UBaseType_t *uxRead, UBaseType_t *uxWrite, UBaseType_t *uxAcquire, UBaseType_t *uxItemsWaiting)
Get information about ring buffer status.

Get information of the a ring buffer’s current status such as free/read/write pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

**Parameters**
- `[in]` `xRingbuffer`: Ring buffer to remove from the queue set
- `[out]` `uxFree`: Pointer used to store free pointer position
- `[out]` `uxRead`: Pointer used to store read pointer position
- `[out]` `uxWrite`: Pointer used to store write pointer position
- `[out]` `uxAcquire`: Pointer used to store acquire pointer position
- `[out]` `uxItemsWaiting`: Pointer used to store number of items (bytes for byte buffer) waiting to be retrieved

```c
void xRingbufferPrintInfo (RingbufHandle_t xRingbuffer)
```

Debugging function to print the internal pointers in the ring buffer.

**Parameters**
- `xRingbuffer`: Ring buffer to show

**Structures**
```c
typedef void * RingbufHandle_t
```

Type by which ring buffers are referenced. For example, a call to `xRingbufferCreate()` returns a `RingbufHandle_t` variable that can then be used as a parameter to `xRingbufferSend()`, `xRingbufferReceive()`, etc.

```c
typedef struct xSTATIC_RINGBUFFER StaticRingbuffer_t
```

Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

**Note** The `CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION` option must be enabled for this structure to be available.

**Enumerations**
```c
enum RingbufferType_t
```

**Values:**

- `RINGBUF_TYPE_NOSPLIT = 0`
  
  No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

- `RINGBUF_TYPE_ALLOWSPLIT`
  
  Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

- `RINGBUF_TYPE_BYTEBUF`
  
  Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.
Hooks

FreeRTOS consists of Idle Hooks and Tick Hooks which allow for application specific functionality to be added to the Idle Task and Tick Interrupt. ESP-IDF provides its own Idle and Tick Hook API in addition to the hooks provided by Vanilla FreeRTOS. ESP-IDF hooks have the added benefit of being run time configurable and asymmetrical.

Vanilla FreeRTOS Hooks  Idle and Tick Hooks in vanilla FreeRTOS are implemented by the user defining the functions `vApplicationIdleHook()` and `vApplicationTickHook()` respectively somewhere in the application. Vanilla FreeRTOS will run the user defined Idle Hook and Tick Hook on every iteration of the Idle Task and Tick Interrupt respectively.

Vanilla FreeRTOS hooks are referred to as Legacy Hooks in ESP-IDF FreeRTOS. To enable legacy hooks, `CONFIG_FREERTOS_LEGACY_HOOKS` should be enabled in project configuration menu.

Due to vanilla FreeRTOS being designed for single core, `vApplicationIdleHook()` and `vApplicationTickHook()` can only be defined once. However, the ESP32 is dual core in nature, therefore same Idle Hook and Tick Hook are used for both cores (in other words, the hooks are symmetrical for both cores).

ESP-IDF Idle and Tick Hooks  Due to the the dual core nature of the ESP32, it may be necessary for some applications to have separate hooks for each core. Furthermore, it may be necessary for the Idle Tasks or Tick Interrupts to execute multiple hooks that are configurable at run time. Therefore the ESP-IDF provides its own hooks API in addition to the legacy hooks provided by Vanilla FreeRTOS.

The ESP-IDF tick/idle hooks are registered at run time, and each tick/idle hook must be registered to a specific CPU. When the idle task runs/tick Interrupt occurs on a particular CPU, the CPU will run each of its registered idle/tick hooks in turn.

Hooks API Reference

Header File

- `esp_common/include/esp_freertos_hooks.h`

Functions

```c
esp_err_t esp_register_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t new_idle_cb, UBaseType_t cpuid)
```

Register a callback to be called from the specified core’s idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning**  Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**Return**

- ESP_OK: Callback registered to the specified core’s idle hook
- ESP_ERR_NO_MEM: No more space on the specified core’s idle hook to register callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

**Parameters**

- `[in] new_idle_cb: Callback to be called`
- `[in] cpuid: id of the core`

```c
esp_err_t esp_register_freertos_idle_hook(esp_freertos_idle_cb_t new_idle_cb)
```

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning**  Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.
Chapter 2. API Reference

Return
- ESP_OK: Callback registered to the calling core’s idle hook
- ESP_ERR_NO_MEM: No more space on the calling core’s idle hook to register callback

Parameters
- [in] new_idle_cb: Callback to be called

`esp_err_t esp_register_freertos_idle_hook_for_cpu (esp_freertos_idle_cb_t new_idle_cb, UBaseType_t cpuid)`

Register a callback to be called from the specified core’s idle hook.

Return
- ESP_OK: Callback registered to specified core’s tick hook
- ESP_ERR_NO_MEM: No more space on the specified core’s tick hook to register the callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

Parameters
- [in] new_tick_cb: Callback to be called
- [in] cpuid: id of the core

`esp_err_t esp_register_freertos_tick_hook (esp_freertos_tick_cb_t new_tick_cb)`

Register a callback to be called from the calling core’s tick hook.

Return
- ESP_OK: Callback registered to specified core’s tick hook
- ESP_ERR_NO_MEM: No more space on the specified core’s tick hook to register the callback

Parameters
- [in] new_tick_cb: Callback to be called

`void esp_deregister_freertos_idle_hook_for_cpu (esp_freertos_idle_cb_t old_idle_cb, UBaseType_t cpuid)`

Unregister an idle callback from the idle hook of the specified core.

Parameters
- [in] old_idle_cb: Callback to be unregistered
- [in] cpuid: id of the core

`void esp_deregister_freertos_idle_hook (esp_freertos_idle_cb_t old_idle_cb)`

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

Parameters
- [in] old_idle_cb: Callback to be unregistered

`void esp_deregister_freertos_tick_hook_for_cpu (esp_freertos_tick_cb_t old_tick_cb, UBaseType_t cpuid)`

Unregister a tick callback from the tick hook of the specified core.

Parameters
- [in] old_tick_cb: Callback to be unregistered
- [in] cpuid: id of the core

`void esp_deregister_freertos_tick_hook (esp_freertos_tick_cb_t old_tick_cb)`

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

Parameters
- [in] old_tick_cb: Callback to be unregistered

Type Definitions

```c
typedef bool (*esp_freertos_idle_cb_t)()
typedef void (*esp_freertos_tick_cb_t)()
```

2.7.3 Heap Memory Allocation
Stack and Heap

ESP-IDF applications use the common computer architecture patterns of stack (dynamic memory allocated by program control flow) and heap (dynamic memory allocated by function calls), as well as statically allocated memory (allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. (See *xTaskCreateStatic()* for the alternative where stacks are statically allocated.)

Because ESP32 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the standard libc `malloc()` and `free()` functions can be used for heap allocation without any special consideration.

However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have memory with certain properties (for example, DMA-Capable Memory or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.

Memory Capabilities

The ESP32 contains multiple types of RAM:

- **DRAM (Data RAM)** is memory used to hold data. This is the most common kind of memory accessed as heap.
- **IRAM (Instruction RAM)** usually holds executable data only. If accessed as generic memory, all accesses must be 32-bit aligned.
- **D/IRAM** is RAM which can be used as either Instruction or Data RAM.

For more details on these internal memory types, see Application memory layout.

It’s also possible to connect external SPI RAM to the ESP32 - external RAM can be integrated into the ESP32’s memory map using the flash cache, and accessed similarly to DRAM.

DRAM uses capability `MALLOC_CAP_8BIT` (accessible in single byte reads and writes). When calling `malloc()`, the ESP-IDF `malloc()` implementation internally calls `heap_caps_malloc(size, MALLOC_CAP_8BIT)` in order to allocate DRAM that is byte-addressable. To test the free DRAM heap size at runtime, call `cpp:func::heap_caps_get_free_size(MALLOC_CAP_8BIT)`.

Because malloc uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.

Available Heap

**DRAM** At startup, the DRAM heap contains all data memory which is not statically allocated by the app. Reducing statically allocated buffers will increase the amount of available free heap.

To find the amount of statically allocated memory, use the `idf.py size` command.

**Note:** Due to a technical limitation, the maximum statically allocated DRAM usage is 160KB. The remaining 160KB (for a total of 320KB of DRAM) can only be allocated at runtime as heap.

**Note:** At runtime, the available heap DRAM may be less than calculated at compile time, because at startup some memory is allocated from the heap before the FreeRTOS scheduler is started (including memory for the stacks of initial FreeRTOS tasks).
IRAM  At startup, the IRAM heap contains all instruction memory which is not used by the app executable code. The *idf.py size* command can be used to find the amount of IRAM used by the app.

D/IRAM  Some memory in the ESP32 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.

Heap Sizes  At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

```
I (252) heap_init: Initializing. RAM available for dynamic allocation:
I (259) heap_init: At 3FFAE6E0 len 00001920 (6 KiB): DRAM
I (265) heap_init: At 3FFB2EC8 len 0002D138 (180 KiB): DRAM
I (272) heap_init: At 3FFE0440 len 00003AE0 (14 KiB): D/IRAM
I (278) heap_init: At 3FFE4350 len 0001BCB0 (111 KiB): D/IRAM
I (284) heap_init: At 4008944C len 00016BB4 (90 KiB): IRAM
```

Finding available heap  See *Heap Information*.

Special Capabilities

DMA-Capable Memory  Use the `MALLOC_CAP_DMA` flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

32-Bit Accessible Memory  If a certain memory structure is only addressed in 32-bit units, for example an array of ints or pointers, it can be useful to allocate it with the `MALLOC_CAP_32BIT` flag. This also allows the allocator to give out IRAM memory; something which it can’t do for a normal malloc() call. This can help to use all the available memory in the ESP32.

Memory allocated with `MALLOC_CAP_32BIT` can only be accessed via 32-bit reads and writes, any other type of access will generate a fatal LoadStoreError exception.

External SPI Memory  When *external RAM* is enabled, external SPI RAM under 4MiB in size can be allocated using standard `malloc` calls, or via `heap_caps_malloc(MALLOC_CAP_SPIRAM)`, depending on configuration. See *Configuring External RAM* for more details.

To use the region above the 4MiB limit, you can use the `himem API`.

API Reference - Heap Allocation

Header File

- heap/include/esp_heap_caps.h

Functions

```c
void *heap_caps_malloc(size_t size, uint32_t caps)
```
Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to libc malloc(), for capability-aware memory.

In IDF, `malloc(p)` is equivalent to `heap_caps_malloc(p, MALLOC_CAP_8BIT)`.

Return  A pointer to the memory allocated on success, NULL on failure

Parameters

- **size**: Size, in bytes, of the amount of memory to allocate
- **caps**: Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned
void **heap_caps_free**(void *ptr)

Free memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc free(), for capability-aware memory.

In IDF, free(p) is equivalent to heap_caps_free(p).

Parameters

- **ptr**: Pointer to memory previously returned from heap_caps_malloc() or heap_caps_realloc(). Can be NULL.

void **heap_caps_realloc**(void *ptr, size_t size, int caps)

Reallocate memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc realloc(), for capability-aware memory.

In IDF, realloc(p, s) is equivalent to heap_caps_realloc(p, s, MALLOC_CAP_8BIT).

‘caps’ parameter can be different to the capabilities that any original ‘ptr’ was allocated with. In this way, realloc can be used to “move” a buffer if necessary to ensure it meets a new set of capabilities.

Return Pointer to a new buffer of size ‘size’ with capabilities ‘caps’, or NULL if allocation failed.

Parameters

- **ptr**: Pointer to previously allocated memory, or NULL for a new allocation.
- **size**: Size of the new buffer requested, or 0 to free the buffer.
- **caps**: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory desired for the new allocation.

void **heap_caps_calloc**(size_t n, size_t size, uint32_t caps)

Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to libc calloc(), for capability-aware memory.

In IDF, calloc(p) is equivalent to heap_caps_calloc(p, MALLOC_CAP_8BIT).

Return A pointer to the memory allocated on success, NULL on failure

Parameters

- **n**: Number of continuing chunks of memory to allocate
- **size**: Size, in bytes, of a chunk of memory to allocate
- **caps**: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

size_t **heap_caps_get_free_size**(uint32_t caps)

Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use heap_caps_get_largest_free_block() for this purpose.

Return Amount of free bytes in the regions

Parameters

- **caps**: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

size_t **heap_caps_get_minimum_free_size**(uint32_t caps)

Get the total minimum free memory of all regions with the given capabilities.

This adds all the low water marks of the regions capable of delivering the memory with the given capabilities.

Note the result may be less than the global all-time minimum available heap of this kind, as “low water marks” are tracked per-region. Individual regions’ heaps may have reached their “low water marks” at different points in time. However this result still gives a “worst case” indication for all-time minimum free heap.

Return Amount of free bytes in the regions

Parameters

- **caps**: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
size_t **heap_caps_get_largest_free_block** (uint32_t **caps**
Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of s for which heap_caps_malloc(s, caps) will succeed.

**Return** Size of largest free block in bytes.

**Parameters**
- **caps**: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

**void heap_caps_get_info** (multi_heap_info_t **info**, uint32_t **caps**
Get heap info for all regions with the given capabilities.

Calls multi_heap_info() on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for multi_heap_info_t, except that minimum_free_bytes has the same caveats described in heap_caps_get_minimum_free_size().

**Parameters**
- **info**: Pointer to a structure which will be filled with relevant heap metadata.
- **caps**: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

**void heap_caps_print_heap_info** (uint32_t **caps**
Print a summary of all memory with the given capabilities.

Calls multi_heap_info on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

**Parameters**
- **caps**: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

**bool heap_caps_check_integrity_all** (bool **print_errors**
Check integrity of all heap memory in the system.

Calls multi_heap_check on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling heap_caps_check_integrity with the caps argument set to MALLOC_CAP_INVALID.

**Return** True if all heaps are valid, False if at least one heap is corrupt.

**Parameters**
- **print_errors**: Print specific errors if heap corruption is found.

**bool heap_caps_check_integrity** (uint32_t **caps**, bool **print_errors**
Check integrity of all heaps with the given capabilities.

Calls multi_heap_check on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also heap_caps_check_integrity_all to check all heap memory in the system and heap_caps_check_integrity_addr to check memory around a single address.

**Return** True if all heaps are valid, False if at least one heap is corrupt.

**Parameters**
- **caps**: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory
- **print_errors**: Print specific errors if heap corruption is found.

**bool heap_caps_check_integrity_addr** (intptr_t **addr**, bool **print_errors**
Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won’t work and you should call heap_caps_check_integrity or heap_caps_check_integrity_all instead.

**Note** The entire heap region around the address is checked, not only the adjacent heap blocks.
Return  True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn’t belong to a heap region.

Parameters
- addr: Address in memory. Check for corruption in region containing this address.
- print_errors: Print specific errors if heap corruption is found.

void heap_caps_malloc_extmem_enable (size_t limit)
Enable malloc() in external memory and set limit below which malloc() attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

Parameters
- limit: Limit, in bytes.

void *heap_caps_malloc_prefer (size_t size, size_t num, ...)
Allocate a chunk of memory as preference in decreasing order.

Attention The variable parameters are bitwise OR of MALLOC_CAP_* flags indicating the type of memory.
This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

Return A pointer to the memory allocated on success, NULL on failure

Parameters
- size: Size, in bytes, of the amount of memory to allocate
- num: Number of variable parameters

void *heap_caps_realloc_prefer (void *ptr, size_t size, size_t num, ...)
Allocate a chunk of memory as preference in decreasing order.

Return Pointer to a new buffer of size ‘size’, or NULL if allocation failed.

Parameters
- ptr: Pointer to previously allocated memory, or NULL for a new allocation.
- size: Size of the new buffer requested, or 0 to free the buffer.
- num: Number of variable parameters

void *heap_caps_calloc_prefer (size_t n, size_t size, size_t num, ...)
Allocate a chunk of memory as preference in decreasing order.

Return A pointer to the memory allocated on success, NULL on failure

Parameters
- n: Number of continuing chunks of memory to allocate
- size: Size, in bytes, of a chunk of memory to allocate
- num: Number of variable parameters

void heap_caps_dump (uint32_t caps)
Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr). For each (variable sized) block in each matching heap, the following output is printed on a single line:

- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).
- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

Parameters
- caps: Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

void heap_caps_dump_all ()
Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.
Output is the same as for heap_caps_dump.

**Macros**

**MALLOC_CAP_EXE**
Flags to indicate the capabilities of the various memory systems.
Memory must be able to run executable code

**MALLOC_CAP_32BIT**
Memory must allow for aligned 32-bit data accesses.

**MALLOC_CAP_8BIT**
Memory must allow for 8/16/...-bit data accesses.

**MALLOC_CAP_DMA**
Memory must be able to accessed by DMA.

**MALLOC_CAP_PID2**
Memory must be mapped to PID2 memory space (PIDs are not currently used)

**MALLOC_CAP_PID3**
Memory must be mapped to PID3 memory space (PIDs are not currently used)

**MALLOC_CAP_PID4**
Memory must be mapped to PID4 memory space (PIDs are not currently used)

**MALLOC_CAP_PID5**
Memory must be mapped to PID5 memory space (PIDs are not currently used)

**MALLOC_CAP_PID6**
Memory must be mapped to PID6 memory space (PIDs are not currently used)

**MALLOC_CAP_PID7**
Memory must be mapped to PID7 memory space (PIDs are not currently used)

**MALLOC_CAP_SPIRAM**
Memory must be in SPI RAM.

**MALLOC_CAP_INTERNAL**
Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

**MALLOC_CAP_DEFAULT**
Memory can be returned in a non-capability-specific memory allocation (e.g. malloc(), calloc()) call.

**MALLOC_CAP_INVALID**
Memory can’t be used / list end marker.

**Thread Safety**  Heap functions are thread safe, meaning they can be called from different tasks simultaneously without any limitations.
It is technically possible to call malloc, free, and related functions from interrupt handler (ISR) context. However this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

**Heap Tracing & Debugging**

The following features are documented on the Heap Memory Debugging page:

- *Heap Information* (free space, etc.)
- *Heap Corruption Detection*
- *Heap Tracing* (memory leak detection, monitoring, etc.)
API Reference - Initialisation

Header File

• heap/include/esp_heap_caps_init.h

Functions

void heap_caps_init()
Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

void heap_caps_enable_nonos_stack_heaps()
Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

esp_err_t heap_caps_add_region(intptr_t start, intptr_t end)
Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in soc_memory_layout.c for the SoC, and are registered via heap_caps_init(). Some regions cannot be used immediately and are later enabled via heap_caps_enable_nonos_stack_heaps().

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the “reserved” regions or other data in soc_memory_layout, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in soc_memory_layout.c.

Use heap_caps_add_region_with_caps() to register a region with custom capabilities.

Return ESP_OK on success, ESP_ERR_INVALID_ARG if a parameter is invalid, ESP_ERR_NOT_FOUND if the specified start address doesn’t reside in a known region, or any error returned by heap_caps_add_region_with_caps().

Parameters

• start: Start address of new region.
• end: End address of new region.

esp_err_t heap_caps_add_region_with_caps(const uint32_t caps[], intptr_t start, intptr_t end)
Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to heap_caps_add_region(), only custom memory capabilities are specified by the caller.

Return

• ESP_OK on success
• ESP_ERR_INVALID_ARG if a parameter is invalid
• ESP_ERR_NO_MEM if no memory to register new heap.
• ESP_ERR_INVALID_SIZE if the memory region is too small to fit a heap
• ESP_FAIL if region overlaps the start and/or end of an existing region

Parameters

• caps: Ordered array of capability masks for the new region, in order of priority. Must have length SOC_MEMORY_TYPE_NO_PRIOS. Does not need to remain valid after the call returns.
• start: Start address of new region.
• end: End address of new region.

Implementation Notes

Knowledge about the regions of memory in the chip comes from the “soc” component, which contains memory layout information for the chip, and the different capabilities of each region. Each region’s capabilities are prioritised,
so that (for example) dedicated DRAM and IRAM regions will be used for allocations ahead of the more versatile D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the `multi_heap` functionality. `multi_heap` allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation (based on desired capabilities, available space, and preferences for each region’s use) and then calling `multi_heap_malloc()` or `multi_heap_calloc()` for the heap situated in that particular region.

Calling `free()` involves finding the particular heap corresponding to the freed address, and then calling `multi_heap_free()` on that particular `multi_heap` instance.

**API Reference - Multi Heap API**

(Note: The multi heap API is used internally by the heap capabilities allocator. Most IDF programs will never need to call this API directly.)

**Header File**

- `heap/include/multi_heap.h`

**Functions**

void `multi_heap_malloc (multi_heap_handle_t heap, size_t size)`
maloc() a buffer in a given heap

Semantics are the same as standard `malloc()`, only the returned buffer will be allocated in the specified heap.

**Return** Pointer to new memory, or NULL if allocation fails.

**Parameters**

- `heap`: Handle to a registered heap.
- `size`: Size of desired buffer.

void `multi_heap_free (multi_heap_handle_t heap, void *p)`
free() a buffer in a given heap.

Semantics are the same as standard `free()`, only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Parameters**

- `heap`: Handle to a registered heap.
- `p`: NULL, or a pointer previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.

void `multi_heap_realloc (multi_heap_handle_t heap, void *p, size_t size)`
realoc() a buffer in a given heap.

Semantics are the same as standard `realloc()`, only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Return** New buffer of ‘size’ containing contents of ‘p’, or NULL if reallocation failed.

**Parameters**

- `heap`: Handle to a registered heap.
- `p`: NULL, or a pointer previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.
- `size`: Desired new size for buffer.

size_t `multi_heap_get_allocated_size (multi_heap_handle_t heap, void *p)`
Return the size that a particular pointer was allocated with.

**Return** Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.
Parameters
  - heap: Handle to a registered heap.
  - p: Pointer, must have been previously returned from multi_heap_malloc() or multi_heap_realloc() for the same heap.

`multi_heap_handle_t multi_heap_register(void *start, size_t size)`
Register a new heap for use.

This function initialise a heap at the specified address, and returns a handle for future heap operations.

Return Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

Parameters
  - start: Start address of the memory to use for a new heap.
  - size: Size (in bytes) of the new heap.

`void multi_heap_set_lock(multi_heap_handle_t heap, void* lock)`
Associate a private lock pointer with a heap.

The lock argument is supplied to the MULTI_HEAP_LOCK() and MULTI_HEAP_UNLOCK() macros, defined in multi_heap_platform.h.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

Parameters
  - heap: Handle to a registered heap.
  - lock: Optional pointer to a locking structure to associate with this heap.

`void multi_heap_dump(multi_heap_handle_t heap)`
Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

Parameters
  - heap: Handle to a registered heap.

`bool multi_heap_check(multi_heap_handle_t heap, bool print_errors)`
Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining MULTI_CHECK_FAIL_PRINTF in multi_heap_platform.h.

Return true if heap is valid, false otherwise.

Parameters
  - heap: Handle to a registered heap.
  - print_errors: If true, errors will be printed to stderr.

`size_t multi_heap_free_size(multi_heap_handle_t heap)`
Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the total_free_bytes member returned by multi_heap_get_heap_info().

Note that the heap may be fragmented, so the actual maximum size for a single malloc() may be lower. To know this size, see the largest_free_block member returned by multi_heap_get_heap_info().

Return Number of free bytes.

Parameters
  - heap: Handle to a registered heap.

`size_t multi_heap_minimum_free_size(multi_heap_handle_t heap)`
Return the lifetime minimum free heap size.
Equivalent to the minimum_free_bytes member returned by multi_heap_get_info().

Returs the lifetime "low water mark" of possible values returned from multi_free_heap_size(), for the specified heap.

**Return** Number of free bytes.

**Parameters**
- heap: Handle to a registered heap.

```c
void multi_heap_get_info(multi_heap_handle_t heap, multi_heap_info_t *info)
```

Return metadata about a given heap.

Fills a `multi_heap_info_t` structure with information about the specified heap.

**Parameters**
- heap: Handle to a registered heap.
- info: Pointer to a structure to fill with heap metadata.

**Structures**

```c
struct multi_heap_info_t
```

Structure to access heap metadata via multi_heap_get_info.

**Public Members**

- `size_t total_free_bytes`
  Total free bytes in the heap. Equivalent to multi_free_heap_size().

- `size_t total_allocated_bytes`
  Total bytes allocated to data in the heap.

- `size_t largest_free_block`
  Size of largest free block in the heap. This is the largest malloc-able size.

- `size_t minimum_free_bytes`
  Lifetime minimum free heap size. Equivalent to multi_minimum_free_heap_size().

- `size_t allocated_blocks`
  Number of (variable size) blocks allocated in the heap.

- `size_t free_blocks`
  Number of (variable size) free blocks in the heap.

- `size_t total_blocks`
  Total number of (variable size) blocks in the heap.

**Type Definitions**

```c
typedef struct multi_heap_info *multi_heap_handle_t
```

Opaque handle to a registered heap.

### 2.7.4 Heap Memory Debugging

**Overview**

ESP-IDF integrates tools for requesting heap information, detecting heap corruption, and tracing memory leaks. These can help track down memory-related bugs.

For general information about the heap memory allocator, see the *Heap Memory Allocation* page.
Heap Information

To obtain information about the state of the heap:

- `xPortGetFreeHeapSize()` is a FreeRTOS function which returns the number of free bytes in the (data memory) heap. This is equivalent to calling `heap_caps_get_free_size(MALLOC_CAP_8BIT)`.
- `heap_caps_get_free_size()` can also be used to return the current free memory for different memory capabilities.
- `heap_caps_get_largest_free_block()` can be used to return the largest free block in the heap. This is the largest single allocation which is currently possible. Tracking this value and comparing to total free heap allows you to detect heap fragmentation.
- `xPortGetMinimumEverFreeHeapSize()` and the related `heap_caps_get_minimum_free_size()` can be used to track the heap “low water mark” since boot.
- `heap_caps_get_info()` returns a `multi_heap_info_t` structure which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- `heap_caps_print_heap_info()` prints a summary to stdout of the information returned by `heap_caps_get_info()`.
- `heap_caps_dump()` and `heap_caps_dump_all()` will output detailed information about the structure of each block in the heap. Note that this can be large amount of output.

Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

- Out of bounds writes & buffer overflow.
- Writes to freed memory.
- Reads from freed or uninitialized memory.

Assertions The heap implementation (multi_heap.c, etc.) includes a lot of assertions which will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration menu under Compiler options -> CONF_CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL.

If a heap integrity assertion fails, a line will be printed like `CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c`. The memory address which is printed is the address of the heap structure which has corrupt content.

It’s also possible to manually check heap integrity by calling `heap_caps_check_integrity_all()` or related functions. This function checks all of requested heap memory for integrity, and can be used even if assertions are disabled. If the integrity check prints an error, it will also contain the address(es) of corrupt heap structures.

Finding Heap Corruption Memory corruption can be one of the hardest classes of bugs to find and fix, as one area of memory can be corrupted from a totally different place. Some tips:

- A crash with a CORRUPT HEAP: message will usually include a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realises the heap is corrupt, but usually the corruption happened elsewhere and earlier in time.
- Increasing the Heap memory debugging `Configuration` level to “Light impact” or “Comprehensive” can give you a more accurate message with the first corrupt memory address.
- Adding regular calls to `heap_caps_check_integrity_all()` or `heap_caps_check_integrity_addr()` in your code will help you pin down the exact time that the corruption happened. You can move these checks around to ‘close in on’ the section of code that corrupted the heap.
- Based on the memory address which is being corrupted, you can use `JTAG debugging` to set a watchpoint on this address and have the CPU halt when it is written to.
- If you don’t have JTAG, but you do know roughly when the corruption happens, then you can set a watchpoint in software just beforehand via `esp_set_watchpoint()`. A fatal exception will occur when the watchpoint triggers. For example `esp_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE`. Note that watchpoints are per-CPU and are set on the current running CPU.
only, so if you don’t know which CPU is corrupting memory then you will need to call this function on both CPUs.

- For buffer overflows, `heap tracing` in `HEAP_TRACE_ALL` mode lets you see which callers are allocating which addresses from the heap. See `Heap Tracing To Find Heap Corruption` for more details. If you can find the function which allocates memory with an address immediately before the address which is corrupted, this will probably be the function which overflows the buffer.
- Calling `heap_caps_dump()` or `heap_caps_dump_all()` can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed/underflowed/etc.

**Configuration** Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.

In the project configuration menu, under Component config there is a menu Heap memory debugging. The setting `CONFIG_HEAP_CORRUPTION_DETECTION` can be set to one of three levels:

**Basic (no poisoning)** This is the default level. No special heap corruption features are enabled, but provided assertions are enabled (the default configuration) then a heap corruption error will be printed if any of the heap’s internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out of bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice).

Calling `heap_caps_check_integrity()` in Basic mode will check the integrity of all heap structures, and print errors if any appear to be corrupted.

**Light Impact** At this level, heap memory is additionally “poisoned” with head and tail “canary bytes” before and after each block which is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted and the integrity check will fail.

The head canary word is 0xABBA1234 (3412BAAB in byte order), and the tail canary word is 0xBAAD5678 (7856ADBA in byte order).

“Basic” heap corruption checks can also detect most out of bounds writes, but this setting is more precise as even a single byte overrun can be detected. With Basic heap checks, the number of overrun bytes before a failure is detected will depend on the properties of the heap.

Enabling “Light Impact” checking increases memory usage, each individual allocation will use 9 to 12 additional bytes of memory (depending on alignment).

Each time `free()` is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When `heap_caps_check_integrity()` is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

In both cases, the check is that the first 4 bytes of an allocated block (before the buffer returned to the user) should be the word 0xABBA1234. Then the last 4 bytes of the allocated block (after the buffer returned to the user) should be the word 0xBAAD5678.

Different values usually indicate buffer underrun or overrun, respectively.

**Comprehensive** This level incorporates the “light impact” detection features plus additional checks for uninitialised-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling “Comprehensive” detection has a substantial runtime performance impact (as all memory needs to be set to the allocation patterns each time a malloc/free completes, and the memory also needs to be checked each time.) However it allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.
Crashes in Comprehensive Mode  If an application crashes reading/writing an address related to 0xCECECECE in Comprehensive mode, this indicates it has read uninitialized memory. The application should be changed to either use calloc() (which zeroes memory), or initialize the memory before using it. The value 0xCECECECE may also be seen in stack-allocated automatic variables, because in IDF most task stacks are originally allocated from the heap and in C stack memory is uninitialized by default.

If an application crashes and the exception register dump indicates that some addresses or values were 0xFEFEFEFE, this indicates it is reading heap memory after it has been freed (a "use after free bug"). The application should be changed to not access heap memory after it has been freed.

If a call to malloc() or realloc() causes a crash because it expected to find the pattern 0xFEFEFEFE in free memory and a different pattern was found, then this indicates the app has a use-after-free bug where it is writing to memory which has already been freed.

Manual Heap Checks in Comprehensive Mode  Calls to heap_caps_check_integrity() may print errors relating to 0xFEFEFEFE, 0xABBA1234 or 0xBAAD5678. In each case the checker is expecting to find a given pattern, and will error out if this is not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behaviour is the same as for Light Impact mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun/underrun.

Heap Tracing

Heap Tracing allows tracing of code which allocates/frees memory. Two tracing modes are supported:

- Standalone. In this mode trace data are kept on-board, so the size of gathered information is limited by the buffer assigned for that purposes. Analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- Host-based. This mode does not have the limitation of the standalone mode, because trace data are sent to the host over JTAG connection using app_trace library. Later on they can be analysed using special tools.

Heap tracing can perform two functions:

- Leak checking: find memory which is allocated and never freed.
- Heap use analysis: show all functions that are allocating/freeing memory while the trace is running.

How To Diagnose Memory Leaks  If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the xPortGetFreeHeapSize(), heap_caps_get_free_size(), or related functions to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.

Standalone Mode  Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> Heap tracing and select Standalone option (see CONFIG_HEAP_TRACING_DEST).
- Call the function heap_trace_init_standalone() early in the program, to register a buffer which can be used to record the memory trace.
- Call the function heap_trace_start() to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- Call the function heap_trace_stop() to stop the trace once the suspect piece of code has finished executing.
- Call the function heap_trace_dump() to dump the results of the heap trace.

An example:
```c
#include "esp_heap_trace.h"
#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in internal RAM

void app_main()
{
    ... 
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}
```

The output from the heap trace will look something like this:

```
2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 count 0x2e9b7384 caller...
    -0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:27
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:52
8 bytes (@ 0x3ffaf804) allocated CPU 0 count 0x2e9b79c0 caller...
    -0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:29
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./blink.c:52
40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0
```

(Above example output is using IDF Monitor to automatically decode PC addresses to their source files & line number.)

The first line indicates how many allocation entries are in the buffer, compared to its total size.

In HEAP_TRACE_LEAKS mode, for each traced memory allocation which has not already been freed a line is printed with:
- XX bytes is number of bytes allocated
- @ 0x... is the heap address returned from malloc/calloc.
- CPU x is the CPU (0 or 1) running when the allocation was made.
- ccoun 0x... is the CCOUNT (CPU cycle count) register value when the allocation was made. Is different for CPU 0 vs CPU 1.
- caller 0x... gives the call stack of the call to malloc()/free(), as a list of PC addresses. These can be decoded to source files and line numbers, as shown above.

The depth of the call stack recorded for each trace entry can be configured in the project configuration menu, under Heap Memory Debugging->Enable heap tracing->Heap tracing stack depth. Up to 10
stack frames can be recorded for each allocation (the default is 2). Each additional stack frame increases the memory usage of each "heap_trace_record_t" record by eight bytes.

Finally, the total number of ‘leaked’ bytes (bytes allocated but not freed while trace was running) is printed, and the total number of allocations this represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations which happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

**Host-Based Mode**  Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> `CONFIG_HEAP_TRACING_DEST` and select Host-Based.
- In the project configuration menu, navigate to Component settings -> Application Level Tracing -> `CONFIG_ESP32_APPTRACE_DESTINATION` and select Trace memory.
- In the project configuration menu, navigate to Component settings -> Application Level Tracing -> FreeRTOS SystemView Tracing and enable `CONFIG_SYSVIEW_ENABLE`.
- Call the function `heap_trace_init_tohost()` early in the program, to initialize JTAG heap tracing module.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode argument to this function is ignored and heap tracing module behaves like `HEAP_TRACE_ALL` was passed: all allocations and deallocations are sent to the host.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.

An example:

```c
#include "esp_heap_trace.h"
...
void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}
void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```

To gather and analyse heap trace do the following on the host:

1. Build the program and download it to the target as described in *Getting Started Guide*.
2. Run OpenOCD (see *JTAG Debugging*).

**Note:** In order to use this feature you need OpenOCD version `v0.10.0-esp32-20181105` or later.

3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare special `gdbinit` file:
target remote :3333

mon reset halt
flushregs
tb heap_trace_start
commands
mon esp32 sysview start file:///tmp/heap.svdat
end
tb heap_trace_stop
commands
mon esp32 sysview stop
end

tb heap_trace_start
commands
mon esp32 sysview start file:///tmp/heap.svdat
end
tb heap_trace_stop
commands
mon esp32 sysview stop
end

Using this file GDB will connect to the target, reset it, and start tracing when program hits breakpoint at `heap_trace_start()`. Trace data will be saved to `/tmp/heap_log.svdat`. Tracing will be stopped when program hits breakpoint at `heap_trace_stop()`.

4. Run GDB using the following command:
   `xtensa-esp32-elf-gdb -x gdbinit </path/to/program/elf>`

5. Quit GDB when program stops at `heap_trace_stop()`. Trace data are saved in `/tmp/heap.svdat`

6. Run processing script:
   `$IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py /tmp/heap_log.svdat </path/to/program/elf>`

The output from the heap trace will look something like this:

```
Parse trace from '/tmp/heap.svdat'
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '[/tmp/heap.svdat]'

Heap Tracing To Find Heap Corruption

Heap can also be used to help track down heap corruption. When a region in heap is corrupted, it may be from some other part of the program which allocated memory at a nearby address.

If you have some idea at what time the corruption occurred, enabling heap tracing in `HEAP_TRACE_ALL` mode allows you to record all of the functions which allocated memory, and the addresses of the allocations.

Using heap tracing in this way is very similar to memory leak detection as described above. For memory which is allocated and not freed, the output is the same. However, records will also be shown for memory which has been freed.

Performance Impact

Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on performance of heap allocation/free operations even when heap tracing is not running.

When heap tracing is running, heap allocation/free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) will also increase this performance impact.

False-Positive Memory Leaks

Not everything printed by `heap_trace_dump()` is necessarily a memory leak. Among things which may show up here, but are not memory leaks:

- Any memory which is allocated after `heap_trace_start()` but then freed after `heap_trace_stop()` will appear in the leak dump.
- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it’s quite possible this memory is freed after `heap_trace_stop()` is called.
- The first time a task uses printf - for example, when it calls printf() - a lock (RTOS mutex semaphore) is allocated by the libc. This allocation lasts until the task is deleted.
- Certain uses of printf(), such as printing floating point numbers, will allocate some memory from the heap on demand. These allocations last until the task is deleted.
- The Bluetooth, WiFi, and TCP/IP libraries will allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short lived, but some may be shown in the heap leak trace if the data was received/transmitted by the lower levels of the network while the leak trace was running.
- TCP connections will continue to use some memory after they are closed, because of the TIME_WAIT state. After the TIME_WAIT period has completed, this memory will be freed.

One way to differentiate between “real” and “false positive” memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

API Reference - Heap Tracing

Header File

- `heap/include/esp_heap_trace.h`

Functions

```c
esp_err_t heap_trace_init_standalone(heap_trace_record_t *record_buffer, size_t num_records)
```

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0);`

Return
Chapter 2. API Reference

- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

**Parameters**
- **record_buffer**: Provide a buffer to use for heap trace data. Must remain valid any time heap tracing is enabled, meaning it must be allocated from internal memory not in PSRAM.
- **num_records**: Size of the heap trace buffer, as number of record structures.

```c
esp_err_t heap_trace_init_tohost (void)
```
Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

**Return**
- ESP_ERR_INVALID_STATE Heap tracing is currently in progress.
- ESP_OK Heap tracing initialised successfully.

```c
esp_err_t heap_trace_start (heap_trace_mode_t mode)
```
Start heap tracing. All heap allocations & frees will be traced, until heap_trace_stop() is called.

**Note** heap_trace_init_standalone() must be called to provide a valid buffer, before this function is called.

**Note** Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

**Return**
- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE A non-zero-length buffer has not been set via heap_trace_init_standalone().
- ESP_OK Tracing is started.

**Parameters**
- **mode**: Mode for tracing.
  - HEAP_TRACE_ALL means all heap allocations and frees are traced.
  - HEAP_TRACE_LEAKS means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

```c
esp_err_t heap_trace_stop (void)
```
Stop heap tracing.

**Return**
- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was not in progress.
- ESP_OK Heap tracing stopped.

```c
esp_err_t heap_trace_resume (void)
```
Resume heap tracing which was previously stopped.

Unlike heap_trace_start(), this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when heap_trace_start() was last called (or HEAP_TRACE_ALL if heap_trace_start() was never called).

**Return**
- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
- ESP_ERR_INVALID_STATE Heap tracing was already started.
- ESP_OK Heap tracing resumed.

```c
size_t heap_trace_get_count (void)
```
Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.

```c
esp_err_t heap_trace_get (size_t index, heap_trace_record_t *record)
```
Return a raw record from the heap trace buffer.

**Note** It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode record indexing may skip entries unless heap tracing is stopped first.

**Return**
- ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in menuconfig.
• ESP_ERR_INVALID_STATE Heap tracing was not initialised.
• ESP_ERR_INVALID_ARG Index is out of bounds for current heap trace record count.
• ESP_OK Record returned successfully.

Parameters

• index: Index (zero-based) of the record to return.
• [out] record: Record where the heap trace record will be copied.

void heap_trace_dump (void)
Dump heap trace record data to stdout.

Note It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAKS mode
the dump may skip entries unless heap tracing is stopped first.

Structures

struct heap_trace_record_t
Trace record data type. Stores information about an allocated region of memory.

Public Members

uint32_t ccount
CCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

void *address
Address which was allocated.

size_t size
Size of the allocation.

void *allocated_by[CONFIG_HEAP_TRACING_STACK_DEPTH]
Call stack of the caller which allocated the memory.

void *freed_by[CONFIG_HEAP_TRACING_STACK_DEPTH]
Call stack of the caller which freed the memory (all zero if not freed.)

Macros

CONFIG_HEAP_TRACING_STACK_DEPTH

Enumerations

enum heap_trace_mode_t
Values:

HEAP_TRACE_ALL
HEAP_TRACE_LEAKS

2.7.5 The himem allocation API

Overview

The ESP32 can access external SPI RAM transparently, so you can use it as normal memory in your program code. However, because the address space for external memory is limited in size, only the first 4MiB can be used as such. Access to the remaining memory is still possible, however this needs to go through a bankswitching scheme controlled by the himem API.

Specifically, what is implemented by the himem API is a bankswitching scheme. Hardware-wise, the 4MiB region for external SPI RAM is mapped into the CPU address space by a MMU, which maps a configurable 32K bank/page of external SPI RAM into each of the 32K pages in the 4MiB region accessed by the CPU. For external memories that are <=4MiB, this MMU is configured to unity mapping, effectively mapping each CPU address 1-to-1 to the external SPI RAM address.
In order to use the himem API, you have to enable it in the menuconfig using CONFIG_SPIRAM_BANKSWITCH_ENABLE, as well as set the amount of banks reserved for this in CONFIG_SPIRAM_BANKSWITCH_RESERVE. This decreases the amount of external memory allocated by functions like malloc(), but it allows you to use the himem api to map any of the remaining memory into the reserved banks.

The himem API is more-or-less an abstraction of the bankswitching scheme: it allows you to claim one or more banks of address space (called ‘regions’ in the API) as well as one or more of banks of memory to map into the ranges.

Example

An example doing a simple memory test of the high memory range is available in esp-idf: system/himem

API Reference

Header File

- esp32/include/esp32/himem.h

Functions

**esp_err_t esp_himem_alloc**(size_t size, esp_himem_handle_t *handle_out)

Allocate a block in high memory.

Return - ESP_OK if successful
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

Parameters
- size: Size of the to-be-allocated block, in bytes. Note that this needs to be a multiple of the external RAM mmu block size (32K).
- [out] handle_out: Handle to be returned

**esp_err_t esp_himem_alloc_map_range**(size_t size, esp_himem_rangehandle_t *handle_out)

Allocate a memory region to map blocks into.

This allocates a contiguous CPU memory region that can be used to map blocks of physical memory into.

Return - ESP_OK if successful
- ESP_ERR_NO_MEM if out of memory or address space
- ESP_ERR_INVALID_SIZE if size is not a multiple of 32K

Parameters
- size: Size of the range to be allocated. Note this needs to be a multiple of the external RAM mmu block size (32K).
- [out] handle_out: Handle to be returned

**esp_err_t esp_himem_map**(esp_himem_handle_t handle, esp_himem_rangehandle_t range, size_t ram_offset, size_t range_offset, size_t len, int flags, void **out_ptr)

Map a block of high memory into the CPUs address space.

This effectively makes the block available for read/write operations.

Note The region to be mapped needs to have offsets and sizes that are aligned to the SPI RAM MMU block size (32K)

Return - ESP_OK if the memory could be mapped
- ESP_ERR_INVALID_ARG if offset, range or len aren’t MMU-block-aligned (32K)
- ESP_ERR_INVALID_SIZE if the offsets/lengths don’t fit in the allocated memory or range
- ESP_ERR_INVALID_STATE if a block in the selected ram offset/length is already mapped, or if a block in the selected range offset/length already has a mapping.

Parameters
- handle: Handle to the block of memory, as given by esp_himem_alloc
- range: Range handle to map the memory in
- ram_offset: Offset into the block of physical memory of the block to map
Chapter 2. API Reference

- range_offset: Offset into the address range where the block will be mapped
- len: Length of region to map
- flags: One of ESP_HIMEM_MAPFLAG_*
- [out] out_ptr: Pointer to variable to store resulting memory pointer in

**esp_err_t esp_himem_free (esp_himem_handle_t handle)**
Free a block of physical memory.

This clears out the associated handle making the memory available for re-allocation again. This will only succeed if none of the memory blocks currently have a mapping.

**Return**
- ESP_OK if the memory is successfully freed
- ESP_ERR_INVALID_ARG if the handle still is (partially) mapped

**Parameters**
- handle: Handle to the block of memory, as given by esp_himem_alloc

**esp_err_t esp_himem_free_map_range (esp_himem_rangehandle_t handle)**
Free a mapping range.

This clears out the associated handle making the range available for re-allocation again. This will only succeed if none of the range blocks currently are used for a mapping.

**Return**
- ESP_OK if the memory is successfully freed
- ESP_ERR_INVALID_ARG if the handle still is (partially) mapped to

**Parameters**
- handle: Handle to the range block, as given by esp_himem_alloc_map_range

**esp_err_t esp_himem_unmap (esp_himem_rangehandle_t range, void *ptr, size_t len)**
Unmap a region.

**Return**
- ESP_OK if the memory is successfully unmapped,
- ESP_ERR_INVALID_ARG if ptr or len are invalid.

**Parameters**
- range: Range handle
- ptr: Pointer returned by esp_himem_map
- len: Length of the block to be unmapped. Must be aligned to the SPI RAM MMU blocksize (32K)

**size_t esp_himem_get_phys_size ()**
Get total amount of memory under control of himem API.

**Return** Amount of memory, in bytes

**size_t esp_himem_get_free_size ()**
Get free amount of memory under control of himem API.

**Return** Amount of free memory, in bytes

**size_t esp_himem_reserved_area_size ()**
Get amount of SPI memory address space needed for bankswitching.

**Note** This is also weakly defined in esp32/spiram.c and returns 0 there, so if no other function in this file is used, no memory is reserved.

**Return** Amount of reserved area, in bytes

**Macros**

ESP_HIMEM_BLKSZ
ESP_HIMEM_MAPFLAG_RO

Indicates that a mapping will only be read from. Note that this is unused for now.

**Type Definitions**

typedef struct esp_himem_ramdata_t *esp_himem_handle_t
typedef struct esp_himem_rangedata_t *esp_himem_rangehandle_t
## 2.7.6 Interrupt allocation

### Overview

The ESP32 has two cores, with 32 interrupts each. Each interrupt has a certain priority level, most (but not all) interrupts are connected to the interrupt mux. Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The esp_intr_alloc abstraction exists to hide all these implementation details.

A driver can allocate an interrupt for a certain peripheral by calling esp_intr_alloc (or esp_intr_alloc_sintrstatus). It can use the flags passed to this function to set the type of interrupt allocated, specifying a specific level or trigger method. The interrupt allocation code will then find an applicable interrupt, use the interrupt mux to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

This code has two different types of interrupts it handles differently: Shared interrupts and non-shared interrupts. The simplest of the two are non-shared interrupts: a separate interrupt is allocated per esp_intr_alloc call and this interrupt is solely used for the peripheral attached to it, with only one ISR that will get called. Shared interrupts can have multiple peripherals triggering it, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to see if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts (because of the chance of missed interrupts when edge interrupts are used.) (The logic behind this: DevA and DevB share an int. DevB signals an int. Int line goes high. ISR handler calls code for DevA -> does nothing. ISR handler calls code for DevB, but while doing that, DevA signals an int. ISR DevB is done, clears int for DevB, exits interrupt code. Now an interrupt for DevA is still pending, but because the int line never went low (DevA kept it high even when the int for DevB was cleared) the interrupt is never serviced.)

### Multicore issues

Peripherals that can generate interrupts can be divided in two types:

- External peripherals, within the ESP32 but outside the Xtensa cores themselves. Most ESP32 peripherals are of this type.
- Internal peripherals, part of the Xtensa CPU cores themselves.

Interrupt handling differs slightly between these two types of peripherals.

#### Internal peripheral interrupts

Each Xtensa CPU core has its own set of six internal peripherals:

- Three timer comparators
- A performance monitor
- Two software interrupts.

Internal interrupt sources are defined in esp_intr_alloc.h as ETS_INTERNAL_*_INTR_SOURCE.

These peripherals can only be configured from the core they are associated with. When generating an interrupt, the interrupt they generate is hard-wired to their associated core; it’s not possible to have e.g. an internal timer comparator of one core generate an interrupt on another core. That is why these sources can only be managed using a task running on that specific core. Internal interrupt sources are still allocatable using esp_intr_alloc as normal, but they cannot be shared and will always have a fixed interrupt level (namely, the one associated in hardware with the peripheral).

#### External Peripheral Interrupts

The remaining interrupt sources are from external peripherals. These are defined in soc/soc.h as ETS_*_INTR_SOURCE.

Non-internal interrupt slots in both CPU cores are wired to an interrupt multiplexer, which can be used to route any external interrupt source to any of these interrupt slots.

- Allocating an external interrupt will always allocate it on the core that does the allocation.
- Freeing an external interrupt must always happen on the same core it was allocated on.
Chapter 2. API Reference

- Disabling and enabling external interrupts from another core is allowed.
- Multiple external interrupt sources can share an interrupt slot by passing ESP_INTR_FLAG_SHARED as a flag to esp_intr_alloc().

Care should be taken when calling esp_intr_alloc() from a task which is not pinned to a core. During task switching, these tasks can migrate between cores. Therefore it is impossible to tell which CPU the interrupt is allocated on, which makes it difficult to free the interrupt handle and may also cause debugging difficulties. It is advised to use xTaskCreatePinnedToCore() with a specific CoreID argument to create tasks that will allocate interrupts. In the case of internal interrupt sources, this is required.

IRAM-Safe Interrupt Handlers

The ESP_INTR_FLAG_IRAM flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erasers can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses.

Refer to the SPI flash API documentation for more details.

Multiple Handlers Sharing A Source

Several handlers can be assigned to a same source, given that all handlers are allocated using the ESP_INTR_FLAG_SHARED flag. They’ll be all allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while its source may still be triggered if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework support this feature, you have to use it very carefully. There usually exist 2 ways to stop a interrupt from being triggered: disable the source or mask peripheral interrupt status. IDF only handles the enabling and disabling of the source itself, leaving status and mask bits to be handled by users. Status bits should always be masked before the handler responsible for it is disabled, or the status should be handled in other enabled interrupt properly. You may leave some status bits unhandled if you just disable one of all the handlers without masking the status bits, which causes the interrupt to trigger infinitely resulting in a system crash.

API Reference

Header File
- esp32/include/esp_intr_alloc.h

Functions

\texttt{esp_err_t esp_intr_mark_shared}(int intno, int cpu, bool is_in_iram)

Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

Return ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

Parameters
- \texttt{intno}: The number of the interrupt (0-31)
- \texttt{cpu}: CPU on which the interrupt should be marked as shared (0 or 1)
- \texttt{is_in_iram}: Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.
**esp_err_t esp_intr_reserve** (int intno, int cpu)

Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

**Return** ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

**Parameters**
- **intno**: The number of the interrupt (0-31)
- **cpu**: CPU on which the interrupt should be marked as shared (0 or 1)

**esp_err_t esp_intr_alloc** (int source, int flags, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_ERR_NOT_FOUND if no free interrupt found with the specified flags ESP_OK otherwise

**Parameters**
- **source**: The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags**: An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAGINTRDISABLED will return from this function with the interrupt disabled.
- **handler**: The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
- **arg**: Optional argument for passed to the interrupt handler
- **ret_handle**: Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

**esp_err_t esp_intr_alloc_intrstatus** (int source, int flags, uint32_t intrstatusreg, uint32_t intrstatusmask, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)

Allocate an interrupt with the given parameters.

This essentially does the same as esp_intr_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_ERR_NOT_FOUND if no free interrupt found with the specified flags ESP_OK otherwise

**Parameters**
- **source**: The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.
- **flags**: An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAGINTRDISABLED will return from this function with the interrupt disabled.
- **intrstatusreg**: The address of an interrupt status register
- **intrstatusmask**: The mask to be used with the intrstatusreg
• **intrstatusmask**: A mask. If a read of address intrstatusreg has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
• **handler**: The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.
• **arg**: Optional argument for passed to the interrupt handler
• **ret_handle**: Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

```c
esp_err_t esp_intr_free(intr_handle_t handle)
```
Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

**Note** When the handler shares its source with other handlers, the interrupt status bits it’s responsible for should be managed properly before freeing it. see esp_intr_disable for more details. Please do not call this function in esp_ipc_call_blocking.

**Return** ESP_ERR_INVALID_ARG the handle is NULL ESP_FAIL failed to release this handle ESP_OK otherwise

**Parameters**
- **handle**: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

```c
int esp_intr_get_cpu(intr_handle_t handle)
```
Get CPU number an interrupt is tied to.

**Return** The core number where the interrupt is allocated

**Parameters**
- **handle**: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

```c
int esp_intr_get_intno(intr_handle_t handle)
```
Get the allocated interrupt for a certain handle.

**Return** The interrupt number

**Parameters**
- **handle**: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

```c
esp_err_t esp_intr_disable(intr_handle_t handle)
```
Disable the interrupt associated with the handle.

**Note**
1. For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
2. When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

**Parameters**
- **handle**: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

```c
esp_err_t esp_intr_enable(intr_handle_t handle)
```
Enable the interrupt associated with the handle.

**Note** For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

**Parameters**
- **handle**: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

```c
esp_err_t esp_intr_set_in_iram(intr_handle_t handle, bool is_in_iram)
```
Set the “in IRAM” status of the handler.

**Note** Does not work on shared interrupts.

**Return** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise

**Parameters**
- **handle**: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
- **is_in_iram**: Boolean indicating whether the interrupt handler should be loaded into IRAM.
handle: The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intstatus

is_in_iram: Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

```c
void esp_intr_noniram_disable()
{
    Disable interrupts that aren’t specifically marked as running from IRAM.
}

void esp_intr_noniram_enable()
{
    Re-enable interrupts disabled by esp_intr_noniram_disable.
}
```

**Macros**

`ESP_INTR_FLAG_LEVEL1`

Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling esp_intr_alloc* needs. Accept a Level 1 interrupt vector (lowest priority)

`ESP_INTR_FLAG_LEVEL2`

Accept a Level 2 interrupt vector.

`ESP_INTR_FLAG_LEVEL3`

Accept a Level 3 interrupt vector.

`ESP_INTR_FLAG_LEVEL4`

Accept a Level 4 interrupt vector.

`ESP_INTR_FLAG_LEVEL5`

Accept a Level 5 interrupt vector.

`ESP_INTR_FLAG_LEVEL6`

Accept a Level 6 interrupt vector.

`ESP_INTR_FLAG_NMI`

Accept a Level 7 interrupt vector (highest priority)

`ESP_INTR_FLAG_SHARED`

Interrupt can be shared between ISRs.

`ESP_INTR_FLAG_EDGE`

Edge-triggered interrupt.

`ESP_INTR_FLAG_IRAM`

ISR can be called if cache is disabled.

`ESP_INTR_FLAG_INTRDISABLED`

Return with this interrupt disabled.

`ESP_INTR_FLAG_LOWMED`

Low and medium priority interrupts. These can be handled in C.

`ESP_INTR_FLAG_HIGH`

High level interrupts. Need to be handled in assembly.

`ESP_INTR_FLAG_LEVELMASK`

Mask for all level flags.

`ETS_INTERNAL_TIMER0_INTR_SOURCE`

Xtensa timer 0 interrupt source.

The esp_intr_alloc* functions can allocate an int for all ETS_*_INTR_SOURCE interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.

`ETS_INTERNAL_TIMER1_INTR_SOURCE`

Xtensa timer 1 interrupt source.
ETS_INTERNAL_TIMER2_INTR_SOURCE
Xtensa timer 2 interrupt source.

ETS_INTERNAL_SW0_INTR_SOURCE
Software int source 1.

ETS_INTERNAL_SW1_INTR_SOURCE
Software int source 2.

ETS_INTERNAL_PROFILING_INTR_SOURCE
Int source for profiling.

ETS_INTERNAL_INTR_SOURCE_OFF
ESP_INTR_ENABLE (inum)
ESP_INTR_DISABLE (inum)

Type Definitions
typedef void (*intr_handler_t)(void *arg)
typedef struct intr_handle_data_t intr_handle_data_t
typedef intr_handle_data_t *intr_handle_t

2.7.7 Watchdogs

Overview

The ESP-IDF has support for two types of watchdogs: The Interrupt Watchdog Timer and the Task Watchdog Timer (TWDT). The Interrupt Watchdog Timer and the TWDT can both be enabled using Project Configuration Menu, however the TWDT can also be enabled during runtime. The Interrupt Watchdog is responsible for detecting instances where FreeRTOS task switching is blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

Interrupt watchdog The interrupt watchdog makes sure the FreeRTOS task switching interrupt isn’t blocked for a long time. This is bad because no other tasks, including potentially important ones like the WiFi task and the idle task, can’t get any CPU runtime. A blocked task switching interrupt can happen because a program runs into an infinite loop with interrupts disabled or hangs in an interrupt.

The default action of the interrupt watchdog is to invoke the panic handler, causing a register dump and an opportunity for the programmer to find out, using either OpenOCD or gdbstub, what bit of code is stuck with interrupts disabled. Depending on the configuration of the panic handler, it can also blindly reset the CPU, which may be preferred in a production environment.

The interrupt watchdog is built around the hardware watchdog in timer group 1. If this watchdog for some reason cannot execute the NMI handler that invokes the panic handler (e.g. because IRAM is overwritten by garbage), it will hard-reset the SOC.

Task Watchdog Timer The Task Watchdog Timer (TWDT) is responsible for detecting instances of tasks running for a prolonged period of time without yielding. This is a symptom of CPU starvation and is usually caused by a higher priority task looping without yielding to a lower-priority task thus starving the lower priority task from CPU time. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

By default the TWDT will watch the Idle Tasks of each CPU, however any task can elect to be watched by the TWDT. Each watched task must ‘reset’ the TWDT periodically to indicate that they have been allocated CPU time. If a task does not reset within the TWDT timeout period, a warning will be printed with information about which tasks failed to reset the TWDT in time and which tasks are currently running on the ESP32 CPUs. And also there is a possibility to redefine the function esp_task_wdt_isr_user_handler in the user code to receive this event.
Chapter 2. API Reference

The TWDT is built around the Hardware Watchdog Timer in Timer Group 0. The TWDT can be initialized by calling `esp_task_wdt_init()` which will configure the hardware timer. A task can then subscribe to the TWDT using `esp_task_wdt_add()` in order to be watched. Each subscribed task must periodically call `esp_task_wdt_reset()` to reset the TWDT. Failure by any subscribed tasks to periodically call `esp_task_wdt_reset()` indicates that one or more tasks have been starved of CPU time or are stuck in a loop somewhere.

A watched task can be unsubscribed from the TWDT using `esp_task_wdt_delete()`. A task that has been unsubscribed should no longer call `esp_task_wdt_reset()`. Once all tasks have unsubscribed from the TWDT, the TWDT can be deinitialized by calling `esp_task_wdt_deinit()`.

By default `CONFIG_ESP_TASK_WDT` in Project Configuration Menu be enabled causing the TWDT to be initialized automatically during startup. Likewise `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0` and `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1` are also enabled by default causing the two Idle Tasks to be subscribed to the TWDT during startup.

**JTAG and watchdogs** While debugging using OpenOCD, the CPUs will be halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not reenable them upon leaving the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32 is connected to OpenOCD via JTAG.

**Interrupt Watchdog API Reference**

**Header File**

- esp32/include/esp_int_wdt.h

**Functions**

```c
void esp_int_wdt_init()
```

Initialize the non-CPU-specific parts of interrupt watchdog. This is called in the init code if the interrupt watchdog is enabled in menuconfig.

**Task Watchdog API Reference**

A full example using the Task Watchdog is available in esp-idf: `system/task_watchdog`

**Header File**

- esp_common/include/esp_task_wdt.h

**Functions**

```c
esp_err_t esp_task_wdt_init_(uint32_t timeout, bool panic)
```

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. If the TWDT is already initialized when this function is called, this function will update the TWDT’s timeout period and panic configurations instead. After initializing the TWDT, any task can elect to be watched by the TWDT by subscribing to it using `esp_task_wdt_add()`.

**Return**

- ESP_OK: Initialization was successful
- ESP_ERR_NO_MEM: Initialization failed due to lack of memory

**Note** `esp_task_wdt_init()` must only be called after the scheduler started

**Parameters**

- [in] `timeout`: Timeout period of TWDT in seconds
• [in] panic: Flag that controls whether the panic handler will be executed when the TWDT times out

`esp_err_t esp_task_wdt_deinit()`
Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT. Calling this function whilst tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

**Return**
- ESP_OK: TWDT successfully deinitialized
- ESP_ERR_INVALID_STATE: Error, tasks are still subscribed to the TWDT
- ESP_ERR_NOT_FOUND: Error, TWDT has already been deinitialized

`esp_err_t esp_task_wdt_add(TaskHandle_t handle)`
Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call `esp_task_wdt_reset()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout. If the task being subscribed is one of the Idle Tasks, this function will automatically enable `esp_task_wdt_reset()` to called from the Idle Hook of the Idle Task. Calling this function whilst the TWDT is uninitialized or attempting to subscribe an already subscribed task will result in an error code being returned.

**Return**
- ESP_OK: Successfully subscribed the task to the TWDT
- ESP_ERR_INVALID_ARG: Error, the task is already subscribed
- ESP_ERR_NO_MEM: Error, could not subscribe the task due to lack of memory
- ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

**Parameters**
- [in] handle: Handle of the task. Input NULL to subscribe the current running task to the TWDT

`esp_err_t esp_task_wdt_reset()`
Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur. If the IDLE tasks have been subscribed to the TWDT, they will automatically call this function from their idle hooks. Calling this function from a task that has not subscribed to the TWDT, or when the TWDT is uninitialized will result in an error code being returned.

**Return**
- ESP_OK: Successfully reset the TWDT on behalf of the currently running task
- ESP_ERR_NOT_FOUND: Error, the current running task has not subscribed to the TWDT
- ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

`esp_err_t esp_task_wdt_delete(TaskHandle_t handle)`
Unsubscribe a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call `esp_task_wdt_reset()`. If the task is an IDLE task, this function will automatically disable the calling of `esp_task_wdt_reset()` from the Idle Hook. Calling this function whilst the TWDT is uninitialized or attempting to unsubscribe an already unsubscribed task from the TWDT will result in an error code being returned.

**Return**
- ESP_OK: Successfully unsubscribed the task from the TWDT
- ESP_ERR_INVALID_ARG: Error, the task is already unsubscribed
- ESP_ERR_INVALID_STATE: Error, the TWDT has not been initialized yet

**Parameters**
- [in] handle: Handle of the task. Input NULL to unsubscribe the current running task.

`esp_err_t esp_task_wdt_status(TaskHandle_t handle)`
Query whether a task is subscribed to the Task Watchdog Timer (TWDT)
This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

**Return**:
- ESP_OK: The task is currently subscribed to the TWDT
- ESP_ERR_NOT_FOUND: The task is currently not subscribed to the TWDT
- ESP_ERR_INVALID_STATE: The TWDT is not initialized, therefore no tasks can be subscribed

**Parameters**
- `[in] handle`: Handle of the task. Input NULL to query the current running task.

### 2.7.8 eFuse Manager

**Introduction**

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

**Hardware description**

The ESP32 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0). For more details see ESP32 Technical Reference Manual in part 20 eFuse controller. Some eFuse bits are available for user applications.

ESP32 has 4 eFuse blocks each of the size of 256 bits (not all bits are available):

- **EFUSE_BLK0** is used entirely for system purposes;
- **EFUSE_BLK1** is used for flash encrypt key. If not using that Flash Encryption feature, they can be used for another purpose;
- **EFUSE_BLK2** is used for security boot key. If not using that Secure Boot feature, they can be used for another purpose;
- **EFUSE_BLK3** can be partially reserved for the custom MAC address, or used entirely for user application. Note that some bits are already used in IDF.

Each block is divided into 8 32-bits registers.

**eFuse Manager component**

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool `efuse_table_gen.py`. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a custom file from the user’s project directory, the utility will check with the `common` CSV file.

**CSV files**:

- **common (esp_efuse_table.csv)** - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse_common_table`). Note that changes in this file can lead to incorrect operation.
- **custom** (optional and can be enabled by `CONFIG_EFUSE_CUSTOM_TABLE`) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse_custom_table`. 
Description CSV file

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK3), bit_start(0..255), bit_count(1..256), comment
```

Individual params in CSV file the following meanings:

**field_name** Name of field. The prefix ESP_EFUSE_ will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see MAC_FACTORY field in the common table).

**efuse_block** Block number. It determines where the eFuse bits will be placed for this field. Available EFUSE_BLK0..EFUSE_BLK3.

**bit_start** Start bit number (0..255). The bit_start field can be omitted. In this case, it will be set to bit_start + bit_count from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.

**bit_count** The number of bits to use in this field (1..-). This parameter can not be omitted. This field also may be MAX_BLK_LEN in this case, the field length will have the maximum block length, taking into account the coding scheme (applicable for ESP_EFUSE_SECURE_BOOT_KEY and ESP_EFUSE_ENCRYPT_FLASH_KEY fields). The value MAX_BLK_LEN depends on CONFIG_EFUSE_MAX_BLK_LEN, will be replaced with “None” - 256, “3/4” - 192, “REPEAT” - 128.

**comment** This param is using for comment field, it also move to C-header file. The comment field can be omitted. If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields MAC_FACTORY and MAC_FACTORY_CRC:

```
# factory MAC address #
#################################
MAC_FACTORY, EFUSE_BLK0, 72, 8, Factory MAC addr[0]
, EFUSE_BLK0, 64, 8, Factory MAC addr[1]
, EFUSE_BLK0, 56, 8, Factory MAC addr[2]
, EFUSE_BLK0, 48, 8, Factory MAC addr[3]
, EFUSE_BLK0, 40, 8, Factory MAC addr[4]
, EFUSE_BLK0, 32, 8, Factory MAC addr[5]
MAC_FACTORY_CRC, EFUSE_BLK0, 80, 8, CRC8 for factory MAC address
```

This field will available in code as ESP_EFUSE_MAC_FACTORY and ESP_EFUSE_MAC_FACTORY_CRC.

**efuse_table_gen.py tool**

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional custom file is used, it will be checked with the existing common file (esp_efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type esp_efuse_desc_t.

To generate a common files, use the following command idf.py efuse_common_table or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32/esp_efuse_table.csv
```

After generation in the folder esp32 create:

- esp_efuse_table.c file.
- In include folder esp_efuse_table.c file.

To generate a custom files, use the following command idf.py efuse_custom_table or:
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32/esp_efuse_table.csv PROJECT_PATH/main/esp_efuse_custom_table.csv

After generation in the folder PROJECT_PATH/main create:

• esp_efuse_custom_table.c file.
• In include folder esp_efuse_custom_table.c file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" or "esp_efuse_custom_table.h"
```

**Support coding scheme**

eFuse have three coding schemes:

• None (value 0).
• 3/4 (value 1).
• Repeat (value 2).

The coding scheme affects only EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3 blocks. EUSE_BLK0 block always has a coding scheme None. Coding changes the number of bits that can be written into a block, the block length is constant 256, some of these bits are used for encoding and are not used.

When using a coding scheme, the length of the payload that can be written is limited (for more details 20.3.1.3 System Parameter coding_scheme):

• None 256 bits.
• 3/4 192 bits.
• Repeat 128 bits.

You can find out the coding scheme of your chip:

- **run a espefuse.py -p COM4 summary command.**
- from esptool utility logs (during flashing).
- calling the function in the code `esp_efuse_get_coding_scheme()` for the EFUSE_BLK3 block.

eFuse tables must always comply with the coding scheme in the chip. There is an `EFUSE_CODE_SCHEME_SELECTOR` option to select the coding type for tables in a Kconfig. When generating source files, if your tables do not follow the coding scheme, an error message will be displayed. Adjust the length or offset fields. If your program was compiled with None encoding and 3/4 is used in the chip, then the ESP_ERR_CODING error may occur when calling the eFuse API (the field is outside the block boundaries). If the field matches the new block boundaries, then the API will work without errors.

Also, 3/4 coding scheme imposes restrictions on writing bits belonging to one coding unit. The whole block with a length of 256 bits is divided into 4 coding units, and in each coding unit there are 6 bytes of useful data and 2 service bytes. These 2 service bytes contain the checksum of the previous 6 data bytes.

It turns out that only one field can be written into one coding unit. Repeated rewriting in one coding unit is prohibited. But if the record was made in advance or through a `esp_efuse_write_block()` function, then reading the fields belonging to one coding unit is possible.

After changing the coding scheme, run `efuse_common_table` and `efuse_custom_table` commands to check the tables of the new coding scheme.

**eFuse API**

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1”.
• `esp_efuse_write_field_blob()` - writes an array.
• `esp_efuse_write_field_cnt()` - writes a required count of bits as “1”.
• `esp_efuse_get_field_size()` - returns the number of bits by the field name.
• `esp_efuse_read_reg()` - returns value of EFuse register.
• `esp_efuse_write_reg()` - writes value to EFuse register.
• `esp_efuse_get_coding_scheme()` - returns EFuse coding scheme for blocks.
• `esp_efuse_read_block()` - reads key to EFuse block starting at the offset and the required size.
• `esp_efuse_write_block()` - writes key to EFuse block starting at the offset and the required size.

For frequently used fields, special functions are made, like this `esp_efuse_get_chip_ver()`, `esp_efuse_get_pkg_ver()`.

How to add a new field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show_efuse_table` or the next command:

```
$ ./efuse_table_gen.py esp32/esp_efuse_table.csv --info
```

Parsing eFuse CSV input file $IDF_PATH/components/efuse/esp32/esp_efuse_table.csv ... 
Verifying eFuse table...

The number of bits not included in square brackets is free (bits in EFUSE_BLK0 are reserved for Espressif). All fields are checked for overlapping.

2. Fill a line for field: field_name, efuse_block, bit_start, bit_count, comment.
3. Run a show_efuse_table command to check eFuse table. To generate source files run efuse_common_table or efuse_custom_table command.

Debug eFuse & Unit tests

Virtual eFuses The Kconfig option CONFIG_EFUSE_VIRTUAL will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests.

espefuse.py esptool includes a useful tool for reading/writing ESP32 eFuse bits - espefuse.py.

espefuse.py -p COM4 summary
espefuse.py v2.3.1

(continues on next page)
### DISABLE_DL_CACHE

Disable flash cache in UART bootloader

- **Value:** 0
- **Type:** R/W

### BLK1

Flash encryption key

- **Value:** 0
- **Type:** R/W

### BLK2

Secure boot key

- **Value:** 0
- **Type:** R/W

### BLK3

Variable Block 3

- **Value:** 0
- **Type:** R/W

### Efuse fuses:

- **WR_DIS**
  - Efuse write disable mask
  - **Value:** 0
  - **Type:** R/W
- **RD_DIS**
  - Efuse read disable mask
  - **Value:** 0
  - **Type:** R/W
- **CODING_SCHEME**
  - Efuse variable block length scheme
  - **Value:** 1
  - **Type:** R/W
- **KEY_STATUS**
  - Usage of efuse block 3 (reserved)
  - **Value:** 0
  - **Type:** R/W

### Config fuses:

- **XPD_SDIO_FORCE**
  - Ignore MDI pin (GPIO12) for VDD_SDIO on reset
  - **Value:** 0
  - **Type:** R/W
- **XPD_SDIO_REG**
  - If XPD_SDIO_FORCE, enable VDD_SDIO reg on reset
  - **Value:** 0
  - **Type:** R/W
- **XPD_SDIO_TIEH**
  - If XPD_SDIO_FORCE & XPD_SDIO_REG, 1 = 3.3V, 0 = 1.8V
  - **Value:** 0
  - **Type:** R/W
- **SPI_PAD_CONFIG_CLK**
  - Override SD_CLK pad (GPIO6/SPICLK)
  - **Value:** 0
  - **Type:** R/W
- **SPI_PAD_CONFIG_Q**
  - Override SD_DATA_0 pad (GPIO7/SPIQ)
  - **Value:** 0
  - **Type:** R/W
- **SPI_PAD_CONFIG_D**
  - Override SD_DATA_1 pad (GPIO8/SPID)
  - **Value:** 0
  - **Type:** R/W
- **SPI_PAD_CONFIG_HD**
  - Override SD_DATA_2 pad (GPIO9/SPIHD)
  - **Value:** 0
  - **Type:** R/W
- **SPI_PAD_CONFIG_CS0**
  - Override SD_CMD pad (GPIO11/SPICS0)
  - **Value:** 0
  - **Type:** R/W
- **DISABLE_SDIO_HOST**
  - Disable SDIO host
  - **Value:** 0
  - **Type:** R/W

### Identity fuses:

- **MAC**
  - MAC Address
  - **Value:** 84:0d:8e:18:8e:44 (CRC ad OK)
  - **Type:** R/W
- **CHIP_VER_REV1**
  - Silicon Revision 1
  - **Value:** 1
  - **Type:** R/W
- **CHIP_VERSION**
  - Reserved for future chip versions
  - **Value:** 2
  - **Type:** R/W
- **CHIP_PACKAGE**
  - Chip package identifier
  - **Value:** 0
  - **Type:** R/W

### Calibration fuses:

- **BLK3_PART_RESERVE**
  - BLOCK3 partially served for ADC calibration data
  - **Value:** 1
  - **Type:** R/W
- **ADC_VREF**
  - Voltage reference calibration
  - **Value:** 1114
  - **Type:** R/
- **ADC1_TP_LOW**
  - ADC1 150mV reading
  - **Value:** 346
  - **Type:** R/W
- **ADC1_TP_HIGH**
  - ADC1 850mV reading
  - **Value:** 3285
  - **Type:** R/W
ADC2_TP_LOW ADC2 150mV reading = 449 R/W
ADC2_TP_HIGH ADC2 850mV reading = 3362 R/W
Flash voltage (VDD_SDIO) determined by GPIO12 on reset (High for 1.8V, Low/NC for 3.3V).

```

Header File

- efuse/include/esp_efuse.h

Functions

```c
esp_err_t esp_efuse_read_field_blob(const esp_efuse_desc_t *field[], void *dst, size_t dst_size_bits)

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field.

Return

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

Parameters

- [in] field: A pointer to the structure describing the fields of efuse.
- [out] dst: A pointer to array that will contain the result of reading.
- [in] dst_size_bits: The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.
```

```c
bool esp_efuse_read_field_bit(const esp_efuse_desc_t *field[])

Read a single bit eFuse field as a boolean value.

Note The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call esp_efuse_read_field_blob() and check the returned value instead.

Note If assertions are enabled and the parameter is invalid, execution will abort

Return

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

Parameters

- [in] field: A pointer to the structure describing the fields of efuse.
```

```c
esp_err_t esp_efuse_read_field_cnt(const esp_efuse_desc_t *field[], size_t *out_cnt)

Reads bits from EFUSE field and returns number of bits programmed as “1”.
```
If the bits are set not sequentially, they will still be counted.

Return
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

Parameters
- [in] field: A pointer to the structure describing the fields of fuse.
- [out] out_cnt: A pointer that will contain the number of programmed as “1” bits.

```c
esp_err_t esp_efuse_write_field_blob(const esp_efuse_desc_t *field, const void *src, size_t src_size_bits)
```
Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

Return
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

Parameters
- [in] field: A pointer to the structure describing the fields of fuse.
- [in] src: A pointer to array that contains the data for writing.
- [in] src_size_bits: The number of bits required to write.

```c
esp_err_t esp_efuse_write_field_cnt(const esp_efuse_desc_t *field, size_t cnt)
```
Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1”, ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

Return
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

Parameters
- [in] field: A pointer to the structure describing the fields of fuse.
- [in] cnt: Required number of programmed as “1” bits.

```c
esp_err_t esp_efuse_write_field_bit(const esp_efuse_desc_t *field[])
```
Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp_efuse_write_field_cnt() with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

Return
- ESP_OK: The operation was successfully completed, or the bit was already set to value 1.
- ESP_ERR_INVALID_ARG: Error in the passed arguments, including if the eFuse field is not 1 bit wide.

Parameters
- [in] field: Pointer to the structure describing the eFuse field.

```c
esp_err_t esp_efuse_set_write_protect(esp_efuse_block_t blk)
```
Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

Return
• ESP_OK: The operation was successfully completed.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
• ESP_ERR_NOT_SUPPORTED: The block does not support this command.

**Parameters**

• [in] blk: Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

`esp_err_t esp_efuse_set_read_protect (esp_efuse_block_t blk)`

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

**Return**

• ESP_OK: The operation was successfully completed.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
• ESP_ERR_NOT_SUPPORTED: The block does not support this command.

**Parameters**

• [in] blk: Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

`int esp_efuse_get_field_size (const esp_efuse_desc_t *field[])`

Returns the number of bits used by field.

**Return**

Returns the number of bits used by field.

**Parameters**

• [in] field: A pointer to the structure describing the fields of efuse.

`uint32_t esp_efuse_read_reg (esp_efuse_block_t blk, unsigned int num_reg)`

Returns value of efuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

**Return**

Value of register

**Parameters**

• [in] blk: Block number of eFuse.
• [in] num_reg: The register number in the block.

`esp_err_t esp_efuse_write_reg (esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)`

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

**Return**

• ESP_OK: The operation was successfully completed.
• ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

**Parameters**

• [in] blk: Block number of eFuse.
• [in] num_reg: The register number in the block.
• [in] val: Value to write.

`esp_efuse_coding_scheme_t esp_efuse_get_coding_scheme (esp_efuse_block_t blk)`

Return efuse coding scheme for blocks.

Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

**Return**

Return efuse coding scheme for blocks

**Parameters**

• [in] blk: Block number of eFuse.

`esp_err_t esp_efuse_read_block (esp_efuse_block_t blk, void *dst_key, size_t offset_in_bits, size_t size_bits)`

Read key to efuse block starting at the offset and the required size.
Chapter 2. API Reference

Return

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

Parameters

- [in] blk: Block number of eFuse.
- [in] dst_key: A pointer to array that will contain the result of reading.
- [in] size_bits: The number of bits required to read.

```c
esp_err_t esp_efuse_write_block (esp_efuse_block_t blk, const void *src_key, size_t offset_in_bits, size_t size_bits)
```

Write key to eFuse block starting at the offset and the required size.

Return

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits

Parameters

- [in] blk: Block number of eFuse.
- [in] src_key: A pointer to array that contains the key for writing.
- [in] size_bits: The number of bits required to write.

```c
uint8_t esp_efuse_get_chip_ver (void)
```

Returns chip version from eFuse.

```c
Return  chip version
```

```c
uint32_t esp_efuse_get_pkg_ver (void)
```

Returns chip package from eFuse.

```c
Return  chip package
```

```c
void esp_efuse_burn_new_values (void)
```

```c
void esp_efuse_reset (void)
```

```c
void esp_efuse_disable_basic_rom_console (void)
```

```c
esp_err_t esp_efuse_apply_34_encoding (const uint8_t *in_bytes, uint32_t *out_words, size_t in_bytes_len)
```

```c
esp_err_t esp_efuse_disable_rom_download_mode (void)
```

```c
void esp_efuse_write_random_key (uint32_t blk_wdata0_reg)
```

```c
uint32_t esp_efuse_read_secure_version ()
```

```c
bool esp_efuse_check_secure_version (uint32_t secure_version)
```

```c
esp_err_t esp_efuse_update_secure_version (uint32_t secure_version)
```

```c
void esp_efuse_init (uint32_t offset, uint32_t size)
```

```c
static bool soc_has_cache_lock_bug (void)
```

Structures

```c
struct esp_efuse_desc_t
```

Structure eFuse field.

```c
Public Members
```

```c
esp_efuse_block_t esp_efuse_block : 8
```

Block of eFuse
uint8_t bit_start
Start bit [0..255]

uint16_t bit_count
Length of bit field [1..-]

Macros
ESP_ERR_EFUSE
Base error code for efuse api.

ESP_OK_EFUSE_CNT
OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL
Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG
Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING
Error while a encoding operation.

Enumerations
enum esp_efuse_block_t
Type of eFuse blocks.

Values:
EFUSE_BLK0 = 0
Number of eFuse block. Reserved.

EFUSE_BLK1 = 1
Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can
be used for another purpose.

EFUSE_BLK2 = 2
Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used
for another purpose.

EFUSE_BLK3 = 3
Number of eFuse block. Uses for the purpose of the user.

enum esp_efuse_coding_scheme_t
Type of coding scheme.

Values:
EFUSE_CODING_SCHEME_NONE = 0
None

EFUSE_CODING_SCHEME_3_4 = 1
3/4 coding

EFUSE_CODING_SCHEME_REPEAT = 2
Repeat coding

2.7.9 Inter-Processor Call

Overview
Due to the dual core nature of the ESP32, there are instances where a certain function must be run in the context
of a particular core (e.g. allocating ISR to an interrupt source of a particular core). The IPC (Inter-Processor Call)
feature allows for the execution of functions on a particular CPU.
Chapter 2. API Reference

A given function can be executed on a particular core by calling `esp_ipc_call()` or `esp_ipc_call_blocking()`. IPC is implemented via two high priority FreeRTOS tasks pinned to each CPU known as the IPC Tasks. The two IPC Tasks remain inactive (blocked) until `esp_ipc_call()` or `esp_ipc_call_blocking()` is called. When an IPC Task of a particular core is unblocked, it will preempt the current running task on that core and execute a given function.

Usage

`esp_ipc_call()` unblocks the IPC task on a particular core to execute a given function. The task that calls `esp_ipc_call()` will be blocked until the IPC Task begins execution of the given function. `esp_ipc_call_blocking()` is similar but will block the calling task until the IPC Task has completed execution of the given function.

Functions executed by IPCs must be functions of type `void func(void *arg)`. To run more complex functions which require a larger stack, the IPC tasks’ stack size can be configured by modifying `CONFIG_ESP_IPC_TASK_STACK_SIZE` in `menuconfig`. The IPC API is protected by a mutex hence simultaneous IPC calls are not possible.

Care should taken to avoid deadlock when writing functions to be executed by IPC, especially when attempting to take a mutex within the function.

API Reference

Header File

- esp_common/include/esp_ipc.h

Functions

`esp_err_t esp_ipc_call(uint32_t cpu_id, esp_ipc_func_t func, void *arg)`

Execute a function on the given CPU.

Run a given function on a particular CPU. The given function must accept a void* argument and return void. The given function is run in the context of the IPC task of the CPU specified by the `cpu_id` parameter. The calling task will be blocked until the IPC task begins executing the given function. If another IPC call is ongoing, the calling task will block until the other IPC call completes. The stack size allocated for the IPC task can be configured in the “Inter-Processor Call (IPC) task stack size” setting in menuconfig. Increase this setting if the given function requires more stack than default.

**Note** In single-core mode, returns ESP_ERR_INVALID_ARG for `cpu_id` 1.

**Return**

- ESP_ERR_INVALID_ARG if `cpu_id` is invalid
- ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
- ESP_OK otherwise

`esp_err_t esp_ipc_call_blocking(uint32_t cpu_id, esp_ipc_func_t func, void *arg)`

Execute a function on the given CPU and blocks until it completes.

Run a given function on a particular CPU. The given function must accept a void* argument and return void. The given function is run in the context of the IPC task of the CPU specified by the `cpu_id` parameter. The calling task will be blocked until the IPC task completes execution of the given function. If another IPC call is ongoing, the calling task will block until the other IPC call completes. The stack size allocated for the IPC task can be configured in the “Inter-Processor Call (IPC) task stack size” setting in menuconfig. Increase this setting if the given function requires more stack than default.

**Note** In single-core mode, returns ESP_ERR_INVALID_ARG for `cpu_id` 1.

**Return**

- ESP_ERR_INVALID_ARG if `cpu_id` is invalid
• ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
  • ESP_OK otherwise

**Parameters**

- `[in] cpu_id`: CPU where the given function should be executed (0 or 1)
- `[in] func`: Pointer to a function of type `void func(void* arg)` to be executed
- `[in] arg`: Arbitrary argument of type `void*` to be passed into the function

2.7.10 High Resolution Timer

**Overview**

Although FreeRTOS provides software timers, these timers have a few limitations:

- Maximum resolution is equal to RTOS tick period
- Timer callbacks are dispatched from a low-priority task

Hardware timers are free from both of the limitations, but often they are less convenient to use. For example, application components may need timer events to fire at certain times in the future, but the hardware timer only contains one “compare” value used for interrupt generation. This means that some facility needs to be built on top of the hardware timer to manage the list of pending events can dispatch the callbacks for these events as corresponding hardware interrupts happen.

`esp_timer` set of APIs provide such facility. Internally, `esp_timer` uses a 32-bit hardware timer (FRC1, “legacy” timer). `esp_timer` provides one-shot and periodic timers, microsecond time resolution, and 64-bit range.

Timer callbacks are dispatched from a high-priority `esp_timer` task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower priority task using a queue instead.

If other tasks with priority higher than `esp_timer` are running, callback dispatching will be delayed until `esp_timer` task has a chance to run. For example, this will happen if a SPI Flash operation is in progress.

Creating and starting a timer, and dispatching the callback takes some time. Therefore there is a lower limit to the timeout value of one-shot `esp_timer`. If `esp_timer_start_once()` is called with a timeout value less than 20us, the callback will be dispatched only after approximately 20us.

Periodic `esp_timer` also imposes a 50us restriction on the minimal timer period. Periodic software timers with period of less than 50us are not practical since they would consume most of the CPU time. Consider using dedicated hardware peripherals or DMA features if you find that a timer with small period is required.

Using `esp_timer` APIs

Single timer is represented by `esp_timer_handle_t` type. Timer has a callback function associated with it. This callback function is called from the `esp_timer` task each time the timer elapses.

- To create a timer, call `esp_timer_create()`.
- To delete the timer when it is no longer needed, call `esp_timer_delete()`.

The timer can be started in one-shot mode or in periodic mode.

- To start the timer in one-shot mode, call `esp_timer_start_once()`, passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.
- To start the timer in periodic mode, call `esp_timer_start_periodic()`, passing the period with which the callback should be called. The timer keeps running until `esp_timer_stop()` is called.

Note that the timer must not be running when `esp_timer_start_once()` or `esp_timer_start_periodic()` is called. To restart a running timer, call `esp_timer_stop()` first, then call one of the start functions.
Obtaining Current Time

`esp_timer` also provides a convenience function to obtain the time passed since start-up, with microsecond precision: `esp_timer_get_time()`. This function returns the number of microseconds since `esp_timer` was initialized, which usually happens shortly before `app_main` function is called.

Unlike `gettimeofday` function, values returned by `esp_timer_get_time()`:

- Start from zero after the chip wakes up from deep sleep
- Do not have timezone or DST adjustments applied

Application Example

The following example illustrates usage of `esp_timer` APIs: `system/esp_timer`.

API Reference

Header File

- `esp_common/include/esp_timer.h`

Functions

`esp_err_t esp_timer_init()`  
Initialize `esp_timer` library.

**Note** This function is called from startup code. Applications do not need to call this function before using other `esp_timer` APIs.

**Return**
- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized
- other errors from interrupt allocator

`esp_err_t esp_timer_deinit()`  
De-initialize `esp_timer` library.

**Note** Normally this function should not be called from applications

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if not yet initialized

`esp_err_t esp_timer_create(const esp_timer_create_args_t *create_args, esp_timer_handle_t *out_handle)`  
Create an `esp_timer` instance.

**Note** When done using the timer, delete it with `esp_timer_delete` function.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if some of the `create_args` are not valid
- ESP_ERR_INVALID_STATE if `esp_timer` library is not initialized yet
- ESP_ERR_NO_MEM if memory allocation fails

**Parameters**
- `create_args`: Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- `[out] out_handle`: Output, pointer to `esp_timer_handle_t` variable which will hold the created timer handle.

`esp_err_t esp_timer_start_once (esp_timer_handle_t timer, uint64_t timeout_us)`  
Start one-shot timer.

Timer should not be running when this function is called.
### esp_timer_start_periodic

**Function**

```c
void esp_timer_start_periodic(esp_timer_handle_t timer, uint64_t period)
```

**Description**

Starts a periodic timer.

**Parameters**

- `timer`: Timer handle created using `esp_timer_create`
- `period`: Timer period, in microseconds

**Return**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if the handle is invalid
- `ESP_ERR_INVALID_STATE` if the timer is already running

### esp_timer_stop

**Function**

```c
void esp_timer_stop(esp_timer_handle_t timer)
```

**Description**

Stops the timer.

**Parameters**

- `timer`: Timer handle created using `esp_timer_create`

**Return**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if the timer is not running

### esp_timer_delete

**Function**

```c
void esp_timer_delete(esp_timer_handle_t timer)
```

**Description**

Deletes an `esp_timer` instance.

**Parameters**

- `timer`: Timer handle allocated using `esp_timer_create`

**Return**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if the timer is not running

### esp_timer_get_time

**Function**

```c
int64_t esp_timer_get_time()
```

**Description**

Gets the time since `esp_timer_init` was called (this normally happens early during application startup).

**Return**

- `int64_t` representing the number of microseconds since `esp_timer_init`

### esp_timer_get_next_alarm

**Function**

```c
int64_t esp_timer_get_next_alarm()
```

**Description**

Gets the timestamp when the next timeout is expected to occur.

**Return**

- `int64_t` representing the timestamp of the nearest timer event, in microseconds.

### esp_timer_dump

**Function**

```c
esp_err_t esp_timer_dump(FILE *stream)
```

**Description**

Dumps the list of timers to a stream.

**Parameters**

- `stream`: Pointer to a file stream (e.g., `stdout`)

**Return**

- `ESP_OK` on success
- Other errors if the dumping fails

**Notes**

If `CONFIG_ESP_TIMER_PROFILING` option is enabled, this prints the list of all the existing timers. Otherwise, only the list of active timers is printed.

The format is:

- `name` period alarm times_armed times_triggered total_callback_run_time
name — timer name (if CONFIG_ESP_TIMER_PROFILING is defined), or timer pointer period — period of timer, in microseconds, or 0 for one-shot timer alarm - time of the next alarm, in microseconds since boot, or 0 if the timer is not started.

The following fields are printed if CONFIG_ESP_TIMER_PROFILING is defined:

times_arme — number of times the timer was armed via esp_timer_start_X times_triggered — number of times the callback was called total_callback_run_time - total time taken by callback to execute, across all calls.

Return

• ESP_OK on success
• ESP_ERR_NO_MEM if cannot allocate temporary buffer for the output

Parameters

• stream: stream (such as stdout) to dump the information to

Structures

struct esp_timer_create_args_t
Timer configuration passed to esp_timer_create.

Public Members

esp_timer_cb_t callback
Function to call when timer expires.

void *arg
Argument to pass to the callback.

esp_timer_dispatch_t dispatch_method
Call the callback from task or from ISR.

const char *name
Timer name, used in esp_timer_dump function.

Type Definitions

typedef struct esp_timer *esp_timer_handle_t
Opaque type representing a single esp_timer.

typedef void (*esp_timer_cb_t)(void *arg)
Timer callback function type.

Parameters

• arg: pointer to opaque user-specific data

Enumerations

typedef enum esp_timer_dispatch_t
Method for dispatching timer callback.

Values:

ESP_TIMER_TASK
Callback is called from timer task.

2.7.11 Logging library

Overview

The logging library provides two ways for setting log verbosity:
Chapter 2. API Reference

- **At compile time**: in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`. All logging statements for verbosity levels higher than `CONFIG_LOG_DEFAULT_LEVEL` will be removed by the preprocessor.

- **At runtime**: all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

**Note:** The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_DEFAULT_LEVEL`. To increase log level for a specific file at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).

**How to use this library**

In each C file that uses logging functionality, define the `TAG` variable as shown below:

```c
static const char* TAG = "MyModule";
```

Then use one of the logging macros to produce output, e.g:

```c
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error_\%0.0f, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- `ESP_LOGE` - error (lowest)
- `ESP_LOGW` - warning
- `ESP_LOGI` - info
- `ESP_LOGD` - debug
- `ESP_LOGV` - verbose (highest)

Additionally, there are `ESP_EARLY_LOGx` versions for each of these macros, e.g., `ESP_EARLY_LOGE`. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal `ESP_LOGx` macros can also be used while compiling the bootloader, but they will fall back to the same implementation as `ESP_EARLY_LOGx` macros.

To override default verbosity level at file or component scope, define the `LOG_LOCAL_LEVEL` macro.

At file scope, define it before including `esp_log.h`, e.g:

```c
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component makefile:

```c
CFLAGS += -D LOG_LOCAL_LEVEL=ESP_LOG_DEBUG
```

To configure logging output per module at runtime, add calls to the function `esp_log_level_set()` as follows:

```c
esp_log_level_set("*", ESP_LOG_ERROR); // set all components to ERROR level
esp_log_level_set("wifi", ESP_LOG_WARN); // enable WARN logs from WiFi stack
esp_log_level_set("dhcpc", ESP_LOG_INFO); // enable INFO logs from DHCP client
```
**Logging to Host via JTAG**  By default, the logging library uses the `vprintf`-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section *Logging to Host*.

**Application Example**  
The logging library is commonly used by most esp-idf components and examples. For demonstration of log functionality, check ESP-IDF’s examples directory. The most relevant examples that deal with logging are the following:

- `system/ota`
- `storage/sd_card`
- `protocols/https_request`

**API Reference**  

**Header File**

- `log/include/esp_log.h`

**Functions**

`void esp_log_level_set(const char *tag, esp_log_level_t level)`

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

Note that this function can not raise log level above the level set using `CONFIG_LOG_DEFAULT_LEVEL` setting in menuconfig.

To raise log level above the default one for a given file, define `LOG_LOCAL_LEVEL` to one of the `ESP_LOG_*` values, before including `esp_log.h` in this file.

**Parameters**

- `tag`: Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value `"*"` resets log level for all tags to the given value.
- `level`: Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

`vprintf_like_t esp_log_set_vprintf(vprintf_like_t func)`

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

**Return**  `func` old Function used for output.

**Parameters**

- `func`: new Function used for output. Must have same signature as `vprintf`.

`uint32_t esp_log_timestamp(void)`

Function which returns timestamp to be used in log output.

This function is used in expansion of `ESP_LOGx` macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

**Return**  `timestamp`, in milliseconds

`uint32_t esp_log_early_timestamp(void)`

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.
Return timestamp, in milliseconds

```c
void esp_log_write (esp_log_level_t level, const char *tag, const char *format, ...)  
```

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.

This function or these macros should not be used from an interrupt.

```c
void esp_log_writev (esp_log_level_t level, const char *tag, const char *format, va_list args)  
```

Write message into the log, va_list variant.

This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.

See esp_log_write()

### Macros

**ESP_LOG_BUFFER_HEX_LEVEL** (tag, buffer, buff_len, level)

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

**Parameters**

- `tag`: description tag
- `buffer`: Pointer to the buffer array
- `buff_len`: length of buffer in bytes
- `level`: level of the log

**ESP_LOG_BUFFER_CHAR_LEVEL** (tag, buffer, buff_len, level)

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

**Parameters**

- `tag`: description tag
- `buffer`: Pointer to the buffer array
- `buff_len`: length of buffer in bytes
- `level`: level of the log

**ESP_LOG_BUFFER.HEXDUMP** (tag, buffer, buff_len, level)

Dump a buffer to the log at specified level.

The dump log shows just like the one below:

```
W (195) log_example: 0x3ffb4280 45 53 50 33 32 20 69 73 20 67 72 65 61 74 20 6c 6f 6e 67 72 61 69 76 65 72 69 6e 67 20 "ESP32 is great, | working along with "the IDF.")
```

It is highly recommend to use terminals with over 102 text width.

**Parameters**

- `tag`: description tag
- `buffer`: Pointer to the buffer array
- `buff_len`: length of buffer in bytes
- `level`: level of the log

**ESP_LOG_BUFFER_HEX** (tag, buffer, buff_len)

Log a buffer of hex bytes at Info level.

See esp_log_buffer_hex_level

**Parameters**

- `tag`: description tag
- `buffer`: Pointer to the buffer array
- `buff_len`: length of buffer in bytes
**ESP_LOG_BUFFER_CHAR** (tag, buffer, buff_len)
Log a buffer of characters at Info level. Buffer should contain only printable characters.

See esp_log_buffer_char_level

Parameters
- tag: description tag
- buffer: Pointer to the buffer array
- buff_len: length of buffer in bytes

**ESP_EARLY_LOGE** (tag, format, ...)
Macro to output logs in startup code, before heap allocator and syscalls have been initialized. Log at ESP_LOG_ERROR level.

See printf, ESP_LOGE

**ESP_EARLY_LOGW** (tag, format, ...)
Macro to output logs in startup code at ESP_LOG_WARN level.

See ESP_EARLY_LOGE, ESP_LOGE, printf

**ESP_EARLY_LOGI** (tag, format, ...)
Macro to output logs in startup code at ESP_LOG_INFO level.

See ESP_EARLY_LOGE, ESP_LOGE, printf

**ESP_EARLY_LOGD** (tag, format, ...)
Macro to output logs in startup code at ESP_LOG_DEBUG level.

See ESP_EARLY_LOGE, ESP_LOGE, printf

**ESP_EARLY_LOGV** (tag, format, ...)
Macro to output logs in startup code at ESP_LOG_VERBOSE level.

See ESP_EARLY_LOGE, ESP_LOGE, printf

**ESP_LOG_EARLY_IMPL** (tag, format, log_level, log_tag_letter, ...)
Runtime macro to output logs at a specified level.

See printf

Parameters
- tag: tag of the log, which can be used to change the log level by esp_log_level_set at runtime.
- level: level of the output log.
- format: format of the output log. see printf
- . . . : variables to be replaced into the log. see printf

**ESP_LOG_LEVEL_LOCAL** (level, tag, format, ...)
Runtime macro to output logs at a specified level. Also check the level with LOG_LOCAL_LEVEL.

See printf, ESP_LOG_LEVEL

**Type Definitions**

typedef int (*vprintf_like_t)(const char *, va_list)
Enumerations

\textbf{enum esp\_log\_level\_t}

Log level.

\begin{itemize}
    \item \textbf{ESP\_LOG\_NONE}
        \begin{itemize}
            \item No log output
        \end{itemize}
    \item \textbf{ESP\_LOG\_ERROR}
        \begin{itemize}
            \item Critical errors, software module can not recover on its own
        \end{itemize}
    \item \textbf{ESP\_LOG\_WARN}
        \begin{itemize}
            \item Error conditions from which recovery measures have been taken
        \end{itemize}
    \item \textbf{ESP\_LOG\_INFO}
        \begin{itemize}
            \item Information messages which describe normal flow of events
        \end{itemize}
    \item \textbf{ESP\_LOG\_DEBUG}
        \begin{itemize}
            \item Extra information which is not necessary for normal use (values, pointers, sizes, etc).
        \end{itemize}
    \item \textbf{ESP\_LOG\_VERBOSE}
        \begin{itemize}
            \item Bigger chunks of debugging information, or frequent messages which can potentially flood the output.
        \end{itemize}
\end{itemize}

2.7.12 Event Loop Library

Overview

The event loop library allows components to declare events to which other components can register handlers – code which will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the wifi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

Using \texttt{esp\_event} APIs

There are two objects of concern for users of this library: events and event loops.

Events are occurrences of note. For example, for WiFi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more \texttt{here}. Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop library APIs.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as \texttt{esp\_event\_handler\_t}.
2. An event loop is created using \texttt{esp\_event\_loop\_create()}, which outputs a handle to the loop of type \texttt{esp\_event\_loop\_handle\_t}. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed \texttt{here}.
3. Components register event handlers to the loop using \texttt{esp\_event\_handler\_register\_with()}. Handlers can be registered with multiple loops, more on that \texttt{here}.
4. Event sources post an event to the loop using \texttt{esp\_event\_post\_to()}.
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using \texttt{esp\_event\_handler\_unregister\_with()}.
6. Event loops which are no longer needed can be deleted using \texttt{esp\_event\_loop\_delete()}.

In code, the flow above may look like as follows:
// 1. Define the event handler

void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void* event_data)
{
    // Event handler logic
}

void app_main()
{
    // 2. A configuration structure of type esp_event_loop_args_t is needed to
    //     specify the properties of the loop to be
    //     created. A handle of type esp_event_loop_handle_t is obtained, which is
    //     needed by the other APIs to reference the loop
    //     to perform their operations on.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...
    };

    esp_event_loop_handle_t loop_handle;
    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID
    //     specifies a hypothetical
    //     event that handler run_on_event should execute on when it gets posted to
    //     the loop.
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event, ...);

    ...

    // 4. Post events to the loop. This queues the event on the event loop. At
    //     some point in time
    //     the event loop executes the event handler registered to the posted event,
    //     in this case run_on_event.
    //     For simplicity sake this example calls esp_event_post_to from app_main, but
    //     posting can be done from
    //     any other tasks (which is the more interesting use case).
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

    ...

    // 5. Unregistering an unneeded handler
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event);

    ...

    // 6. Deleting an unneeded event loop
    esp_event_loop_delete(loop_handle);
}

### Declaring and defining events

As mentioned previously, events consists of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person’s last name and first name, respectively. A last name identifies a family, and the first name
identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```

Event base definition:

```
ESP_EVENT_DEFINE_BASE(EVENT_BASE)
```

**Note:** In IDF, the base identifiers for system events are uppercase and are postfixed with \_EVENT. For example, the base for wifi events is declared and defined as WiFi\_EVENT, the ethernet event base Ethernet\_EVENT, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros ESP\_EVENT\_DECLARE\_BASE and ESP\_EVENT\_DEFINE\_BASE).

For event ID’s, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```
enum {
  EVENT\_ID\_1,
  EVENT\_ID\_2,
  EVENT\_ID\_3,
  ...
}
```

**Default Event Loop**

The default event loop is a special type of loop used for system events (WiFi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loop equivalent.

<table>
<thead>
<tr>
<th>User Event Loops</th>
<th>Default Event Loops</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_event_loop_create()</td>
<td>esp_event_loop_create_default()</td>
</tr>
<tr>
<td>esp_event_loop_delete()</td>
<td>esp_event_loop_delete_default()</td>
</tr>
<tr>
<td>esp_event_handler_register_with()</td>
<td>esp_event_handler_register()</td>
</tr>
<tr>
<td>esp_event_handler_unregister_with()</td>
<td>esp_event_handler_unregister()</td>
</tr>
<tr>
<td>esp_event_post_to()</td>
<td>esp_event_post()</td>
</tr>
</tbody>
</table>

If you compare the signatures for both, they are mostly similar except the for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

**Notes on Handler Registration**

It is possible to register a single handler to multiple events individually, i.e. using multiple calls to esp\_event\_handler\_register\_with(). For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier ESP\_EVENT\_ANY\_BASE and...
special event ID ESP_EVENT_ANY_ID. These special identifiers may be passed as the event base and event ID arguments for `esp_event_handler_register_with()`.

Therefore, the valid arguments to `esp_event_handler_register_with()` are:

1. `<event base>, <event ID>` - handler executes when the event with base `<event base>` and event ID `<event ID>` gets posted to the loop
2. `<event base>, ESP_EVENT_ANY_ID` - handler executes when any event with base `<event base>` gets posted to the loop
3. ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```c
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID, run_on_event_3, ...);
```

If the hypothetical event MY_EVENT_BASE, MY_EVENT_ID is posted, all three handlers run_on_event_1, run_on_event_2, and run_on_event_3 would execute.

If the hypothetical event MY_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only run_on_event_2 and run_on_event_3 would execute.

If the hypothetical event MY_OTHER_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only run_on_event_3 would execute.

**Handler Registration and Handler Dispatch Order** The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also get executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

**Event loop profiling**

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

**Application Example**

Examples on using the esp_event library can be found in `system/esp_event`. The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt esp_event library:

- NMEA Parser, which will decode the statements received from GPS.

**API Reference**

**Header File**

- `esp_event/include/esp_event.h`
Functions

```c
esp_err_t esp_event_loop_create(const esp_event_loop_args_t *event_loop_args,
                                 esp_event_loop_handle_t *event_loop)
```

Create a new event loop.

**Return**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: `event_loop_args` or `event_loop` was NULL
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

**Parameters**

- `[in]` `event_loop_args`: configuration structure for the event loop to create
- `[out]` `event_loop`: handle to the created event loop

```c
esp_err_t esp_event_loop_delete(esp_event_loop_handle_t event_loop)
```

Delete an existing event loop.

**Return**

- ESP_OK: Success
- Others: Fail

**Parameters**

- `[in]` `event_loop`: event loop to delete, must not be NULL

```c
esp_err_t esp_event_loop_create_default()
```

Create default event loop.

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

```c
esp_err_t esp_event_loop_delete_default()
```

Delete the default event loop.

**Return**

- ESP_OK: Success
- Others: Fail

```c
esp_err_t esp_event_loop_run(esp_event_loop_handle_t event_loop, TickType_t ticks_to_run)
```

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in `event_loop_args` argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all of the allotted time waiting on the event queue. Once an event has been unqueued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the unqueued event, and (2) during dispatch of the unqueued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last unqueued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

**Note** encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

**Return**

- ESP_OK: Success
- Others: Fail

**Parameters**

- `[in]` `event_loop`: event loop to dispatch posted events from, must not be NULL
• [in] ticks_to_run: number of ticks to run the loop

```c
esp_err_t esp_event_handler_register(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to the system event loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

**Note** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called.

**Return**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

**Parameters**
- [in] event_base: the base id of the event to register the handler for
- [in] event_id: the id of the event to register the handler for
- [in] event_handler: the handler function which gets called when the event is dispatched
- [in] event_handler_arg: data, aside from event data, that is passed to the handler when it is called

```c
esp_err_t esp_event_handler_register_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to a specific loop.

This function behaves in the same manner as esp_event_handler_register, except the additional specification of the event loop to register the handler to.

**Note** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called.

**Return**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

**Parameters**
- [in] event_loop: the event loop to register this handler function to, must not be NULL
- [in] event_base: the base id of the event to register the handler for
- [in] event_id: the id of the event to register the handler for
- [in] event_handler: the handler function which gets called when the event is dispatched
- [in] event_handler_arg: data, aside from event data, that is passed to the handler when it is called

```c
esp_err_t esp_event_handler_unregister(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)
```

Unregister a handler with the system event loop.

Unregisters a handler so it will no longer be called during dispatch. Handlers can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler, the event_base and event_id arguments must match exactly the arguments passed to esp_event_handler_register() when that
handler was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unreg-
ister handlers that were registered with the same wildcard arguments.

**Note** When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will
not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will
also not be unregistered. This avoids accidental unregistration of handlers registered by other users or
components.

**Return** ESP_OK success

**Return** ESP_ERR_INVALID_ARG invalid combination of event base and event id

**Return** others fail

**Parameters**

• [in] event_base: the base of the event with which to unregister the handler

• [in] event_id: the id of the event with which to unregister the handler

• [in] event_handler: the handler to unregister

```c
esp_err_t esp_event_handler_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)
```

Unregister a handler with the system event loop.

This function behaves in the same manner as esp_event_handler_unregister, except the additional specification
of the event loop to unregister the handler with.

**Return**

• ESP_OK: Success

• ESP_ERR_INVALID_ARG: Invalid combination of event base and event id

• Others: Fail

**Parameters**

• [in] event_loop: the event loop with which to unregister this handler function, must not be
  NULL

• [in] event_base: the base of the event with which to unregister the handler

• [in] event_id: the id of the event with which to unregister the handler

• [in] event_handler: the handler to unregister

```c
esp_err_t esp_event_post(esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the system default event loop. The event loop library keeps a copy of event_data and manages
the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler recieves is
always valid.

**Return**

• ESP_OK: Success

• ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting
  from ISR

• ESP_ERR_INVALID_ARG: Invalid combination of event base and event id

• Others: Fail

**Parameters**

• [in] event_base: the event base that identifies the event

• [in] event_id: the event id that identifies the event

• [in] event_data: the data, specific to the event occurrence, that gets passed to the handler

• [in] event_data_size: the size of the event data

• [in] ticks_to_wait: number of ticks to block on a full event queue

```c
esp_err_t esp_event_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages
the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler recieves is always
valid.

This function behaves in the same manner as esp_event_post_to, except the additional specification of the event
loop to post the event to.
**Return**

- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event id
- Others: Fail

**Parameters**

- **[in]** event_loop: the event loop to post to, must not be NULL
- **[in]** event_base: the event base that identifies the event
- **[in]** event_id: the event id that identifies the event
- **[in]** event_data: the data, specific to the event occurrence, that gets passed to the handler
- **[in]** event_data_size: the size of the event data
- **[in]** ticks_to_wait: number of ticks to block on a full event queue

```c
esp_err_t esp_event_dump(FILE *file)
```

Dumps statistics of all event loops.

Dumps event loop info in the format:

```
event loop
 handler
 handler
 ...
 event loop
 handler
 handler
 ...
```

where:

```
event loop
 format: address, name rx: total_recieved dr: total_dropped
 where:
 address - memory address of the event loop
 name - name of the event loop, 'none' if no dedicated task
 total_recieved - number of successfully posted events
 total_dropped - number of events unsuccessfully posted due to queue being full
```

```
handler
 format: address ev: base, id inv: total_invoked run: total_runtime
 where:
 address - address of the handler function
 base, id - the event specified by event base and id this handler executes
 total_invoked - number of times this handler has been invoked
 total_runtime - total amount of time used for invoking this handler
```

**Note** this function is a noop when CONFIG_ESP_EVENT_LOOP_PROFILING is disabled

**Return**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- Others: Fail

**Parameters**

- **[in]** file: the file stream to output to

**Structures**

```c
struct esp_event_loop_args_t
```

Configuration for creating event loops.
Public Members

```c
int32_t queue_size
size of the event loop queue

const char *task_name
name of the event loop task; if NULL, a dedicated task is not created for event loop

UBaseType_t task_priority
priority of the event loop task, ignored if task name is NULL

uint32_t task_stack_size
stack size of the event loop task, ignored if task name is NULL

BaseType_t task_core_id
core to which the event loop task is pinned to, ignored if task name is NULL
```

Header File

- esp_event/include/esp_event_base.h

Macros

```c
ESP_EVENT_DECLARE_BASE(id)
ESP_EVENT_DEFINE_BASE(id)
ESP_EVENT_ANY_BASE
register handler for any event base
ESP_EVENT_ANY_ID
register handler for any event id
```

Type Definitions

```c
typedef const char *esp_event_base_t
unique pointer to a subsystem that exposes events
typedef void *esp_event_loop_handle_t
a number that identifies an event with respect to a base
typedef void (*esp_event_handler_t)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
function called when an event is posted to the queue
```

Related Documents

Legacy event loop

API Reference

Header File

- esp_event/include/esp_event_legacy.h

Functions

```c
esp_err_t esp_event_send(system_event_t *event)
Send a event to event task.
```

Other task/modules, such as the tcpip_adapter, can call this API to send an event to event task

**Note** This API is part of the legacy event system. New code should use event library API in esp_event.h
Return  ESP_OK : succeed
Return  others : fail
Parameters
  • event: Event to send

`esp_err_t esp_event_process_default (system_event_t *event)`
Default event handler for system events.

This function performs default handling of system events. When using esp_event_loop APIs, it is called automatically before invoking the user-provided callback function.

Note  This API is part of the legacy event system. New code should use event library API in esp_event.h
Applications which implement a custom event loop must call this function as part of event processing.

Return  ESP_OK if an event was handled successfully
Parameters
  • event: pointer to event to be handled

`void esp_event_set_default_eth_handlers ()`
Install default event handlers for Ethernet interface.

Note  This API is part of the legacy event system. New code should use event library API in esp_event.h

`void esp_event_set_default_wifi_handlers ()`
Install default event handlers for Wi-Fi interfaces (station and AP)

Note  This API is part of the legacy event system. New code should use event library API in esp_event.h

`esp_err_t esp_event_loop_init (system_event_cb_t cb, void *ctx)`
Initialize event loop.

Create the event handler and task

Note  This API is part of the legacy event system. New code should use event library API in esp_event.h

Return
  • ESP_OK: succeed
  • others: fail
Parameters
  • cb: application specified event callback, it can be modified by call esp_event_set_cb
  • ctx: reserved for user

`system_event_cb_t esp_event_loop_set_cb (system_event_cb_t cb, void *ctx)`
Set application specified event callback function.

Note  This API is part of the legacy event system. New code should use event library API in esp_event.h
Attention  1. If cb is NULL, means application don’t need to handle If cb is not NULL, it will be call when an event is received, after the default event callback is completed

Return  old callback
Parameters
  • cb: application callback function
  • ctx: argument to be passed to callback

Unions

`union system_event_info_t`
#include <esp_event_legacy.h> Union of all possible system_event argument structures

Public Members

`system_event_sta_connected_t connected`
ESP32 station connected to AP

`system_event_sta_disconnected_t disconnected`
ESP32 station disconnected to AP
system_event_sta_scan_done_t scan_done
    ESP32 station scan (APs) done

system_event_sta_authmode_change_t auth_change
    the auth mode of AP ESP32 station connected to changed

system_event_sta_got_ip_t got_ip
    ESP32 station got IP, first time got IP or when IP is changed

system_event_sta_wps_er_pin_t sta_er_pin
    ESP32 station WPS enrollee mode PIN code received

system_event_sta_wps_fail_reason_t sta_er_fail_reason
    ESP32 station WPS enrollee mode failed reason code received

system_event_sta_wps_er_success_t sta_er_success
    ESP32 station WPS enrollee success

system_event_ap_staconnected_t sta_connected
    a station connected to ESP32 soft-AP

system_event_ap_stadisconnected_t sta_disconnected
    a station disconnected to ESP32 soft-AP

system_event_ap_probe_req_rx_t ap_probereqrecved
    ESP32 soft-AP receive probe request packet

system_event_ap_staipassigned_t ap_staiassigned
    ESP32 soft-AP assign an IP to the station

system_event_got_ip6_t got_ip6
    ESP32 station got IPv6 or or ap or ethernet ipv6 addr state change to preferred

Structures
struct system_event_t
    Event, as a tagged enum

Public Members

system_event_id_t event_id
    event ID

system_event_info_t event_info
    event information

Macros
SYSTEM_EVENT_AP_STA_GOT_IP6

Type Definitions
typedef wifi_event_sta_wps_fail_reason_t system_event_sta_wps_fail_reason_t
    Argument structure of SYSTEM_EVENT_STA_WPS_ER_FAILED event

typedef wifi_event_sta_scan_done_t system_event_sta_scan_done_t
    Argument structure of SYSTEM_EVENT_SCAN_DONE event

typedef wifi_event_sta_connected_t system_event_sta_connected_t
    Argument structure of SYSTEM_EVENT_STA_CONNECTED event

typedef wifi_event_sta_disconnected_t system_event_sta_disconnected_t
    Argument structure of SYSTEM_EVENT_STA_DISCONNECTED event

typedef wifi_event_sta_authmode_change_t system_event_sta_authmode_change_t
    Argument structure of SYSTEM_EVENT_STA_AUTHMODE_CHANGE event
typedef wifi_event_sta_wps_er_pin_t system_event_sta_wps_er_pin_t
  Argument structure of SYSTEM_EVENT_STA_WPS_ER_PIN event

dtypedef wifi_event_sta_wps_er_success_t system_event_sta_wps_er_success_t
  Argument structure of SYSTEM_EVENT_STA_WPS_ER_PIN event

typedef wifi_event_ap_staconnected_t system_event_ap_staconnected_t
  Argument structure of event

typedef wifi_event_ap_stadisconnected_t system_event_ap_stadisconnected_t
  Argument structure of event

typedef wifi_event_ap_probe_req_rx_t system_event_ap_probe_req_rx_t
  Argument structure of event

typedef ip_event_ap_staipassigned_t system_event_ap_staipassigned_t
  Argument structure of event

typedef ip_event_ap_staipassigned_t system_event_ap_staipassigned_t
  Argument structure of event

typedef esp_err_t (* system_event_handler_t)(system_event_t *event)
  Event handler function type

typedef esp_err_t (* system_event_cb_t)(void *ctx, system_event_t *event)
  Application specified event callback function.

Note This API is part of the legacy event system. New code should use event library API in esp_event.h

Return
  • ESP_OK: succeed
  • others: fail

Parameters
  • ctx: reserved for user
  • event: event type defined in this file

Enumerations
enum system_event_id_t
  System event types enumeration

Values:

SYSTEM_EVENT_WIFI_READY = 0
  ESP32 WiFi ready

SYSTEM_EVENT_SCAN_DONE
  ESP32 finish scanning AP

SYSTEM_EVENT_STA_START
  ESP32 station start

SYSTEM_EVENT_STA_STOP
  ESP32 station stop

SYSTEM_EVENT_STA_CONNECTED
  ESP32 station connected to AP

SYSTEM_EVENT_STA_DISCONNECTED
  ESP32 station disconnected from AP

SYSTEM_EVENT_STA_AUTHMODE_CHANGE
  the auth mode of AP connected by ESP32 station changed

SYSTEM_EVENT_STA_GOT_IP
  ESP32 station got IP from connected AP
Chapter 2. API Reference

2.7.13 Application Level Tracing

Overview

IDF provides useful feature for program behaviour analysis: application level tracing. It is implemented in the corresponding library and can be enabled via menuconfig. This feature allows to transfer arbitrary data between host and ESP32 via JTAG interface with small overhead on program execution. Developers can use this library to send

```c
SYSTEM_EVENT_STA_LOST_IP
ESP32 station lost IP and the IP is reset to 0

SYSTEM_EVENT_STA_WPS_ER_SUCCESS
ESP32 station wps succeeds in enrollee mode

SYSTEM_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode

SYSTEM_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wps timeout in enrollee mode

SYSTEM_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode

SYSTEM_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wps overlap in enrollee mode

SYSTEM_EVENT_AP_START
ESP32 soft-AP start

SYSTEM_EVENT_AP_STOP
ESP32 soft-AP stop

SYSTEM_EVENT_AP_STACONNECTED
a station connected to ESP32 soft-AP

SYSTEM_EVENT_AP_STADISCONNECTED
a station disconnected from ESP32 soft-AP

SYSTEM_EVENT_AP_STAIPASSIGNED
ESP32 soft-AP assign an IP to a connected station

SYSTEM_EVENT_AP_PROBEREQRECVED
Receive probe request packet in soft-AP interface

SYSTEM_EVENT_STA_BEACON_TIMEOUT
ESP32 station beacon timeout

SYSTEM_EVENT_GOT_IP6
ESP32 station or ap or ethernet interface v6IP addr is preferred

SYSTEM_EVENT_ETH_START
ESP32 ethernet start

SYSTEM_EVENT_ETH_STOP
ESP32 ethernet stop

SYSTEM_EVENT_ETH_CONNECTED
ESP32 ethernet phy link up

SYSTEM_EVENT_ETH_DISCONNECTED
ESP32 ethernet phy link down

SYSTEM_EVENT_ETH_GOT_IP
ESP32 ethernet got IP from connected AP

SYSTEM_EVENT_MAX
Number of members in this enum
```
application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see Application Specific Tracing
2. Lightweight logging to the host, see Logging to Host
3. System behaviour analysis, see System Behavior Analysis with SEGGER SystemView

API Reference

Header File

- `app_trace/include/esp_app_trace.h`

Functions

```c
esp_err_t esp_apptrace_init()
```

Initializes application tracing module.

**Note** Should be called before any `esp_apptrace_xxx` call.

**Return** ESP_OK on success, otherwise see `esp_err_t`

```c
void esp_apptrace_down_buffer_config(uint8_t *buf, uint32_t size)
```

Configures down buffer.

**Note** Needs to be called before initiating any data transfer using `esp_apptrace_buffer_get` and `esp_apptrace_write`. This function does not protect internal data by lock.

**Parameters**

- `buf`: Address of buffer to use for down channel (host to target) data.
- `size`: Size of the buffer.

```c
uint8_t *esp_apptrace_buffer_get(esp_apptrace_dest_t dest, uint32_t size, uint32_t tmo)
```

Allocates buffer for trace data. After data in buffer are ready to be sent off `esp_apptrace_buffer_put` must be called to indicate it.

**Return** non-NULL on success, otherwise NULL.

**Parameters**

- `dest`: Indicates HW interface to send data.
- `size`: Size of data to write to trace buffer.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

```c
esp_err_t esp_apptrace_buffer_put(esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)
```

Indicates that the data in buffer are ready to be sent off. This function is a counterpart of and must be preceded by `esp_apptrace_buffer_get`.

**Return** ESP_OK on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to send data. Should be identical to the same parameter in call to `esp_apptrace_buffer_get`.
- `ptr`: Address of trace buffer to release. Should be the value returned by call to `esp_apptrace_buffer_get`.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

```c
esp_err_t esp_apptrace_write(esp_apptrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)
```

Writes data to trace buffer.

**Return** ESP_OK on success, otherwise see `esp_err_t`

**Parameters**

- `dest`: Indicates HW interface to send data.
- `data`: Address of data to write to trace buffer.
- `size`: Size of data to write to trace buffer.
- `tmo`: Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.
int esp_apptrace_vprintf_to(esp_apptrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)

vprintf-like function to send log messages to host via specified HW interface.

Return Number of bytes written.

Parameters
- dest: Indicates HW interface to send data.
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
- fmt: Address of format string.
- ap: List of arguments.

int esp_apptrace_vprintf(const char *fmt, va_list ap)

vprintf-like function to send log messages to host.

Return Number of bytes written.

Parameters
- fmt: Address of format string.
- ap: List of arguments.

esp_err_t esp_apptrace_flush(esp_apptrace_dest_t dest, uint32_t tmo)

Flushes remaining data in trace buffer to host.

Return ESP_OK on success, otherwise see esp_err_t

Parameters
- dest: Indicates HW interface to flush data on.
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_apptrace_flush_nolock(esp_apptrace_dest_t dest, uint32_t min_sz, uint32_t tmo)

Flushes remaining data in trace buffer to host without locking internal data. This is special version of esp_apptrace_flush which should be called from panic handler.

Return ESP_OK on success, otherwise see esp_err_t

Parameters
- dest: Indicates HW interface to flush data on.
- min_sz: Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_apptrace_read(esp_apptrace_dest_t dest, void *data, uint32_t *size, uint32_t tmo)

Reads host data from trace buffer.

Return ESP_OK on success, otherwise see esp_err_t

Parameters
- dest: Indicates HW interface to read the data on.
- data: Address of buffer to put data from trace buffer.
- size: Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

uint8_t *esp_apptrace_down_buffer_get(esp_apptrace_dest_t dest, uint32_t *size, uint32_t tmo)

Retrieves incoming data buffer if any. After data in buffer are processed esp_apptrace_down_buffer_put must be called to indicate it.

Return non-NULL on success, otherwise NULL.

Parameters
- dest: Indicates HW interface to receive data.
- size: Address to store size of available data in down buffer. Must be initialized with requested value.
- tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

esp_err_t esp_apptrace_down_buffer_put(esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in down buffer are processed. This function is a counterpart of and must be preceded by esp_apptrace_down_buffer_get.

Return ESP_OK on success, otherwise see esp_err_t

Parameters
• dest: Indicates HW interface to receive data. Should be identical to the same parameter in call to esp_apptrace_down_buffer_get.
• ptr: Address of trace buffer to release. Should be the value returned by call to esp_apptrace_down_buffer_get.
• tmo: Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

bool esp_apptrace_host_is_connected(esp_apptrace_dest_t dest)
Checks whether host is connected.
Parameters
• dest: Indicates HW interface to use.

void *esp_apptrace_fopen(esp_apptrace_dest_t dest, const char *path, const char *mode)
Opens file on host. This function has the same semantic as ‘fopen’ except for the first argument.
Parameters
• dest: Indicates HW interface to use.
• path: Path to file.
• mode: Mode string. See fopen for details.

int esp_apptrace_fclose(esp_apptrace_dest_t dest, void *stream)
Closes file on host. This function has the same semantic as ‘fclose’ except for the first argument.
Parameters
• dest: Indicates HW interface to use.
• stream: File handle returned by esp_apptrace_fopen.

size_t esp_apptrace_fwrite(esp_apptrace_dest_t dest, const void *ptr, size_t size, size_t nmemb, void *stream)
Writes to file on host. This function has the same semantic as ‘fwrite’ except for the first argument.
Parameters
• dest: Indicates HW interface to use.
• ptr: Address of data to write.
• size: Size of an item.
• nmemb: Number of items to write.
• stream: File handle returned by esp_apptrace_fopen.

size_t esp_apptrace_fread(esp_apptrace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)
Read file on host. This function has the same semantic as ‘fread’ except for the first argument.
Parameters
• dest: Indicates HW interface to use.
• ptr: Address to store read data.
• size: Size of an item.
• nmemb: Number of items to read.
• stream: File handle returned by esp_apptrace_fopen.

int esp_apptrace_fseek(esp_apptrace_dest_t dest, void *stream, long offset, int whence)
Set position indicator in file on host. This function has the same semantic as ‘fseek’ except for the first argument.
Parameters
• dest: Indicates HW interface to use.
• stream: File handle returned by esp_apptrace_fopen.
• offset: Offset. See fseek for details.
• whence: Position in file. See fseek for details.
int esp_apptrace_ftell (esp_apptrace_dest_t dest, void *stream)

Get current position indicator for file on host. This function has the same semantic as `ftell` except for the first argument.

**Return** Current position in file. See `ftell` for details.

**Parameters**
- `dest`: Indicates HW interface to use.
- `stream`: File handle returned by `esp_apptrace_fopen`.

int esp_apptrace_fstop (esp_apptrace_dest_t dest)

Indicates to the host that all file operations are completed. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

**Return** ESP_OK on success, otherwise see `esp_err_t`

**Parameters**
- `dest`: Indicates HW interface to use.

void esp_gcov_dump (void)

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

**Enumerations**

```c
enum esp_apptrace_dest_t
```

Application trace data destinations bits.

**Values**:

- `ESP_APTRACE_DEST_TRAX` = 0x1
  
  JTAG destination.

- `ESP_APTRACE_DEST_UART0` = 0x2
  
  UART destination.

**Header File**

- `app_trace/include/esp_sysview_trace.h`

**Functions**

```c
static esp_err_t esp_sysview_flush (uint32_t tmo)
```

Flushes remaining data in SystemView trace buffer to host.

**Return** ESP_OK.

**Parameters**
- `tmo`: Timeout for operation (in us). Use `ESP_APTRACE_TMO_INFINITE` to wait indefinitely.

```c
int esp_sysview_vprintf (const char *format, va_list args)
```

vprintf-like function to sent log messages to the host.

**Return** Number of bytes written.

**Parameters**
- `format`: Address of format string.
- `args`: List of arguments.

```c
esp_err_t esp_sysview_heap_trace_start (uint32_t tmo)
```

Starts SystemView heap tracing.

**Return** ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.

**Parameters**
- `tmo`: Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

```c
esp_err_t esp_sysview_heap_trace_stop (void)
```

Stops SystemView heap tracing.

**Return** ESP_OK.
void esp_sysview_heap_trace_alloc (void *addr, size_t size, const void *callers)

Sends heap allocation event to the host.

Parameters
  • addr: Address of allocated block.
  • size: Size of allocated block.
  • callers: Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

void esp_sysview_heap_trace_free (void *addr, const void *callers)

Sends heap de-allocation event to the host.

Parameters
  • addr: Address of de-allocated block.
  • callers: Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

2.7.14 Power Management

Overview

Power management algorithm included in ESP-IDF can adjust the advanced peripheral bus (APB) frequency, CPU frequency, and put the chip into light sleep mode to run an application at smallest possible power consumption, given the requirements of application components.

Application components can express their requirements by creating and acquiring power management locks.

For example:

• Driver for a peripheral clocked from APB can request the APB frequency to be set to 80 MHz while the peripheral is used.
• RTOS can request the CPU to run at the highest configured frequency while there are tasks ready to run.
• A peripheral driver may need interrupts to be enabled, which means it will have to request disabling light sleep.

Since requesting higher APB or CPU frequencies or disabling light sleep causes higher current consumption, please keep the usage of power management locks by components to a minimum.

Configuration

Power management can be enabled at compile time, using the option CONFIG_PM_ENABLE.

Enabling power management features comes at the cost of increased interrupt latency. Extra latency depends on a number of factors, such as the CPU frequency, single/dual core mode, whether or not frequency switch needs to be done. Minimum extra latency is 0.2 us (when the CPU frequency is 240 MHz and frequency scaling is not enabled). Maximum extra latency is 40 us (when frequency scaling is enabled, and a switch from 40 MHz to 80 MHz is performed on interrupt entry).

Dynamic frequency scaling (DFS) and automatic light sleep can be enabled in an application by calling the function esp_pm_configure(). Its argument is a structure defining the frequency scaling settings, esp_pm_config_esp32_t. In this structure, three fields need to be initialized:

• max_freq_mhz: Maximum CPU frequency in MHz, i.e., the frequency used when the ESP_PM_CPU_FREQ_MAX lock is acquired. This field will usually be set to CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ.
• min_freq_mhz: Minimum CPU frequency in MHz, i.e., the frequency used when only the ESP_PM_APB_FREQ_MAX lock is acquired. This field can be set to the XTAL frequency value, or the XTAL frequency divided by an integer. Note that 10 MHz is the lowest frequency at which the default REF_TICK clock of 1 MHz can be generated.
• light_sleep_enable: Whether the system should automatically enter light sleep when no locks are acquired (true/false).
Alternatively, if you enable the option `CONFIG_PM_DFS_INIT_AUTO` in menuconfig, the maximum CPU frequency will be determined by the `CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ` setting, and the minimum CPU frequency will be locked to the XTAL frequency.

**Note:** Automatic light sleep is based on FreeRTOS Tickless Idle functionality. If automatic light sleep is requested while the option `CONFIG_FREERTOS_USE_TICKLESS_IDLE` is not enabled in menuconfig, `esp_pm_configure()` will return the error `ESP_ERR_NOT_SUPPORTED`.

**Note:** In light sleep, peripherals are clock gated, and interrupts (from GPIOs and internal peripherals) will not be generated. A wakeup source described in the *Sleep Modes* documentation can be used to trigger wakeup from the light sleep state. For example, the EXT0 and EXT1 wakeup sources can be used to wake up the chip via a GPIO.

**Power Management Locks**

Applications have the ability to acquire/release locks in order to control the power management algorithm. When an application acquires a lock, the power management algorithm operation is restricted in a way described below. When the lock is released, such restrictions are removed.

Power management locks have acquire/release counters. If the lock has been acquired a number of times, it needs to be released the same number of times to remove associated restrictions.

ESP32 supports three types of locks described in the table below.

<table>
<thead>
<tr>
<th>Lock</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_PM_CPU_FREQ_MAX</td>
<td>Requests CPU frequency to be at the maximum value set with <code>esp_pm_configure()</code>. For ESP32, this value can be set to 80 MHz, 160 MHz, or 240 MHz.</td>
</tr>
<tr>
<td>ESP_PM_APB_FREQ_MAX</td>
<td>Requests the APB frequency to be at the maximum supported value. For ESP32, this is 80 MHz.</td>
</tr>
<tr>
<td>ESP_PM_NO_LIGHT_SLEEP</td>
<td>Disables automatic switching to light sleep.</td>
</tr>
</tbody>
</table>

**ESP32 Power Management Algorithm**

The table below shows how CPU and APB frequencies will be switched if dynamic frequency scaling is enabled. You can specify the maximum CPU frequency with either `esp_pm_configure()` or `CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ`.
<table>
<thead>
<tr>
<th>Max CPU Frequency Set</th>
<th>Lock Acquisition</th>
<th>CPU and APB Frequencies</th>
</tr>
</thead>
<tbody>
<tr>
<td>240</td>
<td>Any of ESP_PM_CPU_FREQ_MAX or ESP_PM_APB_FREQ_MAX acquired</td>
<td>CPU: 240 MHz&lt;br&gt;APB: 80 MHz</td>
</tr>
<tr>
<td></td>
<td>None</td>
<td>Min values for both frequencies set with esp_pm_configure()</td>
</tr>
<tr>
<td>160</td>
<td>ESP_PM_CPU_FREQ_MAX acquired</td>
<td>CPU: 160 MHz&lt;br&gt;APB: 80 MHz</td>
</tr>
<tr>
<td></td>
<td>ESP_PM_CPU_FREQ_MAX acquired, ESP_PM_APB_FREQ_MAX not acquired</td>
<td>CPU: 80 MHz&lt;br&gt;APB: 80 MHz</td>
</tr>
<tr>
<td></td>
<td>None</td>
<td>Min values for both frequencies set with esp_pm_configure()</td>
</tr>
<tr>
<td>80</td>
<td>Any of ESP_PM_CPU_FREQ_MAX or ESP_PM_APB_FREQ_MAX acquired</td>
<td>CPU: 80 MHz&lt;br&gt;APB: 80 MHz</td>
</tr>
<tr>
<td></td>
<td>None</td>
<td>Min values for both frequencies set with esp_pm_configure()</td>
</tr>
</tbody>
</table>

If none of the locks are acquired, and light sleep is enabled in a call to `esp_pm_configure()`, the system will go into light sleep mode. The duration of light sleep will be determined by:

- FreeRTOS tasks blocked with finite timeouts
- Timers registered with `High resolution timer` APIs

Light sleep duration will be chosen to wake up the chip before the nearest event (task being unblocked, or timer elapses).

**Dynamic Frequency Scaling and Peripheral Drivers**

When DFS is enabled, the APB frequency can be changed multiple times within a single RTOS tick. The APB frequency change does not affect the work of some peripherals, while other peripherals may have issues. For example, Timer Group peripheral timers will keep counting, however, the speed at which they count will change proportionally to the APB frequency.

The following peripherals work normally even when the APB frequency is changing:

- **UART**: if REF_TICK is used as a clock source. See `use_ref_tick` member of `uart_config_t`.
- **LEDC**: if REF_TICK is used as a clock source. See `ledc_timer_config()` function.
- **RMT**: if REF_TICK is used as a clock source. Although the driver does not support REF_TICK, this feature can be enabled by clearing the `RMT_REF_ALWAYS_ON_CHx` bit for the respective channel.

Currently, the following peripheral drivers are aware of DFS and will use the ESP_PM_APB_FREQ_MAX lock for the duration of the transaction:

- SPI master
- I2C
• I2S (If the APPLL clock is used, then it will use the ESP_PM_NO_LIGHT_SLEEP lock)

• SDMMC

The following drivers will hold the ESP_PM_APB_FREQ_MAX lock while the driver is enabled:

• **SPI slave**: between calls to `spi_slave_initialize()` and `spi_slave_free()`.

• **Ethernet**: between calls to `esp_eth_driver_install()` and `esp_eth_driver_uninstall()`.

• **WiFi**: between calls to `esp_wifi_start()` and `esp_wifi_stop()`. If modem sleep is enabled, the lock will be released for the periods of time when radio is disabled.

• **Bluetooth**: between calls to `esp_bt_controller_enable()` and `esp_bt_controller_disable()`. If Bluetooth modem sleep is enabled, the ESP_PM_APB_FREQ_MAX lock will be released for the periods of time when radio is disabled. However the ESP_PM_NO_LIGHT_SLEEP lock will still be held, unless `CONFIG_BTDM_LOW_POWER_CLOCK` option is set to “External 32kHz crystal”.

• **CAN**: between calls to `can_driver_install()` and `can_driver_uninstall()`.

The following peripheral drivers are not aware of DFS yet. Applications need to acquire/release locks themselves, when necessary:

• MCPWM

• PCNT

• Sigma-delta

• Timer group

**API Reference**

**Header File**

- `esp_common/include/esp_pm.h`

**Functions**

```
esp_err_t esp_pm_configure(const void *config)
```

Set implementation-specific power management configuration.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the configuration values are not correct
- ESP_ERR_NOT_SUPPORTED if certain combination of values is not supported, or if `CONFIG_PM_ENABLE` is not enabled in sdkconfig

**Parameters**

- `config`: pointer to implementation-specific configuration structure (e.g. `esp_pm_config_esp32`)

```
esp_err_t esp_pm_lock_create(esp_pm_lock_type_t lock_type, int arg, const char *name, esp_pm_lock_handle_t *out_handle)
```

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call `esp_pm_lock_acquire` to take the lock.

This function must not be called from an ISR.

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if the lock structure cannot be allocated
- ESP_ERR_INVALID_ARG if `out_handle` is NULL or type argument is not valid
- ESP_ERR_NOT_SUPPORTED if `CONFIG_PM_ENABLE` is not enabled in sdkconfig

**Parameters**

- `lock_type`: Power management constraint which the lock should control
- `arg`: argument, value depends on `lock_type`, see `esp_pm_lock_type_t`
- `name`: arbitrary string identifying the lock (e.g. “wifi” or “spi”). Used by the `esp_pm_dump_locks` function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
• [out] out_handle: handle returned from this function. Use this handle when calling esp_pm_lock_delete, esp_pm_lock_acquire, esp_pm_lock_release. Must not be NULL.

`esp_err_t esp_pm_lock_acquire(esp_pm_lock_handle_t handle)`

Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to esp_pm_lock_create, or any of the lower power modes (higher numeric values of ‘mode’).

The lock is recursive, in the sense that if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if the handle is invalid
• ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

Parameters
• handle: handle obtained from esp_pm_lock_create function

`esp_err_t esp_pm_lock_release(esp_pm_lock_handle_t handle)`

Release the lock taken using esp_pm_lock_acquire.

Call to this functions removes power management restrictions placed when taking the lock.

Locks are recursive, so if esp_pm_lock_acquire is called a number of times, esp_pm_lock_release has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp_pm_lock_* functions for the same handle.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if the handle is invalid
• ESP_ERR_INVALID_STATE if lock is not acquired
• ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

Parameters
• handle: handle obtained from esp_pm_lock_create function

`esp_err_t esp_pm_lock_delete(esp_pm_lock_handle_t handle)`

Delete a lock created using esp_pm_lock.

The lock must be released before calling this function.

This function must not be called from an ISR.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if the handle argument is NULL
• ESP_ERR_INVALID_STATE if the lock is still acquired
• ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

Parameters
• handle: handle obtained from esp_pm_lock_create function

`esp_err_t esp_pm_dump_locks(FILE *stream)`

Dump the list of all locks to stderr.

This function dumps debugging information about locks created using esp_pm_lock_create to an output stream.

This function must not be called from an ISR. If esp_pm_lock_acquire/release are called while this function is running, inconsistent results may be reported.

Return
• ESP_OK on success
Chapter 2. API Reference

- ESP_ERR_NOT_SUPPORTED if CONFIG_PM_ENABLE is not enabled in sdkconfig

Parameters
- stream: stream to print information to; use stdout or stderr to print to the console; use fnmemopen/open_memstream to print to a string buffer.

Type Definitions

typedef struct esp_pm_lock *esp_pm_lock_handle_t
Opaque handle to the power management lock.

Enumerations

enum esp_pm_lock_type_t
Power management constraints.

Values:

ESP_PM_CPU_FREQ_MAX
Require CPU frequency to be at the maximum value set via esp_pm_configure. Argument is unused and should be set to 0.

ESP_PM_APB_FREQ_MAX
Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

ESP_PM_NO_LIGHT_SLEEP
Prevent the system from going into light sleep. Argument is unused and should be set to 0.

Header File

- esp32/include/esp32/pm.h

Structures

struct esp_pm_config_esp32_t
Power management config for ESP32.

Pass a pointer to this structure as an argument to esp_pm_configure function.

Public Members

int max_freq_mhz
Maximum CPU frequency, in MHz

int min_freq_mhz
Minimum CPU frequency to use when no locks are taken, in MHz

bool light_sleep_enable
Enter light sleep when no locks are taken

2.7.15 Sleep Modes

Overview

ESP32 is capable of light sleep and deep sleep power saving modes.

In light sleep mode, digital peripherals, most of the RAM, and CPUs are clock-gated, and supply voltage is reduced. Upon exit from light sleep, peripherals and CPUs resume operation, their internal state is preserved.

In deep sleep mode, CPUs, most of the RAM, and all the digital peripherals which are clocked from APB_CLK are powered off. The only parts of the chip which can still be powered on are: RTC controller, RTC peripherals (including ULP coprocessor), and RTC memories (slow and fast).
Wakeup from deep and light sleep modes can be done using several sources. These sources can be combined, in this case the chip will wake up when any one of the sources is triggered. Wakeup sources can be enabled using `esp_sleep_enable_X_wakeup` APIs and can be disabled using `esp_sleep_disable_wakeup_source()` API. Next section describes these APIs in detail. Wakeup sources can be configured at any moment before entering light or deep sleep mode.

Additionally, the application can force specific powerdown modes for the RTC peripherals and RTC memories using `esp_sleep_pd_config()` API.

Once wakeup sources are configured, application can enter sleep mode using `esp_light_sleep_start()` or `esp_deep_sleep_start()` APIs. At this point the hardware will be configured according to the requested wakeup sources, and RTC controller will either power down or power off the CPUs and digital peripherals.

**WiFi/BT and sleep modes**

In deep sleep and light sleep modes, wireless peripherals are powered down. Before entering deep sleep or light sleep modes, applications must disable WiFi and BT using appropriate calls (`esp_bluedroid_disable()`, `esp_bt_controller_disable()`, `esp_wifi_stop()`). WiFi and BT connections will not be maintained in deep sleep or light sleep, even if these functions are not called.

If WiFi connection needs to be maintained, enable WiFi modem sleep, and enable automatic light sleep feature (see Power Management APIs). This will allow the system to wake up from sleep automatically when required by WiFi driver, thereby maintaining connection to the AP.

**Wakeup sources**

**Timer** RTC controller has a built in timer which can be used to wake up the chip after a predefined amount of time. Time is specified at microsecond precision, but the actual resolution depends on the clock source selected for RTC SLOW_CLK. See chapter “Reset and Clock” of the ESP32 Technical Reference Manual for details about RTC clock options.

This wakeup mode doesn’t require RTC peripherals or RTC memories to be powered on during sleep. `esp_sleep_enable_timer_wakeup()` function can be used to enable deep sleep wakeup using a timer.

**Touch pad** RTC IO module contains logic to trigger wakeup when a touch sensor interrupt occurs. You need to configure the touch pad interrupt before the chip starts deep sleep.

Revisions 0 and 1 of the ESP32 only support this wakeup mode when RTC peripherals are not forced to be powered on (i.e. ESP_PD_DOMAIN_RTC_PERIPH should be set to ESP_PD_OPTION_AUTO).

`esp_sleep_enable_touchpad_wakeup()` function can be used to enable this wakeup source.

**External wakeup (ext0)** RTC IO module contains logic to trigger wakeup when one of RTC GPIOs is set to a predefined logic level. RTC IO is part of RTC peripherals power domain, so RTC peripherals will be kept powered on during deep sleep if this wakeup source is requested.

Because RTC IO module is enabled in this mode, internal pullup or pulldown resistors can also be used. They need to be configured by the application using `rtc_gpio_pullup_en()` and `rtc_gpio_pulldown_en()` functions, before calling `esp_sleep_start()`.

In revisions 0 and 1 of the ESP32, this wakeup source is incompatible with ULP and touch wakeup sources.

`esp_sleep_enable_ext0_wakeup()` function can be used to enable this wakeup source.

**Warning:** After wake up from sleep, IO pad used for wakeup will be configured as RTC IO. Before using this pad as digital GPIO, reconfigure it using `rtc_gpio_deinit(gpio_num)` function.
External wakeup (ext1)  RTC controller contains logic to trigger wakeup using multiple RTC GPIOs. One of the two logic functions can be used to trigger wakeup:

- wake up if any of the selected pins is high (ESP_EXT1_WAKEUP_ANY_HIGH)
- wake up if all the selected pins are low (ESP_EXT1_WAKEUP_ALL_LOW)

This wakeup source is implemented by the RTC controller. As such, RTC peripherals and RTC memories can be powered down in this mode. However, if RTC peripherals are powered down, internal pullup and pulldown resistors will be disabled. To use internal pullup or pulldown resistors, request RTC peripherals power domain to be kept on during sleep, and configure pullup/pulldown resistors using rtc_gpio_ functions, before entering sleep:

```c
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_PERIPH, ESP_PD_OPTION_ON);
gpio_pullup_dis(gpio_num);
gpio_pulldown_en(gpio_num);
```

**Warning:** After wake up from sleep, IO pad(s) used for wakeup will be configured as RTC IO. Before using these pads as digital GPIOs, reconfigure them using rtc_gpio_deinit(gpio_num) function.

`esp_sleep_enable_ext1_wakeup()` function can be used to enable this wakeup source.

**ULP coprocessor wakeup**  ULP coprocessor can run while the chip is in sleep mode, and may be used to poll sensors, monitor ADC or touch sensor values, and wake up the chip when a specific event is detected. ULP coprocessor is part of RTC peripherals power domain, and it runs the program stored in RTC slow memory. RTC slow memory will be powered on during sleep if this wakeup mode is requested. RTC peripherals will be automatically powered on before ULP coprocessor starts running the program; once the program stops running, RTC peripherals are automatically powered down again.

Revisions 0 and 1 of the ESP32 only support this wakeup mode when RTC peripherals are not forced to be powered on (i.e. ESP_PD_DOMAIN_RTC_PERIPH should be set to ESP_PD_OPTION_AUTO).

`esp_sleep_enable_ulp_wakeup()` function can be used to enable this wakeup source.

**GPIO wakeup (light sleep only)**  In addition to EXT0 and EXT1 wakeup sources described above, one more method of wakeup from external inputs is available in light sleep mode. With this wakeup source, each pin can be individually configured to trigger wakeup on high or low level using gpio_wakeup_enable() function. Unlike EXT0 and EXT1 wakeup sources, which can only be used with RTC IOs, this wakeup source can be used with any IO (RTC or digital).

`esp_sleep_enable_gpio_wakeup()` function can be used to enable this wakeup source.

**UART wakeup (light sleep only)**  When ESP32 receives UART input from external devices, it is often required to wake up the chip when input data is available. UART peripheral contains a feature which allows waking up the chip from light sleep when a certain number of positive edges on RX pin are seen. This number of positive edges can be set using uart_set_wakeup_threshold() function. Note that the character which triggers wakeup (and any characters before it) will not be received by the UART after wakeup. This means that the external device typically needs to send an extra character to the ESP32 to trigger wakeup, before sending the data.

`esp_sleep_enable_uart_wakeup()` function can be used to enable this wakeup source.

**Power-down of RTC peripherals and memories**

By default, `esp_deep_sleep_start()` and `esp_light_sleep_start()` functions will power down all RTC power domains which are not needed by the enabled wakeup sources. To override this behaviour, `esp_sleep_pd_config()` function is provided.

Note: in revision 0 of the ESP32, RTC fast memory will always be kept enabled in deep sleep, so that the deep sleep stub can run after reset. This can be overridden, if the application doesn’t need clean reset behaviour after deep sleep.
If some variables in the program are placed into RTC slow memory (for example, using RTC_DATA_ATTR attribute), RTC slow memory will be kept powered on by default. This can be overridden using esp_sleep_pd_config() function, if desired.

**Entering light sleep**

esp_light_sleep_start() function can be used to enter light sleep once wakeup sources are configured. It is also possible to go into light sleep with no wakeup sources configured, in this case the chip will be in light sleep mode indefinitely, until external reset is applied.

**Entering deep sleep**

esp_deep_sleep_start() function can be used to enter deep sleep once wakeup sources are configured. It is also possible to go into deep sleep with no wakeup sources configured, in this case the chip will be in deep sleep mode indefinitely, until external reset is applied.

**Configuring IOs**

Some ESP32 IOs have internal pullups or pulldowns, which are enabled by default. If an external circuit drives this pin in deep sleep mode, current consumption may increase due to current flowing through these pullups and pulldowns. To isolate a pin, preventing extra current draw, call rtc_gpio_isolate() function.

For example, on ESP32-WROVER module, GPIO12 is pulled up externally. GPIO12 also has an internal pull-down in the ESP32 chip. This means that in deep sleep, some current will flow through these external and internal resistors, increasing deep sleep current above the minimal possible value. Add the following code before esp_deep_sleep_start() to remove this extra current:

```c
rtc_gpio_isolate(GPIO_NUM_12);
```

**UART output handling**

Before entering sleep mode, esp_deep_sleep_start() will flush the contents of UART FIFOs.

When entering light sleep mode using esp_light_sleep_start(), UART FIFOs will not be flushed. Instead, UART output will be suspended, and remaining characters in the FIFO will be sent out after wakeup from light sleep.

**Checking sleep wakeup cause**

esp_sleep_get_wakeup_cause() function can be used to check which wakeup source has triggered wakeup from sleep mode.

For touch pad and ext1 wakeup sources, it is possible to identify pin or touch pad which has caused wakeup using esp_sleep_get_touchpad_wakeup_status() and esp_sleep_get_extl_wakeup_status() functions.

**Disable sleep wakeup source**

Previously configured wakeup source can be disabled later using esp_sleep_disable_wakeup_source() API. This function deactivates trigger for the given wakeup source. Additionally it can disable all triggers if the argument is ESP_SLEEP_WAKEUP_ALL.
Application Example

Implementation of basic functionality of deep sleep is shown in protocols/sntp example, where ESP module is periodically woken up to retrieve time from NTP server.

More extensive example in system/deep_sleep illustrates usage of various deep sleep wakeup triggers and ULP coprocessor programming.

API Reference

Header File

- esp32/include/esp_sleep.h

Functions

```c
esp_err_t esp_sleep_disable_wakeup_source(esp_sleep_source_t source)
```

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

**Note** This function does not modify wake up configuration in RTC. It will be performed in esp_sleep_start function.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if trigger was not active

**Parameters**

- `source`: number of source to disable of type esp_sleep_source_t

```c
esp_err_t esp_sleep_enable_ulp_wakeup()
```

Enable wakeup by ULP coprocessor.

**Note** ULP wakeup source cannot be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

**Return**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if ULP coprocessor is not enabled or if wakeup triggers conflict

```c
esp_err_t esp_sleep_enable_timer_wakeup(uint64_t time_in_us)
```

Enable wakeup by timer.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if value is out of range (TBD)

**Parameters**

- `time_in_us`: time before wakeup, in microseconds

```c
esp_err_t esp_sleep_enable_touchpad_wakeup()
```

Enable wakeup by touch sensor.

**Note** Touch wakeup source cannot be used when RTC_PERIPH power domain is forced to be powered on (ESP_PD_OPTION_ON) or when ext0 wakeup source is used.

**Note** The FSM mode of the touch button should be configured as the timer trigger mode.

**Return**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if additional current by touch (CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT) is enabled.
- ESP_ERR_INVALID_STATE if wakeup triggers conflict
Chapter 2. API Reference

`touch_pad_t esp_sleep_get_touchpad_wakeup_status()`
Get the touch pad which caused wakeup.

If wakeup was caused by another source, this function will return TOUCH_PAD_MAX;

Return touch pad which caused wakeup

`esp_err_t esp_sleep_enable_ext0_wakeup(gpio_num_t gpio_num, int level)`
Enable wakeup using a pin.

This function uses external wakeup feature of RTC IO peripheral. It will work only if RTC peripherals are kept on during sleep.

This feature can monitor any pin which is an RTC IO. Once the pin transitions into the state given by level argument, the chip will be woken up.

Note This function does not modify pin configuration. The pin is configured in esp_sleep_start, immediately before entering sleep mode.

Note ext0 wakeup source cannot be used together with touch or ULP wakeup sources.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the selected GPIO is not an RTC GPIO, or the mode is invalid
- ESP_ERR_INVALID_STATE if wakeup triggers conflict

Parameters
- gpio_num: GPIO number used as wakeup source. Only GPIOs which have RTC functionality can be used: 0,2,4,12-15,25-27,32-39.
- level: input level which will trigger wakeup (0=low, 1=high)

`esp_err_t esp_sleep_enable_ext1_wakeup(uint64_t mask, esp_sleep_ext1_wakeup_mode_t mode)`
Enable wakeup using multiple pins.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once any of the selected pins goes into the state given by mode argument, the chip will be woken up.

Note This function does not modify pin configuration. The pins are configured in esp_sleep_start, immediately before entering sleep mode.

Note internal pullups and pulldowns don’t work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using esp_sleep_pd_config function.

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if any of the selected GPIOs is not an RTC GPIO, or mode is invalid

Parameters
- mask: bit mask of GPIO numbers which will cause wakeup. Only GPIOs which have RTC functionality can be used in this bit map: 0,2,4,12-15,25-27,32-39.
- mode: select logic function used to determine wakeup condition:
  - ESP_EXT1_WAKEUP_ALL_LOW: wake up when all selected GPIOs are low
  - ESP_EXT1_WAKEUP_ANY_HIGH: wake up when any of the selected GPIOs is high

`esp_err_t esp_sleep_enable_gpio_wakeup()`
Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wakeup from light sleep though.

To enable wakeup, first call gpio_wakeup_enable, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

Note GPIO wakeup source cannot be used together with touch or ULP wakeup sources.

Return
- ESP_OK on success
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE if wakeup triggers conflict

```c
esp_err_t esp_sleep_enable_uart_wakeup (int uart_num)
```
Enable wakeup from light sleep using UART.

Use uart_set_wakeup_threshold function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

**Note** ESP32 does not support wakeup from UART2.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if wakeup from given UART is not supported

**Parameters**
- `uart_num`: UART port to wake up from

```c
uint64_t esp_sleep_get_ext1_wakeup_status ()
```
Get the bit mask of GPIOs which caused wakeup (ext1)

If wakeup was caused by another source, this function will return 0.

**Return** bit mask, if GPIO caused wakeup, BIT(n) will be set

```c
esp_err_t esp_sleep_pd_config (esp_sleep_pd_domain_t domain, esp_sleep_pd_option_t option)
```
Set power down mode for an RTC power domain in sleep mode.

If not set set using this API, all power domains default to ESP_PD_OPTION_AUTO.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if either of the arguments is out of range

**Parameters**
- `domain`: power domain to configure
- `option`: power down option (ESP_PD_OPTION_OFF, ESP_PD_OPTION_ON, or ESP_PD_OPTION_AUTO)

```c
void esp_deep_sleep_start ()
```
Enter deep sleep with the configured wakeup options.

This function does not return.

```c
esp_err_t esp_light_sleep_start ()
```
Enter light sleep with the configured wakeup options.

**Return**
- ESP_OK on success (returned after wakeup)
- ESP_ERR_INVALID_STATE if WiFi or BT is not stopped

```c
void esp_deep_sleep (uint64_t time_in_us)
```
Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time. Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to esp_deep_sleep_enable_timer_wakeup followed by a call to esp_deep_sleep_start.

esp_deep_sleep does not shut down WiFi, BT, and higher level protocol connections gracefully. Make sure relevant WiFi and BT stack functions are called to close any connections and deinitialize the peripherals. These include:

- esp_bluedroid_disable
- esp_bt_controller_disable
- esp_wifi_stop

This function does not return.

**Parameters**
time_in_us: deep-sleep time, unit: microsecond

### esp_sleep_wakeup_cause_t esp_sleep_get_wakeup_cause()

Get the wakeup source which caused wakeup from sleep.

**Return** cause of wake up from last sleep (deep sleep or light sleep)

### void esp_wake_deep_sleep (void)

Default stub to run on wake from deep sleep.

- Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.
- This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.
- See docs/deep-sleep-stub.rst for details.

### void esp_set_deep_sleep_wake_stub (esp_deep_sleep_wake_stub_fn_t new_stub)

Install a new stub at runtime to run on wake from deep sleep.

- If implementing esp_wake_deep_sleep() then it is not necessary to call this function.
- However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked RTC_IRAM_ATTR, and must obey the same rules given for esp_wake_deep_sleep().

### esp_deep_sleep_wake_stub_fn_t esp_get_deep_sleep_wake_stub (void)

Get current wake from deep sleep stub.

- Return current wake from deep sleep stub, or NULL if no stub is installed.

### void esp_default_wake_deep_sleep (void)

The default esp-idf-provided esp_wake_deep_sleep() stub.

- See docs/deep-sleep-stub.rst for details.

### void esp_deep_sleep_disable_rom_logging (void)

Disable logging from the ROM code after deep sleep.

- Using LSB of RTC_STORE4.

### Type Definitions

typedef esp_sleep_source_t esp_sleep_wakeup_cause_t
typedef void (*esp_deep_sleep_wake_stub_fn_t) (void)

Function type for stub to run on wake from sleep.

### Enumerations

enum esp_sleep_ext1_wakeup_mode_t

- Logic function used for EXT1 wakeup mode.

  - **ESP_EXT1_WAKEUP_ALL_LOW** = 0
    - Wake the chip when all selected GPIOs go low.

  - **ESP_EXT1_WAKEUP_ANY_HIGH** = 1
    - Wake the chip when any of the selected GPIOs go high.

enum esp_sleep_pd_domain_t

- Power domains which can be powered down in sleep mode.

  - **ESP_PD_DOMAIN_RTC_PERIPH**
    - RTC IO, sensors and ULP co-processor.
ESP_PD_DOMAIN_RTC_SLOW_MEM
RTC slow memory.

ESP_PD_DOMAIN_RTC_FAST_MEM
RTC fast memory.

ESP_PD_DOMAIN_XTAL
XTAL oscillator.

ESP_PD_DOMAIN_MAX
Number of domains.

def esp_sleep_pd_option_t
Power down options.

Values:

ESP_PD_OPTION_OFF
Power down the power domain in sleep mode.

ESP_PD_OPTION_ON
Keep power domain enabled during sleep mode.

ESP_PD_OPTION_AUTO
Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

def esp_sleep_source_t
Sleep wakeup cause.

Values:

ESP_SLEEP_WAKEUP_UNDEFINED
In case of deep sleep, reset was not caused by exit from deep sleep.

ESP_SLEEP_WAKEUP_ALL
Not a wakeup cause, used to disable all wakeup sources with esp_sleep_disable_wakeup_source.

ESP_SLEEP_WAKEUP_EXT0
Wakeup caused by external signal using RTC_IO.

ESP_SLEEP_WAKEUP_EXT1
Wakeup caused by external signal using RTC_CNTL.

ESP_SLEEP_WAKEUP_TIMER
Wakeup caused by timer.

ESP_SLEEP_WAKEUP_TOUCHPAD
Wakeup caused by touchpad.

ESP_SLEEP_WAKEUP_ULP
Wakeup caused by ULP program.

ESP_SLEEP_WAKEUP_GPIO
Wakeup caused by GPIO (light sleep only)

ESP_SLEEP_WAKEUP_UART
Wakeup caused by UART (light sleep only)

2.7.16 Over The Air Updates (OTA)

OTA Process Overview

The OTA update mechanism allows a device to update itself based on data received while the normal firmware is running (for example, over WiFi or Bluetooth.)
OTA requires configuring the **Partition Table** of the device with at least two “OTA app slot” partitions (ie *ota_0* and *ota_1*) and an “OTA Data Partition”.

The OTA operation functions write a new app firmware image to whichever OTA app slot is not currently being used for booting. Once the image is verified, the OTA Data partition is updated to specify that this image should be used for the next boot.

**OTA Data Partition**

An OTA data partition (type *data*, subtype *ota*) must be included in the **Partition Table** of any project which uses the OTA functions.

For factory boot settings, the OTA data partition should contain no data (all bytes erased to 0xFF). In this case the esp-idf software bootloader will boot the factory app if it is present in the the partition table. If no factory app is included in the partition table, the first available OTA slot (usually *ota_0*) is booted.

After the first OTA update, the OTA data partition is updated to specify which OTA app slot partition should be booted next.

The OTA data partition is two flash sectors (0x2000 bytes) in size, to prevent problems if there is a power failure while it is being written. Sectors are independently erased and written with matching data, and if they disagree a counter field is used to determine which sector was written more recently.

**App rollback**

The main purpose of the application rollback is to keep the device working after the update. This feature allows you to roll back to the previous working application in case a new application has critical errors. When the rollback process is enabled and an OTA update provides a new version of the app, one of three things can happen:

- The application works fine, **esp_ota_mark_app_valid_cancel_rollback()** marks the running application with the state **ESP_OTA_IMG_VALID**. There are no restrictions on booting this application.
- The application has critical errors and further work is not possible, a rollback to the previous application is required, **esp_ota_mark_app_invalid_rollback_and_reboot()** marks the running application with the state **ESP_OTA_IMG_INVALID** and reset. This application will not be selected by the bootloader for boot and will boot the previously working application.
- If the **CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE** option is set, and occur a reset without calling either function then happen and is rolled back.

Note: The state is not written to the binary image of the application it is written to the **otadata** partition. The partition contains a **ota_seq** counter which is a pointer to the slot (ota_0, ota_1, …) from which the application will be selected for boot.

**App OTA State**  States control the process of selecting a boot app:

<table>
<thead>
<tr>
<th>States</th>
<th>Restriction of selecting a boot app in bootloader</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP_OTA_IMG_VALID</td>
<td>No restriction. Will be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_UNDEFINED</td>
<td>No restriction. Will be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_INVALID</td>
<td>Will not be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_ABORTED</td>
<td>Will not be selected.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_NEW</td>
<td>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is set it will be selected only once. In bootloader the state immediately changes to ESP_OTA_IMG_PENDING_VERIFY.</td>
</tr>
<tr>
<td>ESP_OTA_IMG_PENDING</td>
<td>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE option is set it will not be selected and the state will change to ESP_OTA_IMG_ABORTED.</td>
</tr>
</tbody>
</table>

If **CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE** option is not enabled (by default), then the use of the following functions **esp_ota_mark_app_valid_cancel_rollback()** and
**esp_ota_mark_app_invalid_rollback_and_reboot()** are optional, and **ESP_OTA_IMG_NEW** and **ESP_OTA_IMG_PENDING_VERIFY** states are not used.

An option in Kconfig **CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE** allows you to track the first boot of a new application. In this case, the application must confirm its operability by calling **esp_ota_mark_app_valid_cancel_rollback()** function, otherwise the application will be rolled back upon reboot. It allows you to control the operability of the application during the boot phase. Thus, a new application has only one attempt to boot successfully.

### Rollback Process

The description of the rollback process when **CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE** option is enabled:

- The new application successfully downloaded and **esp_ota_set_boot_partition()** function makes this partition bootable and sets the state **ESP_OTA_IMG_NEW**. This state means that the application is new and should be monitored for its first boot.
- Reboot **esp_restart()**.
- The bootloader checks for the **ESP_OTA_IMG_PENDING_VERIFY** state if it is set, then it will be written to **ESP_OTA_IMG_ABORTED**.
- The bootloader selects a new application to boot so that the state is not set as **ESP_OTA_IMG_INVALID** or **ESP_OTA_IMG_ABORTED**.
- The bootloader checks the selected application for **ESP_OTA_IMG_NEW** state if it is set, then it will be written to **ESP_OTA_IMG_PENDING_VERIFY**. This state means that the application requires confirmation of its operability, if this does not happen and a reboot occurs, this state will be overwritten to **ESP_OTA_IMG_ABORTED** (see above) and this application will no longer be able to start, i.e. there will be a rollback to the previous work application.
- A new application has started and should make a self-test.
- If the self-test has completed successfully, then you must call the function **esp_ota_mark_app_valid_cancel_rollback()** because the application is awaiting confirmation of operability (**ESP_OTA_IMG_PENDING_VERIFY** state).
- If the self-test fails then call **esp_ota_mark_app_invalid_rollback_and_reboot()** function to roll back to the previous working application, while the invalid application is set **ESP_OTA_IMG_INVALID** state.
- If the application has not been confirmed, the state remains **ESP_OTA_IMG_PENDING_VERIFY**, and the next boot it will be changed to **ESP_OTA_IMG_ABORTED**. That will prevent re-boot of this application. There will be a rollback to the previous working application.

### Unexpected Reset

If a power loss or an unexpected crash occurs at the time of the first boot of a new application, it will roll back the application.

Recommendation: Perform the self-test procedure as quickly as possible, to prevent rollback due to power loss.

Only **OTA** partitions can be rolled back. Factory partition is not rolled back.

### Booting invalid/aborted apps

Booting an application which was previously set to **ESP_OTA_IMG_INVALID** or **ESP_OTA_IMG_ABORTED** is possible:

- Get the last invalid application partition **esp_ota_get_last_invalid_partition()**.
- Pass the received partition to **esp_ota_set_boot_partition()**, this will update the otadata.
- Restart **esp_restart()**. The bootloader will boot the specified application.

To determine if self-tests should be run during startup of an application, call the **esp_ota_get_state_partition()** function. If result is **ESP_OTA_IMG_PENDING_VERIFY** then self-testing and subsequent confirmation of operability is required.

### Where the states are set

A brief description of where the states are set:

- **ESP_OTA_IMG_VALID** state is set by **esp_ota_mark_app_valid_cancel_rollback()** function.
• ESP_OTA_IMG_UNDEFINED state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled.
• ESP_OTA_IMG_NEW state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled.
• ESP_OTA_IMG_INVALID state is set by `esp_ota_mark_app_invalid_rollback_and_reboot()` function.
• ESP_OTA_IMG_ABORTED state is set if there was no confirmation of the application operability and occurs reboots (if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled).
• ESP_OTA_IMG_PENDING_VERIFY state is set in a bootloader if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled and selected app has ESP_OTA_IMG_NEW state.

Anti-rollback

Anti-rollback prevents rollback to application with security version lower than one programmed in eFuse of chip.

This function works if set `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` option. In the bootloader, when selecting a bootable application, an additional security version check is added which is on the chip and in the application image. The version in the bootable firmware must be greater than or equal to the version in the chip.

`CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` and `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` options are used together. In this case, rollback is possible only on the security version which is equal or higher than the version in the chip.

A typical anti-rollback scheme is

- New firmware released with the elimination of vulnerabilities with the previous version of security.
- After the developer makes sure that this firmware is working. He can increase the security version and release a new firmware.
- Download new application.
- To make it bootable, run the function `esp_ota_set_boot_partition()`. If the security version of the new application is smaller than the version in the chip, the new application will be erased. Update to new firmware is not possible.
- Reboot.
- In the bootloader, an application with a security version greater than or equal to the version in the chip will be selected. If otadata is in the initial state, and one firmware was loaded via a serial channel, whose secure version is higher than the chip, then the secure version of efuse will be immediately updated in the bootloader.
- New application booted. Then the application should perform diagnostics of the operation and if it is completed successfully, you should call `esp_ota_mark_app_valid_cancel_rollback()` function to mark the running application with the ESP_OTA_IMG_VALID state and update the secure version on chip. Note that if was called `esp_ota_mark_app_invalid_rollback_and_reboot()` function a rollback may not happen due to the device may not have any bootable apps then it will return ESP_ERR_OTA_ROLLBACK_FAILED error and stay in the ESP_OTA_IMG_PENDING_VERIFY state.
- The next update of app is possible if a running app is in the ESP_OTA_IMG_VALID state.

Recommendation:

If you want to avoid the download/erase overhead in case of the app from the server has security version lower then running app you have to get `new_app_info.secure_version` from the first package of an image and compare it with the secure version of efuse. Use `esp_efuse_check_secure_version(new_app_info.secure_version)` function if it is true then continue downloading otherwise abort.

```c
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
    if (data_read > 0) {
        if (image_header_was_checked == false) {
(continues on next page)
```
restrictions:

- The number of bits in the secure_version field is limited to 32 bits. This means that only 32 times you can do an anti-rollback. You can reduce the length of this efuse field use CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD option.
- Anti-rollback only works if the encoding scheme for efuse is set to NONE.
- The partition table should not have a factory partition, only two of the app.

security_version:

- In application image it is stored in esp_app_desc structure. The number is set CONFIG_BOOTLOADER_APP_SECURE_VERSION.
- In ESP32 it is stored in efuse EFUSE_BLK3_RDATA4_REG (when a eFuse bit is programmed to 1, it can never be reverted to 0). The number of bits set in this register is the security_version from app.

secure OTA updates without secure boot

The verification of signed OTA updates can be performed even without enabling hardware secure boot. For doing so, refer Signed App Verification Without Hardware Secure Boot

OTA tool (otatool.py)

The component app_update provides a tool otatool.py for performing OTA partition-related operations on a target device. The following operations can be performed using the tool:

- read contents of otdata partition (read_otadata)
- erase otdata partition, effectively resetting device to factory app (erase_otadata)
- switch OTA partitions (switch_ota_partition)
- erasing OTA partition (erase_ota_partition)
- write to OTA partition (write_ota_partition)
- read contents of OTA partition (read_ota_partition)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool’s Python API and command-line interface, respectively.
Python API  
Before anything else, make sure that the `otatool` module is imported.

```python
import sys
import os

idf_path = os.environ['"IDF_PATH"]  # get value of IDF_PATH from environment
otatool_dir = os.path.join(idf_path, "components", "app_update")  # otatool.py
    # lives in $IDF_PATH/components/app_update

sys.path.append(otatool_dir)  # this enables Python to find otatool module
from otatool import *  # import all names inside otatool module
```

The starting point for using the tool’s Python API to do is create a `OtatoolTarget` object:

```python
# Create a partool.py target device connected on serial port /dev/ttyUSB1
target = OtatoolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```python
# Erase otadata, resetting the device to factory app
target.erase_otadata()

# Erase contents of OTA app slot 0
target.erase_ota_partition(0)

# Switch boot partition to that of app slot 1
target.switch_ota_partition(1)

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

The OTA partition to operate on is specified using either the app slot number or the partition name.

More information on the Python API is available in the docstrings for the tool.

Command-line Interface  
The command-line interface of `otatool.py` has the following structure:

```
otatool.py [command-args] [subcommand] [subcommand-args]

- command-args - these are arguments that are needed for executing the main...
- subcommand - this is the operation to be performed
- subcommand-args - these are arguments that are specific to the chosen operation
```

```bash
# Erase otadata, resetting the device to factory app
otatool.py --port "/dev/ttyUSB1" erase_otadata

# Erase contents of OTA app slot 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0

# Switch boot partition to that of app slot 1
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3
```

More information can be obtained by specifying `-help` as argument:

```bash
# Display possible subcommands and show main command argument descriptions
otatool.py --help
```

(continues on next page)
# Show descriptions for specific subcommand arguments

```
otatool.py [subcommand] --help
```

## Application Example

End-to-end example of OTA firmware update workflow: `system/ota`.

## API Reference

### Header File

- `app_update/include/esp_ota_ops.h`

### Functions

#### `const esp_app_desc_t *esp_ota_get_app_description (void)`

Return esp_app_desc structure. This structure includes app version.

**Return** Pointer to esp_app_desc structure.

#### `int esp_ota_get_app_elf_sha256 (char *dst, size_t size)`

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

**Return** Number of bytes written to dst (including null terminator)

**Parameters**

- `dst`: Destination buffer
- `size`: Size of the buffer

#### `esp_err_t esp_ota_begin (const esp_partition_t *partition, size_t *image_size)`

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass OTA_SIZE_UNKNOWN which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until esp_ota_end() is called with the returned handle.

**Note:** If the rollback option is enabled and the running application has the ESP_OTA_IMG_PENDING_VERIFY state then it will lead to the ESP_ERR_OTA_ROLLBACK_INVALID_STATE error. Confirm the running app before to run download a new app, use esp_ota_mark_app_valid_cancel_rollback() function for it (this should be done as early as possible when you first download a new application).

**Return**

- **ESP_OK**: OTA operation commenced successfully.
- **ESP_ERR_INVALID_ARG**: partition or out_handle arguments were NULL, or partition doesn’t point to an OTA app partition.
- **ESP_ERR_NO_MEM**: Cannot allocate memory for OTA operation.
• ESP_ERR_OTA_PARTITION_CONFLICT: Partition holds the currently running firmware, cannot update in place.
• ESP_ERR_NOT_FOUND: Partition argument not found in partition table.
• ESP_ERR_OTA_SELECT_INFO_INVALID: The OTA data partition contains invalid data.
• ESP_ERR_INVALID_SIZE: Partition doesn’t fit in configured flash size.
• ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
• ESP_ERR_OTA_ROLLBACK_INVALID_STATE: If the running app has not confirmed state.

Before performing an update, the application must be valid.

**Parameters**

- **partition**: Pointer to info for partition which will receive the OTA update. Required.
- **image_size**: Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or OTA_SIZE_UNKNOWN, the entire partition is erased.
- **out_handle**: On success, returns a handle which should be used for subsequent esp_ota_write() and esp_ota_end() calls.

**esp_err_t esp_ota_write (esp_ota_handle_t handle, const void *data, size_t size)**

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

**Return**

- ESP_OK: Data was written to flash successfully.
- ESP_ERR_INVALID_ARG: handle is invalid.
- ESP_ERR_OTA_VALIDATE_FAILED: First byte of image contains invalid app image magic byte.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- ESP_ERR_OTA_SELECT_INFO_INVALID: OTA data partition has invalid contents.

**Parameters**

- **handle**: Handle obtained from esp_ota_begin
- **data**: Data buffer to write
- **size**: Size of data buffer in bytes.

**esp_err_t esp_ota_end (esp_ota_handle_t handle)**

Finish OTA update and validate newly written app image.

**Note** After calling esp_ota_end(), the handle is no longer valid and any memory associated with it is freed (regardless of result).

**Return**

- ESP_OK: Newly written OTA app image is valid.
- ESP_ERR_NOT_FOUND: OTA handle was not found.
- ESP_ERR_INVALID_ARG: Handle was never written to.
- ESP_ERR_OTA_VALIDATE_FAILED: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- ESP_ERR_INVALID_STATE: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

**Parameters**

- **handle**: Handle obtained from esp_ota_begin().

**esp_err_t esp_ota_set_boot_partition (const esp_partition_t *partition)**

Configure OTA data for a new boot partition.

**Note** If this function returns ESP_OK, calling esp_restart() will boot the newly configured app partition.

**Return**

- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_ERR_INVALID_ARG: partition argument was NULL or didn’t point to a valid OTA partition of type “app”.
- ESP_ERR_OTA_VALIDATE_FAILED: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- ESP_ERR_NOT_FOUND: OTA data partition not found.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash erase or write failed.

**Parameters**

- **partition**: Pointer to info for partition containing app image to boot.
**const esp_partition_t **esp_ota_get_boot_partition (void)**

Get partition info of currently configured boot app.

- If esp_ota_set_boot_partition() has been called, the partition which was set by that function will be returned.
- If esp_ota_set_boot_partition() has not been called, the result is usually the same as esp_ota_get_running_partition(). The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use esp_image_verify(ESP_IMAGE_VERIFY, ...) to verify if the returned partition contains a bootable image.

**Return** Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

**const esp_partition_t **esp_ota_get_running_partition (void)**

Get partition info of currently running app.

This function is different to esp_ota_get_boot_partition() in that it ignores any change of selected boot partition caused by esp_ota_set_boot_partition(). Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from esp_ota_get_boot_partition() if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

**Return** Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

**const esp_partition_t **esp_ota_get_next_update_partition (const esp_partition_t **start_from)**

Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to esp_ota_begin().

Finds next partition round-robin, starting from the current running partition.

**Return** Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

**Parameters**
- **start_from**: If set, treat this partition info as describing the current running partition. Can be NULL, in which case esp_ota_get_running_partition() is used to find the currently running partition. The result of this function is never the same as this argument.

**esp_err_t esp_ota_get_partition_description (const esp_partition_t **partition, esp_app_desc_t **app_desc)**

Retuns app_app_desc structure for app partition. This structure includes app version.

**Return**
- ESP_OK Successful.
- ESP_ERR_NOT_FOUND app_desc structure is not found. Magic word is incorrect.
- ESP_ERR_NOT_SUPPORTED Partition is not application.
- ESP_ERR_INVALID_ARG Arguments is NULL or if partition’s offset exceeds partition size.
- ESP_ERR_INVALID_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

**Parameters**
- [in] partition: Pointer to app partition. (only app partition)
- [out] app_desc: Structure of info about app.

**esp_err_t esp_ota_mark_app_valid_cancel_rollback ()**

This function is called to indicate that the running app is working well.
Return
- ESP_OK: if successful.

```c
esp_err_t esp_ota_mark_app_invalid_rollback_and_reboot()
```
This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

Return
- ESP_FAIL: if not successful.
- ESP_ERR_OTA.Rollback.FAILED: The rollback is not possible due to flash does not have any apps.

```c
const esp_partition_t *esp_ota_get_last_invalid_partition()
```
Returns last partition with invalid state (ESP_OTA_IMG_INVALID or ESP_OTA_IMG_ABORTED).

Return partition.

```c
esp_err_t esp_ota_get_state_partition(const esp_partition_t *partition, esp_ota_img_states_t *ota_state)
```
Returns state for given partition.

Return
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: partition or ota_state arguments were NULL.
- ESP_ERR_NOT_SUPPORTED: partition is not ota.
- ESP_ERR_NOT_FOUND: Partition table does not have ota data or state was not found for given partition.

Parameters
- [in] partition: Pointer to partition.
- [out] ota_state: state of partition (if this partition has a record in odata).

```c
esp_err_t esp_ota_erase_last_boot_app_partition(void)
```
Erase previous boot app partition and corresponding ota data select for this partition.

When current app is marked to as valid then you can erase previous app partition.

Return
- ESP_OK: Successful, otherwise ESP_ERR.

```c
bool esp_ota_check_rollback_is_possible(void)
```
Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in odata as not UNDEFINED, INVALID or ABORTED and crc is good) and be able booted, and secure_version of app >= secure_version of efuse (if anti-rollback is enabled).

Return
- True: Returns true if the slots have at least one app (except the running app).
- False: The rollback is not possible.

Macros
- OTA_SIZE_UNKNOWN
  Used for esp_ota_begin() if new image size is unknown
- ESP_ERR_OTA_BASE
  Base error code for ota_ops api
- ESP_ERR_OTA_PARTITION_CONFLICT
  Error if request was to write or erase the current running partition
- ESP_ERR_OTA_SELECT_INFO_INVALID
  Error if OTA data partition contains invalid content
- ESP_ERR_OTA_VALIDATE_FAILED
  Error if OTA app image is invalid
Chapter 2. API Reference

ESP_ERR_OTA_SMALL_SEC_VER
Error if the firmware has a secure version less than the running firmware.

ESP_ERR_OTA_ROLLBACK_FAILED
Error if flash does not have valid firmware in passive partition and hence rollback is not possible.

ESP_ERR_OTA_ROLLBACK_INVALID_STATE
Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible.

Type Definitions

typedef uint32_t esp_ota_handle_t
Opaque handle for an application OTA update.

esp_ota_begin() returns a handle which is then used for subsequent calls to esp_ota_write() and esp_ota_end().

2.7.17 ESP HTTPS OTA

Overview

esp_https_ota provides simplified APIs to perform firmware upgrades over HTTPS. It’s an abstraction layer over existing OTA APIs.

Application Example

```c
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_err_t ret = esp_https_ota(&config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer Secure OTA Updates Without Secure boot.

API Reference

Header File

- esp_https_ota/include/esp_https_ota.h
Chapter 2. API Reference

Functions

**esp_err_t esp_https_ota(const esp_http_client_config_t *config)**

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `config`.

**Note** This API handles the entire OTA operation, so if this API is being used then no other APIs from `esp_https_ota` component should be called. If more information and control is needed during the HTTPS OTA process, then one can use `esp_https_ota_begin` and subsequent APIs. If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image.

**Return**

- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_HTTPS_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_HTTPS_OTA_OPERATION_DENIED: HTTPS OTA operation denied.
- ESP_ERR_HTTPS_OTA_OPERATION_TIMEOUT: HTTPS OTA operation timed out.
- ESP_ERR_HTTPS_OTA_OPERATION_FAILED: HTTPS OTA operation failed.
- ESP_ERR_HTTPS_OTA_OPERATION_NO_MEM: Cannot allocate memory for HTTPS OTA operation.
- ESP_ERR_HTTPS_OTA_OPERATION_NO_DATA: HTTPS OTA operation has no data.
- ESP_ERR_HTTPS_OTA_OPERATION_NO_IP: HTTPS OTA operation has no IP.
- ESP_ERR_HTTPS_OTA_OPERATION_NO_PORTS: HTTPS OTA operation has no ports.
- ESP_ERR_HTTPS_OTA_OPERATION_NO_URL: HTTPS OTA operation has no URL.

**Parameters**

- `[in] config`: pointer to `esp_http_client_config_t` structure.

**esp_err_t esp_https_ota_begin(esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)**

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then `esp_https_ota_perform` should be called to continue with the OTA process and there should be a call to `esp_https_ota_finish` on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `http_config`, which is a part of `ota_config`. In case of error, this API explicitly sets `handle` to NULL.

**Note** This API is blocking, so setting `is_async` member of `http_config` structure will result in an error.

**Return**

- ESP_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established.
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in `esp_http_client` component and `esp_http_client` component in `esp-idf`.

**Parameters**

- `[in] ota_config`: pointer to `esp_https_ota_config_t` structure
- `[out] handle`: pointer to an allocated data of type `esp_https_ota_handle_t` which will be initialised in this function

**esp_err_t esp_https_ota_perform(esp_https_ota_handle_t https_ota_handle)**

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if `esp_https_ota_begin()` returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

**Return**

- ESP_ERR_HTTPS_OTA_IN_PROGRESS: OTA update is in progress, call this API again to continue.
- ESP_OK: OTA update was successful
- ESP_FAIL: OTA update failed
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_HTTPS_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_HTTPS_OTA_OPERATION_DENIED: HTTPS OTA operation denied.
- ESP_ERR_HTTPS_OTA_OPERATION_TIMEOUT: HTTPS OTA operation timed out.
- ESP_ERR_HTTPS_OTA_OPERATION_FAILED: HTTPS OTA operation failed.
- ESP_ERR_HTTPS_OTA_OPERATION_NO_MEM: Cannot allocate memory for HTTPS OTA operation.
- ESP_ERR_HTTPS_OTA_OPERATION_NO_DATA: HTTPS OTA operation has no data.
- ESP_ERR_HTTPS_OTA_OPERATION_NO_IP: HTTPS OTA operation has no IP.
- ESP_ERR_HTTPS_OTA_OPERATION_NO_PORTS: HTTPS OTA operation has no ports.
- ESP_ERR_HTTPS_OTA_OPERATION_NO_URL: HTTPS OTA operation has no URL.

Submit Document Feedback
• For other return codes, refer OTA documentation in esp-idf ’ s app_update component.

**Parameters**
• [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

bool esp_https_ota_is_complete_data_received(esp_https_ota_handle_t https_ota_handle)
Checks if complete data was received or not.

**Note**  This API can be called just before esp_https_ota_finish() to validate if the complete image was indeed received.

**Return**
• false
• true

**Parameters**
• [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

**esp_err_t esp_https_ota_finish(esp_https_ota_handle_t https_ota_handle)**
Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

**Note** If this API returns successfully, esp_restart() must be called to boot from the new firmware image

**Return**
• ESP_OK: Clean-up successful
• ESP_ERR_INVALID_STATE
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image

**Parameters**
• [in] https_ota_handle: pointer to esp_https_ota_handle_t structure

**esp_err_t esp_https_ota_get_img_desc (esp_https_ota_handle_t https_ota_handle, esp_app_desc_t *new_app_info)**
Reads app description from image header. The app description provides information like the “Firmware version” of the image.

**Note** This API can be called only after esp_https_ota_begin() and before esp_https_ota_perform(). Calling this API is not mandatory.

**Return**
• ESP_ERR_INVALID_ARG: Invalid arguments
• ESP_FAIL: Failed to read image descriptor
• ESP_OK: Successfully read image descriptor

**Parameters**
• [in] https_ota_handle: pointer to esp_https_ota_handle_t structure
• [out] new_app_info: pointer to an allocated esp_app_desc_t structure

int esp_https_ota_get_image_len_read (esp_https_ota_handle_t https_ota_handle)

**Structures**

**struct esp_https_ota_config_t**
ESP HTTPS OTA configuration.

**Public Members**

const esp_http_client_config_t *http_config
ESP HTTP client configuration

**Macros**
ESP_ERR_HTTPS_OTA_BASE
ESP_ERR_HTTPS_OTA_IN_PROGRESS
Type Definitions
typedef void *esp_https_ota_handle_t

2.7.18 ESP-pthread

Overview

This module offers Espressif specific extensions to the pthread library that can be used to influence the behaviour of pthreads.

- Stack size of the pthreads
- Priority of the created pthreads
- Inheriting this configuration across threads
- Thread name
- Core affinity/core pinning.

Example to tune the stack size of the pthread:

```c
main()
{
    pthread_t t1;

    esp(pthreadCfg_t cfg = esp_create_default_pthread_config();
    cfg.stack_size = (4 * 1024);
    esp_pthread_set_cfg(&cfg);

    pthread_create(&t1, NULL, thread_func);
}
```

The API can also be used for inheriting the settings across threads. For example:

```c
void * my_thread2 (void * p)
{
    /* This thread will inherit the stack size of 4K */
    printf("In my_thread2\n");
}

void * my_thread1 (void * p)
{
    printf("In my_thread1\n");
    pthread_t t2;
    pthread_create(&t2, NULL, my_thread2);
}

main()
{
    pthread_t t1;

    esp(pthreadCfg_t cfg = esp_create_default_pthread_config();
    cfg.stack_size = (4 * 1024);
    cfg.inherit_cfg = true;
    esp_pthread_set_cfg(&cfg);

    pthread_create(&t1, NULL, my_thread1);
}
```

API Reference

Header File
Chapter 2. API Reference

- `pthread/include/esp_pthread.h`

**Functions**

`esp_pthread_cfg_t esp_pthread_get_default_config()`  
Creates a default pthread configuration based on the values set via menuconfig.

- **Return**  
  A default configuration structure.

`esp_err_t esp_pthread_set_cfg(const esp_pthread_cfg_t *cfg)`  
Configure parameters for creating pthread.

- **This API allows you to configure how the subsequent pthread_create() call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.**

- **If the ‘inherit’ flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.**

- **Note**  
  Passing non-NULL attributes to pthread_create() will override the stack_size parameter set using this API

- **Return**  
  - ESP_OK if configuration was successfully set
  - ESP_ERR_NO_MEM if out of memory
  - ESP_ERR_INVALID_ARG if stack_size is less than PTHREAD_STACK_MIN

- **Parameters**  
  - `cfg`: The pthread config parameters

`esp_err_t esp_pthread_get_cfg(esp_pthread_cfg_t *p)`  
Get current pthread creation configuration.

- **This will retrieve the current configuration that will be used for creating threads.**

- **Return**  
  - ESP_OK if the configuration was available
  - ESP_ERR_NOT_FOUND if a configuration wasn’t previously set

- **Parameters**  
  - `p`: Pointer to the pthread config structure that will be updated with the currently configured parameters

**Structures**

`struct esp_pthread_cfg_t`  
pthread configuration structure that influences pthread creation

**Public Members**

- `size_t stack_size`  
  The stack size of the pthread.

- `size_t prio`  
  The thread’s priority.

- `bool inherit_cfg`  
  Inherit this configuration further.

- `const char *thread_name`  
  The thread name.

- `int pin_to_core`  
  The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

**Macros**

`PTHREAD_STACK_MIN`
2.7.19 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see *Error Handling*.

For the full list of error codes defined in ESP-IDF, see *Error Code Reference*.

API Reference

Header File

- esp_common/include/esp_err.h

Functions

`const char* esp_err_to_name (esp_err_t code)`

Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

Return string error message

Parameters
- `code`: esp_err_t error code

`const char* esp_err_to_name_r (esp_err_t code, char *buf, size_t buflen)`

Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

Return buf containing the string error message

Parameters
- `code`: esp_err_t error code
- `[out] buf`: buffer where the error message should be written
- `buflen`: Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

Macros

**ESP_OK**

esp_err_t value indicating success (no error)

**ESP_FAIL**

Generic esp_err_t code indicating failure

**ESP_ERR_NO_MEM**

Out of memory

**ESP_ERR_INVALID_ARG**

Invalid argument

**ESP_ERR_INVALID_STATE**

Invalid state

**ESP_ERR_INVALID_SIZE**

Invalid size

**ESP_ERR_NOT_FOUND**

Requested resource not found
ESP_ERR_NOT_SUPPORTED
Operation or feature not supported

ESP_ERR_TIMEOUT
Operation timed out

ESP_ERR_INVALID_RESPONSE
Received response was invalid

ESP_ERR_INVALID_CRC
CRC or checksum was invalid

ESP_ERR_INVALID_VERSION
Version was invalid

ESP_ERR_INVALID_MAC
MAC address was invalid

ESP_ERR_WIFI_BASE
Starting number of WiFi error codes

ESP_ERR_MESH_BASE
Starting number of MESH error codes

ESP_ERR_FLASH_BASE
Starting number of flash error codes

ESP_ERROR_CHECK(x)
Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK. Prints the error code, error location, and the failed statement to serial output. Disabled if assertions are disabled.

ESP_ERROR_CHECK_WITHOUT_ABORT(x)
Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn’t terminating the program.

Type Definitions
typedef int32_t esp_err_t

2.7.20 App Image Format

An application image consists of the following structures:

1. The esp_image_header_t structure describes the mode of SPI flash and the count of memory segments.
2. The esp_image_segment_header_t structure describes each segment, its length, and its location in ESP32’s memory, followed by the data with a length of data_len. The data offset for each segment in the image is calculated in the following way:

   • offset for 0 Segment = sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t).
   • offset for 1 Segment = offset for 0 Segment + length of 0 Segment + sizeof(esp_image_segment_header_t).
   • offset for 2 Segment = offset for 1 Segment + length of 1 Segment + sizeof(esp_image_segment_header_t).
   • ...

The count of each segment is defined in the segment_count field that is stored in esp_image_header_t. The count cannot be more than ESP_IMAGE_MAX_SEGMENTS.

To get the list of your image segments, please run the following command:

esptool.py --chip esp32 image_info build/app.bin
For more details on the type of memory segments and their address ranges, see the ESP32 Technical Reference Manual, Section 1.3.2 Embedded Memory.

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.

4. If the hash_appended field from esp_image_header_t is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from first byte and up to this field. The length of this field is 32 bytes.

5. If the options CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT or CONFIG_SECURE_BOOT_ENABLED are enabled then the application image will have additional 68 bytes for an ECDSA signature, which includes:

   • version word (4 bytes),
Application Description

The DROM segment starts with the `esp_app_desc_t` structure which carries specific fields describing the application:

- `secure_version` - see Anti-rollback.
- `version` - see App version. *
- `project_name` is filled from PROJECT_NAME. *
- `time` and `date` - compile time and date.
- `idf_ver` - version of ESP-IDF. *
- `app_elf_sha256` - contains sha256 for the elf application file.

* - The maximum length is 32 characters, including null-termination character. For example, if the length of PROJECT_NAME exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`. As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

Adding a Custom Structure to an Application

Customer also has the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```c
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_app_desc = { ... }
```

Offset for custom structure is `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)`. To guarantee that the custom structure is located in the image even if it is not used, you need to add:

- For Make: add `COMPONENT_ADD_LDFLAGS += -u custom_app_desc` into `component.mk`
- For Cmake: add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into `CMakeLists.txt`

API Reference

Header File

- `bootloader_support/include/esp_app_format.h`

Structures

`struct esp_image_header_t`

Main header of binary image.

**Public Members**

- `uint8_t magic`
  Magic word ESP_IMAGE_HEADER_MAGIC
- `uint8_t segment_count`
  Count of memory segments
- `uint8_t spi_mode`
  Flash read mode (esp_image_spi_mode_t as uint8_t)
uint8_t spi_speed : 4
    flash frequency (esp_image_spi_freq_t as uint8_t)

uint8_t spi_size : 4
    flash chip size (esp_image_flash_size_t as uint8_t)

uint32_t entry_addr
    Entry address

uint8_t wp_pin
    WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)

uint8_t spi_pin_drv[3]
    Drive settings for the SPI flash pins (read by ROM bootloader)

esp_chip_id_t chip_id
    Chip identification number

uint8_t min_chip_rev
    Minimum chip revision supported by image

uint8_t reserved[8]
    Reserved bytes in additional header space, currently unused

uint8_t hash_appended
    If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

struct esp_image_segment_header_t
    Header of binary image segment.

Public Members

uint32_t load_addr
    Address of segment

uint32_t data_len
    Length of data

struct esp_app_desc_t
    Description about application.

Public Members

uint32_t magic_word
    Magic word ESP_APP_DESC_MAGIC_WORD

uint32_t secure_version
    Secure version

uint32_t reserved[2]
    reserv1

char version[32]
    Application version

char project_name[32]
    Project name

char time[16]
    Compile time
char date[16]
    Compile date
char idf_ver[32]
    Version IDF
uint8_t app_elf_sha256[32]
    sha256 of elf file
uint32_t reserv2[20]
    reserv2

**Macros**

ESP_IMAGE_HEADER_MAGIC
    The magic word for the `esp_image_header_t` structure.
ESP_IMAGE_MAX_SEGMENTS
    Max count of segments in the image.
ESP_APP_DESC_MAGIC_WORD
    The magic word for the `esp_app_desc` structure that is in DROM.

**Enumerations**

enum esp_chip_id_t
    ESP chip ID.
    *Values:*
    - `ESP_CHIP_ID_ESP32` = 0x0000
        chip ID: ESP32
    - `ESP_CHIP_ID_INVALID` = 0xFFFF
        Invalid chip ID (we defined it to make sure the esp_chip_id_t is 2 bytes size)

enum esp_image_spi_mode_t
    SPI flash mode, used in `esp_image_header_t`.
    *Values:*
    - `ESP_IMAGE_SPI_MODE_QIO`
        SPI mode QIO
    - `ESP_IMAGE_SPI_MODE_QOUT`
        SPI mode QOUT
    - `ESP_IMAGE_SPI_MODE_DIO`
        SPI mode DIO
    - `ESP_IMAGE_SPI_MODE_DOUT`
        SPI mode DOUT
    - `ESP_IMAGE_SPI_MODE_FAST_READ`
        SPI mode FAST_READ
    - `ESP_IMAGE_SPI_MODE_SLOW_READ`
        SPI mode SLOW_READ

enum esp_image_spi_freq_t
    SPI flash clock frequency.
    *Values:*
    - `ESP_IMAGE_SPI_SPEED_40M`
        SPI clock frequency 40 MHz
    - `ESP_IMAGE_SPI_SPEED_26M`
        SPI clock frequency 26 MHz
ESP_IMAGE_SPI_SPEED_20M
SPI clock frequency 20 MHz

ESP_IMAGE_SPI_SPEED_80M = 0xF
SPI clock frequency 80 MHz

enum esp_image_flash_size_t
Supported SPI flash sizes.

Values:

ESP_IMAGE_FLASH_SIZE_1MB = 0
SPI flash size 1 MB

ESP_IMAGE_FLASH_SIZE_2MB
SPI flash size 2 MB

ESP_IMAGE_FLASH_SIZE_4MB
SPI flash size 4 MB

ESP_IMAGE_FLASH_SIZE_8MB
SPI flash size 8 MB

ESP_IMAGE_FLASH_SIZE_16MB
SPI flash size 16 MB

ESP_IMAGE_FLASH_SIZE_MAX
SPI flash size MAX

2.7.21 Miscellaneous System APIs

Software reset

To perform software reset of the chip, esp_restart() function is provided. When the function is called, execution of the program will stop, both CPUs will be reset, application will be loaded by the bootloader and started again.

Additionally, esp_register_shutdown_handler() function is provided to register a routine which needs to be called prior to restart (when done by esp_restart()). This is similar to the functionality of atexit POSIX function.

Reset reason

ESP-IDF application can be started or restarted due to a variety of reasons. To get the last reset reason, call esp_reset_reason() function. See description of esp_reset_reason_t for the list of possible reset reasons.

Heap memory

Two heap memory related functions are provided:

- esp_get_free_heap_size() returns the current size of free heap memory
- esp_get_minimum_free_heap_size() returns the minimum size of free heap memory that was available during program execution.

Note that ESP-IDF supports multiple heaps with different capabilities. Functions mentioned in this section return the size of heap memory which can be allocated using malloc family of functions. For further information about heap memory see Heap Memory Allocation.
Random number generation

ESP32 contains a hardware random number generator, values from it can be obtained using \texttt{esp\_random()}. When Wi-Fi or Bluetooth are enabled, numbers returned by hardware random number generator (RNG) can be considered true random numbers. Without Wi-Fi or Bluetooth enabled, hardware RNG is a pseudo-random number generator. At startup, ESP-IDF bootloader seeds the hardware RNG with entropy, but care must be taken when reading random values between the start of \texttt{app\_main} and initialization of Wi-Fi or Bluetooth drivers.

MAC Address

These APIs allow querying and customizing MAC addresses used by Wi-Fi, Bluetooth, and Ethernet drivers.

ESP32 has up to 4 network interfaces: Wi-Fi station, Wi-Fi AP, Ethernet, and Bluetooth. Each of these interfaces needs to have a MAC address assigned to it. In ESP-IDF these addresses are calculated from \textit{Base MAC address}. Base MAC address can be initialized with factory-programmed value from EFUSE, or with a user-defined value. In addition to setting the base MAC address, applications can specify the way in which MAC addresses are allocated to devices. See \textit{Number of universally administered MAC address} section for more details.

<table>
<thead>
<tr>
<th>Interface</th>
<th>MAC address (4 universally administered)</th>
<th>MAC address (2 universally administered)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wi-Fi Station</td>
<td>base_mac</td>
<td>base_mac</td>
</tr>
<tr>
<td>Wi-Fi SoftAP</td>
<td>base_mac, +1 to the last octet</td>
<td>base_mac, first octet randomized</td>
</tr>
<tr>
<td>Bluetooth</td>
<td>base_mac, +2 to the last octet</td>
<td>base_mac, +1 to the last octet</td>
</tr>
<tr>
<td>Ethernet</td>
<td>base_mac, +3 to the last octet</td>
<td>base_mac, +1 to the last octet, first octet randomized</td>
</tr>
</tbody>
</table>

**Base MAC address** Wi-Fi, Bluetooth, and Ethernet drivers use \texttt{esp\_read\_mac()} function to get MAC address for a specific interface.

By default, this function will use MAC address factory programmed in BLK0 of EFUSE as the base MAC address. MAC addresses of each interface will be calculated according to the table above.

Applications which don’t use MAC address factory programmed into BLK0 of EFUSE can modify base MAC address used by \texttt{esp\_read\_mac()} using a call to \texttt{esp\_base\_mac\_addr\_set()}. Custom value of MAC address can come from application defined storage, such as Flash, NVS, etc. Note that the call to \texttt{esp\_base\_mac\_addr\_set()} needs to happen before network protocol stacks are initialized, for example, early in \texttt{app\_main}.

**Custom MAC address in BLK3 of EFUSE** To facilitate usage of custom MAC addresses, ESP-IDF provides \texttt{esp\_efuse\_mac\_get\_custom()} function, which loads MAC address from BLK3 of EFUSE. This function assumes that custom MAC address is stored in BLK3 of EFUSE (EFUSE\_BLK3\_RDATA0, EFUSE\_BLK3\_RDATA1, EFUSE\_BLK3\_RDATA2, EFUSE\_BLK3\_RDATA3, EFUSE\_BLK3\_RDATA4, EFUSE\_BLK3\_RDATA5 registers) in the following format:

<table>
<thead>
<tr>
<th>Field</th>
<th># of bits</th>
<th>Range of bits</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>

Once MAC address has been obtained using \texttt{esp\_efuse\_mac\_get\_custom()}, call \texttt{esp\_base\_mac\_addr\_set()} to set this MAC address as base MAC address.
Number of universally administered MAC address  Serveral MAC addresses (universally administered by IEEE) are uniquely assigned to the networking interfaces (Wi-Fi/BT/Ethernet). The final octet of each universally administered MAC address increases by one. Only the first one of them (which is called base MAC address) is stored in EFUSE or external storage, the others are generated from it. Here, ‘generate’ means adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address.

If the universally administered MAC addresses are not enough for all of the networking interfaces, locally administered MAC addresses which are derived from universally administered MAC addresses are assigned to the rest of networking interfaces.

See this article for the definition of local and universally administered MAC addresses.

The number of universally administered MAC address can be configured using CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES.

If the number of universal MAC addresses is two, only two interfaces (Wi-Fi Station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (Wi-Fi SoftAP and Ethernet) receive local MAC addresses. These are derived from the universal Wi-Fi station and Bluetooth MAC addresses, respectively.

If the number of universal MAC addresses is four, all four interfaces (Wi-Fi Station, Wi-Fi SoftAP, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address.

When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

Chip version

esp_chip_info() function fills esp_chip_info_t structure with information about the chip. This includes the chip revision, number of CPU cores, and a bit mask of features enabled in the chip.

SDK version

esp_get_idf_version() returns a string describing the IDF version which was used to compile the application. This is the same value as the one available through IDF_VER variable of the build system. The version string generally has the format of git describe output.

To get the version at build time, additional version macros are provided. They can be used to enable or disable parts of the program depending on IDF version.

• ESP_IDF_VERSION_MAJOR, ESP_IDF_VERSION_MINOR, ESP_IDF_VERSION_PATCH are defined to integers representing major, minor, and patch version.
• ESP_IDF_VERSION_VAL and ESP_IDF_VERSION can be used when implementing version checks:

```c
#include "esp_idf_version.h"

#if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
    // enable functionality present in IDF v4.0
#endif
```

App version

Application version is stored in esp_app_desc_t structure. It is located in DROM sector and has a fixed offset from the beginning of the binary file. The structure is located after esp_image_header_t and esp_image_segment_header_t structures. The field version has string type and max length 32 chars.

To set version in your project manually you need to set PROJECT_VER variable in your project CMakeLists.txt/Makefile:
In application CMakeLists.txt put set(PROJECT_VER "0.1.0.1") before including project.cmake.

(For legacy GNU Make build system: in application Makefile put PROJECT_VER = "0.1.0.1" before including project.mk.)

If PROJECT_VER variable is not set in the project then it will be retrieved from either $(PROJECT_PATH)/version.txt file (if present) else using git command git describe. If neither is available then PROJECT_VER will be set to “1”. Application can make use of this by calling esp_ota_get_app_description() or esp_ota_get_partition_description() functions.

API Reference

Header File

- esp_common/include/esp_system.h

Functions

`esp_err_t esp_register_shutdown_handler (shutdown_handler_t handle)`

Registers shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using esp_restart function.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if the handler has already been registered
- ESP_ERR_NO_MEM if no more shutdown handler slots are available

**Parameters**
- `handle`: function to execute on restart

`esp_err_t esp_unregister_shutdown_handler (shutdown_handler_t handle)`

Unregisters shutdown handler.

This function allows you to unregister a handler which was previously registered using esp_register_shutdown_handler function.

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the given handler hasn’t been registered before

`void esp_restart (void)`

Restarts PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be SW_CPU_RESET. Peripherals (except for WiFi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

`esp_reset_reason_t esp_reset_reason (void)`

Get reason of last reset.

**Return** See description of esp_reset_reason_t for explanation of each value.

`uint32_t esp_get_free_heap_size (void)`

Get the size of available heap.

Note that the returned value may be larger than the maximum contiguous block which can be allocated.

**Return** Available heap size, in bytes.

`uint32_t esp_get_free_internal_heap_size (void)`

Get the size of available internal heap.

Note that the returned value may be larger than the maximum contiguous block which can be allocated.

**Return** Available internal heap size, in bytes.
api reference

uint32_t esp_get_minimum_free_heap_size (void)
Get the minimum heap that has ever been available.

Return Minimum free heap ever available

uint32_t esp_random (void)
Get one random 32-bit word from hardware RNG.

The hardware RNG is fully functional whenever an RF subsystem is running (ie Bluetooth or WiFi is enabled).
For random values, call this function after WiFi or Bluetooth are started.

If the RF subsystem is not used by the program, the function bootloader_random_enable() can be called to enable an entropy source. bootloader_random_disable() must be called before RF subsystem or I2S peripheral are used. See these functions’ documentation for more details.

Any time the app is running without an RF subsystem (or bootloader_random) enabled, RNG hardware should be considered a PRNG. A very small amount of entropy is available due to pre-seeding while the IDF bootloader is running, but this should not be relied upon for any use.

Return Random value between 0 and UINT32_MAX

void esp_fill_random (void *buf, size_t len)
Fill a buffer with random bytes from hardware RNG.

Note This function has the same restrictions regarding available entropy as esp_random()

Parameters
- buf: Pointer to buffer to fill with random numbers.
- len: Length of buffer in bytes

esp_err_t esp_base_mac_addr_set (uint8_t *mac)
Set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage e.g. flash and EEPROM.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. If using base MAC address stored in BLK3 of EFUSE or external storage, call this API to set base MAC address with the MAC address which is stored in BLK3 of EFUSE or external storage before initializing WiFi/BT/Ethernet.

Return ESP_OK on success

Parameters
- mac: base MAC address, length: 6 bytes.

esp_err_t esp_base_mac_addr_get (uint8_t *mac)
Return base MAC address which is set using esp_base_mac_addr_set.

Return ESP_OK on success ESP_ERR_INVALID_MAC base MAC address has not been set

Parameters
- mac: base MAC address, length: 6 bytes.

esp_err_t esp_efuse_mac_get_custom (uint8_t *mac)
Return base MAC address which was previously written to BLK3 of EFUSE.

Base MAC address is used to generate the MAC addresses used by the networking interfaces. This API returns the custom base MAC address which was previously written to BLK3 of EFUSE. Writing this EFUSE allows setting of a different (non-Espressif) base MAC address. It is also possible to store a custom base MAC address elsewhere, see esp_base_mac_addr_set() for details.

Return ESP_OK on success ESP_ERR_INVALID_VERSION An invalid MAC version field was read from BLK3 of EFUSE ESP_ERR_INVALID_CRC An invalid MAC CRC was read from BLK3 of EFUSE

Parameters
- mac: base MAC address, length: 6 bytes.

esp_err_t esp_efuse_mac_get_default (uint8_t *mac)
Return base MAC address which is factory-programmed by Espressif in BLK0 of EFUSE.

Return ESP_OK on success

Parameters
- mac: base MAC address, length: 6 bytes.
**esp_err_t esp_read_mac (uint8_t* mac, esp_mac_type_t type)**

Read base MAC address and set MAC address of the interface.

This function first get base MAC address using esp_base_mac_addr_get or reads base MAC address from BLK0 of EFUSE. Then set the MAC address of the interface including wifi station, wifi softap, bluetooth and ethernet.

**Return**  ESP_OK on success

**Parameters**
- **mac**: MAC address of the interface, length: 6 bytes.
- **type**: type of MAC address, 0:wifi station, 1:wifi softap, 2:bluetooth, 3:ethernet.

**esp_err_t esp_derive_local_mac (uint8_t* local_mac, const uint8_t* universal_mac)**

Derive local MAC address from universal MAC address.

This function derives a local MAC address from an universal MAC address. A definition of local vs universal MAC address can be found on Wikipedia <>. In ESP32, universal MAC address is generated from base MAC address in EFUSE or other external storage. Local MAC address is derived from the universal MAC address.

**Return**  ESP_OK on success

**Parameters**
- **local_mac**: Derived local MAC address, length: 6 bytes.
- **universal_mac**: Source universal MAC address, length: 6 bytes.

**void esp_chip_info (esp_chip_info_t *out_info)**

Fill an *esp_chip_info_t* structure with information about the chip.

**Parameters**
- **[out]** out_info: structure to be filled

**Structures**

**struct esp_chip_info_t**

The structure represents information about the chip.

**Public Members**

**esp_chip_model_t** model
- chip model, one of esp_chip_model_t

**uint32_t** features
- bit mask of CHIP_FEATURE_x feature flags

**uint8_t** cores
- number of CPU cores

**uint8_t** revision
- chip revision number

**Macros**

**CHIP_FEATURE_EMB_FLASH**
- Chip has embedded flash memory.

**CHIP_FEATURE_WIFI_BGN**
- Chip has 2.4GHz WiFi.

**CHIP_FEATURE_BLE**
- Chip has Bluetooth LE.

**CHIP_FEATURE_BT**
- Chip has Bluetooth Classic.
Chapter 2. API Reference

**Type Definitions**

```c
typedef void (*shutdown_handler_t)(void)
             Shutdown handler type
```

**Enumerations**

```c
enum esp_mac_type_t
    Values:
    ESP_MAC_WIFI_STA
    ESP_MAC_WIFI_SOFTAP
    ESP_MAC_BT
    ESP_MAC_ETH

enum esp_reset_reason_t
    Reset reasons.
    Values:
    ESP_RST_UNKNOWN
        Reset reason can not be determined.
    ESP_RST_POWERON
        Reset due to power-on event.
    ESP_RST_EXT
        Reset by external pin (not applicable for ESP32)
    ESP_RST_SW
        Software reset via esp_restart.
    ESP_RST_PANIC
        Software reset due to exception/panic.
    ESP_RST_INT_WDT
        Reset (software or hardware) due to interrupt watchdog.
    ESP_RST_TASK_WDT
        Reset due to task watchdog.
    ESP_RST_WDT
        Reset due to other watchdogs.
    ESP_RST_DEEPSLEEP
        Reset after exiting deep sleep mode.
    ESP_RST_BROWNOUT
        Brownout reset (software or hardware)
    ESP_RST_SDIIO
        Reset over SDIO.
```

```c
enum esp_chip_model_t
    Chip models.
    Values:
    CHIP_ESP32 = 1
```

**Header File**

- esp_common/include/esp_idf_version.h
Chapter 2. API Reference

Functions

```c
const char* esp_get_idf_version(void)
```

Return full IDF version string, same as `git describe` output.

**Note** If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don’t differentiate between development, pre-release and release versions, but the output of this function does.

Return constant string from IDF_VER

### Macros

- `ESP_IDF_VERSION_MAJOR` Major version number (X.x.x)
- `ESP_IDF_VERSION_MINOR` Minor version number (x.X.x)
- `ESP_IDF_VERSION_PATCH` Patch version number (x.x.X)
- `ESP_IDF_VERSION_VAL` (major, minor, patch)
  - Macro to convert IDF version number into an integer
  - To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`
- `ESP_IDF_VERSION` Current IDF version, as an integer
  - To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

Code examples for this API section are provided in the `system` directory of ESP-IDF examples.

# 2.8 Project Configuration

## 2.8.1 Introduction

ESP-IDF uses Kconfig system to provide a compile-time project configuration mechanism. Kconfig is based around options of several types: integer, string, boolean. Kconfig files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

## 2.8.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved inside `sdkconfig` file in the project root directory. Based on `sdkconfig` file, application build targets will generate `sdkconfig.h` file in the build directory, and will make `sdkconfig` options available to the project build system and source files.

(For the legacy GNU Make build system, the project configuration menu is opened with `make menuconfig`.)

## 2.8.3 Using `sdkconfig.defaults`

In some cases, such as when `sdkconfig` file is under revision control, the fact that `sdkconfig` file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of `sdkconfig.defaults` file. This file is never touched by the build system, and must be created manually. It can contain all the options which matter for the given application. The format is the same as that of the `sdkconfig` file. Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted and added to the ignore list of the revision control system (e.g. `.gitignore` file for git). Project build targets will automatically create `sdkconfig` file, populated with the settings from `sdkconfig.defaults` file, and the rest of the settings will be set to their default values.
2.8.4 Kconfig Formatting Rules

The following attributes of Kconfig files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, menu is indented by 0 characters, the config inside of the menu by 4 characters, the help of the config by 8 characters and the text of the help by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.
- Lines cannot be wrapped by backslash (because there is a bug in earlier versions of conf-idf which causes that Windows line endings are not recognized after a backslash).

Format checker

tools/check_kconfigs.py is provided for checking the Kconfig formatting rules. The checker checks all Kconfig and Kconfig.projbuild files in the ESP-IDF directory and generates a new file with suffix .new with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For example, indentations will be corrected if there isn’t some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

2.8.5 Backward Compatibility of Kconfig Options

The standard Kconfig tools ignore unknown options in sdkconfig. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. configgen.py is used by the tool chain to pre-process sdkconfig files before anything else, for example menuconfig, would read them. As the consequence, the settings for old options will be kept and not ignored.
2. configgen.py recursively finds all sdkconfig.rename files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the sdkconfig file.
3. configgen.py post-processes sdkconfig files and generates all build outputs (sdkconfig.h, sdkconfig.cmake, auto.conf) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.
4. Deprecated options and their replacements are automatically generated by configgen.py.

2.8.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from Kconfig files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of menuconfig.

By convention, all option names are upper case with underscores. When Kconfig generates sdkconfig and sdkconfig.h files, option names are prefixed with CONFIG_. So if an option ENABLE_FOO is defined in a Kconfig file and selected in menuconfig, then sdkconfig and sdkconfig.h files will have CONFIG_ENABLE_FOO defined. In this reference, option names are also prefixed with CONFIG_, same as in the source code.
SDK tool configuration

Contains:

- `CONFIG_SDK_TOOLPREFIX`
- `CONFIG_SDK_PYTHON`
- `CONFIG_SDK_MAKE_WARN_UNDEFINED_VARIABLES`

`CONFIG_SDK_TOOLPREFIX`

Compiler toolchain path/prefix

*Found in: SDK tool configuration*

The prefix/path that is used to call the toolchain. The default setting assumes a crosstool-ng gcc setup that is in your PATH.

`CONFIG_SDK_PYTHON`

Python interpreter

*Found in: SDK tool configuration*

The executable name/path that is used to run python.

(Note: This option is used with the legacy GNU Make build system only.)

`CONFIG_SDK_MAKE_WARN_UNDEFINED_VARIABLES`

‘make’ warns on undefined variables

*Found in: SDK tool configuration*

Adds –warn-undefined-variables to MAKEFLAGS. This causes make to print a warning any time an undefined variable is referenced.

This option helps find places where a variable reference is misspelled or otherwise missing, but it can be unwanted if you have Makefiles which depend on undefined variables expanding to an empty string.

(Note: this option is used with the legacy GNU Make build system only.)

Application manager

Contains:

- `CONFIG_APP_COMPILE_TIME_DATE`
- `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`
- `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`
- `CONFIG_APP_RETRIEVE_LEN_ELF_SHA`

`CONFIG_APP_COMPILE_TIME_DATE`

Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.
Chapter 2. API Reference

CONFIG_APP_EXCLUDE_PROJECT_VER_VAR

Exclude PROJECT_VER from firmware image

*Found in: Application manager*

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR

Exclude PROJECT_NAME from firmware image

*Found in: Application manager*

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

CONFIG_APP_RETRIEVE_LEN_ELF_SHA

The length of APP ELF SHA is stored in RAM (chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

Bootloader config

Contains:

- `CONFIG_BOOTLOADER_LOG_LEVEL`
- `CONFIG_BOOTLOADER_SPI_WP_PIN`
- `CONFIG_BOOTLOADER_VDDS_DIO_BOOST`
- `CONFIG_BOOTLOADER_FACTORY_RESET`
- `CONFIG_BOOTLOADER_APP_TEST`
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO`
- `CONFIG_BOOTLOADER_WDT_ENABLE`
- `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`
- `CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT`

CONFIG_BOOTLOADER_LOG_LEVEL

Bootloader log verbosity

*Found in: Bootloader config*

Specify how much output to see in bootloader logs.

**Available options:**

- No output (`BOOTLOADER_LOG_LEVEL_NONE`)
- Error (`BOOTLOADER_LOG_LEVEL_ERROR`)
- Warning (`BOOTLOADER_LOG_LEVEL_WARN`)
- Info (`BOOTLOADER_LOG_LEVEL_INFO`)
- Debug (`BOOTLOADER_LOG_LEVEL_DEBUG`)
- Verbose (`BOOTLOADER_LOG_LEVEL_VERBOSE`)
**CONFIG_BOOTLOADER_SPI_WP_PIN**

SPI Flash WP Pin when customising pins via eFuse (read help)

*Found in: Bootloader config*

This value is ignored unless flash mode is set to QIO or QOUT *and* the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. That pin number is compiled into the bootloader instead.

The default value (GPIO 7) is correct for WP pin on ESP32-D2WD integrated flash.

**CONFIG_BOOTLOADER_VDDSDIO_BOOST**

VDDSDIO LDO voltage

*Found in: Bootloader config*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

*Available options:*
- 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)

**CONFIG_BOOTLOADER_FACTORY_RESET**

GPIO triggers factory reset

*Found in: Bootloader config*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input pulled low while device starts up. See settings below.

**CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET**

Number of the GPIO input for factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a factory reset, this GPIO must be pulled low on reset. Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**CONFIG_BOOTLOADER_OTA_DATA_ERASE**

Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.
**CONFIG_BOOTLOADER_DATA_FACTORY_RESET**

Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, …”) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**CONFIG_BOOTLOADER_APP_TEST**

GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**CONFIG_BOOTLOADER_NUM_PIN_APP_TEST**

Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**CONFIG_BOOTLOADER_HOLD_TIME_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in: Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**CONFIG_BOOTLOADER_WDT_ENABLE**

Use RTC watchdog in start code

*Found in: Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on ESP32_RTC_CLK_SRC (INTERNAL_RC or EXTERNAL_CRYSTAL).

**CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE**

Allows RTC watchdog disable in user code

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

If it is set, the client must itself reset or disable rtc_wdt in their code (app_main()). Otherwise rtc_wdt will be disabled before calling app_main function. Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.
CONFIG_BOOTLOADER_WDT_TIME_MS

Timeout for RTC watchdog (ms)

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

Verify that this parameter is correct and more than the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

Enable app rollback support

*Found in: Bootloader config*

After updating the app, the bootloader runs a new app with the “ESP_OOTA_IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

Enable app anti-rollback support

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.

CONFIG_BOOTLOADER_APP_SECURE_VERSION

eFuse secure version of app

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD

Size of the efuse secure version field

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The size of the efuse secure version field. Its length is limited to 32 bits. This determines how many times the security version can be increased.
Chapter 2. API Reference

CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE

Emulate operations with efuse secure version (only test)

Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP анти_ROLLBACK

This option allow emulate read/write operations with efuse secure version. It allow to test anti-rollback implementation without permanent write eFuse bits. In partition table should be exist this partition emul_efuse, data, 5, , 0x2000.

CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT

Enable the support for flash chips of XMC (READ HELP FIRST)

Found in: Bootloader config

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON’T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

Security features

Contains:

- CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
- CONFIG_SECURE_BOOT_ENABLED
- CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES
- CONFIG_SECURE_BOOT_VERIFICATION_KEY
- CONFIG_SECURE_BOOTLOADER_KEY_ENCODING
- CONFIG_SECURE_BOOT_INSECURE
- CONFIG_SECURE_FLASH_ENC_ENABLED
- Potentially insecure options
- CONFIG_SECURE_DISABLE_ROM_DL_MODE

CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

Require signed app images

Found in: Security features

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT

Bootloader verifies app signatures

Found in: Security features > CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.
**CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT**

Verify app signature on update

*Found in: Security features > CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT*

If this option is set, any OTA updated apps will have the signature verified before being considered valid. When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**CONFIG_SECURE_BOOT_ENABLED**

Enable hardware secure boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables secure boot on first boot.

Once enabled, secure boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

Refer to Secure Boot before enabling.

**CONFIG_SECURE_BOOTLOADER_MODE**

Secure bootloader mode

*Found in: Security features > CONFIG_SECURE_BOOT_ENABLED*

**Available options:**

- **One-time flash** (SECURE_BOOTLOADER_ONE_TIME_FLASH)
  
  On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot.
  
  Enabling this option means that the bootloader cannot be changed after the first time it is booted.

- **Reflashable** (SECURE_BOOTLOADER_REFLASHABLE)
  
  Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.
  
  This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.
  
  This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

**CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES**

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py (for example, on a remote signing server.)
CONFIG_SECURE_BOOT_SIGNING_KEY

Secure boot private signing key

*Found in:* Security features ➔ CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See Secure Boot for details.

CONFIG_SECURE_BOOT_VERIFICATION_KEY

Secure boot public signature verification key

*Found in:* Security features

Path to a public key file used to verify signed images. This key is compiled into the bootloader and/or app, to verify app images.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the espsecure.py extract_public_key command.

Refer to Secure Boot before enabling.

CONFIG_SECURE_BOOTLOADER_KEY_ENCODING

Hardware Key Encoding

*Found in:* Security features

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with espfuse.py.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn’t change any firmware code, it only changes the size of key binary which is generated at build time.

**Available options:**
- No encoding (256 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
- 3/4 encoding (192 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

CONFIG_SECURE_BOOT_INSECURE

Allow potentially insecure options

*Found in:* Security features

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to Secure Boot before enabling.
CONFIG_SECURE_FLASH_ENC_ENABLED
Enable flash encryption on boot (READ DOCS FIRST)

Found in: Security features

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read Flash Encryption before enabling.

CONFIG_SECURE_FLASH_ENCRYPTION_MODE
Enable usage mode

Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED

By default Development mode is enabled which allows UART bootloader to perform flash encryption operations

Select Release mode only for production or manufacturing. Once enabled you can not reflash using UART bootloader

Refer to Secure Boot and Flash Encryption for details.

Available options:
• Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
• Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

Potentially insecure options Contains:
• CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC
• CONFIG_SECURE_BOOT_ALLOW_JTAG
• CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION
• CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC
• CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC
• CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE
• CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED

CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC
Leave ROM BASIC Interpreter available on reset

Found in: Security features > Potentially insecure options

By default, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

When either flash encryption or secure boot are enabled, the default is to disable this BASIC fallback mode permanently via eFuse.

If this option is set, this eFuse is not burned and the BASIC ROM Console may remain accessible. Only set this option in testing environments.

CONFIG_SECURE_BOOT_ALLOW_JTAG
Allow JTAG Debugging

Found in: Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.
Chapter 2. API Reference

Only set this option in testing environments.

**CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION**

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC**

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC**

Leave UART bootloader decryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader decryption access on first boot. If set, the UART bootloader will still be able to access hardware decryption.

Only set this option in testing environments. Setting this option allows complete bypass of flash encryption.

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE**

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED**

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espfuse.py.
**CONFIG_SECURE_DISABLE_ROM_DL_MODE**

Permanently disable ROM Download Mode

*Found in: Security features*

If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espefuse.py and similar tools.

Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.

It is also possible to permanently disable Download Mode by calling esp_efuse_disable_rom_download_mode() at runtime.

**Serial flasher config**

Contains:

- `CONFIG_ESPTOOLPY_PORT`
- `CONFIG_ESPTOOLPY_BAUD`
- `CONFIG_ESPTOOLPY_BAUD_OTHER_VAL`
- `CONFIG_ESPTOOLPY_COMPRESSED`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`
- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHSIZE_DETECT`
- `CONFIG_ESPTOOLPY_BEFORE`
- `CONFIG_ESPTOOLPY_AFTER`
- `CONFIG_ESPTOOLPY_MONITOR_BAUD`
- `CONFIG_ESPTOOLPY_MONITOR_BAUD_OTHER_VAL`

**CONFIG_ESPTOOLPY_PORT**

Default serial port

*Found in: Serial flasher config*

The serial port that’s connected to the ESP chip. This can be overridden by setting the ESPPORT environment variable.

This value is ignored when using the CMake-based build system or idf.py.

**CONFIG_ESPTOOLPY_BAUD**

Default baud rate

*Found in: Serial flasher config*

Default baud rate to use while communicating with the ESP chip. Can be overridden by setting the ESPBAUD variable.

This value is ignored when using the CMake-based build system or idf.py.

*Available options:*

- 115200 baud (ESPTOOLPY_BAUD_115200B)
- 230400 baud (ESPTOOLPY_BAUD_230400B)
- 921600 baud (ESPTOOLPY_BAUD_921600B)
- 2Mbaud (ESPTOOLPY_BAUD_2MB)
- Other baud rate (ESPTOOLPY_BAUD_OTHER)
CONFIG_ESPTOOLPY_BAUD_OTHER_VAL
Other baud rate value

Found in: Serial flasher config

CONFIG_ESPTOOLPY_COMPRESSED
Use compressed upload

Found in: Serial flasher config

The flasher tool can send data compressed using zlib, letting the ROM on the ESP chip decompress it on the fly before flashing it. For most payloads, this should result in a speed increase.

CONFIG_ESPTOOLPY_FLASHMODE
Flash SPI mode

Found in: Serial flasher config

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:

- QIO (ESPTOOLPY_FLASHMODE_QIO)
- QOUT (ESPTOOLPY_FLASHMODE_QOUT)
- DIO (ESPTOOLPY_FLASHMODE_DIO)
- DOUT (ESPTOOLPY_FLASHMODE_DOUT)

CONFIG_ESPTOOLPY_FLASHFREQ
Flash SPI speed

Found in: Serial flasher config

The SPI flash frequency to be used.

Available options:

- 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
- 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
- 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
- 20 MHz (ESPTOOLPY_FLASHFREQ_20M)

CONFIG_ESPTOOLPY_FLASHSIZE
Flash size

Found in: Serial flasher config

SPI flash size, in megabytes

Available options:

- 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (ESPTOOLPY_FLASHSIZE_16MB)
CONFIG_ESPTOOLPY_FLASHSIZE_DETECT

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

CONFIG_ESPTOOLPY_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**
- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
- No reset (ESPTOOLPY_BEFORE_NORESET)

CONFIG_ESPTOOLPY_AFTER

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**
- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)

CONFIG_ESPTOOLPY_MONITOR_BAUD

`idf.py monitor` baud rate

*Found in: Serial flasher config*

Baud rate to use when running `idf.py monitor` or `make monitor` to view serial output from a running chip.

Can override by setting the MONITORBAUD environment variable.

**Available options:**
- 9600 bps (ESPTOOLPY_MONITOR_BAUD_9600B)
- 57600 bps (ESPTOOLPY_MONITOR_BAUD_57600B)
- 115200 bps (ESPTOOLPY_MONITOR_BAUD_115200B)
- 230400 bps (ESPTOOLPY_MONITOR_BAUD_230400B)
- 921600 bps (ESPTOOLPY_MONITOR_BAUD_921600B)
- 2 Mbps (ESPTOOLPY_MONITOR_BAUD_2MB)
- Custom baud rate (ESPTOOLPY_MONITOR_BAUD_OTHER)

CONFIG_ESPTOOLPY_MONITOR_BAUD_OTHER_VAL

Custom baud rate value

*Found in: Serial flasher config*
Partition Table

Contains:

- `CONFIG_PARTITION_TABLE_TYPE`
- `CONFIG_PARTITION_TABLE_CUSTOM_FILENAME`
- `CONFIG_PARTITION_TABLE_OFFSET`
- `CONFIG_PARTITION_TABLE_MD5`

`CONFIG_PARTITION_TABLE_TYPE`

Partition Table

*Found in: Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. Otherwise it’s possible to create a new custom partition CSV for your application.

**Available options:**

- Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)
- Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)
- Custom partition table CSV (PARTITION_TABLE_CUSTOM)

`CONFIG_PARTITION_TABLE_CUSTOM_FILENAME`

Custom partition CSV file

*Found in: Partition Table*

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

`CONFIG_PARTITION_TABLE_OFFSET`

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

`CONFIG_PARTITION_TABLE_MD5`

Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.
Chapter 2. API Reference

Compiler options

Contains:

- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_CXX.Exceptions`
- `CONFIG_COMPILER_STACK_CHECK_MODE`
- `CONFIG_COMPILER_WARN_WRITE_STRINGS`
- `CONFIG_COMPILER_DISABLE_GCC8_WARNINGS`

**CONFIG_COMPILER_OPTIMIZATION**

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument).

- for “Release” setting, -Os flag is added to CFLAGS.
- for “Debug” setting, -Og flag is added to CFLAGS.

“Release” with -Os produces smaller & faster compiled code but it may be harder to correlated code addresses to source files when debugging.

To add custom optimization settings, set CFLAGS and/or CPPFLAGS in project makefile, before including $(IDF_PATH)/make/project.mk. Note that custom optimization levels may be unsupported.

**Available options:**

- Debug (-Og) (COMPILER_OPTIMIZATION_LEVEL_DEBUG)
- Release (-Os) (COMPILER_OPTIMIZATION_LEVEL_RELEASE)

**CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL**

Assertion level

*Found in: Compiler options*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

**Available options:**

- Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
- Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
- Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)

If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

**CONFIG_COMPILER_CXX_EXCEPTIONS**

Enable C++ exceptions

*Found in: Compiler options*

Enabling this option compiles all IDF C++ files with exception support enabled.
Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

Contains:

• CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

**CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE**

Emergency Pool Size

*Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**CONFIG_COMPILER_STACK_CHECK_MODE**

Stack smashing protection mode

*Found in: Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

• In NORMAL mode (GCC flag: -fstack-protector) only functions that call alloca, and functions with buffers larger than 8 bytes are protected.
• STRONG mode (GCC flag: -fstack-protector-strong) is like NORMAL, but includes additional functions to be protected—those that have local array definitions, or have references to local frame addresses.
• In OVERALL mode (GCC flag: -fstack-protector-all) all functions are protected.

Modes have the following impact on code performance and coverage:

• performance: NORMAL > STRONG > OVERALL
• coverage: NORMAL < STRONG < OVERALL

**Available options:**

• None (COMPILER_STACK_CHECK_MODE_NONE)
• Normal (COMPILER_STACK_CHECK_MODE_NORM)
• Strong (COMPILER_STACK_CHECK_MODE_STRONG)
• Overall (COMPILER_STACK_CHECK_MODE_ALL)

**CONFIG_COMPILER_WARN_WRITE_STRINGS**

Enable -Wwrite-strings warning flag

*Found in: Compiler options*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`. 
CONFIG_COMPILER_DISABLE_GCC8_WARNINGS

Disable new warnings introduced in GCC 6 - 8

Found in: Compiler options

Enable this option if using GCC 6 or newer, and wanting to disable warnings which don’t appear with GCC 5.

Component config

Contains:

- Application Level Tracing
- Bluetooth
- CONFIG_BLE_MESH
- Driver configurations
- eFuse Bit Manager

Application Level Tracing Contains:

- CONFIG_ESP32_APPTRACE_DESTINATION
Chapter 2. API Reference

- `CONFIG_ESP32_APPTRACE_ONPANIC_HOST_FLUSH_TMO`
- `CONFIG_ESP32_APPTRACE_POSTMORTEM_FLUSH_THRESH`
- `CONFIG_ESP32_APPTRACE_PENDING_DATA_SIZE_MAX`
- `FreeRTOS SystemView Tracing`
- `CONFIG_ESP32_GCOV_ENABLE`

**CONFIG_ESP32_APPTRACE_DESTINATION**

Data Destination

*Found in: Component config > Application Level Tracing*

Select destination for application trace: trace memory or none (to disable).

**Available options:**
- Trace memory (ESP32_APPTRACE_DEST_TRAX)
- None (ESP32_APPTRACE_DEST_NONE)

**CONFIG_ESP32_APPTRACE_ONPANIC_HOST_FLUSH_TMO**

Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG_ESP32_APPTRACE_POSTMORTEM_FLUSH_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG_ESP32_APPTRACE_PENDING_DATA_SIZE_MAX**

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing** Contains:

- `CONFIG_SYSVIEW_ENABLE`

**CONFIG_SYSVIEW_ENABLE**

SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.
CONFIG_SYSVIEW_TS_SOURCE

Timer to use as timestamp source

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

**Available options:**
- CPU cycle counter (CCOUNT) (SYSVIEW_TS_SOURCE_CCOUNT)
- Timer 0, Group 0 (SYSVIEW_TS_SOURCE_TIMER_00)
- Timer 1, Group 0 (SYSVIEW_TS_SOURCE_TIMER_01)
- Timer 0, Group 1 (SYSVIEW_TS_SOURCE_TIMER_10)
- Timer 1, Group 1 (SYSVIEW_TS_SOURCE_TIMER_11)
- esp_timer high resolution timer (SYSVIEW_TS_SOURCE_ESP_TIMER)

CONFIG_SYSVIEW_MAX_TASKS

Maximum supported tasks

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Configures maximum supported tasks in sysview debug

CONFIG_SYSVIEW_BUF_WAIT_TMO

Trace buffer wait timeout

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

CONFIG_SYSVIEW_EVT_OVERFLOW_ENABLE

Trace Buffer Overflow Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Trace Buffer Overflow” event.

CONFIG_SYSVIEW_EVT_ISR_ENTER_ENABLE

ISR Enter Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “ISR Enter” event.

CONFIG_SYSVIEW_EVT_ISR_EXIT_ENABLE

ISR Exit Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “ISR Exit” event.
CONFIG_SYSVIEW_EVT_ISR_TO_SCHEDULER_ENABLE

ISR Exit to Scheduler Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “ISR to Scheduler” event.

CONFIG_SYSVIEW_EVT_TASK_START_EXEC_ENABLE

Task Start Execution Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Task Start Execution” event.

CONFIG_SYSVIEW_EVT_TASK_STOP_EXEC_ENABLE

Task Stop Execution Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Task Stop Execution” event.

CONFIG_SYSVIEW_EVT_TASK_START_READY_ENABLE

Task Start Ready State Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Task Start Ready State” event.

CONFIG_SYSVIEW_EVT_TASK_STOP_READY_ENABLE

Task Stop Ready State Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Task Stop Ready State” event.

CONFIG_SYSVIEW_EVT_TASK_CREATE_ENABLE

Task Create Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Task Create” event.

CONFIG_SYSVIEW_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE

Enables “Task Terminate” event.
**CONFIG_SYSVIEW_EVT_IDLE_ENABLE**

System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE*

Enables “System Idle” event.

**CONFIG_SYSVIEW_EVT_TIMER_ENTER_ENABLE**

Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE*

Enables “Timer Enter” event.

**CONFIG_SYSVIEW_EVT_TIMER_EXIT_ENABLE**

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_SYSVIEW_ENABLE*

Enables “Timer Exit” event.

**CONFIG_ESP32_GCOV_ENABLE**

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

**Bluetooth**

Contains:

- **CONFIG_BT_ENABLED**
- Bluetooth controller
- **CONFIG_BT_HOST**
- Bluedroid Options
- NimBLE Options

**CONFIG_BT_ENABLED**

Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

**Bluetooth controller**

Contains:

- **CONFIG_BTDM_CTRL_MODE**
- **CONFIG_BTDM_CTRL_BLE_MAX_CONN**

- **CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP**

**CONFIG_BTDM_CTRL_MODE**

Bluetooth controller mode (BR/EDR/BLE/DUALMODE)

*Found in: Component config > Bluetooth > Bluetooth controller*

Specify the bluetooth controller mode (BR/EDR, BLE or dual mode).

**Available options:**
- BLE Only (BTDM_CTRL_MODE_BLE_ONLY)
- BR/EDR Only (BTDM_CTRL_MODE_BR_EDR_ONLY)
- Bluetooth Dual Mode (BTDM_CTRL_MODE_BTDM)

**CONFIG_BTDM_CTRL_BLE_MAX_CONN**

BLE Max Connections

*Found in: Component config > Bluetooth > Bluetooth controller*

BLE maximum connections of bluetooth controller. Each connection uses 1KB static DRAM whenever the BT controller is enabled.

**CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN**

BR/EDR ACL Max Connections

*Found in: Component config > Bluetooth > Bluetooth controller*

BR/EDR ACL maximum connections of bluetooth controller. Each connection uses 1.2KB static DRAM whenever the BT controller is enabled.

**CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN**

BR/EDR Sync(SCO/eSCO) Max Connections

*Found in: Component config > Bluetooth > Bluetooth controller*

BR/EDR Synchronize maximum connections of bluetooth controller. Each connection uses 2KB static DRAM whenever the BT controller is enabled.

**CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH**

BR/EDR Sync(SCO/eSCO) default data path

*Found in: Component config > Bluetooth > Bluetooth controller*

SCO data path, i.e. HCI or PCM. SCO data can be sent/received through HCI synchronous packets, or the data can be routed to on-chip PCM module on ESP32. PCM input/output signals can be “matrixed” to GPIOs. The default data path can also be set using API “esp_bredr_sco_datapath_set”

**Available options:**
- HCI (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_HCI)
- PCM (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM)
CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG

PCM Signal Config (Role and Polar)

*Found in: Component config > Bluetooth > Bluetooth controller*

Contains:

- `CONFIG_BTDM_CTRL_PCM_ROLE`
- `CONFIG_BTDM_CTRL_PCM_POLAR`

CONFIG_BTDM_CTRL_PCM_ROLE

PCM Role

*Found in: Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*

PCM role can be configured as PCM master or PCM slave

**Available options:**

- PCM Master (BTDM_CTRL_PCM_ROLE_MASTER)
- PCM Slave (BTDM_CTRL_PCM_ROLE_SLAVE)

CONFIG_BTDM_CTRL_PCM_POLAR

PCM Polar

*Found in: Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*

PCM polarity can be configured as Falling Edge or Rising Edge

**Available options:**

- Falling Edge (BTDM_CTRL_PCM_POLAR_FALLING_EDGE)
- Rising Edge (BTDM_CTRL_PCM_POLAR_RISING_EDGE)

CONFIG_BTDM_CTRL_AUTO_LATENCY

Auto latency

*Found in: Component config > Bluetooth > Bluetooth controller*

BLE auto latency, used to enhance classic BT performance while classic BT and BLE are enabled at the same time.

CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT

Legacy Authentication Vendor Specific Event Enable

*Found in: Component config > Bluetooth > Bluetooth controller*

To protect from BIAS attack during Legacy authentication, Legacy authentication Vendor specific event should be enabled

CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE

The cpu core which bluetooth controller run

*Found in: Component config > Bluetooth > Bluetooth controller*

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

**Available options:**

- Core 0 (PRO CPU) (BTDM_CTRL_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BTDM_CTRL_PINNED_TO_CORE_1)
**CONFIG_BTDM_CTRL_HCI_MODE_CHOICE**

HCI mode

*Found in: Component config > Bluetooth > Bluetooth controller*

Specify HCI mode as VHCI or UART(H4)

**Available options:**

- VHCI (BTDM_CTRL_HCI_MODE_VHCI)
  Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32, too.
- UART(H4) (BTDM_CTRL_HCI_MODE_UART_H4)
  If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

**HCI UART(H4) Options**

Contains:

- `CONFIG_BT_HCI_UART_NO`
- `CONFIG_BT_HCI_UART_BAUDRATE`

**CONFIG_BT_HCI_UART_NO**

UART Number for HCI

*Found in: Component config > Bluetooth > Bluetooth controller > HCI UART(H4) Options*

Uart number for HCI. The available uart is UART1 and UART2.

**CONFIG_BT_HCI_UART_BAUDRATE**

UART Baudrate for HCI

*Found in: Component config > Bluetooth > Bluetooth controller > HCI UART(H4) Options*

UART Baudrate for HCI. Please use standard baudrate.

**MODEM SLEEP Options**

Contains:

- `CONFIG_BTDM_MODEM_SLEEP`
- `CONFIG_BTDM_LOW_POWER_CLOCK`

**CONFIG_BTDM_MODEM_SLEEP**

Bluetooth modem sleep

*Found in: Component config > Bluetooth > Bluetooth controller > MODEM SLEEP Options*

Enable/disable bluetooth controller low power mode.

**CONFIG_BTDM_MODEM_SLEEP_MODE**

Bluetooth Modem sleep mode

*Found in: Component config > Bluetooth > Bluetooth controller > MODEM SLEEP Options > CONFIG_BTDM_MODEM_SLEEP*

To select which strategy to use for modem sleep

**Available options:**

- ORIG Mode(sleep with low power clock) (BTDM_MODEM_SLEEP_MODE_ORIG)
  ORIG mode is a bluetooth sleep mode that can be used for dual mode controller. In this mode, bluetooth controller sleeps between BR/EDR frames and BLE events. A low power clock is used to maintain bluetooth reference clock.
• EVED Mode (For internal test only) (BTDM_MODEM_SLEEP_MODE_EVED)
  EVED mode is for BLE only and is only for internal test. Do not use it for production. This
  mode is not compatible with DFS nor light sleep

**CONFIG_BTDM_LOW_POWER_CLOCK**

Bluetooth low power clock

*Found in: Component config > Bluetooth > Bluetooth controller > MODEM SLEEP Options*

Select the low power clock source for the Bluetooth controller. Bluetooth low power clock is the clock source to maintain time in sleep mode.

- “Main crystal” option provides good accuracy and can support Dynamic Frequency Scaling to be used with Bluetooth modem sleep. Light sleep is not supported.
- “External 32kHz crystal” option allows users to use a 32.768kHz crystal as Bluetooth low power clock. This option is allowed as long as External 32kHz crystal is configured as the system RTC clock source. This option provides good accuracy and supports Bluetooth modem sleep to be used alongside Dynamic Frequency Scaling or light sleep.

**Available options:**

- Main crystal (BTDM_LPCLK_SEL_MAIN_XTAL)
  Main crystal can be used as low power clock for Bluetooth modem sleep. If this option is selected, Bluetooth modem sleep can work under Dynamic Frequency Scaling (DFS) enabled, but cannot work when light sleep is enabled. Main crystal has a good performance in accuracy as the Bluetooth low power clock source.

- External 32kHz crystal (BTDM_LPCLK_SEL_EXT_32K_XTAL)
  External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.

**CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY**

BLE Sleep Clock Accuracy

*Found in: Component config > Bluetooth > Bluetooth controller*

BLE Sleep Clock Accuracy (SCA) for the local device is used to estimate window widening in BLE connection events. With a lower level of clock accuracy (e.g., 500ppm over 250ppm), the slave needs a larger RX window to synchronize with master in each anchor point, thus resulting in an increase of power consumption but a higher level of robustness in keeping connected. According to the requirements of Bluetooth Core specification 4.2, the worst-case accuracy of Classic Bluetooth low power oscillator (LPO) is +/-250ppm in STANDBY and in low power modes such as sniff. For BLE the worst-case SCA is +/-500ppm.

- “151ppm to 250ppm” option is the default value for Bluetooth Dual mode
- “251ppm to 500ppm” option can be used in BLE only mode when using external 32kHz crystal as low power clock. This option is provided in case that BLE sleep clock has a lower level of accuracy, or other error sources contribute to the inaccurate timing during sleep.

**Available options:**

- 251ppm to 500ppm (BTDM_BLE_DEFAULT_SCA_500PPM)
- 151ppm to 250ppm (BTDM_BLE_DEFAULT_SCA_250PPM)

**CONFIG_BTDM_BLE_SCAN_DUPL**

BLE Scan Duplicate Options

*Found in: Component config > Bluetooth > Bluetooth controller*

This select enables parameters setting of BLE scan duplicate.
CONFIG_BTDM_SCAN_DUPL_TYPE

Scan Duplicate Type

*Found in:* Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”. This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data”. This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

**Available options:**

- Scan Duplicate By Device Address (BTDM_SCAN_DUPL_TYPE_DEVICE)
  This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once
- Scan Duplicate By Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA)
  This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.
- Scan Duplicate By Device Address And Advertising Data
  (BTDM_SCAN_DUPL_TYPE_DATA_DEVICE)
  This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

CONFIG_BTDM_SCAN_DUPL_CACHE_SIZE

Maximum number of devices in scan duplicate filter

*Found in:* Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN

Special duplicate BLE Mesh mechanism for BLE Mesh scan

*Found in:* Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL

This enables the BLE scan duplicate for special BLE Mesh scan.

CONFIG_BTDM_MESH_DUPL_SCAN_CACHE_SIZE

Maximum number of Mesh adv packets in scan duplicate filter

*Found in:* Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_BLE_SCAN_DUPL > CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED

BLE full scan feature supported

*Found in:* Component config > Bluetooth > Bluetooth controller

The full scan function is mainly used to provide BLE scan performance. This is required for scenes with high scan performance requirements, such as BLE Mesh scenes.
CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP

BLE adv report flow control supported

*Found in: Component config > Bluetooth > Bluetooth controller*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM

BLE adv report flow control number

*Found in: Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

The number of unprocessed advertising report that Bluedroid can save. If you set `BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a small value, this may cause adv packets lost. If you set `BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a large value, Bluedroid may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set `BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM` according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

CONFIG_BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD

BLE adv lost event threshold value

*Found in: Component config > Bluetooth > Bluetooth controller > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

When adv report flow control is enabled, the ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set `BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD` to a small value or printf every adv lost event, it may cause adv packets lost more.

CONFIG_BT_HOST

Bluetooth Host

*Found in: Component config > Bluetooth*

This helps to choose Bluetooth host stack

**Available options:**

- Bluedroid - Dual-mode (BT_BLUEDROID_ENABLED)
  This option is recommended for classic Bluetooth or for dual-mode usecases
- NimBLE - BLE only (BT_NIMBLE_ENABLED)
  This option is recommended for BLE only usecases to save on memory
- Controller Only (BT_CONTROLLER_ONLY)
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

**Bluedroid Options**

Contains:

- `CONFIG_BT_BTU_TASK_STACK_SIZE`
- `CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_BTU_TASK_STACK_SIZE`
- `CONFIG_BT_BLUEDROID_MEM_DEBUG`
- `CONFIG_BT_CLASSIC_ENABLED`
Chapter 2. API Reference

- CONFIG_BT_HFP_WBS_ENABLE
- CONFIG_BT_SSP_ENABLED
- CONFIG_BT_BLE_ENABLE
- CONFIG_BT_STACK_NO_LOG
- BT DEBUG LOG LEVEL
- CONFIG_BT_ACL_CONNECTIONS
- CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST
- CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY
- CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK
- CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN
- CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

**CONFIG_BT_BTC_TASK_STACK_SIZE**

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Blueador Options*

This select btc task stack size

**CONFIG_BT_BLUEDROID_Pinned_TO_CORE_CHOICE**

The cpu core which Blueador run

*Found in: Component config > Bluetooth > Blueador Options*

Which the cpu core to run Blueador. Can choose core0 and core1. Can not specify no-affinity.

Available options:
- Core 0 (PRO CPU) (BT_BLUEDROID_Pinned_TO_CORE_0)
- Core 1 (APP CPU) (BT_BLUEDROID_Pinned_TO_CORE_1)

**CONFIG_BT_BTU_TASK_STACK_SIZE**

Bluetooth Blueador Host Stack task stack size

*Found in: Component config > Bluetooth > Blueador Options*

This select btu task stack size

**CONFIG_BT_BLUEDROID_MEM_DEBUG**

Blueador memory debug

*Found in: Component config > Bluetooth > Blueador Options*

Blueador memory debug

**CONFIG_BT_CLASSIC_ENABLED**

Classic Bluetooth

*Found in: Component config > Bluetooth > Blueador Options*

For now this option needs “SMP_ENABLE” to be set to yes

**CONFIG_BT_A2DP_ENABLE**

A2DP

*Found in: Component config > Bluetooth > Blueador Options > CONFIG_BT_CLASSIC_ENABLED*

Advanced Audio Distribution Profile
Chapter 2. API Reference

**CONFIG_BT_SPP_ENABLED**

SPP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Serial Port Profile

**CONFIG_BT_HFP_ENABLE**

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

**CONFIG_BT_HFP_ROLE**

Hands-free Profile Role configuration

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

**Available options:**

- Hands Free Unit (BT_HFP_CLIENT_ENABLE)

**CONFIG_BT_HFP_AUDIO_DATA_PATH**

Audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API “esp_bredr_sco_datapath_set” in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

**Available options:**

- PCM (BT_HFP_AUDIO_DATA_PATH_PCM)
- HCI (BT_HFP_AUDIO_DATA_PATH_HCI)

**CONFIG_BT_HFP_WBS_ENABLE**

Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

**CONFIG_BT_SSP_ENABLED**

Secure Simple Pairing

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the Secure Simple Pairing. If disable this option, Bluedroid will only support Legacy Pairing

**CONFIG_BT_BLE_ENABLED**

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy
CONFIG_BT_GATTS_ENABLE
Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be disabled when the app work only on gatt client mode

CONFIG_BT_BLE_BLUFI_ENABLE
Include blufi function

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This option can be close when the app does not require blufi function.

CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE
GATTS Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Service change indication mode for GATT Server.

**Available options:**
- GATTS manually send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_MANUAL)
  Manually send service change indication through API
  esp_ble_gatts_send_service_change_indication()
- GATTS automatically send service change indication (BT_GATTS_SEND_SERVICE_CHANGE_AUTO)
  Let Bluedroid handle the service change indication internally

CONFIG_BT_GATTC_ENABLE
Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app work only on gatt server mode

CONFIG_BT_GATTC_CACHE_NVS_FLASH
Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

This select can save gattc cache data to nvs flash

CONFIG_BT_BLE_SMP_ENABLE
Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app not used the ble security connect.
CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE
Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

CONFIG_BT_STACK_NO_LOG
Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

BT DEBUG LOG LEVEL  Contains:

- CONFIG_BT_LOG_HCI_TRACE_LEVEL
- CONFIG_BT_LOG_BTM_TRACE_LEVEL
- CONFIG_BT_LOG_L2CAP_TRACE_LEVEL
- CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL
- CONFIG_BT_LOG_SDP_TRACE_LEVEL
- CONFIG_BT_LOG_GAP_TRACE_LEVEL
- CONFIG_BT_LOG_BNEP_TRACE_LEVEL
- CONFIG_BT_LOG_PAN_TRACE_LEVEL
- CONFIG_BT_LOG_A2DP_TRACE_LEVEL
- CONFIG_BT_LOG_AVDT_TRACE_LEVEL
- CONFIG_BT_LOG_AVCT_TRACE_LEVEL
- CONFIG_BT_LOG_AVRC_TRACE_LEVEL
- CONFIG_BT_LOG_MCA_TRACE_LEVEL
- CONFIG_BT_LOG_HID_TRACE_LEVEL
- CONFIG_BT_LOG_APPL_TRACE_LEVEL
- CONFIG_BT_LOG_GATT_TRACE_LEVEL
- CONFIG_BT_LOG_SMP_TRACE_LEVEL
- CONFIG_BT_LOG_BTIF_TRACE_LEVEL
- CONFIG_BT_LOG_BTIF_TRACE_LEVEL
- CONFIG_BT_LOG_OSI_TRACE_LEVEL
- CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

CONFIG_BT_LOG_HCI_TRACE_LEVEL
HCI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HCI layer

Available options:

- NONE (BT_LOG_HCI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HCI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HCI_TRACE_LEVEL_WARNING)
- API (BT_LOG_HCI_TRACE_LEVEL_API)
- EVENT (BT_LOG_HCI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HCI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HCI_TRACE_LEVEL_VERBOSE)
CONFIG_BT_LOG_BTM_TRACE_LEVEL

BTM layer

*Found in:* Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTM layer

**Available options:**
- NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_L2CAP_TRACE_LEVEL

L2CAP layer

*Found in:* Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for L2CAP layer

**Available options:**
- NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_L2CAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL

RFCOMM layer

*Found in:* Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for RFCOMM layer

**Available options:**
- NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SDP_TRACE_LEVEL

SDP layer

*Found in:* Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for SDP layer

**Available options:**
- NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (BT_LOG_SDP_TRACE_LEVEL_API)
• EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_GAP_TRACE_LEVEL**

GAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GAP layer

**Available options:**

• NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
• API (BT_LOG_GAP_TRACE_LEVEL_API)
• EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BNEP_TRACE_LEVEL**

BNEP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BNEP layer

**Available options:**

• NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
• API (BT_LOG_BNEP_TRACE_LEVEL_API)
• EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_PAN_TRACE_LEVEL**

PAN layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for PAN layer

**Available options:**

• NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
• API (BT_LOG_PAN_TRACE_LEVEL_API)
• EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_A2D_TRACE_LEVEL**

A2D layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for A2D layer
Available options:
- NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
- API (BT_LOG_A2D_TRACE_LEVEL_API)
- EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVDT_TRACE_LEVEL

AVDT layer

Found in: Component config > Bluetooth > Blueboard Options > BT DEBUG LOG LEVEL

Define BT trace level for AVDT layer

Available options:
- NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVDT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVCT_TRACE_LEVEL

AVCT layer

Found in: Component config > Bluetooth > Blueboard Options > BT DEBUG LOG LEVEL

Define BT trace level for AVCT layer

Available options:
- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVRC_TRACE_LEVEL

AVRC layer

Found in: Component config > Bluetooth > Blueboard Options > BT DEBUG LOG LEVEL

Define BT trace level for AVRC layer

Available options:
- NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)
Chapter 2. API Reference

CONFIG_BT_LOG_MCA_TRACE_LEVEL
MCA layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for MCA layer

Available options:
- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL
HID layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HID layer

Available options:
- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL
APPL layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for APPL layer

Available options:
- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATTTRACE_LEVEL
GATT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for GATT layer

Available options:
- NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_GATT TRACE_LEVEL_WARNING)
- API (BT_LOG_GATT_TRACE_LEVEL_API)
• EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for SMP layer

Available options:
• NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
• API (BT_LOG_SMP_TRACE_LEVEL_API)
• EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTIF layer

Available options:
• NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTIF_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL

BTC layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BTC layer

Available options:
• NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTC_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for OSI layer
Available options:
- NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
- API (BT_LOG_OSI_TRACE_LEVEL_API)
- EVENT (BT_LOG_OSI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL
BLUFI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BLUFI layer

Available options:
- NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
- API (BT_LOG_BLUFI_TRACE_LEVEL_API)
- EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_ACL_CONNECTIONS
BT/BLE MAX ACL CONNECTIONS(1~7)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count

CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST
BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the internal RAM if there have the PSRAM

CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY
Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can make the allocation of memory will become more flexible

CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK
BLE queue congestion check

*Found in: Component config > Bluetooth > Bluedroid Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.
CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Blueandroid Options*

Originally, when doing BLE active scan, Blueandroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Blueandroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Blueandroid Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.

NimBLE Options Contains:

- CONFIG_BT_NIMBLE_MEM_ALLOC_MODE
- CONFIG_BT_NIMBLE_MAX_CONNECTIONS
- CONFIG_BT_NIMBLE_MAX_BONDS
- CONFIG_BT_NIMBLE_MAX_CCCDS
- CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM
- CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE
- CONFIG_BT_NIMBLE_TASK_STACK_SIZE
- CONFIG_BT_NIMBLE_ROLE_CENTRAL
- CONFIG_BT_NIMBLE_ROLE_PERIPHERAL
- CONFIG_BT_NIMBLE_ROLE_BROADCASTER
- CONFIG_BT_NIMBLE_ROLE_OBSERVER
- CONFIG_BT_NIMBLE_NVS_PERSIST
- CONFIG_BT_NIMBLE_SM_LEGACY
- CONFIG_BT_NIMBLE_SM_SC
- CONFIG_BT_NIMBLE_DEBUG
- CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS
- CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME
- CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN
- CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU
- CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE
- CONFIG_BT_NIMBLE_ACL_BUF_COUNT
- CONFIG_BT_NIMBLE_ACL_BUF_SIZE
- CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE
- CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT
- CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT
- CONFIG_BT_NIMBLE_MSYS1_BLOCK_COUNT
- CONFIG_BT_NIMBLE_HS_FLOW_CTRL
- CONFIG_BT_NIMBLE_RPA_TIMEOUT
- CONFIG_BT_NIMBLE_MESH
- CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS

CONFIG_BT_NIMBLE_MEM_ALLOC_MODE

Memory allocation strategy

*Found in: Component config > Bluetooth > NimBLE Options*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,
Chapter 2. API Reference

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF

Recommended mode here is always internal, since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

Available options:
- Internal memory (BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)

CONFIG_BT_NIMBLE_MAX_CONNECTIONS
Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*
Defines maximum number of concurrent BLE connections

CONFIG_BT_NIMBLE_MAX_BONDS
Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*
Defines maximum number of bonds to save for peer security and our security

CONFIG_BT_NIMBLE_MAX_CCCDS
Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*
Defines maximum number of CCC descriptors to save

CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM
Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*
Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE
The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*
The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

Available options:
- Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)
**CONFIG_BT_NIMBLE_TASK_STACK_SIZE**

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**CONFIG_BT_NIMBLE_ROLE_CENTRAL**

Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

**CONFIG_BT_NIMBLE_ROLE_PERIPHERAL**

Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*

**CONFIG_BT_NIMBLE_ROLE_BROADCASTER**

Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*

**CONFIG_BT_NIMBLE_ROLE_OBSERVER**

Enable BLE Observer role

*Found in: Component config > Bluetooth > NimBLE Options*

**CONFIG_BT_NIMBLE_NVS_PERSIST**

Persist the BLE Bonding keys in NVS

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this flag to make bonding persistent across device reboots

**CONFIG_BT_NIMBLE_SM_LEGACY**

Security manager legacy pairing

*Found in: Component config > Bluetooth > NimBLE Options*

Enable security manager legacy pairing

**CONFIG_BT_NIMBLE_SM_SC**

Security manager secure connections (4.2)

*Found in: Component config > Bluetooth > NimBLE Options*

Enable security manager secure connections

**CONFIG_BT_NIMBLE_DEBUG**

Enable extra runtime asserts and host debugging

*Found in: Component config > Bluetooth > NimBLE Options*

This enables extra runtime asserts and host debugging
CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS

Use predefined public-private key pair

*Found in: Component config > Bluetooth > NimBLE Options*

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME

BLE GAP default device name

*Found in: Component config > Bluetooth > NimBLE Options*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API ble_svc_gap_device_name_set()

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN

Maximum length of BLE device name in octets

*Found in: Component config > Bluetooth > NimBLE Options*

Device Name characteristic value shall be 0 to 248 octets in length

CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API ble_att_set_preferred_mtu()

CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

CONFIG_BT_NIMBLE_ACL_BUF_COUNT

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

The number of ACL data buffers.

CONFIG_BT_NIMBLE_ACL_BUF_SIZE

ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)
CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE

HCI Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the size of each HCI event buffer in bytes

CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT

High Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

This is the high priority HCI events’ buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT

Low Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

CONFIG_BT_NIMBLE_MSYS1_BLOCK_COUNT

MSYS_1 Block Count

*Found in: Component config > Bluetooth > NimBLE Options*

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

CONFIG_BT_NIMBLE_HS_FLOW_CTRL

Enable Host Flow control

*Found in: Component config > Bluetooth > NimBLE Options*

Enable Host Flow control

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL

Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control interval in msecs

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH

Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event
CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT
Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection

CONFIG_BT_NIMBLE_RPA_TIMEOUT
RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change. This is applicable in case of Host based RPA

CONFIG_BT_NIMBLE_MESH
Enable BLE mesh functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE Mesh functionality

Contains:

- CONFIG_BT_NIMBLE_MESH_PROXY
- CONFIG_BT_NIMBLE_MESH_PROV
- CONFIG_BT_NIMBLE_MESH_GATT_PROXY
- CONFIG_BT_NIMBLE_MESH_RELAY
- CONFIG_BT_NIMBLE_MESH_LOW_POWER
- CONFIG_BT_NIMBLE_MESH_FRIEND
- CONFIG_BT_NIMBLE_MESH_DEVICE_NAME

CONFIG_BT_NIMBLE_MESH_PROXY
Enable mesh proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

CONFIG_BT_NIMBLE_MESH_PROV
Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioning

CONFIG_BT_NIMBLE_MESH_PB_ADV
Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the advertising bearer
CONFIG_BT_NIMBLE_MESH_PB_GATT
Enable mesh provisioning over GATT bearer

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV

Enable this option to allow the device to be provisioned over the GATT bearer

CONFIG_BT_NIMBLE_MESH_GATT_PROXY
Enable GATT Proxy functionality

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

CONFIG_BT_NIMBLE_MESH_RELAY
Enable mesh relay functionality

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Support for acting as a Mesh Relay Node

CONFIG_BT_NIMBLE_MESH_LOW_POWER
Enable mesh low power mode

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable this option to be able to act as a Low Power Node

CONFIG_BT_NIMBLE_MESH_FRIEND
Enable mesh friend functionality

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable this option to be able to act as a Friend Node

CONFIG_BT_NIMBLE_MESH_DEVICE_NAME
Set mesh device name

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

This value defines Bluetooth Mesh device/node name

CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS
Override TinyCrypt with mbedTLS for crypto computations

*Found in:* Component config > Bluetooth > NimBLE Options

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.
CONFIG_BLE_MESH

ESP BLE Mesh Support

Found in: Component config

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- CONFIG_BLE_MESH_HCI_5_0
- CONFIG_BLE_MESH_USE_DUPLICATE_SCAN
- CONFIG_BLE_MESH_MEM_ALLOC_MODE
- CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC
- CONFIG_BLE_MESH_DEINIT
- BLE Mesh and BLE coexistence support
- CONFIG_BLE_MESH_FAST_PROV
- CONFIG_BLE_MESH_NODE
- CONFIG_BLE_MESH_PROVISIONER
- CONFIG_BLE_MESH_PROV
- CONFIG_BLE_MESH_PB_ADV
- CONFIG_BLE_MESH_PB_GATT
- CONFIG_BLE_MESH_PROXY
- CONFIG_BLE_MESH_GATT_PROXY_SERVER
- CONFIG_BLE_MESH_GATT_PROXY_CLIENT
- CONFIG_BLE_MESH_SETTINGS
- CONFIG_BLE_MESH_SUBNET_COUNT
- CONFIG_BLE_MESH_APP_KEY_COUNT
- CONFIG_BLE_MESH_MODEL_KEY_COUNT
- CONFIG_BLE_MESH_MODEL_GROUP_COUNT
- CONFIG_BLE_MESH_LABEL_COUNT
- CONFIG_BLE_MESH_CRPL
- CONFIG_BLE_MESH_MSG_CACHE_SIZE
- CONFIG_BLE_MESH_ADV_BUF_COUNT
- CONFIG_BLE_MESH_IVU_DIVIDER
- CONFIG_BLE_MESH_TX_SEG_MSG_COUNT
- CONFIG_BLE_MESH_RX_SEG_MSG_COUNT
- CONFIG_BLE_MESH_RX_SDU_MAX
- CONFIG_BLE_MESH_TX_SEG_MAX
- CONFIG_BLE_MESH_RELAY
- CONFIG_BLE_MESH_LOW_POWER
- CONFIG_BLE_MESH_FRIEND
- CONFIG_BLE_MESH_NO_LOG
- BLE Mesh STACK DEBUG LOG LEVEL
- BLE Mesh NET BUF DEBUG LOG LEVEL
- CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT
- Support for BLE Mesh Foundation models
- Support for BLE Mesh Client/Server models
- CONFIG_BLE_MESH_IV_UPDATE_TEST
- BLE Mesh specific test option

CONFIG_BLE_MESH_HCI_5_0

Support sending 20ms non-connectable adv packets

Found in: Component config > CONFIG_BLE_MESH

It is a temporary solution and needs further modifications.
**CONFIG_BLE_MESH_USE_DUPLICATE_SCAN**

Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

**CONFIG_BLE_MESH_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > CONFIG_BLE_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF

Recommended mode here is always internal, since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

**Available options:**

- Internal DRAM (BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (BLE_MESH_MEM_ALLOC_MODE_DEFAULT)

Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.

**CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC**

Enable FreeRTOS static allocation

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE**

Memory allocation for FreeRTOS objects

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC*

Choose the memory to be used for FreeRTOS objects.

**Available options:**

- External SPIRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)

If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.
Chapter 2. API Reference

CONFIG_BLE_MESH_DEINIT
Support de-initialize BLE Mesh stack

*Found in: Component config > CONFIG_BLE_MESH*

If enabled, users can use the function esp_ble_mesh_deinit() to de-initialize the whole BLE Mesh stack.

BLE Mesh and BLE coexistence support Contains:
- CONFIG_BLE_MESH_SUPPORT_BLE_ADV
- CONFIG_BLE_MESH_SUPPORT_BLE_SCAN

CONFIG_BLE_MESH_SUPPORT_BLE_ADV
Support sending normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT
Number of advertising buffers for BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV*

Number of advertising buffers for BLE packets available.

CONFIG_BLE_MESH_SUPPORT_BLE_SCAN
Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

CONFIG_BLE_MESH_FAST_PROV
Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

CONFIG_BLE_MESH_NODE
Support for BLE Mesh Node

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.
CONFIG BLE_MESH_PROVISIONER

Support for BLE Mesh Provisioner

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM

Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

CONFIG_BLE_MESH_MAX_PROV_NODES

Maximum number of devices that can be provisioned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

CONFIG_BLE_MESH_PBA_SAME_TIME

Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

CONFIG_BLE_MESH_PBG_SAME_TIME

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.
**CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB**

Support receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE**

Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**CONFIG_BLE_MESH_PROV**

BLE Mesh Provisioning support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**CONFIG_BLE_MESH_PB_ADV**

Provisioning support using the advertising bearer (PB-ADV)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL**

Interval between two consecutive Unprovisioned Device Beacon

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE_MESH_FAST_PROV is selected, the value is better to be 3 seconds, or less.
CONFIG_BLE_MESH_PB_GATT

Provisioning support using GATT (PB-GATT)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

CONFIG_BLE_MESH_PROXY

BLE Mesh Proxy protocol support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

CONFIG_BLE_MESH_GATT_PROXY_SERVER

BLE Mesh GATT Proxy Server

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

CONFIG_BLE_MESH_NODE_ID_TIMEOUT

Node Identity advertising timeout

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

CONFIG_BLE_MESH_PROXY_FILTER_SIZE

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

CONFIG_BLE_MESH_GATT_PROXY_CLIENT

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.
**CONFIG_BLE_MESH_SETTINGS**

Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG_BLE_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**CONFIG_BLE_MESH_STORE_TIMEOUT**

Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**CONFIG_BLE_MESH_SEQ_STORE_RATE**

How often the sequence number gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that’s guaranteed to be larger than the last one used before power off.

**CONFIG_BLE_MESH_RPL_STORE_TIMEOUT**

Minimum frequency that the RPL gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

**CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY**

A specific option for settings backward compatibility

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of "mesh/role" in nvs. In the new version mesh stack, key of "mesh/role" is added in nvs, recovering node information needs to check "mesh/role" key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.
The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

**CONFIG_BLE_MESH_SPECIFIC_PARTITION**

Use a specific NVS partition for BLE Mesh

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS`

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes’ information in the flash (e.g. more than 20), this option is recommended to be enabled.

**CONFIG_BLE_MESH_PARTITION_NAME**

Name of the NVS partition for BLE Mesh

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION`

This value defines the name of the specified NVS partition used by the mesh stack.

**CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE**

Support using multiple NVS namespaces by Provisioner

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS`

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**CONFIG_BLE_MESH_MAX_NVS_NAMESPACE**

Maximum number of NVS namespaces

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE`

This option specifies the maximum NVS namespaces supported by Provisioner.

**CONFIG_BLE_MESH_SUBNET_COUNT**

Maximum number of mesh subnets per network

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.
CONFIG_BLE_MESH_APP_KEY_COUNT

Maximum number of application keys per network

Fount in: Component config > CONFIG_BLE_MESH

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

CONFIG_BLE_MESH_MODEL_KEY_COUNT

Maximum number of application keys per model

Fount in: Component config > CONFIG_BLE_MESH

This option specifies the maximum number of application keys to which each model can be bound.

CONFIG_BLE_MESH_MODEL_GROUP_COUNT

Maximum number of group address subscriptions per model

Fount in: Component config > CONFIG_BLE_MESH

This option specifies the maximum number of addresses to which each model can be subscribed.

CONFIG_BLE_MESH_LABEL_COUNT

Maximum number of Label UUIDs used for Virtual Addresses

Fount in: Component config > CONFIG_BLE_MESH

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

CONFIG_BLE_MESH_CRPL

Maximum capacity of the replay protection list

Fount in: Component config > CONFIG_BLE_MESH

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

CONFIG_BLE_MESH_MSG_CACHE_SIZE

Network message cache size

Fount in: Component config > CONFIG_BLE_MESH

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.
**CONFIG_BLE_MESH_ADV_BUF_COUNT**

Number of advertising buffers

*Found in: Component config > CONFIG_BLE_MESH*

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**CONFIG_BLE_MESH_IVU_DIVIDER**

Divider for IV Update state refresh timer

*Found in: Component config > CONFIG_BLE_MESH*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**CONFIG_BLE_MESH_TX_SEG_MSG_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**CONFIG_BLE_MESH_RX_SEG_MSG_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

**CONFIG_BLE_MESH_RX_SDU_MAX**

Maximum incoming Upper Transport Access PDU length

*Found in: Component config > CONFIG_BLE_MESH*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.
**CONFIG_BLE_MESH_TX_SEG_MAX**

Maximum number of segments in outgoing messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

**CONFIG_BLE_MESH_RELAY**

Relay support

*Found in: Component config > CONFIG_BLE_MESH*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**CONFIG_BLE_MESH_RELAY_ADV_BUF**

Use separate advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT**

Number of advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF*

Number of advertising buffers for relay packets available.

**CONFIG_BLE_MESH_LOW_POWER**

Support for Low Power features

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

**CONFIG_BLE_MESH_LPinairestablishment**

Perform Friendship establishment using low power

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up
Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**CONFIG_BLE_MESH_LPN_AUTO**
Automatically start looking for Friend nodes once provisioned

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling bt_mesh_lpn_set(true). When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

**CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT**
Time from last received message before going to LPN mode

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO*

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT**
Retry timeout for Friend requests

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**CONFIG_BLE_MESH_LPN_RSSI_FACTOR**
RSSI Factor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. $0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5$. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR**
Receive Window Factor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. $0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5$. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE**
Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The MinQueueSizeLog field is defined as $\log_2(N)$, where $N$ is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives $N = 2$, and value 7 gives $N = 128$. 
CONFIG_BLE_MESH_LPN_RECV_DELAY
Receive delay requested by the local node

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER`

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

CONFIG_BLE_MESH_LPN_POLL_TIMEOUT
The value of the PollTimeout timer

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER`

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT
The starting value of the PollTimeout timer

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER`

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

CONFIG_BLE_MESH_LPN_SCAN_LATENCY
Latency for enabling scanning

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER`

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

CONFIG_BLE_MESH_LPN_GROUPS
Number of groups the LPN can subscribe to

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER`

Maximum number of groups to which the LPN can subscribe.

CONFIG_BLE_MESH_FRIEND
Support for Friend feature

*Found in:* `Component config > CONFIG_BLE_MESH`

Enable this option to be able to act as a Friend Node.

CONFIG_BLE_MESH_FRIEND_RECV_WIN
Friend Receive Window

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND`

Receive Window in milliseconds supported by the Friend node.
Chapter 2. API Reference

**CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE**
Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE**
Friend Subscription List Size

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**CONFIG_BLE_MESH_FRIEND_LP_COUNT**
Number of supported LPN nodes

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**CONFIG_BLE_MESH_FRIEND_SEG_RX**
Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of incomplete segment lists tracked for each Friends’ LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**CONFIG_BLE_MESH_NO_LOG**
Disable BLE Mesh debug logs (minimize bin size)

*Found in: Component config > CONFIG_BLE_MESH*

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**BLE Mesh STACK DEBUG LOG LEVEL** Contains:

- **CONFIG_BLE_MESH_STACK_TRACE_LEVEL**

**CONFIG_BLE_MESH_STACK_TRACE_LEVEL**

BLE_MESH_STACK

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh STACK DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh stack.

*Available options:*

- NONE (BLE_MESH_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_TRACE_LEVEL_INFO)
• DEBUG (BLE_MESH_TRACE_LEVEL_DEBUG)
• VERBOSE (BLE_MESH_TRACE_LEVEL_VERBOSE)

**BLE Mesh NET BUF DEBUG LOG LEVEL**  Contains:

• **CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL**

**CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL**

**BLE_MESH_NET_BUF**

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

**Available options:**

• NONE (BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
• ERROR (BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
• WARNING (BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
• INFO (BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
• DEBUG (BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)
• VERBOSE (BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE)

**CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT**

**Timeout**(ms) for client message response

*Found in: Component config > CONFIG_BLE_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

**Support for BLE Mesh Foundation models**  Contains:

• **CONFIG_BLE_MESH_CFG_CLI**
• **CONFIG_BLE_MESH_HEALTH_CLI**
• **CONFIG_BLE_MESH_HEALTH_SRV**

**CONFIG_BLE_MESH_CFG_CLI**

Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

**CONFIG_BLE_MESH_HEALTH_CLI**

Health Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.
CONFIG_BLE_MESH_HEALTH_SRV

Health Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

Support for BLE Mesh Client/Server models

Contains:

- CONFIG_BLE_MESH_GENERIC_ONOFF_CLI
- CONFIG_BLE_MESH_GENERIC_LEVEL_CLI
- CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI
- CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI
- CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI
- CONFIG_BLE_MESH_GENERIC_BATTERY_CLI
- CONFIG_BLE_MESH_GENERIC_LOCATION_CLI
- CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI
- CONFIG_BLE_MESH_SENSOR_CLI
- CONFIG_BLE_MESH_TIME_CLI
- CONFIG_BLE_MESH_SCENE_CLI
- CONFIG_BLE_MESH_SCHEDULER_CLI
- CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI
- CONFIG_BLE_MESH_LIGHT_CTL_CLI
- CONFIG_BLE_MESH_LIGHT_XYL_CLI
- CONFIG_BLE_MESH_LIGHT_LC_CLI
- CONFIG_BLE_MESH_GENERIC_SERVER
- CONFIG_BLE_MESH_SENSOR_SERVER
- CONFIG_BLE_MESH_TIME_SCENE_SERVER
- CONFIG_BLE_MESH_LIGHTING_SERVER

CONFIG_BLE_MESH_GENERIC_ONOFF_CLI

Generic OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

CONFIG_BLE_MESH_GENERIC_LEVEL_CLI

Generic Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Level Client model.

CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI

Generic Default Transition Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Default Transition Time Client model.

CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI

Generic Power OnOff Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power OnOff Client model.
Chapter 2. API Reference

**CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI**

Generic Power Level Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power Level Client model.

**CONFIG_BLE_MESH_GENERIC_BATTERY_CLI**

Generic Battery Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Battery Client model.

**CONFIG_BLE_MESH_GENERIC_LOCATION_CLI**

Generic Location Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Location Client model.

**CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI**

Generic Property Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Property Client model.

**CONFIG_BLE_MESH_SENSOR_CLI**

Sensor Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor Client model.

**CONFIG_BLE_MESH_TIME_CLI**

Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time Client model.

**CONFIG_BLE_MESH_SCENE_CLI**

Scene Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scene Client model.

**CONFIG_BLE_MESH_SCHEDULER_CLI**

Scheduler Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Scheduler Client model.
CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI
Light Lightness Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light Lightness Client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI
Light CTL Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light CTL Client model.

CONFIG_BLE_MESH_LIGHT_HSL_CLI
Light HSL Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light HSL Client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI
Light XYL Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light XYL Client model.

CONFIG_BLE_MESH_LIGHT_LC_CLI
Light LC Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Light LC Client model.

CONFIG_BLE_MESH_GENERIC_SERVER
Generic server models

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic server models.

CONFIG_BLE_MESH_SENSOR_SERVER
Sensor server models

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Sensor server models.

CONFIG_BLE_MESH_TIME_SCENE_SERVER
Time and Scenes server models

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Time and Scenes server models.
CONFIG_BLE_MESH_LIGHTING_SERVER
Lighting server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Lighting server models.

CONFIG_BLE_MESH_IV_UPDATE_TEST
Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*
This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**BLE Mesh specific test option**  Contains:

- CONFIG_BLE_MESH_SELF_TEST
- CONFIG_BLE_MESH_SHELL
- CONFIG_BLE_MESH_DEBUG

CONFIG_BLE_MESH_SELF_TEST
Perform BLE Mesh self-tests

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*
This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK
Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*
With this option enabled, an unprovisioned device can automatically enter the mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

CONFIG_BLE_MESH_TEST_USE_WHITE_LIST
Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_SELF_TEST*
With this option enabled, users can use white list to filter mesh advertising packets while scanning.

CONFIG_BLE_MESH_SHELL
Enable BLE Mesh shell

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*
Activate shell module that provides BLE Mesh commands to the console.
CONFIG_BLE_MESH_DEBUG
Enable BLE Mesh debug logs

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option
Enable debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_NET
Network layer debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option
Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS
Transport layer debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option
Enable Transport layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_BEACON
Beacon debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option
Enable Beacon-related debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_CRYPTO
Crypto debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option
Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV
Provisioning debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option
Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS
Access layer debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option
Enable Access layer debug logs for the BLE Mesh functionality.
Chapter 2. API Reference

**CONFIG_BLE_MESH_DEBUG_MODEL**

Foundation model debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Foundation Models debug logs for the BLE Mesh functionality.

**CONFIG_BLE_MESH_DEBUG_ADV**

Advertising debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable advertising debug logs for the BLE Mesh functionality.

**CONFIG_BLE_MESH_DEBUG_LOW_POWER**

Low Power debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Low Power debug logs for the BLE Mesh functionality.

**CONFIG_BLE_MESH_DEBUG_FRIEND**

Friend debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Friend debug logs for the BLE Mesh functionality.

**CONFIG_BLE_MESH_DEBUG_PROXY**

Proxy debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Proxy protocol debug logs for the BLE Mesh functionality.

**Driver configurations**  Contains:

- ADC configuration
- SPI configuration
- CAN Configuration
- UART configuration

**ADC configuration**  Contains:

- CONFIG_ADC_FORCE_XPD_FSM
- CONFIG_ADC_DISABLE_DAC
**CONFIG_ADC_FORCE_XPD_FSM**

Use the FSM to control ADC power

*Found in: Component config > Driver configurations > ADC configuration*

ADC power can be controlled by the FSM instead of software. This allows the ADC to be shut off when it is not working leading to lower power consumption. However using the FSM control ADC power will increase the noise of ADC.

**CONFIG_ADC_DISABLE_DAC**

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: Component config > Driver configurations > ADC configuration*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**SPI configuration**

Contains:

- **CONFIG_SPI_MASTER_IN_IRAM**
- **CONFIG_SPI_MASTER_ISR_IN_IRAM**
- **CONFIG_SPI_SLAVE_IN_IRAM**
- **CONFIG_SPI_SLAVE_ISR_IN_IRAM**

**CONFIG_SPI_MASTER_IN_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans, get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

**CONFIG_SPI_MASTER_ISR_IN_IRAM**

Place master ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**CONFIG_SPI_SLAVE_IN_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans, get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.
Chapter 2. API Reference

CONFIG_SPI_SLAVE_ISR_IN_IRAM

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver configurations > SPI configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss. Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

CAN Configuration  Contains:

- CONFIG_CAN_ISR_IN_IRAM

CONFIG_CAN_ISR_IN_IRAM

Place CAN ISR function into IRAM

*Found in: Component config > Driver configurations > CAN Configuration*

Place the CAN ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the ESP_INTR_FLAG_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the CAN_ALERT_AND_LOG flag) will have no effect.

UART configuration  Contains:

- CONFIG_UART_ISR_IN_IRAM

CONFIG_UART_ISR_IN_IRAM

Place UART ISR function into IRAM

*Found in: Component config > Driver configurations > UART configuration*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

eFuse Bit Manager  Contains:

- CONFIG_EFUSE_CUSTOM_TABLE
- CONFIG_EFUSE_VIRTUAL
- CONFIG_EFUSE_CODE_SCHEME_SELECTOR

CONFIG_EFUSE_CUSTOM_TABLE

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

CONFIG_EFUSE_CUSTOM_TABLE_FILENAME

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.
**CONFIG_EFUSE_VIRTUAL**

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

All read and writes operations are redirected to RAM instead of eFuse registers. If this option is set, all permanent changes (via eFuse) are disabled. Log output will state changes which would be applied, but they will not be.

**CONFIG_EFUSE_CODE_SCHEME_SELECTOR**

Coding Scheme Compatibility

*Found in: Component config > eFuse Bit Manager*

Selector eFuse code scheme.

**Available options:**

- None Only (EFUSE_CODE_SCHEME_COMPAT_NONE)
- 3/4 and None (EFUSE_CODE_SCHEME_COMPAT_3_4)
- Repeat, 3/4 and None (common table does not support it) (EFUSE_CODE_SCHEME_COMPAT_REPEAT)

**ESP-TLS**

Contains:

- CONFIG_ESP_TLS_SERVER

**CONFIG_ESP_TLS_SERVER**

Enable ESP-TLS Server

*Found in: Component config > ESP-TLS*

Enable support for creating server side SSL/TLS session

**ESP32-specific**

Contains:

- CONFIG_ESP32_REV_MIN
- CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ
- CONFIG_ESP32_SPIRAM_SUPPORT
- CONFIG_ESP32_TRAX
- CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES
- CONFIG_ESP32_ULP_COPROC_ENABLED
- CONFIG_ESP32_PANIC
- CONFIG_ESP32_DEBUG_OCDAWARE
- CONFIG_ESP32_DEBUG_STUBS_ENABLE
- CONFIG_ESP32_BROWNOUT_DET
- CONFIG_ESP32_REDUCE_PHY_TX_POWER
- CONFIG_ESP32_TIME_SYSCALL
- CONFIG_ESP32_RTC_CLK_SRC
- CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT
- CONFIG_ESP32_RTC_CLK_CAL_CYCLES
- CONFIG_ESP32_RTC_XTAL_CAL_RETRY
- CONFIG_ESP32_RTC_XTAL_BOOTSTRAP_CYCLES
- CONFIG_ESP32_DEEP_SLEEP_WAKEUP_DELAY
- CONFIG_ESP32_XTAL_FREQ_SEL
- CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE
- CONFIG_ESP32_NO_BLOBS
- CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS
- CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS
CONFIG_ESP32_REV_MIN

Minimum Supported ESP32 Revision

*Found in: Component config > ESP32-specific*

Minimum revision that ESP-IDF would support. ESP-IDF performs different strategy on different esp32 revision.

*Available options:*
- Rev 0 (ESP32_REV_MIN_0)
- Rev 1 (ESP32_REV_MIN_1)
- Rev 2 (ESP32_REV_MIN_2)
- Rev 3 (ESP32_REV_MIN_3)

CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ

CPU frequency

*Found in: Component config > ESP32-specific*

CPU frequency to be set on application startup.

*Available options:*
- 80 MHz (ESP32_DEFAULT_CPU_FREQ_80)
- 160 MHz (ESP32_DEFAULT_CPU_FREQ_160)
- 240 MHz (ESP32_DEFAULT_CPU_FREQ_240)

CONFIG_ESP32_SPIRAM_SUPPORT

Support for external, SPI-connected RAM

*Found in: Component config > ESP32-specific*

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

SPI RAM config Contains:

- CONFIG_SPIRAM_BOOT_INIT
- CONFIG_SPIRAM_USE
- CONFIG_SPIRAM_TYPE
- CONFIG_SPIRAM_SPEED
- CONFIG_SPIRAM_MEMTEST
- CONFIG_SPIRAM_CACHE_WORKAROUND
- SPIRAM cache workaround debugging
- CONFIG_SPIRAM_BANKSWITCH_ENABLE
- CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL
- CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP
- CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL
- CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY
- CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY
- CONFIG_SPIRAM_OCCUPY_SPI_HOST
- PSRAM clock and cs IO for ESP32-DOWD
- PSRAM clock and cs IO for ESP32-D2WD
- PSRAM clock and cs IO for ESP32-PICO
- CONFIG_SPIRAM_SPIWP_SD3_PIN
- CONFIG_SPIRAM_2T_MODE
**CONFIG_SPIRAM_BOOT_INIT**

Initialize SPI RAM when booting the ESP32

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you’ll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

**CONFIG_SPIRAM_IGNORE_NOTFOUND**

Ignore PSRAM when not found

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > CONFIG_SPIRAM_BOOT_INIT*

Normally, if `psram` initialization is enabled during compile time but not found at runtime, it is seen as an error making the ESP32 panic. If this is enabled, the ESP32 will keep on running but will not add the (non-existing) RAM to any allocator.

**CONFIG_SPIRAM_USE**

SPI RAM access method

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the ESP32 memory map, by integrating it in the ESP32’s heap as ‘special’ memory needing `heap_caps_malloc` to allocate, or by fully integrating it making `malloc()` also able to return SPI RAM pointers.

**Available options:**

- Integrate RAM into ESP32 memory map (SPIRAM_USE_MEMMAP)
- Make RAM allocatable using `heap_caps_malloc` (SPIRAM_USE_CAPS_ALLOC)
- Make RAM allocatable using `malloc()` as well (SPIRAM_USE_MALLOC)

**CONFIG_SPIRAM_TYPE**

Type of SPI RAM chip in use

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

**Available options:**

- Auto-detect (SPIRAM_TYPE_AUTO)
- ESP-PSRAM32 or IS25WP032 (SPIRAM_TYPE_ESPPSRAM32)
- ESP-PSRAM64 or LY68L6400 (SPIRAM_TYPE_ESPPSRAM64)

**CONFIG_SPIRAM_SPEED**

Set RAM clock speed

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Select the speed for the SPI RAM chip. If SPI RAM is enabled, we only support three combinations of SPI speed mode we supported now:

1. Flash SPI running at 40Mhz and RAM SPI running at 40Mhz
2. Flash SPI running at 80Mhz and RAM SPI running at 40Mhz
3. Flash SPI running at 80Mhz and RAM SPI running at 80Mhz

Note: If the third mode(80Mhz+80Mhz) is enabled for SPI RAM of type 32MBit, one of the HSPI/VSPI host will be occupied by the system. Which SPI host to use can be selected by the config item SPIRAM_OCCUPY_SPI_HOST. Application code should never touch HSPI/VSPI hardware in this
case. The option to select 80MHz will only be visible if the flash SPI speed is also 80MHz. (ESP-TOLPY_FLASHFREQ_80M is true)

**Available options:**
- 40MHz clock speed (SPIRAM_SPEED_40M)
- 80MHz clock speed (SPIRAM_SPEED_80M)

**CONFIG_SPIRAM_MEMTEST**
Run memory test on SPI RAM initialization

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

**CONFIG_SPIRAM_CACHE_WORKAROUND**
Enable workaround for bug in SPI RAM cache for Rev1 ESP32s

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Revision 1 of the ESP32 has a bug that can cause a write to PSRAM not to take place in some situations when the cache line needs to be fetched from external RAM and an interrupt occurs. This enables a fix in the compiler (-mfix-esp32-psram-cache-issue) that makes sure the specific code that is vulnerable to this will not be emitted.

This will also not use any bits of newlib that are located in ROM, opting for a version that is compiled with the workaround and located in flash instead.

The workaround is not required for ESP32 revision 3 and above.

**SPIRAM cache workaround debugging**
Contains:

- **CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY**

**CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY**
Workaround strategy

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > SPIRAM cache workaround debugging*

Select the workaround strategy. Note that the strategy for precompiled libraries (libgcc, newlib, bt, wifi) is not affected by this selection.

Unless you know you need a different strategy, it’s suggested you stay with the default MEMW strategy. Note that DUPLDST can interfere with hardware encryption and this will be automatically disabled if this workaround is selected. ‘Insert nops’ is the workaround that was used in older esp-idf versions. This workaround still can cause faulty data transfers from/to SPI RAM in some situation.

**Available options:**
- Insert memw after vulnerable instructions (default) (SPIRAM_CACHE_WORKAROUND_STRATEGY_MEMW)
- Duplicate LD/ST for 32-bit, memw for 8/16 bit (SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST)
- Insert nops between vulnerable loads/stores (old strategy, obsolete) (SPIRAM_CACHE_WORKAROUND_STRATEGY_NOPS)
CONFIG_SPIRAM_BANKSWITCH_ENABLE
Enable bank switching for >4MiB external RAM

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

The ESP32 only supports 4MiB of external RAM in its address space. The hardware does support larger memories, but these have to be bank-switched in and out of this address space. Enabling this allows you to reserve some MMU pages for this, which allows the use of the esp_himem api to manage these banks.

# Note that this is limited to 62 banks, as esp_spiram_writeback_cache needs some kind of mapping of some banks below that mark to work. We cannot at this moment guarantee this to exist when himem is # enabled.

If spiram 2T mode is enabled, the size of 64Mbit psram will be changed as 32Mbit, so himem will be unusable.

CONFIG_SPIRAM_BANKSWITCH_RESERVE
Amount of 32K pages to reserve for bank switching

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > CONFIG_SPIRAM_BANKSWITCH_ENABLE

Select the amount of banks reserved for bank switching. Note that the amount of RAM allocatable with malloc/esp_heap_alloc_caps will decrease by 32K for each page reserved here.

Note that this reservation is only actually done if your program actually uses the himem API. Without any himem calls, the reservation is not done and the original amount of memory will be available to malloc/esp_heap_alloc_caps.

CONFIG_SPIRAM_MALLOC_ALWAYSSINTERAL
Maximum malloc() size, in bytes, to always put in internal memory

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP
Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL
Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that’s also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.
Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

**CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY**

Allow external memory as an argument to `xTaskCreateStatic`

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

Because some bits of the ESP32 code environment cannot be recompiled with the cache workaround, normally tasks cannot be safely run with their stack residing in external memory; for this reason `xTaskCreate` and friends always allocate stack in internal memory and `xTaskCreateStatic` will check if the memory passed to it is in internal memory. If you have a task that needs a large amount of stack and does not call on ROM code in any way (no direct calls, but also no Bluetooth/WiFi), you can try to disable this and use `xTaskCreateStatic` to create the tasks stack in external memory.

**CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY**

Allow .bss segment placed in external memory

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

If enabled the option, and add EXT_RAM_ATTR defined your variable, then your variable will be placed in PSRAM instead of internal memory, and placed most of variables of lwip, net802.11, pp, blueandroid library to external memory defaultly.

**CONFIG_SPIRAM_OCCUPY_SPI_HOST**

SPI host to use for 32MBit PSRAM

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

When both flash and PSRAM is working under 80MHz, and the PSRAM is of type 32MBit, one of the HSPI/VSPI host will be used to output the clock. Select which one to use here.

*Available options:*
- HSPI host (SPI2) (SPIRAM_OCCUPY_HSPI_HOST)
- VSPI host (SPI3) (SPIRAM_OCCUPY_VSPI_HOST)
- Will not try to use any host, will abort if not able to use the PSRAM (SPIRAM_OCCUPY_NO_HOST)

**PSRAM clock and cs IO for ESP32-DOWD** Contains:

- `CONFIG_D0WD_PSRAM_CLK_IO`
- `CONFIG_D0WD_PSRAM_CS_IO`

**CONFIG_D0WD_PSRAM_CLK_IO**

PSRAM CLK IO number

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-DOWD

The PSRAM CLOCK IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.
CONFIG_D0WD_PSRAM_CS_IO

PSRAM CS IO number

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D0WD

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

PSRAM clock and cs IO for ESP32-D2WD

Contains:

- CONFIG_D2WD_PSRAM_CLK_IO
- CONFIG_D2WD_PSRAM_CS_IO

CONFIG_D2WD_PSRAM_CLK_IO

PSRAM CLK IO number

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

CONFIG_D2WD_PSRAM_CS_IO

PSRAM CS IO number

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD

User can config it based on hardware design. For ESP32-D2WD chip, the psram can only be 1.8V psram, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

PSRAM clock and cs IO for ESP32-PICO

Contains:

- CONFIG_PICO_PSRAM_CS_IO

CONFIG_PICO_PSRAM_CS_IO

PSRAM CS IO number

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config > PSRAM clock and cs IO for ESP32-PICO

User can config it based on hardware design. For ESP32-PICO chip, the psram share clock with flash, so user do not need to configure the clock IO. For the reference hardware design, please refer to https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf

CONFIG_SPIRAM_SPIWP_SD3_PIN

SPI PSRAM WP(SD3) Pin when customising pins via eFuse (read help)

*Found in:* Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config

This value is ignored unless flash mode is set to DIO or DOUT and the SPI flash pins have been overriden by setting the eFuses SPI_PAD_CONFIG_xxx.
When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. And the pSram only has QPI mode, the WP pin is necessary, so we need to configure this value here.

When flash mode is set to QIO or QOUT, the PSRAM WP pin will be set as the value configured in bootloader.

For ESP32-PICO chip, the default value of this config should be 7.

### CONFIG_SPIRAM_2T_MODE

Enable SPI PSRAM 2T mode

*Found in: Component config > ESP32-specific > CONFIG_ESP32_SPIRAM_SUPPORT > SPI RAM config*

Enable this option to fix single bit errors inside 64Mbit PSRAM.

Some 64Mbit PSRAM chips have a hardware issue in the RAM which causes bit errors at multiple fixed bit positions.

Note: If this option is enabled, the 64Mbit PSRAM chip will appear to be 32Mbit in size. Applications will not be affected unless the use the esp_himem APIs, which are not supported in 2T mode.

### CONFIG_ESP32_TRAX

Use TRAX tracing feature

*Found in: Component config > ESP32-specific*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that cannot be used for general purposes anymore. Disable this if you do not know what this is.

### CONFIG_ESP32_TRAX_TWOBANKS

Reserve memory for tracing both pro as well as app cpu execution

*Found in: Component config > ESP32-specific > CONFIG_ESP32_TRAX*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that cannot be used for general purposes anymore. Disable this if you do not know what this is.

# Memory to reverse for trace, used in linker script

### CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES

Number of universally administered (by IEEE) MAC address

*Found in: Component config > ESP32-specific*

Configure the number of universally administered (by IEEE) MAC addresses. During initialisation, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)
Available options:

- Two (ESP32_UNIVERSAL_MAC_ADDRESSES_TWO)
- Four (ESP32_UNIVERSAL_MAC_ADDRESSES_FOUR)

CONFIG_ESP32_ULP_COPROC_ENABLED

Enable Ultra Low Power (ULP) Coprocessor

Found in: Component config > ESP32-specific

Set to ‘y’ if you plan to load a firmware for the coprocessor.

If this option is enabled, further coprocessor configuration will appear in the Components menu.

CONFIG_ESP32_ULP_COPROC_RESERVE_MEM

RTC slow memory reserved for coprocessor

Found in: Component config > ESP32-specific > CONFIG_ESP32_ULP_COPROC_ENABLED

Bytes of memory to reserve for ULP coprocessor firmware & data.

Data is reserved at the beginning of RTC slow memory.

CONFIG_ESP32_PANIC

Panic handler behaviour

Found in: Component config > ESP32-specific

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handlers action here.

Available options:

- Print registers and halt (ESP32_PANIC_PRINT_HALT)
  Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (ESP32_PANIC_PRINT_REBOOT)
  Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (ESP32_PANIC_SILENT_REBOOT)
  Just resets the processor without outputting anything
- Invoke GDBStub (ESP32_PANIC_GDBSTUB)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.

CONFIG_ESP32_DEBUG_OCDWARE

Make exception and panic handlers JTAG/OCD aware

Found in: Component config > ESP32-specific

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

CONFIG_ESP32_DEBUG_STUBS_ENABLE

OpenOCD debug stubs

Found in: Component config > ESP32-specific

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging, e.g. GCOV data dump.
**CONFIG_ESP32_BROWNOUT_DET**

Hardware brownout detect & reset

*Found in: Component config > ESP32-specific*

The ESP32 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**CONFIG_ESP32_BROWNOUT_DET_LVL_SEL**

Brownout voltage level

*Found in: Component config > ESP32-specific > CONFIG_ESP32_BROWNOUT_DET*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP32 chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

**Available options:**
- 2.43V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_0)
- 2.48V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_1)
- 2.58V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_2)
- 2.62V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_3)
- 2.67V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_4)
- 2.70V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_5)
- 2.77V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_6)
- 2.80V +/- 0.05 (ESP32_BROWNOUT_DET_LVL_SEL_7)

**CONFIG_ESP32_REDUCE_PHY_TX_POWER**

Reduce PHY TX power when brownout reset

*Found in: Component config > ESP32-specific*

When brownout reset occurs, reduce PHY TX power to keep the code running

# Note about the use of “FRC1” name: currently FRC1 timer is not used for # high resolution time-keeping anymore. Instead the esp_timer API, implemented # using FRC2 timer, is used. # FRC1 name in the option name is kept for compatibility.

**CONFIG_ESP32_TIME_SYSCALL**

Timers used for gettimeofday function

*Found in: Component config > ESP32-specific*

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.

- If both high-resolution and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- If only high-resolution timer is used, gettimeofday will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- If only RTC timer is used, timekeeping will continue in deep sleep, but time will be measured at 6.6(6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- If no timers are used, gettimeofday and time functions return -1 and set errno to ENOSYS.
- When RTC is used for timekeeping, two RTC_STORE registers are used to keep time in deep sleep mode.

**Available options:**
- RTC and high-resolution timer (ESP32_TIME_SYSCALL_USE_RTC_FRC1)
• RTC (ESP32_TIME_SYSCALL_USE_RTC)
• High-resolution timer (ESP32_TIME_SYSCALL_USE_FRC1)
• None (ESP32_TIME_SYSCALL_USE_NONE)

CONFIG_ESP32_RTC_CLK_SRC

RTC clock source

Found in: Component config > ESP32-specific

Choose which clock is used as RTC clock source.

• “Internal 150kHz oscillator” option provides lowest deep sleep current consumption, and does not require extra external components. However frequency stability with respect to temperature is poor, so time may drift in deep/light sleep modes.
• “External 32kHz crystal” provides better frequency stability, at the expense of slightly higher (1uA) deep sleep current consumption.
• “External 32kHz oscillator” allows using 32kHz clock generated by an external circuit. In this case, external clock signal must be connected to 32K_XP pin. Amplitude should be 0.1 < Vcm < 0.5Vamp, where Vamp is the signal amplitude. Additionally, 1nF capacitor must be connected between 32K_XN pin and ground. 32K_XN pin can not be used as a GPIO in this case.
• “Internal 8.5MHz oscillator divided by 256” option results in higher deep sleep current (by 5uA) but has better frequency stability than the internal 150kHz oscillator. It does not require external components.

Available options:
• Internal 150kHz RC oscillator (ESP32_RTC_CLK_SRC_INT_RC)
• External 32kHz crystal (ESP32_RTC_CLK_SRC_EXT_CRYS)
• External 32kHz oscillator at 32K_XP pin (ESP32_RTC_CLK_SRC_EXT_OSC)
• Internal 8.5MHz oscillator, divided by 256 (~33kHz) (ESP32_RTC_CLK_SRC_INT_8MD256)

CONFIG_ESP32_RTC_EXT_CRYST_ADDIT_CURRENT

Additional current for external 32kHz crystal

Found in: Component config > ESP32-specific

Choose which additional current is used for rtc external crystal.

• With some 32kHz crystal configurations, the X32N and X32P pins may not have enough drive strength to keep the crystal oscillating during deep sleep. If this option is enabled, additional current from touchpad 9 is provided internally to drive the 32kHz crystal. If this option is enabled, deep sleep current is slightly higher (4-5uA) and the touchpad and ULP wakeup sources are not available.

CONFIG_ESP32_RTC_CLK_CAL_CYCLES

Number of cycles for RTC_SLOW_CLK calibration

Found in: Component config > ESP32-specific

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:
• 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
• 32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

**CONFIG_ESP32_RTC_XTAL_CAL_RETRY**
Number of attempts to repeat 32k XTAL calibration

*Found in: Component config > ESP32-specific*
Number of attempts to repeat 32k XTAL calibration before giving up and switching to the internal RC. Increase this option if the 32k crystal oscillator does not start and switches to internal RC.

**CONFIG_ESP32_RTC_XTAL_BOOTSTRAP_CYCLES**
Bootstrap cycles for external 32kHz crystal

*Found in: Component config > ESP32-specific*
To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for RTC_SLOW_CLK calibration” (about 3000).

**CONFIG_ESP32_DEEP_SLEEP_WAKEUP_DELAY**
Extra delay in deep sleep wake stub (in us)

*Found in: Component config > ESP32-specific*
When ESP32 exits deep sleep, the CPU and the flash chip are powered on at the same time. CPU will run deep sleep stub first, and then proceed to load code from flash. Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

By default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing “flash read err, 1000” message printed to the console after deep sleep reset, try increasing this value.

**CONFIG_ESP32_XTAL_FREQ_SEL**
Main XTAL frequency

*Found in: Component config > ESP32-specific*
ESP32 currently supports the following XTAL frequencies:

- 26 MHz
- 40 MHz

Startup code can automatically estimate XTAL frequency. This feature uses the internal 8MHz oscillator as a reference. Because the internal oscillator frequency is temperature dependent, it is not recommended to use automatic XTAL frequency detection in applications which need to work at high ambient temperatures and use high-temperature qualified chips and modules.

**Available options:**

- 40 MHz (ESP32_XTAL_FREQ_40)
- 26 MHz (ESP32_XTAL_FREQ_26)
• Autodetect (ESP32_XTAL_FREQ_AUTO)

**CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE**

Permanently disable BASIC ROM Console

*Found in: Component config > ESP32-specific*

If set, the first time the app boots it will disable the BASIC ROM Console permanently (by burning an eFuse).

Otherwise, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

(Enabling secure boot also disables the BASIC ROM Console by default.)

**CONFIG_ESP32_NO_BLOBS**

No Binary Blobs

*Found in: Component config > ESP32-specific*

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

**CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS**

App compatible with bootloaders before ESP-IDF v2.1

*Found in: Component config > ESP32-specific*

Bootloaders before ESP-IDF v2.1 did less initialisation of the system clock. This setting needs to be enabled to build an app which can be booted by these older bootloaders.

If this setting is enabled, the app can be booted by any bootloader from IDF v1.0 up to the current version.

If this setting is disabled, the app can only be booted by bootloaders from IDF v2.1 or newer.

Enabling this setting adds approximately 1KB to the app’s IRAM usage.

**CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS**

App compatible with bootloader and partition table before ESP-IDF v3.1

*Found in: Component config > ESP32-specific*

Partition tables before ESP-IDF V3.1 do not contain an MD5 checksum field, and the bootloader before ESP-IDF v3.1 cannot read a partition table that contains an MD5 checksum field.

Enable this option only if your app needs to boot on a bootloader and/or partition table that was generated from a version *before* ESP-IDF v3.1.

If this option and Flash Encryption are enabled at the same time, and any data partitions in the partition table are marked Encrypted, then the partition encrypted flag should be manually verified in the app before accessing the partition (see CVE-2021-27926).

**CONFIG_ESP32_RTCDATA_IN_FAST_MEM**

Place RTC_DATA_ATTR and RTC_RODATA_ATTR variables into RTC fast memory segment

*Found in: Component config > ESP32-specific*

This option allows to place .rtc_data and .rtc_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs. This option depends on the CONFIG_FREERTOS_UNICORE option because RTC fast memory can be accessed only by PRO_CPU core.
**CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE**

Use fixed static RAM size

*Found in: Component config > ESP32-specific*

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0_0 region, where its length is set with ESP32_FIXED_STATIC_RAM_SIZE

**CONFIG_ESP32_FIXED_STATIC_RAM_SIZE**

Fixed Static RAM size

*Found in: Component config > ESP32-specific > CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE*

RAM size dedicated for static variables (.data & .bss sections). Please note that the actual length will be reduced by BT_RESERVE_DRAM if Bluetooth controller is enabled.

**CONFIG_ESP32_DPORT_DIS_INTERRUPT_LVL**

Disable the interrupt level for the DPORT workarounds

*Found in: Component config > ESP32-specific*

To prevent interrupting DPORT workarounds, need to disable interrupt with a maximum used level in the system.

**Power Management**

Contains:

- **CONFIG_PM_ENABLE**

**CONFIG_PM_ENABLE**

Support for power management

*Found in: Component config > Power Management*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**CONFIG_PM_DFS_INIT_AUTO**

Enable dynamic frequency scaling (DFS) at startup

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to CONFIG_ESP32_DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.

**CONFIG_PM_USE_RTC_TIMER_REF**

Use RTC timer to prevent time drift (EXPERIMENTAL)

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

When APB clock frequency changes, high-resolution timer (esp_timer) scale and base value need to be adjusted. Each adjustment may cause small error, and over time such small errors may cause time...
drift. If this option is enabled, RTC timer will be used as a reference to compensate for the drift. It is recommended that this option is only used if 32k XTAL is selected as RTC clock source.

**CONFIG_PM_PROFILING**

Enable profiling counters for PM locks

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**CONFIG_PM_TRACE**

Enable debug tracing of PM using GPIOs

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**ADC-Calibration**

Contains:

- `CONFIG_ADC_CAL_EFUSE_TP_ENABLE`
- `CONFIG_ADC_CAL_EFUSE_VREF_ENABLE`
- `CONFIG_ADC_CAL_LUT_ENABLE`

**CONFIG_ADC_CAL_EFUSE_TP_ENABLE**

Use Two Point Values

*Found in: Component config > ADC-Calibration*

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**CONFIG_ADC_CAL_EFUSE_VREF_ENABLE**

Use eFuse Vref

*Found in: Component config > ADC-Calibration*

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

**CONFIG_ADC_CAL_LUT_ENABLE**

Use Lookup Tables

*Found in: Component config > ADC-Calibration*

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.
Common ESP-related Contains:

- CONFIG_ESP_TIMER_PROFILING
- CONFIG_ESP_ERR_TO_NAME_LOOKUP
- CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE
- CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE
- CONFIG_ESP_MAIN_TASK_STACK_SIZE
- CONFIG_ESP_IPC_TASK_STACK_SIZE
- CONFIG_ESP_TIMER_TASK_STACK_SIZE
- CONFIG_ESP_CONSOLE_UART
- CONFIG_ESP_CONSOLE_UART_NUM
- CONFIG_ESP_CONSOLE_UART_TX_GPIO
- CONFIG_ESP_CONSOLE_UART_RX_GPIO
- CONFIG_ESP_CONSOLE_UART_BAUDRATE
- CONFIG_ESP_INT_WDT
- CONFIG_ESP_TASK_WDT

CONFIG_ESP_TIMER_PROFILING
Enable esp_timer profiling features

*Found in: Component config > Common ESP-related*

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

CONFIG_ESP_ERR_TO_NAME_LOOKUP
Enable lookup of error code strings

*Found in: Component config > Common ESP-related*

Functions esp_err_to_name() and esp_err_to_name_r() return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE
System event queue size

*Found in: Component config > Common ESP-related*

Configure system event queue size in different application.

CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE
Event loop task stack size

*Found in: Component config > Common ESP-related*

Configure the “main task” stack size. This is the stack of the task which calls app_main(). If app_main() returns then this task is deleted and its stack memory is freed.
CONFIG_ESP_IPC_TASK_STACK_SIZE

Inter-Processor Call (IPC) task stack size

*Found in: Component config > Common ESP-related*

Configure the IPC tasks stack size. One IPC task runs on each core (in dual core mode), and allows for cross-core function calls.

See IPC documentation for more details.

The default stack size should be enough for most common use cases. It can be shrunk if you are sure that you do not use any custom IPC functionality.

CONFIG_ESP_TIMER_TASK_STACK_SIZE

High-resolution timer task stack size

*Found in: Component config > Common ESP-related*

Configure the stack size of esp_timer/ets_timer task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS” menu.

CONFIG_ESP_CONSOLE_UART

UART for console output

*Found in: Component config > Common ESP-related*

Select whether to use UART for console output (through stdout and stderr).

- Default is to use UART0 on pins GPIO1(TX) and GPIO3(RX).
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This output can be further suppressed by bootstrapping GPIO13 pin to low logic level.

**Available options:**

- Default: UART0, TX=GPIO1, RX=GPIO3 (ESP_CONSOLE_UART_DEFAULT)
- Custom (ESP_CONSOLE_UART_CUSTOM)
- None (ESP_CONSOLE_UART_NONE)

CONFIG_ESP_CONSOLE_UART_NUM

UART peripheral to use for console output (0-1)

*Found in: Component config > Common ESP-related*

Due of a ROM bug, UART2 is not supported for console output via ets_printf.

**Available options:**

- UART0 (ESP_CONSOLE_UART_CUSTOM_NUM_0)
- UART1 (ESP_CONSOLE_UART_CUSTOM_NUM_1)

CONFIG_ESP_CONSOLE_UART_TX_GPIO

UART TX on GPIO#
**CONFIG_ESP_CONSOLE_UART_RX_GPIO**

UART RX on GPIO#

*Found in: Component config > Common ESP-related*

**CONFIG_ESP_CONSOLE_UART_BAUDRATE**

UART console baud rate

*Found in: Component config > Common ESP-related*

**CONFIG_ESP_INT_WDT**

Interrupt watchdog

*Found in: Component config > Common ESP-related*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**CONFIG_ESP_INT_WDT_TIMEOUT_MS**

Interrupt watchdog timeout (ms)

*Found in: Component config > Common ESP-related > CONFIG_ESP_INT_WDT*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**CONFIG_ESP_INT_WDT_CHECK_CPU1**

Also watch CPU1 tick interrupt

*Found in: Component config > Common ESP-related > CONFIG_ESP_INT_WDT*

Also detect if interrupts on CPU 1 are disabled for too long.

**CONFIG_ESP_TASK_WDT**

Initialize Task Watchdog Timer on startup

*Found in: Component config > Common ESP-related*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup. The Task Watchdog timer can be initialized after startup as well (see Task Watchdog Timer API Reference).

**CONFIG_ESP_TASK_WDT_PANIC**

Invoke panic handler on Task Watchdog timeout

*Found in: Component config > Common ESP-related > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference).
**CONFIG_ESP_TASK_WDT_TIMEOUT_S**

Task Watchdog timeout period (seconds)

*Found in: Component config > Common ESP-related > CONFIG_ESP_TASK_WDT*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference).

**CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0**

Watch CPU0 Idle Task

*Found in: Component config > Common ESP-related > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1**

Watch CPU1 Idle Task

*Found in: Component config > Common ESP-related > CONFIG_ESP_TASK_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**Ethernet**

Contains:

- `CONFIG_ETH_USE_ESP32_EMAC`
- `CONFIG_ETH_USE_SPI_ETHERNET`

**CONFIG_ETH_USE_ESP32_EMAC**

Support ESP32 internal EMAC controller

*Found in: Component config > Ethernet*

ESP32 integrates a 10/100M Ethernet MAC controller.

Contains:

- `CONFIG_ETH_PHY_INTERFACE`
- `CONFIG_ETH_RMII_CLK_MODE`
- `CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0`
- `CONFIG_ETH_RMII_CLK_OUT_GPIO`
- `CONFIG_ETH_DMA_BUFFER_SIZE`
- `CONFIG_ETH_DMA_RX_BUFFER_NUM`
- `CONFIG_ETH_DMA_TX_BUFFER_NUM`

**CONFIG_ETH_PHY_INTERFACE**

PHY interface

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select the communication interface between MAC and PHY chip.

**Available options:**

- Reduced Media Independent Interface (RMII) (`ETH_PHY_INTERFACE_RMII`)
- Media Independent Interface (MII) (`ETH_PHY_INTERFACE_MII`)
CONFIG_ETH_RMII_CLK_MODE

RMII clock mode

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select external or internal RMII clock.

**Available options:**

- Input RMII clock from external (ETH_RMII_CLK_INPUT)
  MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.
- Output RMII clock from internal (ETH_RMII_CLK_OUTPUT)
  ESP32 can generate RMII clock by internal APLL. This clock can be routed to the external PHY device. ESP32 supports to route the RMII clock to GPIO0/16/17.

CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0

Output RMII clock from GPIO0 (Experimental!)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

CONFIG_ETH_RMII_CLK_OUT_GPIO

RMII clock GPIO number

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the GPIO number to output RMII Clock.

CONFIG_ETH_DMA_BUFFER_SIZE

Ethernet DMA buffer size (Byte)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the size of each buffer used by Ethernet MAC DMA.

CONFIG_ETH_DMA_RX_BUFFER_NUM

Amount of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA receive buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

CONFIG_ETH_DMA_TX_BUFFER_NUM

Amount of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA transmit buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.
**CONFIG_ETH_USE_SPI_ETHERNET**

Support SPI to Ethernet Module

*Found in: Component config > Ethernet*

ESP-IDF can also support some SPI-Ethernet module.

Contains:

- `CONFIG_ETH_SPI_ETHERNET_DM9051`

**CONFIG_ETH_SPI_ETHERNET_DM9051**

Use DM9051

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

DM9051 is a fast Ethernet controller with an SPI interface. It’s also integrated with a 10/100M PHY and MAC. Set true to enable DM9051 driver.

**Event Loop Library**

Contains:

- `CONFIG_ESP_EVENT_LOOP_PROFILING`
- `CONFIG_ESP_EVENT_POST_FROM_ISR`

**CONFIG_ESP_EVENT_LOOP_PROFILING**

Enable event loop profiling

*Found in: Component config > Event Loop Library*

Enables collections of statistics in the event loop library such as the number of events posted to/recieved by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

**CONFIG_ESP_EVENT_POST_FROM_ISR**

Support posting events from ISRs

*Found in: Component config > Event Loop Library*

Enable posting events from interrupt handlers.

**CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR**

Support posting events from ISRs placed in IRAM

*Found in: Component config > Event Loop Library > CONFIG_ESP_EVENT_POST_FROM_ISR*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

**GDB Stub**

Contains:

- `CONFIG_ESP_GDBSTUB_SUPPORT_TASKS`
CONFIG_ESP_GDBSTUB_SUPPORT_TASKS
Enable listing FreeRTOS tasks through GDB Stub

*Found in: Component config > GDB Stub*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using ‘info threads’ command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

CONFIG_ESP_GDBSTUB_MAX_TASKS
Maximum number of tasks supported by GDB Stub

*Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS*

Set the number of tasks which GDB Stub will support.

ESP HTTP client  Contains:
- CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS
- CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH

CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS
Enable https

*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking mbedtls library and initializing SSL transport

CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH
Enable HTTP Basic Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

HTTP Server  Contains:
- CONFIG_HTTPD_MAX_REQ_HDR_LEN
- CONFIG_HTTPD_MAX_URI_LEN
- CONFIG_HTTPD_ERR_RESP_NO_DELAY
- CONFIG_HTTPD_PURGE_BUF_LEN
- CONFIG_HTTPD_LOG_PURGE_DATA

CONFIG_HTTPD_MAX_REQ_HDR_LEN
Max HTTP Request Header Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server
Chapter 2. API Reference

CONFIG_HTTPD_MAX_URI_LEN
Max HTTP URI Length

Found in: Component config > HTTP Server

This sets the maximum supported size of HTTP request URI to be processed by the server

CONFIG_HTTPD_ERR_RESP_NO_DELAY
Use TCP_NODELAY socket option when sending HTTP error responses

Found in: Component config > HTTP Server

Using TCP_NODEALY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

CONFIG_HTTPD_PURGE_BUF_LEN
Length of temporary buffer for purging data

Found in: Component config > HTTP Server

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

CONFIG_HTTPD_LOG_PURGE_DATA
Log purged content data at Debug level

Found in: Component config > HTTP Server

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

ESP HTTPS OTA  Contains:

• CONFIG_OTA_ALLOW_HTTP

CONFIG_OTA.Allow_HTTP
Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: Component config > ESP HTTPS OTA

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

ESP HTTPS server  Contains:

• CONFIG_ESP_HTTPS_SERVER_ENABLE

CONFIG_ESP_HTTPS_SERVER_ENABLE
Enable ESP_HTTPS_SERVER component

Found in: Component config > ESP HTTPS server

Enable ESP HTTPS server component
**Wi-Fi** Contains:

- `CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE`
- `CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_TX_BUFFER`
- `CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_CSI_ENABLED`
- `CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED`
- `CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED`
- `CONFIG_ESP32_WIFI_NVS_ENABLED`
- `CONFIG_ESP32_WIFI_TASK_CORE_ID`
- `CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN`
- `CONFIG_ESP32_WIFI_MGMT_SBUF_NUM`
- `CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE`
- `CONFIG_ESP32_WIFI_IRAM_OPT`
- `CONFIG_ESP32_WIFI_RX_IRAM_OPT`
- `CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE`

**CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE**

Software controls WiFi/Bluetooth coexistence

*Found in: Component config > Wi-Fi*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM**

Max number of WiFi static RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when `esp_wifi_init` is called, they are not freed until `esp_wifi_deinit` is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If `ESP32_WIFI_AMPDU_RX_ENABLED` is enabled, this value is recommended to set equal or bigger than `ESP32_WIFI_RX_BA_WIN` in order to achieve better throughput and compatibility with both stations and APs.

**CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM**

Max number of WiFi dynamic RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).
If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**CONFIG_ESP32_WIFI_TX_BUFFER**

Type of WiFi TX buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled. “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled. “Dynamic” should be selected to improve the utilization of RAM.

**Available options:**

- Static (ESP32_WIFI_STATIC_TX_BUFFER)
- Dynamic (ESP32_WIFI_DYNAMIC_TX_BUFFER)

**CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM**

Max number of WiFi static TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM**

Max number of WiFi cache TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

**CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM**

Max number of WiFi dynamic TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.
CONFIG_ESP32_WIFI_CSI_ENABLED
WiFi CSI (Channel State Information)

*Found in:* Component config > Wi-Fi

Select this option to enable CSI (Channel State Information) feature. CSI takes about CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED
WiFi AMPDU TX

*Found in:* Component config > Wi-Fi

Select this option to enable AMPDU TX feature.

CONFIG_ESP32_WIFI_TX_BA_WIN
WiFi AMPDU TX BA window size

*Found in:* Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_TX_ENABLED

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9-12.

CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED
WiFi AMPDU RX

*Found in:* Component config > Wi-Fi

Select this option to enable AMPDU RX feature.

CONFIG_ESP32_WIFI_RX_BA_WIN
WiFi AMPDU RX BA window size

*Found in:* Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9-12. If PSRAM is used and WiFi memory is prefered to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

CONFIG_ESP32_WIFI_NVS_ENABLED
WiFi NVS flash

*Found in:* Component config > Wi-Fi

Select this option to enable WiFi NVS flash.
CONFIG_ESP32_WIFI_TASK_CORE_ID

Wi-Fi Task Core ID

*Found in: Component config > Wi-Fi*

Pinned WiFi task to core 0 or core 1.

**Available options:**
- Core 0 (ESP32_WIFI_TASK_PINNED_TO_CORE_0)
- Core 1 (ESP32_WIFI_TASK_PINNED_TO_CORE_1)

CONFIG_ESP32_WIFI_SOFTAP_Beacon_MAX_LEN

Max length of WiFi SoftAP Beacon

*Found in: Component config > Wi-Fi*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However, the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

CONFIG_ESP32_WIFI_MGMT_SBUF_NUM

WiFi mgmt short buffer number

*Found in: Component config > Wi-Fi*

Set the number of WiFi management short buffer.

CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE

Enable WiFi debug log

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi debug log

CONFIG_ESP32_WIFI_DEBUG_LOG_LEVEL

WiFi debug log level

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE*

The WiFi log is divided into the following levels: ERROR, WARNING, INFO, DEBUG, VERBOSE. The ERROR, WARNING, INFO levels are enabled by default, and the DEBUG, VERBOSE levels can be enabled here.

**Available options:**
- WiFi Debug Log Debug (ESP32_WIFI_DEBUG_LOG_DEBUG)
- WiFi Debug Log Verbose (ESP32_WIFI_DEBUG_LOG_VERBOSE)
The WiFi log module contains three parts: WIFI, COEX, MESH. The WIFI module indicates the logs related to WiFi, the COEX module indicates the logs related to WiFi and BT (or BLE) coexist, the MESH module indicates the logs related to Mesh. When ESP32_WIFI_LOG_MODULE_ALL is enabled, all modules are selected.

**Available options:**
- WiFi Debug Log Module All (ESP32_WIFI_DEBUG_LOG_MODULE_ALL)
- WiFi Debug Log Module WiFi (ESP32_WIFI_DEBUG_LOG_MODULE_WIFI)
- WiFi Debug Log Module Coex (ESP32_WIFI_DEBUG_LOG_MODULE_COEX)
- WiFi Debug Log Module Mesh (ESP32_WIFI_DEBUG_LOG_MODULE_MESH)

**CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE**

**CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_ALL**

Enable this option to set the WiFi debug log submodule. Currently the log submodule contains the following parts: INIT, IOCTL, CONN, SCAN. The INIT submodule indicates the initialization process. The IOCTL submodule indicates the API calling process. The CONN submodule indicates the connecting process. The SCAN submodule indicates the scanning process.

**CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_INIT**

When this option is enabled, all debug submodules are selected.

**CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_IOCTL**

**CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_CONN**

Espressif Systems 1240

Submit Document Feedback
**CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE_SCAN**

WiFi Debug Log Submodule Scan

**Found in:** Component config > Wi-Fi > CONFIG_ESP32_WIFI_DEBUG_LOG_ENABLE > CONFIG_ESP32_WIFI_DEBUG_LOG_SUBMODULE

**CONFIG_ESP32_WIFI_IRAM_OPT**

WiFi IRAM speed optimization

**Found in:** Component config > Wi-Fi

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**CONFIG_ESP32_WIFI_RX_IRAM_OPT**

WiFi RX IRAM speed optimization

**Found in:** Component config > Wi-Fi

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE**

Enable WPA3-Personal

**Found in:** Component config > Wi-Fi

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**PHY**

Contains:

- **CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE**
- **CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION**
- **CONFIG_ESP32_PHY_MAX_WIFI_TX_POWER**

**CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE**

Store phy calibration data in NVS

**Found in:** Component config > PHY

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it’s easy that your board calibrate bad data, choose ‘n’. Two cases for example, you should choose ‘n’: 1. If your board is easy to be booted up with antenna disconnected. 2. Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose ‘y’.
Chapter 2. API Reference

**CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION**

Use a partition to store PHY init data

*Found in: Component config > PHY*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: ‘data’, subtype: ‘phy’). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose ‘n’.

**CONFIG_ESP32_PHY_MAX_WIFI_TX_POWER**

Max WiFi TX power (dBm)

*Found in: Component config > PHY*

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Core dump** Contains:

- **CONFIG_ESP32_COREDUMP_TO_FLASH_OR_UART**
- **CONFIG_ESP32_CORE_DUMP_MAX_TASKS_NUM**
- **CONFIG_ESP32_CORE_DUMP_UART_DELAY**

**CONFIG_ESP32_COREDUMP_TO_FLASH_OR_UART**

Data destination

*Found in: Component config > Core dump*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition_table directory.

**Available options:**

- Flash (ESP32_ENABLE_COREDUMP_TO_FLASH)
- UART (ESP32_ENABLE_COREDUMP_TO_UART)
- None (ESP32_ENABLE_COREDUMP_TO_NONE)

**CONFIG_ESP32_CORE_DUMP_MAX_TASKS_NUM**

Maximum number of tasks

*Found in: Component config > Core dump*

Maximum number of tasks snapshots in core dump.

**CONFIG_ESP32_CORE_DUMP_UART_DELAY**

Delay before print to UART

*Found in: Component config > Core dump*

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.
FAT Filesystem support  Contains:

- CONFIG_FATFS_CHOOSE_CODEPAGE
- CONFIG_FATFS_LONG_FILENAMES
- CONFIG_FATFS_MAX_LFN
- CONFIG_FATFS_API_ENCODING
- CONFIG_FATFS_FS_LOCK
- CONFIG_FATFS_TIMEOUT_MS
- CONFIG_FATFS_PER_FILE_CACHE
- CONFIG_FATFS_ALLOC_PREFER_EXTRAM

CONFIG_FATFS_CHOOSE_CODEPAGE

OEM Code Page

*Found in: Component config > FAT Filesystem support*

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using f_setcp function. Note that choosing this option will increase application size by ~480kB.

**Available options:**
- Dynamic (all code pages supported) (FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (FATFS_CODEPAGE_437)
- Arabic (CP720) (FATFS_CODEPAGE_720)
- Greek (CP737) (FATFS_CODEPAGE_737)
- KBL (CP771) (FATFS_CODEPAGE_771)
- Baltic (CP775) (FATFS_CODEPAGE_775)
- Latin 1 (CP850) (FATFS_CODEPAGE_850)
- Latin 2 (CP852) (FATFS_CODEPAGE_852)
- Cyrillic (CP855) (FATFS_CODEPAGE_855)
- Turkish (CP857) (FATFS_CODEPAGE_857)
- Portuguese (CP860) (FATFS_CODEPAGE_860)
- Icelandic (CP861) (FATFS_CODEPAGE_861)
- Hebrew (CP862) (FATFS_CODEPAGE_862)
- Canadian French (CP863) (FATFS_CODEPAGE_863)
- Arabic (CP864) (FATFS_CODEPAGE_864)
- Nordic (CP865) (FATFS_CODEPAGE_865)
- Russian (CP866) (FATFS_CODEPAGE_866)
- Greek 2 (CP869) (FATFS_CODEPAGE_869)
- Japanese (DBCS) (CP932) (FATFS_CODEPAGE_932)
- Simplified Chinese (DBCS) (CP936) (FATFS_CODEPAGE_936)
- Korean (DBCS) (CP949) (FATFS_CODEPAGE_949)
- Traditional Chinese (DBCS) (CP950) (FATFS_CODEPAGE_950)

CONFIG_FATFS_LONG_FILENAMES

Long filename support

*Found in: Component config > FAT Filesystem support*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

**Available options:**
- No long filenames (FATFS_LFN_NONE)
- Long filename buffer in heap (FATFS_LFN_HEAP)
- Long filename buffer on stack (FATFS_LFN_STACK)
**CONFIG_FATFS_MAX_LFN**

Max long filename length

*Found in: Component config > FAT Filesystem support*

Maximum long filename length. Can be reduced to save RAM.

**CONFIG_FATFS_API_ENCODING**

API character encoding

*Found in: Component config > FAT Filesystem support*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

**Available options:**

- API uses ANSI/OEM encoding (FATFS_API_ENCODING_ANSI_OEM)
- API uses UTF-16 encoding (FATFS_API_ENCODING_UTF_16)
- API uses UTF-8 encoding (FATFS_API_ENCODING_UTF_8)

**CONFIG_FATFS_FS_LOCK**

Number of simultaneously open files protected by lock function

*Found in: Component config > FAT Filesystem support*

This option sets the FATFS configuration value _FS_LOCK. The option _FS_LOCK switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

**CONFIG_FATFS_TIMEOUT_MS**

Timeout for acquiring a file lock, ms

*Found in: Component config > FAT Filesystem support*

This option sets the FATFS configuration value _FS_TIMEOUT, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

**CONFIG_FATFS_PER_FILE_CACHE**

Use separate cache for each file

*Found in: Component config > FAT Filesystem support*

This option affects the FATFS configuration value _FS_TINY.

If this option is set, _FS_TINY is 0, and each open file has its own cache, size of the cache is equal to the _MAX_SS variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, _FS_TINY is 1, and single cache is used for all open files, size is also equal to _MAX_SS variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.
**CONFIG_FATFS_ALLOC_PREFER_EXTRAM**

Perfer external RAM when allocating FATFS buffers

*Found in: Component config > FAT Filesystem support*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Modbus configuration**

Contains:

- **CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND**
- **CONFIG_FMB_MASTER_DELAY_MS_CONVERT**
- **CONFIG_FMB_QUEUE_LENGTH**
- **CONFIG_FMB_SERIAL_TASK_STACK_SIZE**
- **CONFIG_FMB_SERIAL_BUF_SIZE**
- **CONFIG_FMB_SERIAL_TASK_PRIO**
- **CONFIG_FMB_PORT_TASK_AFFINITY**
- **CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT**
- **CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT**
- **CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE**
- **CONFIG_FMB_CONTROLLER_STACK_SIZE**
- **CONFIG_FMB_EVENT_QUEUE_TIMEOUT**
- **CONFIG_FMB_TIMER_PORT_ENABLED**
- **CONFIG_FMB_TIMER_GROUP**
- **CONFIG_FMB_TIMER_INDEX**
- **CONFIG_FMB_MASTER_TIMER_GROUP**
- **CONFIG_FMB_MASTER_TIMER_INDEX**

**CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND**

Slave respond timeout (Milliseconds)

*Found in: Component config > Modbus configuration*

If master sends a frame which is not broadcast, it has to wait sometime for slave response. If slave is not respond in this time, the master will process timeout error.

**CONFIG_FMB_MASTER_DELAY_MS_CONVERT**

Slave conversion delay (Milliseconds)

*Found in: Component config > Modbus configuration*

If master sends a broadcast frame, it has to wait conversion time to delay, then master can send next frame.

**CONFIG_FMB_QUEUE_LENGTH**

Modbus serial task queue length

*Found in: Component config > Modbus configuration*

Modbus serial driver queue length. It is used by event queue task. See the serial driver API for more information.

**CONFIG_FMB_SERIAL_TASK_STACK_SIZE**
Chapter 2. API Reference

Modbus serial task stack size

*Found in: Component config > Modbus configuration*

Modbus serial task stack size for event queue task. It may be adjusted when debugging is enabled (for example).

**CONFIG_FMB_SERIAL_BUF_SIZE**

Modbus serial task RX/TX buffer size

*Found in: Component config > Modbus configuration*

Modbus serial task RX and TX buffer size for UART driver initialization. This buffer is used for modbus frame transfer. The Modbus protocol maximum frame size is 256 bytes. Bigger size can be used for non standard implementations.

**CONFIG_FMB_SERIAL_TASK_PRIO**

Modbus serial task priority

*Found in: Component config > Modbus configuration*

Modbus UART driver event task priority. The priority of Modbus controller task is equal to (CONFIG_FMB_SERIAL_TASK_PRIO - 1).

**CONFIG_FMB_PORT_TASK_AFFINITY**

Modbus task affinity

*Found in: Component config > Modbus configuration*

Allows setting the core affinity of the Modbus controller task, i.e. whether the task is pinned to particular CPU, or allowed to run on any CPU.

*Available options:*

- No affinity (FMB_PORT_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (FMB_PORT_TASK_AFFINITY_CPU0)
- CPU1 (FMB_PORT_TASK_AFFINITY_CPU1)

**CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT**

Modbus controller slave ID support

*Found in: Component config > Modbus configuration*

Modbus slave ID support enable. When enabled the Modbus <Report Slave ID> command is supported by stack.

**CONFIG_FMB_CONTROLLER_SLAVE_ID**

Modbus controller slave ID

*Found in: Component config > Modbus configuration > CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT*

Modbus slave ID value to identify modbus device in the network using <Report Slave ID> command. Most significant byte of ID is used as short device ID and other three bytes used as long ID.
Chapter 2. API Reference

**CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT**

Modbus controller notification timeout (ms)

*Found in: Component config > Modbus configuration*

Modbus controller notification timeout in milliseconds. This timeout is used to send notification about accessed parameters.

**CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE**

Modbus controller notification queue size

*Found in: Component config > Modbus configuration*

Modbus controller notification queue size. The notification queue is used to get information about accessed parameters.

**CONFIG_FMB_CONTROLLER_STACK_SIZE**

Modbus controller task stack size

*Found in: Component config > Modbus configuration*

Modbus controller task stack size. The Stack size may be adjusted when debug mode is used which requires more stack size (for example).

**CONFIG_FMB_EVENT_QUEUE_TIMEOUT**

Modbus stack event queue timeout (ms)

*Found in: Component config > Modbus configuration*

Modbus stack event queue timeout in milliseconds. This may help to optimize Modbus stack event processing time.

**CONFIG_FMB_TIMER_PORT_ENABLED**

Modbus stack use timer for 3.5T symbol time measurement

*Found in: Component config > Modbus configuration*

If this option is set the Modbus stack uses timer for T3.5 time measurement. Else the internal UART TOUT timeout is used for 3.5T symbol time measurement.

**CONFIG_FMB_TIMER_GROUP**

Slave Timer group number

*Found in: Component config > Modbus configuration*

Modbus slave Timer group number that is used for timeout measurement.

**CONFIG_FMB_TIMER_INDEX**

Slave Timer index in the group

*Found in: Component config > Modbus configuration*

Modbus slave Timer Index in the group that is used for timeout measurement.
CONFIG_FMB_MASTER_TIMER_GROUP

Master Timer group number

Found in: Component config > Modbus configuration

Modbus master Timer group number that is used for timeout measurement.

CONFIG_FMB_MASTER_TIMER_INDEX

Master Timer index

Found in: Component config > Modbus configuration

Modbus master Timer Index in the group that is used for timeout measurement. Note: Modbus master and slave should have different timer index to be able to work simultaneously.

FreeRTOS Contains:

- CONFIG_FREERTOS_UNICORE
- CONFIG_FREERTOS_CORETIMER
- CONFIG_FREERTOS_HZ

- CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE

CONFIG_FREERTOS_UNICORE

Run FreeRTOS only on first core

Found in: Component config > FreeRTOS

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

# This invisible config value sets the value of tskNO_AFFINITY in task.h. # Intended to be used as a constant from other Kconfig files. # Value is (32-bit) INT_MAX.
**CONFIG_FREERTOS_CORETIMER**

Xtensa timer to use as the FreeRTOS tick source

*Found in: Component config > FreeRTOS*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities. Check

**Available options:**

- Timer 0 (int 6, level 1) (FREERTOS_CORETIMER_0)
  Select this to use timer 0
- Timer 1 (int 15, level 3) (FREERTOS_CORETIMER_1)
  Select this to use timer 1

**CONFIG_FREERTOS_HZ**

Tick rate (Hz)

*Found in: Component config > FreeRTOS*

Select the tick rate at which FreeRTOS does pre-emptive context switching.

**CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION**

Halt when an SMP-untested function is called

*Found in: Component config > FreeRTOS*

Some functions in FreeRTOS have not been thoroughly tested yet when moving to the SMP implementation of FreeRTOS. When this option is enabled, these functions will throw an assert().

**CONFIG_FREERTOS_CHECK_STACKOVERFLOW**

Check for stack overflow

*Found in: Component config > FreeRTOS*

FreeRTOS can check for stack overflows in threads and trigger an user function called vApplicationStackOverflowHook when this happens.

**Available options:**

- No checking (FREERTOS_CHECK_STACKOVERFLOW_NONE)
  Do not check for stack overflows (configCHECK_FOR_STACK_OVERFLOW=0)
- Check by stack pointer value (FREERTOS_CHECK_STACKOVERFLOW_PTRVAL)
  Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK_FOR_STACK_OVERFLOW=1)
- Check using canary bytes (FREERTOS_CHECK_STACKOVERFLOW_CANARY)
  Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK_FOR_STACK_OVERFLOW=2)

**CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK**

Set a debug watchpoint as a stack overflow check

*Found in: Component config > FreeRTOS*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See FREERTOS_CHECK_STACKOVERFLOW for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the debug memory watchpoint 1
(the second one) to allow breaking into the debugger (or panic’ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively only have one watchpoint; the 2nd one is overwritten as soon as a task switch happens.

This check only triggers if the stack overflow writes within 4 bytes of the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**CONFIG_FREERTOS_INTERRUPT_BACKTRACE**

Enable backtrace from interrupt to task context

*Found in: Component config > FreeRTOS*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS**

Number of thread local storage pointers

*Found in: Component config > FreeRTOS*

FreeRTOS has the ability to store per-thread pointers in the task control block. This controls the number of pointers available.

This value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

**CONFIG_FREERTOS_ASSERT**

FreeRTOS assertions

*Found in: Component config > FreeRTOS*

Failed FreeRTOS configASSERT() assertions can be configured to behave in different ways.

**Available options:**

- **abort()** on failed assertions (FREERTOS_ASSERT_FAIL_ABORT)
  If a FreeRTOS configASSERT() fails, FreeRTOS will abort() and halt execution. The panic handler can be configured to handle the outcome of an abort() in different ways.
- **Print and continue failed assertions (FREERTOS_ASSERT_FAIL_PRINT_CONTINUE)**
  If a FreeRTOS assertion fails, print it out and continue.
- **Disable FreeRTOS assertions (FREERTOS_ASSERT_DISABLE)**
  FreeRTOS configASSERT() will not be compiled into the binary.

**CONFIG_FREERTOS_IDLE_TASK_STACKSIZE**

Idle Task stack size

*Found in: Component config > FreeRTOS*

The idle task has its own stack, sized in bytes. The default size is enough for most uses. Size can be reduced to 768 bytes if no (or simple) FreeRTOS idle hooks are used and pthread local storage or FreeRTOS local storage cleanup callbacks are not used.

The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.
Chapter 2. API Reference

**CONFIG_FREERTOS_ISR_STACKSIZE**

ISR stack size

*Found in: Component config > FreeRTOS*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**CONFIG_FREERTOS_LEGACY_HOOKS**

Use FreeRTOS legacy hooks

*Found in: Component config > FreeRTOS*

FreeRTOS offers a number of hooks/callback functions that are called when a timer tick happens, the idle thread runs etc. esp-idf replaces these by runtime registerable hooks using the esp_register_freertos_xxx_hook system, but for legacy reasons the old hooks can also still be enabled. Please enable this only if you have code that for some reason can’t be migrated to the esp_register_freertos_xxx_hook system.

**CONFIG_FREERTOS_MAX_TASK_NAME_LEN**

Maximum task name length

*Found in: Component config > FreeRTOS*

Changes the maximum task name length. Each task allocated will include this many bytes for a task name. Using a shorter value saves a small amount of RAM, a longer value allows more complex names.

For most uses, the default of 16 is OK.

**CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION**

Enable FreeRTOS static allocation API

*Found in: Component config > FreeRTOS*

FreeRTOS gives the application writer the ability to instead provide the memory themselves, allowing the following objects to optionally be created without any memory being allocated dynamically:

- Tasks
- Software Timers (Daemon task is still dynamic. See documentation)
- Queues
- Event Groups
- Binary Semaphores
- Counting Semaphores
- Recursive Semaphores
- Mutexes

Whether it is preferable to use static or dynamic memory allocation is dependent on the application, and the preference of the application writer. Both methods have pros and cons, and both methods can be used within the same RTOS application.

Creating RTOS objects using statically allocated RAM has the benefit of providing the application writer with more control: RTOS objects can be placed at specific memory locations. The maximum RAM footprint can be determined at link time, rather than run time. The application writer does not need to concern themselves with graceful handling of memory allocation failures. It allows the RTOS to be used in applications that simply don’t allow any dynamic memory allocation (although FreeRTOS includes allocation schemes that can overcome most objections).
CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP

Enable static task clean up hook

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION*

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Bear in mind that if this option is enabled you will need to implement the following function:

```c
void vPortCleanUpTCB ( void *pxTCB ) {
    // place clean up code here
}
```

CONFIG_FREERTOS_TIMER_TASK_PRIORITY

FreeRTOS timer task priority

*Found in: Component config > FreeRTOS*

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application’s executable binary.

Use this constant to define the priority that the timer task will run at.

CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH

FreeRTOS timer task stack size

*Found in: Component config > FreeRTOS*

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application’s executable binary.

Use this constant to define the size (in bytes) of the stack allocated for the timer task.

CONFIG_FREERTOS_TIMER_QUEUE_LENGTH

FreeRTOS timer queue length

*Found in: Component config > FreeRTOS*

FreeRTOS provides a set of timer related API functions. Many of these functions use a standard FreeRTOS queue to send commands to the timer service task. The queue used for this purpose is called the ‘timer command queue’. The ‘timer command queue’ is private to the FreeRTOS timer implementation, and cannot be accessed directly.

For most uses the default value of 10 is OK.

CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE

FreeRTOS queue registry size

*Found in: Component config > FreeRTOS*

FreeRTOS uses the queue registry as a means for kernel aware debuggers to locate queues, semaphores, and mutexes. The registry allows for a textual name to be associated with a queue for easy identification within a debugging GUI. A value of 0 will disable queue registry functionality, and a value larger than 0 will specify the number of queues/semaphores/mutexes that the registry can hold.
Chapter 2. API Reference

**CONFIG_FREERTOS_USE_TRACE_FACILITY**

Enable FreeRTOS trace facility

*Found in: Component config > FreeRTOS*

If enabled, configUSE_TRACE_FACILITY will be defined as 1 in FreeRTOS. This will allow the usage of trace facility functions such as uTaskGetSystemState().

**CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS**

Enable FreeRTOS stats formatting functions

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TRACE_FACILITY*

If enabled, configUSE_STATS_FORMATTING_FUNCTIONS will be defined as 1 in FreeRTOS. This will allow the usage of stats formatting functions such as vTaskList().

**CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID**

Enable display of xCoreID in vTaskList

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TRACE_FACILITY > CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

**CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS**

Enable FreeRTOS to collect run time stats

*Found in: Component config > FreeRTOS*

If enabled, configGENERATE_RUN_TIME_STATS will be defined as 1 in FreeRTOS. This will allow FreeRTOS to collect information regarding the usage of processor time amongst FreeRTOS tasks. Run time stats are generated using either the ESP Timer or the CPU Clock as the clock source (Note that run time stats are only valid until the clock source overflows). The function vTaskGetRunTimeStats() will also be available if FREERTOS_USE_STATS_FORMATTING_FUNCTIONS and FREERTOS_USE_TRACE_FACILITY are enabled. vTaskGetRunTimeStats() will display the run time of each task as a % of the total run time of all CPUs (task run time / no of CPUs) / (total run time / 100 )

**CONFIG_FREERTOS_RUN_TIME_STATS_CLK**

Choose the clock source for run time stats

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS*

Choose the clock source for FreeRTOS run time stats. Options are CPU0’s CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

*Available options:*
- Use ESP TIMER for run time stats (FREERTOS_RUN_TIME_STATS_USING_ESP_TIMER) ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (FREERTOS_RUN_TIME_STATS_USING_CPU_CLK) CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP32_DEFAULT_CPU_FREQ_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU
cycles each task is allocated and DOES NOT reflect the amount of time each task runs for
(as CPU clock frequency can change). If the CPU clock consistently runs at the maximum
frequency of 240MHz, it will overflow in approximately 17 seconds.

**CONFIG_FREERTOS_USE_TICKLESS_IDLE**

Tickless idle support

*Found in: Component config > FreeRTOS*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep
mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS_IDLE_TIME_BEFORE_SLEEP option. This feature is also known as “automatic light sleep”.

Note that timers created using esp_timer APIs may prevent the system from entering sleep mode, even
when no tasks need to run.

If disabled, automatic light sleep support will be disabled.

**CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP**

Minimum number of ticks to enter sleep mode for

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_USE_TICKLESS_IDLE*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks.

**CONFIG_FREERTOS_DEBUG_INTERNALS**

Debug FreeRTOS internals

*Found in: Component config > FreeRTOS*

Enable this option to show the menu with internal FreeRTOS debugging features. This option does not
change any code by itself, it just shows/hides some options.

**Contains:**

- **CONFIG_FREERTOS_PORTMUX_DEBUG**
- **CONFIG_FREERTOS_PORTMUX_DEBUG_RECURSIVE**

**CONFIG_FREERTOS_PORTMUX_DEBUG**

Debug portMUX portENTER_CRITICAL/portEXIT_CRITICAL

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_DEBUG_INTERNALS*

If enabled, debug information (including integrity checks) will be printed to UART for the port-specific
MUX implementation.

**CONFIG_FREERTOS_PORTMUX_DEBUG_RECURSIVE**

Debug portMUX Recursion

*Found in: Component config > FreeRTOS > CONFIG_FREERTOS_DEBUG_INTERNALS*

If enabled, additional debug information will be printed for recursive portMUX usage.
CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER

Enclose all task functions in a wrapper function

*Found in: Component config > FreeRTOS*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER

Check that mutex semaphore is given by owner task

*Found in: Component config > FreeRTOS*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE

Tests compliance with Vanilla FreeRTOS port*_.CRITICAL calls

*Found in: Component config > FreeRTOS*

If enabled, context of port*_.CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port*_.CRITICAL from ISR context would cause assert failure

Heap memory debugging  
Contains:

- CONFIG_HEAP_CORRUPTION_DETECTION
- CONFIG_HEAP_TRACING_DEST
- CONFIG_HEAP_TRACING_STACK_DEPTH
- CONFIG_HEAP_TASK_TRACKING

CONFIG_HEAP_CORRUPTION_DETECTION

Heap corruption detection

*Found in: Component config > Heap memory debugging*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

Available options:

- Basic (no poisoning) (HEAP_POISONING_DISABLED)
- Light impact (HEAP_POISONING_LIGHT)
- Comprehensive (HEAP_POISONING_COMPREHENSIVE)

CONFIG_HEAP_TRACING_DEST

Heap tracing

*Found in: Component config > Heap memory debugging*

Enables the heap tracing API defined in esp_heap_trace.h.

This function causes a moderate increase in IRAM code side and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.
Available options:
- Disabled (HEAP_TRACING_OFF)
- Standalone (HEAP_TRACING_STANDALONE)
- Host-based (HEAP_TRACING_TOHOST)

**CONFIG_HEAP_TRACING_STACK_DEPTH**

Heap tracing stack depth

*Found in: Component config > Heap memory debugging*

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

**CONFIG_HEAP_TASK_TRACKING**

Enable heap task tracking

*Found in: Component config > Heap memory debugging*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

**libsodium** Contains:

- **CONFIG_LIBSODIUM_USE_MBEDTLS_SHA**

**CONFIG_LIBSODIUM_USE_MBEDTLS_SHA**

Use mbedTLS SHA256 & SHA512 implementations

*Found in: Component config > libsodium*

If this option is enabled, libsodium will use thin wrappers around mbedTLS for SHA256 & SHA512 operations.

This saves some code size if mbedTLS is also used. However it is incompatible with hardware SHA acceleration (due to the way libsodium’s API manages SHA state).

**Log output** Contains:

- **CONFIG_LOG_DEFAULT_LEVEL**
- **CONFIG_LOG_COLORS**

**CONFIG_LOG_DEFAULT_LEVEL**

Default log verbosity

*Found in: Component config > Log output*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using esp_log_level_set function.

Note that this setting limits which log statements are compiled into the program. So setting this to, say, “Warning” would mean that changing log level to “Debug” at runtime will not be possible.

Available options:

- No output (LOG_DEFAULT_LEVEL_NONE)
- Error (LOG_DEFAULT_LEVEL_ERROR)
• Warning (LOG_DEFAULT_LEVEL_WARN)
• Info (LOG_DEFAULT_LEVEL_INFO)
• Debug (LOG_DEFAULT_LEVEL_DEBUG)
• Verbose (LOG_DEFAULT_LEVEL_VERBOSE)

CONFIG_LOG_COLORS

Use ANSI terminal colors in log output

Found in: Component config > Log output

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

LWIP

Contains:

• CONFIG_LWIP_LOCAL_HOSTNAME
• CONFIG_LWIP_L2_TO_L3_COPY
• CONFIG_LWIP_IRAM_OPTIMIZATION

• ICMP
• LWIP RAW API
• SNTP

CONFIG_LWIP_LOCAL_HOSTNAME
Local netif hostname

*Found in: Component config > LWIP*

The name this device will report to other devices on the network

**CONFIG_LWIP_L2_TO_L3_COPY**

Enable copy between Layer2 and Layer3 packets

*Found in: Component config > LWIP*

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**CONFIG_LWIP_IRAM_OPTIMIZATION**

Enable LWIP IRAM optimization

*Found in: Component config > LWIP*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn’t help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**CONFIG_LWIP_TIMERS_ONDEMAND**

Enable LWIP Timers on demand

*Found in: Component config > LWIP*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**CONFIG_LWIP_MAX_SOCKETS**

Max number of open sockets

*Found in: Component config > LWIP*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**CONFIG_LWIP_USE_ONLY_LWIP_SELECT**

Support LWIP socket select() only

*Found in: Component config > LWIP*

The virtual filesystem layer of select() redirects sockets to lwip_select() and non-socket file descriptors to their respective driver implementations. If this option is enabled then all calls of select() will be redirected to lwip_select(), therefore, select can be used for sockets only.
CONFIG_LWIP_SO_LINGER

Enable SO_LINGER processing

*Found in: Component config > LWIP*

Enabling this option allows SO_LINGER processing. `l_onoff = 1,l_linger` can set the timeout.

If `l_linger=0`, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If `l_linger!=0`, Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

CONFIG_LWIP_SO_REUSE

Enable SO_REUSEADDR option

*Found in: Component config > LWIP*

Enabling this option allows binding to a port which remains in TIME_WAIT.

CONFIG_LWIP_SO_REUSE_RXTOALL

SO_REUSEADDR copies broadcast/multicast to all matches

*Found in: Component config > LWIP > CONFIG_LWIP_SO_REUSE*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don’t plan to receive broadcast or multicast traffic on more than one socket at a time.

CONFIG_LWIP_SO_RCVBUF

Enable SO_RCVBUF option

*Found in: Component config > LWIP*

Enabling this option allows checking for available data on a netconn.

CONFIG_LWIP_IP4_FRAG

Enable fragment outgoing IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

CONFIG_LWIP_IP6_FRAG

Enable fragment outgoing IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

CONFIG_LWIP_IP4_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP4 packets.
CONFIG_LWIP_IP6_REASSEMBLY
Enable reassembly incoming fragmented IP6 packets

*Found in: Component config > LWIP*
Enabling this option allows reassembling incoming fragmented IP6 packets.

CONFIG_LWIP_STATS
Enable LWIP statistics

*Found in: Component config > LWIP*
Enabling this option allows LWIP statistics

CONFIG_LWIP_ETHARP_TRUST_IP_MAC
Enable LWIP ARPtrust

*Found in: Component config > LWIP*
Enabling this option allows ARP table to be updated.

If this option is enabled, the incoming IP packets cause the ARP table to be updated with the source MAC and IP addresses supplied in the packet. You may want to disable this if you do not trust LAN peers to have the correct addresses, or as a limited approach to attempt to handle spoofing. If disabled, lwIP will need to make a new ARP request if the peer is not already in the ARP table, adding a little latency. The peer *is* in the ARP table if it requested our address before. Also notice that this slows down input processing of every IP packet!

There are two known issues in real application if this feature is enabled: - The LAN peer may have bug to update the ARP table after the ARP entry is aged out. If the ARP entry on the LAN peer is aged out but failed to be updated, all IP packets sent from LWIP to the LAN peer will be dropped by LAN peer. - The LAN peer may not be trustful, the LAN peer may send IP packets to LWIP with two different MACs, but the same IP address. If this happens, the LWIP has problem to receive IP packets from LAN peer.

So the recommendation is to disable this option. Here the LAN peer means the other side to which the ESP station or soft-AP is connected.

CONFIG_LWIP_ESP_GRATUITOUS_ARP
Send gratuitous ARP periodically

*Found in: Component config > LWIP*
Enable this option allows to send gratuitous ARP periodically.

This option solves the compatibility issues. If the ARP table of the AP is old, and the AP doesn’t send ARP request to update it’s ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it’s ARP table.

CONFIG_LWIP_GARP_TMR_INTERVAL
GARP timer interval(seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP_GRATUITOUS_ARP*
Set the timer interval for gratuitous ARP. The default value is 60s
Chapter 2. API Reference

CONFIG_LWIP_TCPIP_RECVMBBOX_SIZE

TCPIP task receive mail box size

*Found in: Component config > LWIP*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

CONFIG_LWIP_DHCP_DOES_ARP_CHECK

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

CONFIG_LWIP_DHCP_RESTORE_LAST_IP

DHCP: Restore last IP obtained from DHCP server

*Found in: Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

DHCP server Contains:

- CONFIG_LWIP_DHCPS_LEASE_UNIT
- CONFIG_LWIP_DHCPS_MAX_STATION_NUM

CONFIG_LWIP_DHCPS_LEASE_UNIT

Multiplier for lease time, in seconds

*Found in: Component config > LWIP > DHCP server*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

CONFIG_LWIP_DHCPS_MAX_STATION_NUM

Maximum number of stations

*Found in: Component config > LWIP > DHCP server*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it’s address pool, without notification.

CONFIG_LWIP_AUTOIP

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

Contains:

- CONFIG_LWIP_AUTOIP_TRIES
• CONFIG_LWIP_AUTOIP_MAX_CONFLICTS
• CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL

CONFIG_LWIP_AUTOIP_TRIES
DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: “This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP.” (In the case of ESP-IDF, this means multiple SYSTEM_EVENT_STA_GOT_IP events.)

CONFIG_LWIP_AUTOIP_MAX_CONFLICTS
Max IP conflicts before rate limiting

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL
Rate limited interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

CONFIG_LWIP_IPV6_AUTOCONFIG
Enable IPV6 stateless address autoconfiguration

*Found in: Component config > LWIP*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration.

See RFC 4862.

CONFIG_LWIP_NETIF_LOOPBACK
Support per-interface loopback

*Found in: Component config > LWIP*

Enabling this option means that if a packet is sent with a destination address equal to the interface’s own IP address, it will “loop back” and be received by this interface.

Contains:
• CONFIG_LWIP_LOOPBACK_MAX_PBUFS

CONFIG_LWIP_LOOPBACK_MAX_PBUFS
Max queued loopback packets per interface

*Found in: Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK*

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.
TCP  Contains:

- `CONFIG_LWIP_TCP_ISN_HOOK`
- `CONFIG_LWIP_MAX_ACTIVE_TCP`
- `CONFIG_LWIP_MAX_LISTENING_TCP`
- `CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION`
- `CONFIG_LWIP_TCP_MAXRTX`
- `CONFIG_LWIP_TCP_SYNMAXRTX`
- `CONFIG_LWIP_TCP_MSS`
- `CONFIG_LWIP_TCP_MSL`
- `CONFIG_LWIP_TCP_SNDF_POLL_DEFAULT`
- `CONFIG_LWIP_TCP_WND_DEFAULT`
- `CONFIG_LWIP_TCP_RECVMBOX_SIZE`
- `CONFIG_LWIP_TCP_QUEUE_OOSEQ`
- `CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES`
- `CONFIG_LWIP_TCP_OVERSIZE`
- `CONFIG_LWIP_WND_SCALE`
- `CONFIG_LWIP_TCP_RTO_TIME`

**CONFIG_LWIP_TCP_ISN_HOOK**

Enable TCP ISN Hook

*Found in: Component config > LWIP > TCP*

Enables custom TCP ISN hook to randomize initial sequence number in TCP connection. This is recommended as default lwIP implementation (`tcp_next_iss`) is not very strong, as it does not take into consideration any platform specific entropy source.

**CONFIG_LWIP_MAX_ACTIVE_TCP**

Maximum active TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**CONFIG_LWIP_MAX_LISTENING_TCP**

Maximum listening TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION**

TCP high speed retransmissions

*Found in: Component config > LWIP > TCP*

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.
CONFIG_LWIP_TCP_MAXRTX
Maximum number of retransmissions of data segments

Found in: Component config > LWIP > TCP
Set maximum number of retransmissions of data segments.

CONFIG_LWIP_TCP_SYNMAXRTX
Maximum number of retransmissions of SYN segments

Found in: Component config > LWIP > TCP
Set maximum number of retransmissions of SYN segments.

CONFIG_LWIP_TCP_MSS
Maximum Segment Size (MSS)

Found in: Component config > LWIP > TCP
Set maximum segment size for TCP transmission.
Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP_MSS Range: 576 <= TCP_MSS <= 1460 IPv6 TCP_MSS Range: 1220 <= TCP_mSS <= 1440

CONFIG_LWIP_TCP_MSL
Maximum segment lifetime (MSL)

Found in: Component config > LWIP > TCP
Set maximum segment lifetime in milliseconds.

CONFIG_LWIP_TCP_SND_BUF_DEFAULT
Default send buffer size

Found in: Component config > LWIP > TCP
Set default send buffer size for new TCP sockets.
Per-socket send buffer size can be changed at runtime with lwip_setsockopt(s, TCP_SNDBUF, …).
This value must be at least 2x the MSS size, and the default is 4x the default MSS size.
Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

CONFIG_LWIP_TCP_WND_DEFAULT
Default receive window size

Found in: Component config > LWIP > TCP
Set default TCP receive window size for new TCP sockets.
Per-socket receive window size can be changed at runtime with lwip_setsockopt(s, TCP_WINDOW, …).
Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.
CONFIG_LWIP_TCP_RECMBOX_SIZE

Default TCP receive mail box size

*Found in: Component config > LWIP > TCP*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is: \( \text{LWIP\_TCP\_WND\_DEFAULT/TCP\_MSS} + 2 \). e.g. if \( \text{LWIP\_TCP\_WND\_DEFAULT}=14360 \), \( \text{TCP\_MSS}=1436 \), then the recommended receive mail box size is \( (14360/1436 + 2) = 12 \).

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum \( \text{LWIP\_TCP\_RECCVMBOX\_SIZE} \) packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is \( \text{LWIP\_TCP\_RECCVMBOX\_SIZE} \) multiples the maximum TCP socket number. In other words, the bigger \( \text{LWIP\_TCP\_RECCVMBOX\_SIZE} \) means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

CONFIG_LWIP_TCP_QUEUE_OOSEQ

Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

CONFIG_LWIP_TCP_KEEP_CONNECTION_WHEN_IP_CHANGES

Keep TCP connections when IP changed

*Found in: Component config > LWIP > TCP*

This option is enabled when the following scenario happen: network dropped and reconnected, IP changes is like: \( 192.168.0.2 \rightarrow 0.0.0.0 \rightarrow 192.168.0.2 \)

Disable this option to keep consistent with the original LWIP code behavior.

CONFIG_LWIP_TCP_OVERSIZE

Pre-allocate transmit PBUF size

*Found in: Component config > LWIP > TCP*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

*Available options:*

- MSS (LWIP_TCP_OVERSIZE_MSS)
- 25% MSS (LWIP_TCP_OVERSIZE_QUARTER_MSS)
- Disabled (LWIP_TCP_OVERSIZE_DISABLE)
CONFIG_LWIP_WND_SCALE

Support TCP window scale

*Found in: Component config > LWIP > TCP*

Enable this feature to support TCP window scaling.

CONFIG_LWIP_TCP_RCV_SCALE

Set TCP receiving window scaling factor

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_WND_SCALE*

Enable this feature to support TCP window scaling.

CONFIG_LWIP_TCP_RTO_TIME

Default TCP rto time

*Found in: Component config > LWIP > TCP*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

UDP

Contains:

- `CONFIG_LWIP_MAX_UDP_PCBS`
- `CONFIG_LWIP_UDP_METHOD_SIZE`

CONFIG_LWIP_MAX_UDP_PCBS

Maximum active UDP control blocks

*Found in: Component config > LWIP > UDP*

The maximum number of active UDP "connections" (i.e., UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

CONFIG_LWIP_UDP_METHOD_SIZE

Default UDP receive mailbox size

*Found in: Component config > LWIP > UDP*

Set UDP receive mailbox size. The recommended value is 6.

UDP receive mailbox is a per socket mailbox, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mailbox and the application then fetches the packets from mail box. It means LWIP can caches maximum UDP RECCVMBOX_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP RECCVMBOX_SIZE multiples the maximum UDP socket number. In other words, the bigger UDP RECCVMBOX_SIZE means more memory. On the other hand, if the receive mailbox is too small, the mailbox may be full. If the mailbox is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mailbox is big enough to avoid packet drop between LWIP core and application.
**CONFIG_LWIP_TCP_IP_TASK_STACK_SIZE**

TCP/IP Task Stack Size

*Found in: Component config > LWIP*

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**CONFIG_LWIP_TCP_IP_TASK_AFFINITY**

TCP/IP task affinity

*Found in: Component config > LWIP*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

*Available options:*
- No affinity (LWIP_TCP_IP_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (LWIP_TCP_IP_TASK_AFFINITY_CPU0)
- CPU1 (LWIP_TCP_IP_TASK_AFFINITY_CPU1)

**CONFIG_LWIP_PPP_SUPPORT**

Enable PPP support (new/experimental)

*Found in: Component config > LWIP*

Enable PPP stack. Now only PPP over serial is possible. PPP over serial support is experimental and unsupported.

**CONFIG_LWIP_IPV6_MEMP_NUM ND6_QUEUE**

Max number of IPv6 packets to queue during MAC resolution

*Found in: Component config > LWIP*

Config max number of IPv6 packets to queue during MAC resolution.

**CONFIG_LWIP_IPV6 ND6_NUM_NEIGHBORS**

Max number of entries in IPv6 neighbor cache

*Found in: Component config > LWIP*

Config max number of entries in IPv6 neighbor cache.

**CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT**

Enable Notify Phase Callback

*Found in: Component config > LWIP*

Enable to set a callback which is called on change of the internal PPP state machine.

**CONFIG_LWIP_PPP_PAP_SUPPORT**

Enable PAP support

*Found in: Component config > LWIP*

Enable Password Authentication Protocol (PAP) support
 Chapter 2. API Reference

**CONFIG_LWIP_PPP_CHAP_SUPPORT**
Enable CHAP support

*Found in: Component config > LWIP*
Enable Challenge Handshake Authentication Protocol (CHAP) support

**CONFIG_LWIP_PPP_MSCHAP_SUPPORT**
Enable MSCHAP support

*Found in: Component config > LWIP*
Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

**CONFIG_LWIP_PPP_MPPE_SUPPORT**
Enable MPPE support

*Found in: Component config > LWIP*
Enable Microsoft Point-to-Point Encryption (MPPE) support

**CONFIG_LWIP_PPP_DEBUG_ON**
Enable PPP debug log output

*Found in: Component config > LWIP*
Enable PPP debug log output

**ICMP** Contains:
- **CONFIG_LWIP_MULTICAST_PING**
- **CONFIG_LWIP_BROADCAST_PING**

**CONFIG_LWIP_MULTICAST_PING**
Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

**CONFIG_LWIP_BROADCAST_PING**
Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

**LWIP RAW API** Contains:
- **CONFIG_LWIP_MAX_RAW_PCBS**

**CONFIG_LWIP_MAX_RAW_PCBS**
Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*
The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.
SNTP Contains:

- CONFIG_LWIP_DHCP_MAX_NTP_SERVERS
- CONFIG_LWIP_SNTP_UPDATE_DELAY

**CONFIG_LWIP_DHCP_MAX_NTP_SERVERS**

Maximum number of NTP servers

*Found in: Component config > LWIP > SNTP*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of sntp_setserver/sntp_setservername functions is limited to this value.

**CONFIG_LWIP_SNTP_UPDATE_DELAY**

Request interval to update time (ms)

*Found in: Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

mbedTLS Contains:

- CONFIG_MBEDTLS_MEM_ALLOC_MODE
- CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN
- CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN
- CONFIG_MBEDTLS_DEBUG
- CONFIG_MBEDTLS_ECP_RESTARTABLE
- CONFIG_MBEDTLS_CMAC_C
- CONFIG_MBEDTLS_HARDWARE_AES
- CONFIG_MBEDTLS_HARDWARE_MPI
- CONFIG_MBEDTLS_HARDWARE_SHA
- CONFIG_MBEDTLS_HAVE_TIME
- CONFIG_MBEDTLS_TLS_MODE
- TLS Key Exchange Methods
- CONFIG_MBEDTLS_SSL_RENEGOTIATION
- CONFIG_MBEDTLS_SSL_PROTO_SSL3
- CONFIG_MBEDTLS_SSL_PROTO_TLS1
- CONFIG_MBEDTLS_SSL_PROTO_TLS1_1
- CONFIG_MBEDTLS_SSL_PROTO_TLS1_2
- CONFIG_MBEDTLS_SSL_PROTO_DTLS
- CONFIG_MBEDTLS_SSL_ALPN
- CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS
- CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS
- Symmetric Ciphers
- CONFIG_MBEDTLS_RIPEMD160_C
- Certificates
- CONFIG_MBEDTLS_ECP_C

**CONFIG_MBEDTLS_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
Chapter 2. API Reference

- External SPI RAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls_platform_set_calloc_free() function

Recommended mode here is always internal, since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

Available options:
- Internal memory (MBEDTLS_INTERNAL_MEM_ALLOC)
- External SPI RAM (MBEDTLS_EXTERNAL_MEM_ALLOC)
- Default alloc mode (MBEDTLS_DEFAULT_MEM_ALLOC)
- Custom alloc mode (MBEDTLS_CUSTOM_MEM_ALLOC)

CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN

TLS maximum message content length

*Found in: Component config > mbedTLS*

Maximum TLS message length (in bytes) supported by mbedTLS.

16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max_fragment_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS_ERR_SSL_INVALID_RECORD (-0x7200).

CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN

Asymmetric in/out fragment length

*Found in: Component config > mbedTLS*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN

TLS maximum incoming fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN*

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

CONFIG_MBEDTLS_SSL_OUT_CONTENT_LEN

TLS maximum outgoing fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN*

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).
CONFIG_MBEDTLS_DEBUG
Enable mbedTLS debugging

*Found in: Component config > mbedTLS*

Enable mbedTLS debugging functions at compile time.
If this option is enabled, you can include “mbedtls/esp_debug.h” and call mbedtls_esp_enable_debug_log() at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

CONFIG_MBEDTLS_DEBUG_LEVEL
Set mbedTLS debugging level

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DEBUG*

Set mbedTLS debugging level

*Available options:*

- Warning (MBEDTLS_DEBUG_LEVEL_WARN)
- Info (MBEDTLS_DEBUG_LEVEL_INFO)
- Debug (MBEDTLS_DEBUG_LEVEL_DEBUG)
- Verbose (MBEDTLS_DEBUG_LEVELVERBOSE)

CONFIG_MBEDTLS_ECP_RESTARTABLE
Enable mbedTLS ecp restartable

*Found in: Component config > mbedTLS*

Enable “non-blocking” ECC operations that can return early and be resumed.

CONFIG_MBEDTLS_CMAC_C
Enable CMAC mode for block ciphers

*Found in: Component config > mbedTLS*

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

CONFIG_MBEDTLS_HARDWARE_AES
Enable hardware AES acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

CONFIG_MBEDTLS_HARDWARE_MPI
Enable hardware MPI (bignum) acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to 4096 bit results.

These operations are used by RSA.
CONFIG_MBEDTLS_MPI_USE_INTERRUPT

Use interrupt for MPI operations

*Found in:* Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_MPI

Use an interrupt to coordinate MPI operations.

This allows other code to run on the CPU while an MPI operation is pending. Otherwise the CPU busy-waits.

CONFIG_MBEDTLS_HARDWARE_SHA

Enable hardware SHA acceleration

*Found in:* Component config > mbedTLS

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedTLS.

Due to a hardware limitation, hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

CONFIG_MBEDTLS_HAVE_TIME

Enable mbedtls time

*Found in:* Component config > mbedTLS

System has time.h and time(). The time does not need to be correct, only time differences are used.

CONFIG_MBEDTLS_HAVE_TIME_DATE

Enable mbedtls certificate expiry check

*Found in:* Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME

System has time.h and time(), gmtime() and the clock is correct. The time needs to be correct (not necessarily very accurate, but at least the date should be correct). This is used to verify the validity period of X.509 certificates.

It is suggested that you should get the real time by “SNTP”.

CONFIG_MBEDTLS_TLS_MODE

TLS Protocol Role

*Found in:* Component config > mbedTLS

mbedTLS can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

**Available options:**
- Server & Client (MBEDTLS_TLS_SERVER_AND_CLIENT)
- Server (MBEDTLS_TLS_SERVER_ONLY)
- Client (MBEDTLS_TLS_CLIENT_ONLY)
- None (MBEDTLS_TLS_DISABLED)
**TLS Key Exchange Methods**  Contains:

- `CONFIG_MBEDTLS_PSK_MODES`
- `CONFIG_MBEDTLS_KEY_EXCHANGE_RSA`
- `CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA`
- `CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE`

**CONFIG_MBEDTLS_PSK_MODES**

Enable pre-shared-key ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this option disabled will save code size if they are not used.

**CONFIG_MBEDTLS_KEY_EXCHANGE_PSK**

Enable PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK**

Enable DHE-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK**

Enable ECDHE-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK**

Enable RSA-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**CONFIG_MBEDTLS_KEY_EXCHANGE_RSA**

Enable RSA-only based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to support ciphersuites with prefix TLS-RSA-WITH-
**CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA**

Enable DHE-RSA based cipher suite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to support cipher suites with prefix TLS-DHE-RSA-WITH-

**CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE**

Support Elliptic Curve based cipher suites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show Elliptic Curve based cipher suite mode options.

Disabling all Elliptic Curve cipher suites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only cipher suite modes.

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA**

Enable ECDHE-RSA based cipher suite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support cipher suites with prefix TLS-ECDHE-RSA-WITH-

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA**

Enable ECDHE-ECDSA based cipher suite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support cipher suites with prefix TLS-ECDHE-RSA-WITH-

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA**

Enable ECDH-ECDSA based cipher suite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support cipher suites with prefix TLS-ECDHE-RSA-WITH-

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA**

Enable ECDH-RSA based cipher suite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support cipher suites with prefix TLS-ECDHE-RSA-WITH-

**CONFIG_MBEDTLS_SSL_RENEGOTIATION**

Support TLS renegotiation

*Found in: Component config > mbedTLS*

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don’t need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.
CONFIG_MBEDTLS_SSL_PROTO_SSL3
Legacy SSL 3.0 support
Found in: Component config > mbedTLS
Support the legacy SSL 3.0 protocol. Most servers will speak a newer TLS protocol these days.

CONFIG_MBEDTLS_SSL_PROTO_TLS1
Support TLS 1.0 protocol
Found in: Component config > mbedTLS

CONFIG_MBEDTLS_SSL_PROTO_TLS1_1
Support TLS 1.1 protocol
Found in: Component config > mbedTLS

CONFIG_MBEDTLS_SSL_PROTO_TLS1_2
Support TLS 1.2 protocol
Found in: Component config > mbedTLS

CONFIG_MBEDTLS_SSL_PROTO_DTLS
Support DTLS protocol (all versions)
Found in: Component config > mbedTLS
Requires TLS 1.1 to be enabled for DTLS 1.0 Requires TLS 1.2 to be enabled for DTLS 1.2

CONFIG_MBEDTLS_SSL_ALPN
Support ALPN (Application Layer Protocol Negotiation)
Found in: Component config > mbedTLS
Disabling this option will save some code size if it is not needed.

CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS
TLS: Client Support for RFC 5077 SSL session tickets
Found in: Component config > mbedTLS
Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS
TLS: Server Support for RFC 5077 SSL session tickets
Found in: Component config > mbedTLS
Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.
Symmetric Ciphers  Contains:

- `CONFIG_MBEDTLS_AES_C`
- `CONFIG_MBEDTLS_CAMELLIA_C`
- `CONFIG_MBEDTLS_DES_C`
- `CONFIG_MBEDTLS_RC4_MODE`
- `CONFIG_MBEDTLS_BLOWFISH_C`
- `CONFIG_MBEDTLS_XTEA_C`
- `CONFIG_MBEDTLS_CCM_C`
- `CONFIG_MBEDTLS_GCM_C`

**CONFIG_MBEDTLS_AES_C**

AES block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

**CONFIG_MBEDTLS_CAMELLIA_C**

Camellia block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

**CONFIG_MBEDTLS_DES_C**

DES block cipher (legacy, insecure)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**CONFIG_MBEDTLS_RC4_MODE**

RC4 Stream Cipher (legacy, insecure)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

ARCFOUR (RC4) stream cipher can be disabled entirely, enabled but not added to default ciphersuites, or enabled completely.

Please consider the security implications before enabling RC4.

**Available options:**

- Disabled (`MBEDTLS_RC4_DISABLED`)
- Enabled, not in default ciphersuites (`MBEDTLS_RC4_ENABLED_NO_DEFAULT`)
- Enabled (`MBEDTLS_RC4_ENABLED`)

**CONFIG_MBEDTLS_BLOWFISH_C**

Blowfish block cipher (read help)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedTLS TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.
Chapter 2. API Reference

**CONFIG_MBEDTLS_XTEA_C**

XTEA block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the XTEA block cipher.

**CONFIG_MBEDTLS_CCM_C**

CCM (Counter with CBC-MAC) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**CONFIG_MBEDTLS_GCM_C**

GCM (Galois/Counter) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**CONFIG_MBEDTLS_RIPEMD160_C**

Enable RIPEMD-160 hash algorithm

*Found in: Component config > mbedTLS*

Enable the RIPEMD-160 hash algorithm.

**Certificates**

Contains:

- **CONFIG_MBEDTLS_PEM_PARSE_C**
- **CONFIG_MBEDTLS_PEM_WRITE_C**
- **CONFIG_MBEDTLS_X509_CRL_PARSE_C**
- **CONFIG_MBEDTLS_X509_CSR_PARSE_C**

**CONFIG_MBEDTLS_PEM_PARSE_C**

Read & Parse PEM formatted certificates

*Found in: Component config > mbedTLS > Certificates*

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

**CONFIG_MBEDTLS_PEM_WRITE_C**

Write PEM formatted certificates

*Found in: Component config > mbedTLS > Certificates*

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.
**CONFIG_MBEDTLS_X509_CRL_PARSE_C**

X.509 CRL parsing

*Found in: Component config > mbedTLS > Certificates*

**CONFIG_MBEDTLS_X509_CSR_PARSE_C**

X.509 CSR parsing

*Found in: Component config > mbedTLS > Certificates*

Support for parsing X.509 Certificate Signing Requests

**CONFIG_MBEDTLS_ECP_C**

Elliptic Curve Ciphers

*Found in: Component config > mbedTLS*

Contains:

- `CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_BF384R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_BF512R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED`
- `CONFIG_MBEDTLS_ECP_NIST_OPTIM`

**CONFIG_MBEDTLS_ECDH_C**

Elliptic Curve Diffie-Hellman (ECDH)

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**CONFIG_MBEDTLS_ECDSA_C**

Elliptic Curve DSA

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C > CONFIG_MBEDTLS_ECDH_C*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED**

Enable SECP192R1 curve

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C*

Enable support for SECP192R1 Elliptic Curve.
CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED
Enable SECP224R1 curve
*Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECP_C*
Enable support for SECP224R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED
Enable SECP256R1 curve
*Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECP_C*
Enable support for SECP256R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED
Enable SECP384R1 curve
*Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECP_C*
Enable support for SECP384R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED
Enable SECP521R1 curve
*Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECP_C*
Enable support for SECP521R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED
Enable SECP192K1 curve
*Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECP_C*
Enable support for SECP192K1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED
Enable SECP224K1 curve
*Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECP_C*
Enable support for SECP224K1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED
Enable SECP256K1 curve
*Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECP_C*
Enable support for SECP256K1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED
Enable BP256R1 curve
*Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECP_C*
support for DP Elliptic Curve.
CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED
Enable BP384R1 curve

Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECP_C
support for DP Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED
Enable BP512R1 curve

Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECP_C
support for DP Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED
Enable CURVE25519 curve

Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECP_C
Enable support for CURVE25519 Elliptic Curve.

CONFIG_MBEDTLS_ECP_NIST_OPTIM
NIST ‘modulo p’ optimisations

Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECP_C
NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.
Disabling this option saves some code size.

# end of Elliptic Curve options

mDNS  Contains:

• CONFIG_MDNS_MAX_SERVICES

CONFIG_MDNS_MAX_SERVICES
Max number of services

Found in: Component config > mDNS
Services take up a certain amount of memory, and allowing fewer services to be open at the same time conserves memory. Specify the maximum amount of services here. The valid value is from 1 to 64.

ESP-MQTT Configurations  Contains:

• CONFIG_MQTT_PROTOCOL_311
• CONFIG_MQTT_TRANSPORT_SSL
• CONFIG_MQTT_TRANSPORT_WEBSOCKET
• CONFIG_MQTT_USE_CUSTOM_CONFIG
• CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED
• CONFIG_MQTT_CUSTOM_OUTBOX
CONFIG_MQTT_PROTOCOL_311
Enable MQTT protocol 3.1.1
Found in: Component config > ESP-MQTT Configurations
If not, this library will use MQTT protocol 3.1

CONFIG_MQTT_TRANSPORT_SSL
Enable MQTT over SSL
Found in: Component config > ESP-MQTT Configurations
Enable MQTT transport over SSL with mbdltls

CONFIG_MQTT_TRANSPORT_WEBSOCKET
Enable MQTT over Websocket
Found in: Component config > ESP-MQTT Configurations
Enable MQTT transport over Websocket.

CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE
Enable MQTT over Websocket Secure
Found in: Component config > ESP-MQTT Configurations
Enable MQTT transport over Websocket Secure.

CONFIG_MQTT_USE_CUSTOM_CONFIG
MQTT Using custom configurations
Found in: Component config > ESP-MQTT Configurations
Custom MQTT configurations.

CONFIG_MQTT_TCP_DEFAULT_PORT
Default MQTT over TCP port
Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG
Default MQTT over TCP port

CONFIG_MQTT_SSL_DEFAULT_PORT
Default MQTT over SSL port
Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG
Default MQTT over SSL port

CONFIG_MQTT_WS_DEFAULT_PORT
Default MQTT over Websocket port
Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG
Default MQTT over Websocket port
CONFIG_MQTT_WSS_DEFAULT_PORT
Default MQTT over Websocket Secure port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default MQTT over Websocket Secure port

CONFIG_MQTT_BUFFER_SIZE
Default MQTT Buffer Size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

This buffer size using for both transmit and receive

CONFIG_MQTT_TASK_STACK_SIZE
MQTT task stack size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task stack size

CONFIG_MQTT_DISABLE_API_LOCKS
Disable API locks

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn’t access MQTT API from multiple concurrent tasks

CONFIG_MQTT_TASK_PRIORITY
MQTT task priority

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

MQTT task priority. Higher number denotes higher priority.

CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED
Enable MQTT task core selection

*Found in: Component config > ESP-MQTT Configurations*

This will enable core selection

CONFIG_MQTT_TASK_CORE_SELECTION
Core to use?

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED*

Available options:

- Core 0 (MQTT_USE_CORE_0)
- Core 1 (MQTT_USE_CORE_1)
**CONFIG_MQTT_CUSTOM_OUTBOX**

Enable custom outbox implementation

*Found in: Component config > ESP-MQTT Configurations*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar).

**Newlib**

Contains:

- `CONFIG_NEWLIB_STDOUT_LINE_ENDING`
- `CONFIG_NEWLIB_STDIN_LINE_ENDING`
- `CONFIG_NEWLIB_NANO_FORMAT`

**CONFIG_NEWLIB_STDOUT_LINE_ENDING**

Line ending for UART output

*Found in: Component config > Newlib*

This option allows configuring the desired line endings sent to UART when a newline (‘
’, LF) appears on stdout. Three options are possible:

- **CRLF**: whenever LF is encountered, prepend it with CR
- **LF**: no modification is applied, stdout is sent as is
- **CR**: each occurrence of LF is replaced with CR

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

*Available options:*

- CRLF (NEWLIB_STDOUT_LINE_ENDING_CRLF)
- LF (NEWLIB_STDOUT_LINE_ENDING_LF)
- CR (NEWLIB_STDOUT_LINE_ENDING_CR)

**CONFIG_NEWLIB_STDIN_LINE_ENDING**

Line ending for UART input

*Found in: Component config > Newlib*

This option allows configuring which input sequence on UART produces a newline (‘
’, LF) on stdin. Three options are possible:

- **CRLF**: CRLF is converted to LF
- **LF**: no modification is applied, input is sent to stdin as is
- **CR**: each occurrence of CR is replaced with LF

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

*Available options:*

- CRLF (NEWLIB_STDIN_LINE_ENDING_CRLF)
- LF (NEWLIB_STDIN_LINE_ENDING_LF)
- CR (NEWLIB_STDIN_LINE_ENDING_CR)

**CONFIG_NEWLIB_NANO_FORMAT**

Enable ‘nano’ formatting options for printf/scanf family

*Found in: Component config > Newlib*
ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called “nano” formatting option. This option doesn’t support 64-bit integer formats and C99 features, such as positional arguments.

For more details about “nano” formatting option, please see newlib readme file, search for ‘–enable-newlib-nano-formatted-io’: https://sourceware.org/newlib/README

If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

**NVS** Contains:

- `CONFIG_NVS_ENCRYPTION`

**CONFIG_NVS_ENCRYPTION**

Enable NVS encryption

*Found in: Component config > NVS*

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

**OpenSSL** Contains:

- `CONFIG_OPENSSL_DEBUG`
- `CONFIG_OPENSSL_ASSERT`

**CONFIG_OPENSSL_DEBUG**

Enable OpenSSL debugging

*Found in: Component config > OpenSSL*

Enable OpenSSL debugging function.

If the option is enabled, “SSL_DEBUG” works.

**CONFIG_OPENSSL_DEBUG_LEVEL**

OpenSSL debugging level

*Found in: Component config > OpenSSL > CONFIG_OPENSSL_DEBUG*

OpenSSL debugging level.

Only function whose debugging level is higher than “OPENSSL_DEBUG_LEVEL” works.

For example: If OPENSSL_DEBUG_LEVEL = 2, you use function “SSL_DEBUG(1, “malloc failed”)”. Because 1 < 2, it will not print.

**CONFIG_OPENSSL_LOWLEVEL_DEBUG**

Enable OpenSSL low-level module debugging

*Found in: Component config > OpenSSL > CONFIG_OPENSSL_DEBUG*

If the option is enabled, low-level module debugging function of OpenSSL is enabled, e.g. mbedtls internal debugging function.
**CONFIG_OPENSSL_ASSERT**

Select OpenSSL assert function

*Found in: Component config > OpenSSL*

OpenSSL function needs “assert” function to check if input parameters are valid.

If you want to use assert debugging function, “OPENSSL_DEBUG” should be enabled.

**Available options:**

- Do nothing (OPENSSL_ASSERT_DO NOTHING)
  - Do nothing and “SSL_ASSERT” does not work.
- Check and exit (OPENSSL_ASSERT_EXIT)
  - Enable assert exiting, it will check and return error code.
- Show debugging message (OPENSSL_ASSERT_DEBUG)
  - Enable assert debugging, it will check and show debugging message.
- Show debugging message and exit (OPENSSL_ASSERT_DEBUG_EXIT)
  - Enable assert debugging and exiting, it will check, show debugging message and return error code.
- Show debugging message and block (OPENSSL_ASSERT_DEBUG_BLOCK)
  - Enable assert debugging and blocking, it will check, show debugging message and block by “while (1);”.

**PThreads**  
Contains:

- **CONFIG_PTHREAD_TASK_PRIO_DEFAULT**
- **CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT**
- **CONFIG_PTHREAD_STACK_MIN**
- **CONFIG_PTHREAD_TASK_CORE_DEFAULT**
- **CONFIG_PTHREAD_TASK_NAME_DEFAULT**

**CONFIG_PTHREAD_TASK_PRIO_DEFAULT**

Default task priority

*Found in: Component config > PThreads*

Priority used to create new tasks with default pthread parameters.

**CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT**

Default task stack size

*Found in: Component config > PThreads*

Stack size used to create new tasks with default pthread parameters.

**CONFIG_PTHREAD_STACK_MIN**

Minimum allowed pthread stack size

*Found in: Component config > PThreads*

Minimum allowed pthread stack size set in attributes passed to pthread_create

**CONFIG_PTHREAD_TASK_CORE_DEFAULT**

Default pthread core affinity

*Found in: Component config > PThreads*

The default core to which pthreads are pinned.
Available options:

- No affinity (PTHREAD_DEFAULT_CORE_NO_AFFINITY)
- Core 0 (PTHREAD_DEFAULT_CORE_0)
- Core 1 (PTHREAD_DEFAULT_CORE_1)

CONFIG_PTHREAD_TASK_NAME_DEFAULT

Default name of pthreads

*Found in: Component config > PThreads*

The default name of pthreads.

SPI Flash driver

Contains:

- CONFIG_SPI_FLASH_VERIFY_WRITE
- CONFIG_SPI_FLASH_ENABLE_COUNTERS
- CONFIG_SPI_FLASH_ROM_DRIVER_PATCH
- CONFIG_SPI_FLASH_DANGEROUS_WRITE
- CONFIG_SPI_FLASH_USE_LEGACY_IMPL
- CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE
- CONFIG_SPI_FLASH_YIELD_DURING_ERASE
- CONFIG_SPI_FLASH_SIZE_OVERRIDE
- Auto-detect flash chips
- CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE

CONFIG_SPI_FLASH_VERIFY_WRITE

Verify SPI flash writes

*Found in: Component config > SPI Flash driver*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

CONFIG_SPI_FLASH_LOG_FAILED_WRITE

Log errors if verification fails

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE

Log warning if writing zero bits to ones

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.
CONFIG_SPI_FLASH_ENABLE_COUNTERS

Enable operation counters

*Found in: Component config > SPI Flash driver*

This option enables the following APIs:

- spi_flash_reset_counters
- spi_flash_dump_counters
- spi_flash_get_counters

These APIs may be used to collect performance data for spi_flash APIs and to help understand behaviour of libraries which use SPI flash.

CONFIG_SPI_FLASH_ROM_DRIVER_PATCH

Enable SPI flash ROM driver patched functions

*Found in: Component config > SPI Flash driver*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option is needed to write to flash on ESP32-D2WD, and any configuration where external SPI flash is connected to non-default pins.

CONFIG_SPI_FLASH_DANGEROUS_WRITE

Writing to dangerous flash regions

*Found in: Component config > SPI Flash driver*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the esp_rom_xxx SPI flash ROM functions. These functions should not be called directly from IDF applications.

*Available options:*

- Aborts (SPI_FLASH_DANGEROUS_WRITE_ABORTS)
- Fails (SPI_FLASH_DANGEROUS_WRITE_FAILS)
- Allowed (SPI_FLASH_DANGEROUS_WRITE_ALLOWED)

CONFIG_SPI_FLASH_USE_LEGACY_IMPL

Use the legacy implementation before IDF v4.0

*Found in: Component config > SPI Flash driver*

The implementation of SPI flash has been greatly changed in IDF v4.0. Enable this option to use the legacy implementation.

CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE

Bypass a block erase and always do sector erase

*Found in: Component config > SPI Flash driver*

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.
CONFIG_SPI_FLASH_YIELD_DURING_ERASE
Enables yield operation during flash erase

*Found in: Component config > SPI Flash driver*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks.

CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS
Duration of erasing to yield CPUs (ms)

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

CONFIG_SPI_FLASH_ERASE_YIELD_TICKS
CPU release time (tick)

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

Defines how many ticks will be before returning to continue a erasing.

CONFIG_SPI_FLASH_SIZE_OVERRIDE
Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

Auto-detect flash chips
Contains:

- CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP
- CONFIG_SPI_FLASH_SUPPORT_GD_CHIP

CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP
ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by chip_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

CONFIG_SPI_FLASH_SUPPORT_GD_CHIP
GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by chip_drv member of the chip struct. If you are using Wrover modules, please don’t disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.
CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE

Enable encrypted partition read/write operations

Found in: Component config > SPI Flash driver

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

SPIFFS Configuration Contains:

- CONFIG_SPIFFS_MAX_PARTITIONS
- SPIFFS Cache Configuration
- CONFIG_SPIFFS_PAGE_CHECK
- CONFIG_SPIFFS_GC_MAX_RUNS
- CONFIG_SPIFFS_GC_STATS
- CONFIG_SPIFFS_PAGE_SIZE
- CONFIG_SPIFFS_OBJ_NAME_LEN
- CONFIG_SPIFFS_USE_MAGIC
- CONFIG_SPIFFS_META_LENGTH
- CONFIG_SPIFFS_USE_MTIME
- Debug Configuration

CONFIG_SPIFFS_MAX_PARTITIONS

Maximum Number of Partitions

Found in: Component config > SPIFFS Configuration

Define maximum number of partitions that can be mounted.

SPIFFS Cache Configuration Contains:

- CONFIG_SPIFFS_CACHE

CONFIG_SPIFFS_CACHE

Enable SPIFFS Cache

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration

Enable/disable memory read caching of nucleus file system operations.

CONFIG_SPIFFS_CACHE_WR

Enable SPIFFS Write Caching

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE

Enable memory write caching for file descriptors in hydrogen.

CONFIG_SPIFFS_CACHE_STATS

Enable SPIFFS Cache Statistics

Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE

Enable/disable statistics on caching. Debug/test purpose only.
**CONFIG_SPIFFS_PAGE_CHECK**

Enable SPIFFS Page Check

*Found in: Component config > SPIFFS Configuration*

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**CONFIG_SPIFFS_GC_MAX_RUNS**

Set Maximum GC Runs

*Found in: Component config > SPIFFS Configuration*

Define maximum number of GC runs to perform to reach desired free pages.

**CONFIG_SPIFFS_GC_STATS**

Enable SPIFFS GC Statistics

*Found in: Component config > SPIFFS Configuration*

Enable/disable statistics on gc. Debug/test purpose only.

**CONFIG_SPIFFS_PAGE_SIZE**

SPIFFS logical page size

*Found in: Component config > SPIFFS Configuration*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**CONFIG_SPIFFS_OBJ_NAME_LEN**

Set SPIFFS Maximum Name Length

*Found in: Component config > SPIFFS Configuration*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**CONFIG_SPIFFS_USE_MAGIC**

Enable SPIFFS Filesystem Magic

*Found in: Component config > SPIFFS Configuration*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**CONFIG_SPIFFS_USE_MAGIC_LENGTH**

Enable SPIFFS Filesystem Length Magic

*Found in: Component config > SPIFFS Configuration > CONFIG_SPIFFS_USE_MAGIC*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.
**CONFIG_SPIFFS_META_LENGTH**

Size of per-file metadata field

*Found in: Component config > SPIFFS Configuration*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**CONFIG_SPIFFS_USE_MTIME**

Save file modification time

*Found in: Component config > SPIFFS Configuration*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**Debug Configuration**  
Contains:

- **CONFIG_SPIFFS_DBG**
- **CONFIG_SPIFFS_API_DBG**
- **CONFIG_SPIFFS_GC_DBG**
- **CONFIG_SPIFFS_CACHE_DBG**
- **CONFIG_SPIFFS_CHECK_DBG**
- **CONFIG_SPIFFS_TEST_VISUALISATION**

**CONFIG_SPIFFS_DBG**

Enable general SPIFFS debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print general debug messages to the console.

**CONFIG_SPIFFS_API_DBG**

Enable SPIFFS API debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print API debug messages to the console.

**CONFIG_SPIFFS_GC_DBG**

Enable SPIFFS Garbage Cleaner debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print GC debug messages to the console.

**CONFIG_SPIFFS_CACHE_DBG**

Enable SPIFFS Cache debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print cache debug messages to the console.
CONFIG_SPIFFS_CHECK_DBG
Enable SPIFFS Filesystem Check debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print Filesystem Check debug messages to the console.

CONFIG_SPIFFS_TEST_VISUALISATION
Enable SPIFFS Filesystem Visualization

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enable this option to enable SPIFFS_vis function in the API.

TCP/IP Adapter Contains:

- **CONFIG_NETIF_IP_LOST_TIMER_INTERVAL**
- **CONFIG_NETIF_USE_TCPIP_STACK_LIB**

CONFIG_NETIF_IP_LOST_TIMER_INTERVAL
IP Address lost timer interval (seconds)

*Found in: Component config > TCP/IP Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started every time the IP is lost. Event **SYSTEM_EVENT_STA_LOST_IP** will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

CONFIG_NETIF_USE_TCPIP_STACK_LIB
TCP/IP Stack Library

*Found in: Component config > TCP/IP Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

*Available options:*
- LwIP (TCPIP_LWIP)
  lwIP is a small independent implementation of the TCP/IP protocol suite.

Unity unit testing library Contains:

- **CONFIG_UNITY_ENABLE_FLOAT**
- **CONFIG_UNITY_ENABLE_DOUBLE**
- **CONFIG_UNITY_ENABLE_COLOR**
- **CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER**
- **CONFIG_UNITY_ENABLE_FIXTURE**
- **CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL**

CONFIG_UNITY_ENABLE_FLOAT
Support for float type

*Found in: Component config > Unity unit testing library*

If not set, assertions on float arguments will not be available.
CONFIG_UNITY_ENABLE_DOUBLE

Support for double type

*Found in: Component config > Unity unit testing library*

If not set, assertions on double arguments will not be available.

CONFIG_UNITY_ENABLE_COLOR

Colorize test output

*Found in: Component config > Unity unit testing library*

If set, Unity will colorize test results using console escape sequences.

CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER

Include ESP-IDF test registration/running helpers

*Found in: Component config > Unity unit testing library*

If set, then the following features will be available:

- TEST_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: unity_run_all_tests, unity_run_tests_with_filter, unity_run_single_test_by_name.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via unity_run_menu function.

Disable if a different test registration mechanism is used.

CONFIG_UNITY_ENABLE_FIXTURE

Include Unity test fixture

*Found in: Component config > Unity unit testing library*

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL

Print a backtrace when a unit test fails

*Found in: Component config > Unity unit testing library*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

Virtual file system  Contains:

- CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT
- CONFIG_VFS_SUPPORT_TERMIOS
- Host File System I/O (Semihosting)

CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT

Suppress select() related debug outputs

*Found in: Component config > Virtual file system*

Select() related functions might produce an inconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.
CONFIG_VFS_SUPPORT_TERMIOS

Add support for termios.h

*Found in: Component config > Virtual file system*

Disabling this option can save memory when the support for termios.h is not required.

Host File System I/O (Semihosting) Contains:

- CONFIG_SEMIHOSTFS_MAX_MOUNT_POINTS
- CONFIG_SEMIHOSTFS_HOST_PATH_MAX_LEN

CONFIG_SEMIHOSTFS_MAX_MOUNT_POINTS

Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.

CONFIG_SEMIHOSTFS_HOST_PATH_MAX_LEN

Maximum path length for the host base directory

*Found in: Component config > Virtual file system > Host File System I/O (Semihosting)*

Define maximum path length for the host base directory which is to be mounted. If host path passed to esp_vfs_semihost_register() is longer than this value it will be truncated.

Wear Levelling Contains:

- CONFIG_WL_SECTOR_SIZE
- CONFIG_WL_SECTOR_MODE

CONFIG_WL_SECTOR_SIZE

Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

**Available options:**

- 512 (WL_SECTOR_SIZE_512)
- 4096 (WL_SECTOR_SIZE_4096)

CONFIG_WL_SECTOR_MODE

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:
• In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
• In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

**Available options:**
- Performance (WL_SECTOR_MODE_PERF)
- Safety (WL_SECTOR_MODE_SAFE)

**Wi-Fi Provisioning Manager**
Contains:
- `CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES`
- `CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT`

**CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES**
Max Wi-Fi Scan Result Entries

*Found in: Component config > Wi-Fi Provisioning Manager*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager.

**CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT**
Provisioning auto-stop timeout

*Found in: Component config > Wi-Fi Provisioning Manager*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

**Supplicant**
Contains:
- `CONFIG_WPA_MBEDTLS_CRYPTO`
- `CONFIG_WPA_WPS_STRICT`
- `CONFIG_WPA_DEBUG_PRINT`

**CONFIG_WPA_MBEDTLS_CRYPTO**
Use MbedTLS crypto API’s

*Found in: Component config > Supplicant*

Select this option to use MbedTLS crypto API’s which utilize hardware acceleration.

**CONFIG_WPA_WPS_STRICT**
Strictly validate all WPS attributes

*Found in: Component config > Supplicant*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause interoperability issues with some APs.
Chapter 2. API Reference

**CONFIG_WPA_DEBUG_PRINT**

Print debug messages from WPA Supplicant

*Found in: Component config > Supplicant*

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Compatibility options**

Contains:

- **CONFIG_LEGACY_INCLUDE_COMMON_HEADERS**

**CONFIG_LEGACY_INCLUDE_COMMON_HEADERS**

Include headers across components as before IDF v4.0

*Found in: Compatibility options*

Soc, esp32, and driver components, the most common components. Some header of these components are included implicitly by headers of other components before IDF v4.0. It’s not required for high-level components, but still included through long header chain everywhere.

This is harmful to the modularity. So it’s changed in IDF v4.0.

You can still include these headers in a legacy way until it is totally deprecated by enable this option.

**Deprecated options and their replacements**

- **CONFIG_A2DP_ENABLE** (*CONFIG_BT_A2DP_ENABLE*)
- **CONFIG_ADC2_DISABLE_DAC** (*CONFIG_ADC_DISABLE_DAC*)
- **CONFIG_APP_ANTII_ROLLBACK** (*CONFIG_BOOTLOADER_APP_ANTII_ROLLBACK*)
- **CONFIG_APP_ROLLBACK_ENABLE** (*CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*)

## 2.8.7 Customisations

Because IDF builds by default with *Warning On Undefined Variables*, when the Kconfig tool generates Makefiles (the auto.conf file) its behaviour has been customised. In normal Kconfig, a variable which is set to “no” is undefined. In IDF’s version of Kconfig, this variable is defined in the Makefile but has an empty value.

(Note that *ifdef* and *ifndef* can still be used in Makefiles, because they test if a variable is defined and has a non-empty value.)
When generating header files for C & C++, the behaviour is not customised - so `#ifdef` can be used to test if a boolean config item is set or not.

## 2.9 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see Error Handling.

- **ESP_FAIL** (-1): Generic `esp_err_t` code indicating failure
- **ESP_OK** (0): `esp_err_t` value indicating success (no error)
- **ESP_ERR_NO_MEM** (0x101): Out of memory
- **ESP_ERR_INVALID_ARG** (0x102): Invalid argument
- **ESP_ERR_INVALID_STATE** (0x103): Invalid state
- **ESP_ERR_INVALID_SIZE** (0x104): Invalid size
- **ESP_ERR_NOT_FOUND** (0x105): Requested resource not found
- **ESP_ERR_NOT_SUPPORTED** (0x106): Operation or feature not supported
- **ESP_ERR_TIMEOUT** (0x107): Operation timed out
- **ESP_ERR_INVALID_RESPONSE** (0x108): Received response was invalid
- **ESP_ERR_INVALID_CRC** (0x109): CRC or checksum was invalid
- **ESP_ERR_INVALID_VERSION** (0x10a): Version was invalid
- **ESP_ERR_INVALID_MAC** (0x10b): MAC address was invalid
- **ESP_ERR_NVS_BASE** (0x1100): Starting number of error codes
- **ESP_ERR_NVS_NOT_INITIALIZED** (0x1101): The storage driver is not initialized
- **ESP_ERR_NVS_NOT_FOUND** (0x1102): Id namespace doesn’t exist yet and mode is NVS_READONLY
- **ESP_ERR_NVS_TYPE_MISMATCH** (0x1103): The type of set or get operation doesn’t match the type of value stored in NVS
- **ESP_ERR_NVS_READ_ONLY** (0x1104): Storage handle was opened as read only
- **ESP_ERR_NVS_NOT_ENOUGH_SPACE** (0x1105): There is not enough space in the underlying storage to save the value
- **ESP_ERR_NVS_INVALID_NAME** (0x1106): Namespace name doesn’t satisfy constraints
- **ESP_ERR_NVS_INVALID_HANDLE** (0x1107): Handle has been closed or is NULL
- **ESP_ERR_NVS_REMOVE_FAILED** (0x1108): The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- **ESP_ERR_NVS_KEY_TOO_LONG** (0x1109): Key name is too long
- **ESP_ERR_NVS_PAGE_FULL** (0x110a):Internal error; never returned by nvs API functions
- **ESP_ERR_NVS_INVALID_STATE** (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.
- **ESP_ERR_NVS_INVALID_LENGTH** (0x110c): String or blob length is not sufficient to store data
- **ESP_ERR_NVS_NO_FREE_PAGES** (0x110d): NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.
- **ESP_ERR_NVS_VALUE_TOO_LONG** (0x110e): String or blob length is longer than supported by the implementation
ESP_ERR_NVS_PART_NOT_FOUND (0x110f): Partition with specified name is not found in the partition table

ESP_ERR_NVS_NEW_VERSION_FOUND (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

ESP_ERR_NVS_XTS_ENCR_FAILED (0x1111): XTS encryption failed while writing NVS entry

ESP_ERR_NVS_XTS_DECR_FAILED (0x1112): XTS decryption failed while reading NVS entry

ESP_ERR_NVS_XTS_CFG_FAILED (0x1113): XTS configuration setting failed

ESP_ERR_NVS_XTS_CFG_NOT_FOUND (0x1114): XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED (0x1115): NVS encryption is not supported in this version

ESP_ERR_NVS_XTS_CFG_NOT_FOUND (0x1116): NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART (0x1117): NVS key partition is corrupt

ESP_ERR_NVS_CONTENT_DIFFERS (0x1118): Internal error; never returned by nvs API functions. NVS key is different in comparison

ESP_ERR_ULP_BASE (0x1200): Offset for ULP-related error codes

ESP_ERR_ULP_SIZE_TOO_BIG (0x1201): Program doesn’t fit into RTC memory reserved for the ULP

ESP_ERR_ULP_INVALID_LOAD_ADDR (0x1202): Load address is outside of RTC memory reserved for the ULP

ESP_ERR_ULP_DUPLICATE_LABEL (0x1203): More than one label with the same number was defined

ESP_ERR_ULP_UNDEFINED_LABEL (0x1204): Branch instructions references an undefined label

ESP_ERR_ULP_BRANCH_OUT_OF_RANGE (0x1205): Branch target is out of range of B instruction (try replacing with BX)

ESP_ERR_OTA_BASE (0x1500): Base error code for ota_ops api

ESP_ERR_OTA_PARTITION_CONFLICT (0x1501): Error if request was to write or erase the current running partition

ESP_ERR_OTA_SELECT_INFO_INVALID (0x1502): Error if OTA data partition contains invalid content

ESP_ERR_OTA_VALIDATE_FAILED (0x1503): Error if OTA app image is invalid

ESP_ERR_OTA_SMALL_SEC_VER (0x1504): Error if the firmware has a secure version less than the running firmware.

ESP_ERR_OTA_ROLLBACK_FAILED (0x1505): Error if flash does not have valid firmware in passive partition and hence rollback is not possible

ESP_ERR_OTA_ROLLBACK_INVALID_STATE (0x1506): Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

ESP_ERR_EFUSE (0x1600): Base error code for efuse api.

ESP_OK_EFUSE_CNT (0x1601): OK the required number of bits is set.

ESP_ERR_EFUSE_CNT_IS_FULL (0x1602): Error field is full.

ESP_ERR_EFUSE_REPEATED_PROG (0x1603): Error repeated programming of programmed bits is strictly forbidden.

ESP_ERR_CODING (0x1604): Error while a encoding operation.

ESP_ERR_IMAGE_BASE (0x2000)

ESP_ERR_IMAGE_FLASH_FAIL (0x2001)

ESP_ERR_IMAGE_INVALID (0x2002)

ESP_ERR_WIFI_BASE (0x3000): Starting number of WiFi error codes
ESP_ERR_WIFI_NOT_INIT (0x3001): WiFi driver was not installed by esp_wifi_init
ESP_ERR_WIFI_NOT_STARTED (0x3002): WiFi driver was not started by esp_wifi_start
ESP_ERR_WIFI_NOT_STOPPED (0x3003): WiFi driver was not stopped by esp_wifi_stop
ESP_ERR_WIFI_IF (0x3004): WiFi interface error
ESP_ERR_WIFI_MODE (0x3005): WiFi mode error
ESP_ERR_WIFI_STATE (0x3006): WiFi internal state error
ESP_ERR_WIFI_CONN (0x3007): WiFi internal control block of station or soft-AP error
ESP_ERR_WIFI_NVSTM (0x3008): WiFi internal NVS module error
ESP_ERR_WIFI_MAC (0x3009): MAC address is invalid
ESP_ERR_WIFI_SSID (0x300a): SSID is invalid
ESP_ERR_WIFI_PASSWORD (0x300b): Password is invalid
ESP_ERR_WIFI_TIMEOUT (0x300c): Timeout error
ESP_ERR_WIFI_WAKE_FAIL (0x300d): WiFi is in sleep state (RF closed) and wakeup fail
ESP_ERR_WIFI_WOULD_BLOCK (0x300e): The caller would block
ESP_ERR_WIFI_NOT_CONNECT (0x300f): Station still in disconnect status
ESP_ERR_WIFI_POST (0x3012): Failed to post the event to WiFi task
ESP_ERR_WIFI_INIT_STATE (0x3013): Invalid WiFi state when init/deinit is called
ESP_ERR_WIFI_STOP_STATE (0x3014): Returned when WiFi is stopping
ESP_ERR_WIFI_NOT_ASSOC (0x3015): The WiFi connection is not associated
ESP_ERR_WIFI_TX_DISALLOW (0x3016): The WiFi TX is disallowed
ESP_ERR_WIFI_REGISTRAR (0x3033): WPS registrar is not supported
ESP_ERR_WIFI_WPS_TYPE (0x3034): WPS type error
ESP_ERR_WIFI_WPS_SM (0x3035): WPS state machine is not initialized
ESP_ERR_ESPNOW_BASE (0x3064): ESPNOW error number base.
ESP_ERR_ESPNOW_NOT_INIT (0x3065): ESPNOW is not initialized.
ESP_ERR_ESPNOW_ARG (0x3066): Invalid argument
ESP_ERR_ESPNOW_NO_MEM (0x3067): Out of memory
ESP_ERR_ESPNOW_FULL (0x3068): ESPNOW peer list is full
ESP_ERR_ESPNOW_NOT_FOUND (0x3069): ESPNOW peer is not found
ESP_ERR_ESPNOW_INTERNAL (0x306a): Internal error
ESP_ERR_ESPNOW_EXIST (0x306b): ESPNOW peer has existed
ESP_ERR_ESPNOW_IF (0x306c): Interface error
ESP_ERR_MESH_BASE (0x4000): Starting number of MESH error codes
ESP_ERR_MESH_WIFI_NOT_START (0x4001)
ESP_ERR_MESH_WIFI_NOT_INIT (0x4002)
ESP_ERR_MESH_NOT_CONFIG (0x4003)
ESP_ERR_MESH_NOT_START (0x4004)

ESP_ERR_HTTPD_HANDLERS_FULL (0xb001): All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS (0xb002): URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ (0xb003): Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC (0xb004): Result string truncated

ESP_ERR_HTTPD_RESP_HDR (0xb005): Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND (0xb006): Error occured while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM (0xb007): Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK (0xb008): Failed to launch server task/thread
Chapter 3

ESP32 Hardware Reference

3.1 ESP32 Modules and Boards

Espressif designs and manufactures different modules and development boards to help users evaluate the potential of the ESP32 family of chips.

This document provides description of modules and development boards currently available from Espressif.

**Note:** For description of previous versions of modules and development boards as well as for description of discontinued ones, please go to Section Previous Versions of ESP32 Modules and Boards.

3.1.1 WROOM, SOLO, WROVER, and PICO Modules

This is a family of ESP32-based modules with some integrated key components, including a crystal oscillator and an antenna matching circuit. The modules constitute ready-made solutions for integration into final products. If combined with a few extra components, such as a programming interface, bootstrapping resistors, and pin headers, these modules can also be used for evaluation of ESP32’s functionality.

The key characteristics of these modules are summarized in the table below. Some additional details are covered in the following sections.

</tbody>
</table>

- ESP32-D.. identifies a dual-core chip, ESP32-S.. identifies a single-core chip
- MIFA - Meandered Inverted-F Antenna
- U.FL - U.FL / IPEX antenna connector
- ESP32-WROOM-32x, ESP32-WROVER-B and ESP32-WROVER-IB modules come with 4 MB flash by default but also available with custom flash sizes of 8 MB and 16 MB, see Espressif Products Ordering Information (PDF)
- ESP32 Chip Datasheet (PDF)
- Initial release of the ESP32-WROVER module had 4 MB of PSRAM
• ESP32-WROOM-32 was previously called ESP-WROOM-32

ESP32-WROOM-32

This is a basic and commonly adopted ESP32 module with the ESP32-D0WDQ6 chip on board. It was the first module of the WROOM / WROVER family released to the market.

For key characteristics, see the table in Section WROOM, SOLO, WROVER, and PICO Modules, Espressif Products Ordering Information.

![ESP32-WROOM-32 module (front and back)](image)

Documentation

• ESP32-WROOM-32 Datasheet (PDF)
• ESP32-WROOM-32 Reference Design containing OrCAD schematic, PCB layout, gerber and BOM files

ESP32-WROOM-32D / ESP32-WROOM-32U

Both modules integrate the ESP32-D0WD chip which has a smaller footprint than the chip ESP32-D0WDQ6 installed in ESP32-WROOM-32.

For key characteristics, see the table in Section WROOM, SOLO, WROVER, and PICO Modules and Espressif Products Ordering Information.

ESP32-WROOM-32U is the smallest representative of the whole WROOM / WROVER family of modules.

![ESP32-WROOM-32D module (front and back)](image)

Documentation

• ESP32-WROOM-32D / ESP32-WROOM-32U Datasheet (PDF)
ESP32-SOLO-1

This is a simplified version of the ESP32-WROOM-32D module. It contains a single-core ESP32 chip that supports a clock frequency of up to 160 MHz.

For key characteristics, see the table in Section **WROOM, SOLO, WROVER, and PICO Modules** and **Espressif Products Ordering Information**.

ESP32-WROVER series

This series consists of a few modifications of ESP32-WROOM-32x modules, which among other upgrades include additional 8 MB SPI PSRAM (pseudo static RAM).

For details, see the table in Section **WROOM, SOLO, WROVER, and PICO Modules** and **Espressif Products Ordering Information**.

- **ESP32-WROVER (PCB)** and **ESP32-WROVER (IPEX)** have PSRAM that operates at 1.8 V and supports up to 144 MHz clock rate.
- **ESP32-WROVER-B** and **ESP32-WROVER-IB** have PSRAM that operates at 3.3 V and can supports up to 133 MHz clock rate.

The picture below shows an ESP32-WROVER module with a PCB antenna.

ESP32-PICO-D4

ESP32-PICO-D4 is a System-in-Package (SiP) module, integrating all peripheral components seamlessly, including the following:

- 4 MB flash memory
- crystal oscillator
- filter capacitors
- RF matching circuit

For key characteristics, see Espressif Products Ordering Information.

Documentation

- ESP32-PICO-D4 Datasheet (PDF)

3.1.2 Development Boards

Depending on the intended functionality, different development boards feature:

- Access to different ESP32 GPIO pins.
- Different interfaces: USB, JTAG.
- Different peripherals: touchpads, LCD screens, SD card slots, headers for camera modules, etc.

ESP32-PICO-KIT V4.1

This is the smallest available ESP32-based development board. It features all the components for direct connection to a computer’s USB port as well as pin headers for plugging into a mini breadboard.

The board is equipped with the ESP32-PICO-D4 module. With such a module, the creation of a fully functional development board required only a few external components that fit on a PCB as small as 20 x 52 mm. The external components include antenna, LDO, USB-UART bridge, and two buttons for reset and activation of Firmware Download mode.

Comparing to ESP32-PICO-KIT V4, this version features the CP2102N USB-UART bridge that provides faster transfer rates of up to 3 Mbps.

- ESP32-PICO-D4 Datasheet (PDF)

Previous Versions

- ESP32-PICO-KIT V4
- ESP32-PICO-KIT V3

ESP32 DevKitC V4

This is a small and convenient development board that features:

- ESP32-WROOM-32 module
- USB-to-serial programming interface that also provides power supply for the board
- pin headers
- pushbuttons for reset and activation of Firmware Download mode
- a few other components

Comparing to the previous ESP32 Core Board V2 / ESP32 DevKitC, this version can integrate ESP32-WROVER series module instead of ESP32-WROOM-32 and has the CP2102N chip that supports faster baud rates.

Previous Versions

- ESP32 Core Board V2 / ESP32 DevKitC

ESP-WROVER-KIT V4.1

This board features:

- dual port USB-to-serial converter for programming
- JTAG interface for debugging
- MicroSD card slot
- 3.2” SPI LCD screen
- header for a camera module
- RGB diode for diagnostics
- 32.768 kHz XTAL for internal RTC to operate in low power modes

Power can be supplied either via USB or via a standard 5 mm power supply jack. A power source can be selected with a jumper and can be turned on/off with a separate switch.

This version of the ESP-WROVER-KIT board integrates the ESP-WROVER-B module that has 8 MB PSRAM for flexible extended storage and data processing capabilities. The board can accommodate other versions of ESP modules described in WROOM, SOLO, WROVER, and PICO Modules.

Comparing to ESP-WROVER-KIT V3, this board has the following design changes:

- JP8, JP11, and JP13 have been combined into a single JP2.
- USB connector has been changed to DIP type and moved to the lower right corner of the board.
- R61 has been changed to a Zero-ohm resistor.
- Some components have been replaced with functional equivalents based on test results and sourcing options, e.g., the EN and Boot buttons.

The board in the picture above integrates the ESP32-WROVER-B module.

3.2 Previous Versions of ESP32 Modules and Boards

This sections contains overview and links to documentation of previous version ESP32 Modules and Boards that have been replaced with newer versions or discontinued. It is maintained for convenience of users as several of these boards are still in use and some may still be available for purchase.

To see the latest development boards, please refer to section ESP32 Modules and Boards.
Fig. 8: ESP-WROVER-KIT V4.1 board
3.2.1 **ESP32-PICO-KIT V4**

The smallest ESP32 development board with all the components required to connect it directly to a PC USB port, and pin headers to plug into a mini breadboard. It is equipped with ESP32-PICO-D4 module that integrates 4 MB flash memory, a crystal oscillator, filter capacitors and RF matching circuit in one single package. As result, the fully functional development board requires only a few external components that can easy fit on a 20 x 52 mm PCB including antenna, LDO, USB-UART bridge and two buttons to reset it and put into download mode.

![ESP32-PICO-KIT V4 board](image)

Comparing to ESP32-PICO-KIT V3, this version has revised printout and reduced number of exposed pins. Instead of 20, only 17 header pins are populated, so V4 can fit into a mini breadboard.

- [ESP32-PICO-KIT V4 Schematic (PDF)](#)
- [ESP32-PICO-D4 Datasheet (PDF)](#)

3.2.2 **ESP32-PICO-KIT V3**

The first public release of Espressif’s ESP32-PICO-D4 module on a mini development board. The board has a USB port for programming and debugging and two rows of 20 pin headers to plug into a breadboard. The ESP32-PICO-D4 module itself is small and requires only a few external components. Besides two core CPUs it integrates 4MB flash memory, a crystal oscillator and antenna matching components in one single 7 x 7 mm package. As a result the module and all the components making the complete development board fit into 20 x 52 mm PCB.

3.2.3 ESP32 Core Board V2 / ESP32 DevKitC

Small and convenient development board with ESP-WROOM-32 module installed, break out pin headers and minimum additional components. Includes USB to serial programming interface, that also provides power supply for the board. Has pushbuttons to reset the board and put it in upload mode.

Fig. 11: ESP32 Core Board V2 / ESP32 DevKitC board

3.2.4 ESP-WROVER-KIT V3

The ESP-WROVER-KIT V3 development board has dual port USB to serial converter for programming and JTAG interface for debugging. Power supply is provided by USB interface or from standard 5 mm power supply jack. Power supply selection is done with a jumper and may be put on/off with a separate switch. This board has MicroSD card slot, 3.2” SPI LCD screen and dedicated header to connect a camera. It provides RGB diode for diagnostics. Includes 32.768 kHz XTAL for internal RTC to operate it in low power modes.

As all previous versions of ESP-WROVER-KIT boards, it is ready to accommodate an ESP32-WROOM-32 or ESP32-WROVER series module.

This is the first release of ESP-WROVER-KIT shipped with ESP32-WROVER series module installed by default. This release also introduced several design changes to conditioning and interlocking of signals to the bootstrapping pins. Also, a zero Ohm resistor (R166) has been added between WROVER/WROOM module and VDD33 net, which can be desoldered, or replaced with a shunt resistor, for current measurement. This is intended to facilitate power consumption analysis in various operation modes of ESP32. Refer to schematic - the changes are enclosed in green border.

The camera header has been changed from male back to female. The board soldermask is matte black. The board on picture above has ESP32-WROVER series is installed.

3.2.5 ESP-WROVER-KIT V2

This is updated version of ESP32 DevKitJ V1 described above with design improvements identified when DevKitJ was in use, e.g. improved support for SD card. By default board has ESP-WROOM-32 module installed.
Fig. 12: ESP-WROVER-KIT V3 board
Fig. 13: ESP-WROVER-KIT V2 board
Comparing to previous version, this board has a shiny black finish and a male camera header.

3.2.6 ESP-WROVER-KIT V1 / ESP32 DevKitJ V1

The first version of ESP-WROVER-KIT development board. Shipped with ESP-WROOM-32 on board.

ESP-WROVER-KIT has dual port USB to serial converter for programming and JTAG interface for debugging. Power supply is provided by USB interface or from standard 5 mm power supply jack. Power supply selection is done with a jumper and may be put on/off with a separate switch. The board has MicroSD card slot, 3.2” SPI LCD screen and dedicated header to connect a camera. It provides RGB diode for diagnostics. Includes 32.768 kHz XTAL for internal RTC to operate it in low power modes.

All versions of ESP-WROVER-KIT are ready to accommodate an ESP-WROOM-32 or ESP32-WROVER module.

Fig. 14: ESP-WROVER-KIT V1 / ESP32 DevKitJ V1 board

The board has red soldermask.
3.2.7 ESP32 Demo Board V2

One of first feature rich evaluation boards that contains several pin headers, dip switches, USB to serial programming interface, reset and boot mode press buttons, power switch, 10 touch pads and separate header to connect LCD screen.

![ESP32 Demo Board V2](Fig.15)

Production of this board is discontinued.

API Guides

4.1 General Notes About ESP-IDF Programming

4.1.1 Application startup flow

This note explains various steps which happen before `app_main` function of an ESP-IDF application is called. The high level view of startup process is as follows:

1. First-stage bootloader in ROM loads second-stage bootloader image to RAM (IRAM & DRAM) from flash offset 0x1000.
2. Second-stage bootloader loads partition table and main app image from flash. Main app incorporates both RAM segments and read-only segments mapped via flash cache.
3. Main app image executes. At this point the second CPU and RTOS scheduler can be started.

This process is explained in detail in the following sections.

First stage bootloader

After SoC reset, PRO CPU will start running immediately, executing reset vector code, while APP CPU will be held in reset. During startup process, PRO CPU does all the initialization. APP CPU reset is de-asserted in the `call_start_cpu0` function of application startup code. Reset vector code is located at address 0x40000400 in the mask ROM of the ESP32 chip and can not be modified.

Startup code called from the reset vector determines the boot mode by checking `GPIO_STRAP_REG` register for bootstrap pin states. Depending on the reset reason, the following takes place:

1. Reset from deep sleep: if the value in `RTC_CNTL_STORE6_REG` is non-zero, and CRC value of RTC memory in `RTC_CNTL_STORE7_REG` is valid, use `RTC_CNTL_STORE6_REG` as an entry point address and jump immediately to it. If `RTC_CNTL_STORE6_REG` is zero, or `RTC_CNTL_STORE7_REG` contains invalid CRC, or once the code called via `RTC_CNTL_STORE6_REG` returns, proceed with boot as if it was a power-on reset. Note: to run customized code at this point, a deep sleep stub mechanism is provided. Please see deep sleep documentation for this.
2. For power-on reset, software SOC reset, and watchdog SOC reset: check the `GPIO_STRAP_REG` register if UART or SDIO download mode is requested. If this is the case, configure UART or SDIO, and wait for code to be downloaded. Otherwise, proceed with boot as if it was due to software CPU reset.
3. For software CPU reset and watchdog CPU reset: configure SPI flash based on EFUSE values, and attempt to load the code from flash. This step is described in more detail in the next paragraphs. If loading code from flash fails, unpack BASIC interpreter into the RAM and start it. Note that RTC watchdog is still enabled when this happens, so unless any input is received by the interpreter, watchdog will reset the SOC in a few hundred milliseconds, repeating the whole process. If the interpreter receives any input from the UART, it disables the watchdog.
Application binary image is loaded from flash starting at address 0x1000. First 4kB sector of flash is used to store secure boot IV and signature of the application image. Please check secure boot documentation for details about this.

**Second stage bootloader**

In ESP-IDF, the binary image which resides at offset 0x1000 in flash is the second stage bootloader. Second stage bootloader source code is available in components/bootloader directory of ESP-IDF. Note that this arrangement is not the only one possible with the ESP32 chip. It is possible to write a fully featured application which would work when flashed to offset 0x1000, but this is out of scope of this document. Second stage bootloader is used in ESP-IDF to add flexibility to flash layout (using partition tables), and allow for various flows associated with flash encryption, secure boot, and over-the-air updates (OTA) to take place.

When the first stage bootloader is finished checking and loading the second stage bootloader, it jumps to the second stage bootloader entry point found in the binary image header.

Second stage bootloader reads the partition table found at offset 0x8000. See [partition tables](#) documentation for more information. The bootloader finds factory and OTA partitions, and decides which one to boot based on data found in OTA info partition.

For the selected partition, second stage bootloader copies data and code sections which are mapped into IRAM and DRAM to their load addresses. For sections which have load addresses in DROM and IROM regions, flash MMU is configured to provide the correct mapping. Note that the second stage bootloader configures flash MMU for both PRO and APP CPUs, but it only enables flash MMU for PRO CPU. Reason for this is that second stage bootloader code is loaded into the memory region used by APP CPU cache. The duty of enabling cache for APP CPU is passed on to the application. Once code is loaded and flash MMU is set up, second stage bootloader jumps to the application entry point found in the binary image header.

Currently it is not possible to add application-defined hooks to the bootloader to customize application partition selection logic. This may be required to load different application image depending on a state of a GPIO, for example. Such customization features will be added to ESP-IDF in the future. For now, bootloader can be customized by copying bootloader component into application directory and making necessary changes there. ESP-IDF build system will compile the component in application directory instead of ESP-IDF components directory in this case.

**Application startup**

ESP-IDF application entry point is `call_start_cpu0` function found in `components/esp32/cpu_start.c`. Two main things this function does are to enable heap allocator and to make APP CPU jump to its entry point, `call_start_cpu1`. The code on PRO CPU sets the entry point for APP CPU, de-asserts APP CPU reset, and waits for a global flag to be set by the code running on APP CPU, indicating that it has started. Once this is done, PRO CPU jumps to `start_cpu0` function, and APP CPU jumps to `start_cpu1` function.

Both `start_cpu0` and `start_cpu1` are weak functions, meaning that they can be overridden in the application, if some application-specific change to initialization sequence is needed. Default implementation of `start_cpu0` enables or initializes components depending on choices made in `menuconfig`. Please see source code of this function in `components/esp32/cpu_start.c` for an up to date list of steps performed. Note that any C++ global constructors present in the application will be called at this stage. Once all essential components are initialized, main task is created and FreeRTOS scheduler is started.

While PRO CPU does initialization in `start_cpu0` function, APP CPU spins in `start_cpu1` function, waiting for the scheduler to be started on the PRO CPU. Once the scheduler is started on the PRO CPU, code on the APP CPU starts the scheduler as well.

Main task is the task which runs `app_main` function. Main task stack size and priority can be configured in `menuconfig`. Application can use this task for initial application-specific setup, for example to launch other tasks. Application can also use main task for event loops and other general purpose activities. If `app_main` function returns, main task is deleted.
4.1.2 Application memory layout

ESP32 chip has flexible memory mapping features. This section describes how ESP-IDF uses these features by default.

Application code in ESP-IDF can be placed into one of the following memory regions.

**IRAM (instruction RAM)**

ESP-IDF allocates part of Internal SRAM0 region (defined in the Technical Reference Manual) for instruction RAM. Except for the first 64 kB block which is used for PRO and APP CPU caches, the rest of this memory range (i.e. from 0x40080000 to 0x400A0000) is used to store parts of application which need to run from RAM.

A few components of ESP-IDF and parts of WiFi stack are placed into this region using the linker script.

If some application code needs to be placed into IRAM, it can be done using `IRAM_ATTR` define:

```c
#include "esp_attr.h"

void IRAM_ATTR gpio_isr_handler(void * arg)
{
    // ...
}
```

Here are the cases when parts of application may or should be placed into IRAM.

- **Interrupt handlers must be placed into IRAM if `ESP_INTR_FLAG_IRAM` is used when registering the interrupt handler. In this case, ISR may only call functions placed into IRAM or functions present in ROM. Note 1: all FreeRTOS APIs are currently placed into IRAM, so are safe to call from interrupt handlers. If the ISR is placed into IRAM, all constant data used by the ISR and functions called from ISR (including, but not limited to, const char arrays), must be placed into DRAM using `DRAM_ATTR`.
- **Some timing critical code may be placed into IRAM to reduce the penalty associated with loading the code from flash. ESP32 reads code and data from flash via a 32 kB cache. In some cases, placing a function into IRAM may reduce delays caused by a cache miss.

**IROM (code executed from Flash)**

If a function is not explicitly placed into IRAM or RTC memory, it is placed into flash. The mechanism by which Flash MMU is used to allow code execution from flash is described in the Technical Reference Manual. ESP-IDF places the code which should be executed from flash starting from the beginning of 0x400D0000 — 0x40400000 region. Upon startup, second stage bootloader initializes Flash MMU to map the location in flash where code is located into the beginning of this region. Access to this region is transparently cached using two 32kB blocks in 0x40070000 — 0x40080000 range.

Note that the code outside 0x40000000 — 0x40400000 region may not be reachable with Window ABI CALLx instructions, so special care is required if 0x40400000 — 0x40800000 or 0x40800000 — 0x40C00000 regions are used by the application. ESP-IDF doesn’t use these regions by default.

**RTC fast memory**

The code which has to run after wake-up from deep sleep mode has to be placed into RTC memory. Please check detailed description in `deep sleep` documentation.

**DRAM (data RAM)**

Non-constant static data and zero-initialized data is placed by the linker into the 256 kB 0x3FFB0000 — 0x3FFF0000 region. Note that this region is reduced by 64kB (by shifting start address to 0x3FFC0000) if
Bluetooth stack is used. Length of this region is also reduced by 16 kB or 32kB if trace memory is used. All space which is left in this region after placing static data there is used for the runtime heap.

Constant data may also be placed into DRAM, for example if it is used in an ISR (see notes in IRAM section above). To do that, DRAM_ATTR define can be used:

```c
DRAM_ATTR const char[] format_string = "$p $x$"
char buffer[64];
sprintf(buffer, format_string, ptr, val);
```

Needless to say, it is not advised to use `printf` and other output functions in ISRs. For debugging purposes, use `ESP_EARLY_LOGx` macros when logging from ISRs. Make sure that both `TAG` and format string are placed into DRAM in that case.

The macro `__NOINIT_ATTR` can be used as attribute to place data into `.noinit` section. The values placed into this section will not be initialized at startup and keep its value after software restart.

Example:

```c
__NOINIT_ATTR uint32_t noinit_data;
```

**DROM (data stored in Flash)**

By default, constant data is placed by the linker into a 4 MB region (0x3F400000 — 0x3F800000) which is used to access external flash memory via Flash MMU and cache. Exceptions to this are literal constants which are embedded by the compiler into application code.

**RTC slow memory**

Global and static variables used by code which runs from RTC memory (i.e. deep sleep stub code) must be placed into RTC slow memory. Please check detailed description in deep sleep documentation.

The attribute macro named `RTC_NOINIT_ATTR` can be used to place data into this type of memory. The values placed into this section keep their value after waking from deep sleep.

Example:

```c
RTC_NOINIT_ATTR uint32_t rtc_noinit_data;
```

### 4.1.3 DMA Capable Requirement

Most DMA controllers (e.g. SPI, sdmmc, etc.) have requirements that sending/receiving buffers should be placed in DRAM and word-aligned. We suggest to place DMA buffers in static variables rather than in the stack. Use macro `DMA_ATTR` to declare global/local static variables like:

```c
DMA_ATTR uint8_t buffer[]="I want to send something"

void app_main()
{
    // initialization code...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8*sizeof(buffer),
    };
    spi_device_transmit( spi, &temp );
    // other stuff
}
```

Or:
void app_main()
{
    DMA_ATTR static uint8_t buffer[]="I want to send something";
    // initialization code...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8*sizeof(buffer),
    };
    spi_device_transmit( spi, &temp );
    // other stuff
}

Placing DMA buffers in the stack is still allowed, though you have to keep in mind:

1. Never try to do this if the stack is in the pSRAM. If the stack of a task is placed in the pSRAM, several steps have to be taken as described in Support for external RAM (at least SPI-RAM_ALLOW_STACK_EXTERNAL_MEMORY option enabled in the menuconfig). Make sure your task is not in the pSRAM.
2. Use macro WORD_ALIGNED_ATTR in functions before variables to place them in proper positions like:

```c
void app_main()
{
    uint8_t stuff;
    WORD_ALIGNED_ATTR uint8_t buffer[]="I want to send something"; // or the_
    // buffer will be placed right after stuff.
    // initialization code...
    spi_transaction_t temp = {
        .tx_buffer = buffer,
        .length = 8*sizeof(buffer),
    };
    spi_device_transmit( spi, &temp );
    // other stuff
}
```

## 4.2 Build System

This document explains the implementation of the ESP-IDF build system and the concept of “components”. Read this document if you want to know how to organize and build a new ESP-IDF project or component.

**Note:** This document describes the CMake-based build system, which is the default since ESP-IDF V4.0. ESP-IDF also supports a legacy build system based on GNU Make, which was the default before ESP-IDF V4.0.

### 4.2.1 Overview

An ESP-IDF project can be seen as an amalgamation of a number of components. For example, for a webserver that shows the current humidity, there could be:

- The ESP32 base libraries (libc, ROM bindings, etc)
- The Wi-Fi drivers
- A TCP/IP stack
- The FreeRTOS operating system
- A webserver
- A driver for the humidity sensor
- Main code tying it all together

ESP-IDF makes these components explicit and configurable. To do that, when a project is compiled, the build system will look up all the components in the ESP-IDF directories, the project directories and (optionally) in additional
custom component directories. It then allows the user to configure the ESP-IDF project using a text-based menu system to customize each component. After the components in the project are configured, the build system will compile the project.

**Concepts**

- A “project” is a directory that contains all the files and configuration to build a single “app” (executable), as well as additional supporting elements such as a partition table, data/filesystem partitions, and a bootloader.
- “Project configuration” is held in a single file called `sdkconfig` in the root directory of the project. This configuration file is modified via `idf.py menuconfig` to customise the configuration of the project. A single project contains exactly one project configuration.
- An “app” is an executable which is built by ESP-IDF. A single project will usually build two apps - a “project app” (the main executable, ie your custom firmware) and a “bootloader app” (the initial bootloader program which launches the project app).
- “components” are modular pieces of standalone code which are compiled into static libraries (.a files) and linked into an app. Some are provided by ESP-IDF itself, others may be sourced from other places.
- “Target” is the hardware for which an application is built. At the moment, ESP-IDF supports only one target, esp32.

Some things are not part of the project:

- “ESP-IDF” is not part of the project. Instead it is standalone, and linked to the project via the `IDF_PATH` environment variable which holds the path of the esp-idf directory. This allows the IDF framework to be decoupled from your project.
- The toolchain for compilation is not part of the project. The toolchain should be installed in the system command line PATH.

### 4.2.2 Using the Build System

**idf.py**

The `idf.py` command line tool provides a front-end for easily managing your project builds. It manages the following tools:

- CMake, which configures the project to be built
- A command line build tool (either `Ninja` build or `GNU Make`)
- `esptool.py` for flashing ESP32.

The **getting started guide** contains a brief introduction to how to set up `idf.py` to configure, build, and flash projects. `idf.py` should be run in an ESP-IDF “project” directory, ie one containing a `CMakeLists.txt` file. Older style projects with a Makefile will not work with `idf.py`.

Type `idf.py --help` for a full list of commands. Here are a summary of the most useful ones:

- `idf.py menuconfig` runs the “menuconfig” tool to configure the project.
- `idf.py build` will build the project found in the current directory. This can involve multiple steps:
  - Create the build directory if needed. The sub-directory `build` is used to hold build output, although this can be changed with the `-B` option.
  - Run CMake as necessary to configure the project and generate build files for the main build tool.
  - Run the main build tool (`Ninja` or `GNU Make`). By default, the build tool is automatically detected but it can be explicitly set by passing the `-G` option to `idf.py`.

Building is incremental so if no source files or configuration has changed since the last build, nothing will be done.

- `idf.py clean` will “clean” the project by deleting build output files from the build directory, forcing a “full rebuild” the next time the project is built. Cleaning doesn’t delete CMake configuration output and some other files.
- `idf.py fullclean` will delete the entire “build” directory contents. This includes all CMake configuration output. The next time the project is built, CMake will configure it from scratch. Note that this option recursively deletes *all* files in the build directory, so use with care. Project configuration is not deleted.
• idf.py flash will automatically build the project if necessary, and then flash it to an ESP32. The -p and -b options can be used to set serial port name and flasher baud rate, respectively.
• idf.py monitor will display serial output from the ESP32. The -p option can be used to set the serial port name. Type Ctrl-\ to exit the monitor. See IDF Monitor for more details about using the monitor.

Multiple idf.py commands can be combined into one. For example, idf.py -p COM4 clean flash monitor will clean the source tree, then build the project and flash it to the ESP32 before running the serial monitor.

Note: The environment variables ESPPORT and ESPBAUD can be used to set default values for the -p and -b options, respectively. Providing these options on the command line overrides the default.

Advanced Commands
• idf.py app, idf.py bootloader, idf.py partition_table can be used to build only the app, bootloader, or partition table from the project as applicable.
• There are matching commands idf.py app-flash, etc. to flash only that single part of the project to the ESP32.
• idf.py -p PORT erase_flash will use esptool.py to erase the ESP32’s entire flash chip.
• idf.py size prints some size information about the app. size-components and size-files are similar commands which print more detailed per-component or per-source-file information, respectively. If you define variable -DOUTPUT_JSON=1 when running CMake (or idf.py), the output will be formatted as JSON not as human readable text.
• idf.py reconfigure re-runs CMake even if it doesn’t seem to need re-running. This isn’t necessary during normal usage, but can be useful after adding/removing files from the source tree, or when modifying CMake cache variables. For example, idf.py -DNAME='VALUE' reconfigure can be used to set variable NAME in CMake cache to value VALUE.
• idf.py python-clean deletes generated Python byte code from the IDF directory which may cause issues when switching between IDF and Python versions. It is advised to run this target after switching versions of Python.

The order of multiple idf.py commands on the same invocation is not important, they will automatically be executed in the correct order for everything to take effect (ie building before flashing, erasing before flashing, etc.).

idf.py options  To list all available options, run idf.py --help.
• -C <dir> allows overriding the project directory from the default current working directory.
• -B <dir> allows overriding the build directory from the default build subdirectory of the project directory.
• --ccache flag can be used to enable CCache when compiling source files, if the CCache tool is installed. This can dramatically reduce some build times.

Note that some older versions of CCache may exhibit bugs on some platforms, so if files are not rebuilt as expected then try disabling CCache and build again. CCache can be enabled by default by setting the IDF_CCACHE_ENABLE environment variable to a non-zero value.
• -v flag causes both idf.py and the build system to produce verbose build output. This can be useful for debugging build problems.
• --cmake-warn-uninitialized (or -w) will cause CMake to print uninitialized variable warnings inside the project directory (not for directories not found inside the project directory). This only controls CMake variable warnings inside CMake itself, not other types of build warnings. This option can also be set permanently by setting the IDF_CMAKE_WARN_UNINITIALIZED environment variable to a non-zero value.

Using CMake Directly

idf.py is a wrapper around CMake for convenience. However, you can also invoke CMake directly if you prefer.
When idf.py does something, it prints each command that it runs for easy reference. For example, the idf.py build command is the same as running these commands in a bash shell (or similar commands for Windows Command Prompt):
In the above list, the `cmake` command configures the project and generates build files for use with the final build tool. In this case the final build tool is **Ninja**: running `ninja` actually builds the project.

It’s not necessary to run `cmake` more than once. After the first build, you only need to run `ninja` each time. `ninja` will automatically re-invoke `cmake` if the project needs reconfiguration.

If using CMake with `ninja` or `make`, there are also targets for more of the `idf.py` sub-commands - for example running `make menuconfig` or `ninja menuconfig` in the build directory will work the same as `idf.py menuconfig`.

**Note:** If you’re already familiar with **CMake**, you may find the ESP-IDF CMake-based build system unusual because it wraps a lot of CMake’s functionality to reduce boilerplate. See [writing pure CMake components](#) for some information about writing more “CMake style” components.

### Flashing with ninja or make

It’s possible to build and flash directly from `ninja` or `make` by running a target like:

```
ninja flash
```

Or:

```
make app-flash
```

Available targets are: `flash`, `app-flash` (app only), `bootloader-flash` (bootloader only).

When flashing this way, optionally set the `ESPPORT` and `ESPBAUD` environment variables to specify the serial port and baud rate. You can set environment variables in your operating system or IDE project. Alternatively, set them directly on the command line:

```
ESPPORT=/dev/ttyUSB0 ninja flash
```

**Note:** Providing environment variables at the start of the command like this is Bash shell Syntax. It will work on Linux and macOS. It won’t work when using Windows Command Prompt, but it will work when using Bash-like shells on Windows.

Or:

```
make -j3 app-flash ESPPORT=COM4 ESPBAUD=2000000
```

**Note:** Providing variables at the end of the command line is `make` syntax, and works for `make` on all platforms.

### Using CMake in an IDE

You can also use an IDE with CMake integration. The IDE will want to know the path to the project’s `CMakeLists.txt` file. IDEs with CMake integration often provide their own build tools (CMake calls these “generators”) to build the source files as part of the IDE.

When adding custom non-build steps like “flash” to the IDE, it is recommended to execute `idf.py` for these “special” commands.

For more detailed information about integrating ESP-IDF with CMake into an IDE, see [Build System Metadata](#).
Setting up the Python Interpreter

ESP-IDF works well with all supported Python versions. It should work out-of-box even if you have a legacy system where the default python interpreter is still Python 2.7, however, it is advised to switch to Python 3 if possible.

idf.py and other Python scripts will run with the default Python interpreter, i.e. python. You can switch to a different one like python3 $IDF_PATH/tools/idf.py ... , or you can set up a shell alias or another script to simplify the command.

If using CMake directly, running cmake -D PYTHON=python3 ... will cause CMake to override the default Python interpreter.

If using an IDE with CMake, setting the PYTHON value as a CMake cache override in the IDE UI will override the default Python interpreter.

To manage the Python version more generally via the command line, check out the tools pyenv or virtualenv. These let you change the default Python version.

Possible issues The user of idf.py may sometimes experience ImportError described below.

```
Traceback (most recent call last):
  File "/Users/user_name/e/esp-idf/tools/kconfig_new/confgen.py", line 27, in <module>
    import kconfiglib
ImportError: bad magic number in 'kconfiglib': b'\x03\xf3\r\n'
```

The exception is often caused by .pyc files generated by different Python versions. To solve the issue run the following command:

```
idf.py python-clean
```

4.2.3 Example Project

An example project directory tree might look like this:

```
- myProject/
  - CMakeLists.txt
  - sdkconfig
  - components/
    - component1/
      - CMakeLists.txt
      - Kconfig
      - src1.c
    - component2/
      - CMakeLists.txt
      - Kconfig
      - src1.c
      - include/
        - component2.h
  - main/
    - CMakeLists.txt
    - src1.c
    - src2.c
  - build/
```

This example “myProject” contains the following elements:

- A top-level project CMakeLists.txt file. This is the primary file which CMake uses to learn how to build the project; and may set project-wide CMake variables. It includes the file /tools/cmake/project.cmake which implements the rest of the build system. Finally, it sets the project name and defines the project.
- “sdkconfig” project configuration file. This file is created/updated when idf.py menuconfig runs, and holds configuration for all of the components in the project (including ESP-IDF itself). The “sdkconfig” file may or may not be added to the source control system of the project.
Chapter 4. API Guides

- Optional “components” directory contains components that are part of the project. A project does not have to contain custom components of this kind, but it can be useful for structuring reusable code or including third party components that aren’t part of ESP-IDF. Alternatively, `EXTRA_COMPONENT_DIRS` can be set in the top-level `CMakeLists.txt` to look for components in other places. See the renaming main section for more info. If you have a lot of source files in your project, we recommend grouping most into components instead of putting them all in “main”.

- “main” directory is a special component that contains source code for the project itself. “main” is a default name, the `CMake variable COMPONENT_DIRS` includes this component but you can modify this variable.

- “build” directory is where build output is created. This directory is created by `idf.py` if it doesn’t already exist. CMake configures the project and generates interim build files in this directory. Then, after the main build process is run, this directory will also contain interim object files and libraries as well as final binary output files. This directory is usually not added to source control or distributed with the project source code.

Component directories each contain a component `CMakeLists.txt` file. This file contains variable definitions to control the build process of the component, and its integration into the overall project. See Component CMakeLists Files for more details.

Each component may also include a `Kconfig` file defining the component configuration options that can be set via `menuconfig`. Some components may also include `Kconfig.projbuild` and `project_include.cmake` files, which are special files for overriding parts of the project.

### 4.2.4 Project CMakeLists File

Each project has a single top-level `CMakeLists.txt` file that contains build settings for the entire project. By default, the project `CMakeLists` can be quite minimal.

**Minimal Example CMakeLists**

Minimal project:

```
cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
```

**Mandatory Parts**

The inclusion of these three lines, in the order shown above, is necessary for every project:

- `cmake_minimum_required(VERSION 3.5)` tells CMake the minimum version that is required to build the project. ESP-IDF is designed to work with CMake 3.5 or newer. This line must be the first line in the `CMakeLists.txt` file.
- `include($ENV{IDF_PATH}/tools/cmake/project.cmake)` pulls in the rest of the CMake functionality to configure the project, discover all the components, etc.
- `project(myProject)` creates the project itself, and specifies the project name. The project name is used for the final binary output files of the app - ie `myProject.elf`, `myProject.bin`. Only one project can be defined per `CMakeLists.txt` file.

**Optional Project Variables**

These variables all have default values that can be overridden for custom behaviour. Look in `/tools/cmake/project.cmake` for all of the implementation details.

- `COMPONENT_DIRS, COMPONENTS_DIRS`: Directories to search for components. Defaults to `IDF_PATH/components`, `PROJECT_DIR/components`, and `EXTRA_COMPONENT_DIRS`. Override this variable if you don’t want to search for components in these places.
- `EXTRA_COMPONENT_DIRS, EXTRA_COMPONENTS_DIRS`: Optional list of additional directories to search for components. Paths can be relative to the project directory, or absolute.
Chapter 4. API Guides

- COMPONENTS: A list of component names to build into the project. Defaults to all components found in the COMPONENT_DIRS directories. Use this variable to “trim down” the project for faster build times. Note that any component which “requires” another component via the REQUIRES or PRIV_REQUIRES arguments on component registration will automatically have it added to this list, so the COMPONENTS list can be very short.

Any paths in these variables can be absolute paths, or set relative to the project directory.

To set these variables, use the cmake set command ie set(VARIABLE "VALUE"). The set() commands should be placed after the cmake_minimum(...) line but before the include(...) line.

Renaming main component

The build system provides special treatment to the main component. It is a component that gets automatically added to the build provided that it is in the expected location, PROJECT_DIR/main. All other components in the build are also added as its dependencies, saving the user from hunting down dependencies and providing a build that works right out of the box. Renaming the main component causes the loss of these behind-the-scenes heavy lifting, requiring the user to specify the location of the newly renamed component and manually specifying its dependencies. Specifically, the steps to renaming main are as follows:

1. Rename main directory.
2. Set EXTRA_COMPONENT_DIRS in the project CMakeLists.txt to include the renamed main directory.
3. Specify the dependencies in the renamed component’s CMakeLists.txt file via REQUIRES or PRIV_REQUIRES arguments on component registration.

4.2.5 Component CMakeLists Files

Each project contains one or more components. Components can be part of ESP-IDF, part of the project’s own components directory, or added from custom component directories (see above).

A component is any directory in the COMPONENT_DIRS list which contains a CMakeLists.txt file.

Searching for Components

The list of directories in COMPONENT_DIRS is searched for the project’s components. Directories in this list can either be components themselves (ie they contain a CMakeLists.txt file), or they can be top-level directories whose sub-directories are components.

When CMake runs to configure the project, it logs the components included in the build. This list can be useful for debugging the inclusion/exclusion of certain components.

Multiple components with the same name

When ESP-IDF is collecting all the components to compile, it will do this in the order specified by COMPONENT_DIRS; by default, this means ESP-IDF’s internal components first, then the project’s components, and finally any components set in EXTRA_COMPONENT_DIRS. If two or more of these directories contain component sub-directories with the same name, the component in the last place searched is used. This allows, for example, overriding ESP-IDF components with a modified version by copying that component from the ESP-IDF components directory to the project components directory and then modifying it there. If used in this way, the ESP-IDF directory itself can remain untouched.

Minimal Component CMakeLists

The minimal component CMakeLists.txt file simply registers the component to the build system using idf_component_register:
idf_component_register(SRCS "foo.c" "bar.c"
            INCLUDE_DIRS "include"
            REQUIRES mbedtls)

- SRCS is a list of source files (*.c, *.cpp, *.cc, *.S). These source files will be compiled into the component library.
- INCLUDE_DIRS is a list of directories to add to the global include search path for any component which requires this component, and also the main source files.
- REQUIRES is not actually required, but it is very often required to declare what other components this component will use. See Component Requirements.

A library with the name of the component will be built and linked into the final app.

Directories are usually specified relative to the CMakeLists.txt file itself, although they can be absolute.

There are other arguments that can be passed to idf_component_register. These arguments are discussed here.

See example component requirements and example component CMakeLists for more complete component CMakeLists.txt examples.

Preset Component Variables

The following component-specific variables are available for use inside component CMakeLists, but should not be modified:

- COMPONENT_DIR: The component directory. Evaluates to the absolute path of the directory containing CMakeLists.txt. The component path cannot contain spaces. This is the same as the CMAKE_CURRENT_SOURCE_DIR variable.
- COMPONENT_NAME: Name of the component. Same as the name of the component directory.
- COMPONENT_ALIAS: Alias of the library created internally by the build system for the component.
- COMPONENT_LIB: Name of the library created internally by the build system for the component.

The following variables are set at the project level, but available for use in component CMakeLists:

- CONFIG_*: Each value in the project configuration has a corresponding variable available in cmake. All names begin with CONFIG_. More information here.
- ESP_PLATFORM: Set to 1 when the CMake file is processed within ESP-IDF build system.

Build/Project Variables

The following are some project/build variables that are available as build properties and whose values can be queried using idf_build_get_property from the component CMakeLists.txt:

- PROJECT_NAME: Name of the project, as set in project CMakeLists.txt file.
- PROJECT_DIR: Absolute path of the project directory containing the project CMakeLists. Same as the CMAKE_CURRENT_SOURCE_DIR variable.
- COMPONENTS: Names of all components that are included in this build, formatted as a semicolon-delimited CMake list.
- IDF_VER: Git version of ESP-IDF (produced by git describe)
- IDF_VERSION_MAJOR, IDF_VERSION_MINOR, IDF_VERSION_PATCH: Components of ESP-IDF version, to be used in conditional expressions. Note that this information is less precise than that provided by IDF_VER variable. v4.0-dev-* , v4.0-beta1, v4.0-rc1 and v4.0 will all have the same values of IDF_VERSION_* variables, but different IDF_VER values.
- IDF_TARGET: Name of the target for which the project is being built.
- PROJECT_VER: Project version.
  - If PROJECT_VER variable is set in project CMakeLists.txt file, its value will be used.
  - Else, if the PROJECT_DIR/version.txt exists, its contents will be used as PROJECT_VER.
  - Else, if the project is located inside a Git repository, the output of git describe will be used.
  - Otherwise, PROJECT_VER will be “1”.
Other build properties are listed [here](#).

### Controlling Component Compilation

To pass compiler options when compiling source files belonging to a particular component, use the `target_compile_options` function:

```cmake
target_compile_options($(COMPONENT_LIB) PRIVATE -Wno-unused-variable)
```

To apply the compilation flags to a single source file, use the CMake `set_source_files_properties` command:

```cmake
set_source_files_properties(mysrc.c
  PROPERTIES COMPILE_FLAGS
  -Wno-unused-variable)
```

This can be useful if there is upstream code that emits warnings.

When using these commands, place them after the call to `idf_component_register` in the component CMakeLists file.

#### 4.2.6 Component Configuration

Each component can also have a `Kconfig` file, alongside `CMakeLists.txt`. This contains configuration settings to add to the configuration menu for this component.

These settings are found under the “Component Settings” menu when menuconfig is run.

To create a component `Kconfig` file, it is easiest to start with one of the `Kconfig` files distributed with ESP-IDF.

For an example, see [Adding conditional configuration](#).

#### 4.2.7 Preprocessor Definitions

The ESP-IDF build system adds the following C preprocessor definitions on the command line:

- `ESP_PLATFORM`: Can be used to detect that build happens within ESP-IDF.
- `IDF_VER`: Defined to a git version string. E.g. `v2.0` for a tagged release or `v1.0-275-g0efaa4f` for an arbitrary commit.

#### 4.2.8 Component Requirements

When compiling each component, the ESP-IDF build system recursively evaluates its dependencies. This means each component needs to declare the components that it depends on (`REQUIRES`).

When writing a component

```cmake
idf_component_register(...
  REQUIRES mbedtls
  PRIV_REQUIRES console spiffs)
```

- `REQUIRES` should be set to all components whose header files are `#included` from the `public` header files of this component.
- `PRIV_REQUIRES` should be set to all components whose header files are `#included` from any `source files` in this component, unless already listed in `REQUIRES`. Also any component which is required to be linked in order for this component to function correctly.
Chapter 4. API Guides

- The values of REQUIRE and PRIV_REQUIRES should not depend on any configuration choices (CONFIG_xxx macros). This is because requirements are expanded before configuration is loaded. Other component variables (like include paths or source files) can depend on configuration choices.
- Not setting either or both REQUIRE variables is fine. If the component has no requirements except for the Common component requirements needed for RTOS, libc, etc.

If a components only supports some target chips (values of IDF_TARGET) then it can specify REQUIRED_IDF_TARGETS in the idf_component_register call to express these requirements. In this case the build system will generate an error if the component is included into the build, but does not support the selected target.

**Note:** In CMake terms, REQUIRE & PRIV_REQUIRES are approximate wrappers around the CMake functions target_link_libraries(... PUBLIC ...) and target_link_libraries(... PRIVATE ..).

---

**Example of component requirements**

Imagine there is a car component, which uses the engine component, which uses the spark_plug component:

```bash
- autoProject/
  - CMakeLists.txt
- components/ - car/ - CMakeLists.txt
  - car.c
  - car.h
- engine/ - CMakeLists.txt
  - engine.c
  - include/ - engine.h
- spark_plug/ - CMakeLists.txt
  - plug.c
  - plug.h
```

**Car component** The car.h header file is the public interface for the car component. This header includes engine.h directly because it uses some declarations from this header:

```c
/* car.h */
#include "engine.h"

#ifndef ENGINE_IS_HYBRID
#define CAR_MODEL "Hybrid"
#endif
```

And car.c includes car.h as well:

```c
/* car.c */
#include "car.h"
```

This means the car/CMakeLists.txt file needs to declare that car requires engine:

```c
idf_component_register(SRCS "car.c"
  INCLUDE_DIRS "."
  REQUIRE engine)
```

- SRCS gives the list of source files in the car component.
- INCLUDE_DIRS gives the list of public include directories for this component. Because the public interface is car.h, the directory containing car.h is listed here.
- REQUIRE gives the list of components required by the public interface of this component. Because car.h is a public header and includes a header from engine, we include engine here. This makes sure that any other component which includes car.h will be able to recursively include the required engine.h also.
Engine component The engine component also has a public header file include/engine.h, but this header is simpler:

```c
/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start(void);
```

The implementation is in engine.c:

```c
/* engine.c */
#include "engine.h"
#include "spark_plug.h"
...
```

In this component, engine depends on spark_plug but this is a private dependency. spark_plug.h is needed to compile engine.c, but not needed to include engine.h.

This means that the engine/CMakeLists.txt file can use PRIV REQUIRES:

```c
idf_component_register(SRCS "engine.c"
  INCLUDE_DIRS "include"
  PRIV_REQUIRES spark_plug)
```

As a result, source files in the car component don’t need the spark_plug include directories added to their compiler search path. This can speed up compilation, and stops compiler command lines from becoming longer than necessary.

Spark Plug Component The spark_plug component doesn’t depend on anything else. It has a public header file spark_plug.h, but this doesn’t include headers from any other components.

This means that the spark_plug/CMakeLists.txt file doesn’t need any REQUIRES or PRIV_REQUIRES clauses:

```c
idf_component_register(SRCS "spark_plug.c"
  INCLUDE_DIRS ".")
```

Source File Include Directories

Each component’s source file is compiled with these include path directories, as specified in the passed arguments to idf_component_register:

```c
idf_component_register(...
  INCLUDE_DIRS "include"
  PRIV_INCLUDE_DIRS "other")
```

- The current component’s INCLUDE_DIRS and PRIV_INCLUDE_DIRS.
- The INCLUDE_DIRS belonging to all other components listed in the REQUIRES and PRIV_REQUIRES parameters (ie all the current component’s public and private dependencies).
- Recursively, all of the INCLUDE_DIRS of those components REQUIRE lists (ie all public dependencies of this component’s dependencies, recursively expanded).

Main component requirements

The component named main is special because it automatically requires all other components in the build. So it’s not necessary to pass REQUIRES or PRIV_REQUIRES to this component. See renaming main for a description of what needs to be changed if no longer using the main component.
Common component requirements

To avoid duplication, every component automatically requires some “common” IDF components even if they are not mentioned explicitly. Headers from these components can always be included.

The list of common components is: freertos, newlib, heap, log, soc, esp_rom, esp_common, xtensa, cxx.

Including components in the build

- By default, every component is included in the build.
- If you set the COMPONENTS variable to a minimal list of components used directly by your project, then the build will expand to also include required components. The full list of components will be:
  - Components mentioned explicitly in COMPONENTS.
  - Those components’ requirements (evaluated recursively).
  - The “common” components that every component depends on.
- Setting COMPONENTS to the minimal list of required components can significantly reduce compile times.

Requirements in the build system implementation

- Very early in the CMake configuration process, the script expand_requirements.cmake is run. This script does a partial evaluation of all component CMakeLists.txt files and builds a graph of component requirements (this graph may have cycles). The graph is used to generate a file component_depends.cmake in the build directory.
- The main CMake process then includes this file and uses it to determine the list of components to include in the build (internal BUILD_COMPONENTS variable). The BUILD_COMPONENTS variable is sorted so dependencies are listed first, however as the component dependency graph has cycles this cannot be guaranteed for all components. The order should be deterministic given the same set of components and component dependencies.
- The value of BUILD_COMPONENTS is logged by CMake as “Component names: “
- Configuration is then evaluated for the components included in the build.
- Each component is included in the build normally and the CMakeLists.txt file is evaluated again to add the component libraries to the build.

Component Dependency Order The order of components in the BUILD_COMPONENTS variable determines other orderings during the build:

- Order that project_include.cmake files are included into the project.
- Order that the list of header paths is generated for compilation (via -I argument). (Note that for a given component’s source files, only that component’s dependency’s header paths are passed to the compiler.)

4.2.9 Build Process Internals

For full details about CMake and CMake commands, see the CMake v3.5 documentation.

project.cmake contents

When included from a project CMakeLists file, the project.cmake file defines some utility modules and global variables and then sets IDF_PATH if it was not set in the system environment.

It also defines an overridden custom version of the built-in CMake project function. This function is overridden to add all of the ESP-IDF specific project functionality.
project function

The custom `project()` function performs the following steps:

- Determines the target (set by `IDF_TARGET` environment variable) and saves the target in CMake cache. If the target set in the environment does not match the one in cache, exits with an error.
- Evaluates component dependencies and builds the `BUILD_COMPONENTS` list of components to include in the build (see above).
- Finds all components in the project (searching `COMPONENT_DIRS` and filtering by `COMPONENTS` if this is set).
- Loads the project configuration from the `sdkconfig` file and generates a `sdkconfig.cmake` file and a `sdkconfig.h` header. These define configuration values in CMake and C/C++, respectively. If the project configuration changes, cmake will automatically be re-run to re-generate these files and re-configure the project.
- Sets the `CMAKE_TOOLCHAIN_FILE` variable to the correct toolchain file, depending on the target.
- Declares the actual cmake-level project by calling the `CMake project function`.
- Loads the git version. This includes some magic which will automatically re-run CMake if a new revision is checked out in git. See File Globbing & Incremental Builds.
- Includes `project_include.cmake` files from any components which have them.
- Adds each component to the build. Each component CMakelists file calls `idf_component_register`, calls the CMake `add_library` function to add a library and then adds source files, compile options, etc.
- Adds the final app executable to the build.
- Goes back and adds inter-component dependencies between components (ie adding the public header directories of each component to each other component).

Browse the `/tools/cmake/project.cmake` file and supporting functions in `/tools/cmake/idf_functions.cmake` for more details.

4.2.10 Debugging CMake

Some tips for debugging the ESP-IDF CMake-based build system:

- When CMake runs, it prints quite a lot of diagnostic information including lists of components and component paths.
- Running `cmake -DDEBUG=1` will produce more verbose diagnostic output from the IDF build system.
- Running `cmake` with the `--trace` or `--trace-expand` options will give a lot of information about control flow. See the `cmake` command line documentation.

When included from a project CMakelists file, the `project.cmake` file defines some utility modules and global variables and then sets `IDF_PATH` if it was not set in the system environment.

It also defines an overridden custom version of the built-in `CMake project function`. This function is overridden to add all of the ESP-IDF specific project functionality.

Warning On Undefined Variables

By default, `idf.py` passes the `--warn-uninitialized` flag to `CMake` so it will print a warning if an undefined variable is referenced in the build. This can be very useful to find buggy CMake files.

If you don’t want this behaviour, it can be disabled by passing `--no-warnings` to `idf.py`.

Browse the `/tools/cmake/project.cmake` file and supporting functions in `/tools/cmake/idf_functions.cmake` for more details.

Overriding Parts of the Project

`project_include.cmake` For components that have build requirements which must be evaluated before any component CMakelists files are evaluated, you can create a file called `project_include.cmake` in the component directory. This CMake file is included when `project.cmake` is evaluating the entire project.
project_include.cmake files are used inside ESP-IDF, for defining project-wide build features such as esptool.py command line arguments and the bootloader “special app”.

Unlike component CMakeLists.txt files, when including a project_include.cmake file the current source directory (CMAKE_CURRENT_SOURCE_DIR and working directory) is the project directory. Use the variable COMPONENT_DIR for the absolute directory of the component.

Note that project_include.cmake isn’t necessary for the most common component uses - such as adding include directories to the project, or LDFLAGS to the final linking step. These values can be customised via the CMakeLists.txt file itself. See Optional Project Variables for details.

project_include.cmake files are included in the order given in BUILD_COMPONENTS variable (as logged by CMake). This means that a component’s project_include.cmake file will be included after it’s all dependencies’ project_include.cmake files, unless both components are part of a dependency cycle. This is important if a project_include.cmake file relies on variables set by another component. See also above.

Take great care when setting variables or targets in a project_include.cmake file. As the values are included into the top-level project CMake pass, they can influence or break functionality across all components!

**KConfig.projbuild** This is an equivalent to project_include.cmake for Component Configuration KConfig files. If you want to include configuration options at the top-level of menuconfig, rather than inside the “Component Configuration” sub-menu, then these can be defined in the KConfig.projbuild file alongside the CMakeLists.txt file.

Take care when adding configuration values in this file, as they will be included across the entire project configuration. Where possible, it’s generally better to create a KConfig file for Component Configuration.

project_include.cmake files are used inside ESP-IDF, for defining project-wide build features such as esptool.py command line arguments and the bootloader “special app”.

**Configuration-Only Components** Special components which contain no source files, only Kconfig. projbuild and KConfig, can have a one-line CMakeLists.txt file which calls the function idf_component_register() with no arguments specified. This function will include the component in the project build, but no library will be built and no header files will be added to any include paths.

### 4.2.11 Example Component CMakeLists

Because the build environment tries to set reasonable defaults that will work most of the time, component CMakeLists.txt can be very small or even empty (see Minimal Component CMakeLists). However, overriding component variables is usually required for some functionality.

Here are some more advanced examples of component CMakeLists files.

**Adding conditional configuration**

The configuration system can be used to conditionally compile some files depending on the options selected in the project configuration.

Kconfig:

```c
config FOO_ENABLE_BAR
  bool "Enable the BAR feature."
  help
  This enables the BAR feature of the FOO component.
```

CMakeLists.txt:
This example makes use of the CMake `if` function and `list APPEND` function.

This can also be used to select or stub out an implementation, as such:

Kconfig:

```
config ENABLE_LCD_OUTPUT
  bool "Enable LCD output."
  help
  Select this if your board has a LCD.
config ENABLE_LCD_CONSOLE
  bool "Output console text to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
  Select this to output debugging output to the LCD
config ENABLE_LCD_PLOT
  bool "Output temperature plots to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
  Select this to output temperature plots
```

CMakeLists.txt:

```
if(CONFIG_ENABLE_LCD_OUTPUT)
  set(srcs lcd-real.c lcd-spi.c)
else()
  set(srcs lcd-dummy.c)
endif()

# We need font if either console or plot is enabled
if(CONFIG_ENABLE_LCD_CONSOLE OR CONFIG_ENABLE_LCD_PLOT)
  list(APPEND srcs "font.c")
endif()

idf_component_register(SRCS "${srcs}"
  ...
)
```

**Conditions which depend on the target**

The current target is available to CMake files via `IDF_TARGET` variable.

In addition to that, if target `xyz` is used (`IDF_TARGET=xyz`), then Kconfig variable `CONFIG_IDF_TARGET_XYZ` will be set.

Note that component dependencies may depend on `IDF_TARGET` variable, but not on Kconfig variables. Also one cannot use Kconfig variables in `include` statements in CMake files, but `IDF_TARGET` can be used in such context.
**Source Code Generation**

Some components will have a situation where a source file isn’t supplied with the component itself but has to be generated from another file. Say our component has a header file that consists of the converted binary data of a BMP file, converted using a hypothetical tool called bmp2h. The header file is then included in a C source file called `graphics_lib.c`:

```cmake
add_custom_command(
    OUTPUT logo.h
    COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o logo.h
    DEPENDS ${COMPONENT_DIR}/logo.bmp
    VERBATIM)
add_custom_target(logo DEPENDS logo.h)
add_dependencies(${COMPONENT_LIB} logo)
set_property(DIRECTORY "${COMPONENT_DIR}" APPEND PROPERTY
    ADDITIONAL_MAKE_CLEAN_FILES logo.h)
```

This answer is adapted from the CMake FAQ entry, which contains some other examples that will also work with ESP-IDF builds.

In this example, `logo.h` will be generated in the current directory (the build directory) while `logo.bmp` comes with the component and resides under the component path. Because `logo.h` is a generated file, it should be cleaned when the project is cleaned. For this reason it is added to the `ADDITIONAL_MAKE_CLEAN_FILES` property.

**Note:** If generating files as part of the project CMakeLists.txt file, not a component CMakeLists.txt, then use `build` property `PROJECT_DIR` instead of `${COMPONENT_DIR}` and `${PROJECT_NAME}.elf` instead of `${COMPONENT_LIB}`.

If a source file from another component included `logo.h`, then `add_dependencies` would need to be called to add a dependency between the two components, to ensure that the component source files were always compiled in the correct order.

**Embedding Binary Data**

Sometimes you have a file with some binary or text data that you’d like to make available to your component - but you don’t want to reformat the file as C source.

You can specify argument `EMBED_FILES` in the component registration, giving space-delimited names of the files to embed:

```cmake
idf_component_register(...
    EMBED_FILES server_root_cert.der)
```

Or if the file is a string, you can use the variable `EMBED_TXTFILES`. This will embed the contents of the text file as a null-terminated string:

```cmake
idf_component_register(...
    EMBED_TXTFILES server_root_cert.pem)
```

The file’s contents will be added to the `.rodata` section in flash, and are available via symbol names as follows:

```c
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_
    pem_start");
extern const uint8_t server_root_cert_pem_end[] asm("_binary_server_root_cert_
    pem_end");
```

The names are generated from the full name of the file, as given in `EMBED_FILES`. Characters /, ., etc. are replaced with underscores. The `_binary` prefix in the symbol name is added by objcopy and is the same for both text and binary files.
Chapter 4. API Guides

To embed a file into a project, rather than a component, you can call the function `target_add_binary_data` like this:

```cpp
target_add_binary_data(myproject.elf "main/data.bin" TEXT)
```

Place this line after the `project()` line in your project CMakeLists.txt file. Replace `myproject.elf` with your project name. The final argument can be `TEXT` to embed a null-terminated string, or `BINARY` to embed the content as-is.

For an example of using this technique, see `protocols/https_request` - the certificate file contents are loaded from the text .pem file at compile time.

**Code and Data Placements**

ESP-IDF has a feature called linker script generation that enables components to define where its code and data will be placed in memory through linker fragment files. These files are processed by the build system, and is used to augment the linker script used for linking app binary. See `Linker Script Generation` for a quick start guide as well as a detailed discussion of the mechanism.

**Fully Overriding The Component Build Process**

Obviously, there are cases where all these recipes are insufficient for a certain component, for example when the component is basically a wrapper around another third-party component not originally intended to be compiled under this build system. In that case, it’s possible to forego the ESP-IDF build system entirely by using a CMake feature called `ExternalProject`. Example component CMakeLists:

```cpp
# External build process for quirc, runs in source dir and
# produces libquirc.a
externalproject_add(quirc_build
    PREFIX ${COMPONENT_DIR}
    SOURCE_DIR ${COMPONENT_DIR}/quirc
    CONFIGURE_COMMAND ""
    BUILD_IN_SOURCE 1
    BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
    INSTALL_COMMAND ""
)

# Add libquirc.a to the build process
add_library(quirc STATIC IMPORTED GLOBAL)
add_dependencies(quirc quirc_build)

set_target_properties(quirc PROPERTIES IMPORTED_LOCATION
    ${COMPONENT_DIR}/quirc/libquirc.a)
set_target_properties(quirc PROPERTIES INTERFACE_INCLUDE_DIRECTORIES
    ${COMPONENT_DIR}/quirc/lib)
set_directory_properties( PROPERTIES ADDITIONAL_MAKE_CLEAN_FILES
    "${COMPONENT_DIR}/quirc/libquirc.a")
```

(The above CMakeLists.txt can be used to create a component named `quirc` that builds the `quirc` project using its own Makefile.)

- `externalproject_add` defines an external build system.
  - `SOURCE_DIR`, `CONFIGURE_COMMAND`, `BUILD_COMMAND` and `INSTALL_COMMAND` should always be set. `CONFIGURE_COMMAND` can be set to an empty string if the build system has no “configure” step. `INSTALL_COMMAND` will generally be empty for ESP-IDF builds.
  - Setting `BUILD_IN_SOURCE` means the build directory is the same as the source directory. Otherwise you can set `BUILD_DIR`.
  - Consult the `ExternalProject` documentation for more details about `externalproject_add()`
• The second set of commands adds a library target, which points to the “imported” library file built by the external system. Some properties need to be set in order to add include directories and tell CMake where this file is.
• Finally, the generated library is added to ADDITIONAL_MAKE_CLEAN_FILES. This means make clean will delete this library. (Note that the other object files from the build won’t be deleted.)

**Note:** When using an external build process with PSRAM, remember to add `-mfix-esp32-psram-cache-issue` to the C compiler arguments. See `CONFIG_SPIRAM_CACHE_WORKAROUND` for details of this flag.

**ExternalProject dependencies, clean builds** CMake has some unusual behaviour around external project builds:

• ADDITIONAL_MAKE_CLEAN_FILES only works when “make” is used as the build system. If Ninja or an IDE build system is used, it won’t delete these files when cleaning.
• However, the ExternalProject configure & build commands will always be re-run after a clean is run.
• Therefore, there are two alternative recommended ways to configure the external build command:
  1. Have the external BUILD_COMMAND run a full clean compile of all sources. The build command will be run if any of the dependencies passed to externalproject_add with DEPENDS have changed, or if this is a clean build (ie any of idf.py clean, ninja clean, or make clean was run.)
  2. Have the external BUILD_COMMAND be an incremental build command. Pass the parameter BUILD_ALWAYS 1 to externalproject_add. This means the external project will be built each time a build is run, regardless of dependencies. This is only recommended if the external project has correct incremental build behaviour, and doesn’t take too long to run.

The best of these approaches for building an external project will depend on the project itself, its build system, and whether you anticipate needing to frequently recompile the project.

### 4.2.12 Custom sdkconfig defaults

For example projects or other projects where you don’t want to specify a full sdkconfig configuration, but you do want to override some key values from the ESP-IDF defaults, it is possible to create a file `sdkconfig.defaults` in the project directory. This file will be used when creating a new config from scratch, or when any new config value hasn’t yet been set in the `sdkconfig` file.

To override the name of this file, set the `SDKCONFIG_DEFAULTS` environment variable.

**Target-dependent sdkconfig defaults**

In addition to `sdkconfig.defaults` file, build system will also load defaults from `sdkconfig.defaults.TARGET_NAME` file, where `TARGET_NAME` is the value of IDF_TARGET. For example, for esp32 target, default settings will be taken from `sdkconfig.defaults.first`, and then from `sdkconfig.defaults.esp32`.

If `SDKCONFIG_DEFAULTS` is used to override the name of defaults file, the name of target-specific defaults file will be derived from `SDKCONFIG_DEFAULTS` value.

### 4.2.13 Flash arguments

There are some scenarios that we want to flash the target board without IDF. For this case we want to save the built binaries, esptool.py and esptool write_flash arguments. It’s simple to write a script to save binaries and esptool.py.

After running a project build, the build directory contains binary output files (.bin files) for the project and also the following flashing data files:

- `flash_project_args` contains arguments to flash the entire project (app, bootloader, partition table, PHY data if this is configured).
- `flash_app_args` contains arguments to flash only the app.
- `flash_bootloader_args` contains arguments to flash only the bootloader.
You can pass any of these flasher argument files to `esptool.py` as follows:

```
python esptool.py --chip esp32 write_flash @build/flash_project_args
```

Alternatively, it is possible to manually copy the parameters from the argument file and pass them on the command line.

The build directory also contains a generated file `flasher_args.json` which contains project flash information, in JSON format. This file is used by `idf.py` and can also be used by other tools which need information about the project build.

### 4.2.14 Building the Bootloader

The bootloader is built by default as part of `idf.py build`, or can be built standalone via `idf.py bootloader`.

The bootloader is a special “subproject” inside `/components/bootloader/subproject`. It has its own project CMake-Lists.txt file and builds separate .ELF and .BIN files to the main project. However, it shares its configuration and build directory with the main project.

The subproject is inserted as an external project from the top-level project, by the file `/components/bootloader/project_include.cmake`. The main build process runs CMake for the subproject, which includes discovering components (a subset of the main components) and generating a bootloader-specific config (derived from the main `sdkconfig`).

### 4.2.15 Selecting the Target

Currently ESP-IDF supports one target, `esp32`. It is used by default by the build system. Developers working on adding multiple targets can change the target as follows:

```
rm sdkconfig idf.py -D-IDF_TARGET=new_target reconfigure
```

### 4.2.16 Writing Pure CMake Components

The ESP-IDF build system “wraps” CMake with the concept of “components”, and helper functions to automatically integrate these components into a project build.

However, underneath the concept of “components” is a full CMake build system. It is also possible to make a component which is pure CMake.

Here is an example minimal “pure CMake” component CMakeLists file for a component named `json`:

```
add_library(json STATIC cJSON/cJSON.c cJSON/cJSON_Utils.c)
target_include_directories(json PUBLIC cJSON)
```

- This is actually an equivalent declaration to the IDF `json` component `/components/json/CMakeLists.txt`.
- This file is quite simple as there are not a lot of source files. For components with a large number of files, the globbing behaviour of ESP-IDF’s component logic can make the component CMakeLists style simpler.
- Any time a component adds a library target with the component name, the ESP-IDF build system will automatically add this to the build, expose public include directories, etc. If a component wants to add a library target with a different name, dependencies will need to be added manually via CMake commands.

### 4.2.17 Using Third-Party CMake Projects with Components

CMake is used for a lot of open-source C and C++ projects — code that users can tap into for their applications. One of the benefits of having a CMake build system is the ability to import these third-party projects, sometimes
even without modification! This allows for users to be able to get functionality that may not yet be provided by a component, or use another library for the same functionality.

Importing a library might look like this for a hypothetical library foo to be used in the main component:

```cpp
# Register the component
idf_component_register(...)  
# Set values of hypothetical variables that control the build of `foo`
set(FOO_BUILD_STATIC OFF)
set(FOO_BUILD_TESTS OFF)

# Create and import the library targets
add_subdirectory(foo)

# Publicly link `foo` to `main` component
target_link_libraries(main PUBLIC foo)
```

For an actual example, take a look at `build_system/cmake/import_lib`. Take note that what needs to be done in order to import the library may vary. It is recommended to read up on the library’s documentation for instructions on how to import it from other projects. Studying the library’s CMakeLists.txt and build structure can also be helpful.

It is also possible to wrap a third-party library to be used as a component in this manner. For example, the mbedtls component is a wrapper for Espressif’s fork of mbedtls. See its component CMakeLists.txt.

The CMake variable ESP_PLATFORM is set to 1 whenever the ESP-IDF build system is being used. Tests such as `if (ESP_PLATFORM)` can be used in generic CMake code if special IDF-specific logic is required.

### 4.2.18 Using Prebuilt Libraries with Components

The ESP-IDF build system provides a utility function `add_prebuilt_library` for users to be able to easily import and use prebuilt libraries:

```cpp
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...] [PRIV_REQUIRES req1 req2 ...])
```

where:
- `target_name`- name that can be used to reference the imported library, such as when linking to other targets
- `lib_path`- path to prebuilt library; may be an absolute or relative path to the component directory

Optional arguments `REQUIRES` and `PRIV_REQUIRES` specify dependency on other components. These have the same meaning as the arguments for `idf_component_register`.

Take note that the prebuilt library must have been compiled for the same target as the consuming project. Configuration relevant to the prebuilt library must also match. If not paid attention to, these two factors may contribute to subtle bugs in the app.

For an example, take a look at `build_system/cmake/import_prebuilt`.

### 4.2.19 Using ESP-IDF in Custom CMake Projects

ESP-IDF provides a template CMake project for easily creating an application. However, in some instances the user might already have an existing CMake project or may want to create a custom one. In these cases it is desirable to be able to consume IDF components as libraries to be linked to the user’s targets (libraries/ executables).

It is possible to do so by using the `build system APIs provided` by `tools/cmake/idf.cmake`. For example:

```
cmake_minimum_required(VERSION 3.5)
project(my_custom_app C)
```

(continues on next page)
Chapter 4. API Guides

(continued from previous page)

```c
# Include CMake file that provides ESP-IDF CMake build system APIs.
include(${ENV{IDF_PATH}}/tools/cmake/idf.cmake)

# Include ESP-IDF components in the build, may be thought as an equivalent of
# add_subdirectory() but with some additional processing and magic for ESP-IDF_
# ->build
# specific build processes.
idf_build_process(esp32)

# Create the project executable and plainly link the newlib component to it using
# its alias, idf::newlib.
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

# Let the build system know what the project executable is to attach more targets,_
# dependencies, etc.
idf_build_executable(${CMAKE_PROJECT_NAME}.elf)
```

The example in `build_system/cmake/idf_as_lib` demonstrates the creation of an application equivalent to hello world application using a custom CMake project.

**Note:** The IDF build system can only set compiler flags for source files that it builds. When an external CMake-Lists.txt file is used and PSRAM is enabled, remember to add `-mfix-esp32-psram-cache-issue` to the C compiler arguments. See `CONFIG_SPIRAM_CACHE_WORKAROUND` for details of this flag.

### 4.2.20 ESP-IDF CMake Build System API

**idf-build-commands**

```c
idf_build_get_property(var property [GENERATOR_EXPRESSION])
```

Retrieve a build property `property` and store it in `var` accessible from the current scope. Specifying `GENERATOR_EXPRESSION` will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

```c
idf_build_set_property(property val [APPEND])
```

Set a build property `property` with value `val`. Specifying `APPEND` will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

```c
idf_build_component(component_dir)
```

Present a directory `component_dir` that contains a component to the build system. Relative paths are converted to absolute paths with respect to current directory. All calls to this command must be performed before `idf_build_process`.

This command does not guarantee that the component will be processed during build (see the `COMPONENTS` argument description for `idf_build_process`)

```c
idf_build_process(target
    [PROJECT_DIR project_dir]
    [PROJECT_VER project_ver]
    [PROJECT_NAME project_name]
    [SDKCONFIG sdkconfig]
    [SDKCONFIG_DEFAULTS sdkconfig_defaults]
    [BUILD_DIR build_dir]
    [COMPONENTS component1 component2 ...])
```
Chapter 4. API Guides

Performs the bulk of the behind-the-scenes magic for including ESP-IDF components such as component configuration, libraries creation, dependency expansion and resolution. Among these functions, perhaps the most important from a user’s perspective is the libraries creation by calling each component’s `idf_component_register`. This command creates the libraries for each component, which are accessible using aliases in the form `idf::component_name`. These aliases can be used to link the components to the user’s own targets, either libraries or executables.

The call requires the target chip to be specified with `target` argument. Optional arguments for the call include:

- `PROJECT_DIR` - directory of the project; defaults to `CMAKE_SOURCE_DIR`
- `PROJECT_NAME` - name of the project; defaults to `CMAKE_PROJECT_NAME`
- `PROJECT_VER` - version/revision of the project; defaults to “1”
- `SDKCONFIG` - output path of generated sdkconfig file; defaults to `PROJECT_DIR/sdkconfig` or `CMAKE_SOURCE_DIR/sdkconfig` depending if `PROJECT_DIR` is set
- `SDKCONFIG_DEFAULTS` - defaults file to use for the build; defaults to empty
- `BUILD_DIR` - directory to place ESP-IDF build-related artifacts, such as generated binaries, text files, components; defaults to `CMAKE_BINARY_DIR`
- `COMPONENTS` - select components to process among the components known by the build system (added via `idf_build_component`). This argument is used to trim the build. Other components are automatically added if they are required in the dependency chain, i.e. the public and private requirements of the components in this list are automatically added, and in turn the public and private requirements of those requirements, so on and so forth. If not specified, all components known to the build system are processed.

```
idf_build_executable(executable)
```

Specify the executable `executable` for ESP-IDF build. This attaches additional targets such as dependencies related to flashing, generating additional binary files, etc. Should be called after `idf_build_process`.

```
idf_build_get_config(var config [GENERATOR_EXPRESSION])
```

Get the value of the specified config. Much like build properties, specifying `GENERATOR_EXPRESSION` will retrieve the generator expression string for that config, instead of the actual value, which can be used with CMake commands that support generator expressions. Actual config values are only known after call to `idf_build_process`, however.

**idf-build-properties**

These are properties that describe the build. Values of build properties can be retrieved by using the build command `idf_build_get_property`. For example, to get the Python interpreter used for the build:

```
idf_build_get_property(python PYTHON)
message(STATUS "The Python interpreter is: ${python}")
```

- `BUILD_DIR` - build directory; set from `idf_build_process BUILD_DIR` argument
- `BUILD_COMPONENTS` - list of components included in the build; set by `idf_build_process`.
- `BUILD_COMPONENT_ALIASES` - list of library alias of components included in the build; set by `idf_build_process`.
- `C_COMPILE_OPTIONS` - compile options applied to all components’ C source files
- `COMPILE_DEFINITIONS` - compile definitions applied to all component source files
- `CXX_COMPILE_OPTIONS` - compile options applied to all components’ C++ source files
- `EXECUTABLE` - project executable; set by call to `idf_build_executable`.
- `EXECUTABLE_NAME` - name of project executable without extension; set by call to `idf_build_executable`.
- `IDF_PATH` - ESP-IDF path; set from `IDF_PATH` environment variable, if not, inferred from the location of `idf.cmake`.
- `IDF_TARGET` - target chip for the build; set from the required target argument for `idf_build_process`.
- `IDF_VER` - ESP-IDF version; set from either a version file or the Git revision of the IDF_PATH repository.
• INCLUDE_DIRECTORIES - include directories for all component source files
• KCONFIGS - list of Kconfig files found in components in build; set by \texttt{idf\_build\_process}
• KCONFIG_PROJBUildS - list of Kconfig.projbuild files found in components in build; set by \texttt{idf\_build\_process}
• PROJECT\_NAME - name of the project; set from \texttt{idf\_build\_process} PROJECT\_NAME argument
• PROJECT\_DIR - directory of the project; set from \texttt{idf\_build\_process} PROJECT\_DIR argument
• PROJECT\_VER - version of the project; set from \texttt{idf\_build\_process} PROJECT\_VER argument
• PYTHON - Python interpreter used for the build; set from PYTHON environment variable if available, if not “python” is used
• SDKCONFIG - full path to output config file; set from \texttt{idf\_build\_process} SDKCONFIG argument
• SDKCONFIG\_DEFAULTS - full path to config defaults file; set from \texttt{idf\_build\_process} SDKCONFIG\_DEFAULTS argument
• SDKCONFIG\_HEADER - full path to C/C++ header file containing component configuration; set by \texttt{idf\_build\_process}
• SDKCONFIG\_CMAKE - full path to CMake file containing component configuration; set by \texttt{idf\_build\_process}
• SDKCONFIG\_JSON - full path to JSON file containing component configuration; set by \texttt{idf\_build\_process}
• SDKCONFIG\_JSON\_MENUS - full path to JSON file containing config menus; set by \texttt{idf\_build\_process}

\textbf{idf-component-commands}

\begin{verbatim}
\texttt{idf\_component\_get\_property(var component property [GENERATOR\_EXPRESSION])}
\end{verbatim}

Retrieve a specified component’s component property, property and store it in var accessible from the current scope. Specifying \texttt{GENERATOR\_EXPRESSION} will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

\begin{verbatim}
\texttt{idf\_component\_set\_property(component property val [APPEND])}
\end{verbatim}

Set a specified component’s component property, property with value \texttt{val}. Specifying \texttt{APPEND} will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

\begin{verbatim}
\texttt{idf\_component\_register([\{SRCS src1 src2 ...\} | \{SRC\_DIRS dir1 dir2 ...\} [EXCLUDE_\_SRCS src1 src2 ...]]
\{INCLUDE\_DIRS dir1 dir2 ...
\{PRIV\_INCLUDE\_DIRS dir1 dir2 ...
\{REQUIRES component1 component2 ...
\{PRIV\_REQUIRES component1 component2 ...
\{LD\_FRAGMENTS ldfragment1 ldfragment2 ...
\{REQUIRED\_IDF\_TARGETS target1 target2 ...
\{EMBED\_FILES file1 file2 ...
\{EMBED\_TXTFILES file1 file2 ...})}
\end{verbatim}

Register a component to the build system. Much like the \texttt{project()} CMake command, this should be called from the component’s CMakeLists.txt directly (not through a function or macro) and is recommended to be called before any other command. Here are some guidelines on what commands can \textbf{not} be called before \texttt{idf\_component\_register}:

- commands that are not valid in CMake script mode
- custom commands defined in project_include.cmake
- build system API commands except \texttt{idf\_build\_get\_property}; although consider whether the property may not have been set yet

Commands that set and operate on variables are generally okay to call before \texttt{idf\_component\_register}.

The arguments for \texttt{idf\_component\_register} include:
Chapter 4. API Guides

- **SRCS** - component source files used for creating a static library for the component; if not specified, component is treated as a config-only component and an interface library is created instead.
- **SRC_DIRS, EXCLUDE_SRCS** - used to glob source files (.c, .cpp, .S) by specifying directories, instead of specifying source files manually via SRCS. Note that this is subject to the limitations of globbing in CMake. Source files specified in EXCLUDE_SRCS are removed from the globbed files.
- **INCLUDE_DIRS** - paths, relative to the component directory, which will be added to the include search path for all other components which require the current component
- **PRIV_INCLUDE_DIRS** - directory paths, must be relative to the component directory, which will be added to the include search path for this component’s source files only
- **REQUIRES** - public component requirements for the component
- **PRIV_REQUIRES** - private component requirements for the component; ignored on config-only components
- **LDFRAGMENTS** - component linker fragment files
- **REQUIRED_IDF_TARGETS** - specify the only target the component supports

The following are used for embedding data into the component, and is considered as source files when determining if a component is config-only. This means that even if the component does not specify source files, a static library is still created internally for the component if it specifies either:

- **EMBED_FILES** - binary files to be embedded in the component
- **EMBED_TXTFILES** - text files to be embedded in the component

### idf-component-properties

These are properties that describe a component. Values of component properties can be retrieved by using the build command `idf_component_get_property`. For example, to get the directory of the freertos component:

```sh
idf_component_get_property(dir freertos COMPONENT_DIR)
message(STATUS "The 'freertos' component directory is: ${dir}")
```

- **COMPONENT_ALIAS** - alias for COMPONENT_LIB used for linking the component to external targets; set by `idf_build_component` and alias library itself is created by `idf_component_register`
- **COMPONENT_DIR** - component directory; set by `idf_build_component`
- **COMPONENT_LIB** - name for created component static/interface library; set by `idf_build_component` and library itself is created by `idf_component_register`
- **COMPONENT_NAME** - name of the component; set by `idf_build_component` based on the component directory name
- **COMPONENT_TYPE** - type of the component, whether LIBRARY or CONFIG_ONLY. A component is of type LIBRARY if it specifies source files or embeds a file
- **EMBED_FILES** - list of files to embed in component; set from `idf_component_register EMBED_FILES` argument
- **EMBED_TXTFILES** - list of text files to embed in component; set from `idf_component_register EMBED_TXTFILES` argument
- **INCLUDE_DIRS** - list of component include directories; set from `idf_component_register INCLUDE_DIRS` argument
- **KCONFIG** - component Kconfig file; set by `idf_build_component`
- **KCONFIG_PROJBUILD** - component Kconfig.projbuid; set by `idf_build_component`
- **LDFRAGMENTS** - list of component linker fragment files; set from `idf_component_register LDFRAGMENTS` argument
- **PRIV_INCLUDE_DIRS** - list of component private include directories; set from `idf_component_register PRIV_INCLUDE_DIRS` on components of type LIBRARY
- **PRIV_REQUIRES** - list of private component dependencies; set from `idf_component_register PRIV_REQUIRES` argument
- **REQUIRED_IDF_TARGETS** - list of targets the component supports; set from `idf_component_register REQUIRED_IDF_TARGETS` argument
- **REQUIRED_IDF_TARGETS** - list of targets the component supports; set from `idf_component_register REQUIRED_IDF_TARGETS` argument
- **SRCS** - list of component source files; set from SRCs or SRC_DIRS/EXCLUDE_SRCS argument of `idf_component_register`
4.2.21 File Globbing & Incremental Builds

The preferred way to include source files in an ESP-IDF component is to list them manually via SRCS argument to `idf_component_register`:

```
idf_component_register(SRCS library/a.c library/b.c platform/platform.c
...)
```

This preference reflects the CMake best practice of manually listing source files. This could, however, be inconvenient when there are lots of source files to add to the build. The ESP-IDF build system provides an alternative way for specifying source files using SRC_DIRS:

```
idf_component_register(SRC_DIRS library platform
...)
```

This uses globbing behind the scenes to find source files in the specified directories. Be aware, however, that if a new source file is added and this method is used, then CMake won’t know to automatically re-run and this file won’t be added to the build.

The trade-off is acceptable when you’re adding the file yourself, because you can trigger a clean build or run `idf.py reconfigure` to manually re-run CMake. However, the problem gets harder when you share your project with others who may check out a new version using a source control tool like Git.

For components which are part of ESP-IDF, we use a third party Git CMake integration module (`/tools/cmake/third_party/GetGitRevisionDescription.cmake`) which automatically re-runs CMake any time the repository commit changes. This means if you check out a new ESP-IDF version, CMake will automatically re-run.

For project components (not part of ESP-IDF), there are a few different options:

- If keeping your project file in Git, ESP-IDF will automatically track the Git revision and re-run CMake if the revision changes.
- If some components are kept in a third git repository (not the project repository or ESP-IDF repository), you can add a call to the `git_describe` function in a component CMakeLists file in order to automatically trigger re-runs of CMake when the Git revision changes.
- If not using Git, remember to manually run `idf.py reconfigure` whenever a source file may change.
- To avoid this problem entirely, use SRCS argument to `idf_component_register` to list all source files in project components.

The best option will depend on your particular project and its users.

4.2.22 Build System Metadata

For integration into IDEs and other build systems, when CMake runs the build process generates a number of metadata files in the `build/` directory. To regenerate these files, run `cmake` or `idf.py reconfigure` (or any other `idf.py build command`).

- `compile_commands.json` is a standard format JSON file which describes every source file which is compiled in the project. A CMake feature generates this file, and many IDEs know how to parse it.
- `project_description.json` contains some general information about the ESP-IDF project, configured paths, etc.
- `flasher_args.json` contains `esptool.py` arguments to flash the project’s binary files. There are also `flash_*_args` files which can be used directly with `esptool.py`. See *Flash arguments*.
- `CMakeCache.txt` is the CMake cache file which contains other information about the CMake process, toolchain, etc.
- `config/sdkconfig.json` is a JSON-formatted version of the project configuration values.
- `config/kconfig_menus.json` is a JSON-formatted version of the menus shown in menuconfig, for use in external IDE UIs.
Chapter 4. API Guides

**JSON Configuration Server**

A tool called `confserver.py` is provided to allow IDEs to easily integrate with the configuration system logic. `confserver.py` is designed to run in the background and interact with a calling process by reading and writing JSON over process stdin & stdout.

You can run `confserver.py` from a project via `idf.py confserver` or `ninja confserver`, or a similar target triggered from a different build generator.

The config server outputs human-readable errors and warnings on stderr and JSON on stdout. On startup, it will output the full values of each configuration item in the system as a JSON dictionary, and the available ranges for values which are range constrained. The same information is contained in `sdkconfig.json`:

```json
{
    "version": 1,
    "values": {
        "ITEM": "value",
        "ITEM_2": 1024,
        "ITEM_3": false
    },
    "ranges": {
        "ITEM_2": [0, 32768]
    }
}
```

Only visible configuration items are sent. Invisible/disabled items can be parsed from the static `kconfig_menus.json` file which also contains the menu structure and other metadata (descriptions, types, ranges, etc.)

The Configuration Server will then wait for input from the client. The client passes a request to change one or more values, as a JSON object followed by a newline:

```json
{"version": 1, "set": {"SOME_NAME": false, "OTHER_NAME": true}}
```

The Configuration Server will parse this request, update the project `sdkconfig` file, and return a full list of changes:

```json
{"version": 1, "values": {"SOME_NAME": false, "OTHER_NAME": true}, "ranges": {"HAS_RANGE": [3, 4]}}
```

Items which are now invisible/disabled will return value `null`. Any item which is newly visible will return its newly visible current value.

If the range of a config item changes, due to conditional range depending on another value, then this is also sent:

```json
{"version": 1, "values": {"OTHER_NAME": true}, "ranges": {"HAS_RANGE": [3, 4], "DEPENDS_ON_"
```

If invalid data is passed, an “error” field is present on the object:

```json
{"version": 1, "values": {}, "error": {"The following config symbol(s) were not_visible so were not updated: NOT_VISIBLE_ITEM"}}
```

By default, no config changes are written to the `sdkconfig` file. Changes are held in memory until a “save” command is sent:

```json
{"version": 1, "save": null}
```

To reload the config values from a saved file, discarding any changes in memory, a “load” command can be sent:

```json
{"version": 1, "load": null}
```

The value for both “load” and “save” can be a new pathname, or “null” to load/save the previous pathname. The response to a “load” command is always the full set of config values and ranges, the same as when the server is initially started.

Any combination of “load”, “set”, and “save” can be sent in a single command and commands are executed in that order. Therefore it’s possible to load config from a file, set some config item values and then save to a file in a single command.

**Note:** The configuration server does not automatically load any changes which are applied externally to the `sdkconfig` file. Send a “load” command or restart the server if the file is externally edited.
**Note:** The configuration server does not re-run CMake to regenerate other build files or metadata files after *sdkconfig* is updated. This will happen automatically the next time CMake or *idf.py* is run.

### 4.2.23 Migrating from ESP-IDF GNU Make System

Some aspects of the CMake-based ESP-IDF build system are very similar to the older GNU Make-based system. The developer needs to provide values the include directories, source files etc. There is a syntactical difference, however, as the developer needs to pass these as arguments to the registration command, *idf_component_register*.

#### Automatic Conversion Tool

An automatic project conversion tool is available in `/tools/cmake/convert_to_cmake.py`. Run this command line tool with the path to a project like this:

```bash
$IDF_PATH/tools/cmake/convert_to_cmake.py /path/to/project_dir
```

The project directory must contain a `Makefile`, and GNU Make (make) must be installed and available on the PATH. The tool will convert the project `Makefile` and any component `component.mk` files to their equivalent `CMakeLists.txt` files.

It does so by running `make` to expand the ESP-IDF build system variables which are set by the build, and then producing equivalent CMake lists files to set the same variables.

**Important:** When the conversion tool converts a `component.mk` file, it doesn’t determine what other components that component depends on. This information needs to be added manually by editing the new component `CMakeLists.txt` file and adding `REQUIRES` and/or `PRIV_REQUIRES` clauses. Otherwise, source files in the component will fail to compile as headers from other components are not found. See [Component Requirements](#).

The conversion tool is not capable of dealing with complex `Makefile` logic or unusual targets. These will need to be converted by hand.

#### No Longer Available in CMake

Some features are significantly different or removed in the CMake-based system. The following variables no longer exist in the CMake-based build system:

- **COMPONENT_BUILD_DIR**: Use `CMAKE_CURRENT_BINARY_DIR` instead.
- **COMPONENT_LIBRARY**: Defaulted to `$ (COMPONENT_NAME).a`, but the library name could be overridden by the component. The name of the component library can no longer be overridden by the component.
- **CC, LD, AR, OBJCOPY**: Full paths to each tool from the gcc xtensa cross-toolchain. Use `CMAKE_C_COMPILER`, `CMAKE_C_LINK_EXECUTABLE`, `CMAKE_OBJCOPY`, etc instead. [Full list here](#).
- **HOSTCC, HOSTLD, HOSTAR**: Full names of each tool from the host native toolchain. These are no longer provided, external projects should detect any required host toolchain manually.
- **COMPONENT_ADD_LDFLAGS**: Used to override linker flags. Use the CMake `target_link_libraries` command instead.
- **COMPONENT_ADD_LINKER_DEPS**: List of files that linking should depend on. `target_link_libraries` will usually infer these dependencies automatically. For linker scripts, use the provided custom CMake function `target_linker_scripts`.
- **COMPONENT_SUBMODULES**: No longer used, the build system will automatically enumerate all submodules in the ESP-IDF repository.
- **COMPONENT_EXTRA_INCLUDES**: Used to be an alternative to `COMPONENT_PRIV_INCLUDEDIRS` for absolute paths. Use `PRIV_INCLUDE_DIRS` argument to `idf_component_register` for all cases now (can be relative or absolute).
Chapter 4. API Guides

- **COMPONENT_OBJXS**: Previously, component sources could be specified as a list of object files. Now they can be specified as a list of source files via `SRCS` argument to `idf_component_register`.
- **COMPONENT_OBJSEXCLUDE**: Has been replaced with `EXCLUDE_SRCS` argument to `idf_component_register`. Specify source files (as absolute paths or relative to component directory), instead.
- **COMPONENT_EXTRA_CLEAN**: Set property `ADDITIONAL_MAKE_CLEAN_FILES` instead but note CMake has some restrictions around this functionality.
- **COMPONENT_CONFIG_ONLY**: Call `idf_component_register` without any arguments instead. See [Configuration-Only Components](https://docs.espressif.com/projects/esp-idf/en/latest/esp-idf/components/components.html#configuration-only-components).

### No Default Values

Unlike in the legacy Make-based build system, the following have no default values:

- **Source directories** (`COMPONENT_SRCDIRS` variable in Make, `SRC_DIRS` argument to `idf_component_register` in CMake)
- **Include directories** (`COMPONENT_ADD_INCLUDEDIRS` variable in Make, `INCLUDE_DIRS` argument to `idf_component_register` in CMake)

### No Longer Necessary

- In the legacy Make-based build system, it is required to also set `COMPONENT_SRCDIRS` if `COMPONENT_SRCS` is set. In CMake, the equivalent is not necessary i.e. specifying `SRC_DIRS` to `idf_component_register` if `SRCS` is also specified (in fact, `SRCS` is ignored if `SRC_DIRS` is specified).

### Flashing from make

`make flash` and similar targets still work to build and flash. However, project `sdkconfig` no longer specifies serial port and baud rate. Environment variables can be used to override these. See [Flashing with ninja or make](https://docs.espressif.com/projects/esp-idf/en/latest/esp-idf/components/components.html#flashing-with-ninja-or-make) for more details.

### 4.3 Build System (Legacy GNU Make)

**Note**: Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

This document explains the legacy GNU Make Espressif IoT Development Framework build system and the concept of “components”

Read this document if you want to know how to organise an ESP-IDF project using GNU Make build system.

We recommend using the `esp-idf-template` project as a starting point for your project.

#### 4.3.1 Using the Build System

The `esp-idf` README file contains a description of how to use the build system to build your project.
4.3.2 Overview

An ESP-IDF project can be seen as an amalgamation of a number of components. For example, for a webserver that shows the current humidity, there could be:

- The ESP32 base libraries (libc, rom bindings etc)
- The Wi-Fi drivers
- A TCP/IP stack
- The FreeRTOS operating system
- A webserver
- A driver for the humidity sensor
- Main code tying it all together

ESP-IDF makes these components explicit and configurable. To do that, when a project is compiled, the build environment will look up all the components in the ESP-IDF directories, the project directories and (optionally) in additional custom component directories. It then allows the user to configure the ESP-IDF project using a text-based menu system to customize each component. After the components in the project are configured, the build process will compile the project.

Concepts

- A “project” is a directory that contains all the files and configuration to build a single “app” (executable), as well as additional supporting output such as a partition table, data/filesystem partitions, and a bootloader.
- “Project configuration” is held in a single file called sdkconfig in the root directory of the project. This configuration file is modified via `make menuconfig` to customise the configuration of the project. A single project contains exactly one project configuration.
- An “app” is an executable which is built by esp-idf. A single project will usually build two apps - a “project app” (the main executable, i.e. your custom firmware) and a “bootloader app” (the initial bootloader program which launches the project app).
- “components” are modular pieces of standalone code which are compiled into static libraries (.a files) and linked into an app. Some are provided by esp-idf itself, others may be sourced from other places.

Some things are not part of the project:

- “ESP-IDF” is not part of the project. Instead it is standalone, and linked to the project via the IDF_PATH environment variable which holds the path of the esp-idf directory. This allows the IDF framework to be decoupled from your project.
- The toolchain for compilation is not part of the project. The toolchain should be installed in the system command line PATH, or the path to the toolchain can be set as part of the compiler prefix in the project configuration.

Example Project

An example project directory tree might look like this:

```
- myProject/
  - Makefile
  - sdkconfig
  - components/
    - component1/
      - component.mk
      - Kconfig
      - src1.c
    - component2/
      - component.mk
      - Kconfig
      - src1.c
      - include/
  - main/
    - src1.c
    - src2.c
    - component.mk
  - build/
```
This example “myProject” contains the following elements:

- A top-level project Makefile. This Makefile sets the PROJECT_NAME variable and (optionally) defines other project-wide make variables. It includes the core $(IDF_PATH)/make/project.mk makefile which implements the rest of the ESP-IDF build system.
- “sdkconfig” project configuration file. This file is created/updated when “make menuconfig” runs, and holds configuration for all of the components in the project (including esp-idf itself). The “sdkconfig” file may or may not be added to the source control system of the project.
- Optional “components” directory contains components that are part of the project. A project does not have to contain custom components of this kind, but it can be useful for structuring reusable code or including third party components that aren’t part of ESP-IDF.
- “main” directory is a special “pseudo-component” that contains source code for the project itself. “main” is a default name, the Makefile variable COMPONENT_DIRS includes this component but you can modify this variable (or set EXTRA_COMPONENT_DIRS) to look for components in other places.
- “build” directory is where build output is created. After the make process is run, this directory will contain interim object files and libraries as well as final binary output files. This directory is usually not added to source control or distributed with the project source code.

Component directories contain a component makefile - component.mk. This may contain variable definitions to control the build process of the component, and its integration into the overall project. See Component Makefiles for more details.

Each component may also include a Kconfig file defining the component configuration options that can be set via the project configuration. Some components may also include Kconfig.projbuild and Makefile.projbuild files, which are special files for overriding parts of the project.

Project Makefiles

Each project has a single Makefile that contains build settings for the entire project. By default, the project Makefile can be quite minimal.

Minimal Example Makefile

```make
PROJECT_NAME := myProject
include $(IDF_PATH)/make/project.mk
```

Mandatory Project Variables

- PROJECT_NAME: Name of the project. Binary output files will use this name - ie myProject.bin, myProject.elf.

Optional Project Variables These variables all have default values that can be overridden for custom behaviour. Look in make/project.mk for all of the implementation details.

- PROJECT_PATH: Top-level project directory. Defaults to the directory containing the Makefile. Many other project variables are based on this variable. The project path cannot contain spaces.
- BUILD_DIR_BASE: The build directory for all objects/libraries/binaries. Defaults to $(PROJECT_PATH)/build.
- COMPONENT_DIRS: Directories to search for components. Defaults to $(IDF_PATH)/components, $(PROJECT_PATH)/components, $(PROJECT_PATH)/main and EXTRA_COMPONENT_DIRS. Override this variable if you don’t want to search for components in these places.
- EXTRA_COMPONENT_DIRS: Optional list of additional directories to search for components.
- COMPONENTS: A list of component names to build into the project. Defaults to all components found in the COMPONENT_DIRS directories.
- EXCLUDE_COMPONENTS: Optional list of component names to exclude during the build process. Note that this decreases build time, but not binary size.
• **TEST_EXCLUDE_COMPONENTS**: Optional list of component names to exclude during the build process of unit tests.

Any paths in these Makefile variables should be absolute paths. You can convert relative paths using `${PROJECT_PATH}/xxx`, `${IDF_PATH}/xxx`, or use the Make function `$(abspath xxx)`.

These variables should all be set before the line `include ${(IDF_PATH)/make/project.mk}` in the Makefile.

### Component Makefiles

Each project contains one or more components, which can either be part of esp-idf or added from other component directories.

A component is any directory that contains a `component.mk` file.

### Searching for Components

The list of directories in `COMPONENT_DIRS` is searched for the project’s components. Directories in this list can either be components themselves (ie they contain a `component.mk` file), or they can be top-level directories whose subdirectories are components.

Running the `make list-components` target dumps many of these variables and can help debug the discovery of component directories.

#### Multiple components with the same name

When esp-idf is collecting all the components to compile, it will do this in the order specified by `COMPONENT_DIRS`; by default, this means the idf components first, the project components second and optionally the components in `EXTRA_COMPONENT_DIRS` last. If two or more of these directories contain component subdirectories with the same name, the component in the last place searched is used. This allows, for example, overriding esp-idf components with a modified version by simply copying the component from the esp-idf component directory to the project component tree and then modifying it there. If used in this way, the esp-idf directory itself can remain untouched.

### Minimal Component Makefile

The minimal `component.mk` file is an empty file(!). If the file is empty, the default component behaviour is set:

- All source files in the same directory as the makefile (`*.c`, `*.cpp`, `*.cc`, `*.S`) will be compiled into the component library
- A sub-directory “include” will be added to the global include search path for all other components.
- The component library will be linked into the project app.

See example component makefiles for more complete component makefile examples.

Note that there is a difference between an empty `component.mk` file (which invokes default component build behaviour) and no `component.mk` file (which means no default component build behaviour will occur.) It is possible for a component to have no `component.mk` file, if it only contains other files which influence the project configuration or build process.

### Preset Component Variables

The following component-specific variables are available for use inside `component.mk`, but should not be modified:

- **COMPONENT_PATH**: The component directory. Evaluates to the absolute path of the directory containing `component.mk`. The component path cannot contain spaces.
- **COMPONENT_NAME**: Name of the component. Defaults to the name of the component directory.
- **COMPONENT_BUILD_DIR**: The component build directory. Evaluates to the absolute path of a directory inside `${BUILD_DIR_BASE}` where this component’s source files are to be built. This is also the Current Working Directory any time the component is being built, so relative paths in make targets, etc. will be relative to this directory.
Chapter 4. API Guides

- **COMPONENT_LIBRARY**: Name of the static library file (relative to the component build directory) that will be built for this component. Defaults to $(COMPONENT_NAME).a.

The following variables are set at the project level, but exported for use in the component build:

- **PROJECT_NAME**: Name of the project, as set in project Makefile
- **PROJECT_PATH**: Absolute path of the project directory containing the project Makefile.
- **COMPONENTS**: Name of all components that are included in this build.
- **CONFIG_***: Each value in the project configuration has a corresponding variable available in make. All names begin with CONFIG_
- **CC, LD, AR, OBJCOPY**: Full paths to each tool from the gcc xtensa cross-toolchain.
- **HOSTCC, HOSTLD, HOSTAR**: Full names of each tool from the host native toolchain.
- **IDF_VER**: ESP-IDF version, retrieved from either $(IDF_PATH)/version.txt file (if present) else using git command git describe. Recommended format here is single liner that specifies major IDF release version, e.g. v2.0 for a tagged release or v2.0-275-g0efaa4f for an arbitrary commit. Application can make use of this by calling esp_get_idf_version().
- **IDF_VERSION_MAJOR, IDF_VERSION_MINOR, IDF_VERSION_PATCH**: Components of ESP-IDF version, to be used in conditional expressions. Note that this information is less precise than that provided by IDF_VER variable. v4.0-dev-* v4.0-beta1 v4.0-rc1 and v4.0 will all have the same values of ESP_IDF_VERSION_* variables, but different IDF_VER values.
- **PROJECT_VER**: Project version.
  - If PROJECT_VER variable is set in project Makefile file, its value will be used.
  - Else, if the $PROJECT_PATH/version.txt exists, its contents will be used as PROJECT_VER.
  - Else, if the project is located inside a Git repository, the output of git describe will be used.
  - Otherwise, PROJECT_VER will be "1".

If you modify any of these variables inside component.mk then this will not prevent other components from building but it may make your component hard to build and/or debug.

**Optional Project-Wide Component Variables**  The following variables can be set inside component.mk to control build settings across the entire project:

- **COMPONENT_ADD_INCLUDEDIRS**: Paths, relative to the component directory, which will be added to the include search path for all components in the project. Defaults to include if not overridden. If an include directory is only needed to compile this specific component, add it to COMPONENT_PRIV_INCLUDEDIRS instead.
- **COMPONENT_ADD_LDFLAGS**: Add linker arguments to the LDFLAGS for the app executable. Defaults to -L$(COMPONENT_NAME). If adding pre-compiled libraries to this directory, add them as absolute paths -ie $(COMPONENT_PATH)/libwhatever.a
- **COMPONENT_DEPENDS**: Optional list of component names that should be compiled before this component. This is not necessary for link-time dependencies, because all component include directories are available at all times. It is necessary if one component generates an include file which you then want to include in another component. Most components do not need to set this variable.
- **COMPONENT_ADD_LINKER_DEPS**: Optional list of component-relative paths to files which should trigger a re-link of the ELF file if they change. Typically used for linker script files and binary libraries. Most components do not need to set this variable.

The following variable only works for components that are part of esp-idf itself:

- **COMPONENT_SUBMODULES**: Optional list of git submodule paths (relative to COMPONENT_PATH) used by the component. These will be checked (and initialised if necessary) by the build process. This variable is ignored if the component is outside the IDF_PATH directory.

**Optional Component-Specific Variables**  The following variables can be set inside component.mk to control the build of that component:

- **COMPONENT_PRIV_INCLUDEDIRS**: Directory paths, must be relative to the component directory, which will be added to the include search path for this component’s source files only.
- **COMPONENT_EXTRA_INCLUDES**: Any extra include paths used when compiling the component’s source files. These will be prefixed with '-I' and passed as-is to the compiler. Similar to the COMPO-
NENT_PRIV_INCLUDEDIRS variable, except these paths are not expanded relative to the component directory.

- COMPONENT_SRCDIRS: Directory paths, must be relative to the component directory, which will be searched for source files (*.cpp, *.c, *.S). Defaults to '../', ie the component directory itself. Override this to specify a different list of directories which contain source files.

- COMPONENT_OBJJS: Object files to compile. Default value is a .o file for each source file that is found in COMPONENT_SRCDIRS. Overriding this list allows you to exclude source files in COMPONENT_SRCDIRS that would otherwise be compiled. See Specifying source files

- COMPONENT_EXTRA_CLEAN: Paths, relative to the component build directory, of any files that are generated using custom make rules in the component.mk file and which need to be removed as part of make clean. See Source Code Generation for an example.

- COMPONENT_OWNBUILDTARGET & COMPONENT_OWNCLEANTARGET: These targets allow you to fully override the default build behaviour for the component. See Fully Overriding The Component Makefile for more details.

- COMPONENT_CONFIGONLY: If set, this flag indicates that the component produces no built output at all (ie COMPONENT_LIBRARY is not built), and most other component variables are ignored. This flag is used for IDF internal components which contain only KConfig.projbuild and/or Makefile.projbuild files to configure the project, but no source files.

- CFLAGS: Flags passed to the C compiler. A default set of CFLAGS is defined based on project settings. Component-specific additions can be made via CFLAGS +=. It is also possible (although not recommended) to override this variable completely for a component.

- CPPFLAGS: Flags passed to the C preprocessor (used for .c, .cpp and .S files). A default set of CPPFLAGS is defined based on project settings. Component-specific additions can be made via CPPFLAGS +=. It is also possible (although not recommended) to override this variable completely for a component.

- CXXFLAGS: Flags passed to the C++ compiler. A default set of CXXFLAGS is defined based on project settings. Component-specific additions can be made via CXXFLAGS +=. It is also possible (although not recommended) to override this variable completely for a component.

- COMPONENT_ADD_LDFRAGMENTS: Paths to linker fragment files for the linker script generation functionality. See Linker Script Generation.

To apply compilation flags to a single source file, you can add a variable override as a target, ie:

```make
apps/dhcpserver.o: CFLAGS += -Wno-unused-variable
```

This can be useful if there is upstream code that emits warnings.

**Component Configuration**

Each component can also have a Kconfig file, alongside component.mk. This contains configuration settings to add to the “make menuconfig” for this component.

These settings are found under the “Component Settings” menu when menuconfig is run.

To create a component KConfig file, it is easiest to start with one of the KConfig files distributed with esp-idf.

For an example, see Adding conditional configuration.

**Preprocessor Definitions**

ESP-IDF build systems adds the following C preprocessor definitions on the command line:

- ESP_PLATFORM — Can be used to detect that build happens within ESP-IDF.
- IDF_VER — ESP-IDF version, see Preset Component Variables for more details.

**Build Process Internals**

**Top Level: Project Makefile**

- “make” is always run from the project directory and the project makefile, typically named Makefile.
Chapter 4. API Guides

• The project makefile sets PROJECT_NAME and optionally customises other optional project variables.
• The project makefile includes $(IDF_PATH)/make/project.mk which contains the project-level Make logic.
• project.mk fills in default project-level make variables and includes make variables from the project configuration. If the generated makefile containing project configuration is out of date, then it is regenerated (via targets in project_config.mk) and then the make process restarts from the top.
• project.mk builds a list of components to build, based on the default component directories or a custom list of components set in optional project variables.
• Each component can set some optional project-wide component variables. These are included via generated makefiles named component_project_vars.mk - there is one per component. These generated makefiles are included into project.mk. If any are missing or out of date, they are regenerated (via a recursive make call to the component makefile) and then the make process restarts from the top.
• Makefile.projbuild files from components are included into the make process, to add extra targets or configuration.
• By default, the project makefile also generates top-level build & clean targets for each component and sets up app and clean targets to invoke all of these sub-targets.
• In order to compile each component, a recursive make is performed for the component makefile.

To better understand the project make process, have a read through the project.mk file itself.

Second Level: Component Makefiles

• Each call to a component makefile goes via the $(IDF_PATH)/make/component_wrapper.mk wrapper makefile.
• This component wrapper includes all component Makefile.componentbuild files, making any recipes, variables etc in these files available to every component.
• The component_wrapper.mk is called with the current directory set to the component build directory, and the COMPONENT_MAKEFILE variable is set to the absolute path to component.mk.
• component_wrapper.mk sets default values for all component variables, then includes the component.mk file which can override or modify these.
• If COMPONENT_OWNBUILDTARGET and COMPONENT_OWNCLEANTARGET are not defined, default build and clean targets are created for the component’s source files and the prerequisite COMPONENT_LIBRARY static library file.
• The component_project_vars.mk file has its own target in component_wrapper.mk, which is evaluated from project.mk if this file needs to be rebuilt due to changes in the component makefile or the project configuration.

To better understand the component make process, have a read through the component_wrapper.mk file and some of the component.mk files included with esp-idf.

Running Make Non-Interactively

When running make in a situation where you don’t want interactive prompts (for example: inside an IDE or an automated build system) append BATCH_BUILD=1 to the make arguments (or set it as an environment variable).

Setting BATCH_BUILD implies the following:

• Verbose output (same as V=1, see below). If you don’t want verbose output, also set V=0.
• If the project configuration is missing new configuration items (from new components or esp-idf updates) then the project use the default values, instead of prompting the user for each item.
• If the build system needs to invoke menuconfig, an error is printed and the build fails.

Advanced Make Targets

• make app, make bootloader, make partition table can be used to build only the app, bootloader, or partition table from the project as applicable.
• make erase_flash and make erase_otadata will use esptool.py to erase the entire flash chip and the OTA selection setting from the flash chip, respectively.
• `make size` prints some size information about the app. `make size-components` and `make size-files` are similar targets which print more detailed per-component or per-source-file information, respectively.

**Debugging The Make Process**

Some tips for debugging the esp-idf build system:

• Appending `V=1` to the make arguments (or setting it as an environment variable) will cause make to echo all commands executed, and also each directory as it is entered for a sub-make.
• Running `make -w` will cause make to echo each directory as it is entered for a sub-make - same as `V=1` but without also echoing all commands.
• Running `make --trace` (possibly in addition to one of the above arguments) will print out every target as it is built, and the dependency which caused it to be built.
• Running `make -p` prints a (very verbose) summary of every generated target in each makefile.

For more debugging tips and general make information, see the [GNU Make Manual](https://www.gnu.org/software/make/manual/).

**Warning On Undefined Variables**  
By default, the build process will print a warning if an undefined variable is referenced (like `$(DOES_NOT_EXIST)`). This can be useful to find errors in variable names.

If you don’t want this behaviour, it can be disabled in menuconfig’s top-level menu under SDK tool configuration.

Note that this option doesn’t trigger a warning if `ifdef` or `ifndef` are used in Makefiles.

**Overriding Parts of the Project**

**Makefile.projbuild**  
For components that have build requirements that must be evaluated in the top-level project make pass, you can create a file called `Makefile.projbuild` in the component directory. This makefile is included when `project.mk` is evaluated.

For example, if your component needs to add to `CFLAGS` for the entire project (not just for its own source files) then you can set `CFLAGS +=` in `Makefile.projbuild`.

`Makefile.projbuild` files are used heavily inside esp-idf, for defining project-wide build features such as `esp_tool.py` command line arguments and the bootloader “special app”.

Note that `Makefile.projbuild` isn’t necessary for the most common component uses - such as adding include directories to the project, or `LDFLAGS` to the final linking step. These values can be customised via the `component.mk` file itself. See [Optional Project-Wide Component Variables](#optional-project-wide-component-variables) for details.

Take care when setting variables or targets in this file. As the values are included into the top-level project makefile pass, they can influence or break functionality across all components!

**KConfig.projbuild**  
This is an equivalent to `Makefile.projbuild` for component configuration `KConfig` files.

If you want to include configuration options at the top-level of menuconfig, rather than inside the “Component Configuration” sub-menu, then these can be defined in the `KConfig.projbuild` file alongside the `component.mk` file.

Take care when adding configuration values in this file, as they will be included across the entire project configuration. Where possible, it’s generally better to create a `KConfig` file for `component configuration`.

**Makefile.componentbuild**  
For components that e.g. include tools to generate source files from other files, it is necessary to be able to add recipes, macros or variable definitions into the component build process of every components. This is done by having a `Makefile.componentbuild` in a component directory. This file gets included in `component_wrapper.mk`, before the `component.mk` of the component is included. As with the `Makefile.projbuild`, take care with these files: as they’re included in each component build, a `Makefile.componentbuild` error may only show up when compiling an entirely different component.
Configuration-Only Components  Some special components which contain no source files, only Kconfig. projbuild and Makefile.projbuild, may set the flag COMPONENT_CONFIG_ONLY in the component.mk file. If this flag is set, most other component variables are ignored and no build step is run for the component.

Example Component Makefiles

Because the build environment tries to set reasonable defaults that will work most of the time, component.mk can be very small or even empty (see Minimal Component Makefile). However, overriding component variables is usually required for some functionality.

Here are some more advanced examples of component.mk makefiles:

Adding source directories  By default, sub-directories are ignored. If your project has sources in sub-directories instead of in the root of the component then you can tell that to the build system by setting COMPONENT_SRCDIRS:

```
COMPONENT_SRCDIRS := src1 src2
```

This will compile all source files in the src1/ and src2/ sub-directories instead.

Specifying source files  The standard component.mk logic adds all .S and .c files in the source directories as sources to be compiled unconditionally. It is possible to circumvent that logic and hard-code the objects to be compiled by manually setting the COMPONENT_OBJS variable to the name of the objects that need to be generated:

```
COMPONENT_OBJS := file1.o file2.o thing/filea.o thing/fileb.o anotherthing/main.o
COMPONENT_SRCDIRS := . thing anotherthing
```

Note that COMPONENT_SRCDIRS must be set as well.

Adding conditional configuration  The configuration system can be used to conditionally compile some files depending on the options selected in make menuconfig. For this, ESP-IDF has the compile_only_if and compile_only_if_not macros:

Kconfig:

```
config FOO_ENABLE_BAR
    bool "Enable the BAR feature."
    help
        This enables the BAR feature of the FOO component.
```

component.mk:

```
$(call compile_only_if,$(CONFIG_FOO_ENABLE_BAR),bar.o)
```

As can be seen in the example, the compile_only_if macro takes a condition and a list of object files as parameters. If the condition is true (in this case: if the BAR feature is enabled in menuconfig) the object files (in this case: bar.o) will always be compiled. The opposite goes as well: if the condition is not true, bar.o will never be compiled. compile_only_if_not does the opposite: compile if the condition is false, not compile if the condition is true.

This can also be used to select or stub out an implementation, as such:

Kconfig:

```
config ENABLE_LCD_OUTPUT
    bool "Enable LCD output."
    help
        Select this if your board has a LCD.
config ENABLE_LCD_CONSOLE
    bool "Output console text to LCD"
```

(continues on next page)
depends on ENABLE_LCD_OUTPUT
help
  Select this to output debugging output to the lcd

config ENABLE_LCD_PLOT
  bool "Output temperature plots to LCD"
  depends on ENABLE_LCD_OUTPUT
  help
  Select this to output temperature plots

component.mk:

```
# If LCD is enabled, compile interface to it, otherwise compile dummy interface
$(call compile_only_if,$(CONFIG_ENABLE_LCD_OUTPUT),lcd-real.o lcd-spi.o)
$(call compile_only_if_not,$(CONFIG_ENABLE_LCD_OUTPUT),lcd-dummy.o)

# We need font if either console or plot is enabled
$(call compile_only_if,$(or $(CONFIG_ENABLE_LCD_CONSOLE),$(CONFIG_ENABLE_LCD_PLOT)), font.o)
```

Note the use of the Make `or` function to include the font file. Other substitution functions, like `and` and `if` will also work here. Variables that do not come from menuconfig can also be used: ESP-IDF uses the default Make policy of judging a variable which is empty or contains only whitespace to be false while a variable with any non-whitespace in it is true.

(Note: Older versions of this document advised conditionally adding object filenames to COMPONENT_OBJS. While this still is possible, this will only work when all object files for a component are named explicitly, and will not clean up deselected object files in a `make clean` pass.)

**Source Code Generation** Some components will have a situation where a source file isn’t supplied with the component itself but has to be generated from another file. Say our component has a header file that consists of the converted binary data of a BMP file, converted using a hypothetical tool called bmp2h. The header file is then included in as C source file called graphics_lib.c:

```
COMPONENT_EXTRA_CLEAN := logo.h

graphics_lib.o: logo.h
logoh: $(COMPONENT_PATH)/logo.bmp
    bmp2h -i $^ -o $@
```

In this example, graphics_lib.o and logo.h will be generated in the current directory (the build directory) while logo.bmp comes with the component and resides under the component path. Because logo.h is a generated file, it needs to be cleaned when make clean is called which why it is added to the COMPONENT_EXTRA_CLEAN variable.

**Cosmetic Improvements** Because logo.h is a generated file, it needs to be cleaned when make clean is called which why it is added to the COMPONENT_EXTRA_CLEAN variable.

Adding logo.h to the graphics_lib.o dependencies causes it to be generated before graphics_lib.c is compiled.

If a source file in another component included logo.h, then this component’s name would have to be added to the other component’s COMPONENT_DEPENDS list to ensure that the components were built in-order.

**Embedding Binary Data** Sometimes you have a file with some binary or text data that you’d like to make available to your component - but you don’t want to reformat the file as C source.
You can set a variable `COMPONENT_EMBED_FILES` in component.mk, giving the names of the files to embed in this way:

```
COMPONENT_EMBED_FILES := server_root_cert.der
```

Or if the file is a string, you can use the variable `COMPONENT_EMBED_TXTFILES`. This will embed the contents of the text file as a null-terminated string:

```
COMPONENT_EMBED_TXTFILES := server_root_cert.pem
```

The file’s contents will be added to the .rodata section in flash, and are available via symbol names as follows:

```
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_
          pem_start");
extern const uint8_t server_root_cert_pem_end[]  asm("_binary_server_root_cert_
          pem_end");
```

The names are generated from the full name of the file, as given in `COMPONENT_EMBED_FILES`. Characters /, .., etc. are replaced with underscores. The _binary prefix in the symbol name is added by objcopy and is the same for both text and binary files.

For an example of using this technique, see `protocols/https_request` - the certificate file contents are loaded from the text .pem file at compile time.

**Code and Data Placements**

ESP-IDF has a feature called linker script generation that enables components to define where its code and data will be placed in memory through linker fragment files. These files are processed by the build system, and is used to augment the linker script used for linking app binary. See [Linker Script Generation](#) for a quick start guide as well as a detailed discussion of the mechanism.

**Fully Overriding The Component Makefile**

Obviously, there are cases where all these recipes are insufficient for a certain component, for example when the component is basically a wrapper around another third-party component not originally intended to be compiled under this build system. In that case, it’s possible to forego the esp-idf build system entirely by setting `COMPONENT_OWNBUILDTARGET` and possibly `COMPONENT_OWNCLEANTARGET` and defining your own targets named `build` and `clean` in `component.mk` target. The build target can do anything as long as it creates `$(COMPONENT_LIBRARY)` for the project make process to link into the app binary.

(Actually, even this is not strictly necessary - if the `COMPONENT_ADD_LDFLAGS` variable is overridden then the component can instruct the linker to link other binaries instead.)

**Note:** When using an external build process with PSRAM, remember to add `-mfix-esp32-psram-cache-issue` to the C compiler arguments. See `CONFIG_SPIRAM_CACHE_WORKAROUND` for details of this flag.

**Custom sdkconfig defaults**

For example projects or other projects where you don’t want to specify a full sdkconfig configuration, but you do want to override some key values from the esp-idf defaults, it is possible to create a file `sdkconfig.defaults` in the project directory. This file will be used when running `make defconfig`, or creating a new config from scratch.

To override the name of this file, set the `SDKCONFIG_DEFAULTS` environment variable.
Save flash arguments

There are some scenarios that we want to flash the target board without IDF. For this case we want to save the built binaries, esptool.py and esptool write_flash arguments. It’s simple to write a script to save binaries and esptool.py. We can use command make print_flash_cmd, it will print the flash arguments:

```
--flash_mode dio --flash_freq 40m --flash_size detect 0x1000 bootloader/bootloader.
--bin 0x10000 example_app.bin 0x8000 partition_table_unit_test_app.bin
```

Then use flash arguments as the arguments for esptool write_flash arguments:

```
python esptool.py --chip esp32 --port /dev/ttyUSB0 --baud 921600 --before default_
--reset --after hard_reset write_flash -z --flash_mode dio --flash_freq 40m --
--flash_size detect 0x1000 bootloader/bootloader.bin 0x10000 example_app.bin_
--0x8000 partition_table_unit_test_app.bin
```

4.3.3 Building the Bootloader

The bootloader is built by default as part of “make all”, or can be built standalone via “make bootloader-clean”. There is also “make bootloader-list-components” to see the components included in the bootloader build.

The component in IDF components/bootloader is special, as the second stage bootloader is a separate .ELF and .BIN file to the main project. However it shares its configuration and build directory with the main project.

This is accomplished by adding a subproject under components/bootloader/subproject. This subproject has its own Makefile, but it expects to be called from the project’s own Makefile via some glue in the components/bootloader/Makefile.projectbuild file. See these files for more details.

4.4 Error Handling

4.4.1 Overview

Identifying and handling run-time errors is important for developing robust applications. There can be multiple kinds of run-time errors:

- Recoverable errors:
  - Errors indicated by functions through return values (error codes)
  - C++ exceptions, thrown using `throw` keyword
- Unrecoverable (fatal) errors:
  - Failed assertions (using `assert` macro and equivalent methods) and `abort()` calls.
  - CPU exceptions: access to protected regions of memory, illegal instruction, etc.
  - System level checks: watchdog timeout, cache access error, stack overflow, stack smashing, heap corruption, etc.

This guide explains ESP-IDF error handling mechanisms related to recoverable errors, and provides some common error handling patterns.

For instructions on diagnosing unrecoverable errors, see Fatal Errors.

4.4.2 Error codes

The majority of ESP-IDF-specific functions use `esp_err_t` type to return error codes. `esp_err_t` is a signed integer type. Success (no error) is indicated with ESP_OK code, which is defined as zero.

Various ESP-IDF header files define possible error codes using preprocessor defines. Usually these defines start with `ESP_ERR`_ prefix. Common error codes for generic failures (out of memory, timeout, invalid argument, etc.) are defined in `esp_err.h` file. Various components in ESP-IDF may define additional error codes for specific situations.
Chapter 4. API Guides

For the complete list of error codes, see Error Code Reference.

4.4.3 Converting error codes to error messages

For each error code defined in ESP-IDF components, \texttt{esp_err_t} value can be converted to an error code name using \texttt{esp_err_to_name()} or \texttt{esp_err_to_name_r()} functions. For example, passing 0x101 to \texttt{esp_err_to_name()} will return “ESP_ERR_NO_MEM” string. Such strings can be used in log output to make it easier to understand which error has happened.

Additionally, \texttt{esp_err_to_name_r()} function will attempt to interpret the error code as a standard POSIX error code, if no matching ESP_ERR_ value is found. This is done using \texttt{strerror_r()} function. POSIX error codes (such as ENOENT,ENOMEM) are defined in \texttt{errno.h} and are typically obtained from \texttt{errno} variable. In ESP-IDF this variable is thread-local: multiple FreeRTOS tasks have their own copies of \texttt{errno}. Functions which set \texttt{errno} only modify its value for the task they run in.

This feature is enabled by default, but can be disabled to reduce application binary size. See \texttt{CONFIG_ESP_ERR_TO_NAME_LOOKUP}. When this feature is disabled, \texttt{esp_err_to_name()} and \texttt{esp_err_to_name_r()} are still defined and can be called. In this case, \texttt{esp_err_to_name()} will return UNKNOWN ERROR, and \texttt{esp_err_to_name_r()} will return Unknown error 0xXXXX(YYYYY), where 0xXXXX and YYYYY are the hexadecimal and decimal representations of the error code, respectively.

4.4.4 ESP\_ERROR\_CHECK macro

\texttt{ESP\_ERROR\_CHECK()} macro serves similar purpose as \texttt{assert}, except that it checks \texttt{esp_err_t} value rather than a bool condition. If the argument of \texttt{ESP\_ERROR\_CHECK()} is not equal \texttt{ESP\_OK}, then an error message is printed on the console, and \texttt{abort()} is called.

Error message will typically look like this:

```
ESP\_ERROR\_CHECK failed: esp\_err\_t 0x107 (ESP\_ERR\_TIMEOUT) at 0x400d1fdf
file: "/\texttt{Users/user/esp/example/main/main.c}" line 20
func: \texttt{app\_main}
expression: sdmmc\_card\_init(host, &card)
```

**Note:** If \texttt{IDF\_monitor} is used, addresses in the backtrace will be converted to file names and line numbers.

- The first line mentions the error code as a hexadecimal value, and the identifier used for this error in source code. The latter depends on \texttt{CONFIG\_ESP\_ERR\_TO\_NAME\_LOOKUP} option being set. Address in the program where error has occurred is printed as well.
- Subsequent lines show the location in the program where \texttt{ESP\_ERROR\_CHECK()} macro was called, and the expression which was passed to the macro as an argument.
- Finally, backtrace is printed. This is part of panic handler output common to all fatal errors. See \texttt{Fatal Errors} for more information about the backtrace.

4.4.5 Error handling patterns

1. Attempt to recover. Depending on the situation, this might mean to retry the call after some time, or attempt to de-initialize the driver and re-initialize it again, or fix the error condition using an out-of-band mechanism (e.g reset an external peripheral which is not responding).

Example:
esp_err_t err;
do {
    err = sdio_slave_send_queue(addr, len, arg, timeout);
    // keep retrying while the sending queue is full
} while (err == ESP_ERR_TIMEOUT);
if (err != ESP_OK) {
    // handle other errors
}

2. Propagate the error to the caller. In some middleware components this means that a function must exit with
the same error code, making sure any resource allocations are rolled back.
Example:

sdmmc_card_t* card = calloc(1, sizeof(sdmmc_card_t));
if (card == NULL) {
    return ESP_ERR_NO_MEM;
}
esp_err_t err = sdmmc_card_init(host, &card);
if (err != ESP_OK) {
    // Clean up
    free(card);
    // Propagate the error to the upper layer (e.g. to notify the user).
    // Alternatively, application can define and return custom error code.
    return err;
}

3. Convert into unrecoverable error, for example using ESP_ERROR_CHECK. See ESP_ERROR_CHECK macro
section for details.
Terminating the application in case of an error is usually undesirable behaviour for middleware components,
but is sometimes acceptable at application level.
Many ESP-IDF examples use ESP_ERROR_CHECK to handle errors from various APIs. This is not the best
practice for applications, and is done to make example code more concise.
Example:

ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));

4.4.6 C++ Exceptions

Support for C++ Exceptions in ESP-IDF is disabled by default, but can be enabled using CONFIG_COMPILER_CXX_EXCEPTIONS
option.
Enabling exception handling normally increases application binary size by a few kB. Additionally it may be necessary
to reserve some amount of RAM for exception emergency pool. Memory from this pool will be used if it is not
possible to allocate exception object from the heap. Amount of memory in the emergency pool can be set using
CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE variable.
If an exception is thrown, but there is no catch block, the program will be terminated by abort function, and
backtrace will be printed. See Fatal Errors for more information about backtraces.
See system/cpp_exceptions for an example of C++ exception handling.

4.5 Fatal Errors

4.5.1 Overview

In certain situations, execution of the program can not be continued in a well defined way. In ESP-IDF, these situations include:

• CPU Exceptions: Illegal Instruction, Load/Store Alignment Error, Load/Store Prohibited error, Double
Exception.
Chapter 4. API Guides

• System level checks and safeguards:
  – Interrupt watchdog timeout
  – Task watchdog timeout (only fatal if CONFIG_ESP_TASK_WDT_PANIC is set)
  – Cache access error
  – Brownout detection event
  – Stack overflow
  – Stack smashing protection check
  – Heap integrity check

• Failed assertions, via assert, configASSERT and similar macros.

This guide explains the procedure used in ESP-IDF for handling these errors, and provides suggestions on troubleshooting the errors.

4.5.2 Panic Handler

Every error cause listed in the Overview will be handled by panic handler.

Panic handler will start by printing the cause of the error to the console. For CPU exceptions, the message will be similar to:

```
Guru Meditation Error: Core 0 panic'ed (IllegalInstruction). Exception was...
```

For some of the system level checks (interrupt watchdog, cache access error), the message will be similar to:

```
Guru Meditation Error: Core 0 panic'ed (Cache disabled but cached memory region...
```

In all cases, error cause will be printed in parens. See Guru Meditation Errors for a list of possible error causes.

Subsequent behavior of the panic handler can be set using CONFIG_ESP32_PANIC configuration choice. The available options are:

• Print registers and reboot (CONFIG_ESP32_PANIC_PRINT_REBOOT) — default option.
  This will print register values at the point of the exception, print the backtrace, and restart the chip.

• Print registers and halt (CONFIG_ESP32_PANIC_PRINT_HALT)
  Similar to the above option, but halt instead of rebooting. External reset is required to restart the program.

• Silent reboot (CONFIG_ESP32_PANIC_SILENT_REBOOT)
  Don’t print registers or backtrace, restart the chip immediately.

• Invoke GDB Stub (CONFIG_ESP32_PANIC_GDBSTUB)
  Start GDB server which can communicate with GDB over console UART port. See GDB Stub for more details.

Behavior of panic handler is affected by two other configuration options.

• If CONFIG_ESP32_DEBUG_OCDAWARE is enabled (which is the default), panic handler will detect whether a JTAG debugger is connected. If it is, execution will be halted and control will be passed to the debugger. In this case registers and backtrace are not dumped to the console, and GDBStub / Core Dump functions are not used.

• If Core Dump feature is enabled (CONFIG_ESP32_ENABLE_COREDUMP_TO_FLASH or CONFIG_ESP32_ENABLE_COREDUMP_TO_UART options), then system state (task stacks and registers) will be dumped either to Flash or UART, for later analysis.

The following diagram illustrates panic handler behavior:

4.5.3 Register Dump and Backtrace

Unless CONFIG_ESP32_PANIC_SILENT_REBOOT option is enabled, panic handler prints some of the CPU registers, and the backtrace, to the console:
Fig. 1: Panic Handler Flowchart (click to enlarge)

</table>

Backtrace:

0x400e14ed: app_main at /Users/user/esp/example/main/main.cpp:36
0x400d0802: main_task at /Users/user/esp/esp-idf/components/esp32/cpu_start.c:470

Register values printed are the register values in the exception frame, i.e. values at the moment when CPU exception or other fatal error has occurred.

Register dump is not printed if the panic handler was executed as a result of an abort() call.

In some cases, such as interrupt watchdog timeout, panic handler may print additional CPU registers (EPC1-EPC4) and the registers/backtrace of the code running on the other CPU.

Backtrace line contains PC:SP pairs, where PC is the Program Counter and SP is Stack Pointer, for each stack frame of the current task. If a fatal error happens inside an ISR, the backtrace may include PC:SP pairs both from the task which was interrupted, and from the ISR.

If IDF Monitor is used, Program Counter values will be converted to code locations (function name, file name, and line number), and the output will be annotated with additional lines:

Backtrace: 0x400e14ed:0x3ffb5030 0x400d0802:0x3ffb5050

To find the location where a fatal error has happened, look at the lines which follow the “Backtrace” line. Fatal error location is the top line, and subsequent lines show the call stack.

4.5.4 GDB Stub

If CONFIG_ESP32_PANIC_GDBSTUB option is enabled, panic handler will not reset the chip when fatal error happens. Instead, it will start GDB remote protocol server, commonly referred to as GDB Stub. When this happens, GDB instance running on the host computer can be instructed to connect to the ESP32 UART port.
If **IDF Monitor** is used, GDB is started automatically when GDB Stub prompt is detected on the UART. The output would look like this:

```
Entering gdb stub now.
$T0b#e6GNU gdb (crosstool-NG crosstool-ng-1.22.0-80-gff1f415) 7.10
Copyright (C) 2015 Free Software Foundation, Inc.
License GPLv3+: GNU GPL version 3 or later <http://gnu.org/licenses/gpl.html>
This is free software: you are free to change and redistribute it.
There is NO WARRANTY, to the extent permitted by law. Type "show copying"
and "show warranty" for details.
This GDB was configured as "--host=x86_64-build_apple-darwin16.3.0 --target=xtensa
--esp32-elf".
Type "show configuration" for configuration details.
For bug reporting instructions, please see:
Find the GDB manual and other documentation resources online at:
For help, type "help".
Type "apropos word" to search for commands related to "word"...
Reading symbols from /Users/user/esp/example/build/example.elf...done.
Remote debugging using /dev/cu.usbserial-31301
0x400e1b41 in app_main ()
at /Users/user/esp/example/main/main.cpp:36
36  *((int*) 0) = 0;
(gdb)
```

GDB prompt can be used to inspect CPU registers, local and static variables, and arbitrary locations in memory. It is not possible to set breakpoints, change PC, or continue execution. To reset the program, exit GDB and perform external reset: **Ctrl-T Ctrl-R** in IDF Monitor, or using external reset button on the development board.

### 4.5.5 Guru Meditation Errors

This section explains the meaning of different error causes, printed in pares after **Guru Meditation Error:** Core panic'ed message.

**Note:** See [Wikipedia article](https://en.wikipedia.org/wiki/Guru_meditation) for historical origins of “Guru Meditation”.

**IllegalInstruction**

This CPU exception indicates that the instruction which was executed was not a valid instruction. Most common reasons for this error include:

- FreeRTOS task function has returned. In FreeRTOS, if task function needs to terminate, it should call `vTaskDelete()` function and delete itself, instead of returning.
- Failure to load next instruction from SPI flash. This usually happens if:
  - Application has reconfigured SPI flash pins as some other function (GPIO, UART, etc.). Consult Hardware Design Guidelines and the Datasheet for the chip or module for details about SPI flash pins.
  - Some external device was accidentally connected to SPI flash pins, and has interfered with communication between ESP32 and SPI flash.

**InstrFetchProhibited**

This CPU exception indicates that CPU could not load an instruction because the the address of the instruction did not belong to a valid region in instruction RAM or ROM.

Usually this means an attempt to call a function pointer, which does not point to valid code. **PC** (Program Counter) register can be used as an indicator: it will be zero or will contain garbage value (not 0x4xxxxxxxx).
LoadProhibited, StoreProhibited

This CPU exception happens when application attempts to read from or write to an invalid memory location. The address which was written/read is found in `EXCVADDR` register in the register dump. If this address is zero, it usually means that application attempted to dereference a NULL pointer. If this address is close to zero, it usually means that application attempted to access member of a structure, but the pointer to the structure was NULL. If this address is something else (garbage value, not in \texttt{0x3fxxxxxx - 0x6xxxxxxx} range), it likely means that the pointer used to access the data was either not initialized or was corrupted.

IntegerDivideByZero

Application has attempted to do integer division by zero.

LoadStoreAlignment

Application has attempted to read or write memory location, and address alignment did not match load/store size. For example, 32-bit load can only be done from 4-byte aligned address, and 16-bit load can only be done from a 2-byte aligned address.

LoadStoreError

Application has attempted to do a 8- or 16- bit load/store from a memory region which only supports 32-bit loads/stores. For example, dereferencing a `char*` pointer which points into instruction memory will result in such an error.

Unhandled debug exception

This will usually be followed by a message like:

```
Debug exception reason: Stack canary watchpoint triggered (task_name)
```

This error indicates that application has written past the end of the stack of `task_name` task. Note that not every stack overflow is guaranteed to trigger this error. It is possible that the task writes to stack beyond the stack canary location, in which case the watchpoint will not be triggered.

Interrupt wdt timeout on CPU0 / CPU1

Indicates that interrupt watchdog timeout has occured. See Watchdogs for more information.

Cache disabled but cached memory region accessed

In some situations ESP-IDF will temporarily disable access to external SPI Flash and SPI RAM via caches. For example, this happens with `spi_flash` APIs are used to read/write/erase/mmap regions of SPI Flash. In these situations, tasks are suspended, and interrupt handlers not registered with `ESP_INTR_FLAG_IRAM` are disabled. Make sure that any interrupt handlers registered with this flag have all the code and data in IRAM/DRAM. Refer to the `SPI flash API documentation` for more details.

4.5.6 Other Fatal Errors

Brownout

ESP32 has a built-in brownout detector, which is enabled by default. Brownout detector can trigger system reset if supply voltage goes below safe level. Brownout detector can be configured using `CONFIG_ESP32_BROWNOUT_DET`
and `CONFIG_ESP32_BROWNOUT_DET_LVL_SEL` options. When brownout detector triggers, the following message is printed:

```
Brownout detector was triggered
```

Chip is reset after the message is printed.

Note that if supply voltage is dropping at a fast rate, only part of the message may be seen on the console.

### Corrupt Heap

ESP-IDF heap implementation contains a number of run-time checks of heap structure. Additional checks (“Heap Poisoning”) can be enabled in menuconfig. If one of the checks fails, message similar to the following will be printed:

```
CORRUPT HEAP: Bad tail at 0x3ffe270a. Expected 0xbaad5678 got 0xbac5678 assertion "head != NULL" failed: file "/Users/user/esp/esp-idf/components/heap/multi_heap_poisoning.c", line 201, function: multi_heap_free
abort() was called at PC 0x400dca43 on core 0
```

### Stack Smashing

Stack smashing protection (based on GCC `-fstack-protector*` flags) can be enabled in ESP-IDF using `CONFIG_COMPILER_STACK_CHECK_MODE` option. If stack smashing is detected, message similar to the following will be printed:

```
Stack smashing protect failure!
```

```
Backtrace: 0x4008e6c0:0x3ffc1780 0x4008e8b7:0x3ffe17a0 0x400d2138:0x3ffe17c0...
0x400e79d5:0x3ffe1780 0x400e79a7:0x3ffe1840 0x400e79d5:0x3ffe18a0...
0x400e2235:0x3ffe190c 0x400e1916:0x3ffe18f0 0x400e19cd:0x3ffe1910...
0x400e1a11:0x3ffe1930 0x400e1bb2:0x3ffe1950 0x400d2c44:0x3ffe1a80 0
```

The backtrace should point to the function where stack smashing has occurred. Check the function code for unbounded access to local arrays.

### 4.6 Event Handling

Several ESP-IDF components use events to inform application about state changes, such as connection or disconnection. This document gives an overview of these event mechanisms.

#### 4.6.1 Wi-Fi, Ethernet, and IP Events

Before the introduction of `esp_event library`, events from Wi-Fi driver, Ethernet driver, and TCP/IP stack were dispatched using the so-called legacy event loop. The following sections explain each of the methods.

**esp_event Library Event Loop**

esp_event library is designed to supersede the legacy event loop for the purposes of event handling in ESP-IDF. In the legacy event loop, all possible event types and event data structures had to be defined in `system_event_id_t` enumeration and `system_event_info_t` union, which made it impossible to send custom events to the event
loop, and use the event loop for other kinds of events (e.g. Mesh). Legacy event loop also supported only one event handler function, therefore application components could not handle some of Wi-Fi or IP events themselves, and required application to forward these events from its event handler function.

See esp_event library API reference for general information on using this library. Wi-Fi, Ethernet, and IP events are sent to the default event loop provided by this library.

**Legacy Event Loop**

This event loop implementation is started using `esp_event_loop_init()` function. Application typically supplies an event handler, a function with the following signature:

```c
esp_err_t event_handler(void *ctx, system_event_t *event)
{
}
```

Both the pointer to event handler function, and an arbitrary context pointer are passed to `esp_event_loop_init()`.

When Wi-Fi, Ethernet, or IP stack generate an event, this event is sent to a high-priority event task via a queue. Application-provided event handler function is called in the context of this task. Event task stack size and event queue size can be adjusted using `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE` and `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE` options, respectively.

Event handler receives a pointer to the event structure (`system_event_t`) which describes current event. This structure follows a tagged union pattern: `event_id` member indicates the type of event, and `event_info` member is a union of description structures. Application event handler will typically use `switch(event->event_id)` to handle different kinds of events.

If application event handler needs to relay the event to some other task, it is important to note that event pointer passed to the event handler is a pointer to temporary structure. To pass the event to another task, application has to make a copy of the entire structure.

#### 4.6.2 Mesh Events

ESP-MESH uses a system similar to the Legacy Event Loop to deliver events to the application. See System Events for details.

#### 4.6.3 Bluetooth Events

Various modules of the Bluetooth stack deliver events to applications via dedicated callback functions. Callback functions receive the event type (enumerated value) and event data (union of structures for each event type).
following list gives the registration API name, event enumeration type, and event parameters type.

- **BLE GAP**: `esp_ble_gap_register_callback()`, `esp_gap_ble_cb_event_t`, `esp_ble_gap_cb_param_t`.
  - **BT GAP**: `esp_bt_gap_register_callback()`, `esp_bt_gap_cb_event_t`, `esp_bt_gap_cb_param_t`.
  - **GATT**: `esp_ble_gattc_register_callback()`, `esp_bt_gattc_cb_event_t`, `esp_bt_gattc_cb_param_t`.
  - **GATT**: `esp_ble_gatts_register_callback()`, `esp_bt_gatts_cb_event_t`, `esp_bt_gatts_cb_param_t`.
  - **SPP**: `esp_spp_register_callback()`, `esp_spp_cb_event_t`, `esp_spp_cb_param_t`.
  - **Blufi**: `esp_blufi_register_callbacks()`, `esp_blufi_cb_event_t`, `esp_blufi_cb_param_t`.
  - **A2DP**: `esp_a2d_register_callback()`, `esp_a2d_cb_event_t`, `esp_a2d_cb_param_t`.
  - **AVRC**: `esp_avrc_ct_register_callback()`, `esp_avrc_ct_cb_event_t`, `esp_avrc_ct_cb_param_t`.
  - **HFP Client**: `esp_hf_client_register_callback()`, `esp_hf_client_cb_event_t`, `esp_hf_client_cb_param_t`.

## 4.7 Deep Sleep Wake Stubs

ESP32 supports running a “deep sleep wake stub” when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialisation, bootloader, or ESP-IDF code has run. After the wake stub runs, the SoC can go back to sleep or continue to start ESP-IDF normally.

Deep sleep wake stub code is loaded into “RTC Fast Memory” and any data which it uses must also be loaded into RTC memory. RTC memory regions hold their contents during deep sleep.

### 4.7.1 Rules for Wake Stubs

Wake stub code must be carefully written:

- As the SoC has freshly woken from sleep, most of the peripherals are in reset states. The SPI flash is unmapped.
- The wake stub code can only call functions implemented in ROM or loaded into RTC Fast Memory (see below.)
- The wake stub code can only access data loaded in RTC memory. All other RAM will be uninitialised and have random contents. The wake stub can use other RAM for temporary storage, but the contents will be overwritten when the SoC goes back to sleep or starts ESP-IDF.
- RTC memory must include any read-only data (.rodata) used by the stub.
- Data in RTC memory is initialised whenever the SoC restarts, except when waking from deep sleep. When waking from deep sleep, the values which were present before going to sleep are kept.
- Wake stub code is a part of the main esp-idf app. During normal running of esp-idf, functions can call the wake stub functions or access RTC memory. It is as if these were regular parts of the app.

### 4.7.2 Implementing A Stub

The wake stub in esp-idf is called `esp_wake_deep_sleep()`. This function runs whenever the SoC wakes from deep sleep. There is a default version of this function provided in esp-idf, but the default function is weak-linked so if your app contains a function named `esp_wake_deep_sleep()` then this will override the default.

If supplying a custom wake stub, the first thing it does should be to call `esp_default_wake_deep_sleep()`. It is not necessary to implement `esp_wake_deep_sleep()` in your app in order to use deep sleep. It is only necessary if you want to have special behaviour immediately on wake.

If you want to swap between different deep sleep stubs at runtime, it is also possible to do this by calling the `esp_set_deep_sleep_wake_stub()` function. This is not necessary if you only use the default `esp_wake_deep_sleep()` function.
Chapter 4. API Guides

All of these functions are declared in the `esp_deepsleep.h` header under components/esp32.

### 4.7.3 Loading Code Into RTC Memory

Wake stub code must be resident in RTC Fast Memory. This can be done in one of two ways.

The first way is to use the `RTC_IRAM_ATTR` attribute to place a function into RTC memory:

```c
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The second way is to place the function into any source file whose name starts with `rtc_wake_stub`. Files names `rtc_wake_stub*` have their contents automatically put into RTC memory by the linker.

The first way is simpler for very short and simple code, or for source files where you want to mix “normal” and “RTC” code. The second way is simpler when you want to write longer pieces of code for RTC memory.

### 4.7.4 Loading Data Into RTC Memory

Data used by stub code must be resident in RTC memory. The data can be placed in RTC Fast memory or in RTC Slow memory which is also used by the ULP.

Specifying this data can be done in one of two ways:

The first way is to use the `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` to specify any data (writeable or read-only, respectively) which should be loaded into RTC memory:

```c
RTC_DATA_ATTR int wake_count;
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count \$d\n";
    ets_printf(fmt_str, wake_count);
}
```

The RTC memory area where this data will be placed can be configured via menuconfig option named `CONFIG_ESP32_RTCDATA_IN_FAST_MEM`. This option allows to keep slow memory area for ULP programs and once it is enabled the data marked with `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` are placed in the RTC fast memory segment otherwise it goes to RTC slow memory (default option). This option depends on the `CONFIG_FREERTOS_UNICORE` because RTC fast memory can be accessed only by PRO_CPU.

The similar attributes `RTC_FAST_ATTR` and `RTC_SLOW_ATTR` can be used to specify data that will be force placed into RTC_FAST and RTC_SLOW memory respectively. Any access to data marked with `RTC_FAST_ATTR` is allowed by PRO_CPU only and it is responsibility of user to make sure about it.

Unfortunately, any string constants used in this way must be declared as arrays and marked with `RTC_RODATA_ATTR`, as shown in the example above.

The second way is to place the data into any source file whose name starts with `rtc_wake_stub`.

For example, the equivalent example in `rtc_wake_stub_counter.c`:

```c
int wake_count;
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    ets_printf("Wake count \$d\n", wake_count);
}
```

The second way is a better option if you need to use strings, or write other more complex code.
4.8 ESP-BLE-MESH

Bluetooth® mesh networking enables many-to-many (m:m) device communications and is optimized for creating large-scale device networks.

Devices may relay data to other devices not in direct radio range of the originating device. In this way, mesh networks can span very large physical areas and contain large numbers of devices. It is ideally suited for building automation, sensor networks, and other IoT solutions where tens, hundreds, or thousands of devices need to reliably and securely communicate with one another.

Bluetooth mesh is not a wireless communications technology, but a networking technology. This technology is dependent upon Bluetooth Low Energy (BLE) - a wireless communications protocol stack.

Built on top of Zephyr Bluetooth Mesh stack, the ESP-BLE-MESH implementation supports device provisioning and node control. It also supports such node features as Proxy, Relay, Low power and Friend.

Please see the ESP-BLE-MESH Architecture for information about the implementation of ESP-BLE-MESH architecture and ESP-BLE-MESH API Reference for information about respective API.

ESP-BLE-MESH is implemented and certified based on the latest Mesh Profile v1.0.1, users can refer here for the certification details of ESP-BLE-MESH.

**Note:** If you are looking for Wi-Fi based implementation of mesh for ESP32, please check another product by Espressif called ESP-MESH. For more information and documentation see ESP-MESH.

4.8.1 Getting Started with ESP-BLE-MESH

This section is intended to help you get started with ESP-BLE-MESH for the hardware based on the ESP32 chip by Espressif.

We are going to demonstrate process of setting and operation of a small ESP-BLE-MESH network of three nodes. This process will cover device provisioning and node configuration, and then sending on/off commands to Generic OnOff Server Models on specific nodes.

If you are new to ESP-IDF, please first setup development environment, compile, flash and run example application following top level ESP-IDF Get Started documentation.

**What You Need**

**Hardware:**
- Three ESP32 boards, see options.
- USB cables to connect the boards.
- Computer configured with ESP-IDF.
- Mobile phone or tablet running Android or iOS.

**Software:**
- Example application bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server code to load to the ESP32 boards.
- Mobile App: nRF Mesh for Android or iOS. Optionally you can use some other Apps:
  - EspBleMesh Android App
  - Silicon Labs Android or iOS App

**Installation Step by Step**

This is a detailed roadmap to walk you through the installation process.
Step 1. Check Hardware  Both ESP32-DevKitC and ESP-WROVER-KIT development boards are supported for ESP-BLE-MESH implementation. You can choose particular board through menuconfig: idf.py menuconfig

> Example Configuration > Board selection for ESP-BLE-MESH

Note: If you plan to use ESP32-DevKitC, connect a RGB LED to GPIO pins 25, 26 and 27.

Step 2. Configure Software  Enter the bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server example directory, run idf.py menuconfig to select your board and then run idf.py build to compile the example.

Step 3. Upload Application to Nodes  After the bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server example is compiled successfully, users can run idf.py flash to upload the same generated binary files into each of the three development boards.

Once boards are powered on, the RGB LED on each board should turn GREEN.

![Fig. 2: ESP-BLE-MESH Devices Power On](image)

Step 4. Provision Nodes  In this section, we will use the nRF Mesh Android App to demonstrate how to provision an unprovisioned device. Users can also get its iOS version from the App Store.

4.1 Scanner  The Scanner is App’s functionality to search for unprovisioned devices in range. Open the App, press Scanner at the bottom and the search will start. After a short while we should see three unprovisioned devices displayed.

4.2 Identify  Users can select any unprovisioned device, then the App will try to set up a connection with the selected device. After the BLE connection is established successfully (sometimes users need to try multiple times to
get connected), and proper ESP-BLE-MESH GATT Service is discovered, users can see the IDENTIFY interface button on the screen. The IDENTIFY operation can be used to tell users which device is going to be provisioned.

**Note:** The IDENTIFY operation also needs some cooperation on the device side, then users can see which device is in the provisioning process. Currently when pressing the IDENTIFY interface button, no signs can be seen from the device except from the log on the serial monitor.

After the IDENTIFY interface button is pressed, users can see the PROVISION interface button.

**4.3 Provision** Then, the App will try to provision the unprovisioned device. When the device is provisioned successfully, the RGB LED on the board will turn off, and the App will implement the following procedures:

1. Disconnect with the node
2. Try to reconnect with the node
3. Connect successfully and discover ESP-BLE-MESH GATT Service
4. Get Composition Data of the node and add AppKey to it

When all the procedures are finished, the node is configured properly. And after pressing OK, users can see that unicast address is assigned, and Composition Data of the node is decoded successfully.

Sometimes in procedure 2, the App may fail to reconnect with the node. In this case, after pressing OK, users can see that only unicast address of the node has been assigned, but no Composition Data has been got. Then users need to press CONNECT on the top right, and the previously provisioned node will be displayed on the screen, and users need to choose it and try to connect with the node.

After connecting successfully, the App will show the interface buttons which can be used to get Composition Data and add AppKey.

If the device is the second or the third one which has been provisioned by the App, and after pressing CONNECT, users can see two or three nodes on the screen. In this situation, users can choose any device to connect with, once succeed then go back to the main screen to choose the node which needs to be configured.

Here an example of three devices listed.
Chapter 4. API Guides

Fig. 4: nRF Mesh - IDENTIFY - PROVISION

Fig. 5: nRF Mesh - Configuration Complete
Fig. 6: nRF Mesh - Initial Configuration Failed

Fig. 7: nRF Mesh - Reconnect - Initial Configuration
• The left picture shows that the third device is provisioned successfully, but the App failed to connect with it. When it tries to reconnect with the third node, three nodes are displayed on the App.
• The right picture shows that after connecting with any node successfully, the App displays the information of the three nodes. Users can see that the App has got the Composition Data of the first and the second nodes, but for the third one, only the unicast address has been assigned to it while the Composition Data is unknown.

![Fig. 8: nRF Mesh - Reconnect - Three Nodes](image)

**4.4 Configuration**  
When provisioning and initial configuration are finished, users can start to configure the node, such as binding AppKey with each model with the elements, setting publication information to it, etc.

Example below shows how to bind AppKey with Generic OnOff Server Model within the Primary Element.

**Note:** No need to bind AppKey with the Configuration Server Model, since it only uses the DevKey to encrypt messages in the Upper Transport Layer.

**Step 5. Operate Network**  
After all the Generic OnOff Server Models within the three elements are bound with proper AppKey, users can use the App to turn on/off the RGB LED.

In the `bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server` example, the first Generic OnOff Server Model is used to control the **RED** color, the second one is used to control the **GREEN** color and the third one is used to control the **BLUE** color.

The following screenshot shows different board with different color on.

**Note:** For **nRF Mesh** iOS App [version 1.0.4], when the node contains more than one element, the App is not behaving correctly. If users try to turn on/off the second or the third Generic OnOff Server Model, the message sent by the App is destined to the first Generic OnOff Server Model within the Primary Element.
Fig. 9: nRF Mesh - Model Bind AppKey

Fig. 10: nRF Mesh - Generic OnOff Control
4.8.2 ESP-BLE-MESH Examples

- **ESP-BLE-MESH Node OnOff Server** - shows the use of ESP-BLE-MESH as a node having a Configuration Server model and a Generic OnOff Server model. A ESP-BLE-MESH Provisioner can then provision the unprovisioned device and control a RGB LED representing on/off state, see example code.
- **ESP-BLE-MESH Node OnOff Client** - shows how a Generic OnOff Client model works within a node. The node has a Configuration Server model and a Generic OnOff Client model, see example code.
- **ESP-BLE-MESH Provisioner** - shows how a device can act as an ESP-BLE-MESH Provisioner to provision devices. The Provisioner has a Configuration Server model, a Configuration Client model and a Generic OnOff Client model, see example code.
- **ESP-BLE-MESH Fast Provisioning - Client and Server** - this example is used for showing how fast provisioning can be used in order to create a mesh network. It takes no more than 60 seconds to provision 100 devices, see example client code and example server code.
- **ESP-BLE-MESH and Wi-Fi Coexistence** - an example that demonstrates the Wi-Fi and Bluetooth (BLE/BR/EDR) coexistence feature of ESP32. Simply put, users can use the Wi-Fi while operating Bluetooth, see example code.
- **ESP-BLE-MESH Node Console** - an example that implements BLE Mesh node basic features. Within this example a node can be scanned and provisioned by Provisioner and reply to get/set message from Provisioner, see example node code.

ESP-BLE-MESH Feature List

Supported Features

Mesh Core

• Provisioning: Node Role
  – PB-ADV and PB-GATT
  – OOB Authentication
• Provisioning: Provisioner Role
  – PB-ADV and PB-GATT
  – OOB Authentication

• Networking
  – Relay
  – Segmentation and Reassembly
  – Key Refresh Procedure
  – IV Update Procedure
  – Friend
  – Low Power
  – Proxy Server
  – Proxy Client

• Multiple Client Models Run Simultaneously
  – Support multiple client models send packets to different nodes simultaneously
  – No blocking between client model and server model

• NVS Storing
  – Store provisioning and configuration information of ESP-BLE-MESH Node

Mesh Models

• Foundation models
  – Configuration Server model
  – Configuration Client model
  – Health Server model
  – Health Client model
• Generic client models

ESP-BLE-MESH Architecture

This document introduces ESP-BLE-MESH architecture overview, ESP-BLE-MESH architecture implementation as well as ESP-BLE-MESH auxiliary routines.

• ESP-BLE-MESH Architecture Overview
  – Describes the five major parts of ESP-BLE-MESH architecture and the functionality of each part.
• ESP-BLE-MESH Architecture Implementation
  – Describes the basic functions of ESP-BLE-MESH files, the correspondence between files and ESP-BLE-MESH architecture, and the interface for calling among files.
• ESP-BLE-MESH Auxiliary Routines
  – Describe the auxiliary routines of ESP-BLE-MESH, such as Mesh network management, Mesh features, etc.

1. ESP-BLE-MESH Architecture Overview

Currently ESP-BLE-MESH has implemented most functions of Mesh Profile and all the Client Models defined in Mesh Model specification. Those missing functions/models are under development and will be provided soon. ESP-BLE-MESH architecture has been granted the official Bluetooth certification.

ESP-BLE-MESH architecture includes five key parts:

• Mesh Protocol Stack
  – Mesh Networking is responsible for processing of messages of ESP-BLE-MESH nodes.
  – Mesh Provisioning is responsible for provisioning flow of ESP-BLE-MESH devices.
  – Mesh Models is responsible for the implementation of SIG-defined models.
• Network Management
  – Implements several network management procedures, including node removal procedure, IV Index recovery procedure, etc.
• Features
  – Include several ESP-BLE-MESH features, e.g. Low Power feature, Friend feature, Relay feature, etc.
• Mesh Bearer Layer
Fig. 12: Figure 1.1 ESP-BLE-MESH Architecture Diagram
Chapter 4. API Guides

- Includes Advertising Bearer and GATT Bearer. The bearer layer is crucial to ESP-BLE-MESH protocol stack which is built on Bluetooth Low-Energy technology, because the protocol stack must make use of the bearer layer to transmit data via the BLE advertising channel and connection channel.

  • Applications
    - Based on ESP-BLE-MESH protocol stack and Mesh Models.
    - By calling API and handling Event, Applications interact with Mesh Networking and Mesh Provisioning in ESP-BLE-MESH protocol stack, as well as a series of Models provided by Mesh Models.

1.1 Mesh Protocol Stack

1.1.1 Mesh Networking Mesh Networking in the protocol stack architecture implements the following functions:

  • The communication between nodes in the Mesh network.
  • Encryption and decryption of messages in the Mesh network.
  • Management of Mesh network resources (Network Key, IV Index, etc.).
  • Segmentation and reassembly of Mesh network messages.
  • Model mapping of messages between different models.
  • For more features, please see ESP-BLE-MESH Feature List.

The implementation of Mesh Networking functions is based on hierarchy structure. Functions of each layer are shown in Table 1.1:

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Layer</td>
<td>Access Layer not only defines the format of application data, but also defines and controls the encryption and decryption of the data packets conducted by Upper Transport Layer.</td>
</tr>
<tr>
<td>Upper Transport Layer</td>
<td>Upper Transport Layer encrypts, decrypts, and authenticates application data to and from the access layer; it also handles special messages called “transport control messages”, including messages related to “friendship” and heartbeat messages.</td>
</tr>
<tr>
<td>Lower Transport Layer</td>
<td>Lower Transport Layer handles segmentation and reassembly of PDU.</td>
</tr>
<tr>
<td>Network Layer</td>
<td>Network Layer defines the address type and format of the network messages, and implements the relay function of the device.</td>
</tr>
</tbody>
</table>

1.1.2 Mesh Provisioning Mesh Provisioning in the protocol stack architecture implements the following functions:

  • Provisioning of unprovisioned devices.
  • Allocation of Mesh network resources (unicast address, IV Index, NetKey, etc.).
  • Four authentication methods support during provisioning.
  • For more features, please see ESP-BLE-MESH Feature List.

The implementation of Mesh Provisioning functions is based on hierarchy structure. Functions of each layer are shown in Table 1.2:

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Provisioning PDUs</td>
<td>Provisioning PDUs from different layers are handled using provisioning protocol.</td>
</tr>
<tr>
<td>Generic Provisioning PDU/Proxy PDU</td>
<td>The Provisioning PDUs are transmitted to an unprovisioned device using a Generic Provisioning layer or Proxy protocol layer.</td>
</tr>
<tr>
<td>PB-ADV/PB-GATT Service</td>
<td>These layers define how the Provisioning PDUs are transmitted as transactions that can be segmented and reassembled.</td>
</tr>
<tr>
<td>Advertising/Provisioning Service</td>
<td>The provisioning bearers define how sessions are established such that the transactions from the generic provisioning layer can be delivered to a single device.</td>
</tr>
</tbody>
</table>
1.1.3 Mesh Models  Mesh Models in the protocol stack architecture implements the following functions:

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

Functions of each layer are shown in Table 1.3:

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Model Layer</td>
<td>Model Layer implements models used to standardize the operation of typical user scenarios, including Generic Client/Server Models, Sensor Client/Server Models, Time and Scenes Client/Server Models, Lighting Client/Server Models and several vendor models.</td>
</tr>
<tr>
<td>Foundation Model Layer</td>
<td>Foundation Model Layer implements models related to ESP-BLE-MESH configuration, management, self diagnosis, etc.</td>
</tr>
</tbody>
</table>

1.2 Mesh Network Management  Network Management implements the following functions:

- Node removal procedure is used to remove a node from the network.
- IV Index recovery procedure is used to recover a node’s IV Index.
- IV update procedure is used to update the nodes’ IV Index.
- Key refresh procedure is used to update the nodes’ NetKey, AppKey, etc.
- Network creation procedure is used to create a mesh network.
- NVS storage is used to store node’s networking information.

1.3 Mesh Features  Features includes the following options:

- Low Power feature is used to reduce node’s power consumption.
- Friend feature is used to store messages for Low Power nodes.
- Relay feature is used to relay/forward Network PDUs received by a node over the advertising bearer.
- Proxy Server/Client are two node roles in proxy protocol, which enable nodes to send and receive Network PDUs, mesh beacons, proxy configuration messages and Provisioning PDUs over a connection-oriented bearer.

1.4 Mesh Bearer Layer  Bearers in the protocol stack architecture are responsible for passing of data between ESP-BLE-MESH protocol stack and Bluetooth Low Energy Core.

Bearers can be taken as a carrier layer based on Bluetooth Low Energy Core, which implements the function of receiving and transmitting data for the ESP-BLE-MESH protocol stack.

<table>
<thead>
<tr>
<th>Layer</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>GATT Bearer</td>
<td>The GATT Bearer uses the Proxy protocol to transmit and receive Proxy PDUs between two devices over a GATT connection.</td>
</tr>
<tr>
<td>Advertising Bearer</td>
<td>When using the Advertising Bearer, a mesh packet shall be sent in the Advertising Data of a Bluetooth Low Energy advertising PDU using the Mesh Message AD Type.</td>
</tr>
</tbody>
</table>

1.5 Mesh Applications  The Applications in the protocol stack architecture implement the corresponding functions by calling the API provided by the ESP-BLE-MESH protocol stack and processing the Event reported by the protocol stack. There are some common applications, such as gateway, lighting and etc.

Interaction between application layer (Applications) and API / Event

- Application layer calls API
Chapter 4. API Guides

- Call the provisioning-related API for provisioning.
- Call the model-related API to send messages.
- Call the device-attributes-related API to get local information about the device.

• Application layer processes Event
  The application layer is designed based on events, which take parameters to the application layer. Events are mainly divided into two categories.
  - **The events completed by calling API.**
    * Such as nodes sending messages.
  - **The events that the protocol stack actively reports to the application layer.**
    * The Event that the protocol stack actively reports.
    * The Event that Model actively reports.

• The event is reported by the callback function registered by the application layer, and the callback function also contains the corresponding processing of the event.

**Interaction between API / Event and ESP-BLE-MESH protocol stack**

- API used by user mainly calls functions provided by Mesh Networking, Mesh Provisioning and Mesh Models.
- The interaction between API / Event and the protocol stack does not operate across the hierarchy of the protocol stack. For example, API does not call functions related to Network Layer.

2. ESP-BLE-MESH Architecture Implementation

The design and implementation of ESP-BLE-MESH architecture is based on layers and modules. In details, Section 2.1 (Mesh Networking Implementation), Section 2.2 (Mesh Provisioning Implementation) and Section 2.3 (Mesh Bearers Implementation) are based on layers, and Section 2.4 (Mesh Models Implementation) is on modules.

• **Layer-based Approach:** With Layer-based approach, the architecture is designed according to the layers specified in the Mesh Profile Specification. Each layer has its unique files which include APIs of this layer and etc. The specific design is shown in Figure 2.1.

• **Module-based Approach:** Every file implements an independent function that can be called by other programs.

The design of ESP-BLE-MESH architecture uses layer-based approach. The sequence of layers which data packets are processed through is fixed, i.e., the processing of packets will form a message flow. Thus, we could see flows of messages from the Protocol Stack Interface Diagram in Figure 2.1.

2.1 Mesh Protocol Stack Implementation

2.1.1 Mesh Networking Implementation

The list of files and the functions implemented in each file in Mesh Networking are shown in Table 2.1:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>access.c</td>
<td>ESP-BLE-MESH Access Layer</td>
</tr>
<tr>
<td>transport.c</td>
<td>ESP-BLE-MESH Lower/Upper Transport Layer</td>
</tr>
<tr>
<td>net.c</td>
<td>ESP-BLE-MESH Network Layer</td>
</tr>
<tr>
<td>adv.c</td>
<td>A task used to send ESP-BLE-MESH advertising packets, a callback used to handle received advertising packets and APIs used to allocate adv buffers</td>
</tr>
</tbody>
</table>

2.1.2 Mesh Provisioning Implementation

The implementation of Mesh Provisioning is divided into two chunks due to the Node/Provisioner coexistence.
Chapter 4. API Guides

Fig. 13: ESP-BLE-MESH Architecture Implementation Diagram

Espressif Systems

Release v4.0.3-189-g7c4f5fa

Submit Document Feedback
Specific files that provide implementation of provisioning of Node are shown in Table 2.2:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov.c</td>
<td>ESP-BLE-MESH Node provisioning (PB-ADV &amp; PB-GATT)</td>
</tr>
<tr>
<td>proxy_server.c</td>
<td>ESP-BLE-MESH Proxy Server related functionalities</td>
</tr>
<tr>
<td>beacon.c</td>
<td>APIs used to handle ESP-BLE-MESH Beacons</td>
</tr>
</tbody>
</table>

Specific files that implement functions of Provisioner are shown in Table 2.3:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>provisioner_prov.c</td>
<td>ESP-BLE-MESH Provisioner provisioning (PB-ADV &amp; PB-GATT)</td>
</tr>
<tr>
<td>proxy_client.c</td>
<td>ESP-BLE-MESH Proxy Client related functionalities</td>
</tr>
<tr>
<td>provisioner_main.c</td>
<td>ESP-BLE-MESH Provisioner networking related functionalities</td>
</tr>
</tbody>
</table>

### 2.1.3 Mesh Models Implementation

Mesh Models are used to implement the specific functions of model in nodes. Server model is used to maintain node status. Client model is used to obtain and modify node state.

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>cfg_cli.c</td>
<td>Send Configuration Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>cfg_srv.c</td>
<td>Receive Configuration Client messages and send proper response messages</td>
</tr>
<tr>
<td>health_cli.c</td>
<td>Send Health Client messages and receive corresponding response messages</td>
</tr>
<tr>
<td>health_srv.c</td>
<td>Receive Health Client messages and send proper response messages</td>
</tr>
<tr>
<td>client_common.c</td>
<td>ESP-BLE-MESH model related operations</td>
</tr>
<tr>
<td>generic_client.c</td>
<td>Send ESP-BLE-MESH Generic Client messages and receive corresponding response messages</td>

</tbody>
</table>

### 2.2 Mesh Bearers Implementation

Portability is fully considered in the implementation of Mesh Bearers. When the ESP-BLE-MESH protocol stack is being ported to other platforms, users only need to modify mesh_bearer_adapt.c.

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>mesh_bearer_adapt.c</td>
<td>ESP-BLE-MESH Bearer Layer adapter, This file provides the interfaces used to receive and send ESP-BLE-MESH ADV &amp; GATT related packets.</td>
</tr>
</tbody>
</table>
Note: mesh_bearer_adapt.c is the implementation of Advertising Bearer and GATT Bearer in Mesh Networking framework.

2.3 Mesh Applications Implementation We have provided a series of application examples for customer development, and users can develop products based on ESP-BLE-MESH Examples.

3. Auxiliary Routine Auxiliary routine refers to optional functions in the ESP-BLE-MESH protocol stack. The design of the auxiliary routine generally implement the truncation of code through CONFIG_BLE_MESH.

3.1 Features
- Low Power
- Friend
- Relay
- Proxy Client/Server

3.2 Network Management
- Node Removal procedure
- IV Index Recovery procedure
- IV Update procedure
- Key Refresh procedure
- Network Creation procedure
- NVS Storage

3.3 Auxiliary Routine Implementation When adopting the design of independent module, the two main factors should be considered:
- The module can not be implemented hierarchically, and it can be completely independent, which means it does not rely on the implementation of other modules.
- The functions in the module will be used repeatedly, so it is reasonable to design it into a module. Independent module is shown in Table 3.1:

<table>
<thead>
<tr>
<th>File</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>lpn.c</td>
<td>ESP-BLE-MESH Low Power functionality</td>
</tr>
<tr>
<td>friend.c</td>
<td>ESP-BLE-MESH Friend functionality</td>
</tr>
<tr>
<td>net.c</td>
<td>ESP-BLE-MESH Relay feature, network creation, IV Update procedure, IV Index recovery procedure, Key Refresh procedure related functionalities</td>
</tr>
<tr>
<td>proxy_server.c</td>
<td>ESP-BLE-MESH Proxy Server related functionalities</td>
</tr>
<tr>
<td>proxy_client.c</td>
<td>ESP-BLE-MESH Proxy Client related functionalities</td>
</tr>
<tr>
<td>settings.c</td>
<td>ESP-BLE-MESH NVS storage functionality</td>
</tr>
<tr>
<td>main.c</td>
<td>ESP-BLE-MESH stack initialize, stack enable, node removal related functionalities</td>
</tr>
</tbody>
</table>

ESP-BLE-MESH FAQ

This document provides a summary of frequently asked questions about developing with ESP-BLE-MESH, and is divided into seven sections:
- 1. Provisioner Development
- 2. Node Development
- 3. ESP-BLE-MESH and Wi-Fi Coexistence
- 4. Fast Provisioning
Users could refer to the sections for quick answer to their questions. This document will be updated based on the feedback collected via various channels.

1. **Provisioner Development**  Generally, a Provisioner is used to provision unprovisioned devices and form a mesh network. And after provisioning, roles of the unprovisioned devices will be changed to those of a node.

1.1 What is the flow for an unprovisioned device to join ESP-BLE-MESH network?

There are two phases for a device to join ESP-BLE-MESH network via a Provisioner, namely, provisioning and configuration.

- The phase of provisioning is to assign unicast address, add NetKey and etc. to a device. By provisioning, the device joins the ESP-BLE-MESH network and its role is changed from an unprovisioned device to a node.
- The phase of configuration is to add AppKeys to the node and bind AppKeys to corresponding models. And some items are optional during configuration, including adding subscription addresses to the node, set publication information, etc. By configuration, the node can actually transmit messages to a Provisioner and receive messages from it.

1.2 If a Provisioner wants to change states of a node, what requirements should be met for a Provisioner?

- Client model that corresponds to server model of the node is required.
- NetKey and AppKey used to encrypt messages shall be owned by both the node and the Provisioner.
- The address owned by the node shall be known, which could be its unicast address or subscription address.

1.3 How can NetKey and AppKey be used?

- NetKey is used for encryption of messages in Network Layer. Nodes with the same NetKey are assumed to be in the same subnet while those with different NetKeys cannot communicate with each other.
- AppKey is used for encryption of messages in Upper Transport Layer. If client model and server model are bound to different AppKeys, the communication cannot be achieved.

1.4 How to generate a NetKey or AppKey for Provisioner? Can we use a fixed NetKey or AppKey?

- The API `esp_ble_mesh_provisioner_add_local_net_key()` can be used to add a NetKey with a fixed or random value.
- The API `esp_ble_mesh_provisioner_add_local_app_key()` can be used to add an AppKey with a fixed or random value.

1.5 Is the unicast address of Provisioner fixed?

The value of `prov_unicast_addr` in `esp_ble_mesh_prov_t` is used to set the unicast address of Provisioner, it can be set only once during initialization and can’t be changed afterwards.

1.6 Can the address of Provisioner serve as destination address of the node-reporting-status message?

The unicast address of Provisioner can be set only once during initialization and can’t be changed afterwards. In theory, it can serve as the destination address of the node-reporting-status message, provided that the unicast address of the Provisioner is known by nodes. Nodes can know the unicast address of Provisioner during configuration since Provisioner sends messages to them with its unicast address used as the source address. Subscription address can also be used. Provisioner subscribes to a group address or virtual address, and nodes send messages to the subscription address.
1.7 Is the unicast address of the node that is firstly provisioned by Provisioner to ESP-BLE-MESH network fixed?

The value of `prov_start_address` in `esp_ble_mesh_prov_t` is used to set the starting address when the Provisioner provisions unprovisioned devices, i.e. the unicast address of the node it firstly provisioned. It can be set only once during initialization and can’t be changed afterwards.

1.8 Is the unicast address of the node that mobile App firstly provisioned fixed?

The App will decide the unicast address, and currently most of them are fixed.

1.9 How to know which unprovisioned device is the Provisioner that is provisioning currently?

The value of `prov_attention` in `esp_ble_mesh_prov_t` is used by Provisioner set to unprovisioned device during provisioning. It can be set only once during initialization and can’t be changed afterwards. When the unprovisioned device is joining the mesh network, it can display in a specific way like flashing light to notify Provisioner that it is being provisioned.

1.10 How many ways to authenticate the devices during provisioning? Which way was used in the provided examples?

There are four authentication methods, i.e. No OOB, Static OOB, Output OOB and Input OOB. In the provided examples, No OOB is used.

1.11 What information can be carried by the advertising packets of the unprovisioned device before provisioning into the network?

- Device UUID
- OOB Info
- URL Hash (optional)

1.12 Can such information be used for device identification?

For example, each unprovisioned device contains a unique Device UUID, which can be used for device identification.

1.13 How is the unicast address assigned when the node provisioned by Provisioner contains multiple elements?

- Provisioner will assign an unicast address for the primary element of the node, and unicast address of the remaining elements are incremented one by one.
- For example: If an unprovisioned device has three elements, i.e. the primary element, the second element and the third element. After provisioning, the primary element address of the node is 0x0002 while the second element address is 0x0003, and the third element address is 0x0004.

1.14 How can Provisioner get and parse the Composition Data of nodes through Configuration Client Model?

- Provisioner can get the Composition Data of nodes using the `Configuration Client Model` API `esp_ble_mesh_config_client_set_state()` with `comp_data_get` in the parameter `esp_ble_mesh_cfg_client_get_state_t` set properly.
- Users can refer to the following code to parse the Composition Data:

```
#include <stdio.h>
#include <string.h>
#include <stdint.h>

//test date: 0C001A0001000800030000010501000000800100001003103F002A00
```

(continues on next page)

    data->Vendor_models[i/2].model_id = mystr[i + pos_vnd_base] |
        (mystr[i + pos_vnd_base + 1] < 8);
    printf("%d: %4.4x\n", i/2, data->Vendor_models[i/2].model_id);
    data->Vendor_models[i/2].vendor_id = mystr[i + pos_vnd_base + 2]|
        (mystr[i + pos_vnd_base + 3] < 8);
    printf("%d: %4.4x\n", i/2, data->Vendor_models[i/2].vendor_id);
}
return 0;
}

void app_main(void)
{
    esp_ble_mesh_composition_head head = {0};
    esp_ble_mesh_composition_decode data = {0};
    uint8_t mystr[] = {
        0x0C, 0x00, 0x1A, 0x00,
        0x01, 0x00, 0x08, 0x00,
        0x03, 0x00, 0x00, 0x01,
        0x05, 0x01, 0x00, 0x00,
        0x00, 0x80, 0x01, 0x00,
        0x00, 0x10, 0x03, 0x10,
        0x3F, 0x00, 0x2A, 0x00};

    int ret;

    ret = decode_comp_data(&head, &data, mystr, sizeof(mystr));
    if (ret == -1) {
        printf("decode_comp_data error\n");
    }
}

1.15 How can Provisioner further configure nodes through obtained Composition Data?

Provisioner do the following configuration by calling the Configuration Client Model API esp_ble_mesh_config_client_set_state().

- Add AppKey to nodes with app_key_add in the parameter esp_ble_mesh_cfg_client_set_state_t set properly.
- Add subscription address to the models of nodes with model_sub_add in the parameter esp_ble_mesh_cfg_client_set_state_t set properly.
- Set publication information to the models of nodes with model_pub_set in the parameter esp_ble_mesh_cfg_client_set_state_t set properly.

1.16 Can nodes add corresponding configurations for themselves?

This method can be used in special cases like testing period.

- Here is an example to show nodes add new group addresses for their models.

```c
esp_err_t example_add_fast_prov_group_address(uint16_t model_id, uint16_t...
    ->group_addr)
{
    const esp_ble_mesh_comp_t *comp = NULL;
    esp_ble_mesh_elem_t *element = NULL;
    esp_ble_mesh_model_t *model = NULL;

    (continues on next page)
```
```c
int i, j;

if (!ESP_BLE_MESH_ADDR_IS_GROUP(group_addr)) {
    return ESP_ERR_INVALID_ARG;
}

comp = esp_ble_mesh_get_composition_data();
if (!comp) {
    return ESP_FAIL;
}

for (i = 0; i < comp->element_count; i++) {
    element = &comp->elements[i];
    model = esp_ble_mesh_find_sig_model(element, model_id);
    if (!model) {
        continue;
    }
    for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
        if (model->groups[j] == group_addr) {
            break;
        }
    }
    if (j != ARRAY_SIZE(model->groups)) {
        ESP_LOGW(TAG, "%s: Group address already exists, element_%index: %d", __func__, i);
        continue;
    }
    for (j = 0; j < ARRAY_SIZE(model->groups); j++) {
        if (model->groups[j] == ESP_BLE_MESH_ADDR_UNASSIGNED) {
            model->groups[j] = group_addr;
            break;
        }
    }
    if (j == ARRAY_SIZE(model->groups)) {
        ESP_LOGE(TAG, "%s: Model is full of group addresses, element_%index: %d", __func__, i);
    }
}

return ESP_OK;
```

**Note:** When the NVS storage of the node is enabled, group address added and AppKey bound by this method will not be saved in the NVS when the device is powered off currently. These configuration information can only be saved if they are configured by Configuration Client Model.

### 1.17 How does Provisioner control nodes by grouping?

Generally there are two approaches to implement group control in ESP-BLE-MESH network, group address approach and virtual address approach. And supposing there are 10 devices, i.e., five devices with blue lights and five devices with red lights.

- **Method 1:** 5 blue lights can subscribe to a group address, 5 red lights subscribe to another one. By sending messages to different group addresses, Provisioner can realize group control.
- **Method 2:** 5 blue lights can subscribe to a virtual address, 5 red lights subscribe to another one. By sending messages to different virtual addresses, Provisioner can realize group control.

### 1.18 How does Provisioner add nodes to multiple subnets?
Chapter 4. API Guides

Provisioner can add multiple NetKeys to nodes during configuration, and nodes sharing the same NetKey belong to the same subnet. Provisioner can communicate with nodes on different subnets by using different NetKeys.

1.19 How does Provisioner know if a node in the mesh network is offline?

Node offline is usually defined as: the condition that the node cannot be properly communicated with other nodes in the mesh network due to power failure or some other reasons.

There is no connection between nodes and nodes in the ESP-BLE-MESH network. They communicate with each other through advertising channels.

An example is given here to show how to detect a node is offline by Provisioner.

• The node can periodically send heartbeat messages to Provisioner. And if Provisioner failed to receive heartbeat messages in a certain period, the node is considered to be offline.

**Note:** The heartbeat message should be designed into a single package (less than 11 bytes), so the transmission and reception of it can be more efficient.

1.20 What operations should be performed when Provisioner removes nodes from the network?

Usually when Provisioner tries to remove node from the mesh network, the procedure includes three main steps:

• Firstly, Provisioner adds the node that need to be removed to the “blacklist”.
• Secondly, Provisioner performs the Key Refresh procedure.
• Lastly, the node performs node reset procedure, and switches itself to an unprovisioned device.

1.21 In the Key Refresh procedure, how does Provisioner update the Netkey owned by nodes?

• Provisioner updates the NetKey of nodes using the Configuration Client Model API `esp_ble_mesh_cfg_client_set_state()` with net_key_update in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.
• Provisioner updates the AppKey of nodes using the Configuration Client Model API `esp_ble_mesh_cfg_client_set_state()` with app_key_update in the parameter `esp_ble_mesh_cfg_client_set_state_t` set properly.

1.22 How does Provisioner manage nodes in the mesh network?

ESP-BLE-MESH implements several functions related to basic node management in the example, such as `esp_ble_mesh_store_node_info()`. And ESP-BLE-MESH also provides the API `esp_ble_mesh_provisioner_set_node_name()` which can be used to set the node’s local name and the API `esp_ble_mesh_provisioner_get_node_name()` which can be used to get the node’s local name.

1.23 What does Provisioner need when trying to control the server model of nodes?

Provisioner must include corresponding client model before controlling the server model of nodes.

Provisioner shall add its local NetKey and AppKey.

• Provisioner add NetKey by calling the API `esp_ble_mesh_provisioner_add_local_net_key()`.
• Provisioner add AppKey by calling the API `esp_ble_mesh_provisioner_add_local_app_key()`.

Provisioner shall configure its own client model.

• Provisioner bind AppKey to its own client model by calling the API `esp_ble_mesh_provisioner_bind_app_key_to_local_model()`.
1.24 How does Provisoner control the server model of nodes?

ESP-BLE-MESH supports all SIG-defined client models. Provisoner can use these client models to control the server models of nodes. And the client models are divided into 6 categories with each category has the corresponding functions.

- **Configuration Client Model**
  - The API `esp_ble_mesh_config_client_get_state()` can be used to get the `esp_ble_mesh_cfg_client_get_state_t` values of Configuration Server Model.
  - The API `esp_ble_mesh_config_client_set_state()` can be used to set the `esp_ble_mesh_cfg_client_set_state_t` values of Configuration Server Model.

- **Health Client Model**
  - The API `esp_ble_mesh_health_client_get_state()` can be used to get the `esp_ble_mesh_health_client_get_state_t` values of Health Server Model.
  - The API `esp_ble_mesh_health_client_set_state()` can be used to set the `esp_ble_mesh_health_client_set_state_t` values of Health Server Model.

- **Generic Client Models**
  - The API `esp_ble_mesh_generic_client_get_state()` can be used to get the `esp_ble_mesh_generic_client_get_state_t` values of Generic Server Models.
  - The API `esp_ble_mesh_generic_client_set_state()` can be used to set the `esp_ble_mesh_generic_client_set_state_t` values of Generic Server Models.

- **Lighting Client Models**
  - The API `esp_ble_mesh_light_client_get_state()` can be used to get the `esp_ble_mesh_light_client_get_state_t` values of Lighting Server Models.
  - The API `esp_ble_mesh_light_client_set_state()` can be used to set the `esp_ble_mesh_light_client_set_state_t` values of Lighting Server Models.

- **Sensor Client Models**
  - The API `esp_ble_mesh_sensor_client_get_state()` can be used to get the `esp_ble_mesh_sensor_client_get_state_t` values of Sensor Server Model.
  - The API `esp_ble_mesh_sensor_client_set_state()` can be used to set the `esp_ble_mesh_sensor_client_set_state_t` values of Sensor Server Model.

- **Time and Scenes Client Models**
  - The API `esp_ble_mesh_time_scene_client_get_state()` can be used to get the `esp_ble_mesh_time_scene_client_get_state_t` values of Time and Scenes Server Models.
  - The API `esp_ble_mesh_time_scene_client_set_state()` can be used to set the `esp_ble_mesh_time_scene_client_set_state_t` values of Time and Scenes Server Models.

2. Node Development

2.1 What kind of models are included by nodes?

- In ESP-BLE-MESH, nodes are all composed of a series of models with each model implements some functions of the node.
- Model has two types, client model and server model. Client model can get and set the states of server model.
- Model can also be divided into SIG model and vendor model. All behaviors of SIG models are officially defined while behaviors of vendor models are defined by users.

2.2 Is the format of messages corresponding to each model fixed?

- Messages, which consist of opcode and payload, are divided by opcode.
- The type and the format of the messages corresponding to models are both fixed, which means the messages transmitted between models are fixed.
2.3 Which functions can be used to send messages with the models of nodes?

- For client models, users can use the API `esp_ble_mesh_client_model_send_msg()` to send messages.
- For server models, users can use the API `esp_ble_mesh_server_model_send_msg()` to send messages.
- For publication, users call the API `esp_ble_mesh_model_publish()` to publish messages.

2.4 How to achieve the transmission of messages without packet loss?

Acknowledged message is needed if users want to transmit messages without packet loss. The default time to wait for corresponding response is set in `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT`. If the sender waits for the response until the timer expires, the corresponding timeout event would be triggered.

**Note:** Response timeout can be set in the API `esp_ble_mesh_client_model_send_msg()`. The default value (4 seconds) would be applied if the parameter `msg_timeout` is set to 0.

2.5 How to send unacknowledged messages?

For client models, users can use the API `esp_ble_mesh_client_model_send_msg()` with the parameter `need_rsp` set to `false` to send unacknowledged messages.

For server models, the messages sent by using the API `esp_ble_mesh_server_model_send_msg()` are always unacknowledged messages.

2.6 How to add subscription address to models?

Subscription address can be added through Configuration Client Model.

2.7 What is the difference between messages sent and published by models?

Messages sent by calling the API `esp_ble_mesh_client_model_send_msg()` or `esp_ble_mesh_server_model_send_msg()` will be sent in the duration determined by the Network Transmit state.

Messages published by calling the API `esp_ble_mesh_model_publish()` will be published determined by the Model Publication state. And the publication of messages is generally periodic or with a fixed number of counts. The publication period and publication count are controlled by the Model Publication state, and can be configured through Configuration Client Model.

2.8 How many bytes can be carried when sending unsegmented messages?

The total payload length (which can be set by users) of unsegmented message is 11 octets, so if the opcode of the message is 2 octets, then the message can carry 9-octets of valid information. For vendor messages, due to the 3-octets opcode, the remaining payload length is 8 octets.

2.9 When should the Relay feature of nodes be enabled?

Users can enable the Relay feature of all nodes when nodes detected in the mesh network are sparse.

For dense mesh network, users can choose to just enable the Relay feature of several nodes.

And users can enable the Relay feature by default if the mesh network size is unknown.
2.10 When should the Proxy feature of node be enabled?

If the unprovisioned device is expected to be provisioned by a phone, then it should enable the Proxy feature since almost all the phones do not support sending ESP-BLE-MESH packets through advertising bearer currently. And after the unprovisioned device is provisioned successfully and becoming a Proxy node, it will communicate with the phone using GATT bearer and using advertising bearer to communicate with other nodes in the mesh network.

2.11 How to use the Proxy filter?

The Proxy filter is used to reduce the number of Network PDUs exchanged between a Proxy Client (e.g. the phone) and a Proxy Server (e.g. the node). And with the Proxy filter, Proxy Client can explicitly request to receive only mesh messages with certain destination addresses from Proxy Server.

2.12 When a message can be relayed by a Relay node?

If a message need to be relayed, the following conditions should be met.

- The message is in the mesh network.
- The message is not sent to the unicast address of the node.
- The value of TTL in the message is greater than 1.

2.13 If a message is segmented into several segments, should the other Relay nodes just relay when one of these segments is received or wait until the message is received completely?

Relay nodes will forward segments when one of them are received rather than keeping waiting until all the segments are received.

2.14 What is the principle of reducing power consumption using Low Power feature?

- When the radio is turned on for listening, the device is consuming energy. When low power feature of the node is enabled, it will turn off its radio in the most of the time.
- And cooperation is needed between low power node and friend node, thus low power node can receive messages at an appropriate or lower frequency without the need to keep listening.
- When there are some new messages for low power node, its friend node will store the messages for it. And low power node can poll friend nodes to see if there are new messages at a fixed interval.

2.15 How to continue the communication on the network after powering-down and powering-up again?

Enable the configuration Store ESP-BLE-MESH Node configuration persistently in menuconfig.

2.16 How to send out the self-test results of nodes?

It is recommended that nodes can publish its self-test results periodically through Health Server Model.

2.17 How to transmit information between nodes?

One possible application scenario for transmitting information between nodes is that spray nodes would be triggered once smoke alarm detected high smoke concentration. There are two approaches in implementation.

- Approach 1 is that spray node subscribes to a group address. When smoke alarm detects high smoke concentration, it will publish a message whose destination address is the group address which has been subscribed by spray node.
- Approach 2 is that Provisioner can configure the unicast address of spray node to the smoke alarm. When high smoke concentration is detected, smoke alarm can use send messages to the spray node with the spray node’s unicast address as the destination address.
2.18 Is gateway a must for nodes communication?

- Situation 1: nodes only communicate within the mesh network. In this situation, no gateway is needed. ESP-BLE-MESH network is a flooded network, messages in the network have no fixed paths, and nodes can communicate with each other freely.
- Situation 2: if users want to control the nodes remotely, for example turn on some nodes before getting home, then a gateway is needed.

2.19 When will the IV Update procedure be performed?

IV Update procedure would be performed once sequence number of messages sent detected by the bottom layer of node reached a critical value.

2.20 How to perform IV Update procedure?

Nodes can perform IV Update procedure with Secure Network Beacon.

3. ESP-BLE-MESH and Wi-Fi Coexistence

3.1 Which modes does Wi-Fi support when it coexists with ESP-BLE-MESH?

Currently only Wi-Fi station mode supports the coexistence.

3.2 Why is the Wi-Fi throughput so low when Wi-Fi and ESP-BLE-MESH coexist?

The ESP32-DevKitC board without PSRAM can run properly but the throughput of it is low since it has no PSRAM. When Bluetooth and Wi-Fi coexist, the throughput of ESP32-DevKitC with PSRAM can be stabilized to more than 1Mbps.

And some configurations in menuconfig shall be enabled to support PSRAM.

- ESP32-specific --> Support for external, SPI-connected RAM --> Try to allocate memories of Wi-Fi and LWIP...
- Bluetooth --> Bluedroid Enable --> BT/BLE will first malloc the memory from the PSRAM
- Bluetooth --> Bluedroid Enable --> Use dynamic memory allocation in BT/BLE stack.
- Bluetooth --> Bluetooth controller --> BLE full scan feature supported.
- Wi-Fi --> Software controls Wi-Fi/Bluetooth coexistence --> Wi-Fi

4. Fast Provisioning

4.1 Why is fast provisioning needed?

Normally when they are several unprovisioned devices, users can provision them one by one. But when it comes to a large number of unprovisioned devices (e.g. 100), provisioning them one by one will take huge amount of time. With fast provisioning, users can provision 100 unprovisioned devices in about 50 seconds.

4.2 Why EspBleMesh App would wait for a long time during fast provisioning?

After the App provisioned one Proxy node, it will disconnect from the App during fast provisioning, and reconnect with the App when all the nodes are provisioned.
4.3 Why is the number of node addresses displayed in the App more than that of existing node addresses?

Each time after a fast provisioning process, and before starting a new one, the node addresses in the App should be cleared, otherwise the number of the node address will be incorrect.

4.4 What is the usage of the count value which was input in EspBleMesh App?

The count value is provided to the Proxy node which is provisioned by the App so as to determine when to start Proxy advertising in advance.

4.5 When will Configuration Client Model of the node running fast_prov_server example start to work?

Configuration Client Model will start to work after the Temporary Provisioner functionality is enabled.

4.6 Will the Temporary Provisioner functionality be enabled all the time?

After the nodes receive messages used to turn on/off lights, all the nodes will disable its Temporary Provisioner functionality and become nodes.

5. Log Help

You can find meaning of errors or warnings when they appear at the bottom of ESP-BLE-MESH stack.

5.1 What is the meaning of warning ran out of retransmit attempts?

When the node transmits a segmented message, and due to some reasons, the receiver doesn’t receive the complete message. Then the node will retransmit the message. When the retransmission count reaches the maximum number, which is 4 currently, then this warning will appear.

5.2 What is the meaning of warning Duplicate found in Network Message Cache?

When the node receives a message, it will compare the message with the ones stored in the network cache. If the same has been found in the cache, which means it has been received before, then the message will be dropped.

5.3 What is the meaning of warning Incomplete timer expired?

When the node doesn’t receive all the segments of a segmented message during a certain period (e.g. 10 seconds), then the Incomplete timer will expire and this warning will appear.

5.4 What is the meaning of warning No matching TX context for ack?

When the node receives a segment ack and it doesn’t find any self-send segmented message related with this ack, then this warning will appear.

5.5 What is the meaning of warning No free slots for new incoming segmented messages?

When the node has no space for receiving new segmented message, this warning will appear. Users can make the space larger through the configuration \texttt{CONFIG BLE MESH RX SEG MSG COUNT}.

5.6 What is the meaning of error Model not bound to Appkey \texttt{0x0000}?

When the node sends messages with a model and the model has not been bound to the AppKey with AppKey Index \texttt{0x000}, then this error will appear.
5.7 What is the meaning of error Busy sending message to DST xxxx?

This error means client model of the node has transmitted a message to the target node and now is waiting for a response, users can not send messages to the same node with the same unicast address. After the corresponding response is received or timer is expired, then another message can be sent.

6. Example Help

6.1 How are the ESP-BLE-MESH callback functions classified?

- The API `esp_ble_mesh_register_prov_callback()` is used to register callback function used to handle provisioning and networking related events.
- The API `esp_ble_mesh_register_config_client_callback()` is used to register callback function used to handle Configuration Client Model related events.
- The API `esp_ble_mesh_register_config_server_callback()` is used to register callback function used to handle Configuration Server Model related events.
- The API `esp_ble_mesh_register_health_client_callback()` is used to register callback function used to handle Health Client Model related events.
- The API `esp_ble_mesh_register_health_server_callback()` is used to register callback function used to handle Health Server Model related events.
- The API `esp_ble_mesh_register_generic_client_callback()` is used to register callback function used to handle Generic Client Models related events.
- The API `esp_ble_mesh_register_light_client_callback()` is used to register callback function used to handle Lighting Client Models related events.
- The API `esp_ble_mesh_register_sensor_client_callback()` is used to register callback function used to handle Sensor Client Model related events.
- The API `esp_ble_mesh_register_time_scene_client_callback()` is used to register callback function used to handle Time and Scenes Client Models related events.
- The API `esp_ble_mesh_register_custom_model_callback()` is used to register callback function used to handle vendor model and unrealized server models related events.

7. Others

7.1 How to print the message context?

The examples use `ESP_LOG_BUFFER_HEX()` to print the message context while the ESP-BLE-MESH protocol stack uses `bt_hex()`.

7.2 Which API can be used to restart ESP32?

The API `esp_restart()`.

7.3 How to monitor the remaining space of the stack of a task?

The API `vTaskList()` can be used to print the remaining space of the task stack periodically.

7.4 How to change the level of log without changing the menuconfig output level?

The API `esp_log_level_set()` can be used to change the log output level rather than using menuconfig to change it.
ESP-BLE-MESH Terminology

Table 11: Table 1 ESP-BLE-MESH Terminology - Role

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unprovisioned Device</td>
<td>A device that is not a member of a mesh network is known as an unprovisioned device.</td>
<td>Examples: lighting devices, temperature control devices, manufacturing equipments and electric doors, etc.</td>
</tr>
<tr>
<td>Node</td>
<td>A node is a provisioned device.</td>
<td>The role of unprovisioned device will change to node after being provisioned to ESP-BLE-MESH network. Nodes (such as lighting devices, temperature control devices, manufacturing equipments, and electric doors) are devices that can send, receive, or relay messages in ESP-BLE-MESH network, and they can optionally support one or more subnets.</td>
</tr>
<tr>
<td>Relay Node</td>
<td>A node that supports the Relay feature and has the Relay feature enabled is known as a Relay node.</td>
<td>Relay nodes can receive and resend ESP-BLE-MESH messages, so the messages can be transferred further. Users can decide whether or not to enable forwarding function of nodes according to nodes’ status. Messages can be relayed for multiple times, and each relay is considered as a “hop”. Messages can hop up to 126 times, which is enough for message transmission in a wide area.</td>
</tr>
<tr>
<td>Proxy Node</td>
<td>A node that supports the Proxy feature and has the Proxy feature enabled is known as a Proxy node.</td>
<td>Proxy nodes receive messages from one bearer (it generally includes advertising bearer and GATT bearer) and resend it from another one. The purpose is to connect communication equipments that only support GATT bearer to ESP-BLE-MESH network. Generally, mobile apps need a Proxy node to access Mesh network. Without Proxy nodes, mobile apps cannot communicate with members in Mesh network.</td>
</tr>
<tr>
<td>Friend Node</td>
<td>A node that supports the Friend feature, has the Friend feature enabled, and has a friendship with a node that supports the Low Power feature is known as a Friend node.</td>
<td>Friend node, like the backup of Low Power node (LPN), can store messages that are sent to Low Power node and security updates; the stored information will be transferred to Low Power node when Low Power node needs it. Low Power node must establish “friendship” with another node that supports the Friend Feature to reduce duty cycle of its receiver, thus power consumption of Low Power node can be reduced. Low Power node needs to find a Friend node to establish a friendship with it. The process involved is called “friendship establishment”. Cooperation between Low Power node and Friend nodes enables Low Power node to schedule the use of the radio, thus Low Power node can receive messages at an appropriate or lower frequency without the need of keeping listening. Low Power node will poll Friend node to see if there is new message.</td>
</tr>
<tr>
<td>Low Power Node</td>
<td>A node that supports the Low Power feature and has a friendship with a node that supports the Friend feature is known as a Low Power node.</td>
<td>By polling, Low Power node gets information from Friend node, such as messages, security updates, and etc.</td>
</tr>
<tr>
<td>Provisioner</td>
<td>A node that is capable of adding a device to a mesh network.</td>
<td>The device that can provision unprovisioned devices is called a Provisioner. This process usually needs to be implemented through an app that is typically provided by the product manufacturer and can be used on a gateway, a smartphone, tablet or other carriers.</td>
</tr>
</tbody>
</table>
### Table 12: Table 2 ESP-BLE-MESH Terminology - Composition

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>State</td>
<td>A value representing a condition of an element that is exposed by an element of a node.</td>
<td>Each node in a ESP-BLE-MESH network has an independent set of state values that indicate certain states of the device, like brightness, and color of lighting device. Change of state value will lead to change of the physical state of devices. For example, changing the on/off state of a device is actually turning on/off the device.</td>
</tr>
<tr>
<td>Model</td>
<td>A model defines the basic functionality of a node.</td>
<td>A node may contain multiple models, and each model defines basic functionalities of nodes, like the states needed by the nodes, the messages controlling the states, and actions resulted from messages handling. The function implementation of the nodes is based on models, which can be divided into SIG Model and Vendor Model, with the former defined by SIG and latter defined by users.</td>
</tr>
<tr>
<td>Element</td>
<td>An addressable entity within a device.</td>
<td>A node can contain one or more elements, with each having a unicast address and one or more models, and the models contained by the same element must not be the same.</td>
</tr>
<tr>
<td>Composition Data State</td>
<td>The Composition Data state contains information about a node, the elements it includes, and the supported models.</td>
<td>By reading the value of the Composition Data state, users can know basic information of the node, such as the number of elements, and the models in each element. Provisioner gets this message to further provision the device, such as configuring subscription address and publishing address of nodes.</td>
</tr>
</tbody>
</table>

### Table 13: Table 3 ESP-BLE-MESH Terminology - Features

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Low Power Feature</td>
<td>The ability to operate within a mesh network at significantly reduced receiver duty cycles only in conjunction with a node supporting the Friend feature.</td>
<td>Low Power feature reduces power consumption of nodes. When a Low Power node is searching for a Friend node, and there are multiple Friend nodes nearby, it selects the most suitable Friend node through algorithm.</td>
</tr>
<tr>
<td>Friend Feature</td>
<td>The ability to help a node supporting the Low Power feature to operate by storing messages destined for those nodes.</td>
<td>By enabling friend feature, the node can help to store information for Low Power node. The nodes enabled with friend feature may cause more power and memory consumption.</td>
</tr>
<tr>
<td>Relay Feature</td>
<td>The ability to receive and retransmit mesh messages over the advertising bearer to enable larger networks.</td>
<td>The relay feature enables ESP-BLE-MESH messages to hop among nodes for multiple times, and the transmission distance can exceed the range of direct radio transmission between two nodes, thereby covering the entire network. When a node is enabled with the relay feature to relay messages, it only relays the messages of its own subnet, and does not relay the messages of other subnets. The data integrity will not be considered when the node enabled with relay feature relays segmented messages. The node would relay every segmented message once it receives one rather than waiting for the complete message.</td>
</tr>
<tr>
<td>Proxy Feature</td>
<td>The ability to receive and retransmit mesh messages between GATT and advertising bearers.</td>
<td>The purpose of the proxy feature is to allow nodes without an advertising bearer to access the ESP-BLE-MESH network. The proxy feature is typically used in nodes that need to connect to mobile apps.</td>
</tr>
</tbody>
</table>
## Table 14: Table 4 ESP-BLE-MESH Terminology - Provisioning

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>PB-ADV</td>
<td>PB-ADV is a provisioning bearer used to provision a device using Generic Provisioning PDUs over the advertising channels.</td>
<td>PB-ADV transfers packets generated during the provisioning process over the advertising channels. This way can only be used for provisioning when provisioner and unprovisioned device both support PB-ADV.</td>
</tr>
<tr>
<td>PB-GATT</td>
<td>PB-GATT is a provisioning bearer used to provision a device using Proxy PDUs to encapsulate Provisioning PDUs within the Mesh Provisioning Service.</td>
<td>PB-GATT uses connection channels to transfer packets generated during the provisioning process. If an unprovisioned device wants to be provisioned through this method, it needs to implement the related Mesh Provisioning Service. Unprovisioned devices which don’t implement such service cannot be provisioned into mesh network through PB-GATT bearer.</td>
</tr>
<tr>
<td>Provisioning</td>
<td>Provisioning is a process of adding an unprovisioned device to a mesh network, managed by a Provisioner.</td>
<td>The process of provisioning turns the “unprovisioned device” into a “node”, making it a member of the ESP-BLE-MESH network.</td>
</tr>
<tr>
<td>Authentication Method</td>
<td>Authentication is a step during the provisioning of nodes.</td>
<td>There are four authentication methods for unprovisioned devices: Output OOB, Input OOB, Static OOB, and No OOB.</td>
</tr>
<tr>
<td>Input OOB</td>
<td>Input Out-of-Band</td>
<td>For example, a Provisioner generates and displays a random number, and then prompts users to take appropriate actions to input the random number into the unprovisioned device. Taking lighting switch as an example, users can press the button for several times in a certain period of time to input the random number displayed on the Provisioner. Authentication method of the Input OOB is similar to that of Output OOB, but the role of the device is reversed.</td>
</tr>
<tr>
<td>Output OOB</td>
<td>Output Out-of-Band</td>
<td>For example, an unprovisioned device will choose a random number and output the number in a way that is compatible with its functionality. If the unprovisioned device is a bulb, it can flash a specified number of times. If the unprovisioned device has an LCD screen, the random number can display as a multi-digit value. Users who start provisioning should input the observed number to authenticate the unprovisioned device.</td>
</tr>
<tr>
<td>Static OOB</td>
<td>Static Out-of-Band</td>
<td>Authentication method of Static OOB: use Static OOB information. Use 0 as Static OOB information if No OOB information is needed. Use Static OOB information to authenticate devices which are going through provisioning if OOB information is needed.</td>
</tr>
<tr>
<td>No OOB</td>
<td>No Out-of-Band</td>
<td>Authentication method of No OOB: Set the value of the Static OOB field to 0. Using this way is like not authenticating the unprovisioned devices.</td>
</tr>
<tr>
<td>Term</td>
<td>Official Definition</td>
<td>Detailed Explanation</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Unassigned Address</td>
<td>This is a special address type, with a value of 0x0000. Its use indicates that an Element has not yet been configured or had a Unicast Address assigned to it.</td>
<td>The addresses owned by elements which has not been configured yet or no address has been allocated are unassigned addresses. These elements will not be used for messages transfer because they have no fixed address. Unassigned address is recommended to set as the value of the address before setting the address of user code.</td>
</tr>
<tr>
<td>Unicast Address</td>
<td>A unicast address is a unique address allocated to each element.</td>
<td>During provisioning, the Provisioner will assign a unicast address to each element of node within the life cycle of the nodes in the network. A unicast address may appear in the source/destination address field of a message. Messages sent to a unicast address can only be processed by the element that owns the unicast address.</td>
</tr>
<tr>
<td>Virtual Address</td>
<td>A virtual address represents a set of destination addresses. Each virtual address logically represents a Label UUID, which is a 128-bit value that does not have to be managed centrally.</td>
<td>Associated with specific UUID labels, a virtual address may serve as the publishing or subscription address of the model. A UUID label is a 128-bit value associated with elements of one or more nodes. For virtual addresses, the 15th and 14th bits are set to 1 and 0 respectively; bits from 13th to 0 are set to hash values (providing 16384 hash values). The hash is a derivation of the Label UUID. To use subscribing elements to check the full 128-bit UUID is very inefficient while hash values provide a more efficient way to determine which elements that which messages are finally sent to.</td>
</tr>
<tr>
<td>Group Address</td>
<td>A group address is an address that is programmed into zero or more elements</td>
<td>Group address is another kind of multicast address in the ESP-BLE-MESH network, which is usually used to group nodes. A message sent to the all-proxy address shall be processed by the primary element of all nodes that have the proxy functionality enabled. A message sent to the all-friends address shall be processed by the primary element of all nodes that have the friend functionality enabled. A message sent to the all-relays address shall be processed by the primary element of all nodes that have the relay functionality enabled. A message sent to the all-nodes address shall be processed by the primary element of all nodes.</td>
</tr>
</tbody>
</table>
### Table 16: Table 6 ESP-BLE-MESH Terminology - Security

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device Key (DevKey)</td>
<td>There is also a device key, which is a special application key that is unique to each node, is known only to the node and a Configuration Client, and is used to secure communications between the node and a Configuration Client.</td>
<td>The device key enables you to provision the devices, configure the nodes. The device key is used to encrypt Configuration Messages, i.e. the message transferred between the Provisioner and the node when the device is configured.</td>
</tr>
<tr>
<td>Application Key (AppKey)</td>
<td>Application keys are used to secure communications at the upper transport layer.</td>
<td>Application key is used for decryption of application data before delivering application data to application layer and encryption of them during the delivery of application layer. Some nodes in the network have a specific purpose and can restrict access to potentially sensitive data based on the needs of the application. With specific application keys, these nodes are associated with specific applications. Generally speaking, the fields using different application keys include security (access control of buildings, machine rooms and CEO offices), lighting (plant, exterior building and sidewalks) and HVAC systems. Application keys are bound to Network keys. This means application keys are only used in a context of a Network key they are bound to. An application key shall only be bound to a single Network key.</td>
</tr>
<tr>
<td>Master Security Material</td>
<td>The master security material is derived from the network key (NetKey) and can be used by other nodes in the same network. Messages encrypted with master security material can be decoded by any node in the same network.</td>
<td>The corresponding friendship messages encrypted with the friendship security material: 1. Friend Poll, 2. Friend Update, 3. Friend Subscription List, add/delete/confirm, 4. The Stored Messages sent by friend nodes to Low Power node. The corresponding friendship messages encrypted with the master security material: 1. Friend Clear, 2. Friend Clear Confirm. Based on the setup of the applications, the messages sent from the Low Power node to the friend nodes will be encrypted with the friendship security material or master security material, with the former being used by the messages transmitted between Low Power node and friend nodes and the latter being used by other network messages.</td>
</tr>
</tbody>
</table>

### Table 17: Table 7 ESP-BLE-MESH Terminology - Message

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reassembly / Segmentation</td>
<td>Segmentation and reassembly (SAR) is a method of communication network, which is divided into small units before transmitting packets and reassembled in a proper order at the communication receiving end.</td>
<td>The lower transport layer will automatically segment the message whose size is too big. The receiving end will return a response message, and the transmitting end will send the data packet again that the receiving end does not receive according to the response message. This is automatically completed by the lower transport layer. Unsegmented messages have at most 15 bytes, of which 4 bytes are transMIC, so the remaining is 11 bytes; in the case of segmentation, there are 12 valid bytes in the first several packets, and 8 in the last one. Special case: A shorter packet requires mandatory segmentation from lower transport layer, in which case the valid byte is 8 bytes.</td>
</tr>
<tr>
<td>Unacknowledged / Acknowledged</td>
<td>There are two types of messages: Unacknowledged or Acknowledged</td>
<td>Based on the whether or not the receiving end needs to send the response message, the messages sent are divided into two kinds. The sending end should set the maximum number of retransmission.</td>
</tr>
</tbody>
</table>
### Table 18: Table 8 ESP-BLE-MESH Terminology - Foundation Models

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuration Server Model</td>
<td>This model is used to represent a mesh network configuration of a device.</td>
<td>The node must contain the Configuration Server Model, which is responsible for maintaining configuration-related states. The states that Configuration Server Model maintains include: NetKey List, AppKey List, Model to AppKey List, Node Identity, Key Refresh Phase, Heartbeat Publish, Heartbeat Subscription, Network Transmit, Relay Retransmit etc.</td>
</tr>
<tr>
<td>Configuration Client Model</td>
<td>The model is used to represent an element that can control and monitor the configuration of a node.</td>
<td>The Configuration Client Model uses messages to control the state maintained by the Configuration Server Model. The Provisioner must contain the Configuration Client Model, with which the configuration messages, like Configuration Composition Data Get can be sent.</td>
</tr>
<tr>
<td>Health Server Model</td>
<td>This model is used to represent a mesh network diagnostics of a device.</td>
<td>The Health Server Model is primarily used by devices to check their states and see if there is an error. The states maintained by Health Server model include: Current Fault, Registered Fault, Health Period, and Attention Timer.</td>
</tr>
<tr>
<td>Health Client Model</td>
<td>The model is used to represent an element that can control and monitor the health of a node.</td>
<td>The Health Client Model uses messages to control the state maintained by the Health Server Model. The model can get the self-test information of other nodes through the message “Health Fault Get”.</td>
</tr>
</tbody>
</table>

### Table 19: Table 9 ESP-BLE-MESH Terminology - Network Management

<table>
<thead>
<tr>
<th>Term</th>
<th>Official Definition</th>
<th>Detailed Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Key Refresh procedure</td>
<td>This procedure is used when the security of one or more network keys and/or one or more of the application keys has been compromised or could be compromised.</td>
<td>Key Refresh Procedure is used to update network key and application key of ESP-BLE-MESH network. Key Refresh Procedure is used when the security of one or more network keys and/or one or more application keys is threatened or potentially threatened. Keys are usually updated after some nodes in the network are removed.</td>
</tr>
<tr>
<td>IV (Initialisation Vector) Update Procedure</td>
<td>A node can also use an IV Update procedure to signal to peer nodes that it is updating the IV Index.</td>
<td>The IV Update procedure is used to update the value of ESP-BLE-MESH network’s IV Index. This value is related to the random number required for message encryption. To ensure that the value of the random number is not repeated, this value is periodically incremented. IV Index is a 32-bit value and a shared network resource. For example, all nodes in a mesh network share the same IV Index value. Starting from 0x00000000, the IV Index increments during the IV Update procedure and maintained by a specific process, ensuring the IV Index shared in the mesh network is the same. This can be done when the node believes that it has the risk of exhausting its sequence number, or when it determines that another node is nearly exhausting its sequence number. Note: The update time must not be less than 96 hours. It can be triggered when a secure network beacon is received, or when the node determines that its sequence number is greater than a certain value.</td>
</tr>

- An Intro to Bluetooth Mesh Part 1 / Part 2
4.9 ESP32 Core Dump

4.9.1 Overview

ESP-IDF provides support to generate core dumps on unrecoverable software errors. This useful technique allows post-mortem analysis of software state at the moment of failure. Upon the crash system enters panic state, prints some information and halts or reboots depending configuration. User can choose to generate core dump in order to analyse the reason of failure on PC later on. Core dump contains snapshots of all tasks in the system at the moment of failure. Snapshots include tasks control blocks (TCB) and stacks. So it is possible to find out what task, at what instruction (line of code) and what callstack of that task lead to the crash. ESP-IDF provides special script `espcoredump.py` to help users to retrieve and analyse core dumps. This tool provides two commands for core dumps analysis:

- `info_corefile` - prints crashed task’s registers, callstack, list of available tasks in the system, memory regions and contents of memory stored in core dump (TCBs and stacks)
- `dbg_corefile` - creates core dump ELF file and runs GDB debug session with this file. User can examine memory, variables and tasks states manually. Note that since not all memory is saved in core dump only values of variables allocated on stack will be meaningful.

4.9.2 Configuration

There are a number of core dump related configuration options which user can choose in project configuration menu (`idf.py menuconfig`).

1. Core dump data destination (`Components -> ESP32-specific config -> Core dump -> Data destination`):
   - Disable core dump generation
   - Save core dump to flash
   - Print core dump to UART

2. Maximum number of tasks snapshots in core dump (`Components -> ESP32-specific config -> Core dump -> Maximum number of tasks`).

3. Delay before core dump is printed to UART (`Components -> ESP32-specific config -> Core dump -> Delay before print to UART`). Value is in ms.

4.9.3 Save core dump to flash

When this option is selected core dumps are saved to special partition on flash. When using default partition table files which are provided with ESP-IDF it automatically allocates necessary space on flash. But if user wants to use its own layout file together with core dump feature it should define separate partition for core dump as it is shown below:

```
# Name, Type, SubType, Offset, Size
# Note: if you have increased the bootloader size, make sure to update the offsets...
# to avoid overlap
nvs, data, nvs, 0x9000, 0x6000
phy_init, data, phy, 0xf000, 0x1000
factory, app, factory, 0x10000, 1M
coredump, data, coredump,, 64K
```

There are no special requirements for partition name. It can be chosen according to the user application needs, but partition type should be ‘data’ and sub-type should be ‘coredump’. Also when choosing partition size note that core dump data structure introduces constant overhead of 20 bytes and per-task overhead of 12 bytes. This overhead
does not include size of TCB and stack for every task. So partition size should be at least 20 + max tasks number x (12 + TCB size + max task stack size) bytes.

The example of generic command to analyze core dump from flash is: `espcoredump.py -p </path/to/serial/port> info_corefile </path/to/program/elf/file> or espcoredump.py -p </path/to/serial/port> dbg_corefile </path/to/program/elf/file>`

**4.9.4 Print core dump to UART**

When this option is selected base64-encoded core dumps are printed on UART upon system panic. In this case user should save core dump text body to some file manually and then run the following command: `espcoredump.py info_corefile -t b64 -c </path/to/saved/base64/text> </path/to/program/elf/file>`

Base64-encoded body of core dump will be between the following header and footer:

```
==
<body of base64-encoded core dump, save it to file on disk>
==
CORE DUMP START  CORE DUMP END
```

The `CORE DUMP START` and `CORE DUMP END` lines must not be included in core dump text file.

**4.9.5 ROM Functions in Backtraces**

It is possible situation that at the moment of crash some tasks or/and crashed task itself have one or more ROM functions in their callstacks. Since ROM is not part of the program ELF it will be impossible for GDB to parse such callstacks, because it tries to analyse functions’ prologues to accomplish that. In that case callstack printing will be broken with error message at the first ROM function. To overcome this issue you can use ROM ELF provided by Espressif (https://dl.espressif.com/dl/esp32_rom.elf) and pass it to `espcoredump.py`.

**4.9.6 Running ‘espcoredump.py’**

Generic command syntax:

```
espcoredump.py [options] command [args]
```

**Script Options**
- `-chip,-c {auto,esp32}`. Target chip type. Supported values are `auto` and `esp32`.
- `-port,-p PORT`. Serial port device.
- `-baud,-b BAUD`. Serial port baud rate used when flashing/reading.

**Commands**
- `info_corefile`. Retrieve core dump and print useful info.
- `dbg_corefile`. Retrieve core dump and start GDB session with it.

**Command Arguments**
- `-debug,-d DEBUG`. Log level (0..3).
- `-gdb,-g GDB`. Path to gdb to use for data retrieval.
- `-core,-c CORE`. Path to core dump file to use (if skipped core dump will be read from flash).
- `-core-format,-t CORE_FORMAT`. Specifies that file passed with “-c” is an ELF (“elf”), dumped raw binary (“raw”) or base64-encoded (“b64”) format.
- `-off,-o OFF`. Offset of coredump partition in flash (type `idf.py partition_table` to see it).
- `-save-core,-s SAVE_CORE`. Save core to file. Othwerwise temporary core file will be deleted. Ignored with “-c”
- `-rom-elf,-r ROM_ELF`. Path to ROM ELF file to use (if skipped “esp32_rom.elf” is used).
- `-print-mem,-m Print memory dump. Used only with “info_corefile”`.
Chapter 4. API Guides

4.10 Flash Encryption

This document provides introduction to Flash encryption concept on ESP32 and demonstrates how this feature can be used during development as well as production by the user using a sample example. The primary intention of the document is to act as a quick start guide to test and verify flash encryption operations. The details of the flash encryption block can be found in the ESP32 Technical reference manual.

4.10.1 Introduction

Flash encryption is a feature for encrypting the contents of the ESP32’s attached SPI flash. When flash encryption is enabled, physical readout of the SPI flash is not sufficient to recover most flash contents. Encryption is applied by flashing the ESP32 with plaintext data, and (if encryption is enabled) the bootloader encrypts the data in place on first boot.

With flash encryption enabled, following kinds of flash data are encrypted by default:

- Bootloader
- Partition Table
- All “app” type partitions

Other type of flash data are encrypted conditionally:

- Secure boot bootloader digest (if secure boot is enabled)
- Any partition marked with the “encrypted” flag in the partition table

Flash encryption is separate from the Secure Boot feature, and you can use flash encryption without enabling secure boot. However, for a secure environment both should be used simultaneously.

**Important:** For production use, flash encryption should be enabled in the “Release” mode only.

**Important:** Enabling flash encryption limits the options for further updates of the ESP32. Make sure to read this document (including Limitations of Flash Encryption) and understand the implications of enabling flash encryption.

4.10.2 eFuse Used During Flash Encryption Process

The flash encryption operation is controlled by various eFuses available on ESP32. Below is the list of eFuse and their description:

<table>
<thead>
<tr>
<th>eFuse</th>
<th>Description</th>
<th>Can be locked for</th>
<th>Can be writing</th>
</tr>
</thead>
</table>
| Coding scheme

0

actual number of bits to be used from BLOCK1 to derive final 256 bit AES key. The coding scheme value is decoded as below:

0: 256 bits
1: 192 bits
2: 128 bits
Final AES key is derived based on the FLASH_CRYPT_CONFIG value

BLOCK1

256 bit wide eFuse block for storing

2

(continues on next page)
4.10.3 Flash Encryption Process

Assuming the eFuse values are in default state and second stage bootloader is compiled to support flash encryption, the flash encryption process executes as below:

- **On first power-on reset, all data in flash is un-encrypted (plaintext). First stage loader (ROM) will load the second stage loader in IRAM.**
- **Second stage bootloader will read the flash_crypt_cnt (=00000000b) eFuse value and since the value is 0 (even number of bits set) it will configure and enable the flash encryption block. It will also program FLASH_CRYPT_CFG eFuse to value 0xF.**
- **The flash encryption block will generate AES-256 bit key and store into BLOCK1 eFuse. This operation is performed in hardware and the key cannot be accessed by software.**
- **Next the flash encryption block will encrypt the flash contents (based on partition table flag value). Encrypting in-place can take some time (up to a minute for large partitions).**
- **Second stage bootloader then sets the first available bit in flash_crypt_cnt (=00000001b) to mark the flash contents as encrypted (odd number of bits set).**
- **For **Release Mode** second stage bootloader will program download_dis_encrypt, download_dis_decrypt & download_dis_cache eFuse bits to 1 to prevent UART bootloader from decrypting the flash contents. It will also write protect the FLASH_CRYPT_CNT eFuse bits.**
- **For **Development Mode** second stage bootloader will program only download_dis_decrypt & download_dis_cache eFuse bits to allow UART bootloader refashing of encrypted binaries. Also FLASH_CRYPT_CNT eFuse bits will NOT be write protected.**
- **The second stage bootloader then reboots the device to start executing encrypted image. It will transparently decrypt the flash contents and load into IRAM.**

During development stage there is a frequent need to program different plaintext flash images and test the flash encryption process. This requires UART download mode to be able to load new plaintext images as many number of times as required. However during manufacturing or production UART download mode should not be allowed to access flash contents due to security reason. Hence this requires two different ESP32 configurations: one for development and other for production. Following section describes Development Mode and Release Mode for flash encryption and a step by step process to use them.
4.10.4 Steps to Setup Flash Encryption

Development Mode

It is possible to run flash encryption process for development using either ESP32 internally generated key or external host generated keys.

Using ESP32 Generated Flash Encryption Key

As mentioned above Development Mode allows user to download as many plaintext images using UART download mode. Following steps needs to be done to test flash encryption process:

- Ensure you have a ESP32 device with default flash encryption eFuse settings as shown in eFuse Used During Flash Encryption Process.
- Navigate to flash encryption sample application in $IDF_PATH/examples/security/flash_encryption folder. This sample application will print the status of flash encryption: enabled or disabled. It will print the FLASH_CRYPT_CNT eFuse value.
- Enable flash encryption support in second stage bootloader. In Project Configuration Menu, navigate to “Security Features”.
- Select Enable flash encryption on boot.
- By default the mode is set for Development.
- Select appropriate Bootloader log verbosity under Bootloader config.
- Update to the partition table offset may be required since after enabling flash encryption the size of bootloader is increased. See Bootloader Size
- Save the configuration and exit.

Build and flash the complete image including: bootloader, partition table and app. These partitions are initially written to the flash unencrypted.

idf.py flash monitor

Once the flashing is complete device will reset and on next boot second stage bootloader will encrypt the flash app partition and then reset. Now the sample application would get decrypted at runtime and executed. Below is a sample output when ESP32 boots after flash encryption is enabled for the first time.

Sample program to check Flash Encryption
This is ESP32 chip with 2 CPU cores, WiFi/BT/BLE, silicon revision 1, 4MB...
---external flash
Flash encryption feature is enabled
Flash encryption mode is DEVELOPMENT
Flash in encrypted mode with flash_crypt_cnt = 1
Halting...

At this stage if user wants to update modified plaintext application image to flash in encrypted format it can be done using following command:

```
idf.py encrypted-app-flash monitor
```

Encrypt Multiple Partitions

If all partitions needs to be updated in encrypted format, it can be done as

```
idf.py encrypted-flash monitor
```

Using Host Generated Flash Encryption Key

It is possible to pregenerate the flash encryption key on the host computer and burn it into the ESP32’s eFuse key block. This allows data to be pre-encrypted on the host and flashed to the ESP32 without needing a plaintext flash update. This feature allows encrypted flashing in both Development Mode and Release Mode modes.

**Note:** This option is not recommended for production unless a separate key is generated for each individual device.

- Ensure you have a ESP32 device with default flash encryption eFuse settings as shown in [eFuse Used During Flash Encryption Process](#).
- Generate a random key with espsecure.py:

```
espsecure.py generate_flash_encryption_key my_flash_encryption_key.bin
```
- Burn the key to the device (one time only). **This must be done before first encrypted boot**, otherwise the ESP32 will generate a random key that software can’t access or modify:

```
espefuse.py --port PORT burn_key flash_encryption my_flash_encryption_key.bin
```
- Enable flash encryption support in second stage bootloader. In [Project Configuration Menu](#), navigate to “Security Features”.

Submit Document Feedback

Espressif Systems 1419

Release v4.0.3-189-g7c4f5fa
Chapter 4. API Guides

• Select Enable flash encryption on boot.
• By default the mode is set for Development.
• Select appropriate Bootloader log verbosity under Bootloader config.
• Update to the partition table offset may be required since after enabling flash encryption the size of bootloader is increased. See Bootloader Size
• Save the configuration and exit.

Build and flash the complete image including: bootloader, partition table and app. These partitions are initially written to the flash unencrypted

```
idf.py flash monitor
```

On next boot second stage bootloader will encrypt the flash app partition and then reset. Now the sample application would get decrypted at runtime and executed.

At this stage if user wants to update new plaintext application image to flash they should issue following command

```
idf.py encrypted-app flashes monitor
```

For reprogramming all partitions in encrypted format follow Encrypt Multiple Partitions.

Release Mode

In Release mode UART bootloader can not perform flash encryption operations and new plaintext images can be downloaded ONLY using OTA scheme which will encrypt the plaintext image before writing to flash.

• Ensure you have a ESP32 device with default flash encryption eFuse settings as shown in eFuse Used During Flash Encryption Process.
• Enable flash encryption support in second stage bootloader. In Project Configuration Menu, navigate to Security Features.
• Select Enable flash encryption on boot.
• Select Release Mode, by default the mode is set for Development. Please note once the Release mode is selected the download_dis_encrypt and download_dis_decrypt eFuse bits will be programmed to disable UART bootloader access to flash contents.
• Select appropriate Bootloader log verbosity under Bootloader config.
• Update to the partition table offset may be required since after enabling flash encryption the size of bootloader is increased. See Bootloader Size
• Save the configuration and exit.

Build and flash the complete image including: bootloader, partition table and app. These partitions are initially written to the flash unencrypted

```
idf.py flash monitor
```

On next boot second stage bootloader will encrypt the flash app partition and then reset. Now the sample application should execute correctly.

Once the flash encryption is enabled in Release mode the bootloader will write protect the FLASH_CRYPT_CNT eFuse.

For subsequent plaintext update in field OTA scheme should be used. Please refer OTA for further details.

Best Practices

When using Flash Encryption in production:

• Do not reuse the same flash encryption key between multiple devices. This means that an attacker who copies encrypted data from one device cannot transfer it to a second device.
• When using ESP32 V3, if the UART ROM Download Mode is not needed for a production device then it should be disabled to provide an extra level of protection. Do this by calling `esp_efuse_disable_rom_download_mode()` during application startup. Alternatively, configure the project `CONFIG_ESP32_REV_MIN` level to 3 (targeting ESP32 V3 only) and enable `CONFIG_SECURE_DISABLE_ROM_DL_MODE`. The ability to disable ROM Download Mode is not available on earlier ESP32 versions.

• Enable **Secure Boot** as an extra layer of protection, and to prevent an attacker from selectively corrupting any part of the flash before boot.

**Possible Failures**

Once flash encryption is enabled and if the `FLASH_CRYPT_CNT` eFuse value has an odd number of bits set then all the partitions (which are marked with encryption flag) are expected to contain encrypted ciphertext. Below are three typical failure cases if the ESP32 is loaded with plaintext data:

1. In case the bootloader partition is re-updated with plaintext bootloader image the ROM loader will fail to load the bootloader and following type of failure will be displayed:

   ```
   rst:0x3 (SW_RESET), boot:0x13 (SPI_FAST_FLASH_BOOT)
   flash read err, 1000
   ets_main.c 371
   ets Jun 8 2016 00:22:57
   rst:0x7 (TG0WDT_SYS_RESET), boot:0x13 (SPI_FAST_FLASH_BOOT)
   flash read err, 1000
   ets_main.c 371
   ets Jun 8 2016 00:22:57

   ```

   (continues on next page)
### 4.10.5 Key Points About Flash Encryption

- The contents of the flash are encrypted using AES-256. The flash encryption key is stored in eFuse internal to the chip, and is (by default) protected from software access.
- The flash encryption algorithm is AES-256, where the key is “tweaked” with the offset address of each 32 byte block of flash. This means every 32 byte block (two consecutive 16 byte AES blocks) is encrypted with a unique key derived from the flash encryption key.
- Flash access is transparent via the flash cache mapping feature of ESP32 - any flash regions which are mapped to the address space will be transparently decrypted when read.
  
  It may be desirable for some data partitions to remain unencrypted for ease of access, or to use flash-friendly update algorithms that are ineffective if the data is encrypted. NVS partitions for non-volatile storage cannot be encrypted since NVS library is not directly compatible with flash encryption. Refer to NVS Encryption for more details.
- If flash encryption may be enabled, the programmer must take certain precautions when writing code that uses encrypted flash.
- If secure boot is enabled, reflash the bootloader of an encrypted device requires a “Reflashable” secure boot digest (see Flash Encryption and Secure Boot).

Note: The bootloader app binary bootloader.bin may become too large when both secure boot and flash encryption are enabled. If this happens, the bootloader app will need to be split into two parts: a secure boot part and a main part. The secure boot part will be reflashed separately from the main part.
encryption are enabled. See *Bootloader Size*.

---

**Important:** Do not interrupt power to the ESP32 while the first boot encryption pass is running. If power is interrupted, the flash contents will be corrupted and require flashing with unencrypted data again. A reflash like this will not count towards the flashing limit.

---

### 4.10.6 Using Encrypted Flash

ESP32 app code can check if flash encryption is currently enabled by calling `esp_flash_encryption_enabled()`. Also, device can identify the flash encryption mode by calling `esp_get_flash_encryption_mode()`.

Once flash encryption is enabled, some care needs to be taken when accessing flash contents from code.

#### Scope of Flash Encryption

Whenever the `FLASH_CRYPT_CNT` eFuse is set to a value with an odd number of bits set, all flash content which is accessed via the MMU’s flash cache is transparently decrypted. This includes:

- Executable application code in flash (IROM).
- All read-only data stored in flash (DROM).
- Any data accessed via `spi_flash_mmap()`.
- The software bootloader image when it is read by the ROM bootloader.

**Important:** The MMU flash cache unconditionally decrypts all data. Data which is stored unencrypted in the flash will be “transparently decrypted” via the flash cache and appear to software like random garbage.

#### Reading Encrypted Flash

To read data without using a flash cache MMU mapping, we recommend using the partition read function `esp_partition_read()`. When using this function, data will only be decrypted when it is read from an encrypted partition. Other partitions will be read unencrypted. In this way, software can access encrypted and non-encrypted flash in the same way.

Data which is read via other SPI read APIs are not decrypted:

- Data read via `spi_flash_read()` is not decrypted.
- Data read via ROM function `SPIRead()` is not decrypted (this function is not supported in esp-idf apps).
- Data stored using the Non-Volatile Storage (NVS) API is always stored and read decrypted from the perspective of flash encryption. It is up to the library to provide encryption feature if required. Refer to *NVS Encryption* for more details.

#### Writing Encrypted Flash

Where possible, we recommend using the partition write function `esp_partition_write`. When using this function, data will only be encrypted when writing to encrypted partitions. Data will be written to other partitions unencrypted. In this way, software can access encrypted and non-encrypted flash in the same way.

The `esp_spi_flash_write` function will write data when the `write_encrypted` parameter is set to true. Otherwise, data will be written unencrypted.

The ROM function `esp_rom_spiflash_write_encrypted` will write encrypted data to flash, the ROM function `SPIWrite` will write unencrypted to flash. (these function are not supported in esp-idf apps).
Because data is encrypted in blocks, the minimum write size for encrypted data is 16 bytes (and the alignment is 16 bytes).

### 4.10.7 Updating Encrypted Flash

**OTA Updates**

OTA updates to encrypted partitions will automatically write encrypted, as long as the `esp_partition_write` function is used.

### 4.10.8 Disabling Flash Encryption

If you’ve accidentally enabled flash encryption for some reason, the next flash of plaintext data will soft-brick the ESP32 (the device will reboot continuously, printing the error `flash read err, 1000`).

If flash encryption is enabled in Development mode, you can disable flash encryption again by writing `FLASH_CRYPT_CNT` eFuse. This can only be done three times per chip.

- First, open **Project Configuration Menu** and disable **Enable flash encryption boot** under “Security Features”.
- Exit menuconfig and save the new configuration.
- Run `idf.py menuconfig` again and double-check you really disabled this option! *If this option is left enabled, the bootloader will immediately re-enable encryption when it boots.*
- Run `idf.py flash` to build and flash a new bootloader and app, without flash encryption enabled.
- Run `espefuse.py` (in `components/esptool_py/esptool`) to disable the `FLASH_CRYPT_CNT`:

```
espefuse.py burn_efuse FLASH_CRYPT_CNT
```

Reset the ESP32 and flash encryption should be disabled, the bootloader will boot as normal.

### 4.10.9 Limitations of Flash Encryption

Flash encryption protects firmware against unauthorised readout and modification. It is important to understand the limitations of the flash encryption feature:

- Flash encryption is only as strong as the key. For this reason, we recommend keys are generated on the device during first boot (default behaviour). If generating keys off-device, ensure proper procedure is followed and don’t share the same key between all production devices.
- Not all data is stored encrypted. If storing data on flash, check if the method you are using (library, API, etc.) supports flash encryption.
- Flash encryption does not prevent an attacker from understanding the high-level layout of the flash. This is because the same AES key is used for every pair of adjacent 16 byte AES blocks. When these adjacent 16 byte blocks contain identical content (such as empty or padding areas), these blocks will encrypt to produce matching pairs of encrypted blocks. This may allow an attacker to make high-level comparisons between encrypted devices (i.e. to tell if two devices are probably running the same firmware version).
- For the same reason, an attacker can always tell when a pair of adjacent 16 byte blocks (32 byte aligned) contain two identical 16 byte sequences. Keep this in mind if storing sensitive data on the flash, design your flash storage so this doesn’t happen (using a counter byte or some other non-identical value every 16 bytes is sufficient). **NVS Encryption** deals with this and is suitable for many uses.
- Flash encryption alone may not prevent an attacker from modifying the firmware of the device. To prevent unauthorised firmware from running on the device, use flash encryption in combination with **Secure Boot**.

### 4.10.10 Flash Encryption and Secure Boot

It is recommended to use flash encryption and secure boot together. However, if Secure Boot is enabled then additional restrictions apply to reﬂashing the device:

- **OTA Updates** are not restricted (provided the new app is signed correctly with the Secure Boot signing key).
Chapter 4. API Guides

- **Plaintext serial flash updates** are only possible if the **Reflashable** Secure Boot mode is selected and a Secure Boot key was pre-generated and burned to the ESP32 (refer to **Secure Boot** docs.). In this configuration, *idf.py* bootloader will produce a pre-digested bootloader and secure boot digest file for flashing at offset 0x0. When following the plaintext serial reflashing steps it is necessary to re-flash this file before flashing other plaintext data.

- **Reflashing via Pregenerated Flash Encryption Key** is still possible, provided the bootloader is not reflashed. Reflashing the bootloader requires the same **Reflashable** option to be enabled in the Secure Boot config.

### 4.10.11 Advanced Features

The following information is useful for advanced use of flash encryption:

#### Encrypted Partition Flag

Some partitions are encrypted by default. Otherwise, it is possible to mark any partition as requiring encryption:

In the **partition table** description CSV files, there is a field for flags.

Usually left blank, if you write “encrypted” in this field then the partition will be marked as encrypted in the partition table, and data written here will be treated as encrypted (same as an app partition):

<table>
<thead>
<tr>
<th>Name, Type, SubType, Offset, Size, Flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvs, data, nvs, 0x9000, 0x6000</td>
</tr>
<tr>
<td>phy_init, data, phy, 0xf000, 0x1000</td>
</tr>
<tr>
<td>factory, app, factory, 0x10000, 1M</td>
</tr>
<tr>
<td>secret_data, 0x40, 0x01, 0x20000, 256K, encrypted</td>
</tr>
</tbody>
</table>

- None of the default partition tables include any encrypted data partitions.
- It is not necessary to mark “app” partitions as encrypted, they are always treated as encrypted.
- The “encrypted” flag does nothing if flash encryption is not enabled.
- It is possible to mark the optional phy partition with phy_init data as encrypted, if you wish to protect this data from physical access readout or modification.
- It is not possible to mark the nvs partition as encrypted.

#### Enabling UART Bootloader Encryption/Decryption

By default, on first boot the flash encryption process will burn eFuses **DISABLE_DL_ENCRYPT**, **DISABLE_DL_DECRYPT** and **DISABLE_DL_CACHE**:

- **DISABLE_DL_ENCRYPT** disables the flash encryption operations when running in UART bootloader boot mode.
- **DISABLE_DL_DECRYPT** disables transparent flash decryption when running in UART bootloader mode, even if FLASH_CRYPT_CNT is set to enable it in normal operation.
- **DISABLE_DL_CACHE** disables the entire MMU flash cache when running in UART bootloader mode.

It is possible to burn only some of these eFuses, and write-protect the rest (with unset value 0) before the first boot, in order to preserve them. For example:

```
esefuse.py --port PORT burn_efuse DISABLE_DL_DECRYPT
esefuse.py --port PORT write_protect_efuse DISABLE_DL_ENCRYPT
```

(Note that all 3 of these eFuses are disabled via one write protect bit, so write protecting one will write protect all of them. For this reason, it’s necessary to set any bits before write-protecting.)

**Important:** Write protecting these eFuses to keep them unset is not currently very useful, as *esptool.py* does not support reading encrypted flash.
### Chapter 4. API Guides

#### Important:
If `DISABLE_DL_DECRYPT` is left unset (0) this effectively makes flash encryption useless, as an attacker with physical access can use UART bootloader mode (with custom stub code) to read out the flash contents.

### Setting `FLASH_CRYPT_CONFIG`

The `FLASH_CRYPT_CONFIG` eFuse determines the number of bits in the flash encryption key which are “tweaked” with the block offset. See *Flash Encryption Algorithm* for details.

First boot of the bootloader always sets this value to the maximum `0xF`.

It is possible to write these eFuse manually, and write protect it before first boot in order to select different tweak values. This is not recommended.

It is strongly recommended to never write protect `FLASH_CRYPT_CONFIG` when it the value is zero. If this eFuse is set to zero, no bits in the flash encryption key are tweaked and the flash encryption algorithm is equivalent to AES ECB mode.

### JTAG Debugging

By default, when Flash Encryption is enabled (in either Development or Release mode) then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables flash encryption.

See *JTAG with Flash Encryption or Secure Boot* for more information about using JTAG Debugging with Flash Encryption.

### 4.10.12 Technical Details

The following sections provide some reference information about the operation of flash encryption.

#### Flash Encryption Algorithm

- AES-256 operates on 16 byte blocks of data. The flash encryption engine encrypts and decrypts data in 32 byte blocks, two AES blocks in series.
- The main flash encryption key is stored in eFuse (BLOCK1) and by default is protected from further writes or software readout.
- AES-256 key size is 256 bits (32 bytes), read from eFuse block 1. The hardware AES engine uses the key in reversed byte order to the order stored in the eFuse block. - If `CODING_SCHEME` eFuse is set to 0 (default “None” Coding Scheme) then the eFuse key block is 256 bits and the key is stored as-is (in reversed byte order). - If `CODING_SCHEME` eFuse is set to 1 (3/4 Encoding) then the eFuse key block is 192 bits (in reversed byte order), so overall entropy is reduced. The hardware flash encryption still operates on a 256-bit key, after being read (and un-reversed), the key is extended by as `key = key[0:255] + key[64:127]`.
- AES algorithm is used inverted in flash encryption, so the flash encryption “encrypt” operation is AES decrypt and the “decrypt” operation is AES encrypt. This is for performance reasons and does not alter the effectiveness of the algorithm.
- Each 32 byte block (two adjacent 16 byte AES blocks) is encrypted with a unique key. The key is derived from the main flash encryption key in eFuse, XORed with the offset of this block in the flash (a “key tweak”).
- The specific tweak depends on the setting of `FLASH_CRYPT_CONFIG` eFuse. This is a 4 bit eFuse, where each bit enables XORing of a particular range of the key bits:
  - Bit 1, bits 0-66 of the key are XORed.
  - Bit 2, bits 67-131 of the key are XORed.
  - Bit 3, bits 132-194 of the key are XORed.
  - Bit 4, bits 195-256 of the key are XORed.
It is recommended that `FLASH_CRYPT_CONFIG` is always left to set the default value `0xF`, so that all key bits are XORed with the block offset. See *Setting `FLASH_CRYPT_CONFIG`* for details.
• The high 19 bits of the block offset (bit 5 to bit 23) are XORed with the main flash encryption key. This range is chosen for two reasons: the maximum flash size is 16MB (24 bits), and each block is 32 bytes so the least significant 5 bits are always zero.
• There is a particular mapping from each of the 19 block offset bits to the 256 bits of the flash encryption key, to determine which bit is XORed with which. See the variable _FLASH_ENCRYPTION_TWEAK_PATTERN in the espsecure.py source code for the complete mapping.
• To see the full flash encryption algorithm implemented in Python, refer to the _flash_encryption_operation() function in the espsecure.py source code.

4.11 ESP-IDF FreeRTOS SMP Changes

4.11.1 Overview

The vanilla FreeRTOS is designed to run on a single core. However the ESP32 is dual core containing a Protocol CPU (known as CPU 0 or PRO_CPU) and an Application CPU (known as CPU 1 or APP_CPU). The two cores are identical in practice and share the same memory. This allows the two cores to run tasks interchangeably between them.

The ESP-IDF FreeRTOS is a modified version of vanilla FreeRTOS which supports symmetric multiprocessing (SMP). ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v8.2.0. This guide outlines the major differences between vanilla FreeRTOS and ESP-IDF FreeRTOS. The API reference for vanilla FreeRTOS can be found via http://www.freertos.org/a00106.html

For information regarding features that are exclusive to ESP-IDF FreeRTOS, see ESP-IDF FreeRTOS Additions.

Backported Features: Although ESP-IDF FreeRTOS is based on the Xtensa port of FreeRTOS v8.2.0, a number of FreeRTOS v9.0.0 features have been backported to ESP-IDF.

Tasks and Task Creation: Use xTaskCreatePinnedToCore() or xTaskCreateStaticPinnedToCore() to create tasks in ESP-IDF FreeRTOS. The last parameter of the two functions is xCoreID. This parameter specifies which core the task is pinned to. Acceptable values are 0 for PRO_CPU, 1 for APP_CPU, or tskNO_AFFINITY which allows the task to run on both.

Round Robin Scheduling: The ESP-IDF FreeRTOS scheduler will skip tasks when implementing Round-Robin scheduling between multiple tasks in the Ready state that are of the same priority. To avoid this behavior, ensure that those tasks either enter a blocked state, or are distributed across a wider range of priorities.

Scheduler Suspension: Suspending the scheduler in ESP-IDF FreeRTOS will only affect the scheduler on the calling core. In other words, calling vTaskSuspendAll() on PRO_CPU will not prevent APP_CPU from scheduling, and vice versa. Use critical sections or semaphores instead for simultaneous access protection.

Tick Interrupt Synchronicity: Tick interrupts of PRO_CPU and APP_CPU are not synchronized. Do not expect to use vTaskDelay() or vTaskDelayUntil() as an accurate method of synchronizing task execution between the two cores. Use a counting semaphore instead as their context switches are not tied to tick interrupts due to preemption.

Critical Sections & Disabling Interrupts: In ESP-IDF FreeRTOS, critical sections are implemented using mutexes. Entering critical sections involve taking a mutex, then disabling the scheduler and interrupts of the calling core. However the other core is left unaffected. If the other core attempts to take same mutex, it will spin until the calling core has released the mutex by exiting the critical section.

Floating Point Arithmetic: The ESP32 supports hardware acceleration of single precision floating point arithmetic (float). However the use of hardware acceleration leads to some behavioral restrictions in ESP-IDF FreeRTOS. Therefore, tasks that utilize float will automatically be pinned to a core if not done so already. Furthermore, float cannot be used in interrupt service routines.

Task Deletion: Task deletion behavior has been backported from FreeRTOS v9.0.0 and modified to be SMP compatible. Task memory will be freed immediately when vTaskDelete() is called to delete a task that is not currently running and not pinned to the other core. Otherwise, freeing of task memory will still be delegated to the Idle Task.

Thread Local Storage Pointers & Deletion Callbacks: ESP-IDF FreeRTOS has backported the Thread Local Storage Pointers (TLSP) feature. However the extra feature of Deletion Callbacks has been added. Deletion callbacks
are called automatically during task deletion and are used to free memory pointed to by TLSP. Call `vTaskSetThreadLocalStoragePointerAndDelCallback()` to set TLSP and Deletion Callbacks.

**Configuring ESP-IDF FreeRTOS**: Several aspects of ESP-IDF FreeRTOS can be set in the project configuration (`idf.py menuconfig`) such as running ESP-IDF in Unicore (single core) Mode, or configuring the number of Thread Local Storage Pointers each task will have.

### 4.11.2 Backported Features

The following features have been backported from FreeRTOS v9.0.0 to ESP-IDF.

**Static Allocation**

This feature has been backported from FreeRTOS v9.0.0 to ESP-IDF. The `CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION` option must be enabled in `menuconfig` in order for static allocation functions to be available. Once enabled, the following functions can be called:

- `xTaskCreateStatic()` (see Backporting Notes below)
- `xQueueCreateStatic`
- `xSemaphoreCreateBinaryStatic`
- `xSemaphoreCreateCountingStatic`
- `xSemaphoreCreateMutexStatic`
- `xSemaphoreCreateRecursiveMutexStatic`
- `xTimerCreateStatic()` (see Backporting Notes below)
- `xEventGroupCreateStatic()`

**Other Features**

- `vTaskSetThreadLocalStoragePointer()` (see Backporting Notes below)
- `pvTaskGetThreadLocalStoragePointer()` (see Backporting Notes below)
- `vTaskSetTimerID()`
- `xTimerGetPeriod()`
- `xTimerGetexpiryTime()`
- `pcQueueGetName()`
- `uxSemaphoreGetCount`

**Backporting Notes**

1) `xTaskCreateStatic()` has been made SMP compatible in a similar fashion to `xTaskCreate()` (see Tasks and Task Creation). Therefore `xTaskCreateStaticPinnedToCore()` can also be called.

2) Although vanilla FreeRTOS allows the Timer feature’s daemon task to be statically allocated, the daemon task is always dynamically allocated in ESP-IDF. Therefore `vApplicationGetTimerTaskMemory` does not need to be defined when using statically allocated timers in ESP-IDF FreeRTOS.

3) The Thread Local Storage Pointer feature has been modified in ESP-IDF FreeRTOS to include Deletion Callbacks (see Thread Local Storage Pointers & Deletion Callbacks). Therefore the function `vTaskSetThreadLocalStoragePointerAndDelCallback()` can also be called.

### 4.11.3 Tasks and Task Creation

Tasks in ESP-IDF FreeRTOS are designed to run on a particular core, therefore two new task creation functions have been added to ESP-IDF FreeRTOS by appending `PinnedToCore` to the names of the task creation functions in vanilla FreeRTOS. The vanilla FreeRTOS functions of `xTaskCreate()` and `xTaskCreateStatic()` have led to the addition of `xTaskCreatePinnedToCore()` and `xTaskCreateStaticPinnedToCore()` in ESP-IDF FreeRTOS (see Backported Features).
Chapter 4. API Guides

For more details see freertos/task.c

The ESP-IDF FreeRTOS task creation functions are nearly identical to their vanilla counterparts with the exception of the extra parameter known as xCoreID. This parameter specifies the core on which the task should run on and can be one of the following values.

- 0 pins the task to PRO_CPU
- 1 pins the task to APP_CPU
- tskNO_AFFINITY allows the task to be run on both CPUs

For example xTaskCreatePinnedToCore(tsk_callback, “APP_CPU Task”, 1000, NULL, 10, NULL, 1) creates a task of priority 10 that is pinned to APP_CPU with a stack size of 1000 bytes. It should be noted that the uxStackDepth parameter in vanilla FreeRTOS specifies a task’s stack depth in terms of the number of words, whereas ESP-IDF FreeRTOS specifies the stack depth in terms of bytes.

Note that the vanilla FreeRTOS functions xTaskCreate() and xTaskCreateStatic() have been defined in ESP-IDF FreeRTOS as inline functions which call xTaskCreatePinnedToCore() and xTaskCreateStaticPinnedToCore() respectively with tskNO_AFFINITY as the xCoreID value.

Each Task Control Block (TCB) in ESP-IDF stores the xCoreID as a member. Hence when each core calls the scheduler to select a task to run, the xCoreID member will allow the scheduler to determine if a given task is permitted to run on the core that called it.

4.11.4 Scheduling

The vanilla FreeRTOS implements scheduling in the vTaskSwitchContext() function. This function is responsible for selecting the highest priority task to run from a list of tasks in the Ready state known as the Ready Tasks List (described in the next section). In ESP-IDF FreeRTOS, each core will call vTaskSwitchContext() independently to select a task to run from the Ready Tasks List which is shared between both cores. There are several differences in scheduling behavior between vanilla and ESP-IDF FreeRTOS such as differences in Round Robin scheduling, scheduler suspension, and tick interrupt synchronicity.

Round Robin Scheduling

Given multiple tasks in the Ready state and of the same priority, vanilla FreeRTOS implements Round Robin scheduling between each task. This will result in running those tasks in turn each time the scheduler is called (e.g. every tick interrupt). On the other hand, the ESP-IDF FreeRTOS scheduler may skip tasks when Round Robin scheduling multiple Ready state tasks of the same priority.

The issue of skipping tasks during Round Robin scheduling arises from the way the Ready Tasks List is implemented in FreeRTOS. In vanilla FreeRTOS, pxReadyTasksList is used to store a list of tasks that are in the Ready state. The list is implemented as an array of length configMAX_PRIORITIES where each element of the array is a linked list. Each linked list is of type List_t and contains TCBs of tasks of the same priority that are in the Ready state. The following diagram illustrates the pxReadyTasksList structure.

Each linked list also contains a pxIndex which points to the last TCB returned when the list was queried. This index allows the vTaskSwitchContext() to start traversing the list at the TCB immediately after pxIndex hence implementing Round Robin Scheduling between tasks of the same priority.

In ESP-IDF FreeRTOS, the Ready Tasks List is shared between cores hence pxReadyTasksList will contain tasks pinned to different cores. When a core calls the scheduler, it is able to look at the xCoreID member of each TCB in the list to determine if a task is allowed to run on calling the core. The ESP-IDF FreeRTOS pxReadyTasksList is illustrated below.

Therefore when PRO_CPU calls the scheduler, it will only consider the tasks in blue or purple. Whereas when APP_CPU calls the scheduler, it will only consider the tasks in orange or purple.

Although each TCB has an xCoreID in ESP-IDF FreeRTOS, the linked list of each priority only has a single pxIndex. Therefore when the scheduler is called from a particular core and traverses the linked list, it will skip all TCBs pinned to the other core and point the pxIndex at the selected task. If the other core then calls the scheduler, it will traverse the linked list starting at the TCB immediately after pxIndex. Therefore, TCBs skipped on the
Fig. 14: Illustration of FreeRTOS Ready Task List Data Structure

Fig. 15: Illustration of FreeRTOS Ready Task List Data Structure in ESP-IDF
previous scheduler call from the other core would not be considered on the current scheduler call. This issue is demonstrated in the following illustration.

Fig. 16: Illustration of pxIndex behavior in ESP-IDF FreeRTOS

Referring to the illustration above, assume that priority 9 is the highest priority, and none of the tasks in priority 9 will block hence will always be either in the running or Ready state.

1) **PRO_CPU** calls the scheduler and selects Task A to run, hence moves pxIndex to point to Task A

2) **APP_CPU** calls the scheduler and starts traversing from the task after pxIndex which is Task B. However Task B is not selected to run as it is not pinned to **APP_CPU** hence it is skipped and Task C is selected instead. pxIndex now points to Task C

3) **PRO_CPU** calls the scheduler and starts traversing from Task D. It skips Task D and selects Task E to run and points pxIndex to Task E. Notice that Task B isn’t traversed because it was skipped the last time **APP_CPU** called the scheduler to traverse the list.

4) The same situation with Task D will occur if **APP_CPU** calls the scheduler again as pxIndex now points to Task E

One solution to the issue of task skipping is to ensure that every task will enter a blocked state so that they are removed from the Ready Task List. Another solution is to distribute tasks across multiple priorities such that a given priority will not be assigned multiple tasks that are pinned to different cores.

**Scheduler Suspension**

In vanilla FreeRTOS, suspending the scheduler via `vTaskSuspendAll()` will prevent calls of `vTaskSwitchContext()` from context switching until the scheduler has been resumed with `xTaskResumeAll()`. However servicing ISRs are still permitted. Therefore any changes in task states as a result from the current running task or ISRs will not be executed until the scheduler is resumed. Scheduler suspension in vanilla FreeRTOS is a common protection method against simultaneous access of data shared between tasks, whilst still allowing ISRs to be serviced.

In ESP-IDF FreeRTOS, `xTaskSuspendAll()` will only prevent calls of `vTaskSwitchContext()` from switching contexts on the core that called for the suspension. Hence if **PRO_CPU** calls `vTaskSuspendAll()`, **APP_CPU** will still be able to switch contexts. If data is shared between tasks that are pinned to different cores, scheduler suspension is **NOT** a valid method of protection against simultaneous access. Consider using critical sections (disables interrupts) or semaphores (does not disable interrupts) instead when protecting shared resources in ESP-IDF FreeRTOS.

In general, it’s better to use other RTOS primitives like mutex semaphores to protect against data shared between tasks, rather than `vTaskSuspendAll()`.

**Tick Interrupt Synchronicity**

In ESP-IDF FreeRTOS, tasks on different cores that unblock on the same tick count might not run at exactly the same time due to the scheduler calls from each core being independent, and the tick interrupts to each core being unsynchronized.

In vanilla FreeRTOS the tick interrupt triggers a call to `xTaskIncrementTick()` which is responsible for incrementing the tick counter, checking if tasks which have called `vTaskDelay()` have fulfilled their delay period, and moving those tasks from the Delayed Task List to the Ready Task List. The tick interrupt will then call the scheduler if a context switch is necessary.
In ESP-IDF FreeRTOS, delayed tasks are unblocked with reference to the tick interrupt on PRO_CPU as PRO_CPU is responsible for incrementing the shared tick count. However, tick interrupts to each core might not be synchronized (same frequency but out of phase) hence when PRO_CPU receives a tick interrupt, APP_CPU might not have received it yet. Therefore, if multiple tasks of the same priority are unblocked on the same tick count, the task pinned to PRO_CPU will run immediately whereas the task pinned to APP_CPU must wait until APP_CPU receives its out of sync tick interrupt. Upon receiving the tick interrupt, APP_CPU will then call for a context switch and finally switches contexts to the newly unblocked task.

Therefore, task delays should NOT be used as a method of synchronization between tasks in ESP-IDF FreeRTOS. Instead, consider using a counting semaphore to unblock multiple tasks at the same time.

### 4.11.5 Critical Sections & Disabling Interrupts

Vanilla FreeRTOS implements critical sections in `vTaskEnterCritical` which disables the scheduler and calls `portDISABLE_INTERRUPTS`. This prevents context switches and servicing of ISRs during a critical section. Therefore, critical sections are used as a valid protection method against simultaneous access in vanilla FreeRTOS.

On the other hand, the ESP32 has no hardware method for cores to disable each other’s interrupts. Calling `portDISABLE_INTERRUPTS()` will have no effect on the interrupts of the other core. Therefore, disabling interrupts is NOT a valid protection method against simultaneous access to shared data as it leaves the other core free to access the data even if the current core has disabled its own interrupts.

For this reason, ESP-IDF FreeRTOS implements critical sections using mutexes, and calls to enter or exit a critical section must provide a mutex that is associated with a shared resource requiring access protection. When entering a critical section in ESP-IDF FreeRTOS, the calling core will disable its scheduler and interrupts similar to the vanilla FreeRTOS implementation. However, the calling core will also take the mutex whilst the other core is left unaffected during the critical section. If the other core attempts to take the same mutex, it will spin until the mutex is released. Therefore, the ESP-IDF FreeRTOS implementation of critical sections allows a core to have protected access to a shared resource without disabling the other core. The other core will only be affected if it tries to concurrently access the same resource.

The ESP-IDF FreeRTOS critical section functions have been modified as follows:

- `taskENTER_CRITICAL(mux)`, `taskENTER_CRITICAL_ISR(mux)`, `portENTER_CRITICAL(mux)`, `portENTER_CRITICAL_ISR(mux)` are all macro defined to call `vTaskEnterCritical`
- `taskEXIT_CRITICAL(mux)`, `taskEXIT_CRITICAL_ISR(mux)`, `portEXIT_CRITICAL(mux)`, `portEXIT_CRITICAL_ISR(mux)` are all macro defined to call `vTaskExitCritical`
- `portENTER_CRITICAL_SAFE(mux)`, `portEXIT_CRITICAL_SAFE(mux)` macro identifies the context of execution, i.e., ISR or Non-ISR, and calls appropriate critical section functions (port*_CRITICAL in Non-ISR and port*_CRITICAL_ISR in ISR) in order to be in compliance with Vanilla FreeRTOS.

For more details see [freertos/include/freertos/portmacro.h](https://github.com/esp-idf/esp-idf) and [freertos/task.c](https://github.com/esp-idf/esp-idf).

It should be noted that when modifying vanilla FreeRTOS code to be ESP-IDF FreeRTOS compatible, it is trivial to modify the type of critical section called as they are all defined to call the same function. As long as the same mutex is provided upon entering and exiting, the type of call should not matter.

### 4.11.6 Floating Point Arithmetic

The ESP32 supports hardware acceleration of single precision floating point arithmetic (`float`) via Floating Point Units (FPU, also known as coprocessors) attached to each core. The use of the FPUs imposes some behavioral restrictions on ESP-IDF FreeRTOS.

ESP-IDF FreeRTOS implements Lazy Context Switching for FPUs. In other words, the state of a core’s FPU registers are not immediately saved when a context switch occurs. Therefore, tasks that utilize `float` must be pinned to a particular core upon creation. If not, ESP-IDF FreeRTOS will automatically pin the task in question to whichever core the task was running on upon the task’s first use of `float`. Likewise due to Lazy Context Switching, interrupt service routines must also not use `float`. 
ESP32 does not support hardware acceleration for double precision floating point arithmetic (double). Instead, double is implemented via software hence the behavioral restrictions with regards to float do not apply to double. Note that due to the lack of hardware acceleration, double operations may consume significantly larger amount of CPU time in comparison to float.

### 4.11.7 Task Deletion

FreeRTOS task deletion prior to v9.0.0 delegated the freeing of task memory entirely to the Idle Task. Currently, the freeing of task memory will occur immediately (within vTaskDelete()) if the task being deleted is not currently running or is not pinned to the other core (with respect to the core vTaskDelete() is called on). TLSP deletion callbacks will also run immediately if the same conditions are met.

However, calling vTaskDelete() to delete a task that is either currently running or pinned to the other core will still result in the freeing of memory being delegated to the Idle Task.

### 4.11.8 Thread Local Storage Pointers & Deletion Callbacks

Thread Local Storage Pointers (TLSP) are pointers stored directly in the TCB. TLSP allow each task to have its own unique set of pointers to data structures. However, task deletion behavior in vanilla FreeRTOS does not automatically free the memory pointed to by TLSP. Therefore, if the memory pointed to by TLSP is not explicitly freed by the user before task deletion, memory leak will occur.

ESP-IDF FreeRTOS provides the added feature of Deletion Callbacks. Deletion Callbacks are called automatically during task deletion to free memory pointed to by TLSP. Each TLSP can have its own Deletion Callback. Note that due to the Task Deletion behavior, there can be instances where Deletion Callbacks are called in the context of the Idle Tasks. Therefore, Deletion Callbacks should never attempt to block and critical sections should be kept as short as possible to minimize priority inversion.

Deletion callbacks are of type void (*TlsDeleteCallbackFunction_t)( int, void * ) where the first parameter is the index number of the associated TLSP, and the second parameter is the TLSP itself.

Deletion callbacks are set alongside TLSP by calling vTaskSetThreadLocalStoragePointerAndDeleteCallback(). Calling the vanilla FreeRTOS function vTaskSetThreadLocalStoragePointer() will simply set the TLSP’s associated Deletion Callback to NULL meaning that no callback will be called for that TLSP during task deletion. If a deletion callback is NULL, users should manually free the memory pointed to by the associated TLSP before task deletion in order to avoid memory leak.

CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS in menuconfig can be used to configure the number TLSP and Deletion Callbacks a TCB will have.

For more details see FreeRTOS API reference.

### 4.11.9 Configuring ESP-IDF FreeRTOS

The ESP-IDF FreeRTOS can be configured in the project configuration menu (idf.py menuconfig) under Component Config/FreeRTOS. The following section highlights some of the ESP-IDF FreeRTOS configuration options. For a full list of ESP-IDF FreeRTOS configurations, see FreeRTOS.

CONFIG_FREERTOS_UNICORE will run ESP-IDF FreeRTOS only on PRO_CPU. Note that this is not equivalent to running vanilla FreeRTOS. Behaviors of multiple components in ESP-IDF will be modified such as esp32/cpu_start.c. For more details regarding the effects of running ESP-IDF FreeRTOS on a single core, search for occurrences of CONFIG_FREERTOS_UNICORE in the ESP-IDF components.

CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS will define the number of Thread Local Storage Pointers each task will have in ESP-IDF FreeRTOS.

CONFIG_FREERTOS_SUPPORT_STATIC_ALLOCATION will enable the backported functionality of xTaskCreateStaticPinnedToCore() in ESP-IDF FreeRTOS.
Chapter 4. API Guides

**CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION** will trigger a halt in particular functions in ESP-IDF FreeRTOS which have not been fully tested in an SMP context.

**CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER** will enclose all task functions within a wrapper function. In the case that a task function mistakenly returns (i.e. does not call `vTaskDelete()`), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application, as illustrated below:

```
E (25) FreeRTOS: FreeRTOS task should not return. Aborting now!
abort() was called at PC 0x40085c53 on core 0
```

4.12 Thread Local Storage

4.12.1 Overview

Thread-local storage (TLS) is a mechanism by which variables are allocated such that there is one instance of the variable per extant thread. ESP-IDF provides three ways to make use of such variables:

- **FreeRTOS Native API**: ESP-IDF FreeRTOS native API.
- **Pthread API**: ESP-IDF’s pthread API.
- **C11 Standard**: C11 standard introduces special keyword to declare variables as thread local.

4.12.2 FreeRTOS Native API

The ESP-IDF FreeRTOS provides the following API to manage thread local variables:

- `vTaskSetThreadLocalStoragePointer()`
- `pvTaskGetThreadLocalStoragePointer()`
- `vTaskSetThreadLocalStoragePointerAndDelCallback()`

In this case maximum number of variables that can be allocated is limited by `configNUM_THREAD_LOCAL_STORAGE_POINTERS` macro. Variables are kept in the task control block (TCB) and accessed by their index. Note that index 0 is reserved for ESP-IDF internal uses. Using that API user can allocate thread local variables of an arbitrary size and assign them to any number of tasks. Different tasks can have different sets of TLS variables. If size of the variable is more then 4 bytes then user is responsible for allocating/deallocating memory for it. Variable’s deallocation is initiated by FreeRTOS when task is deleted, but user must provide function (callback) to do proper cleanup.

4.12.3 Pthread API

The ESP-IDF provides the following pthread API to manage thread local variables:

- `pthread_key_create()`
- `pthread_key_delete()`
- `pthread_getspecific()`
- `pthread_setspecific()`

This API has all benefits of the one above, but eliminates some its limits. The number of variables is limited only by size of available memory on the heap. Due to the dynamic nature this API introduces additional performance overhead compared to the native one.

4.12.4 C11 Standard

The ESP-IDF FreeRTOS supports thread local variables according to C11 standard (ones specified with `__thread` keyword). For details on this GCC feature please see [https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local](https://gcc.gnu.org/onlinedocs/gcc-5.5.0/gcc/Thread-Local.html#Thread-Local). Storage for that kind of variables is allocated on the task’s stack. Note that area for all such variables in the program will be allocated on the stack of every task in the system even if that task does not use such
variables at all. For example ESP-IDF system tasks (like `ipc`, `timer` tasks etc.) will also have that extra stack space allocated. So this feature should be used with care. There is a tradeoff: C11 thread local variables are quite handy to use in programming and can be accessed using just a few Xtensa instructions, but this benefit goes with the cost of additional stack usage for all tasks in the system. Due to static nature of variables allocation all tasks in the system have the same sets of C11 thread local variables.

4.13 High-Level Interrupts

The Xtensa architecture has support for 32 interrupts, divided over 8 levels, plus an assortment of exceptions. On the ESP32, the interrupt mux allows most interrupt sources to be routed to these interrupts using the interrupt allocator. Normally, interrupts will be written in C, but ESP-IDF allows high-level interrupts to be written in assembly as well, allowing for very low interrupt latencies.

### 4.13.1 Interrupt Levels

<table>
<thead>
<tr>
<th>Level</th>
<th>Symbol</th>
<th>Remark</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>N/A</td>
<td>Exception and level 0 interrupts. Handled by ESP-IDF</td>
</tr>
<tr>
<td>2-3</td>
<td>N/A</td>
<td>Medium level interrupts. Handled by ESP-IDF</td>
</tr>
<tr>
<td>4</td>
<td>xt_highint4</td>
<td>Normally used by ESP-IDF debug logic</td>
</tr>
<tr>
<td>5</td>
<td>xt_highint5</td>
<td>Free to use</td>
</tr>
<tr>
<td>NMI</td>
<td>xt_nmi</td>
<td>Free to use</td>
</tr>
<tr>
<td>dbg</td>
<td>xt_debugexception</td>
<td>Debug exception. Called on e.g. a BREAK instruction.</td>
</tr>
</tbody>
</table>

Using these symbols is done by creating an assembly file (suffix `.S`) and defining the named symbols, like this:

```assembly
section .iram1,"ax"
.global xt_highint5
.type xt_highint5, @function
.align 4
xt_highint5:
... your code here
rdr a0, EXCSAVE_5
rfi 5
```

For a real-life example, see the `esp32/dport_panic_highint_hdl.S` file; the panic handler interrupt is implemented there.

### 4.13.2 Notes

- Do not call C code from a high-level interrupt; because these interrupts still run in critical sections, this can cause crashes. (The panic handler interrupt does call normal C code, but this is OK because there is no intention of returning to the normal code flow afterwards.)
- Make sure your assembly code gets linked in. If the interrupt handler symbol is the only symbol the rest of the code uses from this file, the linker will take the default ISR instead and not link the assembly file into the final project. To get around this, in the assembly file, define a symbol, like this:

```assembly
.global ld_include_my_isr_file
ld_include_my_isr_file:
```

(The symbol is called `ld_include_my_isr_file` here but can have any arbitrary name not defined anywhere else.) Then, in the component.mk, add this file as an unresolved symbol to the ld command line arguments:

```make
COMPONENT_ADD_LDFLAGS := -u ld_include_my_isr_file
```
This should cause the linker to always include a file defining `ld_include_my_isr_file`, causing the ISR to always be linked in.

- High-level interrupts can be routed and handled using `esp_intr_alloc` and associated functions. The handler and handler arguments to `esp_intr_alloc` must be NULL, however.
- In theory, medium priority interrupts could also be handled in this way. For now, ESP-IDF does not support this.

4.14 JTAG Debugging

This document provides a guide to installing OpenOCD for ESP32 and debugging using GDB. The document is structured as follows:

**Introduction** Introduction to the purpose of this guide.

**How it Works?** Description how ESP32, JTAG interface, OpenOCD and GDB are interconnected and working together to enable debugging of ESP32.

**Selecting JTAG Adapter** What are the criteria and options to select JTAG adapter hardware.

**Setup of OpenOCD** Procedure to install OpenOCD and verify that it is installed.

**Configuring ESP32 Target** Configuration of OpenOCD software and setup JTAG adapter hardware that will make together a debugging target.

**Launching Debugger** Steps to start up a debug session with GDB from Eclipse and from Command Line.

**Debugging Examples** If you are not familiar with GDB, check this section for debugging examples provided from Eclipse as well as from Command Line.

**Building OpenOCD from Sources** Procedure to build OpenOCD from sources for Windows, Linux and MacOS operating systems.

**Tips and Quirks** This section provides collection of tips and quirks related JTAG debugging of ESP32 with OpenOCD and GDB.

4.14.1 Introduction

The ESP32 has two powerful Xtensa cores, allowing for a great deal of variety of program architectures. The FreeRTOS OS that comes with ESP-IDF is capable of multi-core preemptive multithreading, allowing for an intuitive way of writing software.

The downside of the ease of programming is that debugging without the right tools is harder: figuring out a bug that is caused by two threads, running even simultaneously on two different CPU cores, can take a long time when all you have are printf statements. A better and in many cases quicker way to debug such problems is by using a debugger, connected to the processors over a debug port.

Espressif has ported OpenOCD to support the ESP32 processor and the multicore FreeRTOS, which will be the foundation of most ESP32 apps, and has written some tools to help with features OpenOCD does not support natively.

This document provides a guide to installing OpenOCD for ESP32 and debugging using GDB under Linux, Windows and MacOS. Except for OS specific installation procedures, the s/w user interface and use procedures are the same across all supported operating systems.

**Note:** Screenshots presented in this document have been made for Eclipse Neon 3 running on Ubuntu 16.04 LTE. There may be some small differences in what a particular user interface looks like, depending on whether you are using Windows, MacOS or Linux and / or a different release of Eclipse.

4.14.2 How it Works?

The key software and hardware to perform debugging of ESP32 with OpenOCD over JTAG (Joint Test Action Group) interface is presented below and includes xtensa-esp32-elf-gdb debugger. OpenOCD on chip debugger and JTAG adapter connected to ESP32 target.
Under “Application Loading and Monitoring” there is another software and hardware to compile, build and flash application to ESP32, as well as to provide means to monitor diagnostic messages from ESP32.

Debugging using JTAG and application loading/monitoring is integrated under the Eclipse environment, to provide quick and easy transition from writing, compiling and loading the code to debugging, back to writing the code, and so on. All the software is available for Windows, Linux and MacOS platforms.

If the ESP-WROVER-KIT is used, then connection from PC to ESP32 is done effectively with a single USB cable thanks to FT2232H chip installed on WROVER, which provides two USB channels, one for JTAG and the second for UART connection.

Depending on user preferences, both debugger and idf.py build can be operated directly from terminal/command line, instead from Eclipse.

### 4.14.3 Selecting JTAG Adapter

The quickest and most convenient way to start with JTAG debugging is by using ESP-WROVER-KIT. Each version of this development board has JTAG interface already built in. No need for an external JTAG adapter and extra wiring/cable to connect JTAG to ESP32. WROVER KIT is using FT2232H JTAG interface operating at 20 MHz clock speed, which is difficult to achieve with an external adapter.

If you decide to use separate JTAG adapter, look for one that is compatible with both the voltage levels on the ESP32 as well as with the OpenOCD software. The JTAG port on the ESP32 is an industry-standard JTAG port which lacks (and does not need) the TRST pin. The JTAG I/O pins all are powered from the VDD_3P3_RTC pin (which normally would be powered by a 3.3 V rail) so the JTAG adapter needs to be able to work with JTAG pins in that voltage range.

On the software side, OpenOCD supports a fair amount of JTAG adapters. See [http://openocd.org/doc/html/Debug-Adapter-Hardware.html](http://openocd.org/doc/html/Debug-Adapter-Hardware.html) for an (unfortunately slightly incomplete) list of the adapters OpenOCD works with. This page lists SWD-compatible adapters as well; take note that the ESP32 does not support SWD. JTAG adapters that are hardcoded to a specific product line, e.g. ST-LINK debugging adapters for STM32 families, will not work.

The minimal signalling to get a working JTAG connection are TDI, TDO, TCK, TMS and GND. Some JTAG debuggers also need a connection from the ESP32 power line to a line called e.g. Vturl to set the working voltage. SRST can optionally be connected to the CH_PD of the ESP32, although for now, support in OpenOCD for that line is pretty minimal.
4.14.4 Setup of OpenOCD

If you have already set up ESP-IDF with CMake build system according to the Getting Started Guide, then OpenOCD is already installed. After setting up the environment in your terminal, you should be able to run OpenOCD. Check this by executing the following command:

```
openocd --version
```

The output should be as follows (although the version may be more recent than listed here):

```
Open On-Chip Debugger v0.10.0-esp32-20190708 (2019-07-08-11:04)
Licensed under GNU GPL v2
For bug reports, read http://openocd.org/doc/doxygen/bugs.html
```

You may also verify that OpenOCD knows where its configuration scripts are located by printing the value of OPENOCD_SCRIPTS environment variable, by typing echo $OPENOCD_SCRIPTS (for Linux and macOS) or echo %OPENOCD_SCRIPTS% (for Windows). If a valid path is printed, then OpenOCD is set up correctly.

If any of these steps do not work, please go back to the setting up the tools section of the Getting Started Guide.

**Note:** It is also possible to build OpenOCD from source. Please refer to Building OpenOCD from Sources section for details.

4.14.5 Configuring ESP32 Target

Once OpenOCD is installed, move to configuring ESP32 target (i.e ESP32 board with JTAG interface). You will do it in the following three steps:

- Configure and connect JTAG interface
- Run OpenOCD
- Upload application for debugging

**Configure and connect JTAG interface**

This step depends on JTAG and ESP32 board you are using - see the two cases described below.

**Configure WROVER JTAG Interface**  All versions of ESP-WROVER-KIT boards have built-in JTAG functionality. Putting it to work requires setting jumpers to enable JTAG functionality, setting SPI flash voltage and configuring USB drivers. Please refer to step by step instructions below.

**Configure Hardware**

1. Enable on-board JTAG functionality by setting JP8 according to ESP-WROVER-KIT V4.1 Getting Started Guide, Section Setup Options.
2. Verify if ESP32 pins used for JTAG communication are not connected to some other h/w that may disturb JTAG operation:

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>JTAG Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 CHIP PU</td>
<td>TRST_N</td>
</tr>
<tr>
<td>2 MTDI/GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>4 MTCK/GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>5 MTMS/GPIO14</td>
<td>TMS</td>
</tr>
</tbody>
</table>
Configure USB Drivers  Install and configure USB drivers, so OpenOCD is able to communicate with JTAG interface on ESP-WROVER-KIT board as well as with UART interface used to upload application for flash. Follow steps below specific to your operating system.

**Note:** ESP-WROVER-KIT uses an FT2232 adapter. The following instructions can also be used for other FT2232 based JTAG adapters.

**Windows**

1. Using standard USB A / micro USB B cable connect ESP-WROVER-KIT to the computer. Switch the WROVER KIT on.
2. Wait until USB ports of WROVER KIT are recognized by Windows and drives are installed. If they do not install automatically, then download them from [http://www.ftdichip.com/Drivers/D2XX.htm](http://www.ftdichip.com/Drivers/D2XX.htm) and install manually.
4. In Zadig tool go to “Options” and check “List All Devices”.
5. Check the list of devices that should contain two WROVER specific USB entries: “Dual RS232-HS (Interface 0)” and “Dual RS232-HS (Interface 1)”. The driver name would be “FTDIBUS (vxxxx)” and USB ID: 0403 6010.

6. The first device (Dual RS232-HS (Interface 0)) is connected to the JTAG port of the ESP32. Original “FTDIBUS (vxxxx)” driver of this device should be replaced with “WinUSB (v6xxxxx)”. To do so, select “Dual RS232-HS (Interface 0) and reinstall attached driver to the “WinUSB (v6xxxxx)”, see picture above.

**Note:** Do not change the second device “Dual RS232-HS (Interface 1)” . It is routed to ESP32’s serial port (UART) used for upload of application to ESP32’s flash.

Now ESP-WROVER-KIT’s JTAG interface should be available to the OpenOCD. To carry on with debugging environment setup, proceed to section Run OpenOCD.

**Linux**

2. Open a terminal, enter `ls -l /dev/ttyUSB*` command and check, if board’s USB ports are recognized by the OS. You are looking for similar result:
3. Following section “Permissions delegation” in OpenOCD’s README, set up the access permissions to both USB ports.

4. Log off and login, then cycle the power to the board to make the changes effective. In terminal enter again `ls -l /dev/ttyUSB*` command to verify, if group-owner has changed from dialout to plugdev:

```
user-name@computer-name:~/esp$ ls -l /dev/ttyUSB*
crw-rw---- 1 root dialout 188, 0 Jul 10 19:04 /dev/ttyUSB0
crw-rw---- 1 root dialout 188, 1 Jul 10 19:04 /dev/ttyUSB1
```

If you see similar result and you are a member of plugdev group, then the setup is complete.

The `/dev/ttyUSBn` interface with lower number is used for JTAG communication. The other interface is routed to ESP32’s serial port (UART) used for upload of application to ESP32’s flash.

Now ESP-WROVER-KIT’s JTAG interface should be available to the OpenOCD. To carry on with debugging environment setup, proceed to section Run OpenOCD.

**MacOS** On macOS, using FT2232 for JTAG and serial port at the same time needs some additional steps. When the OS loads FTDI serial port driver, it does so for both channels of FT2232 chip. However only one of these channels is used as a serial port, while the other is used as JTAG. If the OS has loaded FTDI serial port driver for the channel used for JTAG, OpenOCD will not be able to connect to the chip. There are two ways around this:

1. Manually unload the FTDI serial port driver before starting OpenOCD, start OpenOCD, then load the serial port driver.
2. Modify FTDI driver configuration so that it doesn’t load itself for channel B of FT2232 chip, which is the channel used for JTAG on WROVER KIT.

**Manually unloading the driver**

1. Install FTDI driver from [http://www.ftdichip.com/Drivers/VCP.htm](http://www.ftdichip.com/Drivers/VCP.htm)
2. Connect USB cable to the WROVER KIT.
3. Unload the serial port driver:

```
sudo kextunload -b com.FTDI.driver.FTDIUSBSerialDriver
```

In some cases you may need to unload Apple’s FTDI driver as well:

```
sudo kextunload -b com.apple.driver.AppleUSBFTDI
```

4. Run OpenOCD:

```
bin/openocd -f interface/ftdi/esp32_devkitj_v1.cfg -f board/esp-wroom-32.cfg
```

5. In another terminal window, load FTDI serial port driver again:

```
sudo kextload -b com.FTDI.driver.FTDIUSBSerialDriver
```

**Note:** If you need to restart OpenOCD, there is no need to unload FTDI driver again — just stop OpenOCD and start it again. The driver only needs to be unloaded if WROVER KIT was reconnected or power was toggled.

This procedure can be wrapped into a shell script, if desired.

**Modifying FTDI driver** In a nutshell, this approach requires modification to FTDI driver configuration file, which prevents the driver from being loaded for channel B of FT2232H.

**Note:** Other boards may use channel A for JTAG, so use this option with caution.
**Warning:** This approach also needs signature verification of drivers to be disabled, so may not be acceptable for all users.

1. Open FTDI driver configuration file using a text editor (note `sudo`):

   ```bash
   sudo nano /Library/Extensions/FTDIUSBSerialDriver.kext/Contents/Info.plist
   ``

2. Find and delete the following lines:

   ```xml
   <key>FT2232H_B</key>
   <dict>
   <key>CFBundleIdentifier</key>
   <string>com.FTDI.driver.FTDIUSBSerialDriver</string>
   <key>IOClass</key>
   <string>FTDIUSBSerialDriver</string>
   <key>IOProviderClass</key>
   <string>IOUSBInterface</string>
   <key>bConfigurationValue</key>
   <integer>1</integer>
   <key>bInterfaceNumber</key>
   <integer>1</integer>
   <key>bcdDevice</key>
   <integer>1792</integer>
   <key>idProduct</key>
   <integer>24592</integer>
   <key>idVendor</key>
   <integer>1027</integer>
   </dict>
   ``

3. Save and close the file

4. Disable driver signature verification:
   1. Open Apple logo menu, choose “Restart…”
   2. When you hear the chime after reboot, press CMD+R immediately
   3. Once Recovery mode starts up, open Terminal
   4. Run the command:

   ```bash
   csrutil enable --without kext
   ``

5. Restart again

After these steps, serial port and JTAG can be used at the same time.

To carry on with debugging environment setup, proceed to section *Run OpenOCD*.

**Configure Other JTAG Interface**  
Refer to section *Selecting JTAG Adapter* for guidance what JTAG interface to select, so it is able to operate with OpenOCD and ESP32. Then follow three configuration steps below to get it working.

**Configure Hardware**

1. Identify all pins / signals on JTAG interface and ESP32 board, that should be connected to establish communication.

<table>
<thead>
<tr>
<th>ESP32 Pin</th>
<th>JTAG Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 CHIP PU</td>
<td>TRST N</td>
</tr>
<tr>
<td>2 MTDI / GPIO15</td>
<td>TDO</td>
</tr>
<tr>
<td>3 MTDI / GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>4 MTCK / GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>5 MTMS / GPIO14</td>
<td>TMS</td>
</tr>
<tr>
<td>6 GND</td>
<td>GND</td>
</tr>
</tbody>
</table>
2. Verify if ESP32 pins used for JTAG communication are not connected to some other h/w that may disturb JTAG operation.
3. Connect identified pin / signals of ESP32 and JTAG interface.

**Configure Drivers** You may need to install driver s/w to make JTAG work with computer. Refer to documentation of JTAG adapter, that should provide related details.

**Connect** Connect JTAG interface to the computer. Power on ESP32 and JTAG interface boards. Check if JTAG interface is visible by computer.

To carry on with debugging environment setup, proceed to section **Run OpenOCD**.

**Run OpenOCD**

Once target is configured and connected to computer, you are ready to launch OpenOCD.

Open a terminal and set it up for using the ESP-IDF as described in the *setting up the environment* section of the Getting Started Guide. Then run OpenOCD (this command works on Windows, Linux, and macOS):

```
openocd -f interface/ftdi/esp32_devkitj_v1.cfg -f board/esp-wroom-32.cfg
```

**Note:** The files provided after `-f` above are specific for ESP-WROVER-KIT with ESP32-WROOM-32 module. You may need to provide different files depending on used hardware. For guidance see **Configuration of OpenOCD for specific target**.

You should now see similar output (this log is for ESP-WROVER-KIT):

```
user-name@computer-name:~/esp/esp-idf$ openocd -f interface/ftdi/esp32_devkitj_v1.cfg
--cfg -f board/esp-wroom-32.cfg
Open On-Chip Debugger v0.10.0-esp32-20190708 (2019-07-08-11:04)

```

- If there is an error indicating permission problems, please see the “Permissions delegation” bit in the OpenOCD README file in `~/esp/openocd-esp32` directory.
- In case there is an error finding configuration files, e.g. Can't find interface/ftdi/esp32_devkitj_v1.cfg, check the path after `-s`. This path is used by OpenOCD to look for the files specified after `-f`. Also check if the file is indeed under provided path.
- If you see JTAG errors (all ones/all zeros) please check your connections, whether no other signals are connected to JTAG besides ESP32’s pins, and see if everything is powered on.

**Upload application for debugging**

Build and upload your application to ESP32 as usual, see Step 8. **Build the Project**.
Another option is to write application image to flash using OpenOCD via JTAG with commands like this:

```
openocd -f interface/ftdi/esp32_devkitj_v1.cfg -f board/esp-wroom-32.cfg -c "program_esp32 filename.bin 0x10000 verify exit"
```

OpenOCD flashing command `program_esp32` has the following format:

```
program_esp32 <image_file> <offset> [verify] [reset] [exit]
```

- `image_file` - Path to program image file.
- `offset` - Offset in flash bank to write image.
- `verify` - Optional. Verify flash contents after writing.
- `reset` - Optional. Reset target after programing.
- `exit` - Optional. Finally exit OpenOCD.

You are now ready to start application debugging. Follow steps described in section below.

### 4.14.6 Launching Debugger

The toolchain for ESP32 features GNU Debugger, in short GDB. It is available with other toolchain programs under filename `xtensa-esp32-elf-gdb`. GDB can be called and operated directly from command line in a terminal. Another option is to call it from within IDE (like Eclipse, Visual Studio Code, etc.) and operate indirectly with help of GUI instead of typing commands in a terminal.

Both options of using debugger are discussed under links below.

- **Eclipse**
- **Command Line**

It is recommended to first check if debugger works from Command Line and then move to using Eclipse.

### 4.14.7 Debugging Examples

This section is intended for users not familiar with GDB. It presents example debugging session from Eclipse using simple application available under `get-started/blink` and covers the following debugging actions:

1. Navigating through the code, call stack and threads
2. Setting and clearing breakpoints
3. Halting the target manually
4. Stepping through the code
5. Checking and setting memory
6. Watching and setting program variables
7. Setting conditional breakpoints

Similar debugging actions are provided using GDB from Command Line.

Before proceeding to examples, set up your ESP32 target and load it with `get-started/blink`.

### 4.14.8 Building OpenOCD from Sources

Please refer to separate documents listed below, that describe build process.

**Building OpenOCD from Sources for Windows**

The following instructions are alternative to downloading binary OpenOCD from Espressif GitHub. To quickly setup the binary OpenOCD, instead of compiling it yourself, backup and proceed to section Setup of OpenOCD.

**Note:** Following instructions are assumed to be runned in MSYS2 environment with MINGW32 subsystem!
Install Dependencies

Install packages that are required to compile OpenOCD:

```
pacman -S --noconfirm --needed autoconf automake git make \
mingw-w64-i686-gcc \
mingw-w64-i686-toolchain \
mingw-w64-i686-libtool \
mingw-w64-i686-pkg-config \
mingw-w64-cross-winpthreads-git \
p7zip
```

Download Sources of OpenOCD

The sources for the ESP32-enabled variant of OpenOCD are available from Espressif GitHub under https://github.com/espressif/openocd-esp32. To download the sources, use the following commands:

```
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

The clone of sources should be now saved in ~/esp/openocd-esp32 directory.

Downloading libusb

Build and export variables for a following OpenOCD compilation:

```
wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
export CPPFLAGS="$CPPFLAGS -IS$(PWD)/libusb/include/libusb-1.0"
export LDFLAGS="$LDFLAGS -L$(PWD)/libusb/MinGW32/.libs/dll"
```

Build OpenOCD

Proceed with configuring and building OpenOCD:

```
cd ~/esp/openocd-esp32
export CPPFLAGS="$CPPFLAGS -D__USE_MINGW_ANSI_STDIO=1 -Wno-error"; export CFLAGS="
-DCFLAGS=" -Wno-error"
./bootstrap
./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --
-build-i686-w64-mingw32 --host-i686-w64-mingw32
make
cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src
cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src
```

Optionally you can add `make install` step at the end. Skip it, if you have an existing OpenOCD (from e.g. another development platform), as it may get overwritten. Also you could use `export DESTDIR="/custom/install/dir"; make install`.

Note:

- Should an error occur, resolve it and try again until the command `make` works.
- If there is a submodule problem from OpenOCD, please `cd` to the `openocd-esp32` directory and input `git submodule update --init`.
- If the `./configure` is successfully run, information of enabled JTAG will be printed under OpenOCD configuration summary.
- If the information of your device is not shown in the log, use `./configure` to enable it as described in `../openocd-esp32/doc/INSTALL.txt`.
- For details concerning compiling OpenOCD, please refer to `openocd-esp32/README.Windows`.
- Don’t forget to copy `libusb-1.0.dll` and `libwinpthread-1.dll` into `OOCD_INSTALLDIR/bin` from `~/esp/openocd-esp32/src`.

Once `make` process is successfully completed, the executable of OpenOCD will be saved in `~/esp/openocd-esp32/src` directory.
Full Listing  A complete described previously process is provided below for the faster execution, e.g. as a shell script:

```bash
pacman -S --noconfirm --needed autoconf automake git make mingw-w64-i686-gcc mingw-w64-i686-toolchain mingw-w64-i686-libtool mingw-w64-i686-pkg-config mingw-w64-i686-cross-winpthreads-git p7zip
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
wget https://github.com/libusb/libusb/releases/download/v1.0.22/libusb-1.0.22.7z
7z x -olibusb ./libusb-1.0.22.7z
export CPPFLAGS="$CPPFLAGS -I${PWD}/libusb/include/libusb-1.0";
export LDFLAGS="-L${PWD}/libusb/MinGW32/.libs/dll"

export CPPFLAGS="-D__USE_MINGW_ANSI_STDIO=1 -Wno-error";
export CFLAGS="-Wno-error"
cd ~/esp/openocd-esp32
./bootstrap
./configure --disable-doxygen-pdf --enable-ftdi --enable-jlink --enable-ulink --build=1686-w64-mingw32 --host=1686-w64-mingw32
make
cp ../libusb/MinGW32/dll/libusb-1.0.dll ./src
cp /opt/i686-w64-mingw32/bin/libwinpthread-1.dll ./src
# # optional
# export DESTDIR="SPWD"
# make install
# cp ./src/libusb-1.0.dll $DESTDIR/mingw32/bin
# cp ./src/libwinpthread-1.dll $DESTDIR/mingw32/bin
```

Next Steps  To carry on with debugging environment setup, proceed to section Configuring ESP32 Target.

Building OpenOCD from Sources for Linux

The following instructions are alternative to downloading binary OpenOCD from Espressif GitHub. To quickly setup the binary OpenOCD, instead of compiling it yourself, backup and proceed to section Setup of OpenOCD.

Download Sources of OpenOCD  The sources for the ESP32-enabled variant of OpenOCD are available from Espressif GitHub under https://github.com/espressif/openocd-esp32. To download the sources, use the following commands:

```bash
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

The clone of sources should be now saved in ~/esp/openocd-esp32 directory.

Install Dependencies  Install packages that are required to compile OpenOCD.

Note:  Install the following packages one by one, check if installation was successful and then proceed to the next package. Resolve reported problems before moving to the next step.

```bash
sudo apt-get install make
sudo apt-get install libtool
sudo apt-get install pkg-config
sudo apt-get install autoconf
sudo apt-get install automake
```

(continues on next page)
sudo apt-get install texinfo
sudo apt-get install libusb-1.0

Note:

- Version of pkg-config should be 0.2.3 or above.
- Version of autoconf should be 2.6.4 or above.
- Version of automake should be 1.9 or above.
- When using USB-Blaster, ASIX Presto, OpenJTAG and FT2232 as adapters, drivers libFTDI and FTD2XX need to be downloaded and installed.
- When using CMSIS-DAP, HIDAPI is needed.

**Build OpenOCD** Proceed with configuring and building OpenOCD:

```bash
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

Optionally you can add `sudo make install` step at the end. Skip it, if you have an existing OpenOCD (from e.g. another development platform), as it may get overwritten.

Note:

- Should an error occur, resolve it and try again until the command `make` works.
- If there is a submodule problem from OpenOCD, please `cd` to the `openocd-esp32` directory and input `git submodule update --init`.
- If the `./configure` is successfully run, information of enabled JTAG will be printed under OpenOCD configuration summary.
- If the information of your device is not shown in the log, use `./configure` to enable it as described in `../openocd-esp32/doc/INSTALL.txt`.
- For details concerning compiling OpenOCD, please refer to `openocd-esp32/README`.

Once `make` process is successfully completed, the executable of OpenOCD will be saved in `~/openocd-esp32/bin` directory.

**Next Steps** To carry on with debugging environment setup, proceed to section *Configuring ESP32 Target*.

**Building OpenOCD from Sources for MacOS**

The following instructions are alternative to downloading binary OpenOCD from Espressif GitHub. To quickly setup the binary OpenOCD, instead of compiling it yourself, backup and proceed to section *Setup of OpenOCD*.

Download Sources of OpenOCD  The sources for the ESP32-enabled variant of OpenOCD are available from Espressif GitHub under https://github.com/espressif/openocd-esp32. To download the sources, use the following commands:

```bash
cd ~/esp
git clone --recursive https://github.com/espressif/openocd-esp32.git
```

The clone of sources should be now saved in `~/esp/openocd-esp32` directory.
Install Dependencies  
Install packages that are required to compile OpenOCD using Homebrew:

```
brew install automake libtool libusb wget gcc@4.9 pkg-config
```

Build OpenOCD  
Proceed with configuring and building OpenOCD:

```
cd ~/esp/openocd-esp32
./bootstrap
./configure
make
```

Optionally you can add `sudo make install` step at the end. Skip it, if you have an existing OpenOCD (from e.g. another development platform), as it may get overwritten.

Note:

- Should an error occur, resolve it and try again until the command `make` works.
- If there is a submodule problem from OpenOCD, please `cd` to the `openocd-esp32` directory and input `git submodule update --init`.
- If the `./configure` is successfully run, information of enabled JTAG will be printed under OpenOCD configuration summary.
- If the information of your device is not shown in the log, use `./configure` to enable it as described in `../openocd-esp32/doc/INSTALL.txt`.
- For details concerning compiling OpenOCD, please refer to `openocd-esp32/README.OSX`.

Once `make` process is successfully completed, the executable of OpenOCD will be saved in `~/esp/openocd-esp32/src/openocd` directory.

Next Steps  
To carry on with debugging environment setup, proceed to section *Configuring ESP32 Target*.

The examples of invoking OpenOCD in this document assume using pre-built binary distribution described in section *Setup of OpenOCD*.

To use binaries build locally from sources, change the path to OpenOCD executable to `src/openocd` and set the `OPENOCD_SCRIPTS` environment variable so that OpenOCD can find the configuration files. For Linux and macOS:

```
cd ~/esp/openocd-esp32
export OPENOCD_SCRIPTS=$PWD/tcl
```

For Windows:

```
cd %USERPROFILE%\esp\openocd-esp32
set "OPENOCD_SCRIPTS=%CD%\tcl"
```

Example of invoking OpenOCD build locally from sources, for Linux and macOS:

```
src/openocd -f interface/ftdi/esp32_devkitj_v1.cfg -f board/esp-wroom-32.cfg
```

and Windows:

```
src\openocd -f interface\ftdi\esp32_devkitj_v1.cfg -f board\esp-wroom-32.cfg
```

Using Debugger

This section covers configuration and running debugger either from Eclipse or Command Line. It is recommended to first check if debugger works from Command Line and then move to using Eclipse.

Eclipse  Debugging functionality is provided out of box in standard Eclipse installation. Another option is to use plugins like “GDB Hardware Debugging” plugin. We have found this plugin quite convenient and decided to use throughout this guide.

To begin with, install “GDB Hardware Debugging” plugin by opening Eclipse and going to Help > Install New Software.

Once installation is complete, configure debugging session following steps below. Please note that some of configuration parameters are generic and some are project specific. This will be shown below by configuring debugging for “blink” example project. If not done already, add this project to Eclipse workspace following guidance in section Build and Flash with Eclipse IDE. The source of get-started/blink application is available in examples directory of ESP-IDF repository.

1. In Eclipse go to Run > Debug Configuration. A new window will open. In the window’s left pane double click “GDB Hardware Debugging” (or select “GDB Hardware Debugging” and press the “New” button) to create a new configuration.

2. In a form that will show upon the right, enter the “Name:” of this configuration, e.g. “Blink checking”.

3. On the “Main” tab below, under “Project:”, press “Browse” button and select the “blink” project.

4. In next line “C/C++ Application:" press “Browse” button and select “blink.elf” file. If “blink.elf” is not there, then likely this project has not been build yet. See Build and Flash with Eclipse IDE how to do it.

5. Finally, under “Build (if required) before launching” click “Disable auto build”.

A sample window with settings entered in points 1 - 5 is shown below.

7. Change default configuration of “Remote host” by entering 3333 under the “Port number”.

Configuration entered in points 6 and 7 is shown on the following picture.

8. The last tab to that requires changing of default configuration is “Startup”. Under “Initialization Commands” uncheck “Reset and Delay (seconds)” and “Halt””. Then, in entry field below, enter the following lines:

```
mon reset halt
flushregs
set remote hardware-watchpoint-limit 2
```

Note:  If you want to update image in the flash automatically before starting new debug session add the following lines of commands at the beginning of “Initialization Commands” textbox:

```
mon reset halt
mon program_esp32 ${workspace_loc:blink/build/blink.bin} 0x10000 verify
```
Fig. 19: Configuration of GDB Hardware Debugging - Main tab
Fig. 20: Configuration of GDB Hardware Debugging - Debugger tab
For description of `program_esp32` command see *Upload application for debugging*.

10. Further down on the same tab, establish an initial breakpoint to halt CPUs after they are reset by debugger. The plugin will set this breakpoint at the beginning of the function entered under “Set break point at:”. Check out this option and enter `app_main` in provided field.

11. Check out “Resume” option. This will make the program to resume after `mon reset halt` is invoked per point 8. The program will then stop at breakpoint inserted at `app_main`.

Configuration described in points 8 - 11 is shown below.

![Configuration of GDB Hardware Debugging - Startup tab](image)

Fig. 21: Configuration of GDB Hardware Debugging - Startup tab

If the “Startup” sequence looks convoluted and respective “Initialization Commands” are not clear to you, check *What is the meaning of debugger’s startup commands?* for additional explanation.

12. If you previously completed *Configuring ESP32 Target* steps described above, so the target is running and ready to talk to debugger, go right to debugging by pressing “Debug” button. Otherwise press “Apply” to save changes, go back to *Configuring ESP32 Target* and return here to start debugging.

Once all 1 - 12 configuration steps are satisfied, the new Eclipse perspective called “Debug” will open as shown on example picture below.

If you are not quite sure how to use GDB, check *Eclipse example debugging session in section Debugging Examples.*

**Command Line**

1. Begin with completing steps described under *Configuring ESP32 Target*. This is prerequisite to start a debugging session.
Fig. 22: Debug Perspective in Eclipse
2. Open a new terminal session and go to directory that contains project for debugging, e.g.

```
cd ~/esp/blink
```

3. When launching a debugger, you will need to provide couple of configuration parameters and commands. Instead of entering them one by one in command line, create a configuration file and name it `gdbinit`:

```
target remote :3333
set remote hardware-watchpoint-limit 2
mon reset halt
flushregs
thb app_main
```

Save this file in current directory.

For more details what’s inside `gdbinit` file, see What is the meaning of debugger’s startup commands?

4. Now you are ready to launch GDB. Type the following in terminal:

```
xtensa-esp32-elf-gdb -x gdbinit build/blink.elf
```

5. If previous steps have been done correctly, you will see a similar log concluded with (gdb) prompt:

```
$ xtensa-esp32-elf-gdb -x gdbinit build/blink.elf
GNU gdb (crosstool-NG crosstool-ng-1.22.0-61-gab8375a) 7.10

Chapter 4. API Guides

Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/. ./blink.
---c:43
43 xTaskCreate(sblink_task, "blink_task", 512, NULL, 5, NULL);
(gdb)

Note the third line from bottom that shows debugger halting at breakpoint established in gdbinit file at function app_main(). Since the processor is halted, the LED should not be blinking. If this is what you see as well, you are ready to start debugging.

If you are not quite sure how to use GDB, check Command Line example debugging session in section Debugging Examples.

Debugging Examples

This section describes debugging with GDB from Eclipse as well as from Command Line.

**Eclipse** Verify if your target is ready and loaded with get-started/blink example. Configure and start debugger following steps in section Eclipse. Pick up where target was left by debugger, i.e. having the application halted at breakpoint established at app_main().

![Debug Perspective in Eclipse](image)

**Switch to C/C++ perspective**

**Switch to Debug perspective**

Fig. 23: Debug Perspective in Eclipse
Examples in this section

1. Navigating through the code, call stack and threads
2. Setting and clearing breakpoints
3. Halting the target manually
4. Stepping through the code
5. Checking and setting memory
6. Watching and setting program variables
7. Setting conditional breakpoints

Navigating through the code, call stack and threads

When the target is halted, debugger shows the list of threads in “Debug” window. The line of code where program halted is highlighted in another window below, as shown on the following picture. The LED stops blinking.

Fig. 24: Target halted during debugging

Specific thread where the program halted is expanded showing the call stack. It represents function calls that lead up to the highlighted line of code, where the target halted. The first line of call stack under Thread #1 contains the last called function `app_main()`, that in turn was called from function `main_task()` shown in a line below. Each line of the stack also contains the file name and line number where the function was called. By clicking/highlighting the stack entries, in window below, you will see contents of this file.

By expanding threads you can navigate throughout the application. Expand Thread #5 that contains much longer call stack. You will see there, besides function calls, numbers like `0x4000000c`. They represent addresses of binary code not provided in source form.

In another window on right, you can see the disassembled machine code no matter if your project provides it in source or only the binary form.

Go back to the `app_main()` in Thread #1 to familiar code of `blink.c` file that will be examined in more details in the following examples. Debugger makes it easy to navigate through the code of entire application. This comes...
Fig. 25: Navigate through the call stack
handy when stepping through the code and working with breakpoints and will be discussed below.

**Setting and clearing breakpoints**  When debugging, we would like to be able to stop the application at critical lines of code and then examine the state of specific variables, memory and registers / peripherals. To do so we are using breakpoints. They provide a convenient way to quickly get to and halt the application at specific line.

Let’s establish two breakpoints when the state of LED changes. Basing on code listing above, this happens at lines 33 and 36. To do so, hold the “Control” on the keyboard and double click on number 33 in file blink.c file. A dialog will open where you can confirm your selection by pressing “OK” button. If you do not like to see the dialog just double click the line number. Set another breakpoint in line 36.

![Fig. 26: Setting a breakpoint](image)

Information how many breakpoints are set and where is shown in window “Breakpoints” on top right. Click “Show Breakpoints Supported by Selected Target” to refresh this list. Besides the two just set breakpoints the list may contain temporary breakpoint at function app_main() established at debugger start. As maximum two breakpoints are allowed (see Breakpoints and watchpoints available), you need to delete it, or debugging will fail.

If you now click “Resume” (click blink_task() under “Tread #8”, if “Resume” button is grayed out), the processor will run and halt at a breakpoint. Clicking “Resume” another time will make it run again, halt on second breakpoint, and so on.

You will be also able to see that LED is changing the state after each click to “Resume” program execution.

Read more about breakpoints under Breakpoints and watchpoints available and What else should I know about breakpoints?

**Halting the target manually**  When debugging, you may resume application and enter code waiting for some event or staying in infinite loop without any break points defined. In such case, to go back to debugging mode, you can break program execution manually by pressing “Suspend” button.
Fig. 27: Three breakpoints are set / maximum two are allowed
To check it, delete all breakpoints and click “Resume”. Then click “Suspend”. Application will be halted at some random point and LED will stop blinking. Debugger will expand thread and highlight the line of code where application halted.

![Debugger interface with Resume and Suspend buttons.](image)

In particular case above, the application has been halted in line 52 of code in file `freertos_hooks.c`. Now you can resume it again by pressing “Resume” button or do some debugging as discussed below.

**Stepping through the code** It is also possible to step through the code using “Step Into (F5)” and “Step Over (F6)” commands. The difference is that “Step Into (F5)” is entering inside subroutines calls, while “Step Over (F6)” steps over the call, treating it as a single source line.

Before being able to demonstrate this functionality, using information discussed in previous paragraph, make sure that you have only one breakpoint defined at line 36 of `blink.c`.

Resume program by entering pressing F8 and let it halt. Now press “Step Over (F6)”, one by one couple of times, to see how debugger is stepping one program line at a time.

If you press “Step Into (F5)” instead, then debugger will step inside subroutine calls.

In this particular case debugger stepped inside `gpio_set_level(BLINK_GPIO, 0)` and effectively moved to `gpio.c` driver code.

See **Why stepping with “next” does not bypass subroutine calls?** for potential limitation of using `next` command.

**Checking and setting memory** To display or set contents of memory use “Memory” tab at the bottom of “Debug” perspective.

With the “Memory” tab, we will read from and write to the memory location `0x3FF44004` labeled as `GPIO_OUT_REG` used to set and clear individual GPIO’s. For more information please refer to ESP32 Technical Reference Manual, chapter IO_MUX and GPIO Matrix.
Fig. 29: Stepping through the code with “Step Over (F6)”
Fig. 30: Stepping through the code with "Step Into (F5)"
Being in the same `blink.c` project as before, set two breakpoints right after `gpio_set_level` instruction. Click “Memory” tab and then “Add Memory Monitor” button. Enter `0x3FF44004` in provided dialog.

Now resume program by pressing F8 and observe “Monitor” tab.

You should see one bit being flipped over at memory location `0x3FF44004` (and LED changing the state) each time F8 is pressed.

To set memory use the same “Monitor” tab and the same memory location. Type in alternate bit pattern as previously observed. Immediately after pressing enter you will see LED changing the state.

Watching and setting program variables A common debugging tasks is checking the value of a program variable as the program runs. To be able to demonstrate this functionality, update file `blink.c` by adding a declaration of a global variable `int i` above definition of function `blink_task`. Then add `i++` inside `while(1)` of this function to get `i` incremented on each blink.

Exit debugger, so it is not confused with new code, build and flash the code to the ESP and restart debugger. There is no need to restart OpenOCD.

Once application is halted, enter a breakpoint in the line where you put `i++`.

In next step, in the window with “Breakpoints”, click the “Expressions” tab. If this tab is not visible, then add it by going to the top menu Window > Show View > Expressions. Then click “Add new expression” and enter `i`.

Resume program execution by pressing F8. Each time the program is halted you will see `i` value being incremented.
Fig. 33: Watching program variable "i"
To modify \( i \) enter a new number in “Value” column. After pressing “Resume (F8)” the program will keep incrementing \( i \) starting from the new entered number.

**Setting conditional breakpoints**  Here comes more interesting part. You may set a breakpoint to halt the program execution, if certain condition is satisfied. Right click on the breakpoint to open a context menu and select “Breakpoint Properties”. Change the selection under “Type:” to “Hardware” and enter a “Condition:” like \( i == 2 \).

![Fig. 34: Setting a conditional breakpoint](image)

If current value of \( i \) is less than 2 (change it if required) and program is resumed, it will blink LED in a loop until condition \( i == 2 \) gets true and then finally halt.

**Command Line**  Verify if your target is ready and loaded with get-started/blink example. Configure and start debugger following steps in section *Command Line*. Pick up where target was left by debugger, i.e. having the application halted at breakpoint established at `app_main()`:

```
Temporary breakpoint 1, app_main () at /home/user-name/esp/blink/main/./blink.c:43
43 xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5, __
(gdb)
```

**Examples in this section**

1. Navigating through the code, call stack and threads
2. Setting and clearing breakpoints
3. Halting and resuming the application
4. Stepping through the code
5. Checking and setting memory
Chapter 4. API Guides

6. Watching and setting program variables
7. Setting conditional breakpoints

Navigating through the code, call stack and threads

When you see the (gdb) prompt, the application is halted. LED should not be blinking.

To find out where exactly the code is halted, enter l or list, and debugger will show couple of lines of code around the halt point (line 43 of code in file blink.c)

```
(gdb) l
38 }
39 }
40
41 void app_main()
42 {
43     xTaskCreate(&blink_task, "blink_task", configMINIMAL_STACK_SIZE, NULL, 5, __-NULL);
44 }
```

Check how code listing works by entering, e.g. l 30, 40 to see particular range of lines of code.

You can use bt or backtrace to see what function calls lead up to this code:

```
(gdb) bt
#0 app_main () at /home/user-name/esp/blink/main/./blink.c:43
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/esp32/./cpu_start.c:339
```

Line #0 of output provides the last function call before the application halted, i.e. app_main () we have listed previously. The app_main () was in turn called by function main_task from line 339 of code located in file cpu_start.c.

To get to the context of main_task in file cpu_start.c, enter frame N, where N = 1, because the main_task is listed under #1):

```
(gdb) frame 1
#1 0x400d057e in main_task (args=0x0) at /home/user-name/esp/esp-idf/components/esp32/./cpu_start.c:339
339     app_main();
```

Enter l and this will reveal the piece of code that called app_main() (in line 339):

```
(gdb) l
334 }
335 }
336 #endif
337 //Enable allocation in region where the startup stacks were located.
338 heap_caps_enable_nonos_stack_heaps();
339 app_main();
340 vTaskDelete(NULL);
341 }
342
```

By listing some lines before, you will see the function name main_task we have been looking for:

```
(gdb) l 326, 341
326 static void main_task(void* args)
327 {
(continues on next page)
328 // Now that the application is about to start, disable boot watchdogs
329 REG_CLR_BIT(TIMG_WDTCONFIG0_REG(0), TIMG_WDT_FLASHBOOT_MOD_EN_S);
330 REG_CLR_BIT(RTC_CNTL_WDTCONFIG0_REG, RTC_CNTL_WDT_FLASHBOOT_MOD_EN);
331 #if !CONFIG_FREERTOS_UNICORE
332 // Wait for FreeRTOS initialization to finish on APP CPU, before replacing...
333 while (port_xSchedulerRunning[1] == 0) {
334    
335 } #endif
336 //Enable allocation in region where the startup stacks were located.
337 heap_caps_enable_nonos_stack_heaps();
338 app_main();
339 vTaskDelete(NULL);
340 }

(gdb)

To see the other code, enter i threads. This will show the list of threads running on target:

```
(gdb) i threads
   Id  Target Id Frame
     8  Thread 1073411336 (dport) 0x400d0848 in dport_access_init_core (arg=
<optimized out>)
     7  Thread 1073408744 (ipc0) xQueueGenericReceive (xQueue=0x3ffae694,
->pvBuffer=0x0, xTicksToWait=1644638200,
->xJustPeeking=0) at /home/user-name/esp/esp-idf/components/freertos/./queue.c:1452
     6  Thread 1073431096 (Tmr Svc) prvTimerTask (pvParameters=0x0)
     5  Thread 1073410208 (ipc1 : Running) 0x4000bfea in ?? ()
     4  Thread 1073432224 (dport) dport_access_init_core (arg=0x0)
     3  Thread 1073431516 (IDLE) prvIdleTask (pvParameters=0x0)
     2  Thread 1073413512 (IDLE) prvIdleTask (pvParameters=0x0)
     1  Thread 1073417722 (main : Running) app_main () at /home/user-name/esp/blink/
->main/.blink.c:43
(gdb)
```

The thread list shows the last function calls per each thread together with the name of C source file if available.

You can navigate to specific thread by entering thread N, where N is the thread Id. To see how it works go to thread 5:

```
(gdb) thread 5
(Switching to thread 5 (Thread 1073410208))
#0 0x4000bfea in ?? ()
(gdb)
```

Then check the backtrace:

```
(gdb) bt
#0 0x4000bfea in ?? ()
#1 0x400083a85 in vPortCPUReleaseMutex (mux=<optimized out>) at /home/user-name/
->esp-idf/components/freertos/.port.c:415
#2 0x40083fc8 in vTaskSwitchContext () at /home/user-name/esp-idf/components/freertos/
->.tasks.c:2846
#3 0x4008532b in _frxt_dispatch ()
#4 0x4008395c in xPortStartScheduler () at /home/user-name/esp-idf/components/freertos/
->.port.c:222
(continues on next page)
As you see, the backtrace may contain several entries. This will let you check what exact sequence of function calls lead to the code where the target halted. Question marks ?? instead of a function name indicate that application is available only in binary format, without any source file in C language. The value like 0x4000bfea is the memory address of the function call.

Using bt, i threads, thread N and list commands we are now able to navigate through the code of entire application. This comes handy when stepping through the code and working with breakpoints and will be discussed below.

Setting and clearing breakpoints  When debugging, we would like to be able to stop the application at critical lines of code and then examine the state of specific variables, memory and registers / peripherals. To do so we are using breakpoints. They provide a convenient way to quickly get to and halt the application at specific line.

Let’ s establish two breakpoints when the state of LED changes. Basing on code listing above this happens at lines 33 and 36. Breakpoints may be established using command break M where M is the code line number:

If you new enter c, the processor will run and halt at a breakpoint. Entering c another time will make it run again, halt on second breakpoint, and so on:

You will be also able to see that LED is changing the state only if you resume program execution by entering c.

To examine how many breakpoints are set and where, use command info break:
Please note that breakpoint numbers (listed under Num) start with 2. This is because first breakpoint has been already established at function `app_main()` by running command `thb app_main` on debugger launch. As it was a temporary breakpoint, it has been automatically deleted and now is not listed anymore.

To remove breakpoints enter `delete N` command (in short `d N`), where N is the breakpoint number:

```
(gdb) delete 1
No breakpoint number 1.
(gdb) delete 2
(gdb)
```

Read more about breakpoints under [Breakpoints and watchpoints available](#) and [What else should I know about breakpoints?](#)

**Halting and resuming the application** When debugging, you may resume application and enter code waiting for some event or staying in infinite loop without any break points defined. In such case, to go back to debugging mode, you can break program execution manually by entering Ctrl+C.

To check it delete all breakpoints and enter `c` to resume application. Then enter Ctrl+C. Application will be halted at some random point and LED will stop blinking. Debugger will print the following:

```
(gdb) c
Continuing.
^CTarget halted. PRO_CPU: PC=0x400D0C00 APP_CPU: PC=0x400D0C00 (active)
[New Thread 1073433352]
Program received signal SIGINT, Interrupt.
[Switching to Thread 1073413512]
0x400d0c00 in esp_vApplicationIdleHook () at /home/user-name/esp/esp-idf/!
components/esp32/./freertos_hooks.c:52
52  asm("waiti 0");
(gdb)
```

In particular case above, the application has been halted in line 52 of code in file `freertos_hooks.c`. Now you can resume it again by enter `c` or do some debugging as discussed below.

**Note:** In MSYS2 shell Ctrl+C does not halt the target but exists debugger. To resolve this issue consider debugging with Eclipse or check a workaround under [http://www.mingw.org/wiki/Workaround_for_GDB_Ctrl_C_Interrupt](http://www.mingw.org/wiki/Workaround_for_GDB_Ctrl_C_Interrupt).

**Stepping through the code** It is also possible to step through the code using `step` and `next` commands (in short `s` and `n`). The difference is that `step` is entering inside subroutines calls, while `next` steps over the call, treating it as a single source line.

To demonstrate this functionality, using command `break` and `delete` discussed in previous paragraph, make sure that you have only one breakpoint defined at line 36 of `blink.c`:

```
(gdb) info break
Num Type Disp Enb Address What
 3 breakpoint keep y 0x400db704 in blink_task at /home/user-name/esp/
  blink/main/.blink.c:36
  breakpoint already hit 1 time
(gdb)
```

Resume program by entering `c` and let it halt:

```
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400D8754 (active) APP_CPU: PC=0x400D1128
```

(continues on next page)
Chapter 4. API Guides

(continued from previous page)

Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.
--> blink.c:36
36     gpio_set_level(BLINK_GPIO, 1);
(gdb)

Then enter \texttt{n} couple of times to see how debugger is stepping one program line at a time:

gdb"
Target halted. PRO_CPU: PC=0x400DB756 (active)  APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB758 (active)  APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active)  APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active)  APP_CPU: PC=0x400D1128
37     vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) n

Target halted. PRO_CPU: PC=0x400DB75E (active)  APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400846FC (active)  APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB761 (active)  APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB746 (active)  APP_CPU: PC=0x400D1128
33     gpio_set_level(BLINK_GPIO, 0);
(gdb)

If you enter \texttt{s} instead, then debugger will step inside subroutine calls:

gdb"
Target halted. PRO_CPU: PC=0x400DB748 (active)  APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74B (active)  APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04C (active)  APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DC04F (active)  APP_CPU: PC=0x400D1128
gpio_set_level (gpio_num=GPIO_NUM_4, level=0) at /home/user-name/esp/esp-idf/.
--components/driver/.gpio.c:183
183     GPIO_CHECK(GPIO_IS_VALID_OUTPUT_GPIO(gpio_num), "GPIO output gpio_num error",
        ESP_ERR_INVALID_ARG);
(gdb)

In this particular case debugger stepped inside \texttt{gpio_set_level} and effectively moved to \texttt{gpio.c} driver code.

See \textit{Why stepping with \texttt{n} does not bypass subroutine calls?} for potential limitation of using \texttt{next} command.

\textbf{Checking and setting memory} Displaying the contents of memory is done with command \texttt{x}. With additional parameters you may vary the format and count of memory locations displayed. Run \texttt{help x} to see more details. Companion command to \texttt{x} is \texttt{set} that let you write values to the memory.

We will demonstrate how \texttt{x} and \texttt{set} work by reading from and writing to the memory location 0x3FF44004 labeled as \texttt{GPIO\_OUT\_REG} used to set and clear individual GPIO’s. For more information please refer to \textit{ESP32 Technical Reference Manual}, chapter IO\_MUX and GPIO Matrix.

Being in the same \texttt{blink.c} project as before, set two breakpoints right after \texttt{gpio_set_level} instruction. Enter two times \texttt{c} to get to the break point followed by \texttt{x} /1wx 0x3FF44004 to display contents of \texttt{GPIO\_OUT\_REG} memory location:

gdb"
Continuing.
Target halted. PRO_CPU: PC=0x400DB75E (active)  APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB74E (active)  APP_CPU: PC=0x400D1128
Breakpoint 2, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.
--> blink.c:34
34     vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004

(continues on next page)
0x3ff44004: 0x00000000
(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active)  APP_CPU: PC=0x400D1128
Target halted. PRO_CPU: PC=0x400DB75B (active)  APP_CPU: PC=0x400D1128
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
   --blink.c:37
37 vTaskDelay(1000 / portTICK_PERIOD_MS);
(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb)
If your are blinking LED connected to GPIO4, then you should see fourth bit being flipped each time the LED
changes the state:

0x3ff44004: 0x00000000
...
0x3ff44004: 0x000000010

Now, when the LED is off, that corresponds to 0x3ff44004: 0x00000000 being displayed, try using set
command to set this bit by writing 0x00000010 to the same memory location:

(gdb) x /1wx 0x3FF44004
0x3ff44004: 0x00000000
(gdb) set {unsigned int}0x3FF44004=0x000010
You should see the LED to turn on immediately after entering set {unsigned
int}0x3FF44004=0x000010 command.

Watching and setting program variables  A common debugging tasks is checking the value of a program variable
as the program runs. To be able to demonstrate this functionality, update file blink.c by adding a declaration of
a global variable int i above definition of function blink_task. Then add i++ inside while(1) of this
function to get i incremented on each blink.

Exit debugger, so it is not confused with new code, build and flash the code to the ESP and restart debugger. There
is no need to restart OpenOCD.

Once application is halted, enter the command watch i:

(gdb) watch i
Hardware watchpoint 2: i
(gdb)
This will insert so called “watchpoint” in each place of code where variable i is being modified. Now enter
continue to resume the application and observe it being halted:

(gdb) c
Continuing.
Target halted. PRO_CPU: PC=0x400DB751 (active)  APP_CPU: PC=0x400D0811
[New Thread 1073432196]
Program received signal SIGTRAP, Trace/breakpoint trap.
[Switching to Thread 1073432196]
0x400db751 in blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/./
   --blink.c:33
33 i++;
(gdb)
Resume application couple more times so i gets incremented. Now you can enter print i (in short p i) to check
the current value of i:
(gdb) p i  
$1 = 3  
(gdb)

To modify the value of \textit{i} use \texttt{set} command as below (you can then print it out to check if it has been indeed changed):

(gdb) set var i = 0  
(gdb) p i  
$3 = 0  
(gdb)

You may have up to two watchpoints, see \textit{Breakpoints and watchpoints available}.

\textbf{Setting conditional breakpoints} \quad Here comes more interesting part. You may set a breakpoint to halt the program execution, if certain condition is satisfied. Delete existing breakpoints and try this:

(gdb) break blink.c:34 if (i == 2)  
Breakpoint 3 at 0x400db753: file /home/user-name/esp/blink/main/.\./blink.c, line 34.  
(gdb)

Above command sets conditional breakpoint to halt program execution in line 34 of \texttt{blink.c} if \texttt{i} \texttt{=} 2.

If current value of \texttt{i} is less than 2 and program is resumed, it will blink LED in a loop until condition \texttt{i} \texttt{=} 2 gets true and then finally halt:

(gdb) set var i = 0  
(gdb) c  
Continuing.  
Target halted. PRO_CPU: PC=0x400DB755 (active)  
APP_CPU: PC=0x400D112C  
Target halted. PRO_CPU: PC=0x400DB753 (active)  
APP_CPU: PC=0x400D112C  
Target halted. PRO_CPU: PC=0x400DB755 (active)  
APP_CPU: PC=0x400D112C  
Target halted. PRO_CPU: PC=0x400DB753 (active)  
APP_CPU: PC=0x400D112C  
Target halted. PRO_CPU: PC=0x400DB755 (active)  
APP_CPU: PC=0x400D112C  
Target halted. PRO_CPU: PC=0x400DB753 (active)  
APP_CPU: PC=0x400D112C  
Target halted. PRO_CPU: PC=0x400DB755 (active)  
APP_CPU: PC=0x400D112C  
Target halted. PRO_CPU: PC=0x400DB753 (active)  
APP_CPU: PC=0x400D112C  
Breakpoint 3, blink_task (pvParameter=0x0) at /home/user-name/esp/blink/main/.\./blink.c:34  
34 gpio_set_level(BLINK_GPIO, 0);  
(gdb)

\textbf{Obtaining help on commands} \quad Commands presented so for should provide are very basis and intended to let you quickly get started with JTAG debugging. Check help what are the other commands at you disposal. To obtain help on syntax and functionality of particular command, being at \texttt{(gdb)} prompt type \texttt{help} and command name:

(gdb) help next  
Step program, proceeding through subroutine calls.  
Usage: next [N]  
Unlike "step", if the current source line calls a subroutine,  
this command does not enter the subroutine, but instead steps over  
the call, in effect treating it as a single source line.  
(gdb)

By typing just \texttt{help}, you will get top level list of command classes, to aid you drilling down to more details. Optionally refer to available GDB cheat sheets, for instance \texttt{http://darkdust.net/files/GDB%20Cheat%20Sheet.pdf}. Good to have as a reference (even if not all commands are applicable in an embedded environment).

\textbf{Ending debugger session} \quad To quit debugger enter \texttt{q}:
(gdb) q
A debugging session is active.

Inferior 1 [Remote target] will be detached.

Quit anyway? (y or n) y
Detaching from program: /home/user-name/esp/blink/build/blink.elf, Remote target
Ending remote debugging.
user-name@computer-name:~/esp/blink$

Tips and Quirks

This section provides collection of all tips and quirks referred to from various parts of this guide.

Breakpoints and watchpoints available ESP32 debugger supports 2 hardware implemented breakpoints and 64 software ones. Hardware breakpoints are implemented by ESP32 chip’s logic and can be set anywhere in the code: either in flash or IRAM program’s regions. Additionally there are 2 types of software breakpoints implemented by OpenOCD: flash (up to 32) and IRAM (up to 32) breakpoints. Currently GDB can not set software breakpoints in flash. So until this limitation is removed those breakpoints have to be emulated by OpenOCD as hardware ones (see below for details). ESP32 also supports two watchpoints, so two variables can be watched for change or read by the GDB command watch myVariable. Note that menuconfig option CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK uses the 2nd watchpoint and will not provide expected results, if you also try to use it within OpenOCD / GDB. See menuconfig’s help for detailed description.

What else should I know about breakpoints? Emulating part of hardware breakpoints using software flash ones means that the GDB command hb myFunction which is invoked for function in flash will use pure hardware breakpoint if it is available otherwise one of the 32 software flash breakpoints is used. The same rule applies to b myFunction-like commands. In this case GDB will decide what type of breakpoint to set itself. If myFunction is resided in writable region (IRAM) software IRAM breakpoint will be used otherwise hardware or software flash breakpoint is used as it is done for hb command.

Flash Mappings vs SW Flash Breakpoints In order to set/clear software breakpoints in flash, OpenOCD needs to know their flash addresses. To accomplish conversion from the ESP32 address space to the flash one, OpenOCD uses mappings of program’s code regions resided in flash. Those mappings are kept in the image header which is prepended to program binary data (code and data segments) and is specific to every application image written to the flash. So to support software flash breakpoints OpenOCD should know where application image under debugging is resided in the flash. By default OpenOCD reads partition table at 0x8000 and uses mappings from the first found application image, but there can be the cases when it will not work, e.g. partition table is not at standard flash location or even there can be multiple images: one factory and two OTA and you may want to debug any of them. To cover all possible debugging scenarios OpenOCD supports special command which can be used to set arbitrary location of application image to debug. The command has the following format:

```
esp32 appimage_offset <offset>
```

Offset should be in hex format. To reset to the default behaviour you can specify -1 as offset.

**Note:** Since GDB requests memory map from OpenOCD only once when connecting to it, this command should be specified in one of the TCL configuration files, or passed to OpenOCD via its command line. In the latter case command line should look like below:

```
openocd -f interface/ftdi/esp32_devkitj_v1.cfg -f board/esp-wroom-32.cfg -c "init; halt; esp32 appimage_offset 0x210000"
```

Another option is to execute that command via OpenOCD telnet session and then connect GDB, but it seems to be less handy.
Why stepping with “next” does not bypass subroutine calls? When stepping through the code with `next` command, GDB is internally setting a breakpoint (one out of two available) ahead in the code to bypass the subroutine calls. This functionality will not work, if the two available breakpoints are already set elsewhere in the code. If this is the case, delete breakpoints to have one “spare”. With both breakpoints already used, stepping through the code with `next` command will work as like with `step` command and debugger will step inside subroutine calls.

Support options for OpenOCD at compile time ESP-IDF has some support options for OpenOCD debugging which can be set at compile time:

- `CONFIG_ESP32_DEBUG_OCDAWARE` is enabled by default. If a panic or unhandled exception is thrown and a JTAG debugger is connected (ie OpenOCD is running), ESP-IDF will break into the debugger.
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK` (disabled by default) sets watchpoint index 1 (the second of two) at the end of any task stack. This is the most accurate way to debug task stack overflows. Click the link for more details.

Please see the project configuration menu menu for more details on setting compile-time options.

FreeRTOS support OpenOCD has explicit support for the ESP-IDF FreeRTOS. GDB can see FreeRTOS tasks as threads. Viewing them all can be done using the GDB `i threads` command, changing to a certain task is done with `thread n`, with `n` being the number of the thread. FreeRTOS detection can be disabled in target’s configuration. For more details see Configuration of OpenOCD for specific target.

Why to set SPI flash voltage in OpenOCD configuration? The MTDI pin of ESP32, being among four pins used for JTAG communication, is also one of ESP32’s bootstrapping pins. On power up ESP32 is sampling binary level on MTDI to set its internal voltage regulator used to supply power to external SPI flash chip. If binary level on MTDI pin on power up is low, the voltage regulator is set to deliver 3.3 V, if it is high, then the voltage is set to 1.8 V. The MTDI pin should have a pull-up or may rely on internal weak pull down resistor (see ESP32 Series Datasheet for details), depending on the type of SPI chip used. Once JTAG is connected, it overrides the pull-up or pull-down resistor that is supposed to do the bootstrapping.

To handle this issue OpenOCD’s board configuration file (e.g. boards\esp-wroom-32.cfg for ESP32-WROOM-32 module) provides `ESP32_FLASH_VOLTAGE` parameter to set the idle state of the TDO line to a specified binary level, therefore reducing the chance of a bad bootup of application due to incorrect flash voltage.

Check specification of ESP32 module connected to JTAG, what is the power supply voltage of SPI flash chip. Then set `ESP32_FLASH_VOLTAGE` accordingly. Most WROOM modules use 3.3 V flash, while WROVER modules use 1.8 V flash.

Optimize JTAG speed In order to achieve higher data rates and minimize number of dropped packets it is recommended to optimize setting of JTAG clock frequency, so it is at maximum and still provides stable operation of JTAG. To do so use the following tips.

1. The upper limit of JTAG clock frequency is 20 MHz if CPU runs at 80 MHz, or 26 MHz if CPU runs at 160 MHz or 240 MHz.
2. Depending on particular JTAG adapter and the length of connecting cables, you may need to reduce JTAG frequency below 20 / 26 MHz.
3. In particular reduce frequency, if you get DSR/DIR errors (and they do not relate to OpenOCD trying to read from a memory range without physical memory being present there).
4. ESP-WROVER-KIT operates stable at 20 / 26 MHz.

What is the meaning of debugger’s startup commands? On startup, debugger is issuing sequence of commands to reset the chip and halt it at specific line of code. This sequence (shown below) is user defined to pick up at most convenient / appropriate line and start debugging.

```
    • set remote hardware-watchpoint-limit 2 — Restrict GDB to using two hardware watchpoints supported by ESP32.
    • mon reset halt — reset the chip and keep the CPUs halted
```

Submit Document Feedback

Espressif Systems 1473 Release v4.0.3-189-g7c4f5fa
• **flushregs** — monitor (mon) command can not inform GDB that the target state has changed. GDB will assume that whatever stack the target had before `mon reset halt` will still be valid. In fact, after reset the target state will change, and executing `flushregs` is a way to force GDB to get new state from the target.

• **thb app_main** — insert a temporary hardware breakpoint at `app_main`, put here another function name if required

• **c** — resume the program. It will then stop at breakpoint inserted at `app_main`.

**Configuration of OpenOCD for specific target**  
OpenOCD needs to be told what JTAG adapter **interface** to use, as well as what type of **board** and processor the JTAG adapter is connected to. To do so, use existing configuration files located in OpenOCD’s share/openocd/scripts/interface and share/openocd/scripts/board folders.

For example, if you connect to ESP-WROVER-KIT with ESP-WROOM-32 module installed (see section ESP-WROVER-KIT V1 / ESP32 DevKitJ V1), use the following configuration files:

• `interface/ftdi/esp32_devkitj_v1.cfg`

• `board/esp-wroom-32.cfg`

Optionally prepare configuration by yourself. To do so, you can check existing files and modify them to match you specific hardware. Below is the summary of available configuration parameters for **board** configuration.

**Adapter’s clock speed**

```makefile
adapter_khz 20000
```

See *Optimize JTAG speed* for guidance how to set this value.

**Single core debugging**

```makefile
set ESP32_ONLYCPU 1
```

Comment out this line for dual core debugging.

**Disable RTOS support**

```makefile
set ESP32_RTOS none
```

Comment out this line to have RTOS support.

**Power supply voltage of ESP32’s SPI flash chip**

```makefile
set ESP32_FLASH_VOLTAGE 1.8
```

Comment out this line to set 3.3 V, ref: *Why to set SPI flash voltage in OpenOCD configuration?*

**Configuration file for ESP32 targets**

```makefile
source [find target/esp32.cfg]
```

---

**Note:** Do not change `source [find target/esp32.cfg]` line unless you are familiar with OpenOCD internals.

Currently `target/esp32.cfg` remains the only configuration file for ESP32 targets (esp108 and esp32). The matrix of supported configurations is as follows:
Chapter 4. API Guides

<table>
<thead>
<tr>
<th>Dual/single</th>
<th>RTOS</th>
<th>Target used</th>
</tr>
</thead>
<tbody>
<tr>
<td>dual</td>
<td>FreeRTOS</td>
<td>esp32</td>
</tr>
<tr>
<td>single</td>
<td>FreeRTOS</td>
<td>esp108 (*)</td>
</tr>
<tr>
<td>dual</td>
<td>none</td>
<td>esp108</td>
</tr>
<tr>
<td>single</td>
<td>none</td>
<td>esp108</td>
</tr>
</tbody>
</table>

(*) — we plan to fix this and add support for single core debugging with esp32 target in a subsequent commits.

Look inside **board.esp-wroom-32.cfg** for additional information provided in comments besides each configuration parameter.

**How debugger resets ESP32?** The board can be reset by entering `mon reset` or `mon reset halt` into GDB.

**Do not use JTAG pins for something else** Operation of JTAG may be disturbed, if some other h/w is connected to JTAG pins besides ESP32 module and JTAG adapter. ESP32 JTAG us using the following pins:

<table>
<thead>
<tr>
<th>ESP32 JTAG Pin</th>
<th>JTAG Signal</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 MTDO / GPIO15</td>
<td>TDO</td>
</tr>
<tr>
<td>2 MTDI / GPIO12</td>
<td>TDI</td>
</tr>
<tr>
<td>3 MTCK / GPIO13</td>
<td>TCK</td>
</tr>
<tr>
<td>4 MTMS / GPIO14</td>
<td>TMS</td>
</tr>
</tbody>
</table>

JTAG communication will likely fail, if configuration of JTAG pins is changed by user application. If OpenOCD initializes correctly (detects the two Tensilica cores), but loses sync and spews out a lot of DTR/DIR errors when the program is ran, it is likely that the application reconfigures the JTAG pins to something else, or the user forgot to connect Vtar to a JTAG adapter that needed it.

Below is an excerpt from series of errors reported by GDB after the application stepped into the code that reconfigured MTDO / GPIO15 to be an input:

```
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
     ~an exception!
cpu0: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated
     ~an overrun!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates target still busy!
     ~an exception!
cpu1: xtensa_resume (line 431): DSR (FFFFFFFF) indicates DIR instruction generated
     ~an overrun!
```

**JTAG with Flash Encryption or Secure Boot** By default, enabling Flash Encryption and/or Secure Boot will disable JTAG debugging. On first boot, the bootloader will burn an eFuse bit to permanently disable JTAG at the same time it enables the other features.

The project configuration option `CONFIG_SECURE_BOOT_ALLOW_JTAG` will keep JTAG enabled at this time, removing all physical security but allowing debugging. (Although the name suggests Secure Boot, this option can be applied even when only Flash Encryption is enabled).

However, OpenOCD may attempt to automatically read and write the flash in order to set **software breakpoints**. This has two problems:

- Software breakpoints are incompatible with Flash Encryption, OpenOCD currently has no support for encrypting or decrypting flash contents.
If Secure Boot is enabled, setting a software breakpoint will change the digest of a signed app and make the signature invalid. This means if a software breakpoint is set and then a reset occurs, the signature verification will fail on boot.

To disable software breakpoints while using JTAG, add an extra argument `-c 'set ESP_FLASH_SIZE 0'` to the start of the OpenOCD command line. For example:

```
openocd -c 'set ESP_FLASH_SIZE 0' -f board/esp32-wrover-kit-3.3v.cfg
```

**Note:** For the same reason, the ESP-IDF app may fail bootloader verification of app signatures, when this option is enabled and a software breakpoint is set.

**JTAG and ESP32-WROOM-32 AT firmware Compatibility Issue** The ESP32-WROOM series of modules come pre-flashed with AT firmware. This firmware configures the pins GPIO12 to GPIO15 as SPI slave interface, which makes using JTAG impossible.

To make JTAG available, build new firmware that is not using pins GPIO12 to GPIO15 dedicated to JTAG communication. After that, flash the firmware onto your module. See also *Do not use JTAG pins for something else.*

**Reporting issues with OpenOCD / GDB** In case you encounter a problem with OpenOCD or GDB programs itself and do not find a solution searching available resources on the web, open an issue in the OpenOCD issue tracker under https://github.com/espressif/openocd-esp32/issues.

1. In issue report provide details of your configuration:
   a. JTAG adapter type.
   b. Release of ESP-IDF used to compile and load application that is being debugged.
   c. Details of OS used for debugging.
   d. Is OS running natively on a PC or on a virtual machine?
2. Create a simple example that is representative to observed issue. Describe steps how to reproduce it. In such an example debugging should not be affected by non-deterministic behaviour introduced by the Wi-Fi stack, so problems will likely be easier to reproduce, if encountered once.
3. Prepare logs from debugging session by adding additional parameters to start up commands. OpenOCD:

   ```
   openocd -l openocd_log.txt -d 3 -f interface/ftdi/esp32_devkitj_v1.cfg
   -f board/esp-wroom-32.cfg
   ```

   Logging to a file this way will prevent information displayed on the terminal. This may be a good thing taken amount of information provided, when increased debug level `-d 3` is set. If you still like to see the log on the screen, then use another command instead:

   ```
   openocd -d 3 -f interface/ftdi/esp32_devkitj_v1.cfg -f board/esp-wroom-32.cfg
   2>&1 | tee openocd.log
   ```

   Debugger:

   ```
   xtensa-esp32-elf-gdb -ex "set remotelogfile gdb_log.txt" <all other
   options>
   ```

   Optionally add command remotelogfile gdb_log.txt to the gdbinit file.
4. Attach both `openocd_log.txt` and `gdb_log.txt` files to your issue report.

**Application Level Tracing library**

**Overview** IDF provides useful feature for program behavior analysis: application level tracing. It is implemented in the corresponding library and can be enabled in menuconfig. This feature allows to transfer arbitrary data between host and ESP32 via JTAG interface with small overhead on program execution.
Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see Application Specific Tracing
2. Lightweight logging to the host, see Logging to Host
3. System behavior analysis, see System Behavior Analysis with SEGGER SystemView

Tracing components when working over JTAG interface are shown in the figure below.

![Tracing Components when Working Over JTAG](image)

**Modes of Operation**

The library supports two modes of operation:

**Post-mortem mode.** This is the default mode. The mode does not need interaction with the host side. In this mode tracing module does not check whether host has read all the data from HW UP BUFFER buffer and overwrites old data with the new ones. This mode is useful when only the latest trace data are interesting to the user, e.g. for analyzing program’s behavior just before the crash. Host can read the data later on upon user request, e.g. via special OpenOCD command in case of working via JTAG interface.

**Streaming mode.** Tracing module enters this mode when host connects to ESP32. In this mode before writing new data to HW UP BUFFER tracing module checks that there is enough space in it and if necessary waits for the host to read data and free enough memory. Maximum waiting time is controlled via timeout values passed by users to corresponding API routines. So when application tries to write data to trace buffer using finite value of the maximum waiting time it is possible situation that this data will be dropped. Especially this is true for tracing from time critical code (ISRs, OS scheduler code etc.) when infinite timeouts can lead to system malfunction. In order to avoid loss of such critical data developers can enable additional data buffering via menuconfig option CONFIG_ESP32_APPTRACE_PENDING_DATA_SIZE_MAX. This macro specifies the size of data which can be buffered in above conditions. The option can also help to overcome situation when data transfer to the host is temporarily slowed down, e.g due to USB bus congestions etc. But it will not help when average bitrate of trace data stream exceeds HW interface capabilities.

**Configuration Options and Dependencies**

Using of this feature depends on two components:
Chapter 4. API Guides

1. **Host side:** Application tracing is done over JTAG, so it needs OpenOCD to be set up and running on host machine. For instructions on how to set it up, please see *JTAG Debugging* for details.

2. **Target side:** Application tracing functionality can be enabled in menuconfig. *Component config > Application Level Tracing* menu allows selecting destination for the trace data (HW interface for transport). Choosing any of the destinations automatically enables `CONFIG_ESP32_APPTRACE_ENABLE` option.

**Note:** In order to achieve higher data rates and minimize number of dropped packets it is recommended to optimize setting of JTAG clock frequency, so it is at maximum and still provides stable operation of JTAG, see *Optimize JTAG speed*.

There are two additional menuconfig options not mentioned above:

1. **Threshold for flushing last trace data to host on panic** (`CONFIG_ESP32_APPTRACE_POSTMORTEM_FLUSH_THRESH`). This option is necessary due to the nature of working over JTAG. In that mode trace data are exposed to the host in 16 KB blocks. In post-mortem mode when one block is filled it is exposed to the host and the previous one becomes unavailable. In other words trace data are overwritten in 16 KB granularity. On panic the latest data from the current input block are exposed to host and host can read them for post-analysis. System panic may occur when very small amount of data are not exposed to the host yet. In this case the previous 16 KB of collected data will be lost and host will see the latest, but very small piece of the trace. It can be insufficient to diagnose the problem. This menuconfig option allows avoiding such situations. It controls the threshold for flushing data in case of panic. For example user can decide that it needs not less than 512 bytes of the recent trace data, so if there is less then 512 bytes of pending data at the moment of panic they will not be flushed and will not overwrite previous 16 KB. The option is only meaningful in post-mortem mode and when working over JTAG.

2. **Timeout for flushing last trace data to host on panic** (`CONFIG_ESP32_APPTRACE_ONPANIC_HOST_FLUSH_TMO`). The option is only meaningful in streaming mode and controls the maximum time tracing module will wait for the host to read the last data in case of panic.

**How to use this library** This library provides API for transferring arbitrary data between host and ESP32. When enabled in menuconfig target application tracing module is initialized automatically at the system startup, so all what the user needs to do is to call corresponding API to send, receive or flush the data.

**Application Specific Tracing** In general user should decide what type of data should be transferred in every direction and how these data must be interpreted (processed). The following steps must be performed to transfer data between target and host:

1. **On target side** user should implement algorithms for writing trace data to the host. Piece of code below shows an example how to do this.

```
#include "esp_app_trace.h"
...
char buf[] = "Hello World!";
esp_err_t res = esp_apptrace_write(ESP_APPTRACE_DEST_TRAX, buf, strlen(buf),
       ESP_APPTRACE_TMO_INFINITE);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to write data to host!");
    return res;
}
```

`esp_apptrace_write()` function uses `memcpy` to copy user data to the internal buffer. In some cases it can be more optimal to use `esp_apptrace_buffer_get()` and `esp_apptrace_buffer_put()` functions. They allow developers to allocate buffer and fill it themselves. The following piece of code shows how to do this.

```
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)esp_apptrace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32, 100/
       /*5ms in us*/);
```

(continues on next page)
Also according to his needs user may want to receive data from the host. Piece of code below shows an example how to do this.

```c
#include "esp_app_trace.h"
...
char buf[32];
char down_buf[32];
sz_t sz = sizeof(buf);
/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
esp_err_t res = esp_apptrace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/*do not wait*/);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
    ...
}
```

esp_apptrace_read() function uses memcpy to copy host data to user buffer. In some cases it can be more optimal to use esp_apptrace_down_buffer_get() and esp_apptrace_down_buffer_put() functions. They allow developers to occupy chunk of read buffer and process it in-place. The following piece of code shows how to do this.

```c
#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
sz_t sz = 32;
/* config down buffer */
esp_apptrace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_apptrace_down_buffer_get(ESP_APPTRACE_DEST_TRAX, &sz, -100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 4) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}
```
Chapter 4. API Guides

(continued from previous page)

```c
esp_err_t res = esp_apptrace_down_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/
/* tmo in us */);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report...
    incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

2. The next step is to build the program image and download it to the target as described in the Getting Started Guide.

3. Run OpenOCD (see JTAG Debugging).

4. Connect to OpenOCD telnet server. It can be done using the following command in terminal:
   `telnet <oocd_host> 4444`. If telnet session is opened on the same machine which runs OpenOCD you can use `localhost` as `<oocd_host>` in the command above.

5. Start trace data collection using special OpenOCD command. This command will transfer tracing data and redirect them to specified file or socket (currently only files are supported as trace data destination). For description of the corresponding commands see OpenOCD Application Level Tracing Commands.

6. The final step is to process received data. Since format of data is defined by user the processing stage is out of the scope of this document. Good starting points for data processor are python scripts in `$IDF_PATH/tools/esp_app_trace`:
   - `apptrace_proc.py` (used for feature tests)
   - `logtrace_proc.py` (see more details in section Logging to Host).

OpenOCD Application Level Tracing Commands

**HW UP BUFFER** is shared between user data blocks and filling of the allocated memory is performed on behalf of the API caller (in task or ISR context). In multithreading environment it can happen that task/ISR which fills the buffer is preempted by another high priority task/ISR. So it is possible situation that user data preparation process is not completed at the moment when that chunk is read by the host. To handle such conditions tracing module prepends all user data chunks with header which contains allocated user buffer size (2 bytes) and length of actually written data (2 bytes). So total length of the header is 4 bytes. OpenOCD command which reads trace data reports error when it reads incomplete user data chunk, but in any case it puts contents of the whole user chunk (including unfilled area) to output file.

Below is the description of available OpenOCD application tracing commands.

**Note:** Currently OpenOCD does not provide commands to send arbitrary user data to the target.

**Command usage:**

```plaintext
esp32 apptrace [start <options>] | [stop] | [status] | [dump <cores_num> <outfile>]
```

**Sub-commands:**

- **start** Start tracing (continuous streaming).
- **stop** Stop tracing.
- **status** Get tracing status.
- **dump** Dump all data from (post-mortem dump).

**Start command syntax:**

```plaintext
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt [skip_size]]]]]
```

- **outfile** Path to file to save data from both CPUs. This argument should have the following format: `file://path/to/file`.
- **poll_period** Data polling period (in ms) for available trace data. If greater than 0 then command runs in non-blocking mode. By default 1 ms.
- **trace_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default -1 (trace size stop trigger is disabled).
**stop_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default -1 (disable this stop trigger). Optionally set it to value longer than longest pause between tracing commands from target.

**wait4halt** If 0 start tracing immediately, otherwise command waits for the target to be halted (after reset, by breakpoint etc.) and then automatically resumes it and starts tracing. By default 0.

**skip_size** Number of bytes to skip at the start. By default 0.

**Note:** If **poll_period** is 0, OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set **trace_size** and wait until this size of data is collected. At this point tracing stops automatically.

Command usage examples:

1. Collect 2048 bytes of tracing data to a file “trace.log”. The file will be saved in “openocd-esp32” directory.

```
esp32 apptrace start file://trace.log 1 2048 5 0 0
```

The tracing data will be retrieved and saved in non-blocking mode. This process will stop automatically after 2048 bytes are collected, or if no data are available for more than 5 seconds.

**Note:** Tracing data is buffered before it is made available to OpenOCD. If you see “Data timeout!” message, then the target is likely sending not enough data to empty the buffer to OpenOCD before expiration of timeout. Either increase the timeout or use a function `esp_apptrace_flush()` to flush the data on specific intervals.

2. Retrieve tracing data indefinitely in non-blocking mode.

```
esp32 apptrace start file://trace.log 1 -1 -1 0 0
```

There is no limitation on the size of collected data and there is no any data timeout set. This process may be stopped by issuing `esp32 apptrace stop` command on OpenOCD telnet prompt, or by pressing Ctrl+C in OpenOCD window.

3. Retrieve tracing data and save them indefinitely.

```
esp32 apptrace start file://trace.log 0 -1 -1 0 0
```

OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing press Ctrl+C in OpenOCD window.

4. Wait for target to be halted. Then resume target’s operation and start data retrieval. Stop after collecting 2048 bytes of data:

```
esp32 apptrace start file://trace.log 0 2048 -1 1 0
```

To configure tracing immediately after reset use the openocd `reset halt` command.

**Logging to Host** IDF implements useful feature: logging to host via application level tracing library. This is a kind of semihosting when all `ESP_LOGx` calls send strings to be printed to the host instead of UART. This can be useful because “printing to host” eliminates some steps performed when logging to UART. The most part of work is done on the host.

By default IDF’s logging library uses `vprintf-like` function to write formatted output to dedicated UART. In general it involves the following steps:

1. Format string is parsed to obtain type of each argument.
2. According to its type every argument is converted to string representation.
3. Format string combined with converted arguments is sent to UART.

Though implementation of vprintf-like function can be optimized to a certain level, all steps above have to be performed in any case and every step takes some time (especially item 3). So it frequently occurs that with additional log added to the program to identify the problem, the program behavior is changed and the problem cannot be reproduced or in the worst cases the program cannot work normally at all and ends up with an error or even hangs.
Possible ways to overcome this problem are to use higher UART bitrates (or another faster interface) and/or move string formatting procedure to the host.

Application level tracing feature can be used to transfer log information to host using `esp_apptrace_vprintf` function. This function does not perform full parsing of the format string and arguments, instead it just calculates number of arguments passed and sends them along with the format string address to the host. On the host log data are processed and printed out by a special Python script.

**Limitations** Current implementation of logging over JTAG has some limitations:

1. Tracing from `ESP_EARLY_LOGx` macros is not supported.
2. No support for printf arguments which size exceeds 4 bytes (e.g. `double` and `uint64_t`).
3. Only strings from `.rodata` section are supported as format strings and arguments.
4. Maximum number of printf arguments is 256.

**How To Use It** In order to use logging via trace module user needs to perform the following steps:

1. On target side special vprintf-like function needs to be installed. As it was mentioned earlier this function is `esp_apptrace_vprintf`. It sends log data to the host. Example code is provided in `system/app_trace_to_host`
2. Follow instructions in items 2-5 in Application Specific Tracing
3. To print out collected log records, run the following command in terminal: `$IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file`

**Log Trace Processor Command Options** Command usage:

```
logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>
```

Positional arguments:

- `trace_file` Path to log trace file
- `elf_file` Path to program ELF file

Optional arguments:

- `-h, --help` show this help message and exit
- `--no-errors, -n` Do not print errors

**System Behavior Analysis with SEGGER SystemView** Another useful IDF feature built on top of application tracing library is the system level tracing which produces traces compatible with SEGGER SystemView tool (see SystemView). SEGGER SystemView is a real-time recording and visualization tool that allows to analyze runtime behavior of an application.

**Note:** Currently IDF-based application is able to generate SystemView compatible traces in form of files to be opened in SystemView application. The tracing process cannot yet be controlled using that tool.

**How To Use It** Support for this feature is enabled by `Component config > Application Level Tracing > FreeRTOS SystemView Tracing (CONFIG_SYSVIEW_ENABLE)` menuconfig option. There are several other options enabled under the same menu:

1. `ESP32 timer to use as SystemView timestamp source (CONFIG_SYSVIEW_TS_SOURCE)` selects the source of timestamps for SystemView events. In single core mode timestamps are generated using ESP32 internal cycle counter running at maximum 240 Mhz (~4 ns granularity). In dual-core mode external timer working at 40 Mhz is used, so timestamp granularity is 25 ns.
2. Individually enabled or disabled collection of SystemView events (CONFIG_SYSVIEW_EVT_XXX):
   - Trace Buffer Overflow Event
   - ISR Enter Event
IDF has all the code required to produce SystemView compatible traces, so user can just configure necessary project options (see above), build, download the image to target and use OpenOCD to collect data as described in the previous sections.

**OpenOCD SystemView Tracing Command Options**  

Command usage:

```
esp32 sysview [start <options>] | [stop] | [status]
```

Sub-commands:

- **start**  Start tracing (continuous streaming).
- **stop**  Stop tracing.
- **status**  Get tracing status.

Start command syntax:

```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

- **outfile1**  Path to file to save data from PRO CPU. This argument should have the following format: `file://path/to/file`
- **outfile2**  Path to file to save data from APP CPU. This argument should have the following format: `file://path/to/file`
- **poll_period**  Data polling period (in ms) for available trace data. If greater then 0 then command runs in non-blocking mode. By default 1 ms.
- **trace_size**  Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default -1 (trace size stop trigger is disabled).
- **stop_tmo**  Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default -1 (disable this stop trigger).

**Note:** If `poll_period` is 0 OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set `trace_size` and wait until this size of data is collected. At this point tracing stops automatically.

Command usage examples:

1. Collect SystemView tracing data to files “pro-cpu.SVDat” and “app-cpu.SVDat”. The files will be saved in “openocd-esp32” directory.

   ```
   esp32 sysview start file://pro-cpu.SVDat file://app-cpu.SVDat
   ```

   The tracing data will be retrieved and saved in non-blocking mode. To stop data this process enter `esp32 aptrace stop` command on OpenOCD telnet prompt, optionally pressing Ctrl+C in OpenOCD window.

2. Retrieve tracing data and save them indefinitely.

   ```
   esp32 sysview start file://pro-cpu.SVDat file://app-cpu.SVDat 0 -1 -1
   ```

   OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing, press Ctrl+C in OpenOCD window.
Data Visualization  After trace data are collected user can use special tool to visualize the results and inspect behavior of the program. Unfortunately SystemView does not support tracing from multiple cores. So when tracing from ESP32 working in dual-core mode two files are generated: one for PRO CPU and another one for APP CPU. User can load every file into separate instance of the tool.

It is uneasy and awkward to analyze data for every core in separate instance of the tool. Fortunately there is Eclipse plugin called Impulse which can load several trace files and makes it possible to inspect events from both cores in one view. Also this plugin has no limitation of 1,000,000 events as compared to free version of SystemView.

Good instruction on how to install, configure and visualize data in Impulse from one core can be found [here](#).

**Note:** IDF uses its own mapping for SystemView FreeRTOS events IDs, so user needs to replace original file with mapping `$SYSVIEW_INSTALL_DIR/Description/SYSVIEW_FreeRTOS.txt` with `$IDF_PATH/docs/api-guides/SYSVIEW_FreeRTOS.txt`. Also contents of that IDF specific file should be used when configuring SystemView serializer using above link.

Configure Impulse for Dual Core Traces  After installing Impulse and ensuring that it can successfully load trace files for each core in separate tabs user can add special Multi Adapter port and load both files into one view. To do this user needs to do the following in Eclipse:

2. In ‘Signal Ports’ view right-click on ‘Ports’ and select ‘Add …’ ->New Multi Adapter Port
4. In open dialog select ‘SystemView Serializer’ as Serializer and set path to PRO CPU trace file. Press OK.
5. Repeat steps 3-4 for APP CPU trace file.
6. Double-click on created port. View for this port should open.
7. Click Start/Stop Streaming button. Data should be loaded.
8. Use ‘Zoom Out’, ‘Zoom In’ and ‘Zoom Fit’ button to inspect data.
9. For settings measurement cursors and other features please see Impulse documentation).

**Note:** If you have problems with visualization (no data are shown or strange behavior of zoom action is observed) you can try to delete current signal hierarchy and double click on the necessary file or port. Eclipse will ask you to create new signal hierarchy.

### 4.15 Bootloader

Bootloader performs the following functions:

1. Minimal initial configuration of internal modules;
2. Select the application partition to boot, based on the partition table and ota_data (if any);
3. Load this image to RAM (IRAM & DRAM) and transfer management to it.

Bootloader is located at the address 0x1000 in the flash.

#### 4.15.1 Bootloader compatibility

It is recommended to update to newer versions of ESP-IDF: when they are released. The OTA (over the air) update process can flash new apps in the field but cannot flash a new bootloader. For this reason, the bootloader supports booting apps built from newer versions of ESP-IDF.

The bootloader does not support booting apps from older versions of ESP-IDF. When updating ESP-IDF manually on an existing product that might need to downgrade the app to an older version, keep using the older ESP-IDF bootloader binary as well.
Chapter 4. API Guides

**Note:** If testing an OTA update for an existing product in production, always test it using the same ESP-IDF bootloader binary that is deployed in production.

---

**Before ESP-IDF V2.1**

Bootloaders built from very old versions of ESP-IDF (before ESP-IDF V2.1) perform less hardware configuration than newer versions. When using a bootloader from these early ESP-IDF versions and building a new app, enable the config option `CONFIG_ESP32_COMPATIBLE_PRE_V2_1_BOOTLOADERS`.

**Before ESP-IDF V3.1**

Bootloaders built from versions of ESP-IDF before V3.1 do not support MD5 checksums in the partition table binary. When using a bootloader from these ESP-IDF versions and building a new app, enable the config option `CONFIG_ESP32_COMPATIBLE_PRE_V3_1_BOOTLOADERS`.

**SPI Flash Configuration**

Each ESP-IDF application or bootloader .bin file contains a header with `CONFIG_ESPTOOLPY_FLASHMODE`, `CONFIG_ESPTOOLPY_FLASHFREQ`, `CONFIG_ESPTOOLPY_FLASHSIZE` embedded in it. These are used to configure the SPI flash during boot.

The first stage bootloader in ROM reads the second stage bootloader header from flash and uses these settings to load it. However, at this time the system clock speed is lower than configured and not all flash modes are supported.

When the second stage bootloader then runs and re-configures the flash, it reads values from the currently selected app binary header not the bootloader header. This allows an OTA update to change the SPI flash settings in use.

Bootloaders prior to ESP-IDF V4.0 used the bootloader’s own header to configure the SPI flash, meaning these values could not be changed in an update. To maintain compatibility with older bootloaders, the app re-initializes the flash settings during app startup using the configuration found in the app header.

**4.15.2 FACTORY reset**

The user can write a basic working firmware and load it into the factory partition. Next, update the firmware via OTA (over the air). The updated firmware will be loaded into an OTA app partition slot and the OTA data partition is updated to boot from this partition. If you want to be able to roll back to the factory firmware and clear the settings, then you need to set `CONFIG_BOOTLOADER_FACTORY_RESET`. The factory reset mechanism allows to reset the device to factory settings:

- Clear one or more data partitions.
- Boot from “factory” partition.

`CONFIG_BOOTLOADER_DATA_FACTORY_RESET` allows customers to select which data partitions will be erased when the factory reset is executed. Can specify the names of partitions through comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, nvs_custom, …”). Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

`CONFIG_BOOTLOADER_OTA_DATA_ERASE` - the device will boot from “factory” partition after a factory reset. The OTA data partition will be cleared.

`CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET` - number of the GPIO input for factory reset uses to trigger a factory reset, this GPIO must be pulled low on reset to trigger this.

`CONFIG_BOOTLOADER_HOLD_TIME_GPIO` - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

Partition table:
# Name, Type, SubType, Offset, Size, Flags
# Note: if you have increased the bootloader size, make sure to update the offsets to avoid overlap

cnv, data, nv, 0x9000, 0x4000
otadata, data, ota, 0xd000, 0x2000
phy_init, data, phy, 0xf000, 0x1000
factory, 0, 0, 0x10000, 1M
test, 0, test, , 512K
ota_0, 0, ota_0, , 512K
ota_1, 0, ota_1, , 512K

4.15.3 Boot from TEST firmware

The user can write a special firmware for testing in production, and run it as needed. The partition table also needs a dedicated partition for this testing firmware (See partition table). To trigger a test app you need to set CONFIG_BOOTLOADER_APP_TEST.

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST - GPIO number to boot TEST partition. The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the normally configured application will boot (factory or any OTA slot).

CONFIG_BOOTLOADER_HOLD_TIME_GPIO - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

4.15.4 Customer bootloader

The current bootloader implementation allows the customer to override it. To do this, you must copy the folder /esp-idf/components/bootloader and then edit /your_project/components/bootloader/subproject/main/bootloader_main.c.

In the bootloader space, you cannot use the drivers and functions from other components. If necessary, then the required functionality should be placed in the folder bootloader (note that this will increase its size). It is necessary to monitor its size because there can be overlays in memory with a partition table leading to damage. At the moment the bootloader is limited to the partition table from the address 0x8000.

4.16 Partition Tables

4.16.1 Overview

A single ESP32’s flash can contain multiple apps, as well as many different kinds of data (calibration data, filesystems, parameter storage, etc). For this reason a partition table is flashed to (default offset) 0x8000 in the flash.

Partition table length is 0xC00 bytes (maximum 95 partition table entries). An MD5 checksum, which is used for checking the integrity of the partition table, is appended after the table data. If the partition table is signed due to secure boot, the signature is appended after the partition table.

Each entry in the partition table has a name (label), type (app, data, or something else), subtype and the offset in flash where the partition is loaded.

The simplest way to use the partition table is to open the project configuration menu (idf.py menuconfig) and choose one of the simple predefined partition tables under CONFIG_PARTITION_TABLE_TYPE:

- “Single factory app, no OTA”
- “Factory app, two OTA definitions”

In both cases the factory app is flashed at offset 0x10000. If you execute idf.py partition_table then it will print a summary of the partition table.
4.16.2 Built-in Partition Tables

Here is the summary printed for the “Single factory app, no OTA” configuration:

```
# Espressif ESP32 Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs,      0x9000, 0x6000,       
phy_init, data, phy,  0x0000, 0x1000,      
factory, app, factory, 0x10000, 1M,        
```

- At a 0x10000 (64KB) offset in the flash is the app labelled “factory”. The bootloader will run this app by default.
- There are also two data regions defined in the partition table for storing NVS library partition and PHY init data.

Here is the summary printed for the “Factory app, two OTA definitions” configuration:

```
# Espressif ESP32 Partition Table
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs,      0x9000, 0x4000,       
otadata, data, ota,  0xd000, 0x2000,      
phy_init, data, phy,  0x0000, 0x1000,      
factory, 0, 0,        0x10000, 1M,         
ota_0, 0, ota_0,      0x110000, 1M,        
ota_1, 0, ota_1,      0x210000, 1M,        
```

- There are now three app partition definitions. The type of the factory app (at 0x10000) and the next two “OTA” apps are all set to “app”, but their subtypes are different.
- There is also a new “otadata” slot, which holds the data for OTA updates. The bootloader consults this data in order to know which app to execute. If “otadata” is empty, it will execute the factory app.

4.16.3 Creating Custom Tables

If you choose “Custom partition table CSV” in menuconfig then you can also enter the name of a CSV file (in the project directory) to use for your partition table. The CSV file can describe any number of definitions for the table you need.

The CSV format is the same format as printed in the summaries shown above. However, not all fields are required in the CSV. For example, here is the “input” CSV for the OTA partition table:

```
# Name, Type, SubType, Offset, Size, Flags
nvs, data, nvs,      0x9000, 0x4000       
otadata, data, ota,  0xd000, 0x2000      
phy_init, data, phy,  0x0000, 0x1000      
factory, app, factory, 0x10000, 1M        
ota_0, app, ota_0,   ,                   
ota_1, app, ota_1,   ,                   
nvs_key, data, nvs_keys, ,                
```

- Whitespace between fields is ignored, and so is any line starting with # (comments).
- Each non-comment line in the CSV file is a partition definition.
- The “Offset” field for each partition is empty. The `gen_esp32part.py` tool fills in each blank offset, starting after the partition table and making sure each partition is aligned correctly.

Name field

Name field can be any meaningful name. It is not significant to the ESP32. Names longer than 16 characters will be truncated.
Chapter 4. API Guides

Type field

Partition type field can be specified as app (0) or data (1). Or it can be a number 0-254 (or as hex 0x00-0xFE). Types 0x00-0x3F are reserved for esp-idf core functions.

If your application needs to store data, please add a custom partition type in the range 0x40-0xFE.

The bootloader ignores any partition types other than app (0) & data (1).

SubType

The 8-bit subtype field is specific to a given partition type. esp-idf currently only specifies the meaning of the subtype field for “app” and “data” partition types.

- When type is “app”, the subtype field can be specified as factory (0), ota_0 (0x10) · · · ota_15 (0x1F) or test (0x20).
  - factory (0) is the default app partition. The bootloader will execute the factory app unless there it sees a partition of type data/ota, in which case it reads this partition to determine which OTA image to boot.
  * OTA never updates the factory partition.
  * If you want to conserve flash usage in an OTA project, you can remove the factory partition and use ota_0 instead.
  - ota_0 (0x10) · · · ota_15 (0x1F) are the OTA app slots. Refer to the OTA documentation for more details, which then use the OTA data partition to configure which app slot the bootloader should boot. If using OTA, an application should have at least two OTA application slots (ota_0 & ota_1). Refer to the OTA documentation for more details.
  - test (0x20) is a reserved subtype for factory test procedures. It will be used as the fallback boot partition if no other valid app partition is found. It is also possible to configure the bootloader to read a GPIO input during each boot, and boot this partition if the GPIO is held low, see Boot from TEST firmware.

- When type is “data”, the subtype field can be specified as ota (0), phy (1), nvs (2), or nvs_keys (4).
  - ota (0) is the OTA data partition which stores information about the currently selected OTA application. This partition should be 0x2000 bytes in size. Refer to the OTA documentation for more details.
  - phy (1) is for storing PHY initialisation data. This allows PHY to be configured per-device, instead of in firmware.
    * In the default configuration, the phy partition is not used and PHY initialisation data is compiled into the app itself. As such, this partition can be removed from the partition table to save space.
  * To load PHY data from this partition, open the project configuration menu (idf.py menuconfig) and enable CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION option. You will also need to flash your devices with phy init data as the esp-idf build system does not do this automatically.
  - nvs (2) is for the Non-Volatile Storage (NVS) API.
    * NVS is used to store per-device PHY calibration data (different to initialisation data).
    * NVS is used to store WiFi data if the esp_wifi_set_storage(WIFI_STORAGE_FLASH) initialisation function is used.
  * The NVS API can also be used for other application data.
  * It is strongly recommended that you include an NVS partition of at least 0x3000 bytes in your project.
  * If using NVS API to store a lot of data, increase the NVS partition size from the default 0x6000 bytes.
  - nvs_keys (4) is for the NVS key partition. See Non-Volatile Storage (NVS) API for more details.
    * It is used to store NVS encryption keys when NVS Encryption feature is enabled.
    * The size of this partition should be 4096 bytes (minimum partition size).

Other data subtypes are reserved for future esp-idf uses.

Offset & Size

Partitions with blank offsets will start after the previous partition, or after the partition table in the case of the first partition.

App partitions have to be at offsets aligned to 0x10000 (64K). If you leave the offset field blank, gen_esp32part.py will automatically align the partition. If you specify an unaligned offset for an app partition, the tool will return
an error.

Sizes and offsets can be specified as decimal numbers, hex numbers with the prefix 0x, or size multipliers K or M (1024 and 1024*1024 bytes).

If you want the partitions in the partition table to work with any starting offset (CONFIG_PARTITION_TABLE_OFFSET) of the table itself, leave the offset field (in CSV file) for all partitions blank. Similarly, if changing the partition table offset then be aware that all blank partition offsets may change to match, and that any fixed offsets may now collide with the partition table (causing an error).

**Flags**

Only one flag is currently supported, encrypted. If this field is set to encrypted, this partition will be encrypted if Flash Encryption is enabled.

(Note that app type partitions will always be encrypted, regardless of whether this flag is set or not.)

### 4.16.4 Generating Binary Partition Table

The partition table which is flashed to the ESP32 is in a binary format, not CSV. The tool `parti-<t>tion_table/gen_esp32part.py` is used to convert between CSV and binary formats.

If you configure the partition table CSV name in the project configuration (idf.py menuconfig) and then build the project or run idf.py partition_table, this conversion is done as part of the build process.

To convert CSV to Binary manually:

```
python gen_esp32part.py input_partitions.csv binary_partitions.bin
```

To convert binary format back to CSV manually:

```
python gen_esp32part.py binary_partitions.bin input_partitions.csv
```

To display the contents of a binary partition table on stdout (this is how the summaries displayed when running idf.py partition_table are generated):

```
python gen_esp32part.py binary_partitions.bin
```

**MD5 checksum**

The binary format of the partition table contains an MD5 checksum computed based on the partition table. This checksum is used for checking the integrity of the partition table during the boot.

The MD5 checksum generation can be disabled by the --disable-md5sum option of gen_esp32part.py or by the CONFIG_PARTITION_TABLE_MD5 option. This is useful for example when one uses a bootloader from ESP-IDF before v3.1 which cannot process MD5 checksums and the boot fails with the error message invalid magic number 0xebeb.

### 4.16.5 Flashing the partition table

- `idf.py partition_table-flash`: will flash the partition table with esptool.py.
- `idf.py flash`: Will flash everything including the partition table.

A manual flashing command is also printed as part of idf.py partition_table output.

Note that updating the partition table doesn’t erase data that may have been stored according to the old partition table. You can use `idf.py erase_flash` (or `esptool.py erase_flash`) to erase the entire flash contents.
### 4.16.6 Partition Tool (parttool.py)

The component `partition_table` provides a tool `parttool.py` for performing partition-related operations on a target device. The following operations can be performed using the tool:

- reading a partition and saving the contents to a file (read_partition)
- writing the contents of a file to a partition (write_partition)
- erasing a partition (erase_partition)
- retrieving info such as offset and size of a given partition (get_partition_info)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool’s Python API and command-line interface, respectively.

#### Python API

Before anything else, make sure that the `parttool` module is imported.

```python
import sys
import os

idf_path = os.environ["IDF_PATH"]  # get value of IDF_PATH from environment
parttool_dir = os.path.join(idf_path, "components", "partition_table")  # parttool.py lives in $IDF_PATH/components/partition_table
sys.path.append(parttool_dir)  # this enables Python to find parttool module
from parttool import *  # import all names inside parttool module
```

The starting point for using the tool’s Python API to do is create a `ParttoolTarget` object:

```python
# Create a partool.py target device connected on serial port /dev/ttyUSB1
target = ParttoolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```python
# Erase partition with name 'storage'
target.erase_partition(PartitionName("storage"))

# Read partition with type 'data' and subtype 'spiffs' and save to file 'spiffs.bin'
target.read_partition(PartitionType("data", "spiffs"), "spiffs.bin")

# Write to partition 'factory' the contents of a file named 'factory.bin'
target.write_partition(PartitionName("factory"), "factory.bin")

# Print the size of default boot partition
storage = target.get_partition_info(PARTITION_BOOT_DEFAULT)
print(storage.size)
```

The partition to operate on is specified using `PartitionName` or `PartitionType` or `PARTITION_BOOT_DEFAULT`. As the name implies, these can be used to refer to partitions of a particular name, typesubtype combination, or the default boot partition.

More information on the Python API is available in the docstrings for the tool.

#### Command-line Interface

The command-line interface of `parttool.py` has the following structure:
parttool.py [command-args] [subcommand] [subcommand-args]

- command-args - These are arguments that are needed for executing the main command (parttool.py), mostly pertaining to the target device
- subcommand - This is the operation to be performed
- subcommand-args - These are arguments that are specific to the chosen operation

# Erase partition with name 'storage'
parttool.py --port "/dev/ttyUSB1" erase_partition --partition-name=storage

# Read partition with type 'data' and subtype 'spiffs' and save to file 'spiffs.bin'
parttool.py --port "/dev/ttyUSB1" read_partition --partition-type=data --partition-subtype=spiffs "spiffs.bin"

# Write to partition 'factory' the contents of a file named 'factory.bin'
parttool.py --port "/dev/ttyUSB1" write_partition --partition-name=factory "factory.bin"

# Print the size of default boot partition
parttool.py --port "/dev/ttyUSB1" get_partition_info --partition-boot-default --info size

More information can be obtained by specifying --help as argument:

# Display possible subcommands and show main command argument descriptions
parttool.py --help

# Show descriptions for specific subcommand arguments
parttool.py [subcommand] --help

## 4.17 Secure Boot

Secure Boot is a feature for ensuring only your code can run on the chip. Data loaded from flash is verified on each reset.

Secure Boot is separate from the Flash Encryption feature, and you can use secure boot without encrypting the flash contents. However, for a secure environment both should be used simultaneously. See Secure Boot & Flash Encryption for more details.

**Important:** Enabling secure boot limits your options for further updates of your ESP32. Make sure to read this document throughly and understand the implications of enabling secure boot.

### 4.17.1 Background

- Most data is stored in flash. Flash access does not need to be protected from physical access in order for secure boot to function, because critical data is stored (non-software-accessible) in Efuses internal to the chip.
- Efuses are used to store the secure bootloader key (in efuse BLOCK2), and also a single Efuse bit (ABS_DONE_0) is burned (written to 1) to permanently enable secure boot on the chip. For more details about efuse, see Chapter 11 “eFuse Controller” in the Technical Reference Manual.
- To understand the secure boot process, first familiarise yourself with the standard ESP-IDF boot process.
- Both stages of the boot process (initial software bootloader load, and subsequent partition & app loading) are verified by the secure boot process, in a “chain of trust” relationship.
4.17.2 Secure Boot Process Overview

This is a high level overview of the secure boot process. Step by step instructions are supplied under How To Enable Secure Boot. Further in-depth details are supplied under Technical Details:

1. The options to enable secure boot are provided in the Project Configuration Menu, under “Secure Boot Configuration”.
2. Secure Boot defaults to signing images and partition table data during the build process. The “Secure boot private signing key” config item is a file path to a ECDSA public/private key pair in a PEM format file.
3. The software bootloader image is built by esp-idf with secure boot support enabled and the public key (signature verification) portion of the secure boot signing key compiled in. This software bootloader image is flashed at offset 0x1000.
4. On first boot, the software bootloader follows the following process to enable secure boot:
   - Hardware secure boot support generates a device secure bootloader key (generated via hardware RNG, then stored read/write protected in efuse), and a secure digest. The digest is derived from the key, an IV, and the bootloader image contents.
   - The secure digest is flashed at offset 0x0 in the flash.
   - Depending on Secure Boot Configuration, efuses are burned to disable JTAG and the ROM BASIC interpreter (it is strongly recommended these options are turned on.)
   - Bootloader permanently enables secure boot by burning the ABS_DONE_0 efuse. The software bootloader then becomes protected (the chip will only boot a bootloader image if the digest matches.)
5. On subsequent boots the ROM bootloader sees that the secure boot efuse is burned, reads the saved digest at 0x0 and uses hardware secure boot support to compare it with a newly calculated digest. If the digest does not match then booting will not continue. The digest and comparison are performed entirely by hardware, and the calculated digest is not readable by software. For technical details see Secure Boot Hardware Support.
6. When running in secure boot mode, the software bootloader uses the secure boot signing key (the public key of which is embedded in the bootloader itself, and therefore validated as part of the bootloader) to verify the signature appended to all subsequent partition tables and app images before they are booted.

4.17.3 Keys

The following keys are used by the secure boot process:

- “secure bootloader key” is a 256-bit AES key that is stored in Efuse block 2. The bootloader can generate this key itself from the internal hardware random number generator, the user does not need to supply it (it is optionally possible to supply this key, see Re-Flashable Software Bootloader). The Efuse holding this key is read & write protected (preventing software access) before secure boot is enabled.
  - By default, the Efuse Block 2 Coding Scheme is “None” and a 256 bit key is stored in this block. On some ESP32s, the Coding Scheme is set to 3/4 Encoding (CODING_SCHEME efuse has value 1) and a 192 bit key must be stored in this block. See ESP32 Technical Reference Manual section 20.3.1.3 System Parameter coding_scheme for more details. The algorithm operates on a 256 bit key in all cases, 192 bit keys are extended by repeating some bits (details).
- “secure boot signing key” is a standard ECDSA public/private key pair (see Image Signing Algorithm) in PEM format.
  - The public key from this key pair (for signature verification but not signature creation) is compiled into the software bootloader and used to verify the second stage of booting (partition table, app image) before booting continues. The public key can be freely distributed, it does not need to be kept secret.
  - The private key from this key pair must be securely kept private, as anyone who has this key can authenticate to any bootloader that is configured with secure boot and the matching public key.

4.17.4 Bootloader Size

When secure boot is enabled the bootloader app binary bootloader.bin may exceed the default bootloader size limit. This is especially likely if flash encryption is enabled as well. The default size limit is 0x7000 (28672) bytes (partition table offset 0x8000 - bootloader offset 0x1000).

If the bootloader becomes too large, the ESP32 will fail to boot - errors will be logged about either invalid partition table or invalid bootloader checksum.
Options to work around this are:

- Reduce **bootloader log level**. Setting log level to Warning, Error or None all significantly reduce the final binary size (but may make it harder to debug).
- Set **partition table offset** to a higher value than 0x8000, to place the partition table later in the flash. This increases the space available for the bootloader. If the partition table CSV file contains explicit partition offsets, they will need changing so no partition has an offset lower than CONFIG_PARTITION_TABLE_OFFSET + 0x1000. (This includes the default partition CSV files supplied with ESP-IDF.)

### 4.17.5 How To Enable Secure Boot

1. Open the *Project Configuration Menu*, navigate to “Secure Boot Configuration” and select the option “One-time Flash”. (To understand the alternative “Reflashable” choice, see *[Re-Flashable Software Bootloader]*.)
2. Select a name for the secure boot signing key. This option will appear after secure boot is enabled. The file can be anywhere on your system. A relative path will be evaluated from the project directory. The file does not need to exist yet.
3. Set other menuconfig options (as desired). Pay particular attention to the “Bootloader Config” options, as you can only flash the bootloader once. Then exit menuconfig and save your configuration.
4. The first time you run `make`, if the signing key is not found then an error message will be printed with a command to generate a signing key via `espsecure.py generate_signing_key`.

**Important:** A signing key generated this way will use the best random number source available to the OS and its Python installation (*/dev/urandom* on OSX/Linux and *CryptGenRandom()* on Windows). If this random number source is weak, then the private key will be weak.

**Important:** For production environments, we recommend generating the keypair using openssl or another industry standard encryption program. See *Generating Secure Boot Signing Key* for more details.

5. Run `idf.py bootloader` to build a secure boot enabled bootloader. The build output will include a prompt for a flashing command, using `esptool.py write_flash`.
6. When you’re ready to flash the bootloader, run the specified command (you have to enter it yourself, this step is not performed by make) and then wait for flashing to complete. **Remember this is a one time flash, you can’t change the bootloader after this!**
7. Run `idf.py flash` to build and flash the partition table and the just-built app image. The app image will be signed using the signing key you generated in step 4.

**Note:** `idf.py flash` doesn’t flash the bootloader if secure boot is enabled.

8. Reset the ESP32 and it will boot the software bootloader you flashed. The software bootloader will enable secure boot on the chip, and then it verifies the app image signature and boots the app. You should watch the serial console output from the ESP32 to verify that secure boot is enabled and no errors have occurred due to the build configuration.

**Note:** Secure boot won’t be enabled until after a valid partition table and app image have been flashed. This is to prevent accidents before the system is fully configured.

**Note:** If the ESP32 is reset or powered down during the first boot, it will start the process again on the next boot.

9. On subsequent boots, the secure boot hardware will verify the software bootloader has not changed (using the secure bootloader key) and then the software bootloader will verify the signed partition table and app image (using the public key portion of the secure boot signing key).
4.17.6 Re-Flashable Software Bootloader

Configuration  “Secure Boot: One-Time Flash” is the recommended configuration for production devices. In this mode, each device gets a unique key that is never stored outside the device.

However, an alternative mode Secure Boot: Reflashable is also available. This mode allows you to supply a binary key file that is used for the secure bootloader key. As you have the key file, you can generate new bootloader images and secure boot digests for them.

In the esp-idf build process, this 256-bit key file is derived from the ECDSA app signing key generated by the user (see the Generating Secure Boot Signing Key step below). This private key’s SHA-256 digest is used as the secure bootloader key in efuse (as-is for Coding Scheme None, or truncate to 192 bytes for 3/4 Encoding). This is a convenience so you only need to generate/protect a single private key.

Note: Although it’s possible, we strongly recommend not generating one secure boot key and flashing it to every device in a production environment. The “One-Time Flash” option is recommended for production environments.

To enable a reflashable bootloader:

1. In the Project Configuration Menu, select “Bootloader Config” -> CONFIG_SECURE_BOOT_ENABLED -> CONFIG_SECURE_BOOTLOADER_MODE -> Reflashable.
2. If necessary, set the CONFIG_SECURE_BOOTLOADER_KEY_ENCODING based on the coding scheme used by the device. The coding scheme is shown in the Features line when esptool.py connects to the chip, or in the espfuse.py summary output.
3. Follow the steps shown above to choose a signing key file, and generate the key file.
4. Run idf.py bootloader. A binary key file will be created, derived from the private key that is used for signing. Two sets of flashing steps will be printed - the first set of steps includes an espfuse.py burn_key command which is used to write the bootloader key to efuse. (Flashing this key is a one-time-only process.) The second set of steps can be used to reflash the bootloader with a pre-calculated digest (generated during the build process).
5. Resume from Step 6 of the one-time flashing process, to flash the bootloader and enable secure boot. Watch the console log output closely to ensure there were no errors in the secure boot configuration.

4.17.7 Generating Secure Boot Signing Key

The build system will prompt you with a command to generate a new signing key via espsecure.py generate_signing_key. This uses the python-ecdsa library, which in turn uses Python’s os.urandom() as a random numbersource.

The strength of the signing key is proportional to (a) the random number source of the system, and (b) the correctness of the algorithm used. For production devices, we recommend generating signing keys from a system with a quality entropy source, and using the best available EC key generation utilities.

For example, to generate a signing key using the openssl command line:

```
openssl ecparam -name prime256v1 -genkey -noout -out my_secure_boot_signing_key.pem
```

Remember that the strength of the secure boot system depends on keeping the signing key private.

4.17.8 Remote Signing of Images

For production builds, it can be good practice to use a remote signing server rather than have the signing key on the build machine (which is the default esp-idf secure boot configuration). The espsecure.py command line program can be used to sign app images & partition table data for secure boot, on a remote system.

To use remote signing, disable the option “Sign binaries during build”. The private signing key does not need to be present on the build system. However, the public (signature verification) key is required because it is compiled into the bootloader (and can be used to verify image signatures during OTA updates.)
To extract the public key from the private key:

```
espsecure.py extract_public_key --keyfile PRIVATE_SIGNING_KEY PUBLIC_VERIFICATION_KEY
```

The path to the public signature verification key needs to be specified in the menuconfig under “Secure boot public signature verification key” in order to build the secure bootloader.

After the app image and partition table are built, the build system will print signing steps using espsecure.py:

```
espsecure.py sign_data --keyfile PRIVATE_SIGNING_KEY BINARY_FILE
```

The above command appends the image signature to the existing binary. You can use the `-output` argument to write the signed binary to a separate file:

```
espsecure.py sign_data --keyfile PRIVATE_SIGNING_KEY --output SIGNED_BINARY_FILE BINARY_FILE
```

### 4.17.9 Secure Boot Best Practices

- Generate the signing key on a system with a quality source of entropy.
- Keep the signing key private at all times. A leak of this key will compromise the secure boot system.
- Do not allow any third party to observe any aspects of the key generation or signing process using espsecure.py. Both processes are vulnerable to timing or other side-channel attacks.
- Enable all secure boot options in the Secure Boot Configuration. These include flash encryption, disabling of JTAG, disabling BASIC ROM interpreter, and disabling the UART bootloader encrypted flash access.
- Use secure boot in combination with flash encryption to prevent local readout of the flash contents.

### 4.17.10 Technical Details

The following sections contain low-level reference descriptions of various secure boot elements:

**Secure Boot Hardware Support**

The first stage of secure boot verification (checking the software bootloader) is done via hardware. The ESP32’s Secure Boot support hardware can perform three basic operations:

1. Generate a random sequence of bytes from a hardware random number generator.
2. Generate a digest from data (usually the bootloader image from flash) using a key stored in Efuse block 2. The key in Efuse can (& should) be read/write protected, which prevents software access. For full details of this algorithm see [Secure Bootloader Digest Algorithm](#). The digest can only be read back by software if Efuse ABS_DONE_0 is not burned (i.e. still 0).
3. Generate a digest from data (usually the bootloader image from flash) using the same algorithm as step 2 and compare it to a pre-calculated digest supplied in a buffer (usually read from flash offset 0x0). The hardware returns a true/false comparison without making the digest available to software. This function is available even when Efuse ABS_DONE_0 is burned.

**Secure Bootloader Digest Algorithm**

Starting with an “image” of binary data as input, this algorithm generates a digest as output. The digest is sometimes referred to as an “abstract” in hardware documentation.

For a Python version of this algorithm, see the `espsecure.py` tool in the components/esptool_py directory (specifically, the `digest_secure_bootloader` command).

Items marked with (^) are to fulfill hardware restrictions, as opposed to cryptographic restrictions.
1. Read the AES key from efuse block 2, in reversed byte order. If Coding Scheme is set to 3/4 Encoding, extend the 192 bit key to 256 bits using the same algorithm described in Flash Encryption Algorithm.
2. Prefix the image with a 128 byte randomly generated IV.
3. If the image length is not modulo 128, pad the image to a 128 byte boundary with 0xFF. (^)
4. For each 16 byte plaintext block of the input image:
   - Reverse the byte order of the plaintext input block (^)
   - Apply AES256 in ECB mode to the plaintext block.
   - Reverse the byte order of the ciphertext output block. (^)
   - Append to the overall ciphertext output.
5. Byte-swap each 4 byte word of the ciphertext (^)
6. Calculate SHA-512 of the ciphertext.

Output digest is 192 bytes of data: The 128 byte IV, followed by the 64 byte SHA-512 digest.

### Image Signing Algorithm

Deterministic ECDSA as specified by RFC 6979.

- Curve is NIST256p (openssl calls this curve “prime256v1”, it is also sometimes called secp256r1).
- Hash function is SHA256.
- Key format used for storage is PEM.
  - In the bootloader, the public key (for signature verification) is flashed as 64 raw bytes.
- Image signature is 68 bytes - a 4 byte version word (currently zero), followed by a 64 bytes of signature data. These 68 bytes are appended to an app image or partition table data.

### Manual Commands

Secure boot is integrated into the esp-idf build system, so make will automatically sign an app image if secure boot is enabled. idf.py bootloader will produce a bootloader digest if menuconfig is configured for it.

However, it is possible to use the espsecure.py tool to make standalone signatures and digests.

To sign a binary image:

```bash
espsecure.py sign_data --keyfile ./my_signing_key.pem --output ./image_signed.bin
```

Keyfile is the PEM file containing an ECDSA private signing key.

To generate a bootloader digest:

```bash
espsecure.py digest_secure_bootloader --keyfile ./securebootkey.bin --output ./booster-loader-digest.bin build/bootloader/bootloader.bin
```

Keyfile is the 32 byte raw secure boot key for the device.

The output of the espsecure.py digest_secure_bootloader command is a single file which contains both the digest and the bootloader appended to it. To flash the combined digest plus bootloader to the device:

```bash
esptool.py write_flash 0x0 bootloader-digest.bin
```

### 4.17.11 Secure Boot & Flash Encryption

If secure boot is used without Flash Encryption, it is possible to launch “time-of-check to time-of-use” attack, where flash contents are swapped after the image is verified and running. Therefore, it is recommended to use both the features together.
4.17.12 Signed App Verification Without Hardware Secure Boot

The integrity of apps can be checked even without enabling the hardware secure boot option. This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement. See How To Enable Signed App Verification for step by step instructions.

An app can be verified on update and, optionally, be verified on boot.

- Verification on update: When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates. If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.
- Verification on boot: When enabled, the bootloader will be compiled with code to verify that an app is signed before booting it. If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

How To Enable Signed App Verification

1. Open Project Configuration Menu -> Security features -> Enable CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
2. “Bootloader verifies app signatures” can be enabled, which verifies app on boot.
3. By default, “Sign binaries during build” will be enabled on selecting “Require signed app images” option, which will sign binary files as a part of build process. The file named in “Secure boot private signing key” will be used to sign the image.
4. If you disable “Sign binaries during build” option then you’ll have to enter path of a public key file used to verify signed images in “Secure boot public signature verification key”. In this case, private signing key should be generated by following instructions in Generating Secure Boot Signing Key; public verification key and signed image should be generated by following instructions in Remote Signing of Images.

4.17.13 Advanced Features

JTAG Debugging

By default, when Secure Boot is enabled then JTAG debugging is disabled via eFuse. The bootloader does this on first boot, at the same time it enables Secure Boot.

See JTAG with Flash Encryption or Secure Boot for more information about using JTAG Debugging with either Secure Boot or signed app verification enabled.

4.18 ULP Coprocessor Programming

4.18.1 ULP coprocessor instruction set

This document provides details about the instructions used by ESP32 ULP coprocessor assembler.

ULP coprocessor has 4 16-bit general purpose registers, labeled R0, R1, R2, R3. It also has an 8-bit counter register (stage_cnt) which can be used to implement loops. Stage count register is accessed using special instructions.

ULP coprocessor can access 8k bytes of RTC_SLOW_MEM memory region. Memory is addressed in 32-bit word units. It can also access peripheral registers in RTC_CNTL, RTC_IO, and SENS peripherals.

All instructions are 32-bit. Jump instructions, ALU instructions, peripheral register and memory access instructions are executed in 1 cycle. Instructions which work with peripherals (TSENS, ADC, I2C) take variable number of cycles, depending on peripheral operation.
The instruction syntax is case insensitive. Upper and lower case letters can be used and intermixed arbitrarily. This is true both for register names and instruction names.

**Note about addressing**

ESP32 ULP coprocessor’s JUMP, ST, LD instructions which take register as an argument (jump address, store/load base address) expect the argument to be expressed in 32-bit words.

Consider the following example program:

```
entry:
    NOP
    NOP
    NOP
    NOP
loop:
    MOVE R1, loop
    JUMP R1
```

When this program is assembled and linked, address of label `loop` will be equal to 16 (expressed in bytes). However `JUMP` instruction expects the address stored in register to be expressed in 32-bit words. To account for this common use case, assembler will convert the address of label `loop` from bytes to words, when generating `MOVE` instruction, so the code generated code will be equivalent to:

```
0000  NOP
0004  NOP
0008  NOP
000c  NOP
0010  MOVE R1, 4
0014  JUMP R1
```

The other case is when the argument of `MOVE` instruction is not a label but a constant. In this case assembler will use the value as is, without any conversion:

```
.set   val, 0x10
MOVE   R1, val
```

In this case, value loaded into R1 will be 0x10.

Similar considerations apply to `LD` and `ST` instructions. Consider the following code:

```
.global array
array: .long 0
.long 0
.long 0
.long 0

MOVE R1, array
MOVE R2, 0x1234
ST R2, R1, 0  // write value of R2 into the first array element,
              // i.e. array[0]
ST R2, R1, 4  // write value of R2 into the second array element
              // (4 byte offset), i.e. array[1]
ADD R1, R1, 2 // this increments address by 2 words (8 bytes)
ST R2, R1, 0  // write value of R2 into the third array element,
              // i.e. array[2]
```
Chapter 4. API Guides

Note about instruction execution time

ULP coprocessor is clocked from RTC_FAST_CLK, which is normally derived from the internal 8MHz oscillator. Applications which need to know exact ULP clock frequency can calibrate it against the main XTAL clock:

```c
#include "soc/rtc.h"

// calibrate 8M/256 clock against XTAL, get 8M/256 clock period
uint32_t rtc_8md256_period = rtc_clk_cal(RTC_CAL_8MD256, 100);
uint32_t rtc_fast_freq_hz = 1000000ULL * (1ull << RTC_CLK_CAL_FRACT) * 256 / rtc_...
```

ULP coprocessor needs certain number of clock cycles to fetch each instruction, plus certain number of cycles to execute it, depending on the instruction. See description of each instruction below for details on the execution time.

Instruction fetch time is:
- 2 clock cycles — for instructions following ALU and branch instructions.
- 4 clock cycles — in other cases.

Note that when accessing RTC memories and RTC registers, ULP coprocessor has lower priority than the main CPUs. This means that ULP coprocessor execution may be suspended while the main CPUs access same memory region as the ULP.

**NOP - no operation**

**Syntax** NOP

**Operands** None

**Cycles** 2 cycle to execute, 4 cycles to fetch next instruction

**Description** No operation is performed. Only the PC is incremented.

**Example:**

```
1:    NOP
```

**ADD - Add to register**

**Syntax** ADD Rdst, Rsrc1, Rsrc2

ADD Rdst, Rsrc1, imm

**Operands**
- `Rdst` - Register R[0..3]
- `Rsrc1` - Register R[0..3]
- `Rsrc2` - Register R[0..3]
- `Imm` - 16-bit signed value

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction adds source register to another source register or to a 16-bit signed value and stores result to the destination register.

**Examples:**

```
1:    ADD R1, R2, R3    //R1 = R2 + R3
2:    Add R1, R2, 0x1234 //R1 = R2 + 0x1234
3:    .set value1, 0x03  //constant value1=0x03
      Add R1, R2, value1 //R1 = R2 + value1
4:    .global label     //declaration of variable label
      Add R1, R2, label  //R1 = R2 + label
```

(continues on next page)
### SUB - Subtract from register

**Syntax**

- `SUB Rdst, Rsrc1, Rsrc2`
- `SUB Rdst, Rsrc1, imm`

**Operands**

- `Rdst` - Register R[0..3]
- `Rsrc1` - Register R[0..3]
- `Rsrc2` - Register R[0..3]
- `imm` - 16-bit signed value

**Cycles**

2 cycles to execute, 4 cycles to fetch next instruction

**Description**
The instruction subtracts the source register from another source register or subtracts 16-bit signed value from a source register, and stores result to the destination register.

**Examples**:

<table>
<thead>
<tr>
<th>Example</th>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>SUB R1, R2, R3</code></td>
<td><code>R1 = R2 - R3</code></td>
</tr>
<tr>
<td>2</td>
<td><code>sub R1, R2, 0x1234</code></td>
<td><code>R1 = R2 - 0x1234</code></td>
</tr>
<tr>
<td>3</td>
<td><code>.set value1, 0x03</code></td>
<td><code>value1 = 0x03</code></td>
</tr>
<tr>
<td>4</td>
<td><code>.global label</code></td>
<td><code>label = value1</code></td>
</tr>
</tbody>
</table>

### AND - Logical AND of two operands

**Syntax**

- `AND Rdst, Rsrc1, Rsrc2`
- `AND Rdst, Rsrc1, imm`

**Operands**

- `Rdst` - Register R[0..3]
- `Rsrc1` - Register R[0..3]
- `Rsrc2` - Register R[0..3]
- `imm` - 16-bit signed value

**Cycles**

2 cycles to execute, 4 cycles to fetch next instruction

**Description**
The instruction does logical AND of a source register and another source register or 16-bit signed value and stores result to the destination register.

**Examples**:

<table>
<thead>
<tr>
<th>Example</th>
<th>Instruction</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>AND R1, R2, R3</code></td>
<td><code>R1 = R2 &amp; R3</code></td>
</tr>
<tr>
<td>2</td>
<td><code>AND R1, R2, 0x1234</code></td>
<td><code>R1 = R2 &amp; 0x1234</code></td>
</tr>
<tr>
<td>3</td>
<td><code>.set value1, 0x03</code></td>
<td><code>value1 = 0x03</code></td>
</tr>
<tr>
<td>4</td>
<td><code>.global label</code></td>
<td><code>label = value1</code></td>
</tr>
</tbody>
</table>

...
OR - Logical OR of two operands

Syntax

OR Rdst, Rscl, Rscl2
OR Rdst, Rscl, imm

Operands

- Rdst - Register R[0..3]
- Rscl - Register R[0..3]
- Rscl2 - Register R[0..3]
- Imm - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction does logical OR of a source register and another source register or 16-bit signed value and stores result to the destination register.

Examples:

1: OR R1, R2, R3 //R1 = R2 || R3
2: OR R1, R2, 0x1234 //R1 = R2 || 0x1234
3: .set value1, 0x03 //constant value1=0x03
   OR R1, R2, value1 //R1 = R2 || value1
4: .global label //declaration of variable label
   OR R1, R2, label //R1 = R2 || label
   ...
   label: nop //definition of variable label

LSH - Logical Shift Left

Syntax

LSH Rdst, Rscl, Rscl2
LSH Rdst, Rscl, imm

Operands

- Rdst - Register R[0..3]
- Rscl - Register R[0..3]
- Rscl2 - Register R[0..3]
- Imm - 16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction does logical shift to left of source register to number of bits from another source register or 16-bit signed value and store result to the destination register.

Examples:

1: LSH R1, R2, R3 //R1 = R2 << R3
2: LSH R1, R2, 0x03 //R1 = R2 << 0x03
3: .set value1, 0x03 //constant value1=0x03
   LSH R1, R2, value1 //R1 = R2 << value1
4: .global label //declaration of variable label
   LSH R1, R2, label //R1 = R2 << label
   ...
   label: nop //definition of variable label

RSH - Logical Shift Right

Syntax

RSH Rdst, Rscl, Rscl2
RSH Rdst, Rscl, imm

Operands

- Rdst - Register R[0..3]
- Rscl - Register R[0..3]
- Rscl2 - Register R[0..3]
- Imm - 16-bit signed value
Chapter 4. API Guides

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction does logical shift to right of source register to number of bits from another source register or 16-bit signed value and store result to the destination register.

Examples:

1: RSH R1, R2, R3 //R1 = R2 >> R3
2: RSH R1, R2, 0x03 //R1 = R2 >> 0x03
3: .set value1, 0x03 //constant value1=0x03
   RSH R1, R2, value1 //R1 = R2 >> value1
4: .global label //declaration of variable label
   RSH R1, R2, label //R1 = R2 >> label
   label: nop //definition of variable label

MOVE –Move to register

Syntax MOVE Rdst, Rsrc

MOVE Rdst, imm

Operands
- Rdst –Register R[0..3]
- Rsrc –Register R[0..3]
- Imm –16-bit signed value

Cycles 2 cycles to execute, 4 cycles to fetch next instruction

Description The instruction move to destination register value from source register or 16-bit signed value.

Note that when a label is used as an immediate, the address of the label will be converted from bytes to words. This is because LD, ST, and JUMP instructions expect the address register value to be expressed in words rather than bytes. To avoid using an extra instruction

Examples:

1: MOVE R1, R2 //R1 = R2
2: MOVE R1, 0x03 //R1 = 0x03
3: .set value1, 0x03 //constant value1=0x03
   MOVE R1, value1 //R1 = value1
4: .global label //declaration of label
   MOVE R1, label //R1 = address_of(label) / 4
   ... label: nop //definition of label

ST –Store data to the memory

Syntax ST Rsrc, Rdst, offset

Operands
- Rsrc –Register R[0..3], holds the 16-bit value to store
- Rdst –Register R[0..3], address of the destination, in 32-bit words
- Offset –10-bit signed value, offset in bytes

Cycles 4 cycles to execute, 4 cycles to fetch next instruction

Description The instruction stores the 16-bit value of Rsrc to the lower half-word of memory with address Rdst+offset. The upper half-word is written with the current program counter (PC), expressed in words, shifted left by 5 bits:

Mem[Rdst + offset / 4]{31:0} = (PC{10:0}, 5'b0, Rsrc{15:0})
The application can use higher 16 bits to determine which instruction in the ULP program has written any particular word into memory.

**Examples:**

<table>
<thead>
<tr>
<th>Example</th>
<th>Instruction</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>1:</td>
<td>ST R1, R2, 0x12 //MEM[R2+0x12] = R1</td>
<td></td>
</tr>
<tr>
<td>2:</td>
<td>.data //Data section definition Addr1: .word 123 // Define label Addr1 16 bit .set offs, 0x00 // Define constant offs .text //Text section definition MOVE R1, 1 // R1 = 1 MOVE R2, Addr1 // R2 = Addr1 ST R1, R2, offs // MEM[R2 + 0] = R1 // MEM[Addr1 + 0] will be 32'h600001</td>
<td></td>
</tr>
</tbody>
</table>

**LD – Load data from the memory**

**Syntax** LD Rdst, Rsrc, offset

**Operands** Rdst – Register R[0..3], destination Rsrc – Register R[0..3], holds address of destination, in 32-bit words Offset – 10-bit signed value, offset in bytes

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction loads lower 16-bit half-word from memory with address Rsrc+offset into the destination register Rdst:

Rdst[15:0] = Mem[Rsrc + offset / 4][15:0]

<table>
<thead>
<tr>
<th>Example</th>
<th>Instruction</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>1:</td>
<td>LD R1, R2, 0x12 //R1 = MEM[R2+0x12]</td>
<td></td>
</tr>
<tr>
<td>2:</td>
<td>.data //Data section definition Addr1: .word 123 // Define label Addr1 16 bit .set offs, 0x00 // Define constant offs .text //Text section definition MOVE R1, 1 // R1 = 1 MOVE R2, Addr1 // R2 = Addr1</td>
<td>// converted into words) LD R1, R2, offs // R1 = MEM[R2 + 0] // R1 will be 123</td>
</tr>
</tbody>
</table>

**JUMP – Jump to an absolute address**

**Syntax** JUMP Rdst

JUMP ImmAddr

JUMP Rdst, Condition

JUMP ImmAddr, Condition

**Operands**

- Rdst – Register R[0..3] containing address to jump to (expressed in 32-bit words)
- ImmAddr – 13 bits address (expressed in bytes), aligned to 4 bytes
- **Condition:**
  - EQ – jump if last ALU operation result was zero
  - OV – jump if last ALU has set overflow flag

**Cycles** 2 cycles to execute, 2 cycles to fetch next instruction

**Description** The instruction makes jump to the specified address. Jump can be either unconditional or based on an ALU flag.

<table>
<thead>
<tr>
<th>Example</th>
<th>Instruction</th>
<th>Comments</th>
</tr>
</thead>
</table>

Espressif Systems 1503 Release v4.0.3-189-g7c4f5fa
Chapter 4. API Guides

1: JUMP R1 // Jump to address in R1 (address in R1 is in 32-bit words)

2: JUMP 0x120, EQ // Jump to address 0x120 (in bytes) if ALU result is zero

3: JUMP label // Jump to label

label: nop // Definition of label

4: .global label // Declaration of global label

MOVE R1, label // R1 = label (value loaded into R1 is in words)

JUMP R1 // Jump to label

label: nop // Definition of label

JUMPR – Jump to a relative offset (condition based on R0)

Syntax

JUMPR Step, Threshold, Condition

Operands

- Step – relative shift from current position, in bytes
- Threshold – threshold value for branch condition
- Condition:
  - EQ (equal) – jump if value in R0 == threshold
  - LT (less than) – jump if value in R0 < threshold
  - LE (less or equal) – jump if value in R0 <= threshold
  - GT (greater than) – jump if value in R0 > threshold
  - GE (greater or equal) – jump if value in R0 >= threshold

Cycles

Conditions LT, GE, LE and GT: 2 cycles to execute, 2 cycles to fetch next instruction
Conditions EQ and GT are implemented in the assembler using one JUMPR instructions:

```
// JUMPR target, threshold, GT is implemented as:
JUMPR target, threshold+1, GE
```

// JUMPR target, threshold, LE is implemented as:

```
JUMPR target, threshold + 1, LT
```

Conditions EQ is implemented in the assembler using two JUMPR instructions:

```
// JUMPR target, threshold, EQ is implemented as:

JUMPR next, threshold + 1, GE
JUMPR target, threshold, GE

next:
```

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

Description

The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of R0 register value and the threshold value.

Examples:

1: pos: JUMPR 16, 20, GE // Jump to address (position + 16 bytes) if...

-value in R0 >= 20

2: // Down counting loop using R0 register

MOVE R0, 16 // load 16 into R0

(continues on next page)
Chapter 4. API Guides

(continued from previous page)

```c
label: SUB R0, R0, 1  // R0--
      NOP           // do something
      JUMPR label, 1, GE // jump to label if R0 >= 1
```

**JUMPS** – Jump to a relative address (condition based on stage count)

**Syntax** **JUMPS** **Step, Threshold, Condition**

**Operands**
- **Step** – relative shift from current position, in bytes
- **Threshold** – threshold value for branch condition
- **Condition**:
  - **EQ** (equal) – jump if value in stage_cnt == threshold
  - **LT** (less than) – jump if value in stage_cnt < threshold
  - **LE** (less or equal) – jump if value in stage_cnt <= threshold
  - **GT** (greater than) – jump if value in stage_cnt > threshold
  - **GE** (greater or equal) – jump if value in stage_cnt >= threshold

**Cycles** Conditions **LE, LT, GE**: 2 cycles to execute, 2 cycles to fetch next instruction

Conditions **EQ, GT** are implemented in the assembler using two **JUMPS** instructions:

```c
// JUMPS target, threshold, EQ is implemented as:
JUMPS next, threshold, LT
JUMPS target, threshold, LE

// JUMPS target, threshold, GT is implemented as:
JUMPS next, threshold, LE
JUMPS target, threshold, GE
```

Therefore the execution time will depend on the branches taken: either 2 cycles to execute + 2 cycles to fetch, or 4 cycles to execute + 4 cycles to fetch.

**Description** The instruction makes a jump to a relative address if condition is true. Condition is the result of comparison of count register value and threshold value.

**Examples**:

1: pos: JUMPS 16, 20, EQ // Jump to (position + 16 bytes) if stage_cnt
    R0-- 20

2: // Up counting loop using stage count register
   STAGE_RST // set stage_cnt to 0
   label: STAGE_INC 1 // stage_cnt++
   NOP // do something
   JUMPS label, 16, LT // jump to label if stage_cnt < 16

**STAGE_RST** – Reset stage count register

**Syntax** **STAGE_RST**

**Operands** No operands

**Description** The instruction sets the stage count register to 0

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Examples**:

1: STAGE_RST // Reset stage count register
STAGE_INC – Increment stage count register

Syntax
STAGE_INC Value

Operands
- Value  8 bits value

Cycles  2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction increments stage count register by given value.

Examples:

```
1:       STAGE_INC 10 // stage_cnt += 10

2:       // Up counting loop example:
         STAGE_RST // set stage_cnt to 0
        label: STAGE_INC 1 // stage_cnt++
         NOP // do something
         JUMPS label, 16, LT // jump to label if stage_cnt < 16
```

STAGE_DEC – Decrement stage count register

Syntax
STAGE_DEC Value

Operands
- Value  8 bits value

Cycles  2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction decrements stage count register by given value.

Examples:

```
1:       STAGE_DEC 10 // stage_cnt -= 10;

2:       // Down counting loop example
         STAGE_RST // set stage_cnt to 0
         STAGE_INC 16 // increment stage_cnt to 16
        label: STAGE_DEC 1 // stage_cnt--;
         NOP // do something
         JUMPS label, 0, GT // jump to label if stage_cnt > 0
```

HALT – End the program

Syntax
HALT

Operands  No operands

Cycles  2 cycles to execute

Description  The instruction halts the ULP coprocessor and restarts ULP wakeup timer, if it is enabled.

Examples:

```
1:       HALT // Halt the coprocessor
```

WAKE – Wake up the chip

Syntax
WAKE

Operands  No operands

Cycles  2 cycles to execute, 4 cycles to fetch next instruction

Description  The instruction sends an interrupt from ULP to RTC controller.

- If the SoC is in deep sleep mode, and ULP wakeup is enabled, this causes the SoC to wake up.
- If the SoC is not in deep sleep mode, and ULP interrupt bit (RTC_CNTL_ULP_CP_INT_ENA) is set in RTC_CNTL_INT_ENA_REG register, RTC interrupt will be triggered.
Note that before using WAKE instruction, ULP program may needs to wait until RTC controller is ready to wake up the main CPU. This is indicated using RTC_CNTL_RDY_FOR_WAKEUP bit of RTC_CNTL_LOW_POWER_ST_REG register. If WAKE instruction is executed while RTC_CNTL_RDY_FOR_WAKEUP is zero, it has no effect (wake up does not occur).

Examples:

```c
1: is_rdy_for_wakeup: // Read RTC_CNTL_RDY_FOR_WAKEUP bit
   READ_RTC_FIELD(RTC_CNTL_LOW_POWER_ST_REG, RTC_CNTL_RDY_FOR_WAKEUP)
   AND r0, r0, 1
   JUMP is_rdy_for_wakeup, eq // Retry until the bit is set

2: WAKE // Trigger wake up
   REG_WR 0x006, 24, 24, 0 // Stop ULP timer (clear RTC_CNTL_ULP_CP_SLP_TIMER_EN)
   HALT // Stop the ULP program
   // After these instructions, SoC will wake up,
   // and ULP will not run again until started by the main program.
```

SLEEP – set ULP wakeup timer period

**Syntax** SLEEP sleep_reg

**Operands**
- sleep_reg – 0..4, selects one of SENS_ULP_CP_SLEEP_CYCx_REG registers.

**Cycles** 2 cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction selects which of the SENS_ULP_CP_SLEEP_CYCx_REG (x = 0..4) register values is to be used by the ULP wakeup timer as wakeup period. By default, the value from SENS_ULP_CP_SLEEP_CYC0_REG is used.

**Examples**:

```c
1: SLEEP 1 // Use period set in SENS_ULP_CP_SLEEP_CYC1_REG

2: .set sleep_reg, 4 // Set constant
   SLEEP sleep_reg // Use period set in SENS_ULP_CP_SLEEP_CYC4_REG
```

WAIT – wait some number of cycles

**Syntax** WAIT Cycles

**Operands**
- Cycles – number of cycles for wait

**Cycles** 2 + Cycles cycles to execute, 4 cycles to fetch next instruction

**Description** The instruction delays for given number of cycles.

**Examples**:

```c
1: WAIT 10 // Do nothing for 10 cycles

2: .set wait_cnt, 10 // Set a constant
   WAIT wait_cnt // wait for 10 cycles
```

TSENS – do measurement with temperature sensor

**Syntax**
- TSENS Rdst, Wait_Delay

**Operands**
- Rdst – Destination Register R[0..3], result will be stored to this register
- Wait_Delay – number of cycles used to perform the measurement

**Cycles** 2 + Wait_Delay + 3 * TSENS_CLK to execute, 4 cycles to fetch next instruction

Espressif Systems 1507 Release v4.0.3-189-g7c4f5fa
Chapter 4. API Guides

Description  The instruction performs measurement using TSENS and stores the result into a general purpose register.

Examples:

```plaintext
1:  TSENS  R1, 1000  // Measure temperature sensor for 1000 cycles, 
    // and store result to R1
```

ADC – do measurement with ADC

Syntax

- ADC Rdst, Sar_sel, Max
- ADC Rdst, Sar_sel, Max, 0 — deprecated form

Operands

- Rdst – Destination Register R[0..3], result will be stored to this register
- Sar_sel – Select ADC: 0 = SARADC1, 1 = SARADC2
- Mux - selected PAD, SARADC Pad[Mux+1] is enabled

Cycles  \( 23 + \max(1, \text{SAR} \_\text{AMP} \_\text{WAIT}1) + \max(1, \text{SAR} \_\text{AMP} \_\text{WAIT}2) + \max(1, \text{SAR} \_\text{AMP} \_\text{WAIT}3) + \text{SAR}x \_\text{SAMPLE} \_\text{CYCLE} + \text{SAR}x \_\text{SAMPLE} \_\text{BIT} \) cycles to execute, 4 cycles to fetch next instruction

Description  The instruction makes measurements from ADC.

Examples:

```plaintext
1:  ADC  R1, 0, 1  // Measure value using ADC1 pad 2 and store...

```

I2C_RD - read single byte from I2C slave

Syntax

- I2C_RD Sub_addr, High, Low, Slave_sel

Operands

- Sub_addr – Address within the I2C slave to read.
- High, Low — Define range of bits to read. Bits outside of [High, Low] range are masked.
- Slave_sel - Index of I2C slave address to use.

Cycles  Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

Description  I2C_RD instruction reads one byte from I2C slave with index Slave_sel. Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where \( x = \text{Slave}\_sel \). 8 bits of read result is stored into R0 register.

Examples:

```plaintext
1:  I2C_RD  0x10, 7, 0, 0  // Read byte from sub-address 0x10 of...
    ->slave with address set in SENS_I2C_SLAVE_ADDR0
```

I2C_WR - write single byte to I2C slave

Syntax

- I2C_WR Sub_addr, Value, High, Low, Slave_sel

Operands

- Sub_addr – Address within the I2C slave to write.
- Value – 8-bit value to be written.
- High, Low — Define range of bits to write. Bits outside of [High, Low] range are masked.
- Slave_sel - Index of I2C slave address to use.

Cycles  Execution time mostly depends on I2C communication time. 4 cycles to fetch next instruction.

Description  I2C_WR instruction writes one byte to I2C slave with index Slave_sel. Slave address (in 7-bit format) has to be set in advance into SENS_I2C_SLAVE_ADDRx register field, where \( x = \text{Slave}\_sel \).
Examples:

```plaintext
1:    I2C_WR 0x20, 0x33, 7, 0, 1  // Write byte 0x33 to sub-address
    ~0x20 of slave with address set in SENS_I2C_SLAVE_ADDR1.
```

**REG_RD – read from peripheral register**

**Syntax**  
REG_RD Addr, High, Low

**Operands**
- Addr – Register address, in 32-bit words
- High – Register end bit number
- Low – Register start bit number

**Cycles** 4 cycles to execute, 4 cycles to fetch next instruction

**Description**  
The instruction reads up to 16 bits from a peripheral register into a general purpose register:  
\[ R0 = \text{REG}[\text{Addr}][\text{High:Low}] \]

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

```plaintext
addr_ulp = (addr_dport - DR_REG_RTCCNTL_BASE) / 4
```

**Examples:**

```plaintext
1:    REG_RD 0x120, 7, 4  // load 4 bits: R0 = {12'b0, REG[0x120][7:4]}
```

**REG_WR – write to peripheral register**

**Syntax**  
REG_WR Addr, High, Low, Data

**Operands**
- Addr – Register address, in 32-bit words.
- High – Register end bit number
- Low – Register start bit number
- Data – Value to write, 8 bits

**Cycles** 8 cycles to execute, 4 cycles to fetch next instruction

**Description**  
The instruction writes up to 8 bits from an immediate data value into a peripheral register:  
\[ \text{REG}[\text{Addr}][\text{High:Low}] = \text{data} \]

This instruction can access registers in RTC_CNTL, RTC_IO, SENS, and RTC_I2C peripherals. Address of the register, as seen from the ULP, can be calculated from the address of the same register on the DPORT bus as follows:

```plaintext
addr_ulp = (addr_dport - DR_REG_RTCCNTL_BASE) / 4
```

**Examples:**

```plaintext
1:    REG_WR 0x120, 7, 0, 0x10  // set 8 bits: REG[0x120][7:0] = 0x10
```

**Convenience macros for peripheral registers access**

ULP source files are passed through C preprocessor before the assembler. This allows certain macros to be used to facilitate access to peripheral registers.

Some existing macros are defined in `soc/soc_ulp.h` header file. These macros allow access to the fields of peripheral registers by their names. Peripheral registers names which can be used with these macros are the ones defined in `soc/rtc_cntl_reg.h, soc/rtc_io_reg.h, soc/sens_reg.h, and soc/rtc_i2c_reg.h`.
READ_RTC_REG(rtc_reg, low_bit, bit_width) Read up to 16 bits from rtc_reg[low_bit + bit_width - 1 : low_bit] into R0. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Read 16 lower bits of RTC_CNTL_TIME0_REG into R0 */
READ_RTC_REG(RTC_CNTL_TIME0_REG, 0, 16)
```

READ_RTC_FIELD(rtc_reg, field) Read from a field in rtc_reg into R0, up to 16 bits. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/sens_reg.h"

/* Read 8-bit SENS_TSENS_OUT field of SENS_SAR_SLAVE_ADDR3_REG into R0 */
READ_RTC_FIELD(SENS_SAR_SLAVE_ADDR3_REG, SENS_TSENS_OUT)
```

WRITE_RTC_REG(rtc_reg, low_bit, bit_width, value) Write immediate value into rtc_reg[low_bit + bit_width - 1 : low_bit], bit_width <= 8. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_io_reg.h"

/* Set BIT(2) of RTC_GPIO_OUT_DATA_W1TS field in RTC_GPIO_OUT_W1TS_REG */
WRITE_RTC_REG(RTC_GPIO_OUT_W1TS_REG, RTC_GPIO_OUT_DATA_W1TS_S + 2, 1, 1)
```

WRITE_RTC_FIELD(rtc_reg, field, value) Write immediate value into a field in rtc_reg, up to 8 bits. For example:

```c
#include "soc/soc_ulp.h"
#include "soc/rtc_cntl_reg.h"

/* Set RTC_CNTL_ULP_CP_SLP_TIMER_EN field of RTC_CNTL_STATE0_REG to 0 */
WRITE_RTC_FIELD(RTC_CNTL_STATE0_REG, RTC_CNTL_ULP_CP_SLP_TIMER_EN, 0)
```

4.18.2 Programming ULP coprocessor using C macros

In addition to the existing binutils port for the ESP32 ULP coprocessor, it is possible to generate programs for the ULP by embedding assembly-like macros into an ESP32 application. Here is an example how this can be done:

```c
const ulp_insn_t program[] = {
  I_MOVI(R3, 16),  /* R3 <- 16 */
  I_LD(R0, R3, 0), /* R0 <- RTC_SLOW_MEM[R3 + 0] */
  I_LD(R1, R3, 1), /* R1 <- RTC_SLOW_MEM[R3 + 1] */
  I_ADDR(R2, R0, R1), /* R2 <- R0 + R1 */
  I_ST(R2, R3, 2), /* R2 -> RTC_SLOW_MEM[R2 + 2] */
  I_HALT()
};
```

The program array is an array of ulp_insn_t, i.e. ULP coprocessor instructions. Each I_XXX preprocessor define translates into a single 32-bit instruction. Arguments of these preprocessor defines can be register numbers (R0 — R3) and literal constants. See ULP coprocessor instruction defines section for descriptions of instructions and arguments they take.

**Note:** Because some of the instruction macros expand to inline function calls, defining such array in global scope will cause the compiler to produce an “initializer element is not constant” error. To fix this error, move the definition of instructions array into local scope.
Chapter 4. API Guides

Load and store instructions use addresses expressed in 32-bit words. Address 0 corresponds to the first word of RTC_SLOW_MEM (which is address 0x50000000 as seen by the main CPUs).

To generate branch instructions, special \_M preprocessor defines are used. \_M\_LABEL define can be used to define a branch target. Label identifier is a 16-bit integer. \_M\_Bxxx defines can be used to generate branch instructions with target set to a particular label.

Implementation note: these \_M preprocessor defines will be translated into two ulp_insn_t values: one is a token value which contains label number, and the other is the actual instruction. ulp_process_macros_and_load function resolves the label number to the address, modifies the branch instruction to use the correct address, and removes the the extra ulp_insn_t token which contains the label numer.

Here is an example of using labels and branches:

```c
const ulp_insn_t program[] = {
    I_MOVI(R0, 34), // R0 <- 34
    M_LABEL(1), // label_1
    I_MOVI(R1, 32), // R1 <- 32
    I_LD(R1, R1, 0), // R1 <- RTC_SLOW_MEM[R1]
    I_MOVI(R2, 33), // R2 <- 33
    I_LD(R2, R2, 0), // R2 <- RTC_SLOW_MEM[R2]
    I_SUBR(R3, R1, R2), // R3 <- R1 - R2
    I_ST(R3, R0, 0), // R3 -> RTC_SLOW_MEM[R0 + 0]
    I_ADDI(R0, R0, 1), // R0++
    M_BL(1, 64), // if (R0 < 64) goto label_1
    I_HALT(),
};
RTC_SLOW_MEM[32] = 42;
RTC_SLOW_MEM[33] = 18;
size_t load_addr = 0;
size_t size = sizeof(program)/sizeof(ulp_insn_t);
ulp_process_macros_and_load(load_addr, program, &size);
ulp_run(load_addr);
```

**Functions**

- **esp_err_t ulp_process_macros_and_load**(uint32_t load_addr, const ulp_insn_t *program, size_t *size)

  Resolve all macro references in a program and load it into RTC memory.

  **Return**
  - ESP_OK on success
  - ESP_ERR_NO_MEM if auxiliary temporary structure cannot be allocated
  - one of ESP_ERR_ulp_xxx if program is not valid or cannot be loaded

  **Parameters**
  - load_addr: address where the program should be loaded, expressed in 32-bit words
  - program: ulp_insn_t array with the program
  - size: size of the program, expressed in 32-bit words

- **esp_err_t ulp_run**(uint32_t entry_point)

  Run the program loaded into RTC memory.

  **Return** ESP_OK on success

  **Parameters**
  - entry_point: entry point, expressed in 32-bit words

**Error codes**

- **ESP_ERR_ulp_BASE**
  Offset for ULP-related error codes
ESP_ERR_UPL_SIZE_TOO_BIG
   Program doesn’t fit into RTC memory reserved for the ULP

ESP_ERR_UPL_INVALID_LOAD_ADDR
   Load address is outside of RTC memory reserved for the ULP

ESP_ERR_UPL_DUPLICATE_LABEL
   More than one label with the same number was defined

ESP_ERR_UPL_UNDEFINED_LABEL
   Branch instructions references an undefined label

ESP_ERR_UPL_BRANCH_OUT_OF_RANGE
   Branch target is out of range of B instruction (try replacing with BX)

ULP coprocessor registers

ULP co-processor has 4 16-bit general purpose registers. All registers have same functionality, with one exception. R0 register is used by some of the compare-and-branch instructions as a source register.

These definitions can be used for all instructions which require a register.

R0
   general purpose register 0

R1
   general purpose register 1

R2
   general purpose register 2

R3
   general purpose register 3

ULP coprocessor instruction defines

I_DELAY (cycles_)
   Delay (nop) for a given number of cycles

I_HALT()
   Halt the coprocessor.

   This instruction halts the coprocessor, but keeps ULP timer active. As such, ULP program will be restarted again by timer. To stop the program and prevent the timer from restarting the program, use I_END(0) instruction.

I_END()
   Stop ULP program timer.

   This is a convenience macro which disables the ULP program timer. Once this instruction is used, ULP program will not be restarted anymore until ulp_run function is called.

   ULP program will continue running after this instruction. To stop the currently running program, use I_HALT().

I_ST(reg_val, reg_addr, offset_)
   Store value from register reg_val into RTC memory.

   The value is written to an offset calculated by adding value of reg_addr register and offset_field (this offset is expressed in 32-bit words). 32 bits written to RTC memory are built as follows:

   • bits [31:21] hold the PC of current instruction, expressed in 32-bit words
   • bits [20:16] = 5’b1
   • bits [15:0] are assigned the contents of reg_val

   RTC_SLOW_MEM[addr + offset_] = { 5’b0, insn_PC[10:0], val[15:0] }
I_LD (reg_dest, reg_addr, offset_)
Load value from RTC memory into reg_dest register.
Loads 16 LSbs from RTC memory word given by the sum of value in reg_addr and value of offset_.

I_WR_REG (reg, low_bit, high_bit, val)
Write literal value to a peripheral register
reg[high_bit : low_bit] = val This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

I_RD_REG (reg, low_bit, high_bit)
Read from peripheral register into R0
R0 = reg[high_bit : low_bit] This instruction can access RTC_CNTL_, RTC_IO_, SENS_, and RTC_I2C peripheral registers.

I_BL (pc_offset, imm_value)
Branch relative if R0 less than immediate value.
pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

I_BGE (pc_offset, imm_value)
Branch relative if R0 greater or equal than immediate value.
pc_offset is expressed in words, and can be from -127 to 127 imm_value is a 16-bit value to compare R0 against

I_BXR (reg_pc)
Unconditional branch to absolute PC, address in register.
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXI (imm_pc)
Unconditional branch to absolute PC, immediate address.
Address imm_pc is expressed in 32-bit words.

I_BXZR (reg_pc)
Branch to absolute PC if ALU result is zero, address in register.
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXZI (imm_pc)
Branch to absolute PC if ALU result is zero, immediate address.
Address imm_pc is expressed in 32-bit words.

I_BXFR (reg_pc)
Branch to absolute PC if ALU overflow, address in register
reg_pc is the register which contains address to jump to. Address is expressed in 32-bit words.

I_BXFI (imm_pc)
Branch to absolute PC if ALU overflow, immediate address
Address imm_pc is expressed in 32-bit words.

I_ADDR (reg_dest, reg_src1, reg_src2)
Addition: dest = src1 + src2

I_SUBR (reg_dest, reg_src1, reg_src2)
Subtraction: dest = src1 - src2

I_ANDR (reg_dest, reg_src1, reg_src2)
Logical AND: dest = src1 & src2

I_ORR (reg_dest, reg_src1, reg_src2)
Logical OR: dest = src1 | src2
Chapter 4. API Guides

I_MOVR (reg_dest, reg_src)
Copy: dest = src

I_LSHR (reg_dest, reg_src, reg_shift)
Logical shift left: dest = src << shift

I_RSHR (reg_dest, reg_src, reg_shift)
Logical shift right: dest = src >> shift

I_ADDI (reg_dest, reg_src, imm_)
Add register and an immediate value: dest = src1 + imm

I_SUBI (reg_dest, reg_src, imm_)
Subtract register and an immediate value: dest = src - imm

I_ANDI (reg_dest, reg_src, imm_)
Logical AND register and an immediate value: dest = src & imm

I_ORI (reg_dest, reg_src, imm_)
Logical OR register and an immediate value: dest = src | imm

I_MOVI (reg_dest, imm_)
Copy an immediate value into register: dest = imm

I_LSHI (reg_dest, reg_src, imm_)
Logical shift left register value by an immediate: dest = src << imm

I_RSHI (reg_dest, reg_src, imm_)
Logical shift right register value by an immediate: dest = val >> imm

M_LABEL (label_num)
Define a label with number label_num.
This is a macro which doesn’t generate a real instruction. The token generated by this macro is removed by ulp_process_macros_and_load function. Label defined using this macro can be used in branch macros defined below.

M_BL (label_num, imm_value)
Macro: branch to label label_num if R0 is less than immediate value.
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BGE (label_num, imm_value)
Macro: branch to label label_num if R0 is greater or equal than immediate value.
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BX (label_num)
Macro: unconditional branch to label.
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BXZ (label_num)
Macro: branch to label if ALU result is zero.
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

M_BXF (label_num)
Macro: branch to label if ALU overflow.
This macro generates two ulp_insn_t values separated by a comma, and should be used when defining contents of ulp_insn_t arrays. First value is not a real instruction; it is a token which is removed by ulp_process_macros_and_load function.

Defines

\texttt{RTC\_SLOW\_MEM}

\begin{itemize}
\item \texttt{RTC\_slow\_memory,8k\_size}
\end{itemize}

The ULP (Ultra Low Power) coprocessor is a simple FSM (Finite State Machine) which is designed to perform measurements using the ADC, temperature sensor, and external I2C sensors, while the main processors are in deep sleep mode. The ULP coprocessor can access the RTC\_SLOW\_MEM memory region, and registers in RTC\_CNTL, RTC\_IO, and SARADC peripherals. The ULP coprocessor uses fixed-width 32-bit instructions, 32-bit memory addressing, and has 4 general-purpose 16-bit registers.

4.18.3 Installing the Toolchain

The ULP coprocessor code is written in assembly and compiled using the binutils-esp32ulp toolchain.

If you have already set up ESP-IDF with CMake build system according to the Getting Started Guide, then the ULP toolchain will already be installed.

If you are using ESP-IDF with the legacy GNU Make based build system, refer to the instructions on this page: \textit{ULP coprocessor (Legacy GNU Make)}.

4.18.4 Compiling the ULP Code

To compile the ULP code as part of the component, the following steps must be taken:

1. The ULP code, written in assembly, must be added to one or more files with .S extension. These files must be placed into a separate directory inside the component directory, for instance ulp/.

2. Call \texttt{ulp_embed_binary} from the component CMakeLists.txt after registration. For example:

\begin{verbatim}
...  
idf_component_register()
set(ulp_app_name ulp_$(COMPONENT_NAME))
set(ulp_s_sources ulp/ulp_assembly_source_file.S)
set(ulp_exp_dep_srcs "ulp_c_source_file.c")
ulp_embed_binary(ulp_app_name "ulp_s_sources" "ulp_exp_dep_srcs")
\end{verbatim}

The first argument to ulp_embed_binary specifies the ULP binary name. The name specified here will also be used by other generated artifacts such as the ELF file, map file, header file and linker export file. The second argument specifies the ULP assembly source files. Finally, the third argument specifies the list of component source files which include the header file to be generated. This list is needed to build the dependencies correctly and ensure that the generated header file will be created before any of these files are compiled. See section below for the concept of generated header files for ULP applications.

3. Build the application as usual (e.g. idf.py app)

Inside, the build system will take the following steps to build ULP program:

1. \textbf{Run each assembly file (foo.S) through the C preprocessor}. This step generates the preprocessed assembly files (foo.ulp.S) in the component build directory. This step also generates dependency files (foo.ulp.d).

2. \textbf{Run preprocessed assembly sources through the assembler}. This produces object (foo.ulp.o) and listing (foo.ulp.lst) files. Listing files are generated for debugging purposes and are not used at later stages of the build process.
3. Run the linker script template through the C preprocessor. The template is located in components/ulp/ld directory.
4. Link the object files into an output ELF file (ulp_app_name.elf). The Map file (ulp_app_name.map) generated at this stage may be useful for debugging purposes.
5. Dump the contents of the ELF file into a binary (ulp_app_name.bin) which can then be embedded into the application.
6. Generate a list of global symbols (ulp_app_name.sym) in the ELF file using esp32ulp-elf-nm.
7. Create an LD export script and header file (ulp_app_name.ld and ulp_app_name.h) containing the symbols from ulp_app_name.sym. This is done using the esp32ulp_mapgen.py utility.
8. Add the generated binary to the list of binary files to be embedded into the application.

4.18.5 Accessing the ULP Program Variables

Global symbols defined in the ULP program may be used inside the main program.

For example, the ULP program may define a variable measurement_count which will define the number of ADC measurements the program needs to make before waking up the chip from deep sleep:

```
.globl measurement_count
measurement_count:
.long 0

/* later, use measurement_count */
move r3, measurement_count
ld r3, r3, 0
```

The main program needs to initialize this variable before the ULP program is started. The build system makes this possible by generating the ${ULP_APP_NAME}.h and ${ULP_APP_NAME}.ld files which define the global symbols present in the ULP program. This files include each global symbol defined in the ULP program, prefixed with ulp_.

The header file contains the declaration of the symbol:

```
extern uint32_t ulp_measurement_count;
```

Note that all symbols (variables, arrays, functions) are declared as uint32_t. For functions and arrays, take the address of the symbol and cast it to the appropriate type.

The generated linker script file defines the locations of symbols in RTC_SLOW_MEM:

```
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

To access the ULP program variables from the main program, include the generated header file and use variables as one normally would:

```
#include "ulp_app_name.h"

// later
void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

Note that the ULP program can only use lower 16 bits of each 32-bit word in RTC memory, because the registers are 16-bit, and there is no instruction to load from the high part of the word.

Likewise, the ULP store instruction writes register value into the lower 16 bits part of the 32-bit word. The upper 16 bits are written with a value which depends on the address of the store instruction, thus when reading variables written by the ULP, the main application needs to mask the upper 16 bits, e.g.:
printf("Last measurement value: \%d\n", ulp_last_measurement & UINT16_MAX);

### 4.18.6 Starting the ULP Program

To run a ULP program, the main application needs to load the ULP program into RTC memory using the `ulp_load_binary` function, and then start it using the `ulp_run` function.

Note that "Enable Ultra Low Power (ULP) Coprocessor" option must be enabled in menuconfig to reserve memory for the ULP. "RTC slow memory reserved for coprocessor" option must be set to a value sufficient to store ULP code and data. If the application components contain multiple ULP programs, then the size of the RTC memory must be sufficient to hold the largest one.

Each ULP program is embedded into the ESP-IDF application as a binary blob. The application can reference this blob and load it in the following way (suppose `ULP_APP_NAME` was defined to `ulp_app_name`):

```c
void start_ulp_program() {
    ESP_ERROR_CHECK( ulp_load_binary(
        0 /* load address, set to 0 when using default linker scripts */,
        bin_start,
        (bin_end - bin_start) / sizeof(uint32_t)) );
}
```

```c
esp_err_t ulp_load_binary(uint32_t load_addr, const uint8_t *program_binary, size_t program_size)
```

Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):

1. MAGIC, (value 0x00706c75, 4 bytes)
2. TEXT_OFFSET, offset of .text section from binary start (2 bytes)
3. TEXT_SIZE, size of .text section (2 bytes)
4. DATA_SIZE, size of .data section (2 bytes)
5. BSS_SIZE, size of .bss section (2 bytes)
6. (TEXT_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
7. .text section
8. .data section

Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with `load_addr == 0`.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `load_addr` is out of range
- ESP_ERR_INVALID_SIZE if `program_size` doesn’t match (TEXT_OFFSET + TEXT_SIZE + DATA_SIZE)
- ESP_ERR_NOT_SUPPORTED if the magic number is incorrect

**Parameters**

- `load_addr`: address where the program should be loaded, expressed in 32-bit words
- `program_binary`: pointer to program binary
- `program_size`: size of the program binary

Once the program is loaded into RTC memory, the application can start it, passing the address of the entry point to the `ulp_run` function:

```c
ESP_ERROR_CHECK( ulp_run(&ulp_entry - RTC_SLOW_MEM) );
```

```c
esp_err_t ulp_run(uint32_t entry_point)
```

Run the program loaded into RTC memory.
4.18.7 ULP program flow

ULP coprocessor is started by a timer. The timer is started once `ulp_run` is called. The timer counts a number of RTC_SLOW_CLK ticks (by default, produced by an internal 150 kHz RC oscillator). The number of ticks is set using SENS_ULP_CP_SLEEP_CYCx_REG registers (x = 0..4). When starting the ULP for the first time, SENS_ULP_CP_SLEEP_CYC0_REG will be used to set the number of timer ticks. Later the ULP program can select another SENS_ULP_CP_SLEEP_CYCx_REG register using `sleep` instruction.

The application can set ULP timer period values (SENS_ULP_CP_SLEEP_CYCx_REG, x = 0..4) using `ulp_set_wakeup_period` function.

### Function: `ulp_set_wakeup_period`

```c
esp_err_t ulp_set_wakeup_period(size_t period_index, uint32_t period_us)
```

Set one of ULP wakeup period values.

ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into SENS_ULP_CP_SLEEP_CYCx_REG registers, x = 0..4. By default, wakeup timer will use the period set into SENS_ULP_CP_SLEEP_CYC0_REG, i.e. period number 0. ULP program code can use SLEEP instruction to select which of the SENS_ULP_CP_SLEEP_CYCx_REG should be used for subsequent wakeups.

However, please note that SLEEP instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

**Note** The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

### Return

- ESP_OK on success
- ESP_ERR_INVALID_ARG if period_index is out of range

### Parameters

- **period_index**: wakeup period setting number (0 - 4)
- **period_us**: wakeup period, us

Once the timer counts the number of ticks set in the selected SENS_ULP_CP_SLEEP_CYCx_REG register, ULP coprocessor powers up and starts running the program from the entry point set in the call to `ulp_run`.

The program runs until it encounters a halt instruction or an illegal instruction. Once the program halts, ULP coprocessor powers down, and the timer is started again.

To disable the timer (effectively preventing the ULP program from running again), clear the RTC_CNTL_ULP_CP_SLP_TIMER_EN bit in the RTC_CNTL_STATE0_REG register. This can be done both from ULP code and from the main program.
4.19 ULP coprocessor (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

ULP (Ultra Low Power) coprocessor is a simple FSM which is designed to perform measurements using ADC, temperature sensor, and external I2C sensors, while main processors are in deep sleep mode. ULP coprocessor can access RTC_SLOW_MEM memory region, and registers in RTC_CNTL, RTC_IO, and SARADC peripherals. ULP coprocessor uses fixed-width 32-bit instructions, 32-bit memory addressing, and has 4 general purpose 16-bit registers.

### 4.19.1 Installing the toolchain

ULP coprocessor code is written in assembly and compiled using the binutils.esp32ulp toolchain.

2. Extract the toolchain into a directory, and add the path to the bin/ directory of the toolchain to the PATH environment variable.

### 4.19.2 Compiling ULP code

To compile ULP code as part of a component, the following steps must be taken:

1. ULP code, written in assembly, must be added to one or more files with .S extension. These files must be placed into a separate directory inside component directory, for instance ulp/.
2. Modify the component makefile, adding the following:

   ```make
   ULP_APP_NAME ?= ulp_$(COMPONENT_NAME)
   ULP_S_SOURCES = $(COMPONENT_PATH)/ulp/ulp_source_file.S
   ULP_EXP_DEP_OBJECTS := main.o
   include $(IDF_PATH)/components/ulp/component_ulp_common.mk
   ```

Here is each line explained:

- **ULP_APP_NAME** Name of the generated ULP application, without an extension. This name is used for build products of the ULP application: ELF file, map file, binary file, generated header file, and generated linker export file.
- **ULP_S_SOURCES** List of assembly files to be passed to the ULP assembler. These must be absolute paths, i.e. start with $(COMPONENT_PATH). Consider using $(addprefix) function if more than one file needs to be listed. Paths are relative to component build directory, so prefixing them is not necessary.
- **ULP_EXP_DEP_OBJECTS** List of object files names within the component which include the generated header file. This list is needed to build the dependencies correctly and ensure that the generated header file is created before any of these files are compiled. See section below explaining the concept of generated header files for ULP applications.

   ```make
   include $(IDF_PATH)/components/ulp/component_ulp_common.mk
   ```

   Includes common definitions of ULP build steps. Defines build targets for ULP object files, ELF file, binary file, etc.
3. Build the application as usual (e.g. idf.py build or idf.py app)

   Inside, the build system will take the following steps to build ULP program:
   1. **Run each assembly file (foo.S) through C preprocessor.** This step generates the preprocessed assembly files (foo.ulp.pS) in the component build directory. This step also generates dependency files (foo.ulp.d).
   2. **Run preprocessed assembly sources through assembler.** This produces objects (foo.ulp.o) and listing (foo.ulp.lst) files. Listing files are generated for debugging purposes and are not used at later stages of build process.
   3. **Run linker script template through C preprocessor.** The template is located in components/ulp/ld directory.
4. **Link object files into an output ELF file** (ulp_app_name.elf). Map file (ulp_app_name.map) generated at this stage may be useful for debugging purposes.

5. **Dump contents of the ELF file into binary** (ulp_app_name.bin) for embedding into the application.

6. **Generate list of global symbols** (ulp_app_name.sym) in the ELF file using esp32ulp-elf-nm.

7. **Create LD export script and header file** (ulp_app_name.ld and ulp_app_name.h) containing the symbols from ulp_app_name.sym. This is done using esp32ulp_mapgen.py utility.

8. **Add the generated binary to the list of binary files** to be embedded into the application.

### 4.19.3 Accessing ULP program variables

Global symbols defined in the ULP program may be used inside the main program.

For example, ULP program may define a variable `measurement_count` which will define the number of ADC measurements the program needs to make before waking up the chip from deep sleep:

```assembly
.global measurement_count
measurement_count: .long 0

/* later, use measurement_count */
move r3, measurement_count
ld r3, r3, 0
```

Main program needs to initialize this variable before ULP program is started. Build system makes this possible by generating a `$\{ULP\_APP\_NAME\}.h` and `$\{ULP\_APP\_NAME\}.ld` files which define global symbols present in the ULP program. These files include each global symbol defined in the ULP program, prefixed with `ulp_`.

The header file contains declaration of the symbol:

```c
extern uint32_t ulp_measurement_count;
```

Note that all symbols (variables, arrays, functions) are declared as `uint32_t`. For functions and arrays, take address of the symbol and cast to the appropriate type.

The generated linker script file defines locations of symbols in RTC_SLOW_MEM:

```ini
PROVIDE ( ulp_measurement_count = 0x50000060 );
```

To access ULP program variables from the main program, include the generated header file and use variables as one normally would:

```c
#include "ulp_app_name.h"

// later
void init_ulp_vars() {
    ulp_measurement_count = 64;
}
```

Note that ULP program can only use lower 16 bits of each 32-bit word in RTC memory, because the registers are 16-bit, and there is no instruction to load from high part of the word.

Likewise, ULP store instruction writes register value into the lower 16 bit part of the 32-bit word. Upper 16 bits are written with a value which depends on the address of the store instruction, so when reading variables written by the ULP, main application needs to mask upper 16 bits, e.g.:

```c
printf("Last measurement value: \%d\n", ulp_last_measurement & UINT16_MAX);
```

### 4.19.4 Starting the ULP program

To run a ULP program, main application needs to load the ULP program into RTC memory using `ulp_load_binary` function, and then start it using `ulp_run` function.
Note that “Enable Ultra Low Power (ULP) Coprocessor” option must be enabled in menuconfig in order to reserve memory for the ULP. “RTC slow memory reserved for coprocessor” option must be set to a value sufficient to store ULP code and data. If the application components contain multiple ULP programs, then the size of the RTC memory must be sufficient to hold the largest one.

Each ULP program is embedded into the ESP-IDF application as a binary blob. Application can reference this blob and load it in the following way (suppose ULP_APP_NAME was defined to $\text{ulp_app_name}$):

```c
extern const uint8_t bin_start[] asm("_binary_ulp_app_name_bin_start");
extern const uint8_t bin_end[] asm("_binary_ulp_app_name_bin_end");

void start_ULP_program() {
    ESP_ERROR_CHECK( ulp_load_binary(
        0 /* load address, set to 0 when using default linker scripts */,
        bin_start,
        (bin_end - bin_start) / sizeof(uint32_t))) ;
}
```

```c
esp_err_t ulp_load_binary(uint32_t load_addr, const uint8_t *program_binary, size_t program_size)

Load ULP program binary into RTC memory.

ULP program binary should have the following format (all values little-endian):

1. MAGIC, (value 0x00706c75, 4 bytes)
2. TEXT_OFFSET, offset of .text section from binary start (2 bytes)
3. TEXT_SIZE, size of .text section (2 bytes)
4. DATA_SIZE, size of .data section (2 bytes)
5. BSS_SIZE, size of .bss section (2 bytes)
6. (TEXT_OFFSET - 12) bytes of arbitrary data (will not be loaded into RTC memory)
7. .text section
8. .data section

Linker script in components/ulp/ld/esp32.ulp.ld produces ELF files which correspond to this format. This linker script produces binaries with load_addr == 0.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if load_addr is out of range
• ESP_ERR_INVALID_SIZE if program_size doesn’t match (TEXT_OFFSET + TEXT_SIZE + DATA_SIZE)
• ESP_ERR_NOT_SUPPORTED if the magic number is incorrect

Parameters
• load_addr: address where the program should be loaded, expressed in 32-bit words
• program_binary: pointer to program binary
• program_size: size of the program binary

Once the program is loaded into RTC memory, application can start it, passing the address of the entry point to $\text{ulp_run}$ function:

```c
ESP_ERROR_CHECK( ulp_run(ulp_entry - RTC_SLOW_MEM) );
```

```c
esp_err_t ulp_run(uint32_t entry_point)

Run the program loaded into RTC memory.

Return ESP_OK on success

Parameters
• entry_point: entry point, expressed in 32-bit words

Declaration of the entry point symbol comes from the above mentioned generated header file, $(ULP_APP_NAME)_h. In assembly source of the ULP application, this symbol must be marked as .global:
4.19.5 ULP program flow

ULP coprocessor is started by a timer. The timer is started once `ulp_run` is called. The timer counts a number of RTC_SLOW_CLK ticks (by default, produced by an internal 150kHz RC oscillator). The number of ticks is set using `SENS_ULP_CP_SLEEP_CYCx_REG` registers (x = 0..4). When starting the ULP for the first time, `SENS_ULP_CP_SLEEP_CYC0_REG` will be used to set the number of timer ticks. Later the ULP program can select another `SENS_ULP_CP_SLEEP_CYCx_REG` register using `sleep` instruction.

The application can set ULP timer period values (SENS_ULP_CP_SLEEP_CYCx_REG, x = 0..4) using `ulp_set_wakeup_period` function.

```c
esp_err_t ulp_set_wakeup_period(size_t period_index, uint32_t period_us)
```

Set one of ULP wakeup period values.

ULP coprocessor starts running the program when the wakeup timer counts up to a given value (called period). There are 5 period values which can be programmed into `SENS_ULP_CP_SLEEP_CYCx_REG` registers, x = 0..4. By default, wakeup timer will use the period set into `SENS_ULP_CP_SLEEP_CYC0_REG`, i.e. period number 0. ULP program code can use `SLEEP` instruction to select which of the `SENS_ULP_CP_SLEEP_CYCx_REG` should be used for subsequent wakeups.

However, please note that `SLEEP` instruction issued (from ULP program) while the system is in deep sleep mode does not have effect, and sleep cycle count 0 is used.

**Note** The ULP FSM requires two clock cycles to wakeup before being able to run the program. Then additional 16 cycles are reserved after wakeup waiting until the 8M clock is stable. The FSM also requires two more clock cycles to go to sleep after the program execution is halted. The minimum wakeup period that may be set up for the ULP is equal to the total number of cycles spent on the above internal tasks. For a default configuration of the ULP running at 150kHz it makes about 133us.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `period_index` is out of range

**Parameters**

- `period_index`: wakeup period setting number (0 - 4)
- `period_us`: wakeup period, us

Once the timer counts the number of ticks set in the selected `SENS_ULP_CP_SLEEP_CYCx_REG` register, ULP coprocessor powers up and starts running the program from the entry point set in the call to `ulp_run`.

The program runs until it encounters a `halt` instruction or an illegal instruction. Once the program halts, ULP coprocessor powers down, and the timer is started again.

To disable the timer (effectively preventing the ULP program from running again), clear the `RTC_CNTL_ULP_CP_SLP_TIMER_EN` bit in the `RTC_CNTL_STATE0_REG` register. This can be done both from ULP code and from the main program.

4.20 Unit Testing in ESP32

ESP-IDF comes with a unit test app based on Unity - unit test framework. Unit tests are integrated in the ESP-IDF repository and are placed in `test` subdirectory of each component respectively.

4.20.1 Add Normal Test Cases

Unit tests are added in the `test` subdirectory of the respective component. Tests are added in C files, a single C file can include multiple test cases. Test files start with the word "test."
The test file should include `unity.h` and the header for the C module to be tested. Tests are added in a function in the C file as follows:

```c
TEST_CASE("test name", "[module name]") { // Add test here }
```

- The first argument is a descriptive name for the test.
- The second argument is an identifier in square brackets. Identifiers are used to group related test, or tests with specific properties.

There is no need to add a main function with `UNITY_BEGIN()` and `UNITY_END()` in each test case. `unity_platform.c` will run `UNITY_BEGIN()`, run the tests cases, and then call `UNITY_END()`.

The test subdirectory should contain a [component CMakeLists.txt](#), since they are themselves, components. ESP-IDF uses the `unity` test framework and should be specified as a requirement for the component. Normally, components should list their sources manually; for component tests however, this requirement is relaxed and the use of the `SRC_DIRS` argument in `idf_component_register` is advised.

Overall, the minimal test subdirectory `CMakeLists.txt` file should contain the following:

```cmake
idf_component_register(SRC_DIRS "."
  INCLUDE_DIRS "."
  REQUIRES unity)
```

See [http://www.throwtheswitch.org/unity](http://www.throwtheswitch.org/unity) for more information about writing tests in Unity.

### 4.20.2 Add Multi-device Test Cases

The normal test cases will be executed on one DUT (Device Under Test). Components need to communicate with each other (like GPIO, SPI …) can’t be tested with normal test cases. Multiple devices test cases support writing and running test with multiple DUTs.

The following is an example of a multi-device test case:

```c
void gpio_master_test()
{
  gpio_config_t slave_config = {
    .pin_bit_mask = 1 << MASTER_GPIO_PIN,
    .mode = GPIO_MODE_INPUT,
  };
  gpio_config(&slave_config);
  unity_wait_for_signal("output high level");
  TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
  gpio_config_t master_config = {
    .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
    .mode = GPIO_MODE_OUTPUT,
  };
  gpio_config(&master_config);
  gpio_set_level(SLAVE_GPIO_PIN, 1);
  unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", 
  "[driver]", gpio_master_test, gpio_slave_test);
```

The macro `TEST_CASE_MULTIPLE_DEVICES` is used to declare a multi-device test case.

- The first argument is test case name.
• The second argument is test case description.
• From the third argument, up to 5 test functions can be defined, each function will be the entry point of tests running on each DUT.

Running test cases from different DUTs could require synchronizing between DUTs. We provide `unity_wait_for_signal` and `unity_send_signal` to support synchronizing with UART. As the scenario in the above example, the slave should get GPIO level after master set level. DUT UART console will prompt and user interaction is required:

DUT1 (master) console:

```
Waiting for signal: [output high level]!
Please press "Enter" key to once any board send this signal.
```

DUT2 (slave) console:

```
Send signal: [output high level]!
```

Once the signal is sent from DUT2, you need to press “Enter” on DUT1, then DUT1 unblocks from `unity_wait_for_signal` and starts to change GPIO level.

### 4.20.3 Add Multi-stage Test Cases

The normal test cases are expected to finish without reset (or only need to check if reset happens). Sometimes we expect to run some specific tests after certain kinds of reset. For example, we expect to test if the reset reason is correct after a wake up from deep sleep. We need to create a deep-sleep reset first and then check the reset reason. To support this, we can define multi-stage test cases, to group a set of test functions:

```c
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}
void check_deepsleep_reset_reason()
{
    RESET_REASON reason = rtc_get_reset_reason();
    TEST_ASSERT(reason == DEEPSLEEP_RESET);
}

TEST_CASE_MULTIPLE_STAGES("reset reason check for deepsleep", 
"[esp32]", trigger_deepsleep, check_deepsleep_reset_reason);
```

Multiple stages test cases present a group of test functions to users. It need user interactions (select case and select different stages) to run the case.

### 4.20.4 Building Unit Test App

Follow the setup instructions in the top-level esp-idf README. Make sure that IDF_PATH environment variable is set to point to the path of esp-idf top-level directory.

Change into `tools/unit-test-app` directory to configure and build it:

- `idf.py menuconfig` - configure unit test app.
- `idf.py -T all build` - build unit test app with tests for each component having tests in the test subdirectory.
- `idf.py -T "xxx yyy" build` - build unit test app with tests for some space-separated specific components (For instance: `idf.py -T heap build` - build unit tests only for heap component directory).
• idf.py -T all -E "xxx yyy" build - build unit test app with all unit tests, except for unit tests of some components (For instance: idf.py -T all -E "ulp mbedtls" build - build all unit tests excludes ulp and mbedtls components).

When the build finishes, it will print instructions for flashing the chip. You can simply run idf.py flash to flash all build output.

You can also run idf.py -T all flash or idf.py -T xxx flash to build and flash. Everything needed will be rebuilt automatically before flashing.

Use menuconfig to set the serial port for flashing.

4.20.5 Running Unit Tests

After flashing reset the ESP32 and it will boot the unit test app.

When unit test app is idle, press “Enter” will make it print test menu with all available tests:

```
Here's the test menu, pick your combo:
(1) "esp_ota_begin() verifies arguments" [ota]
(2) "esp_ota_get_next_update_partition logic" [ota]
(3) "Verify bootloader image in flash" [bootloader_support]
(4) "Verify unit test app image" [bootloader_support]
(5) "can use new and delete" [cxx]
(6) "can call virtual functions" [cxx]
(7) "can use static initializers for non-POD types" [cxx]
(8) "can use std::vector" [cxx]
(9) "static initialization guards work as expected" [cxx]
(10) "global initializers run in the correct order" [cxx]
(11) "before scheduler has started, static initializers work correctly" [cxx]
(12) "adc2 work with wifi" [adc]
(13) "gpio master/slave test example" [ignore][misc][test_env=UT_T2_1][multi_device]
    (1) "gpio_master_test"
    (2) "gpio_slave_test"
(14) "SPI Master clockdiv calculation routines" [spi]
(15) "SPI Master test" [spi][ignore]
(16) "SPI Master test, interaction of multiple devs" [spi][ignore]
(17) "SPI Master no response when switch from host1 (HSPI) to host2 (VSPI)"
    (1) "trigger_deepsleep"
    (2) "check_deepsleep_reset_reason"
```

The normal case will print the case name and description. Master-slave cases will also print the sub-menu (the registered test function names).

Test cases can be run by inputting one of the following:

- Test case name in quotation marks to run a single test case
- Test case index to run a single test case
- Module name in square brackets to run all test cases for a specific module
- An asterisk to run all test cases

[multi_device] and [multi_stage] tags tell the test runner whether a test case is a multiple devices or multiple stages of test case. These tags are automatically added by `TEST_CASE_MULTIPLE_STAGES and TEST_CASE_MULTIPLE_DEVICES macros.

After you select a multi-device test case, it will print sub-menu:
Running gpio master/slave test example...

gpio master/slave test example
(1)  "gpio_master_test"
(2)  "gpio_slave_test"

You need to input a number to select the test running on the DUT.

Similar to multi-device test cases, multi-stage test cases will also print sub-menu:

Running reset reason check for deepsleep...
reset reason check for deepsleep
(1)  "trigger_deepsleep"
(2)  "check_deepsleep_reset_reason"

First time you execute this case, input 1 to run first stage (trigger deepsleep). After DUT is rebooted and able to run test cases, select this case again and input 2 to run the second stage. The case only passes if the last stage passes and all previous stages trigger reset.

### 4.21 Unit Testing (Legacy GNU Make)

**Note:** Since ESP-IDF V4.0, the default build system is based on CMake. This documentation is for the legacy build system based on GNU Make. Support for this build system may be removed in future major releases.

ESP-IDF comes with a unit test app based on Unity - unit test framework. Unit tests are integrated in the ESP-IDF repository and are placed in test subdirectory of each component respectively.

#### 4.21.1 Add normal test cases

Unit tests are added in the test subdirectory of the respective component. Tests are added in C files, a single C file can include multiple test cases. Test files start with the word “test”.

The test file should include unity.h and the header for the C module to be tested.

Tests are added in a function in the C file as follows:

```c
TEST_CASE("test name", "[module name]"
{
   // Add test here
}
```

First argument is a descriptive name for the test, second argument is an identifier in square brackets. Identifiers are used to group related test, or tests with specific properties.

There is no need to add a main function with `UNITY_BEGIN()` and `UNITY_END()` in each test case. `unity_platform.c` will run `UNITY_BEGIN()`, run the tests cases, and then call `UNITY_END()`.

Each test subdirectory needs to include component.mk file with at least the following line of code:

```make
COMPONENT_ADD_LDFLAGS = -Wl,--whole-archive -l$(COMPONENT_NAME) -Wl,--no-whole- --archive
```

See [http://www.throwtheswitch.org/unity](http://www.throwtheswitch.org/unity) for more information about writing tests in Unity.

#### 4.21.2 Add multiple devices test cases

The normal test cases will be executed on one DUT (Device Under Test). Components need to communicate with each other (like GPIO, SPI …) can’t be tested with normal test cases. Multiple devices test cases support writing
and running test with multiple DUTs.

Here’s an example of multiple devices test case:

```c
void gpio_master_test()
{
    gpio_config_t slave_config = {
        .pin_bit_mask = 1 << MASTER_GPIO_PIN,
        .mode = GPIO_MODE_INPUT,
    }
    gpio_config(&slave_config);
    unity_wait_for_signal("output high level");
    TEST_ASSERT(gpio_get_level(MASTER_GPIO_PIN) == 1);
}

void gpio_slave_test()
{
    gpio_config_t master_config = {
        .pin_bit_mask = 1 << SLAVE_GPIO_PIN,
        .mode = GPIO_MODE_OUTPUT,
    }
    gpio_config(&master_config);
    gpio_set_level(SLAVE_GPIO_PIN, 1);
    unity_send_signal("output high level");
}

TEST_CASE_MULTIPLE_DEVICES("gpio multiple devices test example", 
"[driver]", gpio_master_test, gpio_slave_test);
```

The macro `TEST_CASE_MULTIPLE_DEVICES` is used to declare multiple devices test cases. First argument is test case name, second argument is test case description. From the third argument, upto 5 test functions can be defined, each function will be the entry point of tests running on each DUT.

Running test cases from different DUTs could require synchronizing between DUTs. We provide `unity_wait_for_signal` and `unity_send_signal` to support synchronizing with UART. As the scenario in the above example, slave should get GPIO level after master set level. DUT UART console will prompt and requires user interaction:

DUT1 (master) console:

```
Waiting for signal: [output high level]!
Please press "Enter" key once any board send this signal.
```

DUT2 (slave) console:

```
Send signal: [output high level]!
```

Once the signal is sent from DUT2, you need to press “Enter” on DUT1, then DUT1 unblocks from `unity_wait_for_signal` and starts to change GPIO level.

Signals can also be used to pass parameters between multiple devices. For example, DUT1 want to know the MAC address of DUT2, so it can connect to DUT2. In this case, `unity_wait_for_signal_param` and `unity_send_signal_param` can be used:

DUT1 console:

```
Waiting for signal: [dut2 mac address]!
Please input parameter value from any board send this signal and press "Enter" key.
```

DUT2 console:

```
Send signal: [dut2 mac address][10:20:30:40:50:60]!
```
Once the signal is sent from DUT2, you need to input `10:20:30:40:50:60` on DUT1 and press “Enter”. Then DUT1 will get the MAC address string of DUT2 and unblocks from `unity_wait_for_signal_param`, start to connect to DUT2.

### 4.21.3 Add multiple stages test cases

The normal test cases are expected to finish without reset (or only need to check if reset happens). Sometimes we want to run some specific test after certain kinds of reset. For example, we want to test if reset reason is correct after wakeup from deep sleep. We need to create deep sleep reset first and then check the reset reason. To support this, we can define multiple stages test case, to group a set of test functions together:

```c
static void trigger_deepsleep(void)
{
    esp_sleep_enable_timer_wakeup(2000);
    esp_deep_sleep_start();
}

void check_deepsleep_reset_reason()
{
    RESET_REASON reason = rtc_get_reset_reason(0);
    TEST_ASSERT(reason == DEEPSLEEP_RESET);
}
```

Multiple stages test cases present a group of test functions to users. It need user interactions (select case and select different stages) to run the case.

### 4.21.4 Building unit test app

Follow the setup instructions in the top-level esp-idf README. Make sure that IDF_PATH environment variable is set to point to the path of esp-idf top-level directory.

Change into `tools/unit-test-app` directory to configure and build it:

- `make menuconfig` - configure unit test app.
- `make TESTS_ALL=1` - build unit test app with tests for each component having tests in the `test` subdirectory.
- `make TEST_COMPONENTS=ulp mbedtls` - build all unit tests excludes ulp and mbedtls components.

When the build finishes, it will print instructions for flashing the chip. You can simply run `make flash` to flash all build output.

You can also run `make flash TESTS_ALL=1` or `make TEST_COMPONENTS='xxx'` to build and flash. Everything needed will be rebuilt automatically before flashing.

Use menuconfig to set the serial port for flashing.

### 4.21.5 Running unit tests

After flashing reset the ESP32 and it will boot the unit test app.

When unit test app is idle, press “Enter” will make it print test menu with all available tests:
Here's the test menu, pick your combo:

<table>
<thead>
<tr>
<th>Test Case</th>
<th>Module</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_ota_begin() verifies arguments</td>
<td>[ota]</td>
</tr>
<tr>
<td>esp_ota_get_next_update_partition logic</td>
<td>[ota]</td>
</tr>
<tr>
<td>Verify bootloader image in flash</td>
<td>[bootloader_support]</td>
</tr>
<tr>
<td>Verify unit test app image</td>
<td>[bootloader_support]</td>
</tr>
<tr>
<td>can use new and delete</td>
<td>[cxx]</td>
</tr>
<tr>
<td>can call virtual functions</td>
<td>[cxx]</td>
</tr>
<tr>
<td>can use static initializers for non-POD types</td>
<td>[cxx]</td>
</tr>
<tr>
<td>static initialization guards work as expected</td>
<td>[cxx]</td>
</tr>
<tr>
<td>global initializers run in the correct order</td>
<td>[cxx]</td>
</tr>
<tr>
<td>before scheduler has started, static initializers work correctly</td>
<td>[cxx]</td>
</tr>
<tr>
<td>adc2 work with wifi</td>
<td>[adc]</td>
</tr>
<tr>
<td>gpio master/slave test example</td>
<td>[ignore][misc][test_env=UT_T2_1][multi_device]</td>
</tr>
<tr>
<td>SPI Master clockdiv calculation routines</td>
<td>[spi]</td>
</tr>
<tr>
<td>SPI Master test</td>
<td>[spi][ignore]</td>
</tr>
<tr>
<td>SPI Master test, interaction of multiple devs</td>
<td>[spi][ignore]</td>
</tr>
<tr>
<td>SPI Master no response when switch from host1 (HSPI) to host2 (VSPI)</td>
<td>[spi]</td>
</tr>
<tr>
<td>SPI Master DMA test, TX and RX in different regions</td>
<td>[spi]</td>
</tr>
<tr>
<td>SPI Master DMA test: length, start, not aligned</td>
<td>[spi]</td>
</tr>
<tr>
<td>reset reason check for deepsleep</td>
<td>[esp32][test_env=UT_T2_1][multi_stage]</td>
</tr>
<tr>
<td>trigger_deepsleep</td>
<td>[esp32][test_env=UT_T2_1][multi_stage]</td>
</tr>
<tr>
<td>check_deepsleep_reset_reason</td>
<td>[esp32][test_env=UT_T2_1][multi_stage]</td>
</tr>
</tbody>
</table>

Normal case will print the case name and description. Master slave cases will also print the sub-menu (the registered test function names).

Test cases can be run by inputting one of the following:

- Test case name in quotation marks (for example, "esp_ota_begin() verifies arguments") to run a single test case.
- Test case index (for example, 1) to run a single test case.
- Module name in square brackets (for example, [cxx]) to run all test cases for a specific module.
- An asterisk (*) to run all test cases

[multi_device] and [multi_stage] tags tell the test runner whether a test case is a multiple devices or multiple stages test case. These tags are automatically added by `TEST_CASE_MULTIPLE_DEVICES and TEST_CASE_MULTIPLE_STAGES macros.

After you select a multiple devices test case, it will print sub menu:

Running gpio master/slave test example...

gpio master/slave test example
    (1) "gpio_master_test"
    (2) "gpio_slave_test"

You need to input number to select the test running on the DUT.

Similar to multiple devices test cases, multiple stages test cases will also print sub menu:

Running reset reason check for deepsleep...
reset reason check for deepsleep
    (1) "trigger_deepsleep"
    (2) "check_deepsleep_reset_reason"

First time you execute this case, input 1 to run first stage (trigger deepsleep). After DUT is rebooted and able to run test cases, select this case again and input 2 to run the second stage. The case only passes if the last stage passes and all previous stages trigger reset.
4.22 Console

ESP-IDF provides console component, which includes building blocks needed to develop an interactive console over serial port. This component includes following facilities:

- Line editing, provided by linenoise library. This includes handling of backspace and arrow keys, scrolling through command history, command auto-completion, and argument hints.
- Splitting of command line into arguments.
- Argument parsing, provided by argtable3 library. This library includes APIs useful for parsing GNU style command line arguments.
- Functions for registration and dispatching of commands.

These facilities can be used together or independently. For example, it is possible to use line editing and command registration features, but use getopt or custom code for argument parsing, instead of argtable3. Likewise, it is possible to use simpler means of command input (such as fgets) together with the rest of the means for command splitting and argument parsing.

4.22.1 Line editing

Line editing feature lets users compose commands by typing them, erasing symbols using ‘backspace’ key, navigating within the command using left/right keys, navigating to previously typed commands using up/down keys, and performing autocompletion using ‘tab’ key.

Note: This feature relies on ANSI escape sequence support in the terminal application. As such, serial monitors which display raw UART data cannot be used together with the line editing library. If you see [6n or similar escape sequence when running get_started/console example instead of a command prompt (\esp32>), it means that the serial monitor does not support escape sequences. Programs which are known to work are GNU screen, minicom, and idf_monitor.py (which can be invoked using idf.py monitor from project directory).

Here is an overview of functions provided by linenoise library.

Configuration

Linenoise library does not need explicit initialization. However, some configuration defaults may need to be changed before invoking the main line editing function.

linenoiseClearScreen Clear terminal screen using an escape sequence and position the cursor at the top left corner.

linenoiseSetMultiLine Switch between single line and multi line editing modes. In single line mode, if the length of the command exceeds the width of the terminal, the command text is scrolled within the line to show the end of the text. In this case the beginning of the text is hidden. Single line needs less data to be sent to refresh screen on each key press, so exhibits less glitching compared to the multi line mode. On the flip side, editing commands and copying command text from terminal in single line mode is harder. Default is single line mode.

Main loop

linenoise In most cases, console applications have some form of read/eval loop. linenoise is the single function which handles user’s key presses and returns completed line once ‘enter’ key is pressed. As such, it handles the ‘read’ part of the loop.

linenoiseFree This function must be called to release the command line buffer obtained from linenoise function.
Hints and completions

```
linenoiseSetCompletionCallback` When user presses ‘tab’ key, linenoise library invokes completion callback. The callback should inspect the contents of the command typed so far and provide a list of possible completions using calls to `linenoiseAddCompletion` function. `linenoiseSetCompletionCallback` function should be called to register this completion callback, if completion feature is desired.
```

console component provides a ready made function to provide completions for registered commands, `esp_console_get_completion` (see below).

```
linewidthsetAddCompletion Function to be called by completion callback to inform the library about possible completions of the currently typed command.
```

```
linenoiseSetHintsCallback Whenever user input changes, linenoise invokes hint callback. This callback can inspect the command line typed so far, and provide a string with hints (which can include list of command arguments, for example). The library then displays the hint text on the same line where editing happens, possibly with a different color.
```

```
linenoiseSetFreeHintsCallback If hint string returned by hints callback is dynamically allocated or needs to be otherwise recycled, the function which performs such cleanup should be registered via `linenoiseSetFreeHintsCallback`.
```

History

```
linenoiseHistorySetMaxLen This function sets the number of most recently typed commands to be kept in memory. Users can navigate the history using up/down arrows.
```

```
linenoiseHistoryAdd Linenoise does not automatically add commands to history. Instead, applications need to call this function to add command strings to the history.
```

```
linenoiseHistorySave Function saves command history from RAM to a text file, for example on an SD card or on a filesystem in flash memory.
```

```
linenoiseHistoryLoad Counterpart to `linenoiseHistorySave`, loads history from a file.
```

```
linenoiseHistoryFree Releases memory used to store command history. Call this function when done working with linenoise library.
```

4.22.2 Splitting of command line into arguments

```
console component provides `esp_console_split_argv` function to split command line string into arguments. The function returns the number of arguments found (`argc`) and fills an array of pointers which can be passed as `argv` argument to any function which accepts arguments in `argc, argv` format.
```

The command line is split into arguments according to the following rules:

- Arguments are separated by spaces
- If spaces within arguments are required, they can be escaped using `\` (backslash) character.
- Other escape sequences which are recognized are `\\` (which produces literal backslash) and `"`, which produces a double quote.
- Arguments can be quoted using double quotes. Quotes may appear only in the beginning and at the end of the argument. Quotes within the argument must be escaped as mentioned above. Quotes surrounding the argument are stripped by `esp_console_split_argv` function.

Examples:

```
• abc def 1 20 .3 ➔ [abc, def, 1, 20, .3]
• abc "123 456" def ➔ [abc, 123 456, def]
• `a\ b\c" ➔ [a b\c]
```

4.22.3 Argument parsing

For argument parsing, console component includes `argtable3` library. Please see tutorial for an introduction to `argtable3`. Github repository also includes examples.
4.22.4 Command registration and dispatching

**console** component includes utility functions which handle registration of commands, matching commands typed by the user to registered ones, and calling these commands with the arguments given on the command line.

Application first initializes command registration module using a call to `esp_console_init`, and calls `esp_console_cmd_register` function to register command handlers.

For each command, application provides the following information (in the form of `esp_console_cmd_t` structure):

- Command name (string without spaces)
- Help text explaining what the command does
- Optional hint text listing the arguments of the command. If application uses Argtable3 for argument parsing, hint text can be generated automatically by providing a pointer to argtable argument definitions structure instead.
- The command handler function.

A few other functions are provided by the command registration module:

- `esp_console_run` This function takes the command line string, splits it into argc/argv argument list using `esp_console_split_argv`, looks up the command in the list of registered components, and if it is found, executes its handler.
- `esp_console_register_help_command` Adds help command to the list of registered commands. This command prints the list of all the registered commands, along with their arguments and help texts.
- `esp_console_get_completion` Callback function to be used with `linenoiseSetCompletionCallback` from linenoise library. Provides completions to linenoise based on the list of registered commands.
- `esp_console_get_hint` Callback function to be used with `linenoiseSetHintsCallback` from linenoise library. Provides argument hints for registered commands to linenoise.

4.22.5 Example

Example application illustrating usage of the **console** component is available in `examples/system/console` directory. This example shows how to initialize UART and VFS functions, set up linenoise library, read and handle commands from UART, and store command history in Flash. See README.md in the example directory for more details.

4.23 ESP32 ROM console

When an ESP32 is unable to boot from flash ROM (and the fuse disabling it hasn’t been blown), it boots into a rom console. The console is based on TinyBasic, and statements entered should be in the form of BASIC statements. As is common in the BASIC language, without a preceding line number, commands entered are executed immediately; lines with a prefixed line number are stored as part of a program.

4.23.1 Full list of supported statements and functions

**System**

- **BYE** - exits Basic, reboots ESP32, retries booting from flash
- **END** - stops execution from the program, also “STOP”
- **MEM** - displays memory usage statistics
- **NEW** - clears the current program
- **RUN** - executes the current program
Chapter 4. API Guides

IO, Documentation

- PEEK(address) - get a 32-bit value from a memory address
- POKE - write a 32-bit value to memory
- USR(addr, arg1, ..) - Execute a machine language function
- PRINT expression - print out the expression, also "?"
- PHEX expression - print expression as a hex number
- REM stuff - remark/comment, also "!"

Expressions, Math

- A=V, LET A=V - assign value to a variable
- +, -, *, / - Math
- <, <=, =, >, !=, >=, > - Comparisons
- ABS(expression) - returns the absolute value of the expression
- RSEED(v) - sets the random seed to v
- RND(m) - returns a random number from 0 to m
- A=1234 - *Assign a decimal value*
- A=&h1A2 - *Assign a hex value*
- A=&b1001 - *Assign a binary value*

Control

- IF expression statement - perform statement if expression is true
- FOR variable = start TO end - start for block
- FOR variable = start TO end STEP value - start for block with step
- NEXT - end of for block
- GOTO linenum - continue execution at this line number
- GOSUB linenum - call a subroutine at this line number
- RETURN - return from a subroutine
- DELAY - Delay a given number of milliseconds

Pin IO

- IODIR - Set a GPIO-pin as an output (1) or input (0)
- IOSET - Set a GPIO-pin, configured as output, to high (1) or low (0)
- IOGET - Get the value of a GPIO-pin

4.23.2 Example programs

Here are a few example commands and programs to get you started…

Read UART_DATE register of uart0

```
> PHEX PEEK($h3FF40078)
15122500
```

Set GPIO2 using memory writes to GPIO_OUT_REG

Note: you can do this easier with the IOSET command

```
> POKE $h3FF44004, PEEK($h3FF44004) OR $b100
```
Get value of GPIO0

```plaintext
> IODIR 0,0
> PRINT IOGET(0)
0
```

Blink LED

Hook up an LED between GPIO2 and ground. When running the program, the LED should blink 10 times.

```plaintext
10 IODIR 2,1
20 FOR A=1 TO 10
30 IOSET 2,1
40 DELAY 250
50 IOSET 2,0
60 DELAY 250
70 NEXT A
RUN
```

4.23.3 Credits

The ROM console is based on “TinyBasicPlus” by Mike Field and Scott Lawrence, which is based on “68000 TinyBasic” by Gordon Brandly

4.24 RF calibration

ESP32 supports three RF calibration methods during RF initialization:

1. Partial calibration
2. Full calibration
3. No calibration

4.24.1 Partial calibration

During RF initialization, the partial calibration method is used by default for RF calibration. It is done based on the full calibration data which is stored in the NVS. To use this method, please go to menuconfig and enable CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE.

4.24.2 Full calibration

Full calibration is triggered in the following conditions:

1. NVS does not exist.
2. The NVS partition to store calibration data is erased.
3. Hardware MAC address is changed.
4. PHY library version is changed.
5. The RF calibration data loaded from the NVS partition is broken.

It takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. To switch to the full calibration method, go to menuconfig and disable CONFIG_ESP32_PHY_CALIBRATION_AND_DATA_STORAGE. If you use the default method of RF calibration, there are two ways to add the function of triggering full calibration as a last-resort remedy.

1. Erase the NVS partition if you don’t mind all of the data stored in the NVS partition is erased. That is indeed the easiest way.
2. Call API `esp_phy_erase_cal_data_in_nvs()` before initializing WiFi and BT/BLE based on some conditions (e.g. an option provided in some diagnostic mode). In this case, only phy namespace of the NVS partition is erased.

### 4.24.3 No calibration

No calibration method is only used when ESP32 wakes up from deep sleep.

### 4.24.4 PHY initialization data

The PHY initialization data is used for RF calibration. There are two ways to get the PHY initialization data.

One is the default initialization data which is located in the header file `components/esp_wifi/esp32/include/phy_init_data.h`. It is embedded into the application binary after compiling and then stored into read-only memory (DROM). To use the default initialization data, please go to `menuconfig` and disable `CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION`.

Another is the initialization data which is stored in a partition. When using a custom partition table, make sure that PHY data partition is included (type: `data`, subtype: `phy`). With default partition table, this is done automatically. If initialization data is stored in a partition, it has to be flashed there, otherwise runtime error will occur. To switch to the initialization data stored in a partition, go to `menuconfig` and enable `CONFIG_ESP32_PHY_INIT_DATA_IN_PARTITION`.

### 4.25 Wi-Fi Driver

#### 4.25.1 ESP32 Wi-Fi Feature List

- Support Station-only mode, AP-only mode, Station/AP-coexistence mode
- Support IEEE-802.11B, IEEE-802.11G, IEEE802.11N and APIs to configure the protocol mode
- Support WPA/WPA2/WPA2-Enterprise and WPS
- Support AMPDU, HT40, QoS and other key features
- Support Modem-sleep
- Support an Espressif-specific protocol which, in turn, supports up to 1 km of data traffic
- Up to 20 MBit/sec TCP throughput and 30 MBit/sec UDP throughput over the air
- Support Sniffer
- Support set fast_crypto algorithm and normal algorithm switch which used in wifi connect
- Support both fast scan and all channel scan feature
- Support multiple antennas
- Support channel state information

#### 4.25.2 How To Write a Wi-Fi Application

**Preparation**

Generally, the most effective way to begin your own Wi-Fi application is to select an example which is similar to your own application, and port the useful part into your project. It is not a MUST but it is strongly recommended that you take some time to read this article first, especially if you want to program a robust Wi-Fi application. This article is supplementary to the Wi-Fi APIs/Examples. It describes the principles of using the Wi-Fi APIs, the limitations of the current Wi-Fi API implementation, and the most common pitfalls in using Wi-Fi. This article also reveals some design details of the Wi-Fi driver. We recommend that you become familiar at least with the following sections: `<ESP32 Wi-Fi API Error Code>`, `<ESP32 Wi-Fi Programming Model>`, and `<ESP32 Wi-Fi Event Description>`.
Chapter 4. API Guides

Setting Wi-Fi Compile-time Options

Refer to <Wi-Fi Menuconfig>

Init Wi-Fi

Refer to <ESP32 Wi-Fi Station General Scenario>, <ESP32 Wi-Fi AP General Scenario>.

Start/Connect Wi-Fi

Refer to <ESP32 Wi-Fi Station General Scenario>, <ESP32 Wi-Fi AP General Scenario>.

Event-Handling

Generally, it is easy to write code in “sunny-day” scenarios, such as <WIFI_EVENT_STA_START>, <WIFI_EVENT_STA_CONNECTED> etc. The hard part is to write routines in “rainy-day” scenarios, such as <WIFI_EVENT_STA_DISCONNECTED> etc. Good handling of “rainy-day” scenarios is fundamental to robust Wi-Fi applications. Refer to <ESP32 Wi-Fi Event Description>, <ESP32 Wi-Fi Station General Scenario>, <ESP32 Wi-Fi AP General Scenario>. See also an overview of event handling in ESP-IDF.

Write Error-Recovery Routines Correctly at All Times

Just like the handling of “rainy-day” scenarios, a good error-recovery routine is also fundamental to robust Wi-Fi applications. Refer to <ESP32 Wi-Fi Error Code>

4.25.3 ESP32 Wi-Fi API Error Code

All of the ESP32 Wi-Fi APIs have well-defined return values, namely, the error code. The error code can be categorized into:

- No errors, e.g. ESP_OK means that the API returns successfully
- Recoverable errors, such as ESP_ERR_NO_MEM, etc.
- Non-recoverable, non-critical errors
- Non-recoverable, critical errors

Whether the error is critical or not depends on the API and the application scenario, and it is defined by the API user.

The primary principle to write a robust application with Wi-Fi API is to always check the error code and write the error-handling code. Generally, the error-handling code can be used:

- for recoverable errors, in which case you can write a recoverable-error code. For example, when esp_wifi_start returns ESP_ERR_NO_MEM, the recoverable-error code vTaskDelay can be called, in order to get a microseconds’ delay for another try.
- for non-recoverable, yet non-critical, errors, in which case printing the error code is a good method for error handling.
- for non-recoverable, critical errors, in which case “assert” may be a good method for error handling. For example, if esp_wifi_set_mode returns ESP_ERR_WIFI_NOT_INIT, it means that the Wi-Fi driver is not initialized by esp_wifi_init successfully. You can detect this kind of error very quickly in the application development phase.

In esp_err.h, ESP_ERROR_CHECK checks the return values. It is a rather commonplace error-handling code and can be used as the default error-handling code in the application development phase. However, we strongly recommend that API users write their own error-handling code.
4.25.4 ESP32 Wi-Fi API Parameter Initialization

When initializing struct parameters for the API, one of two approaches should be followed: - explicitly set all fields of the parameter or - use get API to get current configuration first, then set application specific fields.

Initializing or getting the entire structure is very important because most of the time the value 0 indicates the default value is used. More fields may be added to the struct in the future and initializing these to zero ensures the application will still work correctly after IDF is updated to a new release.

4.25.5 ESP32 Wi-Fi Programming Model

The ESP32 Wi-Fi programming model is depicted as follows:

![Wi-Fi Programming Model](image)

The Wi-Fi driver can be considered a black box that knows nothing about high-layer code, such as the TCP/IP stack, application task, event task, etc. The application task (code) generally calls Wi-Fi driver APIs to initialize Wi-Fi and handles Wi-Fi events when necessary. Wi-Fi driver receives API calls, handles them, and post events to the application.

Wi-Fi event handling is based on the esp_event library. Events are sent by the Wi-Fi driver to the default event loop. Application may handle these events in callbacks registered using esp_event_handler_register(). Wi-Fi events are also handled by tcpip_adapter component to provide a set of default behaviors. For example, when Wi-Fi station connects to an AP, tcpip_adapter will automatically start the DHCP client.

4.25.6 ESP32 Wi-Fi Event Description

WIFI_EVENT_WIFI_READY

The Wi-Fi driver will never generate this event, which, as a result, can be ignored by the application event callback. This event may be removed in future releases.

WIFI_EVENT_SCAN_DONE

The scan-done event is triggered by esp_wifi_scan_start() and will arise in the following scenarios:

- The scan is completed, e.g., the target AP is found successfully, or all channels have been scanned.
- The scan is stopped by esp_wifi_scan_stop().
- The esp_wifi_scan_start() is called before the scan is completed. A new scan will override the current scan and a scan-done event will be generated.
The scan-done event will not arise in the following scenarios:

- It is a blocked scan.
- The scan is caused by `esp_wifi_connect()`.

Upon receiving this event, the event task does nothing. The application event callback needs to call `esp_wifi_scan_get_ap_num()` and `esp_wifi_scan_get_ap_records()` to fetch the scanned AP list and trigger the Wi-Fi driver to free the internal memory which is allocated during the scan (do not forget to do this)! Refer to ‘ESP32 Wi-Fi Scan’ for a more detailed description.

**WIFI_EVENT_STA_START**

If `esp_wifi_start()` returns `ESP_OK` and the current Wi-Fi mode is Station or AP+Station, then this event will arise. Upon receiving this event, the event task will initialize the LwIP network interface (netif). Generally, the application event callback needs to call `esp_wifi_connect()` to connect to the configured AP.

**WIFI_EVENT_STA_STOP**

If `esp_wifi_stop()` returns `ESP_OK` and the current Wi-Fi mode is Station or AP+Station, then this event will arise. Upon receiving this event, the event task will release the station’s IP address, stop the DHCP client, remove TCP/UDP-related connections and clear the LwIP station netif, etc. The application event callback generally does not need to do anything.

**WIFI_EVENT_STA_CONNECTED**

If `esp_wifi_connect()` returns `ESP_OK` and the station successfully connects to the target AP, the connection event will arise. Upon receiving this event, the event task starts the DHCP client and begins the DHCP process of getting the IP address. Then, the Wi-Fi driver is ready for sending and receiving data. This moment is good for beginning the application work, provided that the application does not depend on LwIP, namely the IP address. However, if the application is LwIP-based, then you need to wait until the `got ip` event comes in.

**WIFI_EVENT_STA_DISCONNECTED**

This event can be generated in the following scenarios:

- When `esp_wifi_disconnect()`, `esp_wifi_stop()`, or `esp_wifi_deinit()` is called and the station is already connected to the AP.
- When `esp_wifi_connect()` is called, but the Wi-Fi driver fails to set up a connection with the AP due to certain reasons, e.g., the scan fails to find the target AP, authentication times out, etc. If there are more than one AP with the same SSID, the disconnected event is raised after the station fails to connect all of the found APs.
- When the Wi-Fi connection is disrupted because of specific reasons, e.g., the station continuously loses N beacons, the AP kicks off the station, the AP’s authentication mode is changed, etc.

Upon receiving this event, the default behavior of the event task is: - Shuts down the station’s LwIP netif. - Notifies the LwIP task to clear the UDP/TCP connections which cause the wrong status to all sockets. For socket-based applications, the application callback can choose to close all sockets and re-create them, if necessary, upon receiving this event.

The most common event handle code for this event in application is to call `esp_wifi_connect()` to reconnect the Wi-Fi. However, if the event is raised because `esp_wifi_disconnect()` is called, the application should not call `esp_wifi_connect()` to reconnect. It’s application’s responsibility to distinguish whether the event is caused by `esp_wifi_disconnect()` or other reasons. Sometimes a better reconnect strategy is required, refer to `<Wi-Fi Reconnect>` and `<Scan When Wi-Fi Is Connecting>`.

Another thing deserves our attention is that the default behavior of LwIP is to abort all TCP socket connections on receiving the disconnect. Most of time it is not a problem. However, for some special application, this may not be what they want, consider following scenarios:
The application creates a TCP connection to maintain the application-level keep-alive data that is sent out every 60 seconds. Due to certain reasons, the Wi-Fi connection is cut off, and the <WIFI_EVENT_STA_DISCONNECTED> is raised. According to the current implementation, all TCP connections will be removed and the keep-alive socket will be in a wrong status. However, since the application designer believes that the network layer should NOT care about this error at the Wi-Fi layer, the application does not close the socket. Five seconds later, the Wi-Fi connection is restored because esp_wifi_connect() is called in the application event callback function. Moreover, the station connects to the same AP and gets the same IPV4 address as before. Sixty seconds later, when the application sends out data with the keep-alive socket, the socket returns an error and the application closes the socket and re-creates it when necessary.

In above scenario, ideally, the application sockets and the network layer should not be affected, since the Wi-Fi connection only fails temporarily and recovers very quickly. The application can enable “Keep TCP connections when IP changed” via LwIP menuconfig.

**IP_EVENT_STA_GOT_IP**

This event arises when the DHCP client successfully gets the IPV4 address from the DHCP server, or when the IPV4 address is changed. The event means that everything is ready and the application can begin its tasks (e.g., creating sockets).

The IPV4 may be changed because of the following reasons:
- The DHCP client fails to renew/rebind the IPV4 address, and the station’s IPV4 is reset to 0.
- The DHCP client rebinds to a different address.
- The static-configured IPV4 address is changed.

Whether the IPV4 address is changed or NOT is indicated by field ip_change of ip_event_got_ip_t. The socket is based on the IPV4 address, which means that, if the IPV4 changes, all sockets relating to this IPV4 will become abnormal. Upon receiving this event, the application needs to close all sockets and recreate the application when the IPV4 changes to a valid one.

**IP_EVENT_GOT_IP6**

This event arises when the IPV6 SLAAC support auto-configures an address for the ESP32, or when this address changes. The event means that everything is ready and the application can begin its tasks (e.g., creating sockets).

**IP_STA_LOST_IP**

This event arises when the IPV4 address become invalid. IP_STA_LOST_IP doesn’t arise immediately after the WiFi disconnects, instead it starts an IPV4 address lost timer, if the IPV4 address is got before ip lost timer expires, IP_EVENT_STA_LOST_IP doesn’t happen. Otherwise, the event arises when IPV4 address lost timer expires.

Generally the application don’t need to care about this event, it is just a debug event to let the application know that the IPV4 address is lost.

**WIFI_EVENT_AP_START**

Similar to <WIFI_EVENT_STA_START>.

**WIFI_EVENT_AP_STOP**

Similar to <WIFI_EVENT_STA_STOP>.
WIFI_EVENT_AP_STACONNECTED

Every time a station is connected to ESP32 AP, the `<WIFI_EVENT_AP_STACONNECTED>` will arise. Upon receiving this event, the event task will do nothing, and the application callback can also ignore it. However, you may want to do something, for example, to get the info of the connected STA, etc.

WIFI_EVENT_AP_STADISCONNECTED

This event can happen in the following scenarios:

- The application calls `esp_wifi_disconnect()`, or `esp_wifi_deauth_sta()`, to manually disconnect the station.
- The Wi-Fi driver kicks off the station, e.g. because the AP has not received any packets in the past five minutes, etc. The time can be modified by `esp_wifi_set_inactive_time()`.
- The station kicks off the AP.

When this event happens, the event task will do nothing, but the application event callback needs to do something, e.g., close the socket which is related to this station, etc.

WIFI_EVENT_AP_PROBEREQRECVED

This event is disabled by default. The application can enable it via API `esp_wifi_set_event_mask()`. When this event is enabled, it will be raised each time the AP receives a probe request.

4.25.7 ESP32 Wi-Fi Station General Scenario

Below is a “big scenario” which describes some small scenarios in Station mode:

1. Wi-Fi/LwIP Init Phase

   • s1.1: The main task calls `tcpip_adapter_init()` to create an LwIP core task and initialize LwIP-related work.
   • s1.2: The main task calls `esp_event_loop_init()` to create a system Event task and initialize an application event’s callback function. In the scenario above, the application event’s callback function does nothing but relaying the event to the application task.
   • s1.3: The main task calls `esp_wifi_init()` to create the Wi-Fi driver task and initialize the Wi-Fi driver.
   • s1.4: The main task calls OS API to create the application task.

Step 1.1–1.4 is a recommended sequence that initializes a Wi-Fi-/LwIP-based application. However, it is NOT a must-follow sequence, which means that you can create the application task in step 1.1 and put all other initializations in the application task. Moreover, you may not want to create the application task in the initialization phase if the application task depends on the sockets. Rather, you can defer the task creation until the IP is obtained.

2. Wi-Fi Configuration Phase

Once the Wi-Fi driver is initialized, you can start configuring the Wi-Fi driver. In this scenario, the mode is Station, so you may need to call `esp_wifi_set_mode(WIFI_MODE_STA)` to configure the Wi-Fi mode as Station. You can call other `esp_wifi_set_xxx` APIs to configure more settings, such as the protocol mode, country code, bandwidth, etc. Refer to `<ESP32 Wi-Fi Configuration>`.

Generally, we configure the Wi-Fi driver before setting up the Wi-Fi connection, but this is NOT mandatory, which means that you can configure the Wi-Fi connection anytime, provided that the Wi-Fi driver is initialized successfully. However, if the configuration does not need to change after the Wi-Fi connection is set up, you should configure the Wi-Fi driver at this stage, because the configuration APIs (such as `esp_wifi_set_protocol`) will cause the Wi-Fi to reconnect, which may not be desirable.

If the Wi-Fi NVS flash is enabled by menuconfig, all Wi-Fi configuration in this phase, or later phases, will be stored into flash. When the board powers on/reboots, you do not need to configure the Wi-Fi driver from scratch. You only
Chapter 4. API Guides

Fig. 37: Sample Wi-Fi Event Scenarios in Station Mode
need to call esp_wifi_get_xxx APIs to fetch the configuration stored in flash previously. You can also configure the Wi-Fi driver if the previous configuration is not what you want.

3. Wi-Fi Start Phase

- s3.1: Call esp_wifi_start to start the Wi-Fi driver.
- s3.2: The Wi-Fi driver posts <WIFI_EVENT_STA_START> to the event task; then, the event task will do some common things and will call the application event callback function.
- s3.3: The application event callback function relays the <WIFI_EVENT_STA_START> to the application task. We recommend that you call esp_wifi_connect(). However, you can also call esp_wifi_connect() in other phrases after the <WIFI_EVENT_STA_START> arises.

4. Wi-Fi Connect Phase

- s4.1: Once esp_wifi_connect() is called, the Wi-Fi driver will start the internal scan/connection process.
- s4.2: If the internal scan/connection process is successful, the <WIFI_EVENT_STA_CONNECTED> will be generated. In the event task, it starts the DHCP client, which will finally trigger the DHCP process.
- s4.3: In the above-mentioned scenario, the application event callback will relay the event to the application task. Generally, the application needs to do nothing, and you can do whatever you want, e.g., print a log, etc.

In step 4.2, the Wi-Fi connection may fail because, for example, the password is wrong, the AP is not found, etc. In a case like this, <WIFI_EVENT_STA_DISCONNECTED> will arise and the reason for such a failure will be provided. For handling events that disrupt Wi-Fi connection, please refer to phase 6.

5. Wi-Fi ‘Got IP’ Phase

- s5.1: Once the DHCP client is initialized in step 4.2, the got IP phase will begin.
- s5.2: If the IP address is successfully received from the DHCP server, then <IP_EVENT_STA_GOT_IP> will arise and the event task will perform common handling.
- s5.3: In the application event callback, <IP_EVENT_STA_GOT_IP> is relayed to the application task. For LwIP-based applications, this event is very special and means that everything is ready for the application to begin its tasks, e.g. creating the TCP/UDP socket, etc. A very common mistake is to initialize the socket before <IP_EVENT_STA_GOT_IP> is received. DO NOT start the socket-related work before the IP is received.

6. Wi-Fi Disconnect Phase

- s6.1: When the Wi-Fi connection is disrupted, e.g. because the AP is powered off, the RSSI is poor, etc., <WIFI_EVENT_STA_DISCONNECTED> will arise. This event may also arise in phase 3. Here, the event task will notify the LwIP task to clear/remove all UDP/TCP connections. Then, all application sockets will be in a wrong status. In other words, no socket can work properly when this event happens.
- s6.2: In the scenario described above, the application event callback function relays <WIFI_EVENT_STA_DISCONNECTED> to the application task. We recommend that esp_wifi_connect() be called to reconnect the Wi-Fi, close all sockets and re-create them if necessary. Refer to <WIFI_EVENT_STA_DISCONNECTED>.

7. Wi-Fi IP Change Phase

- s7.1: If the IP address is changed, the <IP_EVENT_STA_GOT_IP> will arise with “ip_change” set to true.
- s7.2: This event is important to the application. When it occurs, the timing is good for closing all created sockets and recreating them.
Chapter 4. API Guides

8. Wi-Fi Deinit Phase

- s8.1: Call esp_wifi_disconnect() to disconnect the Wi-Fi connectivity.
- s8.2: Call esp_wifi_stop() to stop the Wi-Fi driver.
- s8.3: Call esp_wifi_deinit() to unload the Wi-Fi driver.

4.25.8 ESP32 Wi-Fi AP General Scenario

Below is a “big scenario” which describes some small scenarios in AP mode:

4.25.9 ESP32 Wi-Fi Scan

Currently, the esp_wifi_scan_start() API is supported only in Station or Station+AP mode.

Scan Type

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Scan</td>
<td>Scan by sending a probe request. The default scan is an active scan.</td>
</tr>
<tr>
<td>Passive Scan</td>
<td>No probe request is sent out. Just switch to the specific channel and wait for a beacon. Application can enable it via the scan_type field of wifi_scan_config_t.</td>
</tr>
<tr>
<td>Foreground Scan</td>
<td>This scan is applicable when there is no Wi-Fi connection in Station mode. Foreground or background scanning is controlled by the Wi-Fi driver and cannot be configured by the application.</td>
</tr>
<tr>
<td>Background Scan</td>
<td>This scan is applicable when there is a Wi-Fi connection in Station mode or in Station+AP mode. Whether it is a foreground scan or background scan depends on the Wi-Fi driver and cannot be configured by the application.</td>
</tr>
<tr>
<td>All-Channel Scan</td>
<td>It scans all of the channels. If the channel field of wifi_scan_config_t is set to 0, it is an all-channel scan.</td>
</tr>
<tr>
<td>Specific Channel Scan</td>
<td>It scans specific channels only. If the channel field of wifi_scan_config_t set to 1, it is a specific-channel scan.</td>
</tr>
</tbody>
</table>

The scan modes in above table can be combined arbitrarily, so we totally have 8 different scans:

- All-Channel Background Active Scan
- All-Channel Background Passive Scan
- All-Channel Foreground Active Scan
- All-Channel Foreground Passive Scan
- Specific-Channel Background Active Scan
- Specific-Channel Background Passive Scan
- Specific-Channel Foreground Active Scan
- Specific-Channel Foreground Passive Scan

Scan Configuration

The scan type and other per-scan attributes are configured by esp_wifi_scan_start. The table below provides a detailed description of wifi_scan_config_t.
Fig. 38: Sample Wi-Fi Event Scenarios in AP Mode
### Field | Description
--- | ---
| **ssid** | If the SSID is not NULL, it is only the AP with the same SSID that can be scanned. |
| **bssid** | If the BSSID is not NULL, it is only the AP with the same BSSID that can be scanned. |
| **channel** | If “channel” is 0, there will be an all-channel scan; otherwise, there will be a specific-channel scan. |
| **show_hidden** | If “show_hidden” is 0, the scan ignores the AP with a hidden SSID; otherwise, the scan considers the hidden AP a normal one. |
| **scan_type** | If “scan_type” is WIFI_SCAN_TYPE_ACTIVE, the scan is “active”; otherwise, it is a “passive” one. |
| **scan_time** | This field is used to control how long the scan dwells on each channel. For passive scans, scan_time.passive designates the dwell time for each channel. For active scans, dwell times for each channel are listed in the table below. Here, min is short for scan_time.active.min and max is short for scan_time.active.max.  
- **min=0, max=0**: scan dwells on each channel for 120 ms.  
- **min>0, max=0**: scan dwells on each channel for 120 ms.  
- **min=0, max>0**: scan dwells on each channel for max ms.  
- **min>0, max>0**: the minimum time the scan dwells on each channel is min ms. If no AP is found during this time frame, the scan switches to the next channel. Otherwise, the scan dwells on the channel for max ms.  
If you want to improve the performance of the the scan, you can try to modify these two parameters. |

There also some global scan attributes which is configured by API esp_wifi_set_config, refer to [Station Basic Configuration](#).

### Scan All APs In All Channels(foreground)

**Scenario:**
The scenario above describes an all-channel, foreground scan. The foreground scan can only occur in Station mode where the station does not connect to any AP. Whether it is a foreground or background scan is totally determined by the Wi-Fi driver, and cannot be configured by the application.

**Detailed scenario description:**

**Scan Configuration Phase**

- **s1.1**: Call esp_wifi_set_country() to set the country info if the default country info is not what you want, refer to <[Wi-Fi Country Code](#)>.
- **s1.2**: Call esp_wifi_scan_start() to configure the scan. To do so, you can refer to <[Scan Configuration](#)>.

**Wi-Fi Driver’s Internal Scan Phase**
Fig. 39: Foreground Scan of all Wi-Fi Channels
Chapter 4. API Guides

• s2.1: The Wi-Fi driver switches to channel 1, in case the scan type is WIFI_SCAN_TYPE_ACTIVE, and broadcasts a probe request. Otherwise, the Wi-Fi will wait for a beacon from the APs. The Wi-Fi driver will stay in channel 1 for some time. The dwell time is configured in min/max time, with default value being 120 ms.
• s2.2: The Wi-Fi driver switches to channel 2 and performs the same operation as in step 2.1.
• s2.3: The Wi-Fi driver scans the last channel N, where N is determined by the country code which is configured in step 1.1.

Scan-Done Event Handling Phase

• s3.1: When all channels are scanned, <WIFI_EVENT_SCAN_DONE> will arise.
• s3.2: The application’s event callback function notifies the application task that <WIFI_EVENT_SCAN_DONE> is received. esp_wifi_scan_get_ap_num() is called to get the number of APs that have been found in this scan. Then, it allocates enough entries and calls esp_wifi_scan_get_ap_records() to get the AP records. Please note that the AP records in the Wi-Fi driver will be freed, once esp_wifi_scan_get_ap_records() is called. Do not call esp_wifi_scan_get_ap_records() twice for a single scan-done event. If esp_wifi_scan_get_ap_records() is not called when the scan-done event occurs, the AP records allocated by the Wi-Fi driver will not be freed. So, make sure you call esp_wifi_scan_get_ap_records(), yet only once.

Scan All APs on All Channels(background)

Scenario:
The scenario above is an all-channel background scan. Compared to Scan All APs In All Channels(foreground), the difference in the all-channel background scan is that the Wi-Fi driver will scan the back-to-home channel for 30 ms before it switches to the next channel to give the Wi-Fi connection a chance to transmit/receive data.

Scan for a Specific AP in All Channels

Scenario:
This scan is similar to Scan All APs In All Channels(foreground). The differences are:

• s1.1: In step 1.2, the target AP will be configured to SSID/BSSID.
• s2.1~s2.N: Each time the Wi-Fi driver scans an AP, it will check whether it is a target AP or not. If the scan is WIFI_FAST_SCAN scan and the target AP is found, then the scan-done event will arise and scanning will end; otherwise, the scan will continue. Please note that the first scanned channel may not be channel 1, because the Wi-Fi driver optimizes the scanning sequence.

If there are multiple APs which match the target AP info, for example, if we happen to scan two APs whose SSID is “ap”. If the scan is WIFI_FAST_SCAN, then only the first scanned “ap” will be found, if the scan is WIFI_ALL_CHANNEL_SCAN, both “ap” will be found and the station will connect the “ap” according to the configured strategy, refer to Station Basic Configuration.

You can scan a specific AP, or all of them, in any given channel. These two scenarios are very similar.

Scan in Wi-Fi Connect

When esp_wifi_connect() is called, then the Wi-Fi driver will try to scan the configured AP first. The scan in “Wi-Fi Connect” is the same as Scan for a Specific AP In All Channels, except that no scan-done event will be generated when the scan is completed. If the target AP is found, then the Wi-Fi driver will start the Wi-Fi connection; otherwise, <WIFI_EVENT_STA_DISCONNECTED> will be generated. Refer to Scan for a Specific AP in All Channels.
Fig. 40: Background Scan of all Wi-Fi Channels

1.1 > Configure country code
1.2 > Scan configuration

2.1 > Scan channel 1
2.2 > Back to home channel H
2.3 > Scan channel 2

2.x > Back to home channel H

3.1 > WIFI_EVENT_SCAN_N_DONE
3.2 > WIFI_EVENT_SCAN_N_DONE
Fig. 41: Scan of specific Wi-Fi Channels
Chapter 4. API Guides

Scan In Blocked Mode

If the block parameter of esp_wifi_scan_start() is true, then the scan is a blocked one, and the application task will be blocked until the scan is done. The blocked scan is similar to an unblocked one, except that no scan-done event will arise when the blocked scan is completed.

Parallel Scan

Two application tasks may call esp_wifi_scan_start() at the same time, or the same application task calls esp_wifi_scan_start() before it gets a scan-done event. Both scenarios can happen. However, the Wi-Fi driver does not support multiple concurrent scans adequately. As a result, concurrent scans should be avoided. Support for concurrent scan will be enhanced in future releases, as the ESP32’s Wi-Fi functionality improves continuously.

Scan When Wi-Fi Is Connecting

The esp_wifi_scan_start() fails immediately if the Wi-Fi is in connecting process because the connecting has higher priority than the scan. If scan fails because of connecting, the recommended strategy is to delay sometime and retry scan again, the scan will succeed once the connecting is completed.

However, the retry/delay strategy may not work all the time. Considering following scenario: - The station is connecting a non-existed AP or if the station connects the existed AP with a wrong password, it always raises the event <WIFI_EVENT_STA_DISCONNECTED>. - The application call esp_wifi_connect() to do reconnection on receiving the disconnect event. - Another application task, e.g. the console task, call esp_wifi_scan_start() to do scan, the scan always fails immediately because the station is keeping connecting. - When scan fails, the application simply delay sometime and retry the scan.

In above scenario the scan will never succeed because the connecting is in process. So if the application supports similar scenario, it needs to implement a better reconnect strategy. E.g. - The application can choose to define a maximum continuous reconnect counter, stop reconnect once the reconnect reaches the max counter. - The application can choose to do reconnect immediately in the first N continous reconnect, then give a delay sometime and reconnect again.

The application can define its own reconnect strategy to avoid the scan starve to death. Refer to <Wi-Fi Reconnect>.

4.25.10 ESP32 Wi-Fi Station Connecting Scenario

This scenario only depicts the case when there is only one target AP are found in scan phase, for the scenario that more than one AP with the same SSID are found, refer to <ESP32 Wi-Fi Station Connecting When Multiple APs Are Found>.

Generally, the application does not need to care about the connecting process. Below is a brief introduction to the process for those who are really interested.

Scenario:

Scan Phase

- s1.1. The Wi-Fi driver begins scanning in “Wi-Fi Connect”. Refer to <Scan in Wi-Fi Connect> for more details.
- s1.2. If the scan fails to find the target AP, <WIFI_EVENT_STA_DISCONNECTED> will arise and the reason-code will be WIFI_REASON_NO_AP_FOUND. Refer to <Wi-Fi Reason Code>.

Auth Phase

- s2.1. The authentication request packet is sent and the auth timer is enabled.
Chapter 4. API Guides

Fig. 4.2: Wi-Fi Station Connecting Process

1. **Scan Phase**
   - Event task
   - Wi-Fi task
   - AP
   - 1.1 > Scan
   - 1.2 > WIFI_EVENT_STA_DISCONNECTED

2. **Auth Phase**
   - 2.1 > Auth request
   - 2.2 > WIFI_EVENT_STA_DISCONNECTED
   - 2.3 > Auth response
   - 2.4 > WIFI_EVENT_STA_DISCONNECTED

3. **Assoc Phase**
   - 3.1 > Assoc request
   - 3.2 > WIFI_EVENT_STA_DISCONNECTED
   - 3.3 > Assoc response
   - 3.4 > WIFI_EVENT_STA_DISCONNECTED

4. **4-way Handshake Phase**
   - 4.1 > 1/4 EAPOL
   - 4.2 > WIFI_EVENT_STA_DISCONNECTED
   - 4.3 > 2/4 EAPOL
   - 4.4 > WIFI_EVENT_STA_DISCONNECTED
   - 4.5 > 3/4 EAPOL
   - 4.6 > WIFI_EVENT_STA_DISCONNECTED
   - 4.7 > 4/4 EAPOL
   - 4.8 > WIFI_EVENT_STA_DISCONNECTED
   - 4.9 > WIFI_EVENT_STA_CONNECTED
Chapter 4. API Guides

• s2.2. If the authentication response packet is not received before the authentication timer times out, <WIFI_EVENT_STA_DISCONNECTED> will arise and the reason-code will be WIFI_REASON_AUTH_EXPIRE. Refer to <Wi-Fi Reason Code>.
• s2.3. The auth-response packet is received and the auth-timer is stopped.
• s2.4. The AP rejects authentication in the response and <WIFI_EVENT_STA_DISCONNECTED> arises, while the reason-code is WIFI_REASON_AUTH_FAIL or the reasons specified by the AP. Refer to <Wi-Fi Reason Code>.

Association Phase

• s3.1. The association request is sent and the association timer is enabled.
• s3.2. If the association response is not received before the association timer times out, <WIFI_EVENT_STA_DISCONNECTED> will arise and the reason-code will be WIFI_REASON_ASSOC_EXPIRE. Refer to <Wi-Fi Reason Code>.
• s3.3. The association response is received and the association timer is stopped.
• s3.4. The AP rejects the association in the response and <WIFI_EVENT_STA_DISCONNECTED> arises, while the reason-code is the one specified in the association response. Refer to <Wi-Fi Reason Code>.

Four-way Handshake Phase

• s4.1. The four-way handshake is sent out and the association timer is enabled.
• s4.2. If the association response is not received before the association timer times out, <WIFI_EVENT_STA_DISCONNECTED> will arise and the reason-code will be WIFI_REASON_ASSOC_EXPIRE. Refer to <Wi-Fi Reason Code>.
• s4.3. The association response is received and the association timer is stopped.
• s4.4. The AP rejects the association in the response and <WIFI_EVENT_STA_DISCONNECTED> arises and the reason-code will be the one specified in the association response. Refer to <Wi-Fi Reason Code>.

Wi-Fi Reason Code

The table below shows the reason-code defined in ESP32. The first column is the macro name defined in esp_wifi_types.h. The common prefix WIFI_REASON is removed, which means that UNSPECIFIED actually stands for WIFI_REASON_UNSPECIFIED and so on. The second column is the value of the reason. The third column is the standard value to which this reason is mapped in section 8.4.1.7 of ieee802.11-2012. (For more information, refer to the standard mentioned above.) The last column is a description of the reason.
<table>
<thead>
<tr>
<th>Reason code</th>
<th>Value</th>
<th>Mapped To</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNSPECIFIED</td>
<td>1</td>
<td>1</td>
<td>Generally, it means an internal failure, e.g., the memory runs out, the internal TX fails, or the reason is received from the remote side, etc.</td>
</tr>

<td>Disassociated, because the AP is unable to handle all currently associated STAs at the same time.</td>
</tr>
</tbody>
</table>
4.25.11 ESP32 Wi-Fi Station Connecting When Multiple APs Are Found

This scenario is similar as <ESP32 Wi-Fi Station Connecting Scenario>, the difference is the station will not raise the event <WIFI_EVENT_STA_DISCONNECTED> unless it fails to connect all of the found APs.

4.25.12 Wi-Fi Reconnect

The station may disconnect due to many reasons, e.g. the connected AP is restarted etc. It’s the application’s responsibility to do the reconnect. The recommended reconnect strategy is to call esp_wifi_connect() on receiving event <WIFI_EVENT_STA_DISCONNECTED>.

Sometimes the application needs more complex reconnect strategy: - If the disconnect event is raised because the esp_wifi_disconnect() is called, the application may not want to do reconnect. - If the esp_wifi_scan_start() may be called at anytime, a better reconnect strategy is necessary, refer to <Scan When Wi-Fi Is Connecting>.

Another thing we need to consider is the reconnect may not connect the same AP if there are more than one APs with the same SSID. The reconnect always select current best APs to connect.

4.25.13 Wi-Fi Beacon Timeout

The beacon timeout mechanism is used by ESP32 station to detect whether the AP is alive or not. If the station continuously loses 60 beacons of the connected AP, the beacon timeout happens.

After the beacon timeout happens, the station sends 5 probe requests to AP, it disconnects the AP and raises the event <WIFI_EVENT_STA_DISCONNECTED> if still no probe response or beacon is received from AP.

4.25.14 ESP32 Wi-Fi Configuration

All configurations will be stored into flash when the Wi-Fi NVS is enabled; otherwise, refer to <Wi-Fi NVS Flash>.

Wi-Fi Mode

Call esp_wifi_set_mode() to set the Wi-Fi mode.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WIFI_MODE_NULL</td>
<td>in this mode, the internal data struct is not allocated to the station and the AP, while both the station and AP interfaces are not initialized for RX/TX Wi-Fi data. Generally, this mode is used for Sniffer, or when you only want to stop both the STA and the AP without calling esp_wifi_deinit() to unload the whole Wi-Fi driver.</td>
</tr>
<tr>
<td>WIFI_MODE_STA</td>
<td>in this mode, esp_wifi_start() will init the internal station data, while the station’s interface is ready for the RX and TX Wi-Fi data. After esp_wifi_connect() is called, the STA will connect to the target AP.</td>
</tr>
<tr>
<td>WIFI_MODE_AP</td>
<td>in this mode, esp_wifi_start() will init the internal AP data, while the AP’s interface is ready for RX/TX Wi-Fi data. Then, the Wi-Fi driver starts broad-casting beacons, and the AP is ready to get connected to other stations.</td>
</tr>
<tr>
<td>WIFI_MODE_APSTA</td>
<td>in this mode, esp_wifi_start() will simultaneously init both the station and the AP. This is done in station mode and AP mode. Please note that the channel of the external AP, which the ESP32 Station is connected to, has higher priority over the ESP32 AP channel.</td>
</tr>
</tbody>
</table>

Station Basic Configuration

API esp_wifi_set_config() can be used to configure the station. The table below describes the fields in detail.
### Chapter 4. API Guides

#### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>This is the SSID of the target AP, to which the station wants to connect to.</td>
</tr>
<tr>
<td>passwd</td>
<td>Password of the target AP</td>
</tr>
<tr>
<td>scan_method</td>
<td>For WIFI_FAST_SCAN scan, the scan ends when the first matched AP is found, for WIFI_ALL_CHANNEL_SCAN, the scan finds all matched APs in all channels. The default scan is WIFI_FAST_SCAN.</td>
</tr>
<tr>
<td>bssid_set</td>
<td>If bssid_set is 0, the station connects to the AP whose SSID is the same as the field “ssid”, while the field “bssid” is ignored. In all other cases, the station connects to the AP whose SSID is the same as the “ssid” field, while its BSSID is the same the “bssid” field.</td>
</tr>
<tr>
<td>bssid</td>
<td>This is valid only when bssid_set is 1; see field “bssid_set”.</td>
</tr>
<tr>
<td>channel</td>
<td>If the channel is 0, the station scans the channel 1~N to search for the target AP; otherwise, the station starts by scanning the channel whose value is the same as that of the “channel” field, and then scans others to find the target AP. If you do not know which channel the target AP is running on, set it to 0.</td>
</tr>
<tr>
<td>sort_method</td>
<td>This field is only for WIFI_ALL_CHANNEL_SCAN. If the sort_method is WIFI_CONNECT_AP_BY_SIGNAL, all matched APs are sorted by signal, for AP with best signal will be connected firstly. E.g. if the station want to connect AP whose ssid is “apxx”, the scan finds two AP whose ssid equals to “apxx”, the first AP’s signal is -90dBm, the second AP’s signal is -30dBm, the station connects the second AP firstly, it doesn’t connect the first one unless it fails to connect the second one. If the sort_method is WIFI_CONNECT_AP_BY_SECURITY, all matched APs are sorted by security. E.g. if the station want to connect AP whose ssid is “apxx”, the scan finds two AP whose ssid is “apxx”, the security of the first found AP is open while the second one is WPA2, the stations connects to the second AP firstly, it doesn’t connect the second one unless it fails to connect the first one.</td>
</tr>
<tr>
<td>threshold</td>
<td>The threshold is used to filter the found AP, if the RSSI or security mode is less than the configured threshold, the AP will be discarded. If the RSSI set to 0, it means default threshold, the default RSSI threshold is -127dBm. If the authmode threshold is set to 0, it means default threshold, the default authmode threshold is open.</td>
</tr>
</tbody>
</table>

**Attention:** WEP/WPA security modes are deprecated in IEEE802.11-2016 specifications and are recommended not to be used. These modes can be rejected using authmode threshold by setting threshold as WPA2 by threshold.authmode as WIFI_AUTH_WPA2_PSK.

### AP Basic Configuration

API esp_wifi_set_config() can be used to configure the AP. The table below describes the fields in detail.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssid</td>
<td>SSID of AP; if the ssid[0] is 0xFF and ssid[1] is 0xFF, the AP defaults the SSID to ESP_aabbcc, where “aabbcc” is the last three bytes of the AP MAC.</td>
</tr>
<tr>
<td>passwd</td>
<td>Password of AP; if the auth mode is WIFI_AUTH_OPEN, this field will be ignored.</td>
</tr>
<tr>
<td>ssid_len</td>
<td>Length of SSID; if ssid_len is 0, check the SSID until there is a termination character. If ssid_len &gt; 32, change it to 32; otherwise, set the SSID length according to ssid_len.</td>
</tr>
<tr>
<td>channel</td>
<td>Channel of AP; if the channel is out of range, the Wi-Fi driver defaults the channel to channel 1. So, please make sure the channel is within the required range. For more details, refer to &lt;Wi-Fi Country Code&gt;.</td>
</tr>
<tr>
<td>auth_mode</td>
<td>Auth mode of ESP32 AP; currently, ESP32 Wi-Fi does not support AUTH_WEP. If the authmode is an invalid value, AP defaults the value to WIFI_AUTH_OPEN.</td>
</tr>
<tr>
<td>ssid_hidden</td>
<td>If ssid_hidden is 1, AP does not broadcast the SSID; otherwise, it does broadcast the SSID.</td>
</tr>
<tr>
<td>max_connection</td>
<td>Currently, ESP32 Wi-Fi supports up to 10 Wi-Fi connections. If max_connection &gt; 10, AP defaults the value to 10.</td>
</tr>
<tr>
<td>beacon_interval</td>
<td>Beacon interval; the value is 100 ~ 60000 ms, with default value being 100 ms. If the value is out of range, AP defaults it to 100 ms.</td>
</tr>
</tbody>
</table>
Wi-Fi Protocol Mode

Currently, the IDF supports the following protocol modes:

<table>
<thead>
<tr>
<th>Protocol Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11 B</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B) to set the station/AP to 802.11B-only mode.</td>
</tr>
<tr>
<td>802.11 BG</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11 BGN</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11 BGNLR</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_11B</td>
</tr>
<tr>
<td>802.11 LR</td>
<td>Call esp_wifi_set_protocol(ifx, WIFI_PROTOCOL_LR) to set the station/AP to the Espressif-specific mode.</td>
</tr>
</tbody>
</table>

This mode is an Espressif-patented mode which can achieve a one-kilometer line of sight range. Please, make sure both the station and the AP are connected to an ESP32 device.

Long Range (LR)

Long Range (LR) mode is an Espressif-patented Wi-Fi mode which can achieve a one-kilometer line of sight range. It has better reception sensitivity, stronger anti-interference ability and longer transmission distance than the traditional 802.11B mode.

LR Compitability Since LR is Espressif unique Wi-Fi mode, only ESP32 devices can transmit and receive the LR data. In other words, the ESP32 device should NOT transmit the data in LR data rate if the connected device doesn’t support LR. The application can achieve this by configuring suitable Wi-Fi mode. If the negotiated mode supports LR, the ESP32 may transmit data in LR rate, otherwise, ESP32 will transmit all data in traditional Wi-Fi data rate.

Following table depicts the Wi-Fi mode negotiation:

<table>
<thead>
<tr>
<th>AP STA</th>
<th>BGN</th>
<th>BG</th>
<th>B</th>
<th>BGNLR</th>
<th>BGLR</th>
<th>BLR</th>
<th>LR</th>
</tr>
</thead>
<tbody>

<td>BLR</td>
<td>BLR</td>
<td>LR</td>
</tr>
<tr>
<td>LR</td>
<td>*</td>
<td>*</td>
<td>*</td>
<td>LR</td>
<td>LR</td>
<td>LR</td>
<td>LR</td>
</tr>
</tbody>
</table>

In above table, the row is the Wi-Fi mode of AP and the column is the Wi-Fi mode of station. The “-” indicates Wi-Fi mode of the AP and station are not compatible.

According to the table, we can conclude that:
For LR enabled in ESP32 AP, it’s incompatible with traditional 802.11 mode because the beacon is sent in LR mode.

For LR enabled in ESP32 station and the mode is NOT LR only mode, it’s compatible with traditional 802.11 mode.

If both station and AP are ESP32 devices and both of them enable LR mode, the negotiated mode supports LR.

If the negotiated Wi-Fi mode supports both traditional 802.11 mode and LR mode, it’s the WiFi driver’s responsibility to automatically select the best data rate in different Wi-Fi mode and the application don’t need to care about it.

**LR Impacts to Traditional Wi-Fi device**

The data transmission in LR rate has no impacts on the traditional Wi-Fi device because:

- The CCA and backoff process in LR mode are consistent with 802.11 specification.
- The traditional Wi-Fi device can detect the LR signal via CCA and do backoff.

In other words, the impact transmission in LR mode is similar as the impact in 802.11B mode.

**LR Transmission Distance** The reception sensitivity of LR has about 4 dB gain than the traditional 802.11 B mode, theoretically the transmission distance is about 2 to 2.5 times the distance of 11B.

**LR Throughput** The LR rate has very limited throughput because the raw PHY data rate LR is 1/2 Mbits and 1/4 Mbits.

**When to Use LR**

The general conditions for using LR are:

- Both the AP and station are ESP32 devices.
- Long distance WiFi connection and data transmission is required.
- Data throughput requirements are very small, such as remote device control, etc.

**Wi-Fi Country Code**

Call esp_wifi_set_country() to set the country info. The table below describes the fields in detail, please consult local 2.4GHz RF operating regulations before configuring these fields.
### Field Description

**cc[3]**  
Country code string, this attributes identify the country or noncountry entity in which the station/AP is operating. If it’s a country, the first two octets of this string is the two character country info as described in document ISO/IEC3166-1. The third octect is one of the following:

- an ASCII space character, if the regulations under which the station/AP is operating encompass all environments for the current frequency band in the country
- an ASCII ‘O’ character if the regulations under which the station/AP is operating are for an outdoor environment only, or
- an ASCII ‘I’ character if the regulations under which the station/AP is operating are for an indoor environment only.
- an ASCII ‘X’ character if the station/AP is operating under a noncountry entity. The first two octets of the noncountry entity is two ASCII ‘XX’ characters.
- the binary representation of the Operating Class table number currently in use. Refer 802.11-2012 Annex E.

**schan**  
Start channel, it’s the minimum channel number of the regulations under which the station/AP can operate.

**snum**  
Total channel number of the regulations, e.g. if the schan=1, nchan=13, it means the station/AP can send data from channel 1 to 13.

**policy**  
Country policy, this field control which country info will be used if the configured country info is conflict with the connected AP’s. More description about policy is provided in following section.

The default country info is {.cc="CN", .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}, if the WiFi Mode is station/AP coexist mode, they share the same configured country info. Sometimes, the country info of AP, to which the station is connected, is different from the country info of configured. For example, the configured station has country info {.cc="JP", .schan=1, .nchan=14, policy=WIFI_COUNTRY_POLICY_AUTO}, but the connected AP has country info {.cc="CN", .schan=1, .nchan=13}, then country info of connected AP’s is used. Following table depicts which country info is used in different WiFi Mode and different country policy, also describe the impact to active scan.
<table>
<thead>
<tr>
<th>WiFi Mode</th>
<th>Policy</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Station</td>
<td>WIFI_COUNTRY_POLICY_AUTO</td>
<td>If the connected AP has country IE in its beacon, the country info equals to the country info in beacon, otherwise, use default country info. For scan:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• before the station connects to the AP, scans channel “schan” to “min(11, schan+nchan-1)” with active scan and channel min(12, schan+nchan)” to 14 with passive scan. E.g. if the used country info is {.cc=&quot; CN&quot;, .schan=1, .nchan=6} then 1 to 6 is active scan and 7 to 14 is passive scan If the used country info is {.cc=&quot; CN&quot;, .schan=1, .nchan=12} then 1 to 11 is active scan and 12 to 14 is passive scan</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• after the station connects to the AP, scans channel “schan” to “schan+nchan-1” with active scan and channel “schan+nchan” to 14 with passive scan</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Always keep in mind that if if a AP with with hidden SSID is set to a passive scan channel, the passive scan will not find it. In other words, if the application hopes to find the AP with hidden SSID in every channel, the policy of country info should be configured to WIFI_COUNTRY_POLICY_MANUAL.</td>
</tr>
<tr>
<td>Station</td>
<td>WIFI_COUNTRY_POLICY_MANUAL</td>
<td>Always use the configured country info For scan, scans channel “schan” to “schan+nchan-1” with active scan</td>
</tr>
<tr>
<td>AP</td>
<td>WIFI_COUNTRY_POLICY_AUTO</td>
<td>Always use the configured country info</td>
</tr>
<tr>
<td>AP</td>
<td>WIFI_COUNTRY_POLICY_MANUAL</td>
<td>Always use the configured country info</td>
</tr>
<tr>
<td>Station/AP coexist</td>
<td>WIFI_COUNTRY_POLICY_AUTO</td>
<td>If the station doesn’ t connects to any AP, the AP use the configured country info. If the station connects to an AP, the AP has the same country info as the station. Same as station mode with policy WIFI_COUNTRY_POLICY_AUTO</td>
</tr>
</tbody>
</table>

**Home Channel** In AP mode, the home channel is defined as that of the AP channel. In Station mode, the home channel is defined as the channel of the AP to which the station is connected. In Station+AP mode, the home channel of AP and station must be the same. If the home channels of Station and AP are different, the station’s home channel is always in priority. Take the following as an example: at the beginning, the AP is on channel 6, then the
station connects to an AP whose channel is 9. Since the station’s home channel has a higher priority, the AP needs to switch its channel from 6 to 9 to make sure that both station and AP have the same home channel.

**Wi-Fi Vendor IE Configuration**

By default, all Wi-Fi management frames are processed by the Wi-Fi driver, and the application does not need to care about them. Some applications, however, may have to handle the beacon, probe request, probe response and other management frames. For example, if you insert some vendor-specific IE into the management frames, it is only the management frames which contain this vendor-specific IE that will be processed. In ESP32, esp_wifi_set_vendor_ie() and esp_wifi_set_vendor_ie_cb() are responsible for this kind of tasks.

**4.25.15 Wi-Fi Security**

In addition to traditional security methods (WEP/WPA-TKIP/WPA2-CCMP), ESP32 Wi-Fi now supports state-of-the-art security protocols, namely Protected Management Frames based on 802.11w standard and Wi-Fi Protected Access 3 (WPA3-Personal). Together, PMF and WPA3 provide better privacy and robustness against known attacks in traditional modes.

**Protected Management Frames (PMF)**

In Wi-Fi, management frames such as beacons, probes, (de)authentication, (dis)association are used by non-AP stations to scan and connect to an AP. Unlike data frames, these frames are sent unencrypted. An attacker can use eavesdropping and packet injection to send spoofed (de)authentication/(dis)association frames at the right time, leading to following attacks in case of unprotected management frame exchanges.

- DOS attack on one or all clients in the range of the attacker.
- Tearing down existing association on AP side by sending association request.
- Forcing a client to perform 4-way handshake again in case PSK is compromised in order to get PTK.
- Getting SSID of hidden network from association request.
- Launching man-in-the-middle attack by forcing clients to deauth from legitimate AP and associating to a rogue one.

PMF provides protection against these attacks by encrypting unicast management frames and providing integrity checks for broadcast management frames. These include deauthentication, disassociation and robust management frames. It also provides Secure Association (SA) teardown mechanism to prevent spoofed association/authentication frames from disconnecting already connected clients.

ESP32 supports the following three modes of operation with respect to PMF.

- **PMF not supported:** In this mode, ESP32 indicates to AP that it is not capable of supporting management protection during association. In effect, security in this mode will be equivalent to that in traditional mode.
- **PMF capable, but not required:** In this mode, ESP32 indicates to AP that it is capable of supporting PMF. The management protection will be used if AP mandates PMF or is at least capable of supporting PMF.
- **PMF capable and required:** In this mode, ESP32 will only connect to AP, if AP supports PMF. If not, ESP32 will refuse to connect to the AP.

`esp_wifi_set_config()` can be used to configure PMF mode by setting appropriate flags in `pmf_cfg` parameter. Currently, PMF is supported only in Station mode.

**WPA3-Personal**

Wi-Fi Protected Access-3 (WPA3) is a set of enhancements to Wi-Fi access security intended to replace the current WPA2 standard. In order to provide more robust authentication, WPA3 uses Simultaneous Authentication of Equals (SAE), which is password-authenticated key agreement method based on Diffie-Hellman key exchange. Unlike WPA2, the technology is resistant to offline-dictionary attack, where the attacker attempts to determine shared password based on captured 4-way handshake without any further network interaction. WPA3 also provides forward
secrecy, which means the captured data cannot be decrypted even if password is compromised after data transmission. Please refer to Security section of Wi-Fi Alliance’s official website for further details.

In order to enable WPA3-Personal. “Enable WPA3-Personal” should be selected in menuconfig. If enabled, ESP32 uses SAE for authentication if supported by the AP. Since PMF is a mandatory requirement for WPA3, PMF capability should be at least set to “PMF capable, but not required” for ESP32 to use WPA3 mode. Application developers need not worry about the underlying security mode as highest available is chosen from security standpoint. Note that Wi-Fi stack size requirement will increase approximately by 3k when WPA3 is used. Currently, WPA3 is supported only in Station mode.

4.25.16 ESP32 Wi-Fi Power-saving Mode

Station Sleep

Currently, ESP32 Wi-Fi supports the Modem-sleep mode which refers to the legacy power-saving mode in the IEEE 802.11 protocol. Modem-sleep mode works in Station-only mode and the station must connect to the AP first. If the Modem-sleep mode is enabled, station will switch between active and sleep state periodically. In sleep state, RF, PHY and BB are turned off in order to reduce power consumption. Station can keep connection with AP in modem-sleep mode.

Modem-sleep mode includes minimum and maximum power save modes. In minimum power save mode, station wakes up every DTIM to receive beacon. Broadcast data will not be lost because it is transmitted after DTIM. However, it can not save much more power if DTIM is short for DTIM is determined by AP.

In maximum power save mode, station wakes up every listen interval to receive beacon. This listen interval can be set longer than the AP DTIM period. Broadcast data may be lost because station may be in sleep state at DTIM time. If listen interval is longer, more power is saved but broadcast data is more easy to lose. Listen interval can be configured by calling API esp_wifi_set_config() before connecting to AP.

Call esp_wifi_set_ps(WIFI_PS_MIN_MODEM) to enable Modem-sleep minimum power save mode or esp_wifi_set_ps(WIFI_PS_MAX_MODEM) to enable Modem-sleep maximum power save mode after calling esp_wifi_init(). When station connects to AP, Modem-sleep will start. When station disconnects from AP, Modem-sleep will stop.

Call esp_wifi_set_ps(WIFI_PS_NONE) to disable modem sleep entirely. This has much higher power consumption, but provides minimum latency for receiving Wi-Fi data in real time. When modem sleep is enabled, received Wi-Fi data can be delayed for as long as the DTIM period (minimum power save mode) or the listen interval (maximum power save mode). Disabling modem sleep entirely is not possible for Wi-Fi and Bluetooth coexist mode.

The default Modem-sleep mode is WIFI_PS_MIN_MODEM.

AP Sleep

Currently ESP32 AP doesn’t support all of the power save feature defined in Wi-Fi specification. To be specific, the AP only caches unicast data for the stations connect to this AP, but doesn’t cache the multicast data for the stations. If stations connected to the ESP32 AP are power save enabled, they may experience multicast packet loss.

In future, all power save features will be supported on ESP32 AP.

4.25.17 ESP32 Wi-Fi Connect Crypto

Now ESP32 have two group crypto functions can be used when do wifi connect, one is the original functions, the other is optimized by ESP hardware: 1. Original functions which is the source code used in the folder components/wpa_supplicant/src/crypto function; 2. The optimized functions is in the folder components/wpa_supplicant/src/fast_crypto, these function used the hardware crypto to make it faster than origin one, the type of function’s name add fast_ to distinguish with the original one. For example, the API aes_wrap() is used to encrypt frame information when do 4 way handshake, the fast_aes_wrap() has the same result but can be faster.
Two groups of crypto function can be used when register in the wpa_crypto_funcs_t, wpa2_crypto_funcs_t and wps_crypto_funcs_t structure, also we have given the recommend functions to register in the fast_crypto_ops.c, you can register the function as the way you need, however what should make action is that the crypto_hash_xxx function and crypto_cipher_xxx function need to register with the same function to operation. For example, if you register crypto_hash_init() function to initialize the esp_crypto_hash structure, you need use the crypto_hash_update() and crypto_hash_finish() function to finish the operation, rather than fast_crypto_hash_update() or fast_crypto_hash_finish().

4.25.18 ESP32 Wi-Fi Throughput

The table below shows the best throughput results we got in Espressif’s lab and in a shield box.

<table>
<thead>
<tr>
<th>Type/Throughput</th>
<th>Air In Lab</th>
<th>Shield-box</th>
<th>Test Tool</th>
<th>IDF Version (commit ID)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Raw 802.11 Packet RX</td>
<td>N/A</td>
<td>130 MBit/sec</td>
<td>Internal tool</td>
<td>NA</td>
</tr>
<tr>
<td>Raw 802.11 Packet TX</td>
<td>N/A</td>
<td>130 MBit/sec</td>
<td>Internal tool</td>
<td>NA</td>
</tr>
<tr>
<td>UDP RX</td>
<td>30 MBit/sec</td>
<td>90 MBit/sec</td>
<td>iperf example</td>
<td>05838641</td>
</tr>
<tr>
<td>UDP TX</td>
<td>30 MBit/sec</td>
<td>60 MBit/sec</td>
<td>iperf example</td>
<td>05838641</td>
</tr>
<tr>
<td>TCP RX</td>

</tr>
</tbody>
</table>

When the throughput is tested by iperf example, the sdkconfig is examples/wifi/iperf/sdkconfig.defaults.

4.25.19 Wi-Fi 80211 Packet Send

The esp_wifi_80211_tx() API can be used to:

- Send the beacon, probe request, probe response, action frame.
- Send the non-QoS data frame.

It cannot be used for sending encrypted or QoS frames.

Preconditions of Using esp_wifi_80211_tx

- The Wi-Fi mode is Station, or AP, or Station+AP.
- Either esp_wifi_set_promiscuous(true), or esp_wifi_start(), or both of these APIs return ESP_OK. This is because we need to make sure that Wi-Fi hardware is initialized before esp_wifi_80211_tx() is called. In ESP32, both esp_wifi_set_promiscuous(true) and esp_wifi_start() can trigger the initialization of Wi-Fi hardware.
- The parameters of esp_wifi_80211_tx are hereby correctly provided.

Data rate

- If there is no WiFi connection, the data rate is 1Mbps.
- If there is WiFi connection and the packet is from station to AP or from AP to station, the data rate is same as the WiFi connection. Otherwise the data rate is 1Mbps.

Side-Effects to Avoid in Different Scenarios

Theoretically, if we do not consider the side-effects the API imposes on the Wi-Fi driver or other stations/APs, we can send a raw 802.11 packet over the air, with any destination MAC, any source MAC, any BSSID, or any other type of packet. However, robust/useful applications should avoid such side-effects. The table below provides some tips/recommendations on how to avoid the side-effects of esp_wifi_80211_tx in different scenarios.
<table>
<thead>
<tr>
<th>Scenario</th>
<th>Description</th>
</tr>
</thead>
</table>
| No WiFi connection | In this scenario, no Wi-Fi connection is set up, so there are no side-effects on the Wi-Fi driver. If `en_sys_seq==true`, the Wi-Fi driver is responsible for the sequence control. If `en_sys_seq==false`, the application needs to ensure that the buffer has the correct sequence. Theoretically, the MAC address can be any address. However, this may impact other stations/APs with the same MAC/BSSID. Side-effect example#1 The application calls `esp_wifi_80211_tx` to send a beacon with BSSID == `mac_x` in AP mode, but the `mac_x` is not the MAC of the AP interface. Moreover, there is another AP, say “other-AP”, whose bssid is `mac_x`. If this happens, an “unexpected behavior” may occur, because the stations which connect to the “other-AP” cannot figure out whether the beacon is from the “other-AP” or the `esp_wifi_80211_tx`. To avoid the above-mentioned side-effects, we recommend that:  
  • If `esp_wifi_80211_tx` is called in Station mode, the first MAC should be a multicast MAC or the exact target-device’s MAC, while the second MAC should be that of the station interface.  
  • If `esp_wifi_80211_tx` is called in AP mode, the first MAC should be a multicast MAC or the exact target-device’s MAC, while the second MAC should be that of the AP interface. The recommendations above are only for avoiding side-effects and can be ignored when there are good reasons for doing this. |
| Have WiFi connection | When the Wi-Fi connection is already set up, and the sequence is controlled by the application, the latter may impact the sequence control of the Wi-Fi connection, as a whole. So, the `en_sys_seq` need to be true, otherwise `ESP_ERR_WIFI_ARG` is returned. The MAC-address recommendations in the “No WiFi connection” scenario also apply to this scenario. If the WiFi mode is station mode and the MAC address1 is the MAC of AP to which the station is connected, the MAC address2 is the MAC of station interface, we say the packets is from the station to AP. On the other hand, if the WiFi mode is AP mode and the MAC address1 is the MAC of the station who connects to this AP, the MAC address2 is the MAC of AP interface, we say the packet is from the AP to station. To avoid conflicting with WiFi connections, the following checks are applied:  
  • If the packet type is data and is from the station to AP, the ToDS bit in ieee80211 frame control should be 1, the FromDS bit should be 0, otherwise the packet will be discarded by WiFi driver.  
  • If the packet type is data and is from the AP to station, the ToDS bit in ieee80211 frame control should be 0, the FromDS bit should be 1, otherwise the packet will be discarded by WiFi driver.  
  • If the packet is from station to AP or from AP to station, the Power Management, More Data, Re-Transmission bit should be 0, otherwise the packet will be discarded by WiFi driver. `ESP_ERR_WIFI_ARG` is returned if any check fails. |
4.25.20 Wi-Fi Sniffer Mode

The Wi-Fi sniffer mode can be enabled by esp_wifi_set_promiscuous(). If the sniffer mode is enabled, the following packets can be dumped to the application:

- 802.11 Management frame
- 802.11 Data frame, including MPDU, AMPDU, MSDU, etc.
- 802.11 MIMO frame, for MIMO frame, the sniffer only dumps the length of the frame.
- 802.11 Control frame

The following packets will NOT be dumped to the application:

- 802.11 error frame, such as the frame with a CRC error, etc.

For frames that the sniffer can dump, the application can additionally decide which specific type of packets can be filtered to the application by using esp_wifi_set_promiscuous_filter() and esp_wifi_set_promiscuous_ctrl_filter(). By default, it will filter all 802.11 data and management frames to the application.

The Wi-Fi sniffer mode can be enabled in the Wi-Fi mode of WIFI_MODE_NULL, or WIFI_MODE_STA, or WIFI_MODE_AP, or WIFI_MODE_APSTA. In other words, the sniffer mode is active when the station is connected to the AP, or when the AP has a Wi-Fi connection. Please note that the sniffer has a great impact on the throughput of the station or AP Wi-Fi connection. Generally, we should NOT enable the sniffer, when the station/AP Wi-Fi connection experiences heavy traffic unless we have special reasons.

Another noteworthy issue about the sniffer is the callback wifi_promiscuous_cb_t. The callback will be called directly in the Wi-Fi driver task, so if the application has a lot of work to do for each filtered packet, the recommendation is to post an event to the application task in the callback and defer the real work to the application task.

4.25.21 Wi-Fi Multiple Antennas

The Wi-Fi multiple antennas selecting can be depicted as following picture:

```
| Enabled | | Antenna 0 |
|---------|-----------------------------|
| ~--------| \                     |
| ~ | --- antenna 0 | \ \ \ \ GPIO[0] <----> antenna_select[0] ---| ~

RX/TX __ Antenna | --- antenna 1 \ \ \ \ \ | GPIO[1] <----> antenna_select[1] ---| ~
| ~ | ... ... | \ \ \ \ \ | / | GPIO[2] <----> antenna_select[2] ---| Switch...
| ~ | --- antenna 15 \ \ \ \ \ | // | GPIO[3] <----> antenna_select[3] ---| ________
| ~ | | Antenna 1 | // |
```

ESP32 supports up to sixteen antennas through external antenna switch. The antenna switch can be controlled by up to four address pins - antenna_select[0:3]. Different input value of antenna_select[0:3] means selecting different antenna. E.g. the value ‘0b1011’ means the antenna 11 is selected. The default value of antenna_select[3:0] is ‘0b0000’, it means the antenna 0 is selected by default.

Up to four GPIOs are connected to the four active high antenna_select pins. ESP32 can select the antenna by control the GPIO[0:3]. The API esp_wifi_set_ant_gpio() is used to configure which GPIOs are connected to antenna_selects. If GPIO[x] is connected to antenna_select[x], then gpio_config->gpio_cfg[x].gpio_num should be provided.

Although up to sixteen antennas are supported, only one or two antennas can be simultaneously enabled for RX/TX. The API esp_wifi_set_ant() is used to configure which antennas are enabled.

The enabled antennas selecting algorithm is also configured by esp_wifi_set_ant(). The RX/TX antenna mode can be WIFI_ANT_MODE_ANT0, WIFI_ANT_MODE_ANT1 or WIFI_ANT_MODE_AUTO. If the antenna mode is WIFI_ANT_MODE_AUTO, the enabled antenna 0 is selected for RX/TX data. If the antenna mode
is WIFI_ANT_MODE_ANT1, the enabled antenna 1 is selected for RX/TX data. Otherwise, WiFi automatically selects the antenna that has better signal from the enabled antennas.

If the RX antenna mode is WIFI_ANT_MODE_AUTO, the default antenna mode also needs to be set. Because the RX antenna switching only happens when some conditions are met, e.g. the RX antenna starts to switch if the RSSI is lower than -65dBm and if another antenna has better signal etc. RX uses the default antenna if the conditions are not met. If the default antenna mode is WIFI_ANT_MODE_ANT1, the enabled antenna 1 is used as the default RX antenna, otherwise the enabled antenna 0 is used as the default RX antenna.

Some limitations need to be considered:
- The TX antenna can be set to WIFI_ANT_MODE_AUTO only if the RX antenna mode is WIFI_ANT_MODE_AUTO because TX antenna selecting algorithm is based on RX antenna in WIFI_ANT_MODE_AUTO type.
- Currently BT doesn’t support the multiple antennas feature, please don’t use multiple antennas related APIs.

Following is the recommended scenarios to use the multiple antennas:
- In Wi-Fi mode WIFI_MODE_STA, both RX/TX antenna modes are configured to WIFI_ANT_MODE_AUTO. The WiFi driver selects the better RX/TX antenna automatically.
- The RX antenna mode is configured to WIFI_ANT_MODE_AUTO. The TX antenna mode is configured to WIFI_ANT_MODE_ANT0 or WIFI_ANT_MODE_ANT1. The applications can choose to always select a specified antenna for TX, or implement their own TX antenna selecting algorithm, e.g. selecting the TX antenna mode based on the channel switch information etc.
- Both RX/TX antenna modes are configured to WIFI_ANT_MODE_ANT0 or WIFI_ANT_MODE_ANT1.

Wi-Fi Multiple Antennas Configuration

Generally, following steps can be taken to configure the multiple antennas:
- Configure which GPIOs are connected to the antenna_selects, for example, if four antennas are supported and GPIO20/GPIO21 are connected to antenna_select[0]/antenna_select[1], the configurations look like:

```c
wifi_ant_gpio_config_t config = {
    { .gpio_select = 1, .gpio_num = 20 },
    { .gpio_select = 1, .gpio_num = 21 }
};
```

- Configure which antennas are enabled and how RX/TX use the enabled antennas, for example, if antenna1 and antenna3 are enabled, the RX needs to select the better antenna automatically and uses antenna1 as its default antenna, the TX always selects the antenna3. The configuration looks like:

```c
wifi_ant_config_t config = {
    .rx_ant_mode = WIFI_ANT_MODE_AUTO,
    .rx_ant_default = WIFI_ANT_ANT0,
    .tx_ant_mode = WIFI_ANT_MODE_ANT1,
    .enabled_ant0 = 1,
    .enabled_ant1 = 3
};
```

### 4.25.22 Wi-Fi Channel State Information

Channel state information (CSI) refers to the channel information of a Wi-Fi connection. In ESP32, this information consists of channel frequency responses of sub-carriers and is estimated when packets are received from the transmitter. Each channel frequency response of sub-carrier is recorded by two bytes of signed characters. The first one is imaginary part and the second one is real part. There are up to three fields of channel frequency responses according to the type of received packet. They are legacy long training field (LLTF), high throughput LTF (HT-LTF) and space time block code HT-LTF (STBC-HT-LTF). For different types of packets which are received on channels with different state, the sub-carrier index and total bytes of signed characters of CSI is shown in the following table.
channel | secondary channel | none | below | above
--- | --- | --- | --- | ---
channel | none | HT | non | HT
bandwidth | 20MHz | 40MHz | 20MHz | 40MHz
STBC | non | non | STBC | non | STBC | non | STBC | non | STBC | non | STBC
sub-carrier index | LLTF | 0~31, 32~1 | 0~31, 32~1 | 0~63 | 0~63 | 0~63 | 0~63 | -64~1 | -64~1 | -64~1 | -64~1 | -64~1 | -64~1
| HT-LTF | 0~31, 32~1 | 0~31, 32~1 | 0~63 | 0~63 | 0~63 | 0~63 | -64~1 | -64~1 | -64~1 | -64~1 | -64~1 | 0~60, 60~1
| STBC-HT-LTF | * | * | 0~31, 32~1 | * | * | 0~62 | * | * | -62~1 | * | 0~60, 60~1 | 0~60, 60~1

Total bytes | 128 | 256 | 384 | 128 | 256 | 384 | 384 | 612 | 128 | 256 | 376 | 384 | 612

All of the information in the table can be found in the structure wifi_csi_info_t.

- Secondary channel refers to secondary_channel field of rx_ctrl field.
- Signal mode of packet refers to sig_mode field of rx_ctrl field.
- Channel bandwidth refers to cwb field of rx_ctrl field.
- STBC refers to stbc field of rx_ctrl field.
- Total bytes refers to len field.
- The CSI data corresponding to each Long Training Field (LTF) type is stored in a buffer starting from the buf field. Each item is stored as two bytes: imaginary part followed by real part. The order of each item is the same as the sub-carrier in the table. The order of LTF is: LLTF, HT-LTF, STBC-HT-LTF. However all 3 LTFs may not be present, depending on the channel and packet information (see above).
- If first_word_invalid field of wifi_csi_info_t is true, it means that the first four bytes of CSI data is invalid due to a hardware limitation in ESP32.
- More information like RSSI, noise floor of RF, receiving time and antenna is in the rx_ctrl field.

**Note:**

- For STBC packet, CSI is provided for every space-time stream without CSD (cyclic shift delay). As each cyclic shift on the additional chains shall be -200ns, only the CSD angle of first space-time stream is recorded in sub-carrier 0 of HT-LTF and STBC-HT-LTF for there is no channel frequency response in sub-carrier 0. CSD[10:0] is 11 bits, ranging from -pi to pi.
- If LLTF, HT-LTF or STBC-HT-LTF is not enabled by calling API `esp_wifi_set_csi_config()`, the total bytes of CSI data will be fewer than that in the table. For example, if LLTF and HT-LTF is not enabled and STBC-HT-LTF is enabled, when a packet is received with the condition above/HT/40MHz/STBC, the total bytes of CSI data is 244 ((61 + 60) * 2 + 2 = 244, the result is aligned to four bytes and the last two bytes is invalid).

### 4.25.23 Wi-Fi Channel State Information Configure

To use Wi-Fi CSI, the following steps need to be done.

- Select Wi-Fi CSI in menuconfig. It is “Menuconfig -> Components config -> Wi-Fi -> WiFi CSI(Channel State Information)”.
- Set CSI receiving callback function by calling API `esp_wifi_set_csi_rx_cb()`.
Chapter 4. API Guides

- Configure CSI by calling API `esp_wifi_set_csi_config()`.
- Enable CSI by calling API `esp_wifi_set_csi()`.

The CSI receiving callback function runs from Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post necessary data to a queue and handle it from a lower priority task. Because station does not receive any packet when it is disconnected and only receives packets from AP when it is connected, it is suggested to enable sniffer mode to receive more CSI data by calling `esp_wifi_set_promiscuous()`.

### 4.25.24 Wi-Fi HT20/40

ESP32 supports Wi-Fi bandwidth HT20 or HT40, it doesn’t support HT20/40 coexist. `esp_wifi_set_bandwidth` can be used to change the default bandwidth of station or AP. The default bandwidth for ESP32 station and AP is HT40.

In station mode, the actual bandwidth is firstly negotiated during the Wi-Fi connection. It is HT40 only if both the station and the connected AP support HT40, otherwise it’s HT20. If the bandwidth of connected AP is changes, the actual bandwidth is negotiated again without Wi-Fi disconnecting.

Similarly, in AP mode, the actual bandwidth is negotiated between AP and the stations that connect to the AP. It’s HT40 if the AP and one of the stations support HT40, otherwise it’s HT20.

In station/AP coexist mode, the station/AP can configure HT20/40 seperately. If both station and AP are negotiated to HT40, the HT40 channel should be the channel of station because the station always has higher priority than AP in ESP32. E.g. the configured bandwidth of AP is HT40, the configured primary channel is 6 and the configured secondary channel is 10. The station is connected to an router whose primary channel is 6 and secondary channel is 2, then the actual channel of AP is changed to primary 6 and secondary 2 automatically.

Theoretically the HT40 can gain better throughput because the maximum raw physicial (PHY) data rate for HT40 is 150Mbps while it’s 72Mbps for HT20. However, if the device is used in some special environment, e.g. there are too many other Wi-Fi devices around the ESP32 device, the performance of HT40 may be degraded. So if the applications need to support same or similar scenarios, it’s recommended that the bandwidth is always configured to HT20.

### 4.25.25 Wi-Fi QoS

ESP32 supports all the mandatory features required in WFA Wi-Fi QoS Certification.

Four ACs (Access Category) are defined in Wi-Fi specification, each AC has a its own priority to access the Wi-Fi channel. Moreover a map rule is defined to map the QoS priority of other protocol, such as 802.11D or TCP/IP precedence to Wi-Fi AC.

Below is a table describes how the IP Precedences are mapped to Wi-Fi ACs in ESP32, it also indicates whether the AMPDU is supported for this AC. The table is sorted with priority descending order, namely, the AC_VO has highest priority.

<table>
<thead>
<tr>
<th>IP Precedence</th>
<th>Wi-Fi AC</th>
<th>Support AMPDU?</th>
</tr>
</thead>
<tbody>
<tr>
<td>6, 7</td>
<td>AC_VO (Voice)</td>
<td>No</td>
</tr>
<tr>
<td>4, 5</td>
<td>AC_VI (Video)</td>
<td>Yes</td>
</tr>
<tr>
<td>3, 0</td>
<td>AC_BE (Best Effort)</td>
<td>Yes</td>
</tr>
<tr>
<td>1, 2</td>
<td>AC_BK (Background)</td>
<td>Yes</td>
</tr>
</tbody>
</table>

The application can make use of the QoS feature by configuring the IP precedence via socket option IP_TOS. Here is an example to make the socket to use VI queue:

```c
const int ip_precedence_vi = 4;
const int ip_precedence_offset = 5;
int priority = (ip_precedence_vi << ip_precedence_offset);
setsockopt(socket_id, IPPROTO_IP, IP_TOS, &priority, sizeof(priority));
```

Theoretically the higher priority AC has better performance than the low priority AC, however, it’s not always be true, here...
• For some really important application traffic, can put it into AC_VO queue. Avoid sending big traffic via AC_VO queue. On one hand, the AC_VO queue doesn’t support AMPDU and it can’t get better performance than other queue if the traffic is big, on the other hand, it may impact the the management frames that also use AC_VO queue.
• Avoid using more than two different AMPDU supported precedences, e.g. socket A uses precedence 0, socket B uses precedence 1, socket C uses precedence 2, this is a bad design because it may need much more memory. To be detailed, the Wi-Fi driver may generate a Block Ack session for each precedence and it needs more memory if the Block Ack session is setup.

**4.25.26 Wi-Fi AMSDU**

ESP32 supports receiving AMSDU but doesn’t support transmitting AMSDU. The transmitting AMSDU is not necessary since ESP32 has transmitting AMPDU.

**4.25.27 Wi-Fi Fragment**

ESP32 supports Wi-Fi receiving fragment, but doesn’t support Wi-Fi transmitting fragment. The Wi-Fi transmitting fragment will be supported in future release.

**4.25.28 WPS Enrollee**

ESP32 supports WPS enrollee feature in Wi-Fi mode WIFI_MODE_STA or WIFI_MODE_APSTA. Currently ESP32 supports WPS enrollee type PBC and PIN.

**4.25.29 Wi-Fi Buffer Usage**

This section is only about the dynamic buffer configuration.

**Why Buffer Configuration Is Important**

In order to get a robust, high-performance system, we need to consider the memory usage/configuration very carefully, because:

• the available memory in ESP32 is limited.
• currently, the default type of buffer in LwIP and Wi-Fi drivers is “dynamic”, which means that both the LwIP and Wi-Fi share memory with the application. Programmers should always keep this in mind; otherwise, they will face a memory issue, such as “running out of heap memory”.
• it is very dangerous to run out of heap memory, as this will cause ESP32 an “undefined behavior”. Thus, enough heap memory should be reserved for the application, so that it never runs out of it.
• the Wi-Fi throughput heavily depends on memory-related configurations, such as the TCP window size, Wi-Fi RX/TX dynamic buffer number, etc.
• the peak heap memory that the ESP32 LwIP/Wi-Fi may consume depends on a number of factors, such as the maximum TCP/UDP connections that the application may have, etc.
• the total memory that the application requires is also an important factor when considering memory configuration.

Due to these reasons, there is not a good-for-all application configuration. Rather, we have to consider memory configurations separately for every different application.

**Dynamic vs. Static Buffer**

The default type of buffer in LwIP and Wi-Fi drivers is “dynamic”. Most of the time the dynamic buffer can significantly save memory. However, it makes the application programming a little more difficult, because in this case the application needs to consider memory usage in LwIP/Wi-Fi.
Peak LwIP Dynamic Buffer

The default type of LwIP buffer is “dynamic”, and this section considers the dynamic buffer only. The peak heap memory that LwIP consumes is the theoretically-maximum memory that the LwIP driver consumes. Generally, the peak heap memory that the LwIP consumes depends on:

- the memory required to create a UDP connection: lwip_udp_conn
- the memory required to create a TCP connection: lwip_tcp_conn
- the number of UDP connections that the application has: lwip_udp_con_num
- the number of TCP connections that the application has: lwip_tcp_con_num
- the TCP TX window size: lwip_tcp_tx_win_size
- the TCP RX window size: lwip_tcp_rx_win_size

So, the peak heap memory that the LwIP consumes can be calculated with the following formula:

\[
lwip\_dynamic\_peek\_memory = (lwip\_udp\_con\_num \times lwip\_udp\_conn) + (lwip\_tcp\_con\_num \times (lwip\_tcp\_tx\_win\_size + lwip\_tcp\_rx\_win\_size + lwip\_tcp\_conn))
\]

Some TCP-based applications need only one TCP connection. However, they may choose to close this TCP connection and create a new one when an error (such as a sending failure) occurs. This may result in multiple TCP connections existing in the system simultaneously, because it may take a long time for a TCP connection to close, according to the TCP state machine (refer to RFC793).

Peak Wi-Fi Dynamic Buffer

The Wi-Fi driver supports several types of buffer (refer to Wi-Fi Buffer Configure). However, this section is about the usage of the dynamic Wi-Fi buffer only. The peak heap memory that Wi-Fi consumes is the theoretically-maximum memory that the Wi-Fi driver consumes. Generally, the peak memory depends on:

- the number of dynamic rx buffers that are configured: wifi_rx_dynamic_buf_num
- the number of dynamic tx buffers that are configured: wifi_tx_dynamic_buf_num
- the maximum packet size that the Wi-Fi driver can receive: wifi_rx_pkt_size_max
- the maximum packet size that the Wi-Fi driver can send: wifi_tx_pkt_size_max

So, the peak memory that the Wi-Fi driver consumes can be calculated with the following formula:

\[
wifi\_dynamic\_peek\_memory = (wifi\_rx\_dynamic\_buf\_num \times wifi\_rx\_pkt\_size\_max) + (wifi\_tx\_dynamic\_buf\_num \times wifi\_tx\_pkt\_size\_max)
\]

Generally, we do not need to care about the dynamic tx long buffers and dynamic tx long long buffers, because they are management frames which only have a small impact on the system.

4.25.30 Wi-Fi Menuconfig

Wi-Fi Buffer Configure

If you are going to modify the default number or type of buffer, it would be helpful to also have an overview of how the buffer is allocated/freed in the data path. The following diagram shows this process in the TX direction:

**Description:**
- The application allocates the data which needs to be sent out.
- The application calls TCPIP-/Socket-related APIs to send the user data. These APIs will allocate a PBUF used in LwIP, and make a copy of the user data.
- When LwIP calls a Wi-Fi API to send the PBUF, the Wi-Fi API will allocate a “Dynamic Tx Buffer” or “Static Tx Buffer”, make a copy of the LwIP PBUF, and finally send the data.

The following diagram shows how buffer is allocated/freed in the RX direction:

**Description:**
- The Wi-Fi hardware receives a packet over the air and puts the packet content to the “Static Rx Buffer”, which is also called “RX DMA Buffer”.

Espressif Systems 1569
Submit Document Feedback
Release v4.0.3-189-g7c4f5fa
The Wi-Fi driver allocates a “Dynamic Rx Buffer”, makes a copy of the “Static Rx Buffer”, and returns the “Static Rx Buffer” to hardware.

The Wi-Fi driver delivers the packet to the upper-layer (LwIP), and allocates a PBUF for holding the “Dynamic Rx Buffer”.

The application receives data from LwIP.

The diagram shows the configuration of the Wi-Fi internal buffer.
<table>
<thead>
<tr>
<th>Buffer Type</th>
<th>Alloc Type</th>
<th>Default</th>
<th>Configurable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Static RX Buffer (Hardware RX Buffer)</td>
<td>Static</td>
<td>10 * 1600 Bytes</td>
<td>Yes</td>
<td>This is a kind of DMA memory. It is initialized in esp_wifi_init() and freed in esp_wifi_deinit(). The ‘Static Rx Buffer’ forms the hardware receiving list. Upon receiving a frame over the air, hardware writes the frame into the buffer and raises an interrupt to the CPU. Then, the Wi-Fi driver reads the content from the buffer and returns the buffer back to the list. If the application want to reduce the the memory statically allocated by Wi-Fi, they can reduce this value from 10 to 6 to save 6400 Bytes memory. It’s not recommended to reduce the configuration to a value less than 6 unless the AMPDU feature is disabled.</td>
</tr>
<tr>
<td>Dynamic RX Buffer</td>
<td>Dynamic</td>
<td>32</td>
<td>Yes</td>
<td>The buffer length is variable and it depends on the received frames’ length. When the Wi-Fi driver receives a frame from the ‘Hardware Rx Buffer’, the ‘Dynamic Rx Buffer’ needs to be allocated from the heap. The number of the Dynamic Rx Buffer, configured in the menuconfig, is used to limit the total un-freed Dynamic Rx Buffer number.</td>
</tr>
<tr>
<td>Dynamic TX Buffer</td>
<td>Dynamic</td>
<td>32</td>
<td>Yes</td>
<td>This is a kind of DMA memory. It is allocated to the heap. When the upper-layer (LwIP) sends packets to the Wi-Fi driver, it firstly allocates a Dynamic TX Buffer and makes a copy of the upper-layer buffer. The Dynamic and Static TX Buffers are mutually exclusive.</td>
</tr>
</tbody>
</table>

**Note:**
- When the AMPDU feature is disabled, the AMPDU buffer can be shared by Static RX Buffer and Dynamic RX Buffer.
Chapter 4. API Guides

Wi-Fi NVS Flash

If the Wi-Fi NVS flash is enabled, all Wi-Fi configurations set via the Wi-Fi APIs will be stored into flash, and the Wi-Fi driver will start up with these configurations next time it powers on/reboots. However, the application can choose to disable the Wi-Fi NVS flash if it does not need to store the configurations into persistent memory, or has its own persistent storage, or simply due to debugging reasons, etc.

Wi-Fi AMPDU

ESP32 supports both receiving and transmitting AMPDU, the AMPDU can greatly improve the Wi-Fi throughput. Generally, the AMPDU should be enabled. Disabling AMPDU is usually for debugging purposes.

Espressif Wireshark User Guide

1. Overview

1.1 What is Wireshark?

Wireshark (originally named “Ethereal”) is a network packet analyzer that captures network packets and displays the packet data as detailed as possible. It uses WinPcap as its interface to directly capture network traffic going through a network interface controller (NIC).

You could think of a network packet analyzer as a measuring device used to examine what is going on inside a network cable, just like a voltmeter is used by an electrician to examine what is going on inside an electric cable.

In the past, such tools were either very expensive, proprietary, or both. However, with the advent of Wireshark, all that has changed.

Wireshark is released under the terms of the GNU General Public License, which means you can use the software and the source code free of charge. It also allows you to modify and customize the source code.

Wireshark is, perhaps, one of the best open source packet analyzers available today.

1.2 Some Intended Purposes

Here are some examples of how Wireshark is typically used:

- Network administrators use it to troubleshoot network problems.
- Network security engineers use it to examine security problems.
- Developers use it to debug protocol implementations.
- People use it to learn more about network protocol internals.

Beside these examples, Wireshark can be used for many other purposes.

1.3 Features

The main features of Wireshark are as follows:

- Available for UNIX and Windows
- Captures live packet data from a network interface
- Displays packets along with detailed protocol information
- Opens/saves the captured packet data
- Imports/exports packets into a number of file formats, supported by other capture programs
- Advanced packet filtering
- Searches for packets based on multiple criteria
- Colorizes packets according to display filters
- Calculates statistics
- …and a lot more!
1.4 Wireshark Can or Can’t Do

- **Live capture from different network media.**
  Wireshark can capture traffic from different network media, including wireless LAN.

- **Import files from many other capture programs.**
  Wireshark can import data from a large number of file formats, supported by other capture programs.

- **Export files for many other capture programs.**
  Wireshark can export data into a large number of file formats, supported by other capture programs.

- **Numerous protocol dissectors.**
  Wireshark can dissect, or decode, a large number of protocols.

- **Wireshark is not an intrusion detection system.**
  It will not warn you if there are any suspicious activities on your network. However, if strange things happen, Wireshark might help you figure out what is really going on.

- **Wireshark does not manipulate processes on the network, it can only perform “measurements” within it.**
  Wireshark does not send packets on the network or influence it in any other way, except for resolving names (converting numerical address values into a human readable format), but even that can be disabled.

2. Where to Get Wireshark

You can get Wireshark from the official website: https://www.wireshark.org/download.html

Wireshark can run on various operating systems. Please download the correct version according to the operating system you are using.

This demonstration uses Wireshark 2.2.6 on Linux.

**a) Start Wireshark**

On Linux, you can run the shell script provided below. It starts Wireshark, then configures NIC and the channel for packet capture.

```bash
ifconfig $1 down
iwconfig $1 mode monitor
iwconfig $1 channel $2
ifconfig $1 up
Wireshark&
```

In the above script, the parameter $1 represents NIC and $2 represents channel. For example, wlan0 in ./xxx.sh wlan0 6, specifies the NIC for packet capture, and 6 identifies the channel of an AP or Soft-AP.

**b) Run the Shell Script to Open Wireshark and Display Capture Interface**

![Wireshark Capture Interface](image)

Fig. 45: Wireshark Capture Interface
c) Select the Interface to Start Packet Capture

As the red markup shows in the picture above, many interfaces are available. The first one is a local NIC and the second one is a wireless NIC.

Please select the NIC according to your requirements. This document will use the wireless NIC to demonstrate packet capture.

Double click wlan0 to start packet capture.

d) Set up Filters

Since all packets in the channel will be captured, and many of them are not needed, you have to set up filters to get the packets that you need.

Please find the picture below with the red markup, indicating where the filters should be set up.

![Fig. 46: Setting up Filters in Wireshark](image)

Click Filter, the top left blue button in the picture below. The display filter dialogue box will appear.

![Fig. 47: Display Filter Dialogue Box](image)

Click the Expression button to bring up the Filter Expression dialogue box and set the filter according to your requirements.

The quickest way: enter the filters directly in the toolbar.

Click on this area to enter or modify the filters. If you enter a wrong or unfinished filter, the built-in syntax check turns the background red. As soon as the correct expression is entered, the background becomes green.

The previously entered filters are automatically saved. You can access them anytime by opening the drop down list.

For example, as shown in the picture below, enter two MAC addresses as the filters and click Apply (the blue arrow). In this case, only the packet data transmitted between these two MAC addresses will be captured.
Fig. 48: *Filter Expression* Dialogue Box

Fig. 49: Filter Toolbar

Fig. 50: Example of MAC Addresses applied in the Filter Toolbar
e) Packet List

You can click any packet in the packet list and check the detailed information about it in the box below the list. For example, if you click the first packet, its details will appear in that box.

Fig. 51: Example of Packet List Details

f) Stop/Start Packet Capture

As shown in the picture below, click the red button to stop capturing the current packet.

Fig. 52: Stopping Packet Capture

Click the top left blue button to start or resume packet capture.

g) Save the Current Packet

On Linux, go to File -> Export Packet Dissections -> As Plain Text File to save the packet.

Please note that All packets, Displayed and All expanded must be selected.

By default, Wireshark saves the captured packet in a libpcap file. You can also save the file in other formats, e.g. .txt, to analyze it in other tools.

4.26 ESP-MESH

This guide provides information regarding the ESP-MESH protocol. Please see the MESH API Reference for more information about API usage.

4.26.1 Overview

ESP-MESH is a networking protocol built atop the Wi-Fi protocol. ESP-MESH allows numerous devices (henceforth referred to as nodes) spread over a large physical area (both indoors and outdoors) to be interconnected under a single WLAN (Wireless Local-Area Network). ESP-MESH is self-organizing and self-healing meaning the network can be built and maintained autonomously.

The ESP-MESH guide is split into the following sections:

1. Introduction
2. ESP-MESH Concepts
3. Building a Network
4. Managing a Network
5. Data Transmission
6. Channel Switching
7. Performance
8. Further Notes

4.26.2 Introduction

A traditional infrastructure Wi-Fi network is a point-to-multipoint network where a single central node known as the access point (AP) is directly connected to all other nodes known as stations. The AP is responsible for arbitrating and forwarding transmissions between the stations. Some APs also relay transmissions to/from an external IP network via a router. Traditional infrastructure Wi-Fi networks suffer the disadvantage of limited coverage area due to the requirement that every station must be in range to directly connect with the AP. Furthermore, traditional Wi-Fi networks are susceptible to overloading as the maximum number of stations permitted in the network is limited by the capacity of the AP.

ESP-MESH differs from traditional infrastructure Wi-Fi networks in that nodes are not required to connect to a central node. Instead, nodes are permitted to connect with neighboring nodes. Nodes are mutually responsible for
relaying each others transmissions. This allows an ESP-MESH network to have much greater coverage area as nodes can still achieve interconnectivity without needing to be in range of the central node. Likewise, ESP-MESH is also less susceptible to overloading as the number of nodes permitted on the network is no longer limited by a single central node.

## Terminology

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Node</strong></td>
<td>Any device that is or can be part of an ESP-MESH network</td>
</tr>
<tr>
<td><strong>Root Node</strong></td>
<td>The top node in the network</td>
</tr>
<tr>
<td><strong>Child Node</strong></td>
<td>A node X is a child node when it is connected to another node Y where the connection makes node X more distant from the root node than node Y (in terms of number of connections).</td>
</tr>
<tr>
<td><strong>Parent Node</strong></td>
<td>The converse notion of a child node</td>
</tr>
<tr>
<td><strong>Sub-Child Node</strong></td>
<td>Any node reachable by repeated proceeding from parent to child</td>
</tr>
<tr>
<td><strong>Sibling Nodes</strong></td>
<td>Nodes that share the same parent node</td>
</tr>
<tr>
<td><strong>Connection</strong></td>
<td>A traditional Wi-Fi association between an AP and a station. A node in ESP-MESH will use its station interface to associate with the softAP interface of another node, thus forming a connection. The connection process includes the authentication and association processes in Wi-Fi.</td>
</tr>
<tr>
<td><strong>Upstream Connection</strong></td>
<td>The connection from a node to its parent node</td>
</tr>
<tr>
<td><strong>Downstream Connection</strong></td>
<td>The connection from a node to one of its child nodes</td>
</tr>
<tr>
<td><strong>Wireless Hop</strong></td>
<td>The portion of the path between source and destination nodes that corresponds to a single wireless connection. A data packet that traverses a single connection is known as single-hop whereas traversing multiple connections is known as multi-hop.</td>
</tr>
<tr>
<td><strong>Subnetwork</strong></td>
<td>A subnetwork is subdivision of an ESP-MESH network which consists of a node and all of its descendant nodes. Therefore the subnetwork of the root node consists of all nodes in an ESP-MESH network.</td>
</tr>
<tr>
<td><strong>MAC Address</strong></td>
<td>Media Access Control Address used to uniquely identify each node or router within an ESP-MESH network.</td>
</tr>
<tr>
<td><strong>DS</strong></td>
<td>Distribution System (External IP Network)</td>
</tr>
</tbody>
</table>

## Tree Topology

ESP-MESH is built atop the infrastructure Wi-Fi protocol and can be thought of as a networking protocol that combines many individual Wi-Fi networks into a single WLAN. In Wi-Fi, stations are limited to a single connection with an AP (upstream connection) at any time, whilst an AP can be simultaneously connected to multiple stations (downstream connections). However ESP-MESH allows nodes to simultaneously act as a station and an AP. Therefore a node in ESP-MESH can have multiple downstream connections using its softAP interface, whilst simultaneously having a single upstream connection using its station interface. This naturally results in a tree network topology with a parent-child hierarchy consisting of multiple layers.

ESP-MESH is a multiple hop (multi-hop) network meaning nodes can transmit packets to other nodes in the network through one or more wireless hops. Therefore, nodes in ESP-MESH not only transmit their own packets, but simultaneously serve as relays for other nodes. Provided that a path exists between any two nodes on the physical layer (via one or more wireless hops), any pair of nodes within an ESP-MESH network can communicate.

**Note:** The size (total number of nodes) in an ESP-MESH network is dependent on the maximum number of layers permitted in the network, and the maximum number of downstream connections each node can have. Both of these variables can be configured to limit the size of the network.
Node Types

**Root Node:** The root node is the top node in the network and serves as the only interface between the ESP-MESH network and an external IP network. The root node is connected to a conventional Wi-Fi router and relays packets to/from the external IP network to nodes within the ESP-MESH network. **There can only be one root node within an ESP-MESH network** and the root node’s upstream connection may only be with the router. Referring to the diagram above, node A is the root node of the network.

**Leaf Nodes:** A leaf node is a node that is not permitted to have any child nodes (no downstream connections). Therefore a leaf node can only transmit or receive its own packets, but cannot forward the packets of other nodes. If a node is situated on the network’s maximum permitted layer, it will be assigned as a leaf node. This prevents the node from forming any downstream connections thus ensuring the network does not add an extra layer. Some nodes without a softAP interface (station only) will also be assigned as leaf nodes due to the requirement of a softAP interface for any downstream connections. Referring to the diagram above, nodes L/M/N are situated on the network’s maximum permitted layer hence have been assigned as leaf nodes.

**Intermediate Parent Nodes:** Connected nodes that are neither the root node or a leaf node are intermediate parent nodes. An intermediate parent node must have a single upstream connection (a single parent node), but can have zero to multiple downstream connections (zero to multiple child nodes). Therefore an intermediate parent node can transmit and receive packets, but also forward packets sent from its upstream and downstream connections. Referring to the diagram above, nodes B to J are intermediate parent nodes. **Intermediate parent nodes without downstream connections such as nodes E/F/G/I/J are not equivalent to leaf nodes** as they are still permitted to form downstream connections in the future.

**Idle Nodes:** Nodes that have yet to join the network are assigned as idle nodes. Idle nodes will attempt to form an upstream connection with an intermediate parent node or attempt to become the root node under the correct circumstances (see *Automatic Root Node Selection*). Referring to the diagram above, nodes K and O are idle nodes.

**Beacon Frames & RSSI Thresholding**

Every node in ESP-MESH that is able to form downstream connections (i.e. has a softAP interface) will periodically transmit Wi-Fi beacon frames. A node uses beacon frames to allow other nodes to detect its presence and know of its status. Idle nodes will listen for beacon frames to generate a list of potential parent nodes, one of which the idle node will form an upstream connection with. ESP-MESH uses the Vendor Information Element to store metadata such as:

- Node Type (Root, Intermediate Parent, Leaf, Idle)
Current layer of Node
Maximum number of layers permitted in the network
Current number of child nodes
Maximum number of downstream connections to accept

The signal strength of a potential upstream connection is represented by RSSI (Received Signal Strength Indication) of the beacon frames of the potential parent node. To prevent nodes from forming a weak upstream connection, ESP-MESH implements an RSSI threshold mechanism for beacon frames. If a node detects a beacon frame with an RSSI below a preconfigured threshold, the transmitting node will be disregarded when forming an upstream connection.

**Panel A** of the illustration above demonstrates how the RSSI threshold affects the number of parent node candidates an idle node has.

**Panel B** of the illustration above demonstrates how an RF shielding object can lower the RSSI of a potential parent node. Due to the RF shielding object, the area in which the RSSI of node X is above the threshold is significantly reduced. This causes the idle node to disregard node X even though node X is physically adjacent. The idle node will instead form an upstream connection with the physically distant node Y due to a stronger RSSI.

**Note:** Nodes technically still receive all beacon frames on the MAC layer. The RSSI threshold is an ESP-MESH feature that simply filters out all received beacon frames that are below the preconfigured threshold.

**Preferred Parent Node**

When an idle node has multiple parent nodes candidates (potential parent nodes), the idle node will form an upstream connection with the **preferred parent node**. The preferred parent node is determined based on the following criteria:

- Which layer the parent node candidate is situated on
- The number of downstream connections (child nodes) the parent node candidate currently has

The selection of the preferred parent node will always prioritize the parent node candidate on the shallowest layer of the network (including the root node). This helps minimize the total number of layers in an ESP-MESH network.
when upstream connections are formed. For example, given a second layer node and a third layer node, the second layer node will always be preferred.

If there are multiple parent node candidates within the same layer, the parent node candidate with the least child nodes will be preferred. This criteria has the effect of balancing the number of downstream connections amongst nodes of the same layer.

Panel A of the illustration above demonstrates an example of how the idle node G selects a preferred parent node given the five parent node candidates B/C/D/E/F. Nodes on the shallowest layer are preferred, hence nodes B/C are prioritized since they are second layer nodes whereas nodes D/E/F are on the third layer. Node C is selected as the preferred parent node due it having fewer downstream connections (fewer child nodes) compared to node B.

Panel B of the illustration above demonstrates the case where the root node is within range of the idle node G. In other words, the root node’s beacon frames are above the RSSI threshold when received by node G. The root node is always the shallowest node in an ESP-MESH network hence is always the preferred parent node given multiple
parent node candidates.

Note: Users may also define their own algorithm for selecting a preferred parent node, or force a node to only connect with a specific parent node (see the Mesh Manual Networking Example).

Routing Tables

Each node within an ESP-MESH network will maintain its individual routing table used to correctly route ESP-MESH packets (see ESP-MESH Packet) to the correct destination node. The routing table of a particular node will consist of the MAC addresses of all nodes within the particular node’s subnetwork (including the MAC address of the particular node itself). Each routing table is internally partitioned into multiple subtables with each subtable corresponding to the subnetwork of each child node.

![Routing Tables Example](image)

Using the diagram above as an example, the routing table of node B would consist of the MAC addresses of nodes B to I (i.e. equivalent to the subnetwork of node B). Node B’s routing table is internally partitioned into two subtables containing of nodes C to F and nodes G to I (i.e. equivalent to the subnetworks of nodes C and G respectively).

ESP-MESH utilizes routing tables to determine whether an ESP-MESH packet should be forwarded upstream or downstream based on the following rules.

1. If the packet’s destination MAC address is within the current node’s routing table and is not the current node, select the subtable that contains the destination MAC address and forward the data packet downstream to the child node corresponding to the subtable.

2. If the destination MAC address is not within the current node’s routing table, forward the data packet upstream to the current node’s parent node. Doing so repeatedly will result in the packet arriving at the root node where the routing table should contain all nodes within the network.

Note: Users can call `esp_mesh_get_routing_table()` to obtain a node’s routing table, or `esp_mesh_get_routing_table_size()` to obtain the size of a node’s routing table. `esp_mesh_get_subnet_nodes_list()` can be used to obtain the corresponding subtable of a specific child node. Likewise `esp_mesh_get_subnet_nodes_num()` can be used to obtain the size of the subtable.
4.26.4 Building a Network

General Process

**Warning:** Before the ESP-MESH network building process can begin, certain parts of the configuration must be uniform across each node in the network (see `mesh_cfg_t`). Each node must be configured with the same Mesh Network ID, router configuration, and softAP configuration.

An ESP-MESH network building process involves selecting a root node, then forming downstream connections layer by layer until all nodes have joined the network. The exact layout of the network can be dependent on factors such as root node selection, parent node selection, and asynchronous power-on reset. However, the ESP-MESH network building process can be generalized into the following steps:

1. **Root Node Selection**
   - The root node can be designated during configuration (see section on User Designated Root Node), or dynamically elected based on the signal strength between each node and the router (see Automatic Root Node Selection). Once selected, the root node will connect with the router and begin allowing downstream connections to form. Referring to the figure above, node A is selected to be the root node hence node A forms an upstream connection with the router.

2. **Second Layer Formation**
   - Once the root node has connected to the router, idle nodes in range of the root node will begin connecting with the root node thereby forming the second layer of the network. Once connected, these second layer nodes become intermediate parent nodes (assuming maximum permitted layers > 2) hence the next layer to form. Referring to the figure above, nodes B to D are in range of the root node. Therefore nodes B to D form upstream connections with the root node and become intermediate parent nodes.

3. **Formation of remaining layers**
   - The remaining idle nodes will connect with intermediate parent nodes within range thereby forming a new layer in the network. Once connected, the idles nodes become intermediate parent node or leaf nodes depending on the networks maximum permitted layers. This step is repeated until there are no more idle nodes within the network or until the maximum permitted layer of the network has been reached. Referring to the figure above, nodes E/F/G connect with nodes B/C/D respectively and become intermediate parent nodes themselves.
4. Limiting Tree Depth To prevent the network from exceeding the maximum permitted number of layers, nodes on the maximum layer will automatically become leaf nodes once connected. This prevents any other idle node from connecting with the leaf node thereby prevent a new layer from forming. However if an idle node has no other potential parent node, it will remain idle indefinitely. Referring to the figure above, the network’s maximum permitted layers is set to four. Therefore when node H connects, it becomes a leaf node to prevent any downstream connections from forming.

Automatic Root Node Selection

The automatic selection of a root node involves an election process amongst all idle nodes based on their signal strengths with the router. Each idle node will transmit their MAC addresses and router RSSI values via Wi-Fi beacon frames. The MAC address is used to uniquely identify each node in the network whilst the router RSSI is used to indicate a node’s signal strength with reference to the router.

Each node will then simultaneously scan for the beacon frames from other idle nodes. If a node detects a beacon frame with a stronger router RSSI, the node will begin transmitting the contents of that beacon frame (i.e. voting for the node with the stronger router RSSI). The process of transmission and scanning will repeat for a preconfigured minimum number of iterations (10 iterations by default) and result in the beacon frame with the strongest router RSSI being propagated throughout the network.

After all iterations, each node will individually check for its vote percentage (number of votes/number of nodes participating in election) to determine if it should become the root node. If a node has a vote percentage larger than a preconfigured threshold (90% by default), the node will become a root node.

The following diagram demonstrates how an ESP-MESH network is built when the root node is automatically selected.

1. On power-on reset, each node begins transmitting beacon frames consisting of their own MAC addresses and their router RSSIs.
2. Over multiple iterations of transmission and scanning, the beacon frame with the strongest router RSSI is propagated throughout the network. Node C has the strongest router RSSI (-10db) hence its beacon frame is propagated throughout the network. All nodes participating in the election vote for node C thus giving node C a vote percentage of 100%. Therefore node C becomes a root node and connects with the router.
3. Once Node C has connected with the router, nodes A/B/D/E connect with node C as it is the preferred parent node (i.e. the shallowest node). Nodes A/B/D/E form the second layer of the network.
4. Node F and G connect with nodes D and E respectively and the network building process is complete.

**Note:** The minimum number of iterations for the election process can be configured using `esp_mesh_set_attempts()`. Users should adjust the number of iterations based on the number of nodes within the network (i.e. the larger the network the larger number of scan iterations required).

**Warning:** Vote percentage threshold can also be configured using `esp_mesh_set_vote_percentage()`. Setting a low vote percentage threshold can result in two or more nodes becoming root nodes within the same ESP-MESH network leading to the building of multiple networks. If such is the case, ESP-MESH has internal mechanisms to autonomously resolve the root node conflict. The networks of the multiple root nodes will be combined into a single network with a single root node. However, root node conflicts where two or more root nodes have the same router SSID but different router BSSID are not handled.

**User Designated Root Node**

The root node can also be designated by user which will entail the designated root node to directly connect with the router and forgo the election process. When a root node is designated, all other nodes within the network must also forgo the election process to prevent the occurrence of a root node conflict. The following diagram demonstrates how an ESP-MESH network is built when the root node is designated by the user.

![Diagram showing the steps of network building with a user designated root node.](image)

**Fig. 64:** Root Node Designation Example (Root Node = A, Max Layers = 4)

1. Node A is designated the root node by the user therefore directly connects with the router. All other nodes forgo the election process.

2. Nodes C/D connect with node A as their preferred parent node. Both nodes form the second layer of the network.

3. Likewise, nodes B/E connect with node C, and node F connects with node D. Nodes B/E/F form the third layer of the network.

4. Node G connects with node E, forming the fourth layer of the network. However the maximum permitted number of layers in this network is configured as four, therefore node G becomes a leaf node to prevent any new layers from forming.
**Note:** When designating a root node, the root node should call `esp_mesh_set_parent()` in order to directly connect with the router. Likewise, all other nodes should call `esp_mesh_fix_root()` to forgo the election process.

**Parent Node Selection**

By default, ESP-MESH is self-organizing meaning that each node will autonomously select which potential parent node to form an upstream connection with. The autonomously selected parent node is known as the preferred parent node. The criteria used for selecting the preferred parent node is designed to reduce the number of layers in the ESP-MESH network and to balance the number of downstream connections between potential parent nodes (see section on Preferred Parent Node).

However ESP-MESH also allows users to disable self-organizing behavior which will allow users to define their own criteria for parent node selection, or to configure nodes to have designated parent nodes (see the Mesh Manual Networking Example).

**Asynchronous Power-on Reset**

ESP-MESH network building can be affected by the order in which nodes power-on. If certain nodes within the network power-on asynchronously (i.e. separated by several minutes), the final structure of the network could differ from the ideal case where all nodes are powered on synchronously. Nodes that are delayed in powering on will adhere to the following rules:

**Rule 1:** If a root node already exists in the network, the delayed node will not attempt to elect a new root node, even if it has a stronger RSSI with the router. The delayed node will instead join the network like any other idle node by connecting with a preferred parent node. If the delayed node is the designated root node, all other nodes in the network will remain idle until the delayed node powers-on.

**Rule 2:** If a delayed node forms an upstream connection and becomes an intermediate parent node, it may also become the new preferred parent of other nodes (i.e. being a shallower node). This will cause the other nodes to switch their upstream connections to connect with the delayed node (see Parent Node Switching).

**Rule 3:** If an idle node has a designated parent node which is delayed in powering-on, the idle node will not attempt to form any upstream connections in the absence of its designated parent node. The idle node will remain idle indefinitely until its designated parent node powers-on.

The following example demonstrates the effects of asynchronous power-on with regards to network building.

1. Nodes A/C/D/F/G/H are powered-on synchronously and begin the root node election process by broadcasting their MAC addresses and router RSSIs. Node A is elected as the root node as it has the strongest RSSI.

2. Once node A becomes the root node, the remaining nodes begin forming upstream connections layer by layer with their preferred parent nodes. The result is a network with five layers.

3. Node B/E are delayed in powering-on but neither attempt to become the root node even though they have stronger router RSSIs (-20db and -10db) compared to node A. Instead both delayed nodes form upstream connections with their preferred parent nodes A and C respectively. Both Nodes B/E become intermediate parent nodes after connecting.

4. Nodes D/G switch their upstream connections as node B is the new preferred parent node due to it being on a shallower layer (second layer node). Due to the switch, the resultant network has three layers instead of the original five layers.

**Synchronous Power-On:** Had all nodes powered-on synchronously, node E would have become the root node as it has the strongest router RSSI (-10db). This would result in a significantly different network layout compared to the network formed under the conditions of asynchronous power-on. However the synchronous power-on network layout can still be reached if the user manually switches the root node (see `esp_mesh_waive_root()`).
Fig. 65: Network Building with Asynchronous Power On Example
Loop-back Avoidance, Detection, and Handling

A loop-back is the situation where a particular node forms an upstream connection with one of its descendant nodes (a node within the particular node’s subnetwork). This results in a circular connection path thereby breaking the tree topology. ESP-MESH prevents loop-back during parent selection by excluding nodes already present in the selecting node’s routing table (see Routing Tables) thus prevents a particular node from attempting to connect to any node within its subnetwork.

In the event that a loop-back occurs, ESP-MESH utilizes a path verification mechanism and energy transfer mechanism to detect the loop-back occurrence. The parent node of the upstream connection that caused the loop-back will then inform the child node of the loop-back and initiate a disconnection.

4.26.5 Managing a Network

ESP-MESH is a self healing network meaning it can detect and correct for failures in network routing. Failures occur when a parent node with one or more child nodes breaks down, or when the connection between a parent node and its child nodes becomes unstable. Child nodes in ESP-MESH will autonomously select a new parent node and form an upstream connection with it to maintain network interconnectivity. ESP-MESH can handle both Root Node Failures and Intermediate Parent Node Failures.

Root Node Failure

If the root node breaks down, the nodes connected with it (second layer nodes) will promptly detect the failure of the root node. The second layer nodes will initially attempt to reconnect with the root node. However after multiple failed attempts, the second layer nodes will initialize a new round of root node election. The second layer node with the strongest router RSSI will be elected as the new root node whilst the remaining second layer nodes will form an upstream connection with the new root node (or a neighboring parent node if not in range).

If the root node and multiple downstream layers simultaneously break down (e.g. root node, second layer, and third layer), the shallowest layer that is still functioning will initialize the root node election. The following example illustrates an example of self healing from a root node break down.

Fig. 66: Self Healing From Root Node Failure

1. Node C is the root node of the network. Nodes A/B/D/E are second layer nodes connected to node C.
2. Node C breaks down. After multiple failed attempts to reconnect, the second layer nodes begin the election process by broadcasting their router RSSIs. Node B has the strongest router RSSI.
3. Node B is elected as the root node and begins accepting downstream connections. The remaining second layer nodes A/D/E form upstream connections with node B thus the network is healed and can continue operating normally.

**Note:** If a designated root node breaks down, the remaining nodes will not autonomously attempt to elect a new root node as an election process will never be attempted whilst a designated root node is used.

### Intermediate Parent Node Failure

If an intermediate parent node breaks down, the disconnected child nodes will initially attempt to reconnect with the parent node. After multiple failed attempts to reconnect, each child node will begin to scan for potential parent nodes (see *Beacon Frames & RSSI Thresholding*).

If other potential parent nodes are available, each child node will individually select a new preferred parent node (see *Preferred Parent Node*) and form an upstream connection with it. If there are no other potential parent nodes for a particular child node, it will remain idle indefinitely.

The following diagram illustrates an example of self healing from an Intermediate Parent Node break down.

![Fig. 67: Self Healing From Intermediate Parent Node Failure](image)

1. The following branch of the network consists of nodes A to G.

2. Node C breaks down. Nodes F/G detect the break down and attempt to reconnect with node C. After multiple failed attempts to reconnect, nodes F/G begin to select a new preferred parent node.

3. Node G is out of range from any other parent node hence remains idle for the time being. Node F is in range of nodes B/E, however node B is selected as it is the shallower node. Node F becomes an intermediate parent node after connecting with Node B thus node G can connect with node F. The network is healed, however the network routing as been affected and an extra layer has been added.

**Note:** If a child node has a designated parent node that breaks down, the child node will make no attempt to connect with a new parent node. The child node will remain idle indefinitely.

### Root Node Switching

ESP-MESH does not automatically switch the root node unless the root node breaks down. Even if the root node’s router RSSI degrades to the point of disconnection, the root node will remain unchanged. Root node switching is the act of explicitly starting a new election such that a node with a stronger router RSSI will be elected as the new root node. This can be a useful method of adapting to degrading root node performance.
To trigger a root node switch, the current root node must explicitly call `esp_mesh_waive_root()` to trigger a new election. The current root node will signal all nodes within the network to begin transmitting and scanning for beacon frames (see **Automatic Root Node Selection**) whilst remaining connected to the network (i.e. not idle). If another node receives more votes than the current root node, a root node switch will be initiated. The root node will remain unchanged otherwise.

A newly elected root node sends a **switch request** to the current root node which in turn will respond with an acknowledgment signifying both nodes are ready to switch. Once the acknowledgment is received, the newly elected root node will disconnect from its parent and promptly form an upstream connection with the router thereby becoming the new root node of the network. The previous root node will disconnect from the router whilst maintaining all of its downstream connections and enter the idle state. The previous root node will then begin scanning for potential parent nodes and selecting a preferred parent.

The following diagram illustrates an example of a root node switch.

![Root Node Switch Example](image)

1. Node C is the current root node but has degraded signal strength with the router (-85db). The node C triggers a new election and all nodes begin transmitting and scanning for beacon frames whilst still being connected.

2. After multiple rounds of transmission and scanning, node B is elected as the new root node. Node B sends node C a **switch request** and node C responds with an acknowledgment.

3. Node B disconnects from its parent and connects with the router becoming the networks new root node. Node C disconnects from the router, enters the idle state, and begins scanning for and selecting a new preferred parent node. Node C maintains all its downstream connections throughout this process.

4. Node C selects node B as its preferred parent node, forms an upstream connection, and becomes a second layer node. The network layout is similar after the switch as node C still maintains the same subnetwork. However each node in node C’s subnetwork has been placed one layer deeper as a result of the switch. **Parent Node Switching** may adjust the network layout afterwards if any nodes have a new preferred parent node as a result of the root node switch.

**Note:** Root node switching must require an election hence is only supported when using a self-organized ESP-MESH network. In other words, root node switching cannot occur if a designated root node is used.
Parent Node Switching

Parent Node Switching entails a child node switching its upstream connection to another parent node of a shallower layer. **Parent Node Switching occurs autonomously** meaning that a child node will change its upstream connection automatically if a potential parent node of a shallower layer becomes available (i.e. due to an **Asynchronous Power-on Reset**).

All potential parent nodes periodically transmit beacon frames (see *Beacon Frames & RSSI Thresholding*) allowing for a child node to scan for the availability of a shallower parent node. Due to parent node switching, a self-organized ESP-MESH network can dynamically adjust its network layout to ensure each connection has a good RSSI and that the number of layers in the network is minimized.

4.26.6 Data Transmission

**ESP-MESH Packet**

ESP-MESH network data transmissions use ESP-MESH packets. ESP-MESH packets are **entirely contained within the frame body of a Wi-Fi data frame**. A multi-hop data transmission in an ESP-MESH network will involve a single ESP-MESH packet being carried over each wireless hop by a different Wi-Fi data frame.

The following diagram shows the structure of an ESP-MESH packet and its relation with a Wi-Fi data frame.

![ESP-MESH Packet Diagram](image)

**Fig. 69: ESP-MESH Packet**

The **header** of an ESP-MESH packet contains the MAC addresses of the source and destination nodes. The options field contains information pertaining to the special types of ESP-MESH packets such as a group transmission or a packet originating from the external IP network (see *MESH_OPT_SEND_GROUP* and *MESH_OPT_RECV_DS_ADDR*).

The **payload** of an ESP-MESH packet contains the actual application data. This data can be raw binary data, or encoded under an application layer protocol such as HTTP, MQTT, and JSON (see *mesh_proto_t*).

**Note:** When sending an ESP-MESH packet to the external IP network, the destination address field of the header will contain the IP address and port of the target server rather than the MAC address of a node (see *mesh_addr_t*). Furthermore the root node will handle the formation of the outgoing TCP/IP packet.

**Group Control & Multicasting**

Multicasting is a feature that allows a single ESP-MESH packet to be transmitted simultaneously to multiple nodes within the network. Multicasting in ESP-MESH can be achieved by either specifying a list of target nodes, or specifying a preconfigured group of nodes. Both methods of multicasting are called via *esp_mesh_send()*.

To multicast by specifying a list of target nodes, users must first set the ESP-MESH packet’s destination address to the **Multicast-Group Address** (01:00:5E:xx:xx:xx). This signifies that the ESP-MESH packet is a multicast packet with a group of addresses, and that the address should be obtained from the header options. Users must then list the MAC addresses of the target nodes as options (see *mesh_opt_t* and *MESH_OPT_SEND_GROUP*). This
method of multicasting requires no prior setup but can incur a large amount of overhead data as each target node’s MAC address must be listed in the options field of the header.

Multicasting by group allows an ESP-MESH packet to be transmitted to a preconfigured group of nodes. Each grouping is identified by a unique ID, and a node can be placed into a group via `esp_mesh_set_group_id()`. Multicasting to a group involves setting the destination address of the ESP-MESH packet to the target group ID. Furthermore, the `MESH_DATA_GROUP` flag must set. Using groups to multicast incurs less overhead, but requires nodes to previously added into groups.

**Note:** During a multicast, all nodes within the network still receive the ESP-MESH packet on the MAC layer. However, nodes not included in the MAC address list or the target group will simply filter out the packet.

**Broadcasting**

Broadcasting is a feature that allows a single ESP-MESH packet to be transmitted simultaneously to all nodes within the network. Each node essentially forwards a broadcast packet to all of its upstream and downstream connections such that the packet propagates throughout the network as quickly as possible. However, ESP-MESH utilizes the following methods to avoid wasting bandwidth during a broadcast.

1. When an intermediate parent node receives a broadcast packet from its parent, it will forward the packet to each of its child nodes whilst storing a copy of the packet for itself.
2. When an intermediate parent node is the source node of the broadcast, it will transmit the broadcast packet upstream to is parent node and downstream to each of its child nodes.
3. When an intermediate parent node receives a broadcast packet from one of its child nodes, it will forward the packet to its parent node and each of its remaining child nodes whilst storing a copy of the packet for itself.
4. When a leaf node is the source node of a broadcast, it will directly transmit the packet to its parent node.
5. When the root node is the source node of a broadcast, the root node will transmit the packet to all of its child nodes.
6. When the root node receives a broadcast packet from one of its child nodes, it will forward the packet to each of its remaining child nodes whilst storing a copy of the packet for itself.
7. When a node receives a broadcast packet with a source address matching its own MAC address, the node will discard the broadcast packet.
8. When an intermediate parent node receives a broadcast packet from its parent node which was originally transmitted from one of its child nodes, it will discard the broadcast packet.

**Upstream Flow Control**

ESP-MESH relies on parent nodes to control the upstream data flow of their immediate child nodes. To prevent a parent node’s message buffer from overflowing due to an overload of upstream transmissions, a parent node will allocate a quota for upstream transmissions known as a receiving window for each of its child nodes. Each child node must apply for a receiving window before it is permitted to transmit upstream. The size of a receiving window can be dynamically adjusted. An upstream transmission from a child node to the parent node consists of the following steps:

1. Before each transmission, the child node sends a window request to its parent node. The window request consists of a sequence number which corresponds to the child node’s data packet that is pending transmission.
2. The parent node receives the window request and compares the sequence number with the sequence number of the previous packet sent by the child node. The comparison is used to calculate the size of the receiving window which is transmitted back to the child node.
3. The child node transmits the data packet in accordance with the window size specified by the parent node. If the child node depletes its receiving window, it must obtain another receiving windows by sending a request before it is permitted to continue transmitting.
Note: ESP-MESH does not support any downstream flow control.

Warning: Due to Parent Node Switching, packet loss may occur during upstream transmissions.

Due to the fact that the root node acts as the sole interface to an external IP network, it is critical that downstream nodes are aware of the root node’s connection status with the external IP network. Failing to do so can lead to nodes attempting to pass data upstream to the root node whilst it is disconnected from the IP network. This results in unnecessary transmissions and packet loss. ESP-MESH address this issue by providing a mechanism to stabilize the throughput of outgoing data based on the connection status between the root node and the external IP network. The root node can broadcast its external IP network connection status to all other nodes by calling \texttt{esp\_mesh\_post\_toDS\_state()}.

**Bi-Directional Data Stream**

The following diagram illustrates the various network layers involved in an ESP-MESH Bidirectional Data Stream.

![Bi-Directional Data Stream Diagram](image)

Fig. 70: ESP-MESH Bidirectional Data Stream

Due to the use of Routing Tables, ESP-MESH is able to handle packet forwarding entirely on the mesh layer. A TCP/IP layer is only required on the root node when it transmits/receives a packet to/from an external IP network.

### 4.26.7 Channel Switching

**Background**

In traditional Wi-Fi networks, channels are predetermined frequency ranges. In an infrastructure basic service set (BSS), the serving AP and its connected stations must be on the same operating channels (1 to 14) in which beacons are transmitted. Physically adjacent BSS (Basic Service Sets) operating on the same channel can lead to interference and degraded performance.

In order to allow a BSS adapt to changing physical layer conditions and maintain performance, Wi-Fi contains mechanisms for network channel switching. A network channel switch is an attempt to move a BSS to a new operating channel whilst minimizing disruption to the BSS during this process. However it should be recognized that a channel switch may be unsuccessful in moving all stations to the new operating channel.

In an infrastructure Wi-Fi network, network channel switches are triggered by the AP with the aim of having the AP and all connected stations synchronously switch to a new channel. Network channel switching is implemented by embedding a Channel Switch Announcement (CSA) element within the AP’s periodically transmitted beacon.
frames. The CSA element is used to advertise to all connected stations regarding an upcoming network channel switch and will be included in multiple beacon frames up until the switch occurs.

A CSA element contains information regarding the **New Channel Number** and a **Channel Switch Count** which indicates the number of beacon frame intervals (TBTTs) remaining until the network channel switch occurs. Therefore, the Channel Switch Count is decremented every beacon frame and allows connected stations to synchronize their channel switch with the AP.

### ESP-MESH Network Channel Switching

ESP-MESH Network Channel Switching also utilize beacon frames that contain a CSA element. However, being a multi-hop network makes the switching process in ESP-MESH more complex due to the fact that a beacon frame might not be able to reach all nodes within the network (i.e. in a single hop). Therefore, an ESP-MESH network relies on nodes to forward the CSA element so that it is propagated throughout the network.

When an intermediate parent node with one or more child nodes receives a beacon frame containing a CSA, the node will forward the CSA element by including the element in its next transmitted beacon frame (i.e. with the same **New Channel Number** and **Channel Switch Count**). Given that all nodes within an ESP-MESH network receive the same CSA, the nodes can synchronize their channel switches using the Channel Switch Count, albeit with a short delay due to CSA element forwarding.

An ESP-MESH network channel switch can be triggered by either the router or the root node.

#### Root Node Triggered

A root node triggered channel switch can only occur when the ESP-MESH network is not connected to a router. By calling `esp_mesh_switch_channel()`, the root node will set an initial Channel Switch Count value and begin including a CSA element in its beacon frames. Each CSA element is then received by second layer nodes, and forwarded downstream in their own beacon frames.

#### Router Triggered

When an ESP-MESH network is connected to a router, the entire network must use the same channel as the router. Therefore, the root node will not be permitted to trigger a channel switch when it is connected to a router.

When the root node receives beacon frame containing a CSA element from the router, the root node will set **Channel Switch Count value in the CSA element to a custom value** before forwarding it downstream via beacon frames. It will also decrement the Channel Switch Count of subsequent CSA elements relative to the custom value. This custom value can be based on factors such as the number of network layers, the current number of nodes etc.

The setting the Channel Switch Count value to a custom value is due to the fact that the ESP-MESH network and its router may have a different and varying beacon intervals. Therefore, the Channel Switch Count value provided by the router is irrelevant to an ESP-MESH network. By using a custom value, nodes within the ESP-MESH network are able to switch channels synchronously relative to the ESP-MESH network’s beacon interval. However, this will also result in the ESP-MESH network’s channel switch being unsynchronized with the channel switch of the router and its connected stations.

### Impact of Network Channel Switching

- Due to the ESP-MESH network channel switch being unsynchronized with the router’s channel switch, there will be a delay:
  - The ESP-MESH network’s channel switch time is dependent on the ESP-MESH network’s beacon interval and the root node’s custom Channel Switch Count value.
  - The channel discrepancy prevents any data exchange between the root node and the router during that ESP-MESH network’s switch.
  - In the ESP-MESH network, the root node and intermediate parent nodes will request their connected child nodes to stop transmissions until the channel switch takes place by setting the Channel Switch Mode field in the CSA element to 1.
  - Frequent router triggered network channel switches can degrade the ESP-MESH network’s performance. Note that this can be caused by the ESP-MESH network itself (e.g. due to wireless medium...
contention with ESP-MESH network). If this is the case, users should disable the automatic channel switching on the router and use a specified channel instead.

- **When there is a temporary channel discrepancy, the root node remains technically connected to the router.**
  
  - Disconnection occurs after the root node fails to receive any beacon frames or probe responses from the router over a fixed number of router beacon intervals.
  - Upon disconnection, the root node will automatically re-scan all channels for the presence of a router.

- **If the root node is unable to receive any of the router’s CSA beacon frames (e.g. due to short switch time given by the router),**
  
  - After the router switches channels, the root node will no longer be able to receive the router’s beacon frames and probe responses and result in a disconnection after a fixed number of beacon intervals.
  - The root node will re-scan all channels for the router after disconnection.
  - The root node will maintain downstream connections throughout this process.

**Note:** Although ESP-MESH network channel switching aims to move all nodes within the network to a new operating channel, it should be recognized that a channel switch might not successfully move all nodes (e.g. due to reasons such as node failures).

### Channel and Router Switching Configuration

ESP-MESH allows for autonomous channel switching to be enabled/disabled via configuration. Likewise, autonomous router switching (i.e. when a root node autonomously connects to another router) can also be enabled/disabled by configuration. Autonomous channel switching and router switching is dependent on the following configuration parameters and run-time conditions.

**Allow Channel Switch:** This parameter is set via the `allow_channel_switch` field of the `mesh_cfg_t` structure and permits an ESP-MESH network to dynamically switch channels when set.

**Preset Channel:** An ESP-MESH network can have a preset channel by setting the `channel` field of the `mesh_cfg_t` structure to the desired channel number. If this field is unset, the `allow_channel_switch` parameter is overridden such that channel switches are always permitted.

**Allow Router Switch:** This parameter is set via the `allow_router_switch` field of the `mesh_router_t` and permits an ESP-MESH network to dynamically switch to a different router when set.

**Preset Router BSSID:** An ESP-MESH network can have a preset router by setting the `bssid` field of the `mesh_router_t` structure to the BSSID of the desired router. If this field is unset, the `allow_router_switch` parameter is overridden such that router switches are always permitted.

**Root Node Present:** The presence of a root node will also affect whether or a channel or router switch is permitted.

The following table illustrates how the different combinations of parameters/conditions affect whether channel switching and/or router switching is permitted. Note that $X$ represents a “don’t care” for the parameter.
### 4.26.8 Performance

The performance of an ESP-MESH network can be evaluated based on multiple metrics such as the following:

**Network Building Time:** The amount of time taken to build an ESP-MESH network from scratch.

**Healing Time:** The amount of time taken for the network to detect a node break down and carry out appropriate actions to heal the network (such as generating a new root node or forming new connections).

**Per-hop latency:** The latency of data transmission over one wireless hop. In other words, the time taken to transmit a data packet from a parent node to a child node or vice versa.

**Network Node Capacity:** The total number of nodes the ESP-MESH network can simultaneously support. This number is determined by the maximum number of downstream connections a node can accept and the maximum number of layers permissible in the network.

The following table lists the common performance figures of an ESP-MESH network. However users should note that performance numbers can vary greatly between installations based on network configuration and operating environment.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Networking Building Time</td>
<td>&lt; 60 seconds</td>
</tr>
<tr>
<td>Healing time</td>
<td>Root Node Break Down: &lt; 10 seconds</td>
</tr>
<tr>
<td></td>
<td>Child Node Break Down: &lt; 5 seconds</td>
</tr>
<tr>
<td>Per-hop latency</td>
<td>10 to 30 milliseconds</td>
</tr>
</tbody>
</table>

**Note:** The following test conditions were used to generate the performance figures above.

- Number of test devices: **100**
- Maximum Downstream Connections to Accept: **6**
- Maximum Permissible Layers: **6**

**Note:** Throughput depends on packet error rate and hop count.
Chapter 4. API Guides

Note: The throughput of root node’s access to the external IP network is directly affected by the number of nodes in the ESP-MESH network and the bandwidth of the router.

4.26.9 Further Notes

- Data transmission uses Wi-Fi WPA2-PSK encryption
- Mesh networking IE uses AES encryption

Router and internet icon made by Smashicons from www.flaticon.com

4.27 BluFi

4.27.1 Overview

The BluFi for ESP32 is a Wi-Fi network configuration function via Bluetooth channel. It provides a secure protocol to pass Wi-Fi configuration and credentials to the ESP32. Using this information ESP32 can then e.g. connect to an AP or establish a SoftAP.

Fragmenting, data encryption, checksum verification in the BluFi layer are the key elements of this process.

You can customize symmetric encryption, asymmetric encryption and checksum support customization. Here we use the DH algorithm for key negotiation, 128-AES algorithm for data encryption, and CRC16 algorithm for checksum verification.

4.27.2 The BluFi Flow

The BluFi networking flow includes the configuration of the SoftAP and Station.

The following uses Station as an example to illustrate the core parts of the procedure, including broadcast, connection, service discovery, negotiation of the shared key, data transmission, connection status backhaul.

1. Set the ESP32 into GATT Server mode and then it will send broadcasts with specific advertising data. You can customize this broadcast as needed, which is not a part of the BluFi Profile.
2. Use the App installed on the mobile phone to search for this particular broadcast. The mobile phone will connect to ESP32 as the GATT Client once the broadcast is confirmed. The App used during this part is up to you.
3. After the GATT connection is successfully established, the mobile phone will send a data frame for key negotiation to ESP32 (see the section The Frame Formats Defined in BluFi for details).
4. After ESP32 receives the data frame of key negotiation, it will parse the content according to the user-defined negotiation method.
5. The mobile phone works with ESP32 for key negotiation using the encryption algorithms such as DH, RSA or ECC.
6. After the negotiation process is completed, the mobile phone will send a control frame for security-mode setup to ESP32.
7. When receiving this control frame, ESP32 will be able to encrypt and decrypt the communication data using the shared key and the security configuration.
8. The mobile phone sends the data frame defined in the section of The Frame Formats Defined in BluFi, with the Wi-Fi configuration information to ESP32, including SSID, password, etc.
9. The mobile phone sends a control frame of Wi-Fi connection request to ESP32. When receiving this control frame, ESP32 will regard the communication of essential information as done and get ready to connect to the Wi-Fi.
10. After connecting to the Wi-Fi, ESP32 will send a control frame of Wi-Fi connection status report to the mobile phone, to report the connection status. At this point the networking procedure is completed.
Note:
1. After ESP32 receives the control frame of security-mode configuration, it will execute the operations in accordance with the defined security mode.
2. The data lengths before and after symmetric encryption/decryption must stay the same. It also supports in-place encryption and decryption.

4.27.3 The flow chart of BluFi

![BluFi Flow Chart](image)

4.27.4 The Frame Formats Defined in BluFi

The frame formats for the communication between the mobile phone App and ESP32 are defined as follows:
The frame format with no fragment (8 bit):
If the **Frame Ctrl** bit is enabled, the **Total length** bit indicates the length of remaining part of the frame. It can tell the remote how much memory needs to be allocated.

The frame format with fragments (8 bit):

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSB - Type</td>
<td>1</td>
</tr>
<tr>
<td>FrameControl(Frag)</td>
<td>1</td>
</tr>
<tr>
<td>Sequence Number</td>
<td>1</td>
</tr>
<tr>
<td>DataLength</td>
<td>1</td>
</tr>
<tr>
<td>Data</td>
<td>${\text{Data Length}}$</td>
</tr>
<tr>
<td>MSB - CheckSum</td>
<td>2</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSB - Type (Ack)</td>
<td>1</td>
</tr>
<tr>
<td>Frame Control</td>
<td>1</td>
</tr>
<tr>
<td>Sequence Number</td>
<td>1</td>
</tr>
<tr>
<td>DataLength</td>
<td>1</td>
</tr>
<tr>
<td>Data</td>
<td>Aplied Sequence Number</td>
</tr>
<tr>
<td>MSB - CheckSum</td>
<td>2</td>
</tr>
</tbody>
</table>

Normally, the control frame does not contain data bits, except for Ack Frame.

The format of Ack Frame (8 bit):

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LSB - Type (Ack)</td>
<td>1</td>
</tr>
<tr>
<td>Frame Control</td>
<td>1</td>
</tr>
<tr>
<td>Sequence Number</td>
<td>1</td>
</tr>
<tr>
<td>DataLength</td>
<td>1</td>
</tr>
<tr>
<td>Data</td>
<td>Acked Sequence Number</td>
</tr>
<tr>
<td>MSB - CheckSum</td>
<td>2</td>
</tr>
</tbody>
</table>

1. **Type**

The **Type** field, taking 1 byte, is divided into **Type** and **Subtype**, that Type uses the lower 2 bits and **Subtype** uses the upper 6 bits.

- The control frame is not encrypted for the time being and supports to be verified;
- The data frame supports to be encrypted and verified.

1.1 **Control Frame (0x0 b’ 00)**
<table>
<thead>
<tr>
<th>Control Frame (Binary)</th>
<th>Explanation</th>

<td>Custom Data</td>
<td>To send or receive custom data.</td>
</tr>
</tbody>
</table>

2. Frame Control
Control field, takes 1 byte and each bit has a different meaning.
### Chapter 4. API Guides

<table>
<thead>
<tr>
<th>Bit</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x01</td>
<td>Indicates whether the frame is encrypted. 1 means encryption, and 0 means unencrypted. The encrypted part of the frame includes the full clear data before the DATA field is encrypted (no checksum). Control frame is not encrypted, so this bit is 0.</td>
</tr>
<tr>
<td>0x02</td>
<td>The data field that indicates whether a frame contains a checksum (such as SHA1, MD5, CRC, etc.) for the end of the frame data field includes SEQUEN + data length + clear text. Both the control frame and the data frame can contain a check bit or not.</td>
</tr>
<tr>
<td>0x04</td>
<td>Represents the data direction. 0 means the mobile phone to ESP32; 1 means ESP32 to the mobile phone.</td>
</tr>
<tr>
<td>0x08</td>
<td>Indicates whether the other person is required to reply to an ACK. 0 indicates no requirement; 1 indicates to reply Ack.</td>
</tr>
<tr>
<td>0x10</td>
<td>Indicates whether there are subsequent data fragments. 0 indicates that there are no subsequent data fragments for this frame; 1 indicates that there are subsequent data fragments and used to transmit longer data. In the case of a frag frame, the total length of the current content section + subsequent content section is given, in the first 2 bytes of the data field (that is, the content data of the maximum support 64K).</td>
</tr>
<tr>
<td>0x10~0x80</td>
<td>Reserved</td>
</tr>
</tbody>
</table>

3. Sequence Control
   Sequence control field. When a frame is sent, the value of sequence field is automatically incremented by 1 regardless of the type of frame, which prevents Replay Attack. The sequence is cleared after each reconnection.

4. Length
   The length of the data field that does not include CheckSum.

5. Data
   The instruction of the data field is different according to various values of Type or Subtype. Please refer to the table above.

6. CheckSum
   This field takes 2 bytes that is used to check “sequence + data length + clear text data”.

### 4.27.5 The Security Implementation of ESP32

1. Securing data
   To ensure that the transmission of the Wi-Fi SSID and password is secure, the message needs to be encrypted using symmetric encryption algorithms, such as AES, DES and so on. Before using symmetric encryption algorithms, the devices are required to negotiate (or generate) a shared key using an asymmetric encryption algorithm (DH, RSA, ECC, etc).

2. Ensuring data integrity
   To ensure data integrity, you need to add a checksum algorithm, such as SHA1, MD5, CRC, etc.

3. Securing identity (signature)
   Algorithm like RSA can be used to secure identity. But for DH, it needs other algorithms as an companion for signature.

4. Replay attack prevention
   It is added to the Sequence field and used during the checksum verification.
   For the coding of ESP32, you can determine and develop the security processing, such as key negotiation. The mobile application sends the negotiation data to ESP32 and then the data will be sent to the application layer for processing. If the application layer does not process it, you can use the DH encryption algorithm provided by BluFi to negotiate the key.
   The application layer needs to register several security-related functions to BluFi:
typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t *output_data, int *output_len, bool *need_free)

This function is for ESP32 to receive normal data during negotiation, and after processing is completed, the data will be transmitted using Output_data and Output_len.

BluFi will send output_data from Negotiate_data_handler after Negotiate_data_handler is called.

Here are two "*", because the length of the data to be emitted is unknown that requires the function to allocate itself (malloc) or point to the global variable, and to inform whether the memory needs to be freed by NEED_FREE.

typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int *crypt_len)

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

typedef int (*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int *crypt_len)

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

typedef uint16_t (*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)

This function is used to compute CheckSum and return a value of CheckSum. BluFi uses the returned value to compare the CheckSum of the frame.

4.27.6 GATT Related Instructions

UUID

BluFi Service UUID: 0xFFFF, 16 bit
BluFi (the mobile -> ESP32): 0xFF01, writable
Blufi (ESP32 -> the mobile phone): 0xFF02, readable and callable

4.28 Support for external RAM

4.28.1 Introduction

ESP32 has a few hundred kilobytes of internal RAM, residing on the same die as the rest of the chip components. It can be insufficient for some purposes, so ESP32 has the ability to also use up to 4 MB of external SPI RAM memory. The external memory is incorporated in the memory map and, with certain restrictions, is usable in the same way as internal data RAM.

4.28.2 Hardware

ESP32 supports SPI PSRAM connected in parallel with the SPI flash chip. While ESP32 is capable of supporting several types of RAM chips, the ESP32 SDK only supports the ESP-PSRAM32 chip at the moment.

The ESP-PSRAM32 chip is a 1.8 V device which can only be used in parallel with a 1.8 V flash component. Make sure to either set the MTDI pin to a high signal level on bootup, or program ESP32 eFuses to always use the VDD_SIO level of 1.8 V. Not doing this can damage the PSRAM and/or flash chip.

To connect the ESP-PSRAM32 chip to ESP32D0W*, connect the following signals:
Chapter 4. API Guides

- PSRAM /CE (pin 1) > ESP32 GPIO 16
- PSRAM SO (pin 2) > flash DO
- PSRAM SIO[2] (pin 3) > flash WP
- PSRAM SI (pin 5) > flash DI
- PSRAM SCLK (pin 6) > ESP32 GPIO 17
- PSRAM SIO[3] (pin 7) > flash HOLD
- PSRAM Vcc (pin 8) > ESP32 VCC_SDIO

Connections for ESP32D2W* chips are TBD.

Note: Espressif produces the line of ESP32-WROVER modules which contain ESP32, 1.8 V flash, and ESP-PSRAM32. These modules are ready to be mounted on an end product PCB.

4.28.3 Configuring External RAM

ESP-IDF fully supports the use of external memory in applications. Once the external RAM is initialized at startup, ESP-IDF can be configured to handle it in several ways:

- Integrate RAM into the ESP32 memory map
- Add external RAM to the capability allocator
- Provide external RAM via malloc() (default)
- Allow .bss segment placed in external memory

Integrate RAM into the ESP32 memory map

Select this option by choosing “Integrate RAM into ESP32 memory map” from CONFIG_SPIRAM_USE.

This is the most basic option for external SPI RAM integration. Most likely, you will need another, more advanced option.

During the ESP-IDF startup, external RAM is mapped into the data address space, starting at address 0x3F800000 (byte-accessible). The length of this region is the same as the SPI RAM size (up to the limit of 4 MB).

Applications can manually place data in external memory by creating pointers to this region. So if an application uses external memory, it is responsible for all management of the external SPI RAM: coordinating buffer usage, preventing corruption, etc.

Add external RAM to the capability allocator

Select this option by choosing “Make RAM allocatable using heap_caps_malloc(…, MALLOC_CAP_SPIRAM)” from CONFIG_SPIRAM_USE.

When enabled, memory is mapped to address 0x3F800000 and also added to the capabilities-based heap memory allocator using MALLOC_CAP_SPIRAM.

To allocate memory from external RAM, a program should call heap_caps_malloc(size, MALLOC_CAP_SPIRAM). After use, this memory can be freed by calling the normal free() function.

Provide external RAM via malloc()

Select this option by choosing “Make RAM allocatable using malloc() as well” from CONFIG_SPIRAM_USE. This is the default option.

In this case, memory is added to the capability allocator as described for the previous option. However, it is also added to the pool of RAM that can be returned by the standard malloc() function.

This allows any application to use the external RAM without having to rewrite the code to use heap_caps_malloc(..., MALLOC_CAP_SPIRAM).
An additional configuration item, `CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL`, can be used to set the size threshold when a single allocation should prefer external memory:

- When allocating a size less than the threshold, the allocator will try internal memory first.
- When allocating a size equal to or larger than the threshold, the allocator will try external memory first.

If a suitable block of preferred internal/external memory is not available, the allocator will try the other type of memory.

Because some buffers can only be allocated in internal memory, a second configuration item `CONFIG_SPIRAM_MALLOC_reserve_INTERNAL` defines a pool of internal memory which is reserved for explicitly internal allocations (such as memory for DMA use). Regular `malloc()` will not allocate from this pool. The `MALLOC_CAP_DMA` and `MALLOC_CAP_INTERNAL` flags can be used to allocate memory from this pool.

**Allow .bss segment placed in external memory**

Enable this option by checking `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY`. This configuration setting is independent of the other three.

If enabled, a region of the address space starting from 0x3F800000 will be used to store zero-initialized data (BSS segment) from the lwIP, net80211, libbpc, and bluedroid ESP-IDF libraries.

Additional data can be moved from the internal BSS segment to external RAM by applying the macro `EXT_RAM_ATTR` to any static declaration (which is not initialized to a non-zero value).

This option reduces the internal static memory used by the BSS segment.

Remaining external RAM can also be added to the capability heap allocator using the method shown above.

### 4.28.4 Restrictions

External RAM use has the following restrictions:

- When flash cache is disabled (for example, if the flash is being written to), the external RAM also becomes inaccessible; any reads from or writes to it will lead to an illegal cache access exception. This is also the reason why ESP-IDF does not by default allocate any task stacks in external RAM (see below).
- External RAM cannot be used as a place to store DMA transaction descriptors or as a buffer for a DMA transfer to read from or write into. Any buffers that will be used in combination with DMA must be allocated using `heap_caps_malloc(size, MALLOC_CAP_DMA)` and can be freed using a standard `free()` call.
- External RAM uses the same cache region as the external flash. This means that frequently accessed variables in external RAM can be read and modified almost as quickly as in internal ram. However, when accessing large chunks of data (>32 KB), the cache can be insufficient, and speeds will fall back to the access speed of the external RAM. Moreover, accessing large chunks of data can “push out” cached flash, possibly making the execution of code slower afterwards.
- External RAM cannot be used as task stack memory. Due to this, `xTaskCreate()` and similar functions will always allocate internal memory for stack and task TCBs, and functions such as `xTaskCreateStatic()` will check if the buffers passed are internal. However, for tasks not calling on code in ROM in any way, directly or indirectly, the menuconfig option `CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY` will eliminate the check in `xTaskCreateStatic`, allowing a task’s stack to be in external RAM. Using this is not advised, however.
- By default, failure to initialize external RAM will cause the ESP-IDF startup to abort. This can be disabled by enabling the config item `CONFIG_SPIRAM_IGNORE_NOTFOUND`. If `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY` is enabled, the option to ignore failure is not available as the linker will have assigned symbols to external memory addresses at link time.
- When used at 80 MHz clock speed, external RAM must also occupy either the HSPI or VSPI bus. Select which SPI host will be used by `CONFIG_SPIRAM_OCCUPY_SPI_HOST`. 
4.28.5 Chip revisions

There are some issues with certain revisions of ESP32 that have repercussions for use with external RAM. The issues are documented in the ESP32 ECO document. In particular, ESP-IDF handles the bugs mentioned in the following ways:

ESP32 rev v0

ESP-IDF has no workaround for the bugs in this revision of silicon, and it cannot be used to map external PSRAM into ESP32’s main memory map.

ESP32 rev v1

The bugs in this revision of silicon cause issues if certain sequences of machine instructions operate on external memory. (ESP32 ECO 3.2). As a workaround, the GCC compiler received the flag `-mfix-esp32-psram-cache-issue` to filter these sequences and only output the code that can safely be executed. Enable this flag by checking `CONFIG_SPIRAM_CACHE_WORKAROUND`.

Aside from linking to a recompiled version of Newlib with the additional flag, ESP-IDF also does the following:

- Avoids using some ROM functions
- Allocates static memory for the WiFi stack

4.29 Linker Script Generation

4.29.1 Overview

There are several memory regions where code and data can be placed. Code and read-only data are placed by default in flash, writable data in RAM, etc. However, it is sometimes necessary to change these default placements. For example, it may be necessary to place critical code in RAM for performance reasons or to place code in RTC memory for use in a wake stub or the ULP coprocessor.

With the linker script generation mechanism, it is possible to specify these placements at the component level within ESP-IDF. The component presents information on how it would like to place its symbols, objects or the entire archive. During build the information presented by the components are collected, parsed and processed; and the placement rules generated is used to link the app.

4.29.2 Quick Start

This section presents a guide for quickly placing code/data to RAM and RTC memory - placements ESP-IDF provides out-of-the-box.

For this guide, suppose we have the following:

```
- components/
  - my_component/
    - CMakeLists.txt
    - component.mk
    - Kconfig
    - src/
      - my_src1.c
      - my_src2.c
      - my_src3.c
      - my_linker_fragment_file.lf
```

- a component named `my_component` that is archived as library `libmy_component.a` during build
• three source files archived under the library, my_src1.c, my_src2.c and my_src3.c which are compiled as my_src1.o, my_src2.o and my_src3.o, respectively
• under my_src1.o, the function my_function1 is defined; under my_src2.o, the function my_function2 is defined
• there exist bool-type config PERFORMANCE_MODE (y/n) and int type config PERFORMANCE_LEVEL (with range 0-3) in my_component’s Kconfig

Creating and Specifying a Linker Fragment File

Before anything else, a linker fragment file needs to be created. A linker fragment file is simply a text file with a .lf extension upon which the desired placements will be written. After creating the file, it is then necessary to present it to the build system. The instructions for the build systems supported by ESP-IDF are as follows:

Make In the component’s component.mk file, set the variable COMPONENT_ADD_LDFRAGMENTS to the path of the created linker fragment file. The path can either be an absolute path or a relative path from the component directory.

```
COMPONENT_ADD_LDFRAGMENTS += my_linker_fragment_file.lf
```

CMake In the component’s CMakeLists.txt file, specify argument LDFRAGMENTS in the idf_component_register call. The value of LDFRAGMENTS can either be an absolute path or a relative path from the component directory to the created linker fragment file.

```
# file paths relative to CMakeLists.txt
idf_component_register(...
    LDFRAGMENTS "path/to/linker_fragment_file.lf" "path/to/
    another_linker_fragment_file.lf"
    ...)
```

Specifying placements

It is possible to specify placements at the following levels of granularity:

• object file (.obj or .o files)
• symbol (function/variable)
• archive (.a files)

Placing object files Suppose the entirety of my_src1.o is performance-critical, so it is desirable to place it in RAM. On the other hand, the entirety of my_src2.o contains symbols needed coming out of deep sleep, so it needs to be put under RTC memory. In the the linker fragment file, we can write:

```
[mapping:my_component]
archive: libmy_component.a
entries:
    my_src1 (noflash)    # places all my_src1 code/read-only data under IRAM/DRAM
    my_src2 (rtc)        # places all my_src2 code/data and read-only data under...
                         # RTC fast memory/RTC slow memory
```

What happens to my_src3.o? Since it is not specified, default placements are used for my_src3.o. More on default placements here.
Placing symbols  Continuing our example, suppose that among functions defined under object1.o, only my_function1 is performance-critical; and under object2.o, only my_function2 needs to execute after the chip comes out of deep sleep. This could be accomplished by writing:

```
[mapping:my_component]
archive: libmy_component.a
entries:
  my_src1:my_function1 (noflash)
  my_src2:my_function2 (rtc)
```

The default placements are used for the rest of the functions in my_src1.o and my_src2.o and the entire object3.o. Something similar can be achieved for placing data by writing the variable name instead of the function name, like so:

```
my_src1:my_variable (noflash)
```

Warning: There are limitations in placing code/data at symbol granularity. In order to ensure proper placements, an alternative would be to group relevant code and data into source files, and use object-granularity placements.

Placing entire archive  In this example, suppose that the entire component archive needs to be placed in RAM. This can be written as:

```
[mapping:my_component]
archive: libmy_component.a
entries:
  * (noflash)
```

Similarly, this places the entire component in RTC memory:

```
[mapping:my_component]
archive: libmy_component.a
entries:
  * (rtc)
```

Configuration-dependent placements  Suppose that the entire component library should only have special placement when a certain condition is true; for example, when CONFIG_PERFORMANCE_MODE == y. This could be written as:

```
[mapping:my_component]
archive: libmy_component.a
entries:
  if PERFORMANCE_MODE == y:
    * (noflash)
  else:
    * (default)
```

For a more complex config-dependent placement, suppose the following requirements: when CONFIG_PERFORMANCE_LEVEL == 1, only object1.o is put in RAM; when CONFIG_PERFORMANCE_LEVEL == 2, object1.o and object2.o; and when CONFIG_PERFORMANCE_LEVEL == 3 all object files under the archive are to be put into RAM. When these three are false however, put entire library in RTC memory. This scenario is a bit contrived, but, it can be written as:

```
[mapping:my_component]
archive: libmy_component.a
entries:
  if PERFORMANCE_LEVEL == 1:
    (continues on next page)
```
my_src1 (noflash)
elif PERFORMANCE_LEVEL = 2:
    my_src1 (noflash)
    my_src2 (noflash)
elif PERFORMANCE_LEVEL = 3:
    my_src1 (noflash)
    my_src2 (noflash)
    my_src3 (noflash)
else:
    * (rtc)

Nesting condition-checking is also possible. The following is equivalent to the snippet above:

[mapping:my_component]
archive: libmy_component.a
entries:
    if PERFORMANCE_LEVEL <= 3 && PERFORMANCE_LEVEL > 0:
        if PERFORMANCE_LEVEL >= 1:
            object1 (noflash)
            if PERFORMANCE_LEVEL >= 2:
                object2 (noflash)
                if PERFORMANCE_LEVEL >= 3:
                    object2 (noflash)
        else:
            * (rtc)

The ‘default’ placements

Up until this point, the term ‘default placements’ has been mentioned as fallback placements for when the placement rules rtc and noflash are not specified. It is important to note that the tokens noflash or rtc are not merely keywords, but are actually entities called fragments, specifically schemes.

In the same manner as rtc and noflash are schemes, there exists a default scheme which defines what the default placement rules should be. As the name suggests, it is where code and data are usually placed, i.e. code/consts are placed in flash, variables placed in RAM, etc. More on the default scheme here.

Note: For an example of an ESP-IDF component using the linker script generation mechanism, see freertos/CMakeLists.txt. freertos uses this to place its object files to the instruction RAM for performance reasons.

This marks the end of the quick start guide. The following text discusses the internals of the mechanism in a little bit more detail. The following sections should be helpful in creating custom placements or modifying default behavior.

4.29.3 Linker Script Generation Internals

Linking is the last step in the process of turning C/C++ source files into an executable. It is performed by the toolchain’s linker, and accepts linker scripts which specify code/data placements, among other things. With the linker script generation mechanism, this process is no different, except that the linker script passed to the linker is dynamically generated from: (1) the collected linker fragment files and (2) linker script template.

Note: The tool that implements the linker script generation mechanism lives under tools/ldgen.
Chapter 4. API Guides

Linker Fragment Files

As mentioned in the quick start guide, fragment files are simple text files with the .lf extension containing the desired placements. This is a simplified description of what fragment files contain, however. What fragment files actually contain are ‘fragments’. Fragments are entities which contain pieces of information which, when put together, form placement rules that tell where to place sections of object files in the output binary. There are three types of fragments: sections, scheme and mapping.

Grammar  The three fragment types share a common grammar:

```
[type:name]
key: value
key:
  value
  value
  ...
```

- **type**: Corresponds to the fragment type, can either be sections, scheme or mapping.
- **name**: The name of the fragment, should be unique for the specified fragment type.
- **key, value**: Contents of the fragment; each fragment type may support different keys and different grammars for the key values.

**Note**: In cases where multiple fragments of the same type and name are encountered, an exception is thrown.

**Note**: The only valid characters for fragment names and keys are alphanumeric characters and underscore.

Condition Checking

Condition checking enable the linker script generation to be configuration-aware. Depending on whether expressions involving configuration values are true or not, a particular set of values for a key can be used. The evaluation uses eval_string from tools/kconfig_new/kconfiglib.py and adheres to its required syntax and limitations. Supported operators are as follows:

- **comparison**
  - LessThan <
  - LessThanOrEqualTo <=
  - MoreThan >
  - MoreThanOrEqualTo >=
  - Equal =
  - NotEqual !=

- **logical**
  - Or ||
  - And &&
  - Negation !

- **grouping**
  - Parenthesis ()

Condition checking behaves as you would expect an if...elseif/elif...else block in other languages. Condition-checking is possible for both key values and entire fragments. The two sample fragments below are equivalent:

```
# Value for keys is dependent on config
[type:name]
key_1:
  if CONDITION = y:
    value_1
```

(continues on next page)
else:
    value_2

key_2:
    if CONDITION = y:
        value_a
    else:
        value_b

# Entire fragment definition is dependent on config
if CONDITION = y:
    [type:name]
    key_1:
        value_1
    key_2:
        value_b
else:
    [type:name]
    key_1:
        value_2
    key_2:
        value_b

Comments

Comment in linker fragment files begin with #. Like in other languages, comments are used to provide helpful descriptions and documentation and are ignored during processing.

Compatibility with ESP-IDF v3.x Linker Script Fragment Files

ESP-IDF v4.0 brings some changes to the linker script fragment file grammar:

- indentation is enforced and improperly indented fragment files generate a parse exception; this was not enforced in the old version but previous documentation and examples demonstrate properly indented grammar
- move to if...elif...else structure for conditionals, with the ability to nest checks and place entire fragments themselves inside conditionals
- mapping fragments now requires a name like other fragment types

Linker script generator should be able to parse ESP-IDF v3.x linker fragment files that are indented properly (as demonstrated by the ESP-IDF v3.x version of this document). Backward compatibility with the previous mapping fragment grammar (optional name and the old grammar for conditionals) has also been retained but with a deprecation warning. Users should switch to the newer grammar discussed in this document as support for the old grammar is planned to be removed in the future.

Note that linker fragment files using the new ESP-IDF v4.0 grammar is not supported on ESP-IDF v3.x, however.

Types

Sections

Sections fragments defines a list of object file sections that the GCC compiler emits. It may be a default section (e.g. .text, .data) or it may be user defined section through the __attribute__ keyword.

The use of an optional ‘+’ indicates the inclusion of the section in the list, as well as sections that start with it. This is the preferred method over listing both explicitly.

[sections:name]
entries:
    .section+
    .section
    ...

Example:
Scheme

Scheme fragments define what target a sections fragment is assigned to.

Example:

```
[scheme:noflash]
entries:
  text -> iram0_text # the entries under the sections fragment named...
  rodata -> dram0_data # the entries under the sections fragment named...
```

The default scheme

There exists a special scheme with the name default. This scheme is special because catch-all placement rules are generated from its entries. This means that, if one of its entries is text -> flash_text, the placement rule

```
*(.literal .literal.* .text .text.*)
```

will be generated for the target flash_text.

These catch-all rules then effectively serve as fallback rules for those whose mappings were not specified.

Note: The default scheme is defined in esp32/ld/esp32_fragments.lf. The noflash and rtc scheme fragments which are built-in schemes referenced in the quick start guide are also defined in this file.

Mapping

Mapping fragments define what scheme fragment to use for mappable entities, i.e. object files, function names, variable names, archives.

```
[mapping:name]
archive: archive # output archive file name, as built (i.e. libxxx.
  --a)
entries:
  object:symbol (scheme) # symbol granularity
  object (scheme) # object granularity
  * (scheme) # archive granularity
```

There are three levels of placement granularity:
Chapter 4. API Guides

- symbol: The object file name and symbol name are specified. The symbol name can be a function name or a variable name.
- object: Only the object file name is specified.
- archive: * is specified, which is a short-hand for all the object files under the archive.

To know what an entry means, let us expand a sample object-granularity placement:

```plaintext
object (scheme)
```

Then expanding the scheme fragment from its entries definitions, we have:

```plaintext
object (sections -> target,
sections -> target,
...)
```

Expanding the sections fragment with its entries definition:

```plaintext
object (.section, # given this object file
  .section, # put its sections listed here at this
  ... -> target, # target
  .section,
  .section, # same should be done for these sections
  ... -> target,
  ...
  ...) # and so on
```

Example:

```plaintext
[mapping:map]
archive: libfreertos.a
entries:
  * (noflash)
```

**On Symbol-Granularity Placements** Symbol granularity placements is possible due to compiler flags `-ffunction-sections` and `-fddata-sections`. ESP-IDF compiles with these flags by default. If the user opts to remove these flags, then the symbol-granularity placements will not work. Furthermore, even with the presence of these flags, there are still other limitations to keep in mind due to the dependence on the compiler’s emitted output sections.

For example, with `-ffunction-sections`, separate sections are emitted for each function; with section names predictably constructed i.e. `.text.{func_name}` and `.literal.{func_name}`. This is not the case for string literals within the function, as they go to pooled or generated section names.

With `-fddata-sections`, for global scope data the compiler predictably emits either `.data.{var_name}`, `.rodata.{var_name}` or `.bss.{var_name}`; and so Type I mapping entry works for these. However, this is not the case for static data declared in function scope, as the generated section name is a result of mangling the variable name with some other information.

**Linker Script Template**

The linker script template is the skeleton in which the generated placement rules are put into. It is an otherwise ordinary linker script, with a specific marker syntax that indicates where the generated placement rules are placed.

To reference the placement rules collected under a `target` token, the following syntax is used:

```plaintext
mapping[target]
```

Example:
The example below is an excerpt from a possible linker script template. It defines an output section `.iram0.text`, and inside is a marker referencing the target `.iram0_text`.

```
.iram0.text :
{
    /* Code marked as running out of IRAM */
    _iram_text_start = ABSOLUTE(.);
    /* Marker referencing .iram0_text */
    mapping[iram0_text]
    _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg
```

Suppose the generator collected the fragment definitions below:

```
[sections:text]
 .text+ 
 .literal+
[sections:iram]
 .iram1+
[scheme:default]
 entries:
    text -> flash_text
    iram -> iram0_text
[scheme:noflash]
 entries:
    text -> iram0_text
[mapping:freertos]
 archive: libfreertos.a
 entries:
    * (noflash)
```

Then the corresponding excerpt from the generated linker script will be as follows:

```
.iram0.text :
{
    /* Code marked as running out of IRAM */
    _iram_text_start = ABSOLUTE(.);
    /* Placement rules generated from the processed fragments, placed where the
    marker was in the template */
    *(.iram1 .iram1.*)
    *(libfreertos.a:(.literal .text .literal.* .text.*)
    _iram_text_end = ABSOLUTE(.);
} > iram0_0_seg
```

*libfreertos.a:(.literal .text .literal.* .text.*)

Rule generated from the entry * (noflash) of the freertos mapping fragment. All text sections of all object files under the archive libfreertos.a will be collected under the target iram0_text (as per the noflash scheme) and placed wherever in the template iram0_text is referenced by a marker.

*(.iram1 .iram1.*)

Rule generated from the default scheme entry iram -> iram0_text. Since the default scheme specifies an iram -> iram0_text entry, it too is placed wherever iram0_text is referenced
Chapter 4. API Guides

by a marker. Since it is a rule generated from the default scheme, it comes first among all other rules collected under the same target name.

Note: The linker script template currently used is esp32/ld/esp32.project.ld.in, specified by the esp32 component; the generated output script is put under its build directory.

4.30 Tools

4.30.1 IDF Docker Image

IDF Docker image (espressif/idf) is intended for building applications and libraries with specific versions of ESP-IDF, when doing automated builds.

The image contains:

- Common utilities such as git, wget, curl, zip.
- Python 3.6 or newer.
- A copy of a specific version of ESP-IDF (see below for information about versions). IDF_PATH environment variable is set, and points to ESP-IDF location in the container.
- All the build tools required for the specific version of ESP-IDF: CMake, make, ninja, cross-compiler toolchains, etc.
- All Python packages required by ESP-IDF are installed in a virtual environment.

The image entrypoint sets up PATH environment variable to point to the correct version of tools, and activates the Python virtual environment. As a result, the environment is ready to use the ESP-IDF build system.

The image can also be used as a base for custom images, if additional utilities are required.

Tags

Multiple tags of this image are maintained:

- latest: tracks master branch of ESP-IDF
- vX.Y: corresponds to ESP-IDF release vX.Y
- release-vX.Y: tracks release/vX.Y branch of ESP-IDF

Note: Versions of ESP-IDF released before this feature was introduced do not have corresponding Docker image versions. You can check the up-to-date list of available tags at https://hub.docker.com/r/espressif/idf/tags.

Usage

Setting up Docker Before using the espressif/idf Docker image locally, make sure you have Docker installed. Follow the instructions at https://docs.docker.com/install/, if it is not installed yet.

If using the image in CI environment, consult the documentation of your CI service on how to specify the image used for the build process.

Building a project with CMake In the project directory, run:

docker run --rm -v $PWD:/project -w /project espressif/idf idf.py build

The above command explained:

- docker run: runs a Docker image. It is a shorter form of the command docker container run.
- --rm: removes the container when the build is finished
Chapter 4. API Guides

- \(-v \, $PWD:/project\): mounts the current directory on the host ($PWD) as /project directory in the container
- \(\text{espressif/idf}\): uses Docker image \text{espressif/idf} with tag latest (implicitly added by Docker when no tag is specified)
- \(\text{idf.py build}\): runs this command inside the container

To build with a specific docker image tag, specify it as \text{espressif/idf:TAG}:

```
docker run --rm -v $PWD:/project -w /project espressif/idf:v4.0 idf.py build
```

**Note:** At the time of writing, v4.0 release of ESP-IDF does not exist, yet, so the above command will not work. You can check the up-to-date list of available tags at [https://hub.docker.com/r/espressif/idf/tags](https://hub.docker.com/r/espressif/idf/tags).

---

**Building a project with GNU Make**  
Same as for CMake, except that the build command is different:

```
docker run --rm -v $PWD:/project -w /project espressif/idf make defconfig all -j4
```

**Note:** If the \text{sdkconfig} file does not exist, the default behavior of GNU Make build system is to open the menuconfig UI. This may be not desired in automated build environments. To ensure that the \text{sdkconfig} file exists, \text{defconfig} target is added before \text{all}.

---

**Using the image interactively**  
It is also possible to do builds interactively, to debug build issues or test the automated build scripts. Start the container with \(-i\, -t\) flags:

```
docker run --rm -v $PWD:/project -w /project -it espressif/idf
```

Then inside the container, use \text{idf.py} as usual:

```
idf.py menuconfig
idf.py build
```

**Note:** Commands which communicate with the development board, such as \text{idf.py flash} and \text{idf.py monitor} will not work in the container unless the serial port is passed through into the container. However currently this is not possible with Docker for Windows ([https://github.com/docker/for-win/issues/1018](https://github.com/docker/for-win/issues/1018)) and Docker for Mac ([https://github.com/docker/for-mac/issues/900](https://github.com/docker/for-mac/issues/900)).
Chapter 5

Libraries and Frameworks

5.1 Cloud Frameworks

ESP32 supports multiple cloud frameworks using agents built on top of ESP-IDF. Here are the pointers to various supported cloud frameworks’ agents and examples:

5.1.1 AWS IoT

https://github.com/espressif/esp-aws-iot is an open source repository for ESP32 based on Amazon Web Services’ aws-iot-device-sdk-embedded-C.

5.1.2 Azure IoT

https://github.com/espressif/esp-azure is an open source repository for ESP32 based on Microsoft Azure’s azure-iot-sdk-c SDK.

5.1.3 Google IoT Core

https://github.com/espressif/esp-google-iot is an open source repository for ESP32 based on Google’s iot-device-sdk-embedded-c SDK.
Chapter 6

Contributions Guide

We welcome contributions to the esp-idf project!

6.1 How to Contribute

Contributions to esp-idf - fixing bugs, adding features, adding documentation - are welcome. We accept contributions via Github Pull Requests.

6.2 Before Contributing

Before sending us a Pull Request, please consider this list of points:

- Is the contribution entirely your own work, or already licensed under an Apache License 2.0 compatible Open Source License? If not then we unfortunately cannot accept it.
- Does any new code conform to the esp-idf Style Guide?
- Does the code documentation follow requirements in Documenting Code?
- Is the code adequately commented for people to understand how it is structured?
- Is there documentation or examples that go with code contributions? There are additional suggestions for writing good examples in examples readme.
- Are comments and documentation written in clear English, with no spelling or grammar errors?
- Example contributions are also welcome. Please check the Creating Examples guide for these.
- If the contribution contains multiple commits, are they grouped together into logical changes (one major change per pull request)? Are any commits with names like “fixed typo” squashed into previous commits?
- If you’re unsure about any of these points, please open the Pull Request anyhow and then ask us for feedback.

6.3 Pull Request Process

After you open the Pull Request, there will probably be some discussion in the comments field of the request itself. Once the Pull Request is ready to merge, it will first be merged into our internal git system for in-house automated testing.

If this process passes, it will be merged onto the public github repository.

6.4 Legal Part

Before a contribution can be accepted, you will need to sign our Contributor Agreement. You will be prompted for this automatically as part of the Pull Request process.

6.5.1 Espressif IoT Development Framework Style Guide

About this guide

Purpose of this style guide is to encourage use of common coding practices within the ESP-IDF.

Style guide is a set of rules which are aimed to help create readable, maintainable, and robust code. By writing code which looks the same way across the code base we help others read and comprehend the code. By using same conventions for spaces and newlines we reduce chances that future changes will produce huge unreadable diffs. By following common patterns for module structure and by using language features consistently we help others understand code behavior.

We try to keep rules simple enough, which means that they can not cover all potential cases. In some cases one has to bend these simple rules to achieve readability, maintainability, or robustness.

When doing modifications to third-party code used in ESP-IDF, follow the way that particular project is written. That will help propose useful changes for merging into upstream project.

C code formatting

Indentation

Use 4 spaces for each indentation level. Don’t use tabs for indentation. Configure the editor to emit 4 spaces each time you press tab key.

Vertical space

Place one empty line between functions. Don’t begin or end a function with an empty line.

```c
void function1()
{
    do_one_thing();
    do_another_thing();
        // INCORRECT, don't place empty line here
}

// place empty line here

void function2()
{
    int var = 0;
    while (var < SOME_CONSTANT) {
        do_stuff(&var);
    }
}
```

Horizontal space

Always add single space after conditional and loop keywords:

```c
if (condition) {  // correct
    // ...
}

switch (n) {     // correct
    case 0:
        // ...
}

for(int i = 0; i < CONST; ++i) {  // INCORRECT
    // ...
}
```
Add single space around binary operators. No space is necessary for unary operators. It is okay to drop space around multiply and divide operators:

```c
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);  // correct
const int y = y0 + (x - x0) * (y1 - y0) / (x1 - x0);  // also okay
int y_cur = -y;
++y_cur;
const int y = y0 + (x-x0) * (y1-y0) / (x1-x0);  // INCORRECT
```

No space is necessary around . and -> operators.

Sometimes adding horizontal space within a line can help make code more readable. For example, you can add space to align function arguments:

```c
gpio_matrix_in(PIN_CAM_D6, I2S0I_DATA_IN14_IDX, false);
gpio_matrix_in(PIN_CAM_D7, I2S0I_DATA_IN15_IDX, false);
gpio_matrix_in(PIN_CAM_HREF, I2S0I_H_ENABLE_IDX, false);
gpio_matrix_in(PIN_CAM_PCLK, I2S0I_DATA_IN15_IDX, false);
```

Note however that if someone goes to add new line with a longer identifier as first argument (e.g. PIN_CAM_VSYNC), it will not fit. So other lines would have to be realigned, adding meaningless changes to the commit.

Therefore, use horizontal alignment sparingly, especially if you expect new lines to be added to the list later.

Never use TAB characters for horizontal alignment.

Never add trailing whitespace at the end of the line.

**Braces**

- Function definition should have a brace on a separate line:

```c
// This is correct:
void function(int arg) {
}

// NOT like this:
void function(int arg) {
}
```

- Within a function, place opening brace on the same line with conditional and loop statements:

```c
if (condition) {
    do_one();
} else if (other_condition) {
    do_two();
}
```

**Comments**

Use // for single line comments. For multi-line comments it is okay to use either // on each line or a /* */ block.

Although not directly related to formatting, here are a few notes about using comments effectively.

- Don’t use single comments to disable some functionality:
### Contributions Guide

#### void init_something()
```c
void init_something()
{
    setup_dma();
    // load_resources(); // WHY is this thing commented, asks the reader?
    start_timer();
}
```

- If some code is no longer required, remove it completely. If you need it you can always look it up in git history of this file. If you disable some call because of temporary reasons, with an intention to restore it in the future, add explanation on the adjacent line:

```c
void init_something()
{
    setup_dma();
    // TODO: we should load resources here, but loader is not fully integrated yet.
    // load_resources();
    start_timer();
}
```

- Same goes for `#if 0 ... #endif` blocks. Remove code block completely if it is not used. Otherwise, add comment explaining why the block is disabled. Don’t use `#if 0 ... #endif` or comments to store code snippets which you may need in the future.

- Don’t add trivial comments about authorship and change date. You can always look up who modified any given line using git. E.g. this comment adds clutter to the code without adding any useful information:

```c
void init_something()
{
    setup_dma();
    // XXX add 2016-09-01
    init_dma_list();
    fill_dma_item(0);
    // end XXX add
    start_timer();
}
```

#### Line Endings
Commits should only contain files with LF (Unix style) endings.

Windows users can configure git to check out CRLF (Windows style) endings locally and commit LF endings by setting the `core.autocrlf` setting. [Github has a document about setting this option](https://github.com). However because MSYS2 uses Unix-style line endings, it is often easier to configure your text editor to use LF (Unix style) endings when editing ESP-IDF source files.

If you accidentally have some commits in your branch that add LF endings, you can convert them to Unix by running this command in an MSYS2 or Unix terminal (change directory to the IDF working directory and check the correct branch is currently checked out, beforehand):

```bash
git rebase --exec 'git diff-tree --no-commit-id --name-only -r HEAD | xargs --dos2unix && git commit -a --amend --no-edit --allow-empty' master
```

(Note that this line rebase on master, change the branch name at the end to rebase on another branch.)

For updating a single commit, it’s possible to run `dos2unix FILENAME` and then run `git commit --amend`

#### Formatting your code
You can use astyle program to format your code according to the above recommendations.

If you are writing a file from scratch, or doing a complete rewrite, feel free to re-format the entire file. If you are changing a small portion of file, don’t re-format the code you didn’t change. This will help others when they review your changes.
To re-format a file, run:

```
tools/format.sh components/my_component/file.c
```

**CMake Code Style**

- Indent with four spaces.
- Maximum line length 120 characters. When splitting lines, try to focus on readability where possible (for example, by pairing up keyword/argument pairs on individual lines).
- Don’t put anything in the optional parentheses after `endforeach()`, `endif()`, etc.
- Use lowercase (`with_underscores`) for command, function, and macro names.
- For locally scoped variables, use lowercase (`with_underscores`).
- For globally scoped variables, use uppercase (`WITH_UNDERSCORES`).
- Otherwise follow the defaults of the `cmake-lint` project.

**Configuring the code style for a project using EditorConfig**

EditorConfig helps developers define and maintain consistent coding styles between different editors and IDEs. The EditorConfig project consists of a file format for defining coding styles and a collection of text editor plugins that enable editors to read the file format and adhere to defined styles. EditorConfig files are easily readable and they work nicely with version control systems.

For more information, see EditorConfig Website.

**Documenting code**

Please see the guide here: Documenting Code.

**Naming**

- Any variable or function which is only used in a single source file should be declared `static`.
- Public names (non-static variables and functions) should be namespaced with a per-component or per-unit prefix, to avoid naming collisions. i.e `esp_vfs_register()` or `esp_console_run()`. Starting the prefix with `esp_` for Espressif-specific names is optional, but should be consistent with any other names in the same component.
- Static variables should be prefixed with `s_` for easy identification. For example, `static bool s_invert`.
- Avoid unnecessary abbreviations (i.e shortening `data` to `dat`), unless the resulting name would otherwise be very long.

**Structure**

To be written.

**Language features**

To be written.

### 6.5.2 Documenting Code

The purpose of this description is to provide quick summary on documentation style used in `espressif/esp-idf` repository and how to add new documentation.
Introduction

When documenting code for this repository, please follow Doxygen style. You are doing it by inserting special commands, for instance @param, into standard comments blocks, for example:

```c
/**
 * @param ratio this is oxygen to air ratio
 */
```

Doxygen is phrasing the code, extracting the commands together with subsequent text, and building documentation out of it.

Typical comment block, that contains documentation of a function, looks like below.

![Function Prototype]

Doxygen supports couple of formatting styles. It also gives you great flexibility on level of details to include in documentation. To get familiar with available features, please check data rich and very well organized Doxygen Manual.

Why we need it?

The ultimate goal is to ensure that all the code is consistently documented, so we can use tools like Sphinx and Breathe to aid preparation and automatic updates of API documentation when the code changes.

With these tools the above piece of code renders like below:

![Code Rendered]

Go for it!

When writing code for this repository, please follow guidelines below.
1. Document all building blocks of code: functions, structs, typedefs, enums, macros, etc. Provide enough information on purpose, functionality and limitations of documented items, as you would like to see them documented when reading the code by others.

2. Documentation of function should describe what this function does. If it accepts input parameters and returns some value, all of them should be explained.

3. Do not add a data type before parameter or any other characters besides spaces. All spaces and line breaks are compressed into a single space. If you like to break a line, then break it twice.

4. If function has void input or does not return any value, then skip @param or @return

5. When documenting a define as well as members of a struct or enum, place specific comment like below after each member.
6. To provide well formatted lists, break the line after command (like @return in example below).

```
* @return
  * ESP_OK if erase operation was successful
  * ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
  * ESP_ERR_NVS_READ_ONLY if handle was opened as read only
  * ESP_ERR_NVS_NOT_FOUND if the requested key doesn't exist
  * other error codes from the underlying storage driver
```

7. Overview of functionality of documented header file, or group of files that make a library, should be placed in the same directory in a separate README.rst file. If directory contains header files for different APIs, then the file name should be apiname-readme.rst.

**Go one extra mile**

There is couple of tips, how you can make your documentation even better and more useful to the reader.

1. Add code snippets to illustrate implementation. To do so, enclose snippet using @code{c} and @endcode commands.

```
* @code{c}
  */
  // Example of using nvs_get_i32:
  int32_t max_buffer_size = 4096; // default value
  esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
  assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
  // if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
  // have its default value.
* @endcode
```

The code snippet should be enclosed in a comment block of the function that it illustrates.

2. To highlight some important information use command @attention or @note.

```
* @attention
  * 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
  * 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to...
```

Above example also shows how to use a numbered list.

3. To provide common description to a group of similar functions, enclose them using /**@{*/ and /**@}*/ markup commands:

```
/**@{
 /**
  * @brief common description of similar functions
```

(continues on next page)
void first_similar_function (void);
void second_similar_function (void);
/** @@ */

For practical example see nvs_flash/include/nvs.h.

4. You may want to go even further and skip some code like e.g. repetitive defines or enumerations. In such case enclose the code within /** @cond */ and /** @endcond */ commands. Example of such implementation is provided in driver/include/driver/gpio.h.

5. Use markdown to make your documentation even more readable. You will add headers, links, tables and more.

6. Prepare one or more complete code examples together with description. Place description in a separate file README.md in specific folder of examples directory.

**Linking Examples**

When linking to examples on GitHub do not use absolute / hardcoded URLs. Instead, use docutils custom roles that will generate links for you. These auto-generated links point to the tree or blob for the git commit ID (or tag) of the repository. This is needed to ensure that links do not get broken when files in master branch are moved around or deleted.

The following roles are provided:

- :idf:`path` - points to directory inside ESP-IDF
- :idf_file:`path` - points to file inside ESP-IDF
- :idf_raw:`path` - points to raw view of the file inside ESP-IDF
- :component:`path` - points to directory inside ESP-IDF components dir
- :component_file:`path` - points to file inside ESP-IDF components dir
- :component_raw:`path` - points to raw view of the file inside ESP-IDF components dir
- :example:`path` - points to directory inside ESP-IDF examples dir
- :example_file:`path` - points to file inside ESP-IDF examples dir
- :example_raw:`path` - points to raw view of the file inside ESP-IDF examples dir

Example implementation:

```
* :example:`get-started/hello_world`
* :example:`Hello World! <get-started/hello_world>`
```

How it renders:

- get-started/hello_world
- Hello World!

A check is added to the CI build script, which searches RST files for presence of hard-coded links (identified by tree/master, blob/master, or raw/master part of the URL). This check can be run manually: cd docs and then make gh-linkcheck.
Chapter 6. Contributions Guide

Linking Language Versions

Switching between documentation in different languages may be done using `:link_to_translation:` custom role. The role placed on a page of documentation provides a link to the same page in a language specified as a parameter. Examples below show how to enter links to Chinese and English versions of documentation:

```
:link_to_translation:`zh_CN:  中文版`
:link_to_translation:`en:English`
```

The language is specified using standard abbreviations like `en` or `zh_CN`. The text after last semicolon is not standardized and may be entered depending on the context where the link is placed, e.g.:

```
:link_to_translation:`en:see description in English`
```

Add Illustrations

Consider adding diagrams and pictures to illustrate described concepts. Sometimes it is better to add an illustration than writing a lengthy paragraph to describe a complex idea, a data structure or an algorithm. This repository is using `blockdiag` suite of tools to generate diagram images from simple text files.

The following types of diagrams are supported:

- Block diagram
- Sequence diagram
- Activity diagram
- Logical network diagram

With this suite of tools it is possible to generate beautiful diagram images from simple text format (similar to graphviz’s DOT format). The diagram elements are laid out automatically. The diagram code is then converted into “.png” graphics and integrated “behind the scenes” into Sphinx documents.

For the diagram preparation you can use an on-line interactive shell that instantly shows the rendered image.

Below are couple of diagram examples:

- Simple block diagram / `blockdiag - Wi-Fi Buffer Configuration`
- Slightly more complicated block diagram / `blockdiag - Wi-Fi programming model`
- Sequence diagram / `seqdiag - Scan for a Specific AP in All Channels`
- Packet diagram / `packetdiag - NVS Page Structure`

Try them out by modifying the source code and see the diagram instantly rendering below.

Note: There may be slight differences in rendering of font used by the interactive shell compared to the font used in the esp-idf documentation.

Add Notes

Working on a document, you might need to:

- Place some suggestions on what should be added or modified in future.
- Leave a reminder for yourself or somebody else to follow up.

In this case, add a todo note to your reST file using the directive `.. todo::`. For example:

```
.. todo::
    Add a package diagram.
```
If you add .. todolist:: to a reST file, the directive will be replaced by a list of all todo notes from the whole documentation.

By default, the directives .. todo:: and .. todolist:: are ignored by documentation builders. If you want the notes and the list of notes to be visible in your locally built documentation, do the following:

1. Open your local conf_common.py file.
2. Find the parameter todo_include_todos.
3. Change its value from False to True.

Before pushing your changes to origin, please set the value of todo_include_todos back to False.

For more details about the extension, see sphinx.ext.todo documentation.

Put it all together

Once documentation is ready, follow instruction in API Documentation Template and create a single file, that will merge all individual pieces of prepared documentation. Finally add a link to this file to respective .. toctree:: in index.rst file located in /docs folder or subfolders.

OK, but I am new to Sphinx!

1. No worries. All the software you need is well documented. It is also open source and free. Start by checking Sphinx documentation. If you are not clear how to write using rst markup language, see reStructuredText Primer. You can also use markdown (.md) files, and find out about more about the specific markdown syntax that we use on Recommonmark parser’s documentation page <https://recommonmark.readthedocs.io/en/latest/>.
2. Check the source files of this documentation to understand what is behind of what you see now on the screen. Sources are maintained on GitHub in espressif/esp-idf repository in docs folder. You can go directly to the source file of this page by scrolling up and clicking the link in the top right corner. When on GitHub, see what’s really inside, open source files by clicking Raw button.
3. You will likely want to see how documentation builds and looks like before posting it on the GitHub. There are two options to do so:
   • Install Sphinx, Breathe, Blockdiag and Doxygen to build it locally, see chapter below.
   • Set up an account on Read the Docs and build documentation in the cloud. Read the Docs provides document building and hosting for free and their service works really quick and great.
4. To preview documentation before building, use Sublime Text editor together with OmniMarkupPreviewer plugin.

Setup for building documentation locally

Install Dependencies You can setup environment to build documentation locally on your PC by installing:

1. Doxygen - https://www.stack.nl/~dimitri/doxygen/

The package “sphinx_rtd_theme” is added to have the same “look and feel” of ESP32 Programming Guide documentation like on the “Read the Docs” hosting site.

Do not worry about being confronted with several packages to install. Besides Doxygen, all remaining packages are written in Python. Therefore installation of all of them is combined into one simple step.

Installation of Doxygen is OS dependent:

Linux
Chapter 6. Contributions Guide

```
sudo apt-get install doxygen
```

**Windows** - install in MSYS2 console

```
pacman -S doxygen
```

**MacOS**

```
brew install doxygen
```

**Note:** If you are installing on Windows MSYS2 system (Linux and MacOS users should skip this note, Windows users who don’t use MSYS2 will need to find other alternatives), **before** going further, execute two extra steps below. These steps are required to install dependencies of “blockdiag” discussed under *Add Illustrations*.

1. Update all the system packages:

   ```
   $ pacman -Syu
   ```

   This process will likely require restarting of the MSYS2 MINGW32 console and repeating above commands, until update is complete.

2. Install pillow, that is one of dependences of the blockdiag:

   ```
   $ pacman -S mingw32/mingw-w64-i686-python2-pillow
   ```

   Check the log on the screen that mingw-w64-i686-python2-pillow-4.3.0-1 is installed. Previous versions of pillow will not work.

A downside of Windows installation is that fonts of the blockdiag pictures `<add-illustrations>` do not render correctly, you will see some random characters instead. Until this issue is fixed, you can use the interactive shell to see how the complete picture looks like.

All remaining applications are Python packages and you can install them in one step as follows:

```
cd ~/esp/esp-idf/docs
pip install --user -r requirements.txt
```

**Note:** Installation steps assume that ESP-IDF is placed in ~/esp/esp-idf directory, that is default location of ESP-IDF used in documentation.

Change to directory with files for specific language:

```
cd en
```

Now you should be ready to build documentation by invoking:

```
make html
```

This may take couple of minutes. After completion, documentation will be placed in ~/esp/esp-idf/docs/en/_build/html folder. To see it, open index.html in a web browser.

**Wrap up**

We love good code that is doing cool things. We love it even better, if it is well documented, so we can quickly make it run and also do the cool things.

Go ahead, contribute your code and documentation!

6.5.3 Documentation Add-ons and Extensions Reference

This documentation is created using `Sphinx` application that renders text source files in `reStructuredText (.rst)` format located in `docs` directory. For some more details on that process, please refer to section Documenting Code.

Besides Sphinx there are several other applications that help to provide nicely formatted and easy to navigate documentation. These applications are listed in section Setup for building documentation locally with the installed version numbers provided in file `docs/requirements.txt`.

On top of that we have created a couple of custom add-ons and extensions to help integrate documentation with underlining ESP-IDF repository and further improve navigation as well as maintenance of documentation.

The purpose of this section is to provide a quick reference to the add-ons and the extensions.

Documentation Folder Structure

- The ESP-IDF repository contains a dedicated documentation folder `docs` in the root.
- The `docs` folder contains localized documentation in `docs/en` (English) and `docs/zh_CN` (simplified Chinese) subfolders.
- Graphics files and fonts common to localized documentation are contained in `docs/_static` subfolder
- Remaining files in the root of `docs` as well as `docs/en` and `docs/zh_CN` provide configuration and scripts used to automate documentation processing including the add-ons and extensions.
- Several folders and files are generated dynamically during documentation build and placed primarily in `docs/[lang]/_build` folders. These folders are temporary and not visible in ESP-IDF repository.

Add-ons and Extensions Reference

`docs/conf_common.py` This file contains configuration common to each localized documentation (e.g. English, Chinese). The contents of this file is imported to standard Sphinx configuration file `conf.py` located in respective language folders (e.g. `docs/en`, `docs/zh_CN`) during build for each language.

`docs/check_doc_warnings.sh` If there are any warnings reported during documentation build, then the build is failed. The warnings should be resolved before merging any documentation updates. This script is doing check for warnings in respective log file to fail the build. See also description of `sphinx-known-warnings.txt` below.

`docs/check_lang_folder_sync.sh` To reduce potential discrepancies when maintaining concurrent language version, the structure and filenames of language folders `docs/en` and `docs/zh_CN` folders should be kept identical. The script `check_lang_folder_sync.sh` is run on each documentation build to verify if this condition is met.

Note: If a new content is provided in e.g. English, and there is no any translation yet, then the corresponding file in `zh_CN` folder should contain an .. include:: directive pointing to the source file in English. This will automatically include the English version visible to Chinese readers. For example if a file `docs/zh_CN/contribute/documenting-code.rst` does not have a Chinese translation, then it should contain .. include:: ../en/contribute/documenting-code.rst instead.

`docs/docs_common.mk` It contains the common code which is included into the language-specific Makefiles. Note that this file contains couple of customizations comparing to what is provided within standard Sphinx installation, e.g. gh-linkcheck command has been added.

`docs/gen-dxd.py` A Python script that generates API reference files based on Doxygen `xml` output. The files have an inc extension and are located in `docs/[lang]/_build/inc` directory created dynamically when documentation is build. Please refer to Documenting Code and API Documentation Template, section API Reference for additional details on this process.
Chapter 6. Contributions Guide

**docs/gen-toolchain-links.py** There are couple of places in documentation that provide links to download the toolchain.

To provide one source of this information and reduce effort to manually update several files, this script generates toolchain download links and toolchain unpacking code snippets based on information found in `tools/toolchain_versions.mk`.

**docs/gen-version-specific-includes.py** Another Python script to automatically generate reStructuredText `.inc` snippets with version-based content for this ESP-IDF version.

**docs/html_redirects.py** During documentation lifetime some source files are moved between folders or renamed. This Python script is adding a mechanism to redirect documentation pages that have changed URL by generating in the Sphinx output static HTML redirect pages. The script is used together with a redirection list `html_redirect_pages` defined in file `docs/conf_common.py`.

**docs/link-roles.py** This is an implementation of a custom Sphinx Roles to help linking from documentation to specific files and folders in ESP-IDF. For description of implemented roles please see Linking Examples and Linking Language Versions.

**docs/local_util.py** A collection of utility functions useful primarily when building documentation locally (see Setup for building documentation locally) to reduce the time to generate documentation on a second and subsequent builds. The utility functions check what Doxygen `.xml` input files have been changed and copy these files to destination folders, so only the changed files are used during build process.

**docs/sphinx-known-warnings.txt** There are couple of spurious Sphinx warnings that cannot be resolved without doing update to the Sphinx source code itself. For such specific cases respective warnings are documented in `sphinx-known-warnings.txt` file, that is checked during documentation build, to ignore the spurious warnings.

**tools/gen_esp_err_to_name.py** This script is traversing the ESP-IDF directory structure looking for error codes and messages in source code header files to generate an `.inc` file to include in documentation under Error Codes Reference.

**tools/kconfig_new/confgen.py** Options to configure ESP-IDF’s components are contained in `Kconfig` files located inside directories of individual components, e.g. `components/bt/Kconfig`. This script is traversing the component directories to collect configuration options and generate an `.inc` file to include in documentation under Configuration Options Reference.

- Documenting Code

6.5.4 Creating Examples

Each ESP-IDF example is a complete project that someone else can copy and adapt the code to solve their own problem. Examples should demonstrate ESP-IDF functionality, while keeping this purpose in mind.

Structure

- The main directory should contain a source file named `(something)_example_main.c` with the main functionality.
- If the example has additional functionality, split it logically into separate C or C++ source files under `main` and place a corresponding header file in the same directory.
- If the example has a lot of additional functionality, consider adding a `components` directory to the example project and make some example-specific components with library functionality. Only do this if the components are specific to the example, if they’re generic or common functionality then they should be added to ESP-IDF itself.
- The example should have a `README.md` file. Use the template example `README` and adapt it for your particular example.
- Examples should have an `example_test.py` file for running an automated example test. If submitting a GitHub Pull Request which includes an example, it’s OK not to include this file initially. The details can be discussed as part of the Pull Request.
Chapter 6. Contributions Guide

General Guidelines

Example code should follow the *Espressif IoT Development Framework Style Guide*.

Checklist

Checklist before submitting a new example:

- Example project name (in Makefile and README.md) uses the word “example”. Use “example” instead of “demo”, “test” or similar words.
- Example does one distinct thing. If the example does more than one thing at a time, split it into two or more examples.
- Example has a README.md file which is similar to the template example README.
- Functions and variables in the example are named according to naming section of the style guide. (For non-static names which are only specific to the example’s source files, you can use example or something similar as a prefix.)
- All code in the example is well structured and commented.
- Any unnecessary code (old debugging logs, commented-out code, etc.) is removed from the example.
- Options in the example (like network names, addresses, etc.) are not hard-coded. Use configuration items if possible, or otherwise declare macros or constants
- Configuration items are provided in a KConfig.projbuild file with a menu named “Example Configuration”. See existing example projects to see how this is done.
- All original example code has a license header saying it is “in the public domain / CC0”, and a warranty disclaimer clause. Alternatively, the example is licensed under Apache License 2.0. See existing examples for headers to adapt from.
- Any adapted or third party example code has the original license header on it. This code must be licensed compatible with Apache License 2.0.

6.5.5 API Documentation Template

**Note:** *INSTRUCTIONS*

1. Use this file (docs/api-reference/template.rst) as a template to document API.
2. Change the file name to the name of the header file that represents documented API.
3. Include respective files with descriptions from the API folder using ..include::
   - README.rst
   - example.rst
   - ...
4. Optionally provide description right in this file.
5. Once done, remove all instructions like this one and any superfluous headers.

Overview

**Note:** *INSTRUCTIONS*

1. Provide overview where and how this API may be used.
2. Where applicable include code snippets to illustrate functionality of particular functions.
3. To distinguish between sections, use the following heading levels:
   - # with overline, for parts
   - * with overline, for chapters
   - =, for sections
   - –, for subsections
   - ^, for subsubsections
   - “, for paragraphs
Application Example

Note: **INSTRUCTIONS**

1. Prepare one or more practical examples to demonstrate functionality of this API.
2. Each example should follow pattern of projects located in `esp-idf/examples/` folder.
3. Place example in this folder complete with `README.md` file.
4. Provide overview of demonstrated functionality in `README.md`.
5. With good overview reader should be able to understand what example does without opening the source code.
6. Depending on complexity of example, break down description of code into parts and provide overview of functionality of each part.
7. Include flow diagram and screenshots of application output if applicable.
8. Finally add in this section synopsis of each example together with link to respective folder in `esp-idf/examples/`.

API Reference

Note: **INSTRUCTIONS**

1. This repository provides for automatic update of API reference documentation using code markup retrieved by Doxygen from header files.
2. Update is done on each documentation build by invoking script `docs/gen-dxd.py` for all header files listed in the INPUT statement of `docs/Doxyfile`.
3. Each line of the INPUT statement (other than a comment that begins with `##`) contains a path to header file `*.h` that will be used to generate corresponding `*.inc` files:

```plaintext
## Wi-Fi - API Reference
../components/esp32/include/esp_wifi.h \
../components/esp32/include/esp_smartconfig.h \
```

4. The `*.inc` files contain formatted reference of API members generated automatically on each documentation build. All `*.inc` files are placed in Sphinx `_build` directory. To see directives generated for e.g. `esp_wifi.h`, run `python gen-dxd.py esp32/include/esp_wifi.h`.
5. To show contents of `*.inc` file in documentation, include it as follows:

```plaintext
.. include:: /_build/inc/esp_wifi.inc
```

For example see `docs/en/api-reference/wifi/esp_wifi.rst`.

Below is the list of common .. doxygen:: directives:

- Functions .. doxygenfunction:: name_of_function
- Unions .. doxygenunion:: name_of_union
- Structures .. doxygenstruct:: name_of_structure together with :members:
- Macros .. doxygendefine:: name_of_define
- Type Definitions .. doxygentypedef:: name_of_type
- Enumerations .. doxygenenum:: name_of_enumeration

See Breathe documentation for additional information.

To provide a link to header file, use the `link custom role` as follows:

```plaintext
* :component_file:`path_to/header_file.h`
```
7. In any case, to generate API reference, the file `docs/Doxyfile` should be updated with paths to `*.h` headers that are being documented.

8. When changes are committed and documentation is built, check how this section has been rendered. Correct annotations in respective header files, if required.

### 6.5.6 Contributor Agreement

**Individual Contributor Non-Exclusive License Agreement**

including the Traditional Patent License OPTION

Thank you for your interest in contributing to Espressif IoT Development Framework (esp-idf) ("We" or "Us"). The purpose of this contributor agreement ("Agreement") is to clarify and document the rights granted by contributors to Us. To make this document effective, please follow the instructions at CONTRIBUTING.rst

1. **DEFINITIONS**  
   "You" means the Individual Copyright owner who submits a Contribution to Us. If You are an employee and submit the Contribution as part of your employment, You have had Your employer approve this Agreement or sign the Entity version of this document.

   "Contribution" means any original work of authorship (software and/or documentation) including any modifications or additions to an existing work, Submitted by You to Us, in which You own the Copyright. If You do not own the Copyright in the entire work of authorship, please contact Us at angus@espressif.com.

   "Copyright" means all rights protecting works of authorship owned or controlled by You, including copyright, moral and neighboring rights, as appropriate, for the full term of their existence including any extensions by You.

   "Material" means the software or documentation made available by Us to third parties. When this Agreement covers more than one software project, the Material means the software or documentation to which the Contribution was Submitted. After You Submit the Contribution, it may be included in the Material.

   "Submit" means any form of physical, electronic, or written communication sent to Us, including but not limited to electronic mailing lists, source code control systems, and issue tracking systems that are managed by, or on behalf of, Us, but excluding communication that is conspicuously marked or otherwise designated in writing by You as "Not a Contribution."

   "Submission Date" means the date You Submit a Contribution to Us.

   "Documentation" means any non-software portion of a Contribution.

2. **LICENSE GRANT**  
   2.1 Copyright License to Us

Subject to the terms and conditions of this Agreement, You hereby grant to Us a worldwide, royalty-free, NON-exclusive, perpetual and irrevocable license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, under the Copyright covering the Contribution to use the Contribution by all means, including, but not limited to:

- to publish the Contribution,
- to modify the Contribution, to prepare derivative works based upon or containing the Contribution and to combine the Contribution with other software code,
- to reproduce the Contribution in original or modified form,
- to distribute, to make the Contribution available to the public, display and publicly perform the Contribution in original or modified form.

2.2 Moral Rights remain unaffected to the extent they are recognized and not waivable by applicable law. Notwithstanding, You may add your name in the header of the source code files of Your Contribution and We will respect this attribution when using Your Contribution.
3. PATENTS  3.1 Patent License

Subject to the terms and conditions of this Agreement You hereby grant to us a worldwide, royalty-free, non-exclusive, perpetual and irrevocable (except as stated in Section 3.2) patent license, with the right to transfer an unlimited number of non-exclusive licenses or to grant sublicenses to third parties, to make, have made, use, sell, offer for sale, import and otherwise transfer the Contribution and the Contribution in combination with the Material (and portions of such combination). This license applies to all patents owned or controlled by You, whether already acquired or hereafter acquired, that would be infringed by making, having made, using, selling, offering for sale, importing or otherwise transferring of Your Contribution(s) alone or by combination of Your Contribution(s) with the Material.

3.2 Revocation of Patent License

You reserve the right to revoke the patent license stated in section 3.1 if we make any infringement claim that is targeted at your Contribution and not asserted for a Defensive Purpose. An assertion of claims of the Patents shall be considered for a “Defensive Purpose” if the claims are asserted against an entity that has filed, maintained, threatened, or voluntarily participated in a patent infringement lawsuit against Us or any of Our licensees.

4. DISCLAIMER  THE CONTRIBUTION IS PROVIDED “AS IS”. MORE PARTICULARLY, ALL EXPRESS OR IMPLIED WARRANTIES INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTY OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NON-INFRINGEMENT ARE EXPRESSLY DISCLAIMED BY YOU TO US AND BY US TO YOU. TO THE EXTENT THAT ANY SUCH WARRANTIES CANNOT BE DISCLAIMED, SUCH WARRANTY IS LIMITED IN DURATION TO THE MINIMUM PERIOD PERMITTED BY LAW.

5. Consequential Damage Waiver  TO THE MAXIMUM EXTENT PERMITTED BY APPLICABLE LAW, IN NO EVENT WILL YOU OR US BE LIABLE FOR ANY LOSS OF PROFITS, LOSS OF ANTICIPATED SAVINGS, LOSS OF DATA, INDIRECT, SPECIAL, INCIDENTAL, CONSEQUENTIAL AND EXEMPLARY DAMAGES ARISING OUT OF THIS AGREEMENT REGARDLESS OF THE LEGAL OR EQUITABLE THEORY (CONTRACT, TORT OR OTHERWISE) UPON WHICH THE CLAIM IS BASED.

6. Approximation of Disclaimer and Damage Waiver  IF THE DISCLAIMER AND DAMAGE WAIVER MENTIONED IN SECTION 4 AND SECTION 5 CANNOT BE GIVEN LEGAL EFFECT UNDER APPLICABLE LOCAL LAW, REVIEWING COURTS SHALL APPLY LOCAL LAW THAT MOST CLOSELY APPROXIMATES AN ABSOLUTE WAIVER OF ALL CIVIL LIABILITY IN CONNECTION WITH THE CONTRIBUTION.

7. Term  7.1 This Agreement shall come into effect upon Your acceptance of the terms and conditions.

7.2 In the event of a termination of this Agreement Sections 4, 5, 6, 7 and 8 shall survive such termination and shall remain in full force thereafter. For the avoidance of doubt, Contributions that are already licensed under a free and open source license at the date of the termination shall remain in full force after the termination of this Agreement.

8. Miscellaneous  8.1 This Agreement and all disputes, claims, actions, suits or other proceedings arising out of this agreement or relating in any way to it shall be governed by the laws of People’s Republic of China excluding its private international law provisions.

8.2 This Agreement sets out the entire agreement between You and Us for Your Contributions to Us and overrides all other agreements or understandings.

8.3 If any provision of this Agreement is found void and unenforceable, such provision will be replaced to the extent possible with a provision that comes closest to the meaning of the original provision and that is enforceable. The terms and conditions set forth in this Agreement shall apply notwithstanding any failure of essential purpose of this Agreement or any limited remedy to the maximum extent possible under law.

8.4 You agree to notify Us of any facts or circumstances of which you become aware that would make this Agreement inaccurate in any respect.

Chapter 7

ESP-IDF Versions

The ESP-IDF GitHub repository is updated regularly, especially the master branch where new development takes place.

For production use, there are also stable releases available.

7.1 Releases

The documentation for the current stable release version can always be found at this URL:

Documentation for the latest version (master branch) can always be found at this URL:

The full history of releases can be found on the GitHub repository Releases page. There you can find release notes, links to each version of the documentation, and instructions for obtaining each version.

Another place to find documentation for all releases is the documentation page, where you can go to the bottom-left corner and click the versions dropup (a bar with a small triangle). You can also use this dropup to switch between versions of the documentation.
7.2 Which Version Should I Start With?

- For production purposes, use the current stable version. Stable versions have been manually tested, and are updated with “bugfix releases” which fix bugs without changing other functionality (see Versioning Scheme for more details).
  
  In order to maximize the time between updates to new ESP-IDF versions, use the latest stable Long Term Support release version. This version can be found on the Releases page.
- For prototyping, experimentation or for developing new ESP-IDF features, use the latest version (master branch in Git). The latest version in the master branch has all the latest features and has passed automated testing, but has not been completely manually tested (“bleeding edge”).
- If a required feature is not yet available in a stable release, but you do not want to use the master branch, it is possible to check out a pre-release version or a release branch. It is recommended to start from a stable version and then follow the instructions for Updating to a Pre-Release Version or Updating to a Release Branch.

See Updating ESP-IDF if you already have a local copy of ESP-IDF and wish to update it.

7.3 Versioning Scheme

ESP-IDF uses Semantic Versioning. This means that:
7. ESP-IDF Versions

• Major Releases, like v3.0, add new functionality and may change functionality. This includes removing deprecated functionality.
  If updating to a new major release (for example, from v2.1 to v3.0), some of your project’s code may need updating and functionality may need to be re-tested. The release notes on the Releases page include lists of Breaking Changes to refer to.
• Minor Releases like v3.1 add new functionality and fix bugs but will not change or remove documented functionality, or make incompatible changes to public APIs.
  If updating to a new minor release (for example, from v3.0 to v3.1), your project’s code does not require updating, but you should re-test your project. Pay particular attention to the items mentioned in the release notes on the Releases page.
• Bugfix Releases like v3.0.1 only fix bugs and do not add new functionality.
  If updating to a new bugfix release (for example, from v3.0 to v3.0.1), you do not need to change any code in your project, and you only need to re-test the functionality directly related to bugs listed in the release notes on the Releases page.

7.4 Support Periods

Each ESP-IDF major and minor release version has an associated support period. After this period, the release is End of Life and no longer supported. Some releases are designated Long Term Support, which means the support period is longer than for other releases.

The ESP-IDF Support Period Policy explains this in detail, and describes how the support periods for each release are determined.

Each release on the Releases page includes information about the support period for that particular release.

As a general guideline:

• Using Long Term Support releases will maximize the amount of time between required ESP-IDF major or minor upgrades.
• Using standard stable releases will require more frequent upgrades to new ESP-IDF versions. However, this means that new features and major improvements will be available more frequently.

It is also possible to upgrade from a Long Term Support release to a standard release, and vice versa.

7.5 Checking the Current Version

The local ESP-IDF version can be checked by using git:

```
cd $IDF_PATH
git describe --dirty
```

The ESP-IDF version is also compiled into the firmware and can be accessed (as a string) via the macro IDF_VER. The default ESP-IDF bootloader will print the version on boot (the version information is not always updated in code, it only changes if that particular source file is recompiled).

If writing code that needs to support multiple ESP-IDF versions, the version can be checked at compile time using compile-time macros.

Examples of ESP-IDF versions:
### Chapter 7. ESP-IDF Versions

<table>
<thead>
<tr>
<th>Version String</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| v3.2-dev-306-gbeb3611ca | Master branch pre-release.  
- v3.2-dev - in development for version 3.2.  
- 306 - number of commits after v3.2 development started.  
- beb3611ca - commit identifier. |
| v3.0.2 | Stable release, tagged v3.0.2. |
| v3.1-beta1-75-g346d6b0ea | Beta version in development (on a release branch).  
- v3.1-beta1 - pre-release tag.  
- 75 - number of commits after the pre-release beta tag was assigned.  
- 346d6b0ea - commit identifier. |
| v3.0.1-dirty | Stable release, tagged v3.0.1.  
- dirty means that there are modifications in the local ESP-IDF directory. |

#### 7.6 Git Workflow

The development (Git) workflow of the Espressif ESP-IDF team is as follows:

- New work is always added on the master branch (latest version) first. The ESP-IDF version on master is always tagged with -dev (for “in development”), for example v3.1-dev.
- Changes are first added to an internal Git repository for code review and testing but are pushed to GitHub after automated testing passes.
- When a new version (developed on master) becomes feature complete and “beta” quality, a new branch is made for the release, for example release/v3.1. A pre-release tag is also created, for example v3.1-beta1. You can see a full list of branches and a list of tags on GitHub. Beta pre-releases have release notes which may include a significant number of Known Issues.
- As testing of the beta version progresses, bug fixes will be added to both the master branch and the release branch. New features for the next release may start being added to master at the same time.
- Once testing is nearly complete a new release candidate is tagged on the release branch, for example v3.1-rcl. This is still a pre-release version.
- If no more significant bugs are found or reported, then the final Major or Minor Version is tagged, for example v3.1. This version appears on the Releases page.
- As bugs are reported in released versions, the fixes will continue to be committed to the same release branch.
- Regular bugfix releases are made from the same release branch. After manual testing is complete, a bugfix release is tagged (i.e. v3.1.1) and appears on the Releases page.

#### 7.7 Updating ESP-IDF

Updating ESP-IDF depends on which version(s) you wish to follow:

- **Updating to Stable Release** is recommended for production use.
- **Updating to Master Branch** is recommended for the latest features, development use, and testing.
- **Updating to a Release Branch** is a compromise between the first two.
Chapter 7. ESP-IDF Versions

Note: These guides assume that you already have a local copy of ESP-IDF cloned. To get one, check Step 2 in the Getting Started guide for any ESP-IDF version.

7.7.1 Updating to Stable Release

To update to a new ESP-IDF release (recommended for production use), this is the process to follow:

- Check the Releases page regularly for new releases.
- When a bugfix release for the version you are using is released (for example, if using v3.0.1 and v3.0.2 is released), check out the new bugfix version into the existing ESP-IDF directory:

  ```
  cd $IDF_PATH
  git fetch
  git checkout vX.Y.Z
  git submodule update --init --recursive
  ```

- When major or minor updates are released, check the Release Notes on the releases page and decide if you want to update or to stay with your current release. Updating is via the same Git commands shown above.

Note: If you installed the stable release via zip file instead of using git, it might not be possible to update versions using the commands. In this case, update by downloading a new zip file and replacing the entire IDF_PATH directory with its contents.

7.7.2 Updating to a Pre-Release Version

It is also possible to git checkout a tag corresponding to a pre-release version or release candidate, the process is the same as Updating to Stable Release.

Pre-release tags are not always found on the Releases page. Consult the list of tags on GitHub for a full list. Caveats for using a pre-release are similar to Updating to a Release Branch.

7.7.3 Updating to Master Branch

Note: Using Master branch means living “on the bleeding edge” with the latest ESP-IDF code.

To use the latest version on the ESP-IDF master branch, this is the process to follow:

- Check out the master branch locally:

  ```
  cd $IDF_PATH
  git checkout master
  git pull
  git submodule update --init --recursive
  ```

- Periodically, re-run git pull to pull the latest version of master. Note that you may need to change your project or report bugs after updating your master branch.
- To switch from master to a release branch or stable version, run git checkout as shown in the other sections.

Important: It is strongly recommended to regularly run git pull and then git submodule update --init --recursive so a local copy of master does not get too old. Arbitrary old master branch revisions are
effectively unsupportable “snapshots” that may have undocumented bugs. For a semi-stable version, try *Updating to a Release Branch* instead.

### 7.7.4 Updating to a Release Branch

In terms of stability, using a release branch is part-way between using the master branch and only using stable releases. A release branch is always beta quality or better, and receives bug fixes before they appear in each stable release.

You can find a list of branches on GitHub.

For example, to follow the branch for ESP-IDF v3.1, including any bugfixes for future releases like v3.1.1, etc:

```bash
cd $IDF_PATH
git fetch
git checkout release/v3.1
git pull
git submodule update --init --recursive
```

Each time you `git pull` this branch, ESP-IDF will be updated with fixes for this release.

**Note:** There is no dedicated documentation for release branches. It is recommended to use the documentation for the closest version to the branch which is currently checked out.
Chapter 8

Resources

- The esp32.com forum is a place to ask questions and find community resources.
- Check the Issues section on GitHub if you find a bug or have a feature request. Please check existing Issues before opening a new one.
- A comprehensive collection of solutions, practical applications, components and drivers based on ESP-IDF is available in ESP32 IoT Solution repository. In most of cases descriptions are provided both in English and in 中文.
- To develop applications using Arduino platform, refer to Arduino core for ESP32 WiFi chip.
- Several books have been written about ESP32 and they are listed on Espressif web site.
- If you’re interested in contributing to ESP-IDF, please check the Contributions Guide.
- For additional ESP32 product related information, please refer to documentation section of Espressif site.
- Download latest and previous versions of this documentation in PDF and HTML format.
Chapter 9

Copyrights and Licenses

9.1 Software Copyrights

All original source code in this repository is Copyright (C) 2015-2018 Espressif Systems. This source code is licensed under the Apache License 2.0 as described in the file LICENSE.

Additional third party copyrighted code is included under the following licenses.

Where source code headers specify Copyright & License information, this information takes precedence over the summaries made here.

9.1.1 Firmware Components

These third party libraries can be included into the application (firmware) produced by ESP-IDF.

- **Newlib** is licensed under the BSD License and is Copyright of various parties, as described in COPYING.NEWLIB.
- **Xtensa header files** are Copyright (C) 2013 Tensilica Inc and are licensed under the MIT License as reproduced in the individual header files.
- Original parts of **FreeRTOS** (components/freertos) are Copyright (C) 2015 Real Time Engineers Ltd and is licensed under the GNU General Public License V2 with the FreeRTOS Linking Exception, as described in license.txt.
- Original parts of **LWIP** (components/lwip) are Copyright (C) 2001, 2002 Swedish Institute of Computer Science and are licensed under the BSD License as described in COPYING file.

### 9.1.2 Build Tools

This is the list of licenses for tools included in this repository, which are used to build applications. The tools do not become part of the application (firmware), so their license does not affect licensing of the application.

- **esptool.py** is Copyright (C) 2014-2016 Fredrik Ahlberg, Angus Gratton and is licensed under the GNU General Public License v2, as described in LICENSE file.
- **KConfig** is Copyright (C) 2002 Roman Zippel and others, and is licensed under the GNU General Public License V2.

### 9.2 ROM Source Code Copyrights

ESP32 mask ROM hardware includes binaries compiled from portions of the following third party software:

- **Newlib**, licensed under the BSD License and is Copyright of various parties, as described in COPYING.NEWLIB.
- **Xtensa libhal**, Copyright (c) Tensilica Inc and licensed under the MIT license (see below).
- **TinyBasic Plus**, Copyright Mike Field & Scott Lawrence and licensed under the MIT license (see below).
- **miniz**, by Rich Geldreich - placed into the public domain.
- **wpa_supplicant** Copyright (c) 2003-2005 Jouni Malinen and licensed under the BSD license.
- **TJpgDec** Copyright (C) 2011, ChaN, all right reserved. See below for license.

### 9.3 Xtensa libhal MIT License

9.5 TJpgDec License

TJpgDec - Tiny JPEG Decompressor R0.01 (C)ChaN, 2011 The TJpgDec is a generic JPEG decompressor module for tiny embedded systems. This is a free software that opened for education, research and commercial developments under license policy of following terms.

Copyright (C) 2011, ChaN, all right reserved.

- The TJpgDec module is a free software and there is NO WARRANTY.
- No restriction on use. You can use, modify and redistribute it for personal, non-profit or commercial products UNDER YOUR RESPONSIBILITY.
- Redistributions of source code must retain the above copyright notice.
Chapter 10

About

This is documentation of ESP-IDF, the framework to develop applications for ESP32 chip by Espressif.

The ESP32 is 2.4 GHz Wi-Fi and Bluetooth combo, which integrates one or two 32-bit microprocessors, with up to 600 DMIPS processing power.

Fig. 1: Espressif IoT Integrated Development Framework

The ESP-IDF, Espressif IoT Development Framework, provides toolchain, API, components and workflows to develop applications for ESP32 using Windows, Linux and Mac OS operating systems.
Chapter 11

Switch Between Languages/切换语言

The ESP-IDF Programming Manual is now available in two languages. Please refer to the English version if there is any discrepancy.

《ESP-IDF 编程手册》部分文档现在有两种语言的版本。如有出入请以英文版本为准。

- English/英文
- Chinese/中文

You can easily change from one language to another by the panel on the sidebar like below. Just click on the Read the Docs title button on the left-bottom corner if it is folded.

如下图所示，你可使用边栏的面板进行语言的切换。如果该面板被折叠，点击左下角 Read the Docs 标题按钮来显示它。

In the image, the text appears to be a list of function names and variables, likely from a source code document related to file system or network operations. The code snippet includes various function names such as `esp_vfs_register`, `esp_vfs_unregister`, `esp_vfs_open`, and more, indicating it might be from a library for handling file system operations in a microcontroller or embedded system environment.

Some specific functions mentioned include:
- `esp_vfs_register` and `esp_vfs_unregister` for registering and unregistering file system operations.
- `esp_vfs_open` and `esp_vfs_rename` for opening and renaming files.
- `esp_vfs_stat` and `esp_vfs_mkdir` for system call-like operations.
- `esp_vhci_host_register_callback` and others for USB Host interface operations.

The text also includes comments in C++ style, indicating that the content is related to C++ classes and functions, such as `std::vector<int>` and `std::map<std::string, int>`.

The code snippet also contains C macro and C function documentation, which is typical in embedded systems for compact documentation of APIs.

Overall, the text is a detailed listing of file system and network operations, likely from a software development documentation source for an embedded systems library.

The code snippet is too long to provide a meaningful summary, but it is evident that it pertains to file system and network operations, possibly for an embedded system or microcontroller environment.
