linked list of IP addresses found

## Macros

**MDNS\_TYPE\_A**

**MDNS\_TYPE\_PTR**

**MDNS\_TYPE\_TXT**

**MDNS\_TYPE\_AAAA**

**MDNS\_TYPE\_SRV**

**MDNS\_TYPE\_OPT**

**MDNS\_TYPE\_NSEC**

**MDNS\_TYPE\_ANY**

### Type Definitions

typedef struct mdns\_search\_once\_s **mdns\_search\_once\_t**

Asynchronous query handle.

typedef struct *mdns\_ip\_addr\_s* **mdns\_ip\_addr\_t**

mDNS query linked list IP item

typedef enum *mdns\_if\_internal* **mdns\_if\_t**

typedef struct *mdns\_result\_s* **mdns\_result\_t**

mDNS query result structure

typedef void (\***mdns\_query\_notify\_t**)(*mdns\_search\_once\_t* \*search)

### Enumerations

enum **mdns\_ip\_protocol\_t**

mDNS enum to specify the ip\_protocol type

*Values:*

enumerator **MDNS\_IP\_PROTOCOL\_V4**

enumerator **MDNS\_IP\_PROTOCOL\_V6**

enumerator **MDNS\_IP\_PROTOCOL\_MAX**

enum **mdns\_if\_internal**

*Values:*

enumerator **MDNS\_IF\_STA**

enumerator **MDNS\_IF\_AP**

enumerator **MDNS\_IF\_ETH**

enumerator **MDNS\_IF\_MAX**

### 2.4.11 ESP-Modbus

The Espressif ESP-Modbus Library (`esp-modbus`) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces.

#### Options Of Usage

There are two options for using the ESP-Modbus library in your projects:

1. Using the `freemodbus` component included in the current release of ESP-IDF.  
The ESP-IDF component `freemodbus` included in this release reflects the `esp-modbus` component of version v1.0.7. This release of the component is used by default in the existing examples mentioned below on this page.  
The downside of this option is that the `freemodbus` component may not contain the latest fixes from `esp-modbus` repository. Because of this, it is recommended to use the original `esp-modbus` component for new projects (the option 2).
2. Using the `esp-modbus` component via the component manager instead of `freemodbus`.  
Additional information for the ESP-Modbus component can be found in the separate repository:

- [ESP-Modbus component on GitHub](#)

In order to use `esp-modbus` component, your application must include the statement below in its `CMakeLists.txt` file to exclude the `freemodbus` component from the build. The excluding of the `freemodbus` component is required to avoid compilation issues when `esp-modbus` is used in conjunction with the component manager.

```
set(EXCLUDE_COMPONENTS freemodbus)
```

If your project uses the make build system, the statement below needs to be added into project Makefile:

```
EXCLUDE_COMPONENTS := freemodbus
```

The main component folder of the new application shall include the component manager manifest file `idf_component.yml` as below:

```
dependencies:
  idf: ">=4.1"
  espressif/esp-modbus:
    version: "^1.0"
```

This option allows to use the latest `esp-modbus` component updates in any projects based on ESP-IDF versions from v4.1 up to v5.0. Refer to [component manager documentation](#) for more information on how to set up the component manager. The `esp-modbus` component can be found in [component manager registry](#).

#### Managed Documentation

The component documentation can be found on the link below:

- [ESP-Modbus documentation \(English\)](#)

#### Application Example

The examples below demonstrate the ESP-Modbus library of serial, TCP ports for slave and master implementations accordingly.

- [protocols/modbus/serial/mb\\_slave](#)
- [protocols/modbus/serial/mb\\_master](#)
- [protocols/modbus/tcp/mb\\_tcp\\_slave](#)
- [protocols/modbus/tcp/mb\\_tcp\\_master](#)

Please refer to the specific example `README.md` for details.

### 2.4.12 ESP WebSocket Client

#### Overview

The ESP WebSocket client is an implementation of [WebSocket protocol client](#) for ESP32-S3

#### Features

- Supports WebSocket over TCP, TLS with mbedtls
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

#### Configuration

##### URI

- Supports `ws`, `wss` schemes
- WebSocket samples:
  - `ws://echo.websocket.org`: WebSocket over TCP, default port 80
  - `wss://echo.websocket.org`: WebSocket over SSL, default port 443

Minimal configurations:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org",
};
```

The WebSocket client supports the use of both path and query in the URI. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org/connectionhandler?id=104",
};
```

If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567
```

##### TLS Configuration:

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "wss://echo.websocket.org",
    .cert_pem = (const char *)websocket_org_pem_start,
};
```

---

**Note:** If you want to verify the server, then you need to provide a certificate in PEM format, and provide to `cert_pem` in `websocket_client_config_t`. If no certificate is provided then the TLS connection will default not requiring verification.

---

PEM certificate for this example could be extracted from an `openssl s_client` command connecting to `websocket.org`. In case a host operating system has `openssl` and `sed` packages installed, one could execute the following command to download and save the root or intermediate root certificate to a file (Note for Windows users: Both Linux like environment or Windows native packages may be used). `` echo "" | openssl s_client -showcerts -connect websocket.org:443 | sed -n "1,/Root/d; /BEGIN/,/END/p" | openssl x509 -outform PEM >websocket_org.pem ``

This command will extract the second certificate in the chain and save it as a pem-file.

**Subprotocol** The subprotocol field in the config struct can be used to request a subprotocol

```
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
    .subprotocol = "soap",
};
```

---

**Note:** The client is indifferent to the subprotocol field in the server response and will accept the connection no matter what the server replies.

---

For more options on `esp_websocket_client_config_t`, please refer to API reference below

## Events

- **WEBSOCKET\_EVENT\_CONNECTED:** The client has successfully established a connection to the server. The client is now ready to send and receive data. Contains no event data.
- **WEBSOCKET\_EVENT\_DISCONNECTED:** The client has aborted the connection due to the transport layer failing to read data, e.g. because the server is unavailable. Contains no event data.
- **WEBSOCKET\_EVENT\_DATA:** The client has successfully received and parsed a WebSocket frame. The event data contains a pointer to the payload data, the length of the payload data as well as the opcode of the received frame. A message may be fragmented into multiple events if the length exceeds the buffer size. This event will also be posted for non-payload frames, e.g. pong or connection close frames.
- **WEBSOCKET\_EVENT\_ERROR:** Not used in the current implementation of the client.

If the client handle is needed in the event handler it can be accessed through the pointer passed to the event handler:

```
esp_websocket_client_handle_t client = (esp_websocket_client_handle_t)handler_args;
```

## Limitations and Known Issues

- The client is able to request the use of a subprotocol from the server during the handshake, but does not do any subprotocol related checks on the response from the server.

## Application Example

A simple WebSocket example that uses `esp_websocket_client` to establish a websocket connection and send/receive data with the [websocket.org](https://websocket.org) server can be found here: [protocols/websocket](#).

**Sending Text Data** The WebSocket client supports sending data as a text data frame, which informs the application layer that the payload data is text data encoded as UTF-8. Example:

```
esp_websocket_client_send_text(client, data, len, portMAX_DELAY);
```

## API Reference

### Header File

- `components/esp_websocket_client/include/esp_websocket_client.h`

### Functions

`esp_websocket_client_handle_t esp_websocket_client_init` (`const esp_websocket_client_config_t *config`)

Start a WebSocket session. This function must be the first function to call, and it returns a `esp_websocket_client_handle_t` that you must use as input to other functions in the interface. This call **MUST** have a corresponding call to `esp_websocket_client_destroy` when the operation is complete.

**Parameters** `config` –[in] The configuration

**Returns**

- `esp_websocket_client_handle_t`
- NULL if any errors

`esp_err_t esp_websocket_client_set_uri` (`esp_websocket_client_handle_t client`, `const char *uri`)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones. Must stop the WebSocket client before set URI if the client has been connected.

**Parameters**

- `client` –[in] The client
- `uri` –[in] The uri

**Returns** `esp_err_t`

`esp_err_t esp_websocket_client_start` (`esp_websocket_client_handle_t client`)

Open the WebSocket connection.

**Parameters** `client` –[in] The client

**Returns** `esp_err_t`

`esp_err_t esp_websocket_client_stop` (`esp_websocket_client_handle_t client`)

Stops the WebSocket connection without websocket closing handshake.

This API stops ws client and closes TCP connection directly without sending close frames. It is a good practice to close the connection in a clean way using `esp_websocket_client_close()`.

Notes:

- Cannot be called from the websocket event handler

**Parameters** `client` –[in] The client

**Returns** `esp_err_t`

`esp_err_t esp_websocket_client_destroy` (`esp_websocket_client_handle_t client`)

Destroy the WebSocket connection and free all resources. This function must be the last function to call for an session. It is the opposite of the `esp_websocket_client_init` function and must be called with the same handle as input that a `esp_websocket_client_init` call returned. This might close all connections this handle has used.

Notes:

- Cannot be called from the websocket event handler

**Parameters** `client` –[in] The client

**Returns** `esp_err_t`

`int esp_websocket_client_send` (`esp_websocket_client_handle_t client`, `const char *data`, `int len`, `TickType_t timeout`)

Generic write data to the WebSocket connection; defaults to binary send.

**Parameters**

- **client** –[in] The client
- **data** –[in] The data
- **len** –[in] The length
- **timeout** –[in] Write data timeout in RTOS ticks

**Returns**

- Number of data was sent
- (-1) if any errors

int **esp\_websocket\_client\_send\_bin** (*esp\_websocket\_client\_handle\_t* client, const char \*data, int len, TickType\_t timeout)

Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

**Parameters**

- **client** –[in] The client
- **data** –[in] The data
- **len** –[in] The length
- **timeout** –[in] Write data timeout in RTOS ticks

**Returns**

- Number of data was sent
- (-1) if any errors

int **esp\_websocket\_client\_send\_text** (*esp\_websocket\_client\_handle\_t* client, const char \*data, int len, TickType\_t timeout)

Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

**Parameters**

- **client** –[in] The client
- **data** –[in] The data
- **len** –[in] The length
- **timeout** –[in] Write data timeout in RTOS ticks

**Returns**

- Number of data was sent
- (-1) if any errors

*esp\_err\_t* **esp\_websocket\_client\_close** (*esp\_websocket\_client\_handle\_t* client, TickType\_t timeout)

Close the WebSocket connection in a clean way.

Sequence of clean close initiated by client:

- Client sends CLOSE frame
- Client waits until server echos the CLOSE frame
- Client waits until server closes the connection
- Client is stopped the same way as by the `esp_websocket_client_stop()`

Notes:

- Cannot be called from the websocket event handler

**Parameters**

- **client** –[in] The client
- **timeout** –[in] Timeout in RTOS ticks for waiting

**Returns** *esp\_err\_t*

*esp\_err\_t* **esp\_websocket\_client\_close\_with\_code** (*esp\_websocket\_client\_handle\_t* client, int code, const char \*data, int len, TickType\_t timeout)

Close the WebSocket connection in a clean way with custom code/data Closing sequence is the same as for `esp_websocket_client_close()`

Notes:

- Cannot be called from the websocket event handler

**Parameters**

- **client** –[in] The client
- **code** –[in] Close status code as defined in RFC6455 section-7.4
- **data** –[in] Additional data to closing message
- **len** –[in] The length of the additional data
- **timeout** –[in] Timeout in RTOS ticks for waiting

**Returns** esp\_err\_t

bool **esp\_websocket\_client\_is\_connected** (*esp\_websocket\_client\_handle\_t* client)

Check the WebSocket client connection state.

**Parameters** **client** –[in] The client handle

**Returns**

- true
- false

*esp\_err\_t* **esp\_websocket\_register\_events** (*esp\_websocket\_client\_handle\_t* client,  
*esp\_websocket\_event\_id\_t* event, *esp\_event\_handler\_t*  
event\_handler, void \*event\_handler\_arg)

Register the WebSocket Events.

**Parameters**

- **client** –The client handle
- **event** –The event id
- **event\_handler** –The callback function
- **event\_handler\_arg** –User context

**Returns** esp\_err\_t

## Structures

struct **esp\_websocket\_event\_data\_t**

WebSocket event data.

### Public Members

const char \***data\_ptr**

Data pointer

int **data\_len**

Data length

uint8\_t **op\_code**

Received opcode

*esp\_websocket\_client\_handle\_t* **client**

esp\_websocket\_client\_handle\_t context

void \***user\_context**

user\_data context, from *esp\_websocket\_client\_config\_t* user\_data

int **payload\_len**

Total payload length, payloads exceeding buffer will be posted through multiple events

int **payload\_offset**

Actual offset for the data associated with this event

struct **esp\_websocket\_client\_config\_t**

Websocket client setup configuration.

### Public Members

const char \***uri**

Websocket URI, the information on the URI can be overrides the other fields below, if any

const char \***host**

Domain or IP as string

int **port**

Port to connect, default depend on esp\_websocket\_transport\_t (80 or 443)

const char \***username**

Using for Http authentication - Not supported for now

const char \***password**

Using for Http authentication - Not supported for now

const char \***path**

HTTP Path, if not set, default is /

bool **disable\_auto\_reconnect**

Disable the automatic reconnect function when disconnected

void \***user\_context**

HTTP user data context

int **task\_prio**

Websocket task priority

int **task\_stack**

Websocket task stack

int **buffer\_size**

Websocket buffer size

const char \***cert\_pem**

Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert\_len.

size\_t **cert\_len**

Length of the buffer pointed to by cert\_pem. May be 0 for null-terminated pem

const char \***client\_cert**

Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_key` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_cert_len`.

size\_t **client\_cert\_len**

Length of the buffer pointed to by `client_cert`. May be 0 for null-terminated pem

const char \***client\_key**

Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_cert` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_key_len`

size\_t **client\_key\_len**

Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

*esp\_websocket\_transport\_t* **transport**

Websocket transport type, see ``esp_websocket_transport_t``

const char \***subprotocol**

Websocket subprotocol

const char \***user\_agent**

Websocket user-agent

const char \***headers**

Websocket additional headers

int **pingpong\_timeout\_sec**

Period before connection is aborted due to no PONGs received

bool **disable\_pingpong\_discon**

Disable auto-disconnect due to no PONG received within `pingpong_timeout_sec`

bool **use\_global\_ca\_store**

Use a global `ca_store` for all the connections in which this bool is set.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time. Default is 5 (second)

int **keep\_alive\_interval**

Keep-alive interval time. Default is 5 (second)

int **keep\_alive\_count**

Keep-alive packet retry send count. Default is 3 counts

size\_t **ping\_interval\_sec**

Websocket ping interval, defaults to 10 seconds if not set

struct ifreq **\*if\_name**

The name of interface for data to go through. Use the default interface without setting

### Type Definitions

```
typedef struct esp_websocket_client *esp_websocket_client_handle_t
```

### Enumerations

```
enum esp_websocket_event_id_t
```

Websocket Client events id.

*Values:*

enumerator **WEBSOCKET\_EVENT\_ANY**

enumerator **WEBSOCKET\_EVENT\_ERROR**

This event occurs when there are any errors during execution

enumerator **WEBSOCKET\_EVENT\_CONNECTED**

Once the Websocket has been connected to the server, no data exchange has been performed

enumerator **WEBSOCKET\_EVENT\_DISCONNECTED**

The connection has been disconnected

enumerator **WEBSOCKET\_EVENT\_DATA**

When receiving data from the server, possibly multiple portions of the packet

enumerator **WEBSOCKET\_EVENT\_CLOSED**

The connection has been closed cleanly

enumerator **WEBSOCKET\_EVENT\_MAX**

```
enum esp_websocket_transport_t
```

Websocket Client transport.

*Values:*

enumerator **WEBSOCKET\_TRANSPORT\_UNKNOWN**

Transport unknown

enumerator **WEBSOCKET\_TRANSPORT\_OVER\_TCP**

Transport over tcp

enumerator `WEBSOCKET_TRANSPORT_OVER_SSL`

Transport over ssl

### 2.4.13 ESP Serial Slave Link

#### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The `esp_serial_slave_link` component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an `esp_serial_slave_link` device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

#### Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

#### ESP SPI Slave HD (Half Duplex) Mode Protocol

##### SPI Slave Capabilities of Espressif chips

	ESP32	ESP32-S2	ESP32-C3
SPI Slave HD	N	Y (v2)	Y (v2)
Tohost intr		N	N
Frhost intr		2 *	2 *
TX DMA		Y	Y
RX DMA		Y	Y
Shared registers		72	64

**Introduction** In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- Command: 8-bit, master to slave  
This phase determines the rest phases of the transactions. See [Supported Commands](#).
- Address: 8-bit, master to slave, optional  
For some commands (WRBUF, RDBUF), this phase specifies the address of shared buffer to write to/read from. For other commands with this phase, they are meaningless, but still have to exist in the transaction.
- Dummy: 8-bit, floating, optional  
This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- Data: variable length, the direction is also determined by the command.  
This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP and HD pins.

**Data IO Modes** In some IO modes, more data wires can be use to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here' s the modes supported by ESP32-S2 SPI slave and the wire number used in corresponding modes.

Mode	command WN	address WN	dummy cycles	data WN
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined by the command sent by the master (See *Supported Commands*), except from the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it's not compatible with the normal modes. The master should only send QPI commands when the slave is in the QPI mode. To exit from the QPI mode, master can send EXQPI command.

### Supported Commands

**Note:** The command name are in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	•	•
ENQPI	Enter QPI mode	0x06	•	•
WR_DONE	Write segments done	0x07	•	•
CMD8	Interrupt	0x08	•	•
CMD9	Interrupt	0x09	•	•
CMDA	Interrupt	0x0A	•	•
EXQPI	Exit QPI mode	0xDD	•	•

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

**Segment Transaction Mode** Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn't have to prepare large buffer as the size of data provided by the slave. After the master finish reading/writing a buffer, it has to send corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR\_DONE (0x07) for the WRDMA, and CMD8 (0x08) for the RDDMA.

Here's an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them are 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

## Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the *esp\_serial\_slave\_link* component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.

The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.

- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

## Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.

The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.

4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers. The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SPI Slave Capabilities of Espressif chips* for more details.

### Initialization of ESP Serial Slave Link

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see [Document of SDMMC driver](#)) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

---

### ESP SPI Slave

**Note:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

---

Hasn't been supported yet.

### APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

#### Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

#### Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

#### TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_paket()` to send data to the slave.

## RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset counters (Optional)** Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

## Application Example

The example below shows how ESP32-S3 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

[peripherals/sdio](#).

Please refer to the specific example README.md for details.

## API Reference

### Header File

- [components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl.h](#)

### Functions

`esp_err_t` **essl\_init** (`essl_handle_t` handle, `uint32_t` wait\_ms)

Initialize the slave.

#### Parameters

- **handle** –Handle of an ESSL device.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: If success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

`esp_err_t` **essl\_wait\_for\_ready** (`essl_handle_t` handle, `uint32_t` wait\_ms)

Wait for interrupt of an ESSL slave device.

#### Parameters

- **handle** –Handle of an ESSL device.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: If success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_get\_tx\_buffer\_num** (`essl_handle_t` handle, `uint32_t` \*out\_tx\_num, `uint32_t` wait\_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

#### Parameters

- **handle** –Handle of a ESSL device.
- **out\_tx\_num** –Output of buffer num that host can send data to ESSL slave.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode

- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_get\_rx\_data\_size** (*essl\_handle\_t* handle, uint32\_t \*out\_rx\_size, uint32\_t wait\_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

#### Parameters

- **handle** –Handle of an ESSL device.
- **out\_rx\_size** –Output of data size to read from slave, in bytes
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_reset\_cnt** (*essl\_handle\_t* handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

**Parameters** **handle** –Handle of an ESSL device.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- ESP\_ERR\_INVALID\_ARG: Invalid argument, handle is not init.

*esp\_err\_t* **essl\_send\_packet** (*essl\_handle\_t* handle, const void \*start, size\_t length, uint32\_t wait\_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

#### Parameters

- **handle** –Handle of an ESSL device.
- **start** –Start address of the packet to send
- **length** –Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP\_ERR\_TIMEOUT: No buffer to use, or error ftrom SDMMC host controller.
- ESP\_ERR\_NOT\_FOUND: Slave is not ready for receiving.
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_get\_packet** (*essl\_handle\_t* handle, void \*out\_data, size\_t size, size\_t \*out\_length, uint32\_t wait\_ms)

Get a packet from ESSL slave.

#### Parameters

- **handle** –Handle of an ESSL device.
- **out\_data** –[out] Data output address
- **size** –The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- **out\_length** –[out] Output of length the data actually received from slave.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success: All the data has been read from the slave.
- ESP\_ERR\_INVALID\_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP\_ERR\_NOT\_FINISHED: Read was successful, but there is still data remaining.
- ESP\_ERR\_NOT\_FOUND: Slave is not ready to send data.
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_write\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t value, uint8\_t \*value\_o, uint32\_t wait\_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

---

**Note:** sdio 28-31 are reserved, the lower API helps to skip.

---

#### Parameters

- **handle** –Handle of an ESSL device.
- **addr** –Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** –Value to write to the register.
- **value\_o** –Output of the returned written value.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_read\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t \*value\_o, uint32\_t wait\_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

#### Parameters

- **handle** –Handle of a `essl` device.
- **addr** –Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value\_o** –Output value read from the register.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_wait\_intr** (*essl\_handle\_t* handle, uint32\_t wait\_ms)

wait for an interrupt of the slave

#### Parameters

- **handle** –Handle of an ESSL device.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: If interrupt is triggered.
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- ESP\_ERR\_TIMEOUT: No interrupts before timeout.

*esp\_err\_t* **essl\_clear\_intr** (*essl\_handle\_t* handle, uint32\_t intr\_mask, uint32\_t wait\_ms)

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

#### Parameters

- **handle** –Handle of an ESSL device.
- **intr\_mask** –Mask of interrupt bits to clear.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_get\_intr** (*essl\_handle\_t* handle, uint32\_t \*intr\_raw, uint32\_t \*intr\_st, uint32\_t wait\_ms)

Get interrupt bits of ESSL slave.

#### Parameters

- **handle** –Handle of an ESSL device.

- **intr\_raw** –Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- **intr\_st** –Output of the masked interrupt bits. set to NULL if only raw bits are read.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: Success
- ESP\_INVALID\_ARG: If both `intr_raw` and `intr_st` are NULL.
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_set\_intr\_ena** (`essl_handle_t` handle, uint32\_t ena\_mask, uint32\_t wait\_ms)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Parameters**

- **handle** –Handle of an ESSL device.
- **ena\_mask** –Mask of the interrupt bits to enable.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_get\_intr\_ena** (`essl_handle_t` handle, uint32\_t \*ena\_mask\_o, uint32\_t wait\_ms)

Get interrupt enable bits of ESSL slave.

**Parameters**

- **handle** –Handle of an ESSL device.
- **ena\_mask\_o** –Output of interrupt bit enable mask.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK Success
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_send\_slave\_intr** (`essl_handle_t` handle, uint32\_t intr\_mask, uint32\_t wait\_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Parameters**

- **handle** –Handle of an ESSL device.
- **intr\_mask** –Mask of interrupt bits to send to slave.
- **wait\_ms** –Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Type Definitions**

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

**Header File**

- [components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl\\_sdio.h](#)

**Functions**

`esp_err_t` **essl\_sdio\_init\_dev** (`essl_handle_t` \*out\_handle, const `essl_sdio_config_t` \*config)

Initialize the ESSL SDIO device and get its handle.

**Parameters**

- **out\_handle** –Output of the handle.
- **config** –Configuration for the ESSL SDIO device.

**Returns**

- ESP\_OK: on success
- ESP\_ERR\_NO\_MEM: memory exhausted.

*esp\_err\_t* **essl\_sdio\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

**Parameters** **handle** –Handle of the ESSL SDIO device to deinit.

**Returns**

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: wrong handle passed

## Structures

struct **essl\_sdio\_config\_t**

Configuration for the ESSL SDIO device.

### Public Members

*sdmmc\_card\_t* \***card**

The initialized sdmmc card pointer of the slave.

int **recv\_buffer\_size**

The pre-negotiated recv buffer size used by both the host and the slave.

## Header File

- [components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl\\_spi.h](#)

## Functions

*esp\_err\_t* **essl\_spi\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_spi\_config\_t* \*init\_config)

Initialize the ESSL SPI device function list and get its handle.

**Parameters**

- **out\_handle** –[out] Output of the handle
- **init\_config** –Configuration for the ESSL SPI device

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_NO\_MEM: Memory exhausted
- ESP\_ERR\_INVALID\_STATE: SPI driver is not initialized
- ESP\_ERR\_INVALID\_ARG: Wrong register ID

*esp\_err\_t* **essl\_spi\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

**Parameters** **handle** –Handle of the ESSL SPI device

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI is not in use

*esp\_err\_t* **essl\_spi\_read\_reg** (void \*arg, uint8\_t addr, uint8\_t \*out\_value, uint32\_t wait\_ms)

Read from the shared registers.

---

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `rx_sync_reg` in `essl_spi_config_t`)

---

**Parameters**

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1).
- **out\_value** –[out] Read buffer for the shared registers.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* `essl_spi_get_packet` (void \*arg, void \*out\_data, size\_t size, uint32\_t wait\_ms)

Get a packet from Slave.

**Parameters**

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **out\_data** –[out] Output data address
- **size** –The size of the output data.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: On Success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The output data address is neither DMA capable nor 4 byte-aligned
- `ESP_ERR_INVALID_SIZE`: Master requires `size` bytes of data but Slave did not load enough bytes.

*esp\_err\_t* `essl_spi_write_reg` (void \*arg, uint8\_t addr, uint8\_t value, uint8\_t \*out\_value, uint32\_t wait\_ms)

Write to the shared registers.

---

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

---

---

**Note:** Feature of checking the actual written value (`out_value`) is not supported.

---

**Parameters**

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** –Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1)
- **value** –Buffer for data to send, should be align to 4.
- **out\_value** –[out] Not supported, should be set to `NULL`.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: success

- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- `ESP_ERR_NOT_SUPPORTED`: Should set `out_value` to `NULL`. See note 2.
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_send\_packet** (void \*arg, const void \*data, size\_t size, uint32\_t wait\_ms)

Send a packet to Slave.

#### Parameters

- **arg** –Context of the component. (Member `arg` from `essl_handle_t`)
- **data** –Address of the data to send
- **size** –Size of the data to send.
- **wait\_ms** –Time to wait before timeout (reserved for future use, user should set this to 0).

#### Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The data address is not DMA capable
- `ESP_ERR_INVALID_SIZE`: Master will send `size` bytes of data but Slave did not load enough RX buffer

void **essl\_spi\_reset\_cnt** (void \*arg)

Reset the counter in Master context.

---

**Note:** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

---

**Parameters** **arg** –Context of the component. (Member `arg` from `essl_handle_t`)

*esp\_err\_t* **essl\_spi\_rdbuf** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in ISR way.

---

**Note:** The slave's HW doesn't guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a `rdbuf` SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

---

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –`SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: on success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_rdbuf\_polling** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in polling way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** –Address of the slave shared buffer
- **len** –Length to read
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: on success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrbuf** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in ISR way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **addr** –Address of the slave shared buffer,
- **len** –Length to write
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrbuf\_polling** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in polling way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **addr** –Address of the slave shared buffer,
- **len** –Length to write
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_polling_transmit`.

*esp\_err\_t* **essl\_spi\_rddma** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int len, int seg\_len, uint32\_t flags)

Receive long buffer in segments from the slave through its DMA.

---

**Note:** This function combines several `:cpp:func:essl_spi_rddma_seg` and one `:cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** –Total length of data to receive.
- **seg\_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `rddma_done` will still be sent.)
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* `essl_spi_rddma_seg` (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int seg\_len, uint32\_t flags)

Read one data segment from the slave through its DMA.

---

**Note:** To read long buffer, call `:cpp:func:essl_spi_rddma` instead.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **out\_data** –[out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- **seg\_len** –Length of this segment
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* `essl_spi_rddma_done` (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the `rddma_done` command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

---

**Note:** This is required only when the slave is working in segment mode.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* `essl_spi_wrdma` (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int len, int seg\_len, uint32\_t flags)

Send long buffer in segments to the slave through its DMA.

---

**Note:** This function combines several `:cpp:func:essl_spi_wrdma_seg` and one `:cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

---

#### Parameters

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **len** –Total length of data to send.
- **seg\_len** –Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent.)
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrdma\_seg** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int seg\_len, uint32\_t flags)

Send one data segment to the slave through its DMA.

---

**Note:** To send long buffer, call `:cpp:func:essl_spi_wrdma` instead.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **data** –Buffer for data to send, strongly suggested to be in the DRAM
- **seg\_len** –Length of this segment
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrdma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the `wrdma_done` command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

---

**Note:** This is required only when the slave is working in segment mode.

---

**Parameters**

- **spi** –SPI device handle representing the slave
- **flags** –SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from `:cpp:func:spi_device_transmit`.

**Structures**

struct **essl\_spi\_config\_t**

Configuration of ESSL SPI device.

**Public Members**

*spi\_device\_handle\_t* \***spi**

Pointer to SPI device handle.

uint32\_t **tx\_buf\_size**

The pre-negotiated Master TX buffer size used by both the host and the slave.

**uint8\_t tx\_sync\_reg**

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

**uint8\_t rx\_sync\_reg**

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

## 2.4.14 ESP x509 Certificate Bundle

### Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

---

**Note:** The bundle is currently not available when using WolfSSL.

---

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the `gen_cert_bundle.py` python utility the certificates' subject name and public key are stored in a file and embedded in the ESP32-S3 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Apr 26 03:12:05 2022 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90 % coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

---

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `ca.crt_all.pem`.

---

### Configuration

Most configuration is done through `menuconfig`. Make and CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {
    .cert_bundle_attach = esp_cert_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);

esp_cert_bundle_attach(&conf);
```

### Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found [here](#). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of [curl](#). Another alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#)

The common certificates bundle were made by selecting the authorities with a market share of more than 1 % from w3tech's [SSL Survey](#). These authorities were then used to pick the names of the certificates for the filter list, `cmn_cert_authorities.csv`, from [this list](#) provided by Mozilla.

### Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in IDF, then the certificate list can be downloaded from Mozilla as described in [Updating the Certificate Bundle](#).

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https\\_x509\\_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https\\_request](#).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https\\_mbedtls](#).

### API Reference

#### Header File

- [components/mbedtls/esp\\_cert\\_bundle/include/esp\\_cert\\_bundle.h](#)

#### Functions

*esp\_err\_t* **esp\_cert\_bundle\_attach** (void \*conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in `menuconfig` and embedded in the binary.

**Parameters** `conf` **–[in]** The config struct for the SSL connection.

#### Returns

- `ESP_OK` if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp\_cert\_bundle\_detach** (mbedtls\_ssl\_config \*conf)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

**Parameters** `conf` **–[in]** The config struct for the SSL connection.

`esp_err_t esp_cert_bundle_set` (const uint8\_t \*x509\_bundle, size\_t bundle\_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

#### Parameters

- **x509\_bundle** –[in] A pointer to the certificate bundle.
- **bundle\_size** –[in] Size of the certificate bundle in bytes.

#### Returns

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

Code examples for this API section are provided in the [protocols](#) directory of ESP-IDF examples.

## 2.4.15 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in [Networking APIs](#).

## 2.5 Provisioning API

### 2.5.1 Protocol Communication

#### Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

Following features are available for provisioning :

- **Communication security at application level** -
  - protocomm\_security0 (no security)
  - protocomm\_security1 (curve25519 key exchange + AES-CTR encryption)
- Proof-of-possession (support with protocomm\_security1 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for protocomm\_security1) by performing the two way handshake. See [Unified Provisioning](#) for more details about the secure handshake logic.

#### Transport Example (SoftAP + HTTP) with Security 1

For complete example see [provisioning/legacy/softap\\_prov](#)

```
/* Endpoint handler to be registered with protocomm.
 * This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                           const uint8_t *inbuf, ssize_t inlen,
                           uint8_t **outbuf, ssize_t *outlen,
```

(continues on next page)

(continued from previous page)

```

                                void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen;          /* Output data length updated */
    *outbuf = malloc(inlen); /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
        .data = {
            .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
        }
    };

    /* Start protocomm server on top of HTTP */
    protocomm_httpd_start(pc, &pc_config);

    /* Create Proof of Possession object from pop_string. It must be valid
     * throughout the scope of protocomm endpoint. This need not be
     ↪static,
     * ie. could be dynamically allocated and freed at the time of
     ↪endpoint
     * removal */
    const static protocomm_security_pop_t pop_obj = {
        .data = (const uint8_t *) strdup(pop_string),
        .len = strlen(pop_string)
    };

    /* Set security for communication at application level. Just like for
     * request handlers, setting security creates an endpoint and
     ↪registers
     * the handler provided by protocomm_security1. One can similarly use
     * protocomm_security0. Only one type of security can be set for a
     * protocomm instance at a time. */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security1,
     ↪&pop_obj);

    /* Private data passed to the endpoint must be valid throughout the
     ↪scope
     * of protocomm endpoint. This need not be static, ie. could be
     ↪dynamically
     * allocated and freed at the time of endpoint removal */
    static uint32_t priv_data = 1234;

```

(continues on next page)

(continued from previous page)

```

    /* Add a new endpoint for the protocomm instance, identified by a
    ↪unique name
    * and register a handler function along with private data to be
    ↪passed at the
    * time of handler execution. Multiple endpoints can be added as long
    ↪as they
    * are identified by unique names */
    protocomm_add_endpoint(pc, "echo_req_endpoint",
                          echo_req_handler, (void *) &priv_data);

    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it's name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);

    /* Delete (deallocate) the protocomm instance */
    protocomm_delete(pc);
}

```

### Transport Example (BLE) with Security 0

For complete example see [provisioning/legacy/ble\\_prov](#)

```

/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };

    /* Config for protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <-----
            * -----> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
            0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_
    ↪table[0]),
        .nu_lookup = nu_lookup_table
    };

    /* Start protocomm layer on top of BLE */
    protocomm_ble_start(pc, &config);
}

```

(continues on next page)

(continued from previous page)

```

    /* For protocomm_security0, Proof of Possession is not used, and can
    ↪be kept NULL */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security0,
    ↪NULL);
    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler,
    ↪NULL);
    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop BLE protocomm service */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}

```

## API Reference

### Header File

- [components/protocomm/include/common/protocomm.h](#)

### Functions

*protocomm\_t* \***protocomm\_new** (void)

Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the *protocomm\_t* structure initialized to NULL.

#### Returns

- *protocomm\_t*\* : On success
- NULL : No memory for allocating new instance

void **protocomm\_delete** (*protocomm\_t* \*pc)

Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using `protocomm_new()`.

**Parameters** *pc* –[in] Pointer to the protocomm instance to be deleted

*esp\_err\_t* **protocomm\_add\_endpoint** (*protocomm\_t* \*pc, const char \*ep\_name, *protocomm\_req\_handler\_t* h, void \*priv\_data)

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

---

#### Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
  - This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the *protocomm\_t* instance structure.
- 

#### Parameters

- **pc** –[in] Pointer to the protocomm instance
- **ep\_name** –[in] Endpoint identifier(name) string
- **h** –[in] Endpoint handler function
- **priv\_data** –[in] Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP\_ERR\_NO\_MEM : Error allocating endpoint resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name/handler arguments

*esp\_err\_t* **protocomm\_remove\_endpoint** (*protocomm\_t* \*pc, const char \*ep\_name)

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

---

**Note:**

- This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.
- 

**Parameters**

- **pc** –[in] Pointer to the protocomm instance
- **ep\_name** –[in] Endpoint identifier(name) string

**Returns**

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_open\_session** (*protocomm\_t* \*pc, uint32\_t session\_id)

Allocates internal resources for new transport session.

---

**Note:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- 

**Parameters**

- **pc** –[in] Pointer to the protocomm instance
- **session\_id** –[in] Unique ID for a communication session

**Returns**

- ESP\_OK : Request handled successfully
- ESP\_ERR\_NO\_MEM : Error allocating internal resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_close\_session** (*protocomm\_t* \*pc, uint32\_t session\_id)

Frees internal resources used by a transport session.

---

**Note:**

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- 

**Parameters**

- **pc** –[in] Pointer to the protocomm instance
- **session\_id** –[in] Unique ID for a communication session

**Returns**

- ESP\_OK : Request handled successfully
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_req\_handle** (*protocomm\_t* \*pc, const char \*ep\_name, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

---

**Note:**

- An endpoint must be bound to a valid *protocomm* instance, created using *protocomm\_new()*.
  - Resulting output buffer must be deallocated by the caller.
- 

**Parameters**

- **pc** –[in] Pointer to the *protocomm* instance
- **ep\_name** –[in] Endpoint identifier(name) string
- **session\_id** –[in] Unique ID for a communication session
- **inbuf** –[in] Input buffer contains input request data which is to be processed by the registered handler
- **inlen** –[in] Length of the input buffer
- **outbuf** –[out] Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **outlen** –[out] Buffer length of the allocated output buffer

**Returns**

- ESP\_OK : Request handled successfully
- ESP\_FAIL : Internal error in execution of registered handler
- ESP\_ERR\_NO\_MEM : Error allocating internal resource
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_set\_security** (*protocomm\_t* \*pc, const char \*ep\_name, const *protocomm\_security\_t* \*sec, const *protocomm\_security\_pop\_t* \*pop)

Add endpoint security for a *protocomm* instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

---

**Note:**

- An endpoint must be bound to a valid *protocomm* instance, created using *protocomm\_new()*.
  - The choice of security can be any *protocomm\_security\_t* instance. Choices *protocomm\_security0* and *protocomm\_security1* are readily available.
- 

**Parameters**

- **pc** –[in] Pointer to the *protocomm* instance
- **ep\_name** –[in] Endpoint identifier(name) string
- **sec** –[in] Pointer to endpoint security instance
- **pop** –[in] Pointer to proof of possession for authenticating a client

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP\_ERR\_INVALID\_STATE : Security endpoint already set
- ESP\_ERR\_NO\_MEM : Error allocating endpoint resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name/handler arguments

*esp\_err\_t* **protocomm\_unset\_security** (*protocomm\_t* \*pc, const char \*ep\_name)

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

#### Parameters

- **pc** –[in] Pointer to the protocomm instance
- **ep\_name** –[in] Endpoint identifier(name) string

#### Returns

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

*esp\_err\_t* **protocomm\_set\_version** (*protocomm\_t* \*pc, const char \*ep\_name, const char \*version)

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

---

#### Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- 

#### Parameters

- **pc** –[in] Pointer to the protocomm instance
- **ep\_name** –[in] Endpoint identifier(name) string
- **version** –[in] Version identifier(name) string

#### Returns

- ESP\_OK : Success
- ESP\_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP\_ERR\_INVALID\_STATE : Version endpoint already set
- ESP\_ERR\_NO\_MEM : Error allocating endpoint resource
- ESP\_ERR\_INVALID\_ARG : Null instance/name/handler arguments

*esp\_err\_t* **protocomm\_unset\_version** (*protocomm\_t* \*pc, const char \*ep\_name)

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

#### Parameters

- **pc** –[in] Pointer to the protocomm instance
- **ep\_name** –[in] Endpoint identifier(name) string

#### Returns

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Endpoint with specified name doesn't exist
- ESP\_ERR\_INVALID\_ARG : Null instance/name arguments

### Type Definitions

```
typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
```

Function prototype for protocomm endpoint handler.

```
typedef struct protocomm protocomm_t
```

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

---

**Note:** Structure of the protocomm object is kept private

---

## Header File

- `components/protocomm/include/security/protocomm_security.h`

## Structures

struct **protocomm\_security\_pop**

Proof Of Possession for authenticating a secure session.

### Public Members

const uint8\_t \***data**

Pointer to buffer containing the proof of possession data

uint16\_t **len**

Length (in bytes) of the proof of possession data

struct **protocomm\_security**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

---

**Note:** This structure should not have any dynamic members to allow re-entrancy

---

### Public Members

int **ver**

Unique version number of security implementation

*esp\_err\_t* (\***init**)(*protocomm\_security\_handle\_t* \*handle)

Function for initializing/allocating security infrastructure

*esp\_err\_t* (\***cleanup**)(*protocomm\_security\_handle\_t* handle)

Function for deallocating security infrastructure

*esp\_err\_t* (\***new\_transport\_session**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id)

Starts new secure transport session with specified ID

*esp\_err\_t* (\***close\_transport\_session**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id)

Closes a secure transport session with specified ID

*esp\_err\_t* (\***security\_req\_handler**)(*protocomm\_security\_handle\_t* handle, const *protocomm\_security\_pop\_t* \*pop, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen, void \*priv\_data)

Handler function for authenticating connection request and establishing secure session

*esp\_err\_t* (\***encrypt**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*outbuf, ssize\_t \*outlen)

Function which implements the encryption algorithm

*esp\_err\_t* (\***decrypt**)(*protocomm\_security\_handle\_t* handle, uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*outbuf, ssize\_t \*outlen)

Function which implements the decryption algorithm

### Type Definitions

typedef struct *protocomm\_security\_pop* **protocomm\_security\_pop\_t**

Proof Of Possession for authenticating a secure session.

typedef void \***protocomm\_security\_handle\_t**

typedef struct *protocomm\_security* **protocomm\_security\_t**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

---

**Note:** This structure should not have any dynamic members to allow re-entrancy

---

### Header File

- [components/protocomm/include/security/protocomm\\_security0.h](#)

### Header File

- [components/protocomm/include/security/protocomm\\_security1.h](#)

### Header File

- [components/protocomm/include/transport/protocomm\\_httpd.h](#)

### Functions

*esp\_err\_t* **protocomm\_httpd\_start** (*protocomm\_t* \*pc, const *protocomm\_httpd\_config\_t* \*config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

---

**Note:** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

---

#### Parameters

- **pc** –[in] Protocomm instance pointer obtained from `protocomm_new()`
- **config** –[in] Pointer to config structure for initializing HTTP server

#### Returns

- `ESP_OK` : Success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_NOT_SUPPORTED` : Transport layer bound to another protocomm instance
- `ESP_ERR_INVALID_STATE` : Transport layer already bound to this protocomm instance
- `ESP_ERR_NO_MEM` : Memory allocation for server resource failed
- `ESP_ERR_HTTPD_*` : HTTP server error on start

*esp\_err\_t* **protocomm\_httpd\_stop** (*protocomm\_t* \*pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**Parameters** **pc** –[in] Same protocomm instance that was passed to `protocomm_httpd_start()`

**Returns**

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : Null / incorrect protocomm instance pointer

## Unions

union **protocomm\_httpd\_config\_data\_t**

*#include* <*protocomm\_httpd.h*> Protocomm HTTPD Configuration Data

### Public Members

void \***handle**

HTTP Server Handle, if `ext_handle_provided` is set to true

*protocomm\_http\_server\_config\_t* **config**

HTTP Server Configuration, if a server is not already active

## Structures

struct **protocomm\_http\_server\_config\_t**

Config parameters for protocomm HTTP server.

### Public Members

uint16\_t **port**

Port on which the HTTP server will listen

size\_t **stack\_size**

Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned **task\_priority**

Priority of server task

struct **protocomm\_httpd\_config\_t**

Config parameters for protocomm HTTP server.

### Public Members

bool **ext\_handle\_provided**

Flag to indicate if an external HTTP Server Handle has been provided. In such a case, protocomm will use the same HTTP Server and not start a new one internally.

*protocomm\_httpd\_config\_data\_t* **data**

Protocomm HTTPD Configuration Data

## Macros

**PROTOCOLM\_HTTPD\_DEFAULT\_CONFIG** ()

## Header File

- [components/protocomm/include/transport/protocomm\\_ble.h](#)

## Functions

*esp\_err\_t* **protocomm\_ble\_start** (*protocomm\_t* \*pc, const *protocomm\_ble\_config\_t* \*config)

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

### Parameters

- **pc** –[in] Protocomm instance pointer obtained from `protocomm_new()`
- **config** –[in] Pointer to config structure for initializing BLE

### Returns

- **ESP\_OK** : Success
- **ESP\_FAIL** : Simple BLE start error
- **ESP\_ERR\_NO\_MEM** : Error allocating memory for internal resources
- **ESP\_ERR\_INVALID\_STATE** : Error in ble config
- **ESP\_ERR\_INVALID\_ARG** : Null arguments

*esp\_err\_t* **protocomm\_ble\_stop** (*protocomm\_t* \*pc)

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

---

**Note:** You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

---

**Parameters** **pc** –[in] Same protocomm instance that was passed to `protocomm_ble_start()`

### Returns

- **ESP\_OK** : Success
- **ESP\_FAIL** : Simple BLE stop error
- **ESP\_ERR\_INVALID\_ARG** : Null / incorrect protocomm instance

## Structures

struct **name\_uuid**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

### Public Members

const char \***name**

Name of the handler, which is passed to protocomm layer

uint16\_t **uuid**

UUID to be assigned to the BLE characteristic which is mapped to the handler

struct **protocomm\_ble\_config**

Config parameters for protocomm BLE service.

## Public Members

char **device\_name**[29 + 1]

BLE device name being broadcast at the time of provisioning

uint8\_t **service\_uuid**[16]

128 bit UUID of the provisioning service

uint8\_t \***manufacturer\_data**

BLE device manufacturer data pointer in advertisement

ssize\_t **manufacturer\_data\_len**

BLE device manufacturer data length in advertisement

ssize\_t **nu\_lookup\_count**

Number of entries in the Name-UUID lookup table

*protocomm\_ble\_name\_uuid\_t* \***nu\_lookup**

Pointer to the Name-UUID lookup table

unsigned **ble\_bonding**

BLE bonding

unsigned **ble\_sm\_sc**

BLE security flag

## Macros

### **MAX\_BLE\_DEVNAME\_LEN**

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

### **BLE\_UUID128\_VAL\_LENGTH**

### **MAX\_BLE\_MANUFACTURER\_DATA\_LEN**

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

## Type Definitions

typedef struct *name\_uuid* **protocomm\_ble\_name\_uuid\_t**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct *protocomm\_ble\_config* **protocomm\_ble\_config\_t**

Config parameters for protocomm BLE service.

## 2.5.2 Unified Provisioning

### Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. *Extensible Protocol*: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.
2. *Transport Flexibility*: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.
3. *Security Scheme Flexibility*: It's understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that's WPA2 protected or BLE with "just-works" security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.
4. *Compact Data Representation*: The protocol uses [Google Protobufs](#) as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

### Typical Provisioning Process

#### Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.
2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app
3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.
5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases
6. SoftAP based provisioning requires the phone app user to go to "System Settings" to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

#### Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be

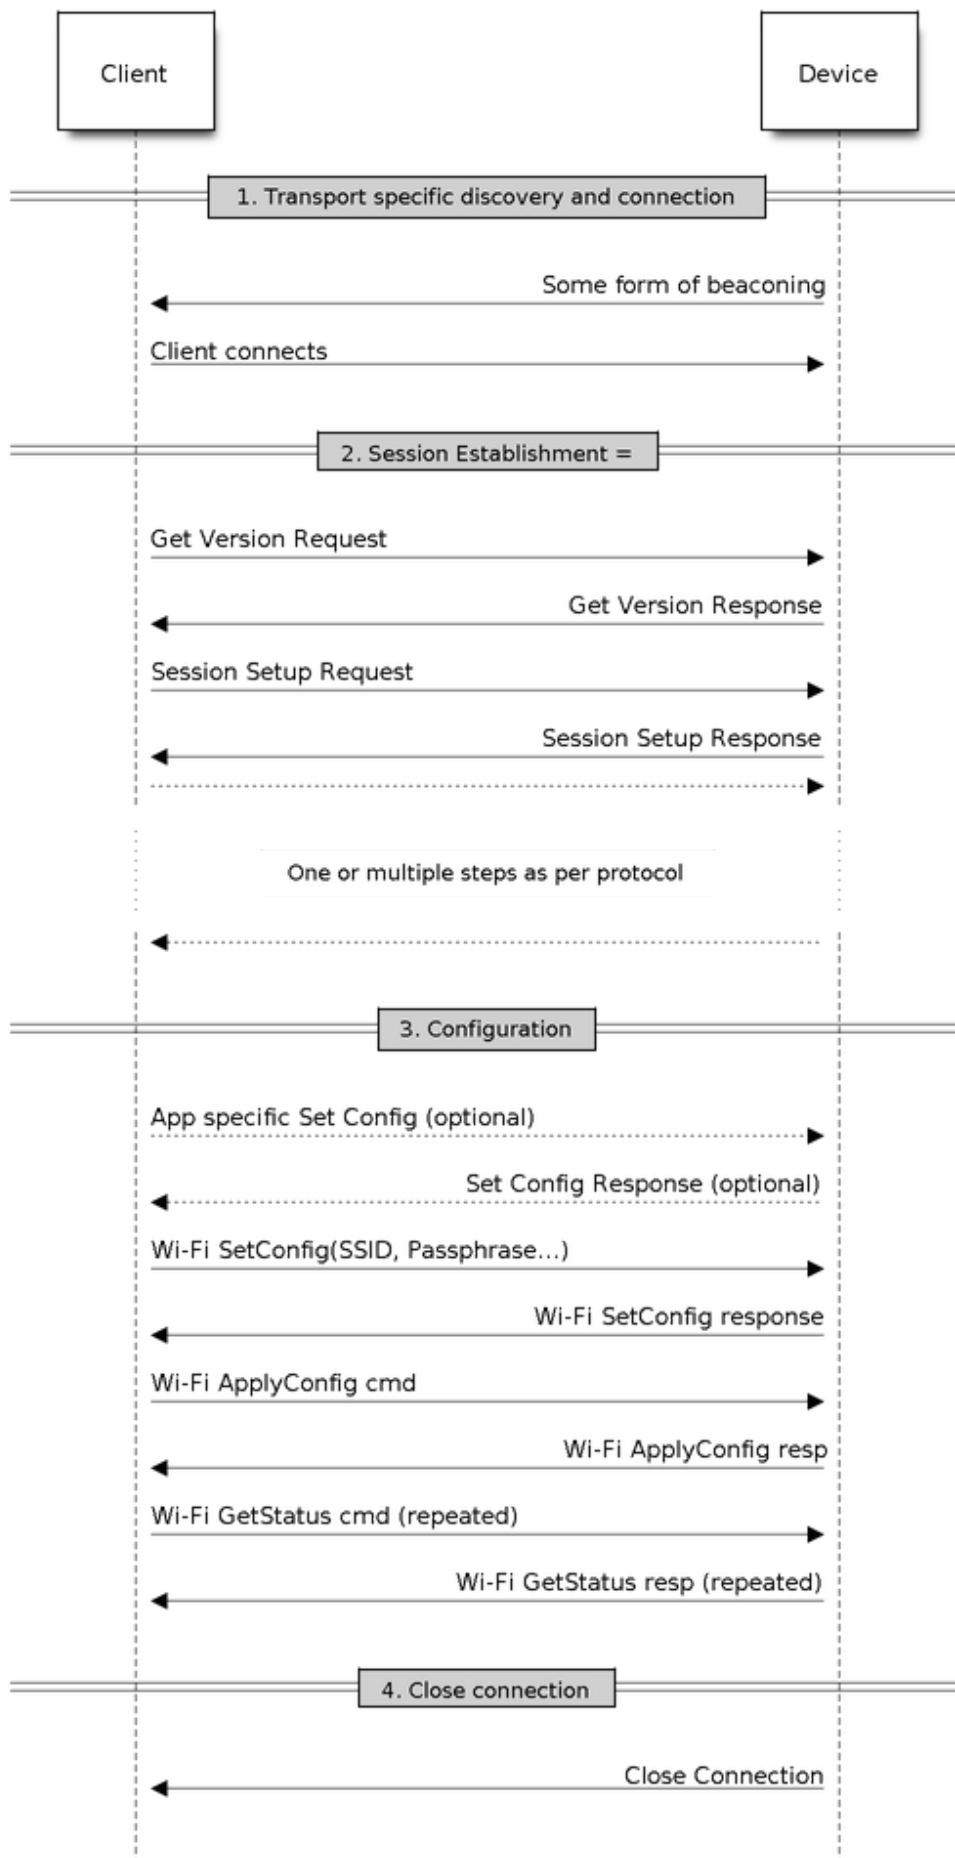

Fig. 25: Typical Provisioning Process

entered on the provisioning client as a security measure to make sure that the user can provision the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. *Transport Security*: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.
2. *Application Security*: The unified provisioning subsystem provides application level security (*securityI*) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

### Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

### Architecture

The below diagram shows architecture of unified provisioning.

Fig. 26: Unified Provisioning Architecture

It relies on the base layer called *Protocol Communication* (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a `protocomm` instance which is mapped to a specific transport and specific security scheme. Each transport in the `protocomm` has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

## Security Schemes

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes :

- a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
- b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram

## Sample Code

Please refer to [Protocol Communication](#) and [Wi-Fi Provisioning](#) for API guides and code snippets on example usage. Application implementation can be found as an example under [provisioning](#).

## Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - [BLE Provisioning app on Play Store](#).
  - [SoftAP Provisioning app on Play Store](#).
  - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
  - [BLE Provisioning app on app store](#).
  - [SoftAP Provisioning app on app Store](#).
  - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/MacOS/Windows : [tools/esp\\_prov](#) (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

## 2.5.3 Wi-Fi Provisioning

### Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure [Protocol Communication](#) (`protocomm`) sessions. The set of `wifi_prov_mgr_` APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

**Initialization** `wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other `wifi_prov_mgr_` APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

Fig. 27: Security1

```
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};

ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager :

- *scheme* : This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options :
  - `wifi_prov_scheme_ble` : BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap` : Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console` : Serial transport and console for handling provisioning commands
- *scheme\_event\_handler* : An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn't require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only BLE memory. Used when main application requires classic BT.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
  - `WIFI_PROV_EVENT_HANDLER_NONE` - Don't use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.
- *app\_event\_handler* (Deprecated) : It is now recommended to catch `WIFI_PROV_EVENT`s` that are emitted to the default event loop handler. See definition of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```
static void event_handler(void* arg, esp_event_base_t event_base,
                        int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV: {
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t_
→*)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials"
                        "\n\tSSID      : %s\n\tPassword : %s",
                        (const char *) wifi_sta_cfg->ssid,
                        (const char *) wifi_sta_cfg->password);
```

(continues on next page)

(continued from previous page)

```

        break;
    }
    case WIFI_PROV_CRED_FAIL: {
        wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_
↪reason_t *)event_data;
        ESP_LOGE(TAG, "Provisioning failed!\n\tReason : %s"
↪"\n\tPlease reset to factory and retry_
↪provisioning",
                (*reason == WIFI_PROV_STA_AUTH_ERROR) ?
                "Wi-Fi station authentication failed" : "Wi-Fi_
↪access-point not found");
        break;
    }
    case WIFI_PROV_CRED_SUCCESS:
        ESP_LOGI(TAG, "Provisioning successful");
        break;
    case WIFI_PROV_END:
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
        break;
    default:
        break;
}
}
}

```

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

**Check Provisioning State** Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken :

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```

bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );

```

**Start Provisioning Service** At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to :

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses *protocomm*, we have the option of choosing one of the security features provided by it :

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (*pop*), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the *pop* is simply ignored

See [Provisioning](#) for details about the security features.

```

const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );

```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**Note:** If the device fails to connect with the provided credentials, it won't accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in [Check Provisioning State](#).

**Waiting For Completion** Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```

// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_
↪name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();

```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT`s` and call `cpp:func:`wifi_prov_mgr_deinit()`` when event ID is `WIFI_PROV_END`:

```

static void event_handler(void* arg, esp_event_base_t event_base,
                          int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}

```

**User Side Implementation** When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using BLE transport, a custom 128 bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th

and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn't be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic will be assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows :

Table 7: Endpoints provided by Provisioning Service

Endpoint Name (BLE + GATT Server)	URI (SoftAP + HTTP Server + mDNS)	Description
prov-session	<a href="http://&lt;mdns-hostname&gt;.local/prov-session">http://&lt;mdns-hostname&gt;.local/prov-session</a>	Security endpoint used for session establishment
prov-scan	<a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a>	Endpoint used for starting Wi-Fi scan and receiving scan results
prov-config	<a href="http://&lt;mdns-hostname&gt;.local/prov-config">http://&lt;mdns-hostname&gt;.local/prov-config</a>	Endpoint used for configuring Wi-Fi credentials on device
proto-ver	<a href="http://&lt;mdns-hostname&gt;.local/proto-ver">http://&lt;mdns-hostname&gt;.local/proto-ver</a>	Endpoint for retrieving version info

Immediately after connecting, the client application may fetch the version / capabilities information from the *proto-ver* endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like : `prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, ...`. Here label *prov* provides provisioning service version (*ver*) and capabilities (*cap*). For now, only *no\_pop* capability is supported, which indicates that the service doesn't require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like *my\_app* in this example). These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the *.proto* files found under `protocomm/proto`, which define the Protobuf message structures supported by *prov-session* endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of *wifi\_config* commands, serialized as Protobuf messages (the corresponding *.proto* files can be found under `wifi_provisioning/proto`) :

- *get\_status* - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- *set\_config* - For setting the Wi-Fi connection credentials
- *apply\_config* - For applying the credentials saved during *set\_config* and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the *wifi\_config* commands described above. The *wifi\_scan* endpoint supports the following protobuf commands :

- *scan\_start* - For starting Wi-Fi scan with various options :
  - *blocking* (input) - If true, the command returns only when the scanning is finished
  - *passive* (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - *group\_channels* (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value

of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for atleast 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting `group_channels` to 4, will create 5 groups, with each group having 3 channels, except the last one which will have  $14 \% 3 = 2$  channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.

- `period_ms` (input) - Scan parameter specifying how long to wait on each channel
- `scan_status` - Gives the status of scanning process :
  - `scan_finished` (output) - When scan has finished this returns true
  - `result_count` (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- `scan_result` - For fetching scan results. This can be called even if scan is still on going
  - `start_index` (input) - Starting index from where to fetch the entries from the results list
  - `count` (input) - Number of entries to fetch from the starting index
  - `entries` (output) - List of entries returned. Each entry consists of `ssid`, `channel` and `rssi` information

**Additional Endpoints** In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See [protocomm](#) for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_
↪key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, ↪
↪custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When / How To Stop Provisioning Service?** The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service will only be stopped after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and `WIFI_PROV_END` event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials

over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

## Application Examples

For complete example implementation see [provisioning/wifi\\_prov\\_mgr](#)

## Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - [BLE Provisioning app on Play Store](#).
  - [SoftAP Provisioning app on Play Store](#).
  - Source code on GitHub: [esp-idf-provisioning-android](#).
- **iOS:**
  - [BLE Provisioning app on app store](#).
  - [SoftAP Provisioning app on app Store](#).
  - Source code on GitHub: [esp-idf-provisioning-ios](#).
- Linux/MacOS/Windows : [tools/esp\\_prov](#) (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

## API Reference

### Header File

- [components/wifi\\_provisioning/include/wifi\\_provisioning/manager.h](#)

### Functions

`esp_err_t wifi_prov_mgr_init (wifi_prov_mgr_config_t config)`

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI\_PROV\_INIT is emitted right after initialization is complete

**Parameters** `config` –[in] Configuration structure

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Fail

void `wifi_prov_mgr_deinit` (void)

Stop provisioning (if running) and release resource used by the manager.

Event WIFI\_PROV\_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI\_PROV\_END, and then performs the de-initialization

`esp_err_t wifi_prov_mgr_is_provisioned` (bool \*provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp\_wifi component

If one were to call `esp_wifi_set_config()` directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

---

**Note:** Calling `wifi_prov_mgr_start_provisioning()` automatically resets the provision state, irrespective of what the state was prior to making the call.

---

**Parameters** `provisioned` –[out] True if provisioned, else false

**Returns**

- `ESP_OK` : Retrieved provision state successfully
- `ESP_FAIL` : Wi-Fi not initialized
- `ESP_ERR_INVALID_ARG` : Null argument supplied
- `ESP_ERR_INVALID_STATE` : Manager not initialized

`esp_err_t` **wifi\_prov\_mgr\_start\_provisioning** (`wifi_prov_security_t` security, const char \*pop, const char \*service\_name, const char \*service\_key)

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- `wifi_prov_scheme_ble` : This starts `protocomm_ble`, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- `wifi_prov_scheme_softap` : This activates SoftAP mode of Wi-Fi and starts `protocomm_httpd`, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type `_esp_wifi_prov._tcp`)

Event `WIFI_PROV_START` is emitted right after provisioning starts without failure

---

**Note:** This API will start provisioning service even if device is found to be already provisioned, i.e. `wifi_prov_mgr_is_provisioned()` yields true

---

**Parameters**

- **security** –[in] Specify which `protocomm` security scheme to use :
  - `WIFI_PROV_SECURITY_0` : For no security
  - `WIFI_PROV_SECURITY_1` : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- **pop** –[in] Pointer to proof of possession string (NULL if not needed). This is relevant only for `protocomm` security 1, in which case it is used for authenticating secure session
- **service\_name** –[in] Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- **service\_key** –[in] Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

**Returns**

- `ESP_OK` : Provisioning started successfully
- `ESP_FAIL` : Failed to start provisioning service
- `ESP_ERR_INVALID_STATE` : Provisioning manager not initialized or already started

void **wifi\_prov\_mgr\_stop\_provisioning** (void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event `WIFI_PROV_END` will be emitted.

If `wifi_prov_mgr_deinit()` is called without calling this API first, it will automatically stop the provisioning service and emit the `WIFI_PROV_END`, followed by `WIFI_PROV_DEINIT`, before returning.

This API will generally be used along with `wifi_prov_mgr_disable_auto_stop()` in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient `cleanup_delay`, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

`Cleanup_delay` is set when calling `wifi_prov_mgr_disable_auto_stop()`. If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once `WIFI_PROV_CRED_SUCCESS` is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending `Wi-Fi state connected` response the service is stopped immediately.

void **wifi\_prov\_mgr\_wait** (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event `WIFI_PROV_END` is emitted.

This will not block if provisioning is not started or not initialized.

*esp\_err\_t* **wifi\_prov\_mgr\_disable\_auto\_stop** (uint32\_t cleanup\_delay)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call `wifi_prov_mgr_stop_provisioning()` later when the device is fully configured and the provisioning service is no longer required.

---

**Note:** This must be called before executing `wifi_prov_mgr_start_provisioning()`

---

**Parameters** `cleanup_delay` **–[in]** Sets the delay after which the actual cleanup of transport related resources is done after a call to `wifi_prov_mgr_stop_provisioning()` returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

**Returns**

- `ESP_OK` : Success
- `ESP_ERR_INVALID_STATE` : Manager not initialized or provisioning service already started

*esp\_err\_t* **wifi\_prov\_mgr\_set\_app\_info** (const char \*label, const char \*version, const char \*\*capabilities, size\_t total\_capabilities)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

---

**Note:** This must be called before executing `wifi_prov_mgr_start_provisioning()`

---

**Parameters**

- **label** –[in] String indicating the application name.
- **version** –[in] String indicating the application version. There is no constraint on format.
- **capabilities** –[in] Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- **total\_capabilities** –[in] Size of capabilities array

**Returns**

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_STATE : Manager not initialized or provisioning service already started
- ESP\_ERR\_NO\_MEM : Failed to allocate memory for version string
- ESP\_ERR\_INVALID\_ARG : Null argument

*esp\_err\_t* **wifi\_prov\_mgr\_endpoint\_create** (const char \*ep\_name)

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

---

**Note:** This API can only be called BEFORE provisioning is started

---

---

**Note:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

---

---

**Note:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

---

**Parameters** **ep\_name** –[in] unique name of the endpoint

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

*esp\_err\_t* **wifi\_prov\_mgr\_endpoint\_register** (const char \*ep\_name, *protocomm\_req\_handler\_t* handler, void \*user\_ctx)

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

---

**Note:** This API can only be called AFTER provisioning has started

---

---

**Note:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

---

---

**Note:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

---

**Parameters**

- **ep\_name** –[in] Name of the endpoint
- **handler** –[in] Endpoint handler function
- **user\_ctx** –[in] User data

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

void **wifi\_prov\_mgr\_endpoint\_unregister** (const char \*ep\_name)

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

**Parameters** **ep\_name** –[in] Name of the endpoint

*esp\_err\_t* **wifi\_prov\_mgr\_event\_handler** (void \*ctx, *system\_event\_t* \*event)

Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager's internal state machine depending on incoming Wi-Fi events

---

**Note:** : This function is DEPRECATED, because events are now handled internally using the event loop library, *esp\_event*. Calling this will do nothing and simply return ESP\_OK.

---

**Parameters**

- **ctx** –[in] Event context data
- **event** –[in] Event info

**Returns**

- ESP\_OK : Event handled successfully

*esp\_err\_t* **wifi\_prov\_mgr\_get\_wifi\_state** (*wifi\_prov\_sta\_state\_t* \*state)

Get state of Wi-Fi Station during provisioning.

**Parameters** **state** –[out] Pointer to *wifi\_prov\_sta\_state\_t* variable to be filled

**Returns**

- ESP\_OK : Successfully retrieved Wi-Fi state
- ESP\_FAIL : Provisioning app not running

*esp\_err\_t* **wifi\_prov\_mgr\_get\_wifi\_disconnect\_reason** (*wifi\_prov\_sta\_fail\_reason\_t* \*reason)

Get reason code in case of Wi-Fi station disconnection during provisioning.

**Parameters** **reason** –[out] Pointer to *wifi\_prov\_sta\_fail\_reason\_t* variable to be filled

**Returns**

- ESP\_OK : Successfully retrieved Wi-Fi disconnect reason
- ESP\_FAIL : Provisioning app not running

*esp\_err\_t* **wifi\_prov\_mgr\_configure\_sta** (*wifi\_config\_t* \*wifi\_cfg)

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through *protocomm*, then this API needs to be called.

Event *WIFI\_PROV\_CRED\_RECV* is emitted after credentials have been applied and Wi-Fi station started

**Parameters** `wifi_cfg` –[in] Pointer to Wi-Fi configuration structure

**Returns**

- ESP\_OK : Wi-Fi configured and started successfully
- ESP\_FAIL : Failed to set configuration

*esp\_err\_t* `wifi_prov_mgr_reset_provisioning` (void)

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

**Returns**

- ESP\_OK : Reset provisioning config successfully
- ESP\_FAIL : Failed to reset provisioning config

*esp\_err\_t* `wifi_prov_mgr_reset_sm_state_on_failure` (void)

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

**Returns**

- ESP\_OK : Reset provisioning state machine successfully
- ESP\_FAIL : Failed to reset provisioning state machine
- ESP\_ERR\_INVALID\_STATE : Manager not initialized

## Structures

struct `wifi_prov_event_handler_t`

Event handler that is used by the manager while provisioning service is active.

## Public Members

*wifi\_prov\_cb\_func\_t* `event_cb`

Callback function to be executed on provisioning events

void \*`user_data`

User context data to pass as parameter to callback function

struct `wifi_prov_scheme`

Structure for specifying the provisioning scheme to be followed by the manager.

---

**Note:** Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
  - `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
  - `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)
- 

## Public Members

*esp\_err\_t* (`*prov_start`)(*protocomm\_t* \*pc, void \*config)

Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

*esp\_err\_t* (**\*prov\_stop**)(*protocomm\_t* \*pc)

Function which is to be called by the manager to stop the provisioning service previously associated with a *protocomm* instance

void (**\*new\_config**)(void)

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to *prov\_start()*

void (**\*delete\_config**)(void \*config)

Function which is to be called by the manager to delete a configuration generated using *new\_config()*

*esp\_err\_t* (**\*set\_config\_service**)(void \*config, const char \*service\_name, const char \*service\_key)

Function which is to be called by the manager to set the service name and key values in the configuration structure

*esp\_err\_t* (**\*set\_config\_endpoint**)(void \*config, const char \*endpoint\_name, uint16\_t uuid)

Function which is to be called by the manager to set a *protocomm* endpoint with an identifying name and UUID in the configuration structure

*wifi\_mode\_t* **wifi\_mode**

Sets mode of operation of Wi-Fi during provisioning This is set to :

- **WIFI\_MODE\_APSTA** for SoftAP transport
- **WIFI\_MODE\_STA** for BLE transport

struct **wifi\_prov\_mgr\_config\_t**

Structure for specifying the manager configuration.

## Public Members

*wifi\_prov\_scheme\_t* **scheme**

Provisioning scheme to use. Following schemes are already available:

- **wifi\_prov\_scheme\_ble** : for provisioning over BLE transport + GATT server
- **wifi\_prov\_scheme\_softap** : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- **wifi\_prov\_scheme\_console** : for provisioning over Serial UART transport + Console (for debugging)

*wifi\_prov\_event\_handler\_t* **scheme\_event\_handler**

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use **WIFI\_PROV\_EVENT\_HANDLER\_NONE** when not used. When using scheme **wifi\_prov\_scheme\_ble**, the following options are available:

- **WIFI\_PROV\_SCHEME\_BLE\_EVENT\_HANDLER\_FREE\_BTDM**
- **WIFI\_PROV\_SCHEME\_BLE\_EVENT\_HANDLER\_FREE\_BLE**
- **WIFI\_PROV\_SCHEME\_BLE\_EVENT\_HANDLER\_FREE\_BT**

*wifi\_prov\_event\_handler\_t* **app\_event\_handler**

Event handler that can be set for the purpose of incorporating application specific behavior. Use **WIFI\_PROV\_EVENT\_HANDLER\_NONE** when not used.

## Macros

### **WIFI\_PROV\_EVENT\_HANDLER\_NONE**

Event handler can be set to none if not used.

## Type Definitions

```
typedef void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```
typedef struct wifi_prov_scheme wifi_prov_scheme_t
```

Structure for specifying the provisioning scheme to be followed by the manager.

---

**Note:** Ready to use schemes are available:

- `wifi_prov_scheme_ble` : for provisioning over BLE transport + GATT server
  - `wifi_prov_scheme_softap` : for provisioning over SoftAP transport + HTTP server
  - `wifi_prov_scheme_console` : for provisioning over Serial UART transport + Console (for debugging)
- 

```
typedef enum wifi_prov_security wifi_prov_security_t
```

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

## Enumerations

```
enum wifi_prov_cb_event_t
```

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

*Values:*

```
enumerator WIFI_PROV_INIT
```

Emitted when the manager is initialized

```
enumerator WIFI_PROV_START
```

Indicates that provisioning has started

```
enumerator WIFI_PROV_CRED_RECV
```

Emitted when Wi-Fi AP credentials are received via `protocomm endpoint wifi_config`. The event data in this case is a pointer to the corresponding `wifi_sta_config_t` structure

```
enumerator WIFI_PROV_CRED_FAIL
```

Emitted when device fails to connect to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`. The event data in this case is a pointer to the disconnection reason code with type `wifi_prov_sta_fail_reason_t`

```
enumerator WIFI_PROV_CRED_SUCCESS
```

Emitted when device successfully connects to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`

enumerator **WIFI\_PROV\_END**

Signals that provisioning service has stopped

enumerator **WIFI\_PROV\_DEINIT**

Signals that manager has been de-initialized

enum **wifi\_prov\_security**

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

*Values:*

enumerator **WIFI\_PROV\_SECURITY\_0**

No security (plain-text communication)

enumerator **WIFI\_PROV\_SECURITY\_1**

This secure communication mode consists of X25519 key exchange

- proof of possession (pop) based authentication
- AES-CTR encryption

### Header File

- [components/wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_ble.h](#)

### Functions

void **wifi\_prov\_scheme\_ble\_event\_cb\_free\_bt**(void \*user\_data, [wifi\\_prov\\_cb\\_event\\_t](#) event, void \*event\_data)

void **wifi\_prov\_scheme\_ble\_event\_cb\_free\_ble**(void \*user\_data, [wifi\\_prov\\_cb\\_event\\_t](#) event, void \*event\_data)

void **wifi\_prov\_scheme\_ble\_event\_cb\_free\_bt**(void \*user\_data, [wifi\\_prov\\_cb\\_event\\_t](#) event, void \*event\_data)

[esp\\_err\\_t](#) **wifi\_prov\_scheme\_ble\_set\_service\_uuid**(uint8\_t \*uuid128)

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000fff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`, otherwise the default UUID will be used.

---

**Note:** The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

---

**Parameters** **uuid128** –[in] A custom 128 bit UUID

#### Returns

- **ESP\_OK** : Success
- **ESP\_ERR\_INVALID\_ARG** : Null argument

`esp_err_t wifi_prov_scheme_ble_set_mfg_data` (uint8\_t \*mfg\_data, ssize\_t mfg\_data\_len)

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to `wifi_prov_mgr_start_provisioning()`.

---

**Note:** It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e.  $(mfg\_data\_len + 2) < 31 - (device\_name\_length + 2)$ . If the `mfg_data` length exceeds this limit, the length will be truncated.

---

#### Parameters

- **mfg\_data** –[in] Custom manufacturer data
- **mfg\_data\_len** –[in] Manufacturer data length

#### Returns

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : Null argument

#### Macros

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM`

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE`

`WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT`

#### Header File

- [components/wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_softap.h](#)

#### Functions

void `wifi_prov_scheme_softap_set_httpd_handle` (void \*handle)

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

---

**Note:** This API should be called before `wifi_prov_mgr_start_provisioning()`

---

**Parameters** **handle** –[in] Handle to HTTPD server instance

#### Header File

- [components/wifi\\_provisioning/include/wifi\\_provisioning/scheme\\_console.h](#)

#### Header File

- [components/wifi\\_provisioning/include/wifi\\_provisioning/wifi\\_config.h](#)

## Functions

*esp\_err\_t* **wifi\_prov\_config\_data\_handler** (uint32\_t session\_id, const uint8\_t \*inbuf, ssize\_t inlen, uint8\_t \*\*outbuf, ssize\_t \*outlen, void \*priv\_data)

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (protocomm proto-comm\_req\_handler\_t) using `protocomm_add_endpoint()`

## Structures

struct **wifi\_prov\_sta\_conn\_info\_t**

WiFi STA connected status information.

### Public Members

char **ip\_addr**[IP4ADDR\_STRLEN\_MAX]

IP Address received by station

char **bssid**[6]

BSSID of the AP to which connection was established

char **ssid**[33]

SSID of the to which connection was established

uint8\_t **channel**

Channel of the AP

uint8\_t **auth\_mode**

Authorization mode of the AP

struct **wifi\_prov\_config\_get\_data\_t**

WiFi status data to be sent in response to `get_status` request from master.

### Public Members

*wifi\_prov\_sta\_state\_t* **wifi\_state**

WiFi state of the station

*wifi\_prov\_sta\_fail\_reason\_t* **fail\_reason**

Reason for disconnection (valid only when `wifi_state` is `WIFI_STATION_DISCONNECTED`)

*wifi\_prov\_sta\_conn\_info\_t* **conn\_info**

Connection information (valid only when `wifi_state` is `WIFI_STATION_CONNECTED`)

struct **wifi\_prov\_config\_set\_data\_t**

WiFi config data received by slave during `set_config` request from master.

### Public Members

char **ssid**[33]  
SSID of the AP to which the slave is to be connected

char **password**[64]  
Password of the AP

char **bssid**[6]  
BSSID of the AP

uint8\_t **channel**  
Channel of the AP

struct **wifi\_prov\_config\_handlers**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

### Public Members

*esp\_err\_t* (\***get\_status\_handler**)(*wifi\_prov\_config\_get\_data\_t* \*resp\_data, *wifi\_prov\_ctx\_t* \*\*ctx)  
Handler function called when connection status of the slave (in WiFi station mode) is requested

*esp\_err\_t* (\***set\_config\_handler**)(const *wifi\_prov\_config\_set\_data\_t* \*req\_data, *wifi\_prov\_ctx\_t* \*\*ctx)  
Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

*esp\_err\_t* (\***apply\_config\_handler**)(*wifi\_prov\_ctx\_t* \*\*ctx)  
Handler function for applying the configuration that was set in `set_config_handler`. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when `get_status_handler` is invoked again by the master.

*wifi\_prov\_ctx\_t* \***ctx**  
Context pointer to be passed to above handler functions upon invocation

### Type Definitions

typedef struct *wifi\_prov\_ctx* **wifi\_prov\_ctx\_t**

Type of context data passed to each get/set/apply handler function set in `wifi_prov_config_handlers` structure.

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

typedef struct *wifi\_prov\_config\_handlers* **wifi\_prov\_config\_handlers\_t**

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as `priv_data` for protocomm request handler (refer to `wifi_prov_config_data_handler()`) when calling `protocomm_add_endpoint()`.

## Enumerations

enum `wifi_prov_sta_state_t`

WiFi STA status for conveying back to the provisioning master.

*Values:*

enumerator `WIFI_PROV_STA_CONNECTING`

enumerator `WIFI_PROV_STA_CONNECTED`

enumerator `WIFI_PROV_STA_DISCONNECTED`

enum `wifi_prov_sta_fail_reason_t`

WiFi STA connection fail reason.

*Values:*

enumerator `WIFI_PROV_STA_AUTH_ERROR`

enumerator `WIFI_PROV_STA_AP_NOT_FOUND`

Code examples for above API are provided in the [provisioning](#) directory of ESP-IDF examples.

Code example for above API is provided in [wifi/smart\\_config](#)

Code example for above API is provided in [wifi/wifi\\_easy\\_connect/dpp-enrollee](#)

## 2.6 Storage API

### 2.6.1 FAT Filesystem Support

ESP-IDF uses the [FatFs](#) library to work with FAT filesystems. FatFs resides in the `fatfs` component. Although the library can be used directly, many of its features can be accessed via VFS, using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.

#### Using FatFs with VFS

The header file `fatfs/vfs/esp_vfs_fat.h` defines the functions for connecting FatFs and VFS.

The function `esp_vfs_fat_register()` allocates a `FATFS` structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs. The function `esp_vfs_fat_unregister_path()` deletes the registration with VFS, and frees the `FATFS` structure.

Most applications use the following workflow when working with `esp_vfs_fat_` functions:

1. Call `esp_vfs_fat_register()` to specify:
  - Path prefix where to mount the filesystem (e.g. `"/sdcard"`, `"/spiflash"`)
  - FatFs drive number
  - A variable which will receive the pointer to the `FATFS` structure

2. Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.
3. Call the FatFs function `f_mount`, and optionally `f_fdisk`, `f_mkfs`, to mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`. For more information, see [FatFs documentation](#).
4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to `esp_vfs_register()` (for example, `"/sdcard/hello.txt"`). The filesystem uses [8.3 filenames](#) format (SFN) by default. If you need to use long filenames (LFN), enable the `CONFIG_FATFS_LONG_FILENAMES` option. More details on the FatFs filenames are available [here](#).
5. Optionally, by enabling the option `CONFIG_FATFS_USE_FASTSEEK`, use the POSIX `lseek` function to perform it faster, the fast seek will not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.
6. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix (for example, `"/hello.txt"`).
7. Close all open files.
8. Call the FatFs function `f_mount` for the same drive number, with `NULL FATFS*` argument, to unmount the filesystem.
9. Call the FatFs function `ff_diskio_register()` with `NULL ff_diskio_impl_t*` argument and the same drive number to unregister the disk I/O driver.
10. Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the `FATFS` structure allocated in Step 1.

The convenience functions `esp_vfs_fat_sdmmc_mount`, `esp_vfs_fat_sdspi_mount` and `esp_vfs_fat_sdcard_unmount` wrap the steps described above and also handle SD card initialization. These two functions are described in the next section.

*esp\_err\_t* **esp\_vfs\_fat\_register** (const char \*base\_path, const char \*fat\_drive, size\_t max\_files, FATFS \*\*out\_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, `fat_drive` argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for `f_mount` call.

---

**Note:** This function doesn't mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

---

#### Parameters

- **base\_path** –path prefix where FATFS should be registered
- **fat\_drive** –FATFS drive specification; if only one drive is used, can be an empty string
- **max\_files** –maximum number of files which can be open at the same time
- **out\_fs** –[out] pointer to FATFS structure which can be used for FATFS `f_mount` call is returned via this argument.

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_register` was already called
- `ESP_ERR_NO_MEM` if not enough memory or too many VFSes already registered

*esp\_err\_t* **esp\_vfs\_fat\_unregister\_path** (const char \*base\_path)

Un-register FATFS from VFS.

---

**Note:** FATFS structure returned by `esp_vfs_fat_register` is destroyed after this call. Make sure to call `f_mount` function to unmount it before calling `esp_vfs_fat_unregister_path`. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one

---

**Parameters** **base\_path** –path prefix where FATFS is registered. This is the same used when `esp_vfs_fat_register` was called

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if FATFS is not registered in VFS

### Using FatFs with VFS and SD cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()` and `esp_vfs_fat_sdcard_unmount()`. These function perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmc_unmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.

`esp_err_t esp_vfs_fat_sdmmc_mount` (const char \*base\_path, const `sdmmc_host_t` \*host\_config, const void \*slot\_config, const `esp_vfs_fat_mount_config_t` \*mount\_config, `sdmmc_card_t` \*\*out\_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in `host_config`
- initializes SD card with configuration in `slot_config`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

---

**Note:** Use this API to mount a card through SDSPI is deprecated. Please call `esp_vfs_fat_sdspi_mount()` instead for that case.

---

**Parameters**

- **base\_path** –path where partition should be registered (e.g. “/sdcard” )
- **host\_config** –Pointer to structure describing SDMMC host. When using SDMMC peripheral, this structure can be initialized using `SDMMC_HOST_DEFAULT()` macro. When using SPI peripheral, this structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- **slot\_config** –Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to `sdmmc_slot_config_t` structure initialized using `SDMMC_SLOT_CONFIG_DEFAULT`. (Deprecated) For SPI peripheral, pass a pointer to `sdspi_slot_config_t` structure initialized using `SDSPI_SLOT_CONFIG_DEFAULT()`.
- **mount\_config** –pointer to structure with extra parameters for mounting FATFS
- **out\_card** –[out] if not NULL, pointer to the card information structure will be returned via this argument

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

`esp_err_t esp_vfs_fat_sdspi_mount` (const char \*base\_path, const `sdmmc_host_t` \*host\_config\_input, const `sdspi_device_config_t` \*slot\_config, const `esp_vfs_fat_mount_config_t` \*mount\_config, `sdmmc_card_t` \*\*out\_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in `slot_config`, and attach it to an initialized SPI bus.
- initializes SD card with configuration in `host_config_input`
- mounts FAT partition on SD card using FATFS library, with configuration in `mount_config`
- registers FATFS library with VFS, with prefix given by `base_prefix` variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

---

**Note:** This function try to attach the new SD SPI device to the bus specified in `host_config`. Make sure the SPI bus specified in `host_config->slot` have been initialized by `spi_bus_initialize()` before.

---

#### Parameters

- **base\_path** –path where partition should be registered (e.g. “/sdcard” )
- **host\_config\_input** –Pointer to structure describing SDMMC host. This structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- **slot\_config** –Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to `sdspi_device_config_t` structure initialized using `SDSPI_DEVICE_CONFIG_DEFAULT()`.
- **mount\_config** –pointer to structure with extra parameters for mounting FATFS
- **out\_card** –[out] If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it’ s not suggested to use more than one card at the same time and unmount one of them in your application.

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_sdmmc_mount` was already called
- `ESP_ERR_NO_MEM` if memory can not be allocated
- `ESP_FAIL` if partition can not be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

struct **esp\_vfs\_fat\_mount\_config\_t**

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount` functions.

#### Public Members

bool **format\_if\_mount\_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int **max\_files**

Max number of open files.

size\_t **allocation\_unit\_size**

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and `128 * sector size`. For SD cards, sector size is always 512 bytes. For wear\_leveling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

*esp\_err\_t* **esp\_vfs\_fat\_sdcard\_unmount** (const char \*base\_path, *sdmmc\_card\_t* \*card)

Unmount an SD card from the FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount()` or `esp_vfs_fat_sdspi_mount()`

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the card argument is unregistered
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_sdmmc_mount` hasn't been called

### Using FatFs with VFS in read-only mode

The header file `fatfs/vfs/esp_vfs_fat.h` also defines the convenience functions `esp_vfs_fat_rawflash_mount()` and `esp_vfs_fat_rawflash_unmount()`. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning which will not be changed by production application throughout the lifetime of the hardware.

*esp\_err\_t* **esp\_vfs\_fat\_rawflash\_mount** (const char \*base\_path, const char \*partition\_label, const *esp\_vfs\_fat\_mount\_config\_t* \*mount\_config)

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition\_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base\_prefix variable

---

**Note:** Wear levelling is not used when FAT is mounted in read-only mode using this function.

---

#### Parameters

- **base\_path** –path where FATFS partition should be mounted (e.g. “/spiflash” )
- **partition\_label** –label of the partition which should be used
- **mount\_config** –pointer to structure with extra parameters for mounting FATFS

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition table does not contain FATFS partition with given label
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_rawflash_mount` was already called for the same partition
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

*esp\_err\_t* **esp\_vfs\_fat\_rawflash\_unmount** (const char \*base\_path, const char \*partition\_label)

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_rawflash_mount`.

#### Parameters

- **base\_path** –path where partition should be registered (e.g. “/spiflash” )
- **partition\_label** –label of partition to be unmounted

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `esp_vfs_fat_spiflash_mount` hasn't been called

## FatFS disk IO layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

They provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmhc()`.

void **ff\_diskio\_register** (BYTE pdrv, const `ff_diskio_impl_t` \*discio\_impl)

Register or unregister diskio driver for given drive number.

When FATFS library calls one of disk\_XXX functions for driver number pdrv, corresponding function in discio\_impl for given pdrv will be called.

### Parameters

- **pdrv** –drive number
- **discio\_impl** –pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

struct **ff\_diskio\_impl\_t**

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

## Public Members

DSTATUS (\***init**)(unsigned char pdrv)

disk initialization function

DSTATUS (\***status**)(unsigned char pdrv)

disk status check function

DRESULT (\***read**)(unsigned char pdrv, unsigned char \*buff, uint32\_t sector, unsigned count)

sector read function

DRESULT (\***write**)(unsigned char pdrv, const unsigned char \*buff, uint32\_t sector, unsigned count)

sector write function

DRESULT (\***ioctl**)(unsigned char pdrv, unsigned char cmd, void \*buff)

function to get info about disk and do some misc operations

void **ff\_diskio\_register\_sdmhc** (unsigned char pdrv, `sdmmc_card_t` \*card)

Register SD/MMC diskio driver

### Parameters

- **pdrv** –drive number
- **card** –pointer to `sdmmc_card_t` structure describing a card; card should be initialized before calling `f_mount`.

`esp_err_t` **ff\_diskio\_register\_wl\_partition** (unsigned char pdrv, `wl_handle_t` flash\_handle)

Register spi flash partition

### Parameters

- **pdrv** –drive number
- **flash\_handle** –handle of the wear levelling partition.

`esp_err_t ff_diskio_register_raw_partition` (unsigned char pdrv, const `esp_partition_t` \*part\_handle)

Register spi flash partition

#### Parameters

- **pdrv** –drive number
- **part\_handle** –pointer to raw flash partition.

## 2.6.2 Manufacturing Utility

### Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- [esptool.py](#)
- [Flash Download tool](#) (available on Windows only). Just download it, unzip, and follow the instructions inside the *doc* folder.
- Direct flash programming using custom production tools.

### Prerequisites

This utility is dependent on `esp-idf`'s NVS partition utility.

- **Operating System requirements:**
  - Linux / MacOS / Windows (standard distributions)
- **The following packages are needed to use this utility:**
  - [Python](#)

---

### Note:

**Before using this utility, please make sure that:**

- The path to Python is added to the PATH environment variable.
  - You have installed the packages from *requirement.txt*, the file in the root of the `esp-idf` directory.
- 

### Workflow

### CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the *REPEAT* tag is optional):

```
name1,namespace,      <-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

---

**Note:** The first line in this file should always be the namespace entry.

---

Each line should have three parameters: *key*, *type*, *encoding*, separated by a comma. If the *REPEAT* tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

*Please refer to README of the NVS Partition Generator utility for detailed description of each parameter.*

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

---

**Note:**

**Make sure there are no spaces:**

- before and after ‘,’
  - at the end of each line in a CSV file
- 

### Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```
key1,key2,key3,....
value1,value2,value3,....
```

---

**Note:** The first line in the file should always contain the *key* names. All the keys from the configuration file should be present here in the **same order**. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

---

Each line should contain the *value* of the corresponding keys, separated by a comma. If the key has the *REPEAT* tag, its corresponding value **must** be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

**value** Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fccdd,,102
3,1a2b3c4d5e6feeff,,103
```

**Note:** If the ‘REPEAT’ tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the ‘REPEAT’ tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

## Running the utility

### Usage:

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

#### Optional Arguments:

No.	Parameter	Description
1	-h, --help	show this help message <b>and</b> exit

#### Commands:

Run mfg\_gen.py {command} -h **for** additional help

No.	Parameter	Description
1	generate	Generate NVS partition
2	generate-key	Generate keys <b>for</b> encryption

### To generate factory images for each device (Default): Usage:

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
                             [--keyfile KEYFILE] [--inputkey INPUTKEY]
                             [--outdir OUTDIR]
                             conf values prefix size
```

(continues on next page)

(continued from previous page)

Positional Arguments:		
Parameter	Description	
conf	Path to configuration csv file to parse	
values	Path to values csv file to parse	
prefix	Unique name <b>for</b> each output filename prefix	
size	Size of NVS partition <b>in bytes</b> (must be multiple of 4096)	
Optional Arguments:		
Parameter	Description	
-h, --help	show this help message <b>and</b> exit	
--fileid FILEID	Unique file identifier( <b>any</b> key <b>in</b> values file) <b>for</b> each filename suffix (Default: numeric value(1, 2,3...))	
--version {1,2}	Set multipage blob version. Version 1 - Multipage blob support disabled. Version 2 - Multipage blob support enabled. Default: Version 2	
--keygen	Generates key <b>for</b> encrypting NVS partition	
--inputkey INPUTKEY	File having key <b>for</b> encrypting NVS partition	
--outdir OUTDIR	Output directory to store files created	

(continues on next page)

(continued from previous page)

```

|                                     | (Default: current directory)
↩-----+
↩-----+

```

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↩singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the `file` type relative to the directory from which you are running the utility.

### To generate encrypted factory images for each device:

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↩singlepage_blob.csv Sample 0x3000 --keygen
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created.

**Note:** This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to [NVS key partition](#) for more details.

- Encrypt by providing the encryption keys as input binary file:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_
↩singlepage_blob.csv Sample 0x3000 --inputkey keys/sample_keys.bin
```

### To generate only encryption keys: Usage:

```
python mfg_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]

Optional Arguments:
+-----+
↩-----+
| Parameter          | Description
↩-----+
+-----+
| -h, --help        | show this help message and exit
↩-----+
+-----+
| --keyfile KEYFILE | Path to output encryption keys file
↩-----+
+-----+
| --outdir OUTDIR   | Output directory to store files created.
↩-----+
|                   | (Default: current directory)
↩-----+
↩-----+
```

(continues on next page)

---

You can run the utility to generate only encryption keys using the command below:

```
python mfg_gen.py generate-key
```

---

**Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: `%m-%d_%H-%M`.

---

---

**Note:** To provide custom target filename use the `-keyfile` argument.

---

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis.

The default numeric value: 1,2,3... of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

## 2.6.3 Non-volatile storage library

### Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

**Underlying storage** Currently, NVS uses a portion of main flash memory through the `esp_partition` API. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open()` API function or any other partition by specifying its name using the `nvs_open_from_partition()` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

---

**Note:** if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase-flash` target to erase all contents of the flash chip.

---

---

**Note:** NVS works best for storing many small values, rather than a few large values of the type 'string' and 'blob'. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

---

**Keys and values** NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`

- zero-terminated string
- variable length binary data (blob)

---

**Note:** String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508,000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

---

Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key works as follows:

- If the new value is of the same type as the old one, value is updated.
- If the new value has a different data type, an error is returned.

Data type check is also performed when reading a value. An error is returned if the data type of the read operation does not match the data type of the value.

**Namespaces** To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Furthermore, there can be no more than 254 different namespaces in one NVS partition. Namespace name is specified in the `nvs_open()` or `nvs_open_from_partition` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_*`, `nvs_set_*`, and `nvs_commit()` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

**NVS iterators** Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find()` returns an opaque handle, which is used in subsequent calls to the `nvs_entry_next()` and `nvs_entry_info()` functions.
- `nvs_entry_next()` returns iterator to the next key-value pair.
- `nvs_entry_info()` returns information about each key-value pair

If none or no other key-value pair was found for given criteria, `nvs_entry_find()` and `nvs_entry_next()` return NULL. In that case, the iterator does not have to be released. If the iterator is no longer needed, you can release it by using the function `nvs_release_iterator()`.

**Security, tampering, and robustness** NVS is not directly compatible with the ESP32-S3 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32-S3 flash encryption. Please refer to [NVS Encryption](#) for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.

## NVS Encryption

Data stored in NVS partitions can be encrypted using AES-XTS in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one *sector* and relative address of the entry (w.r.t. partition-start) is fed to the encryption algorithm as *sector-number*. The NVS Encryption can be enabled by enabling `CONFIG_NVS_ENCRYPTION`. The keys required for NVS encryption are stored in yet

another partition, which is protected using *Flash Encryption*. Therefore, enabling *Flash Encryption* is a prerequisite for NVS encryption.

The NVS Encryption is enabled by default when *Flash Encryption* is enabled. This is done because Wi-Fi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them as default choice if platform level encryption is already enabled.

For using NVS encryption, the partition table must contain the *NVS key partition*. Two partition tables containing the *NVS key partition* are provided for NVS encryption under the partition table option (menuconfig->Partition Table). They can be selected with the project configuration menu (`idf.py menuconfig`). Please refer to the example [security/flash\\_encryption](#) for how to configure and use NVS encryption feature.

### NVS key partition

An application requiring NVS encryption support needs to be compiled with a key-partition of the type *data* and subtype *key*. This partition should be marked as *encrypted* and its size should be the minimum partition size (4KB). Refer to [Partition Tables](#) for more details. Two additional partition tables which contain the *NVS key partition* are provided under the partition table option (menuconfig->Partition Table). They can be directly used for *NVS Encryption*. The structure of these partitions is depicted below.

-----+-----+-----+-----+
XTS encryption key (32)
-----+-----+-----+-----+
XTS tweak key (32)
-----+-----+-----+-----+
CRC32 (4)
-----+-----+-----+-----+

The XTS encryption keys in the *NVS key partition* can be generated in one of the following two ways.

#### 1. Generate the keys on the ESP chip:

When NVS encryption is enabled the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first *NVS key partition*. Then the API function automatically generates and stores the NVS keys in that partition by making use of the `nvs_flash_generate_keys()` API function provided by `nvs_flash/include/nvs_flash.h`. New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`.

The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys()` API function provided by `nvs_flash.h`. The API function will then write those keys onto the key-partition in encrypted form.

#### 2. Use pre-generated key partition:

This option will be required by the user when keys in the *NVS key partition* are not generated by the application. The *NVS key partition* containing the XTS encryption keys can be generated with the help of *NVS Partition Generator Utility*. Then the user can store the pre generated key partition on the flash with help of the following two commands:

##### i) Build and flash the partition table

```
idf.py partition-table partition-table-flash
```

ii) Store the keys in the *NVS key partition* (on the flash) with the help of `parttool.py` (see Partition Tool section in [partition-tables](#) for more details)

```
parttool.py --port /dev/ttyUSB0 --partition-table-offset "nvs_key_
↪partition_offset" write_partition --partition-name="name of nvs_key_
↪partition" --input "nvs_key partition"
```

Since the key partition is marked as *encrypted* and *Flash Encryption* is enabled, the bootloader will encrypt this partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide correct key-partition/keys for the purpose of encryption/decryption.

**Encrypted Read/Write** The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of, and writing to an encrypted nvs partition as well.

**Encrypt the default NVS partition:** To enable encryption for the default NVS partition no additional steps are necessary. When `CONFIG_NVS_ENCRYPTION` is enabled, the `nvs_flash_init()` API function internally performs some additional steps using the first *NVS key partition* found to enable encryption for the default NVS partition (refer to the API documentation for more details). Alternatively, `nvs_flash_secure_init()` API function can also be used to enable encryption for the default NVS partition.

**Encrypt a custom NVS partition:** To enable encryption for a custom NVS partition, `nvs_flash_secure_init_partition()` API function is used instead of `nvs_flash_init_partition()`.

When `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` API functions are used, the applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled.

1. Find key partition and NVS data partition using `esp_partition_find*` API functions.
2. Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg()` or `nvs_flash_generate_keys()` API functions.
3. Initialise NVS flash partition using the `nvs_flash_secure_init()` or `nvs_flash_secure_init_partition()` API functions.
4. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
5. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
6. Deinitialise an NVS partition using `nvs_flash_deinit()`.

### NVS Partition Generator Utility

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to *NVS Partition Generator Utility*.

### Application Example

You can find code examples in the `storage` directory of ESP-IDF examples:

[storage/nvs\\_rw\\_value](#)

Demonstrates how to read a single integer value from, and write it to NVS.

The value checked in this example holds the number of the ESP32-S3 module restarts. The value's function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read / write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

[storage/nvs\\_rw\\_blob](#)

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32-S3 module restarts.

- value - tracks the number of the ESP32-S3 module soft and hard restarts.
- blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read / write operation was successful.

[storage/nvs\\_rw\\_value\\_cxx](#)

This example does exactly the same as [storage/nvs\\_rw\\_value](#), except that it uses the C++ NVS handle class.

## Internals

**Log of key-value pairs** NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

**Pages and entries** NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a *sequence number* associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

**Empty/uninitialized** Flash storage for the page is empty (all bytes are `0xff`). Page is not used to store any data at this point and does not have a sequence number.

**Active** Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.

**Full** Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.

**Erasing** Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.

**Corrupted** Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in *uninitialized* state for later use. This may be useful for debugging.

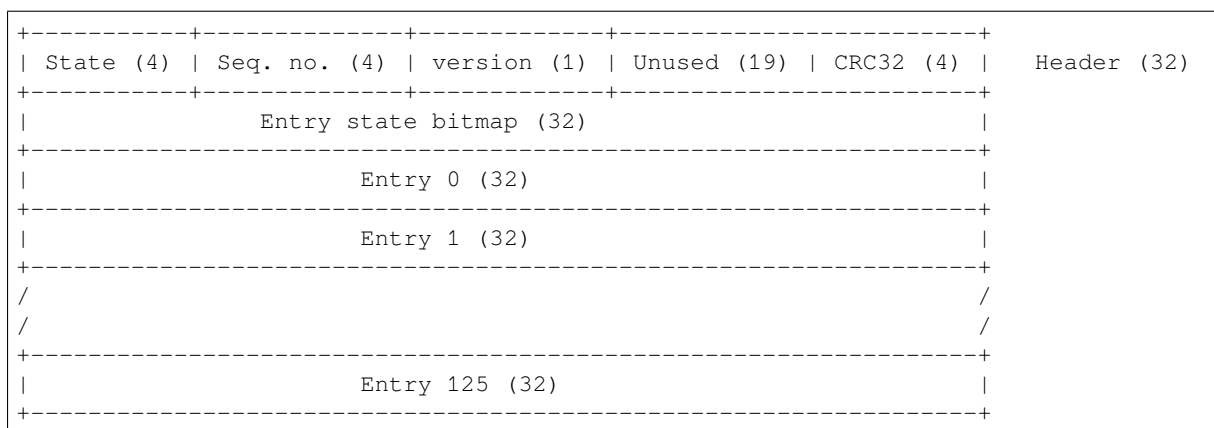

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

**Structure of a page** For now, we assume that flash sector size is 4096 bytes and that ESP32-S3 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via `menuconfig`) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32-S3 flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs, an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32-S3 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the *erased* state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

**Entry and entry state bitmap** Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 \* 126) are not used.

**Empty (2' b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).

**Written (2' b10)** A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.

**Erased (2' b00)** A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

**Structure of entry** For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called "blob index". Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

(continues on next page)

(continued from previous page)

Individual fields in entry structure have the following meanings:

**NS** Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

**Type** One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.

**Span** Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

**ChunkIndex** Used to store the index of a blob-data chunk for blob types. For other types, this should be `0xff`.

**CRC32** Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

**Key** Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

**Data** For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with `0xff`.

For “blob index” entry, these 8 bytes hold the following information about data-chunks:

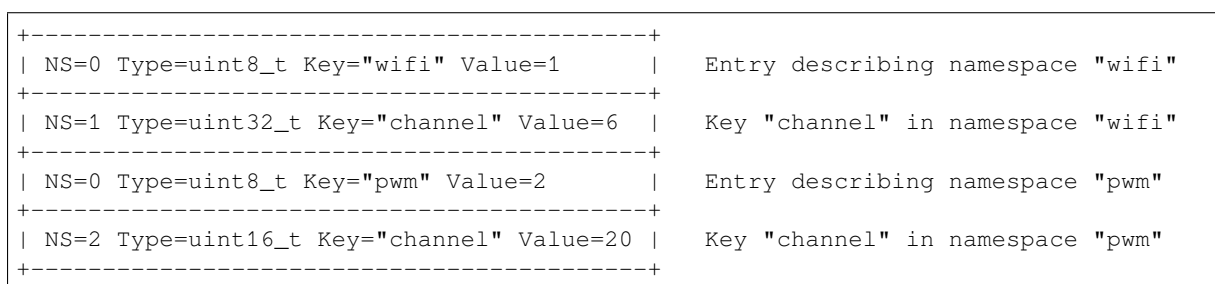

- **Size** (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart** (Only for blob index.) `ChunkIndex` of the first blob-data chunk of this blob. Subsequent chunks have `chunkIndex` incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The *Span* field of the first entry indicates how many entries are used.

**Namespaces** As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.

**Item hash list** To reduce the number of reads from flash memory, each member of the `Page` class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, `Page::findItem` first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item will be found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and `ChunkIndex`. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead

for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

## API Reference

### Header File

- [components/nvs\\_flash/include/nvs\\_flash.h](#)

### Functions

*esp\_err\_t* **nvs\_flash\_init** (void)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS\_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

- a. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs\_keys” )
- b. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
- c. Internally call “nvs\_flash\_secure\_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

#### Returns

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if no partition with label “nvs” is found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs\_flash\_read\_security\_cfg API (when “NVS\_ENCRYPTION” is enabled).
- error codes from nvs\_flash\_generate\_keys API (when “NVS\_ENCRYPTION” is enabled).
- error codes from nvs\_flash\_secure\_init\_partition API (when “NVS\_ENCRYPTION” is enabled) .

*esp\_err\_t* **nvs\_flash\_init\_partition** (const char \*partition\_label)

Initialize NVS flash storage for the specified partition.

**Parameters** *partition\_label* –[in] Label of the partition. Must be no longer than 16 characters.

#### Returns

- ESP\_OK if storage was successfully initialized.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if specified partition is not found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_init\_partition\_ptr** (const *esp\_partition\_t* \*partition)

Initialize NVS flash storage for the partition specified by partition pointer.

**Parameters** *partition* –[in] pointer to a partition obtained by the ESP partition API.

#### Returns

- ESP\_OK if storage was successfully initialized
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_INVALID\_ARG in case partition is NULL
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_deinit** (void)

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

**Returns**

- ESP\_OK on success (storage was deinitialized)
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage was not initialized prior to this call

*esp\_err\_t* **nvs\_flash\_deinit\_partition** (const char \*partition\_label)

Deinitialize NVS storage for the given NVS partition.

**Parameters** *partition\_label* –[in] Label of the partition

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage for given partition was not initialized prior to this call

*esp\_err\_t* **nvs\_flash\_erase** (void)

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs” ).

---

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

---

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no NVS partition labeled “nvs” in the partition table
- different error in case de-initialization fails (shouldn’ t happen)

*esp\_err\_t* **nvs\_flash\_erase\_partition** (const char \*part\_name)

Erase specified NVS partition.

Erase all content of a specified NVS partition

---

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

---

**Parameters** *part\_name* –[in] Name (label) of the partition which should be erased

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn’ t happen)

*esp\_err\_t* **nvs\_flash\_erase\_partition\_ptr** (const *esp\_partition\_t* \*partition)

Erase custom partition.

Erase all content of specified custom partition.

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

---

**Parameters** **partition** –[in] pointer to a partition obtained by the ESP partition API.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if there is no partition with the specified parameters in the partition table
- ESP\_ERR\_INVALID\_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_secure\_init** (*nvs\_sec\_cfg\_t* \*cfg)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Parameters** **cfg** –[in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is NULL, no encryption is used.

**Returns**

- ESP\_OK if storage has been initialized successfully.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if no partition with label “nvs” is found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_secure\_init\_partition** (const char \*partition\_label, *nvs\_sec\_cfg\_t* \*cfg)

Initialize NVS flash storage for the specified partition.

**Parameters**

- **partition\_label** –[in] Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- **cfg** –[in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is null, no encryption/decryption is used.

**Returns**

- ESP\_OK if storage has been initialized successfully.
- ESP\_ERR\_NVS\_NO\_FREE\_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP\_ERR\_NOT\_FOUND if specified partition is not found in the partition table
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

*esp\_err\_t* **nvs\_flash\_generate\_keys** (const *esp\_partition\_t* \*partition, *nvs\_sec\_cfg\_t* \*cfg)

Generate and store NVS keys in the provided esp partition.

**Parameters**

- **partition** –[in] Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** –[out] Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

**Returns** -ESP\_OK, if cfg was read successfully; -ESP\_INVALID\_ARG, if partition or cfg; -or error codes from `esp_partition_write/erase` APIs.

*esp\_err\_t* **nvs\_flash\_read\_security\_cfg** (const *esp\_partition\_t* \*partition, *nvs\_sec\_cfg\_t* \*cfg)

Read NVS security configuration from a partition.

---

**Note:** Provided partition is assumed to be marked ‘encrypted’ .

---

### Parameters

- **partition** –[in] Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **cfg** –[out] Pointer to nvs security configuration structure. Pointer must be non-NULL.

**Returns** -ESP\_OK, if `cfg` was read successfully; -ESP\_INVALID\_ARG, if `partition` or `cfg`; -ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED, if the partition is not yet written with keys. -ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART, if the partition containing keys is found to be corrupt -or error codes from `esp_partition_read` API.

### Structures

struct **nvs\_sec\_cfg\_t**

Key for encryption and decryption.

### Public Members

uint8\_t **eky**[32]

XTS encryption and decryption key

uint8\_t **tky**[32]

XTS tweak key

### Macros

**NVS\_KEY\_SIZE**

### Header File

- [components/nvs\\_flash/include/nvs.h](#)

### Functions

`esp_err_t nvs_set_i8` (*nvs\_handle\_t* handle, const char \*key, int8\_t value)

set int8\_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

### Parameters

- **handle** –[in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** –[in] Key name. Maximal length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- **value** –[in] The value to set.

### Returns

- ESP\_OK if value was set successfully
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP\_ERR\_NVS\_INVALID\_HANDLE if handle has been closed or is NULL
- ESP\_ERR\_NVS\_READ\_ONLY if storage handle was opened as read only
- ESP\_ERR\_NVS\_INVALID\_NAME if key name doesn't satisfy constraints

- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

`esp_err_t nvs_set_u8` (*nvs\_handle\_t* handle, const char \*key, uint8\_t value)

set uint8\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i16` (*nvs\_handle\_t* handle, const char \*key, int16\_t value)

set int16\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u16` (*nvs\_handle\_t* handle, const char \*key, uint16\_t value)

set uint16\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i32` (*nvs\_handle\_t* handle, const char \*key, int32\_t value)

set int32\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u32` (*nvs\_handle\_t* handle, const char \*key, uint32\_t value)

set uint32\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_i64` (*nvs\_handle\_t* handle, const char \*key, int64\_t value)

set int64\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_u64` (*nvs\_handle\_t* handle, const char \*key, uint64\_t value)

set uint64\_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

`esp_err_t nvs_set_str` (*nvs\_handle\_t* handle, const char \*key, const char \*value)

set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

#### Parameters

- **handle** –[in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** –[in] Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** –[in] The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

#### Returns

- `ESP_OK` if value was set successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

- `ESP_ERR_NVS_VALUE_TOO_LONG` if the string value is too long

`esp_err_t nvs_get_i8(nvs_handle_t handle, const char *key, int8_t *out_value)`

get `int8_t` value for given key

These functions retrieve value for the key, given its name. If `key` does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

`out_value` has to be a pointer to an already allocated variable of the given type.

```
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

### Parameters

- **handle** –[in] Handle obtained from `nvs_open` function.
- **key** –[in] Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **out\_value** –Pointer to the output value. May be `NULL` for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in `length` argument.

### Returns

- `ESP_OK` if the value was retrieved successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if length is not sufficient to store data

`esp_err_t nvs_get_u8(nvs_handle_t handle, const char *key, uint8_t *out_value)`

get `uint8_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i16(nvs_handle_t handle, const char *key, int16_t *out_value)`

get `int16_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u16(nvs_handle_t handle, const char *key, uint16_t *out_value)`

get `uint16_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i32(nvs_handle_t handle, const char *key, int32_t *out_value)`

get `int32_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_u32(nvs_handle_t handle, const char *key, uint32_t *out_value)`

get `uint32_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

`esp_err_t nvs_get_i64(nvs_handle_t handle, const char *key, int64_t *out_value)`

get `int64_t` value for given key

This function is the same as `nvs_get_i8` except for the data type.

*esp\_err\_t* **nvs\_get\_u64** (*nvs\_handle\_t* handle, const char \*key, uint64\_t \*out\_value)

get uint64\_t value for given key

This function is the same as `nvs_get_i8` except for the data type.

*esp\_err\_t* **nvs\_get\_str** (*nvs\_handle\_t* handle, const char \*key, char \*out\_value, size\_t \*length)

get string value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn't match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

All functions expect `out_value` to be a pointer to an already allocated variable of the given type.

`nvs_get_str` and `nvs_get_blob` functions support WinAPI-style length queries. To get the size necessary to store the value, call `nvs_get_str` or `nvs_get_blob` with zero `out_value` and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For `nvs_get_str`, this length includes the zero terminator. When calling `nvs_get_str` and `nvs_get_blob` with non-zero `out_value`, length has to be non-zero and has to point to the length available in `out_value`. It is suggested that `nvs_get/set_str` is used for zero-terminated C strings, and `nvs_get/set_blob` used for arbitrary data structures.

```
// Example (without error checking) of using nvs_get_str to get a string into
// dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
// into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

### Parameters

- **handle** **[in]** Handle obtained from `nvs_open` function.
- **key** **[in]** Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **out\_value** **[out]** Pointer to the output value. May be `NULL` for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.
- **length** **[inout]** A non-zero pointer to the variable holding the length of `out_value`. In case `out_value` a zero, will be set to the length required to hold the value. In case `out_value` is not zero, will be set to the actual length of the value written. For `nvs_get_str` this includes zero terminator.

### Returns

- `ESP_OK` if the value was retrieved successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_INVALID_LENGTH` if `length` is not sufficient to store data

*esp\_err\_t* **nvs\_get\_blob** (*nvs\_handle\_t* handle, const char \*key, void \*out\_value, size\_t \*length)

get blob value for given key

This function behaves the same as `nvs_get_str`, except for the data type.

*esp\_err\_t* **nvs\_open** (const char \*name, *nvs\_open\_mode\_t* open\_mode, *nvs\_handle\_t* \*out\_handle)

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

#### Parameters

- **name** –[in] Namespace name. Maximal length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- **open\_mode** –[in] NVS\_READWRITE or NVS\_READONLY. If NVS\_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out\_handle** –[out] If successful (return code is zero), handle will be returned in this argument.

#### Returns

- ESP\_OK if storage handle was opened successfully
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with label “nvs” is not found
- ESP\_ERR\_NVS\_NOT\_FOUND id namespace doesn't exist yet and mode is NVS\_READONLY
- ESP\_ERR\_NVS\_INVALID\_NAME if namespace name doesn't satisfy constraints
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- other error codes from the underlying storage driver

*esp\_err\_t* **nvs\_open\_from\_partition** (const char \*part\_name, const char \*name, *nvs\_open\_mode\_t* open\_mode, *nvs\_handle\_t* \*out\_handle)

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as `nvs_open()` API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API.

#### Parameters

- **part\_name** –[in] Label (name) of the partition of interest for object read/write/erase
- **name** –[in] Namespace name. Maximal length is (NVS\_KEY\_NAME\_MAX\_SIZE-1) characters. Shouldn't be empty.
- **open\_mode** –[in] NVS\_READWRITE or NVS\_READONLY. If NVS\_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out\_handle** –[out] If successful (return code is zero), handle will be returned in this argument.

#### Returns

- ESP\_OK if storage handle was opened successfully
- ESP\_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP\_ERR\_NVS\_NOT\_INITIALIZED if the storage driver is not initialized
- ESP\_ERR\_NVS\_PART\_NOT\_FOUND if the partition with specified name is not found
- ESP\_ERR\_NVS\_NOT\_FOUND id namespace doesn't exist yet and mode is NVS\_READONLY
- ESP\_ERR\_NVS\_INVALID\_NAME if namespace name doesn't satisfy constraints
- ESP\_ERR\_NO\_MEM in case memory could not be allocated for the internal structures
- ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- other error codes from the underlying storage driver

*esp\_err\_t* **nvs\_set\_blob** (*nvs\_handle\_t* handle, const char \*key, const void \*value, size\_t length)

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until `nvs_commit` function is called.

**Parameters**

- **handle** –[in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** –[in] Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.
- **value** –[in] The value to set.
- **length** –[in] length of binary value to set, in bytes; Maximum length is 508000 bytes or  $(97.6\%$  of the partition size - 4000) bytes whichever is lower.

**Returns**

- `ESP_OK` if value was set successfully
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if storage handle was opened as read only
- `ESP_ERR_NVS_INVALID_NAME` if key name doesn't satisfy constraints
- `ESP_ERR_NVS_NOT_ENOUGH_SPACE` if there is not enough space in the underlying storage to save the value
- `ESP_ERR_NVS_REMOVE_FAILED` if the value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn't fail again.
- `ESP_ERR_NVS_VALUE_TOO_LONG` if the value is too long

*esp\_err\_t* `nvs_erase_key` (*nvs\_handle\_t* handle, const char \*key)

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

**Parameters**

- **handle** –[in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.
- **key** –[in] Key name. Maximal length is `(NVS_KEY_NAME_MAX_SIZE-1)` characters. Shouldn't be empty.

**Returns**

- `ESP_OK` if erase operation was successful
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if handle was opened as read only
- `ESP_ERR_NVS_NOT_FOUND` if the requested key doesn't exist
- other error codes from the underlying storage driver

*esp\_err\_t* `nvs_erase_all` (*nvs\_handle\_t* handle)

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

**Parameters** **handle** –[in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

**Returns**

- `ESP_OK` if erase operation was successful
- `ESP_FAIL` if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is `NULL`
- `ESP_ERR_NVS_READ_ONLY` if handle was opened as read only
- other error codes from the underlying storage driver

*esp\_err\_t* `nvs_commit` (*nvs\_handle\_t* handle)

Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

**Parameters** `handle` **–[in]** Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

**Returns**

- `ESP_OK` if the changes have been written successfully
- `ESP_ERR_NVS_INVALID_HANDLE` if `handle` has been closed or is `NULL`
- other error codes from the underlying storage driver

void `nvs_close` (`nvs_handle_t` handle)

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with `nvs_open` once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using `nvs_commit` function. Once this function is called on a handle, the handle should no longer be used.

**Parameters** `handle` **–[in]** Storage handle to close

`esp_err_t` `nvs_get_stats` (const char \*part\_name, `nvs_stats_t` \*nvs\_stats)

Fill structure `nvs_stats_t`. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```
// Example of nvs_get_stats() to get the number of used entries and free_
↪entries:
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
      nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_
↪entries);
```

**Parameters**

- **part\_name** **–[in]** Partition name NVS in the partition table. If pass a `NULL` than will use `NVS_DEFAULT_PART_NAME` ( “nvs” ).
- **nvs\_stats** **–[out]** Returns filled structure `nvs_states_t`. It provides info about used memory the partition.

**Returns**

- `ESP_OK` if the changes have been written successfully. Return param `nvs_stats` will be filled.
- `ESP_ERR_NVS_PART_NOT_FOUND` if the partition with label “name” is not found. Return param `nvs_stats` will be filled 0.
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized. Return param `nvs_stats` will be filled 0.
- `ESP_ERR_INVALID_ARG` if `nvs_stats` equal to `NULL`.
- `ESP_ERR_INVALID_STATE` if there is page with the status of `INVALID`. Return param `nvs_stats` will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first `INVALID` page.

`esp_err_t` `nvs_get_used_entry_count` (`nvs_handle_t` handle, `size_t` \*used\_entries)

Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value `used_entries` (if `err` is equal to `ESP_OK`). Because the name space entry takes one entry.

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs_
↳in one namespace:
nvs_handle_t handle;
nvs_open("namespace1", NVS_READWRITE, &handle);
...
size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}
```

**Parameters**

- **handle** –[in] Handle obtained from `nvs_open` function.
- **used\_entries** –[out] Returns amount of used entries from a namespace.

**Returns**

- `ESP_OK` if the changes have been written successfully. Return param `used_entries` will be filled valid value.
- `ESP_ERR_NVS_NOT_INITIALIZED` if the storage driver is not initialized. Return param `used_entries` will be filled 0.
- `ESP_ERR_NVS_INVALID_HANDLE` if handle has been closed or is NULL. Return param `used_entries` will be filled 0.
- `ESP_ERR_INVALID_ARG` if `used_entries` equal to NULL.
- Other error codes from the underlying storage driver. Return param `used_entries` will be filled 0.

*nvs\_iterator\_t* **nvs\_entry\_find** (const char \*part\_name, const char \*namespace\_name, *nvs\_type\_t* type)

Create an iterator to enumerate NVS entries based on one or more parameters.

```
// Example of listing all the key-value pairs of any type under specified_
↳partition and namespace
nvs_iterator_t it = nvs_entry_find(partition, namespace, NVS_TYPE_ANY);
while (it != NULL) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info);
    it = nvs_entry_next(it);
    printf("key '%s', type '%d' \n", info.key, info.type);
};
// Note: no need to release iterator obtained from nvs_entry_find function when
// nvs_entry_find or nvs_entry_next function return NULL, indicating no_
↳other
// element for specified criteria was found.
}
```

**Parameters**

- **part\_name** –[in] Partition name
- **namespace\_name** –[in] Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- **type** –[in] One of `nvs_type_t` values.

**Returns** Iterator used to enumerate all the entries found, or NULL if no entry satisfying criteria was found. Iterator obtained through this function has to be released using `nvs_release_iterator` when not used any more.

*nvs\_iterator\_t* **nvs\_entry\_next** (*nvs\_iterator\_t* iterator)

Returns next item matching the iterator criteria, NULL if no such item exists.

Note that any copies of the iterator will be invalid after this call.

**Parameters** **iterator** **–[in]** Iterator obtained from `nvs_entry_find` function. Must be non-NULL.

**Returns** NULL if no entry was found, valid `nvs_iterator_t` otherwise.

void **nvs\_entry\_info** (*nvs\_iterator\_t* iterator, *nvs\_entry\_info\_t* \*out\_info)

Fills *nvs\_entry\_info\_t* structure with information about entry pointed to by the iterator.

**Parameters**

- **iterator** **–[in]** Iterator obtained from `nvs_entry_find` or `nvs_entry_next` function. Must be non-NULL.
- **out\_info** **–[out]** Structure to which entry information is copied.

void **nvs\_release\_iterator** (*nvs\_iterator\_t* iterator)

Release iterator.

**Parameters** **iterator** **–[in]** Release iterator obtained from `nvs_entry_find` function. NULL argument is allowed.

## Structures

struct **nvs\_entry\_info\_t**

information about entry obtained from `nvs_entry_info` function

## Public Members

char **namespace\_name**[16]

Namespace to which key-value belong

char **key**[16]

Key of stored key-value pair

*nvs\_type\_t* **type**

Type of stored key-value pair

struct **nvs\_stats\_t**

---

**Note:** Info about storage space NVS.

---

## Public Members

size\_t **used\_entries**

Amount of used entries.

size\_t **free\_entries**

Amount of free entries.

size\_t **total\_entries**

Amount all available entries.

size\_t **namespace\_count**

Amount name space.

## Macros

### **ESP\_ERR\_NVS\_BASE**

Starting number of error codes

### **ESP\_ERR\_NVS\_NOT\_INITIALIZED**

The storage driver is not initialized

### **ESP\_ERR\_NVS\_NOT\_FOUND**

Id namespace doesn't exist yet and mode is NVS\_READONLY

### **ESP\_ERR\_NVS\_TYPE\_MISMATCH**

The type of set or get operation doesn't match the type of value stored in NVS

### **ESP\_ERR\_NVS\_READ\_ONLY**

Storage handle was opened as read only

### **ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE**

There is not enough space in the underlying storage to save the value

### **ESP\_ERR\_NVS\_INVALID\_NAME**

Namespace name doesn't satisfy constraints

### **ESP\_ERR\_NVS\_INVALID\_HANDLE**

Handle has been closed or is NULL

### **ESP\_ERR\_NVS\_REMOVE\_FAILED**

The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

### **ESP\_ERR\_NVS\_KEY\_TOO\_LONG**

Key name is too long

### **ESP\_ERR\_NVS\_PAGE\_FULL**

Internal error; never returned by nvs API functions

### **ESP\_ERR\_NVS\_INVALID\_STATE**

NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

### **ESP\_ERR\_NVS\_INVALID\_LENGTH**

String or blob length is not sufficient to store data

### **ESP\_ERR\_NVS\_NO\_FREE\_PAGES**

NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

### **ESP\_ERR\_NVS\_VALUE\_TOO\_LONG**

Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

### **ESP\_ERR\_NVS\_PART\_NOT\_FOUND**

Partition with specified name is not found in the partition table

**ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND**

NVS partition contains data in new format and cannot be recognized by this version of code

**ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED**

XTS encryption failed while writing NVS entry

**ESP\_ERR\_NVS\_XTS\_DECR\_FAILED**

XTS decryption failed while reading NVS entry

**ESP\_ERR\_NVS\_XTS\_CFG\_FAILED**

XTS configuration setting failed

**ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND**

XTS configuration not found

**ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED**

NVS encryption is not supported in this version

**ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED**

NVS key partition is uninitialized

**ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART**

NVS key partition is corrupt

**ESP\_ERR\_NVS\_WRONG\_ENCRYPTION**

NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP\_ERR\_NVS\_CONTENT\_DIFFERS**

Internal error; never returned by nvs API functions. NVS key is different in comparison

**NVS\_DEFAULT\_PART\_NAME**

Default partition name of the NVS partition in the partition table

**NVS\_PART\_NAME\_MAX\_SIZE**

maximum length of partition name (excluding null terminator)

**NVS\_KEY\_NAME\_MAX\_SIZE**

Maximal length of NVS key name (including null terminator)

**Type Definitions**

```
typedef uint32_t nvs_handle_t
```

Opaque pointer type representing non-volatile storage handle

```
typedef nvs_handle_t nvs_handle
```

```
typedef nvs_open_mode_t nvs_open_mode
```

typedef struct nvs\_opaque\_iterator\_t \***nvs\_iterator\_t**  
Opaque pointer type representing iterator to nvs entries

### Enumerations

enum **nvs\_open\_mode\_t**  
Mode of opening the non-volatile storage.

*Values:*

enumerator **NVS\_READONLY**  
Read only

enumerator **NVS\_READWRITE**  
Read and write

enum **nvs\_type\_t**  
Types of variables.

*Values:*

enumerator **NVS\_TYPE\_U8**  
Type uint8\_t

enumerator **NVS\_TYPE\_I8**  
Type int8\_t

enumerator **NVS\_TYPE\_U16**  
Type uint16\_t

enumerator **NVS\_TYPE\_I16**  
Type int16\_t

enumerator **NVS\_TYPE\_U32**  
Type uint32\_t

enumerator **NVS\_TYPE\_I32**  
Type int32\_t

enumerator **NVS\_TYPE\_U64**  
Type uint64\_t

enumerator **NVS\_TYPE\_I64**  
Type int64\_t

enumerator **NVS\_TYPE\_STR**  
Type string

enumerator **NVS\_TYPE\_BLOB**  
Type blob

enumerator **NVS\_TYPE\_ANY**

Must be last

## 2.6.4 NVS Partition Generator Utility

### Introduction

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file based on key-value pairs provided in a CSV file. The binary file is compatible with NVS architecture defined in *Non-Volatile Storage*. This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

### Prerequisites

To use this utility in encryption mode, install the following packages:

- cryptography package

All the required packages are included in *requirements.txt* in the root of the esp-idf directory.

### CSV file format

Each line of a .csv file should contain 4 parameters, separated by a comma. The table below provides the description for each of these parameters.

No.	Parameter	Description	Notes
1	Key	Key of the data. The data can be accessed later from an application using this key.	
2	Type	Supported values are <code>file</code> , <code>data</code> and <code>namespace</code> .	
3	Encoding	Supported values are: <code>u8</code> , <code>i8</code> , <code>u16</code> , <code>i16</code> , <code>u32</code> , <code>i32</code> , <code>u64</code> , <code>i64</code> , <code>string</code> , <code>hex2bin</code> , <code>base64</code> and <code>binary</code> . This specifies how actual data values are encoded in the resulting binary file. The difference between the <code>string</code> and <code>binary</code> encoding is that <code>string</code> data is terminated with a NULL character, whereas <code>binary</code> data is not.	As of now, for the file type, only <code>hex2bin</code> , <code>base64</code> , <code>string</code> , and <code>binary</code> encoding is supported.
4	Value	Data value.	Encoding and Value cells for the <code>namespace</code> field type should be empty. Encoding and Value of <code>namespace</code> is fixed and is not configurable. Any values in these cells are ignored.

**Note:** The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:

```
key, type, encoding, value      <-- column header
namespace_name, namespace,,    <-- First entry should be of type "namespace"
key1, data, u8, 1
key2, file, string, /path/to/file
```

**Note:****Make sure there are no spaces:**

- before and after ‘,’
- at the end of each line in a CSV file

**NVS Entry and Namespace association**

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

**Note:** First entry in a CSV file should always be a namespace entry.

**Multipage Blob Support**

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section *Structure of entry*. If you intend to use an older format, the utility provides an option to disable this feature.

**Encryption Support**

The NVS Partition Generator utility also allows you to create an encrypted binary file. The utility uses the AES-XTS encryption. Please refer to *NVS Encryption* for more details.

**Decryption Support**

This utility allows you to decrypt an encrypted NVS binary file. The utility uses an NVS binary file encrypted using AES-XTS encryption. Please refer to *NVS Encryption* for more details.

**Running the utility****Usage:**

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

**Optional Arguments:**

```
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| No. | Parameter | Description |
↪      |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 1   | -h, --help | show this help message and exit |
↪      |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
```

**Commands:**

(continues on next page)

(continued from previous page)

```

Run nvs_partition_gen.py {command} -h for additional help
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| No. | Parameter | Description |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 1 | generate | Generate NVS partition |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| 2 | generate-key | Generate keys for encryption |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| 3 | encrypt | Generate NVS encrypted partition |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| 4 | decrypt | Decrypt NVS encrypted partition |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+

```

**To generate NVS partition (Default):****Usage:**

```

python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir_
↪OUTDIR]
                                input output size
Positional Arguments:
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| Parameter | Description |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| input | Path to CSV file to parse |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| output | Path to output NVS binary file |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| size | Size of NVS partition in bytes (must be multiple_
↪of 4096) |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
Optional Arguments:
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+
| Parameter | Description |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| -h, --help | show this help message and exit |
↪-----+
-----+-----+-----+-----+-----+-----+-----+-----+-----+-----+
↪-----+

```

(continues on next page)

(continued from previous page)

--version {1,2}	Set multipage blob version.	↵
↵		↵
	Version 1 - Multipage blob support disabled.	↵
↵		↵
	Version 2 - Multipage blob support enabled.	↵
↵		↵
	Default: Version 2	↵
↵		↵
↵		↵
+-----+	-----	
↵-----+		
--outdir OUTDIR	Output directory to store files created	↵
↵		↵
	(Default: current directory)	↵
↵		↵
+-----+	-----	
↵-----+		

You can run the utility to generate NVS partition using the command below: A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

### To generate only encryption keys:

#### Usage:

```
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE]
                                      [--outdir OUTDIR]
```

Optional Arguments:

+-----+	-----	
↵-----+		
Parameter	Description	↵
↵		↵
+=====+	=====	
-h, --help	show this help message <b>and</b> exit	↵
↵		↵
+-----+	-----	
↵-----+		
--keyfile KEYFILE	Path to output encryption keys file	↵
↵		↵
+-----+	-----	
↵-----+		
--outdir OUTDIR	Output directory to store files created.	↵
↵		↵
	(Default: current directory)	↵
↵		↵
+-----+	-----	
↵-----+		

You can run the utility to generate only encryption keys using the command below:

```
python nvs_partition_gen.py generate-key
```

### To generate encrypted NVS partition:

#### Usage:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen]
                                   [--keyfile KEYFILE] [--inputkey INPUTKEY]
                                   [--outdir OUTDIR]
                                   input output size

Positional Arguments:
+-----+
| Parameter | Description |
+-----+
| input     | Path to CSV file to parse |
+-----+
| output    | Path to output NVS binary file |
+-----+
| size      | Size of NVS partition in bytes (must be multiple of 4096) |
+-----+

Optional Arguments:
+-----+
| Parameter | Description |
+-----+
| -h, --help | show this help message and exit |
+-----+
| --version {1,2} | Set multipage blob version. | |
| | | Version 1 - Multipage blob support disabled. |
| | | Version 2 - Multipage blob support enabled. |
| | | Default: Version 2 |
+-----+
| --keygen | Generates key for encrypting NVS partition |
+-----+
| --keyfile KEYFILE | Path to output encryption keys file |
+-----+
| --inputkey INPUTKEY | File having key for encrypting NVS partition |
+-----+
| --outdir OUTDIR | Output directory to store files created |
+-----+
```

(continues on next page)

(continued from previous page)

```
|                                     | (Default: current directory) |
↩                                     |                               |
+-----+-----+-----+-----+
↩-----+-----+-----+-----+
```

You can run the utility to encrypt NVS partition using the command below: A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
↩0x3000 --keygen
```

**Note:** Encryption key of the following format <outdir>/keys/keys-<timestamp>.bin is created.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
↩0x3000 --keygen --keyfile sample_keys.bin
```

**Note:** Encryption key of the following format <outdir>/keys/sample\_keys.bin is created.

**Note:** This newly created file having encryption keys in keys/ directory is compatible with NVS key-partition structure. Refer to [NVS key partition](#) for more details.

- Encrypt by providing the encryption keys as input binary file:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
↩0x3000 --inputkey sample_keys.bin
```

### To decrypt encrypted NVS partition:

#### Usage:

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key_
↩output

Positional Arguments:
+-----+-----+-----+-----+
↩-----+-----+-----+-----+
| Parameter | Description |
↩-----+-----+-----+-----+
| input     | Path to encrypted NVS partition file to parse |
↩-----+-----+-----+-----+
| key       | Path to file having keys for decryption |
↩-----+-----+-----+-----+
| output    | Path to output decrypted binary file |
↩-----+-----+-----+-----+
```

(continues on next page)

(continued from previous page)

```
Optional Arguments:
+-----+-----+
↪-----+
| Parameter          | Description          | ↪
↪-----+
+-----+-----+
| -h, --help        | show this help message and exit | ↪
↪-----+
+-----+-----+
↪-----+
| --outdir OUTDIR   | Output directory to store files created | ↪
↪-----+
|                   | (Default: current directory)           | ↪
↪-----+
+-----+-----+
↪-----+
```

You can run the utility to decrypt encrypted NVS partition using the command below:

```
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

**You can also provide the format version number:**

- Multipage Blob Support Disabled (Version 1)
- Multipage Blob Support Enabled (Version 2)

**Multipage Blob Support Disabled (Version 1):** You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 -
↪--version 1
```

**Multipage Blob Support Enabled (Version 2):** You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --
↪version 2
```

---

**Note:** *Minimum NVS Partition Size needed is 0x3000 bytes.*

---

---

**Note:** *When flashing the binary onto the device, make sure it is consistent with the application's sdkconfig.*

---

### Caveats

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

## 2.6.5 SD/SDIO/MMC Driver

### Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers ([driver/include/driver/sdmmc\\_host.h](#) and [driver/include/driver/sdsp\\_i\\_host.h](#)) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SDMMC host, see [SDMMC Host API](#)
- SD SPI host, see [SD SPI Host API](#)

The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card initialization and data transfer commands.

The protocol layer works with the host via the `sdmmc_host_t` structure. This structure contains pointers to various functions of the host.

### Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the [storage/sd\\_card](#) directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.

**Combo (memory + IO) cards** The driver does not support SD combo cards. Combo cards are treated as IO cards.

**Thread safety** Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the `sdmmc_card_t` structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.

### Protocol layer API

The protocol layer is given the `sdmmc_host_t` structure. This structure describes the SD/MMC host driver, lists its capabilities, and provides pointers to functions of the driver. The protocol layer stores card-specific information in the `sdmmc_card_t` structure. When sending commands to the SD/MMC host driver, the protocol layer uses the `sdmmc_command_t` structure to describe the command, arguments, expected return values, and data to transfer if there is any.

### Using API with SD memory cards

1. To initialize the host, call the host driver functions, e.g., `sdmmc_host_init()`, `sdmmc_host_init_slot()`.
2. To initialize the card, call `sdmmc_card_init()` and pass to it the parameters `host` - the host driver information, and `card` - a pointer to the structure `sdmmc_card_t` which will be filled with information about the card when the function completes.
3. To read and write sectors of the card, use `sdmmc_read_sectors()` and `sdmmc_write_sectors()` respectively and pass to it the parameter `card` - a pointer to the card information structure.

- If the card is not used anymore, call the host driver function - e.g., `sdmmc_host_deinit()` - to disable the host peripheral and free the resources allocated by the driver.

**Using API with eMMC chips** From the protocol layer's perspective, eMMC memory chips behave exactly like SD memory cards. Even though eMMCs are chips and do not have a card form factor, the terminology for SD cards can still be applied to eMMC due to the similarity of the protocol (`sdmmc_card_t`, `sdmmc_card_init`). Note that eMMC chips cannot be used over SPI, which makes them incompatible with the SD SPI host driver.

To initialize eMMC memory and perform read/write operations, follow the steps listed for SD cards in the previous section.

**Using API with SDIO cards** Initialization and the probing process is the same as with SD memory cards. The only difference is in data transfer commands in SDIO mode.

During the card initialization and probing, performed with `sdmmc_card_init()`, the driver only configures the following registers of the IO card:

- The IO portion of the card is reset by setting RES bit in the I/O Abort (0x06) register.
- If 4-line mode is enabled in host and slot configuration, the driver attempts to set the Bus width field in the Bus Interface Control (0x07) register. If setting the field is successful, which means that the slave supports 4-line mode, the host is also switched to 4-line mode.
- If high-speed mode is enabled in the host configuration, the SHS bit is set in the High Speed (0x13) register.

In particular, the driver does not set any bits in (1) I/O Enable and Int Enable registers, (2) I/O block sizes, etc. Applications can set them by calling `sdmmc_io_write_byte()`.

For card configuration and data transfer, choose the pair of functions relevant to your case from the table below.

Action	Read Function	Write Function
Read and write a single byte using IO_RW_DIRECT (CMD52)	<code>sd- mmc_io_read_byte()</code>	<code>sd- mmc_io_write_byte()</code>
Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode	<code>sd- mmc_io_read_bytes()</code>	<code>sd- mmc_io_write_bytes()</code>
Read and write blocks of data using IO_RW_EXTENDED (CMD53) in block mode	<code>sd- mmc_io_read_blocks()</code>	<code>sd- mmc_io_write_blocks()</code>

SDIO interrupts can be enabled by the application using the function `sdmmc_io_enable_int()`. When using SDIO in 1-line mode, the D1 line also needs to be connected to use SDIO interrupts.

If you want the application to wait until the SDIO interrupt occurs, use `sdmmc_io_wait_int()`.

## API Reference

### Header File

- `components/sdmmc/include/sdmmc_cmd.h`

### Functions

`esp_err_t sdmmc_card_init` (const `sdmmc_host_t`\*host, `sdmmc_card_t`\*out\_card)

Probe and initialize SD/MMC card using given host

---

**Note:** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

---

### Parameters

- `host` – pointer to structure defining host controller

- **out\_card** –pointer to structure which will receive information about the card when the function completes

**Returns**

- ESP\_OK on success
- One of the error codes from SDMMC host controller

void **sdmmc\_card\_print\_info** (FILE \*stream, const *sdmmc\_card\_t* \*card)

Print information about the card to a stream.

**Parameters**

- **stream** –stream obtained using fopen or fdopen
- **card** –card information structure initialized using sdmmc\_card\_init

*esp\_err\_t* **sdmmc\_get\_status** (*sdmmc\_card\_t* \*card)

Get status of SD/MMC card

**Parameters** **card** –pointer to card information structure previously initialized using sdmmc\_card\_init

**Returns**

- ESP\_OK on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_write\_sectors** (*sdmmc\_card\_t* \*card, const void \*src, size\_t start\_sector, size\_t sector\_count)

Write given number of sectors to SD/MMC card

**Parameters**

- **card** –pointer to card information structure previously initialized using sdmmc\_card\_init
- **src** –pointer to data buffer to read data from; data size must be equal to sector\_count \* card->csd.sector\_size
- **start\_sector** –sector where to start writing
- **sector\_count** –number of sectors to write

**Returns**

- ESP\_OK on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_read\_sectors** (*sdmmc\_card\_t* \*card, void \*dst, size\_t start\_sector, size\_t sector\_count)

Read given number of sectors from the SD/MMC card

**Parameters**

- **card** –pointer to card information structure previously initialized using sdmmc\_card\_init
- **dst** –pointer to data buffer to write into; buffer size must be at least sector\_count \* card->csd.sector\_size
- **start\_sector** –sector where to start reading
- **sector\_count** –number of sectors to read

**Returns**

- ESP\_OK on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_read\_byte** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t reg, uint8\_t \*out\_byte)

Read one byte from an SDIO card using IO\_RW\_DIRECT (CMD52)

**Parameters**

- **card** –pointer to card information structure previously initialized using sdmmc\_card\_init
- **function** –IO function number
- **reg** –byte address within IO function
- **out\_byte** –[out] output, receives the value read from the card

**Returns**

- ESP\_OK on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_write\_byte** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t reg, uint8\_t in\_byte, uint8\_t \*out\_byte)

Write one byte to an SDIO card using IO\_RW\_DIRECT (CMD52)

#### Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **reg** –byte address within IO function
- **in\_byte** –value to be written
- **out\_byte** –[out] if not NULL, receives new byte value read from the card (read-after-write).

#### Returns

- ESP\_OK on success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_read\_bytes** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, void \*dst, size\_t size)

Read multiple bytes from an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see `sdmmc_io_read_blocks`.

#### Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **addr** –byte address within IO function where reading starts
- **dst** –buffer which receives the data read from card
- **size** –number of bytes to read

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_write\_bytes** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, const void \*src, size\_t size)

Write multiple bytes to an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

#### Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **addr** –byte address within IO function where writing starts
- **src** –data to be written
- **size** –number of bytes to write

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_read\_blocks** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, void \*dst, size\_t size)

Read blocks of data from an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

#### Parameters

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **addr** –byte address within IO function where writing starts

- **dst** –buffer which receives the data read from card
- **size** –number of bytes to read, must be divisible by the card block size.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_write\_blocks** (*sdmmc\_card\_t* \*card, uint32\_t function, uint32\_t addr, const void \*src, size\_t size)

Write blocks of data to an SDIO card using IO\_RW\_EXTENDED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see `sdmmc_io_write_bytes`.

**Parameters**

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **function** –IO function number
- **addr** –byte address within IO function where writing starts
- **src** –data to be written
- **size** –number of bytes to read, must be divisible by the card block size.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

*esp\_err\_t* **sdmmc\_io\_enable\_int** (*sdmmc\_card\_t* \*card)

Enable SDIO interrupt in the SDMMC host

**Parameters** **card** –pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if the host controller does not support IO interrupts

*esp\_err\_t* **sdmmc\_io\_wait\_int** (*sdmmc\_card\_t* \*card, TickType\_t timeout\_ticks)

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

**Parameters**

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **timeout\_ticks** –time to wait for the interrupt, in RTOS ticks

**Returns**

- ESP\_OK if the interrupt is received
- ESP\_ERR\_NOT\_SUPPORTED if the host controller does not support IO interrupts
- ESP\_ERR\_TIMEOUT if the interrupt does not happen in `timeout_ticks`

*esp\_err\_t* **sdmmc\_io\_get\_cis\_data** (*sdmmc\_card\_t* \*card, uint8\_t \*out\_buffer, size\_t buffer\_size, size\_t \*inout\_cis\_size)

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

**Parameters**

- **card** –pointer to card information structure previously initialized using `sdmmc_card_init`
- **out\_buffer** –Output buffer of the CIS data
- **buffer\_size** –Size of the buffer.
- **inout\_cis\_size** –Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than `buffer_size`. The function searches for `CIS_CODE_END` until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if `CIS_CODE_END` is found.

**Returns**

- **ESP\_OK**: on success
- **ESP\_ERR\_INVALID\_RESPONSE**: if the card does not (correctly) support CIS.
- **ESP\_ERR\_INVALID\_SIZE**: **CIS\_CODE\_END** found, but **buffer\_size** is less than required size, which is stored in the **inout\_cis\_size** then.
- **ESP\_ERR\_NOT\_FOUND**: if the **CIS\_CODE\_END** not found. Increase input value of **inout\_cis\_size** or set it to 0, if you still want to search for the end; output value of **inout\_cis\_size** is invalid in this case.
- and other error code return from **sdmmc\_io\_read\_bytes**

*esp\_err\_t* **sdmmc\_io\_print\_cis\_info** (uint8\_t \*buffer, size\_t buffer\_size, FILE \*fp)

Parse and print the CIS information of an SDIO card.

---

**Note:** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in **sdmmc\_io.c** and contribute to the IDF through the Github repository.

```
using sdmmc_card_init
```

---

**Parameters**

- **buffer** – Buffer to parse
- **buffer\_size** – Size of the buffer.
- **fp** – File pointer to print to, set to **NULL** to print to **stdout**.

**Returns**

- **ESP\_OK**: on success
- **ESP\_ERR\_NOT\_SUPPORTED**: if the value from the card is not supported to be parsed.
- **ESP\_ERR\_INVALID\_SIZE**: if the CIS size fields are not correct.

**Header File**

- [components/driver/include/driver/sdmmc\\_types.h](#)

**Structures**

struct **sdmmc\_csd\_t**

Decoded values from SD card Card Specific Data register

**Public Members**

int **csd\_ver**

CSD structure format

int **mmc\_ver**

MMC version (for CID format)

int **capacity**

total number of sectors

int **sector\_size**

sector size in bytes

int **read\_block\_len**

block length for reads

int **card\_command\_class**  
Card Command Class for SD

int **tr\_speed**  
Max transfer speed

struct **sdmmc\_cid\_t**  
Decoded values from SD card Card IDentification register

### Public Members

int **mfg\_id**  
manufacturer identification number

int **oem\_id**  
OEM/product identification number

char **name**[8]  
product name (MMC v1 has the longest)

int **revision**  
product revision

int **serial**  
product serial number

int **date**  
manufacturing date

struct **sdmmc\_scr\_t**  
Decoded values from SD Configuration Register

### Public Members

int **sd\_spec**  
SD Physical layer specification version, reported by card

int **bus\_width**  
bus widths supported by card: BIT(0) —1-bit bus, BIT(2) —4-bit bus

struct **sdmmc\_ext\_csd\_t**  
Decoded values of Extended Card Specific Data

### Public Members

uint8\_t **power\_class**  
Power class used by the card

struct **sdmmc\_switch\_func\_rsp\_t**  
SD SWITCH\_FUNC response buffer

### Public Members

uint32\_t **data**[512 / 8 / sizeof(uint32\_t)]  
response data

struct **sdmmc\_command\_t**  
SD/MMC command information

### Public Members

uint32\_t **opcode**  
SD or MMC command index

uint32\_t **arg**  
SD/MMC command argument

*sdmmc\_response\_t* **response**  
response buffer

void \***data**  
buffer to send or read into

size\_t **datalen**  
length of data buffer

size\_t **blklen**  
block length

int **flags**  
see below

*esp\_err\_t* **error**  
error returned from transfer

int **timeout\_ms**  
response timeout, in milliseconds

struct **sdmmc\_host\_t**  
SD/MMC Host description

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

## Public Members

uint32\_t **flags**

flags defining host properties

int **slot**

slot number, to be passed to host functions

int **max\_freq\_khz**

max frequency supported by the host

float **io\_voltage**

I/O voltage used by the controller (voltage switching is not supported)

*esp\_err\_t* (\***init**)(void)

Host function to initialize the driver

*esp\_err\_t* (\***set\_bus\_width**)(int slot, size\_t width)

host function to set bus width

size\_t (\***get\_bus\_width**)(int slot)

host function to get bus width

*esp\_err\_t* (\***set\_bus\_ddr\_mode**)(int slot, bool ddr\_enable)

host function to set DDR mode

*esp\_err\_t* (\***set\_card\_clk**)(int slot, uint32\_t freq\_khz)

host function to set card clock frequency

*esp\_err\_t* (\***set\_cclk\_always\_on**)(int slot, bool cclk\_always\_on)

host function to set whether the clock is always enabled

*esp\_err\_t* (\***do\_transaction**)(int slot, *sdmmc\_command\_t* \*cmdinfo)

host function to do a transaction

*esp\_err\_t* (\***deinit**)(void)

host function to deinitialize the driver

*esp\_err\_t* (\***deinit\_p**)(int slot)

host function to deinitialize the driver, called with the `slot`

*esp\_err\_t* (\***io\_int\_enable**)(int slot)

Host function to enable SDIO interrupt line

*esp\_err\_t* (\***io\_int\_wait**)(int slot, TickType\_t timeout\_ticks)

Host function to wait for SDIO interrupt line to be active

int **command\_timeout\_ms**

timeout, in milliseconds, of a single command. Set to 0 to use the default value.

struct **sdmmc\_card\_t**

SD/MMC card information structure

### Public Members

*sdmmc\_host\_t* **host**

Host with which the card is associated

uint32\_t **ocr**

OCR (Operation Conditions Register) value

*sdmmc\_cid\_t* **cid**

decoded CID (Card IDentification) register value

*sdmmc\_response\_t* **raw\_cid**

raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

*sdmmc\_csd\_t* **csd**

decoded CSD (Card-Specific Data) register value

*sdmmc\_scr\_t* **scr**

decoded SCR (SD card Configuration Register) value

*sdmmc\_ext\_csd\_t* **ext\_csd**

decoded EXT\_CSD (Extended Card Specific Data) register value

uint16\_t **rca**

RCA (Relative Card Address)

uint16\_t **max\_freq\_khz**

Maximum frequency, in kHz, supported by the card

uint32\_t **is\_mem**

Bit indicates if the card is a memory card

uint32\_t **is\_sdio**

Bit indicates if the card is an IO card

uint32\_t **is\_mmc**

Bit indicates if the card is MMC

uint32\_t **num\_io\_functions**

If **is\_sdio** is 1, contains the number of IO functions on the card

uint32\_t **log\_bus\_width**

log<sub>2</sub>(bus width supported by card)

uint32\_t **is\_ddr**

Card supports DDR mode

uint32\_t **reserved**

Reserved for future expansion

### Macros

**SDMMC\_HOST\_FLAG\_1BIT**

host supports 1-line SD and MMC protocol

**SDMMC\_HOST\_FLAG\_4BIT**

host supports 4-line SD and MMC protocol

**SDMMC\_HOST\_FLAG\_8BIT**

host supports 8-line MMC protocol

**SDMMC\_HOST\_FLAG\_SPI**

host supports SPI protocol

**SDMMC\_HOST\_FLAG\_DDR**

host supports DDR mode for SD/MMC

**SDMMC\_HOST\_FLAG\_DEINIT\_ARG**

host `deinit` function called with the slot argument

**SDMMC\_FREQ\_DEFAULT**

SD/MMC Default speed (limited by clock divider)

**SDMMC\_FREQ\_HIGHSPEED**

SD High speed (limited by clock divider)

**SDMMC\_FREQ\_PROBING**

SD/MMC probing speed

**SDMMC\_FREQ\_52M**

MMC 52MHz speed

**SDMMC\_FREQ\_26M**

MMC 26MHz speed

### Type Definitions

typedef uint32\_t **sdmmc\_response\_t**[4]

SD/MMC command response buffer

## 2.6.6 SPI Flash API

## Overview

The `spi_flash` component contains API functions related to reading, writing, erasing, memory mapping for data in the external flash. The `spi_flash` component also has higher-level API functions which work with partitions defined in the *partition table*.

Different from the API before IDF v4.0, the functionality of `esp_flash_*` APIs is not limited to the “main” SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access to external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

---

**Note:** Instead of through the cache connected to the SPI0 peripheral, most `esp_flash_*` APIs go through other SPI peripherals like SPI1, SPI2, etc.. This makes them able to access to not only the main flash, but also external flash.

However due to limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations are also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

---

---

**Note:** Flash APIs after IDF v4.0 are no longer *atomic*. A writing operation during another on-going read operation, on the overlapped flash address, may cause the return data from the read operation to be partly same as before, and partly updated as new written.

---

Kconfig option `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` can be used to switch `spi_flash_*` functions back to the implementation before ESP-IDF v4.0. However, the code size may get bigger if you use the new API and the old API at the same time.

Encrypted reads and writes use the old implementation, even if `CONFIG_SPI_FLASH_USE_LEGACY_IMPL` is not enabled. As such, encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

## Support for features of flash chips

**Quad/Dual mode chips** Flash features of different vendors are operated in different ways and need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all 24-bits address flash chips are supported, because they don't need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on following chip types:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

## Optional Features

**Optional features for flash** Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- *Auto Suspend & Resume*
- *Flash unique ID*
- *High performance mode*
- *OPI flash support*

- *32-bit Address Flash Chips*

---

**Note:** When Flash optional features listed in this page are used, aside from the capability of ESP chips, and ESP-IDF version you are using, you will also need to make sure these features are supported by flash chips used.

- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact [Espressif's business team](#) to know if we can supply such products for you.
  - If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.
- 

**Attention:** This document only shows that IDF code has supported the features of those flash chips. It's not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own brought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

**Auto Suspend & Resume** This feature is only supported on ESP32-C3 for now.

The support for ESP32-S3 may be added in the future.

**Flash unique ID** This feature is supported on all Espressif chips.

Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

List of Flash chips that support this feature:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

**High performance mode** This feature is only supported on ESP32-S3 for now.

The support for ESP32-S2, ESP32-C3 may be added in the future.

---

**Note:** This section is provided for Dual mode (DOUT/DIO) and Quad mode (QIO/QOUT) flash chips. Octal flash used on ESP-chips support High performance mode by default so far, you can refer to the octal flash support list below.

---

High performance mode (HPM) means that the SPI1 and flash chip works under high frequency. Usually, when the operating frequency of the flash is greater than 80 MHz, it is considered that the flash works under HPM.

As far as we acknowledged, there are more than three strategies for High Performance Mode (HPM) in typical SPI flash parts. For some flash chips, HPM is controlled by dummy cycle bit in the registers, while for other chips, it can be controlled by other bits (like HPM bit) in the register, or some special command. The difference in strategies requires the driver to explicitly add support for each chip.

**Attention:** It is hard to create several strategies to cover all situations, so all flash chips using HPM need to be supported explicitly. Therefore, if you try to use a flash not listed in [Quad Flash HPM support list](#), it might cause some error. So, when you try to use the flash chip beyond supported list, please test properly.

Moreover, when the *Dummy Cycle adjustment* strategy is adopted by the flash chip, the flash remains in a state in which DC is different from the default value after a software reset. The sub mode of HPM that adjusts the dummy cycle to run at higher frequency in the application is called *HPM-DC*. *HPM-DC* feature needs a feature *DC Aware* to be enabled in the bootloader. Otherwise different DC value will forbid the 2nd bootloader from being boot up after reset.

To enable High Performance Mode:

1. De-select [CONFIG\\_ESPTOOLPY\\_OCT\\_FLASH](#). HPM is not used for Octal flash, enabling related options may bypass HPM functions.
2. Enable `CONFIG_SPI_FLASH_HPM_ENA` option.
3. Switch Flash frequency to HPM ones. For example, `CONFIG_ESPTOOLPY_FLASHFREQ_120M`.
4. Make sure the config option for *HPM-DC* feature (under `CONFIG_SPI_FLASH_HPM_DC` choices) is selected correctly according to whether the bootloader supports *DC Aware*.
  - If bootloader supports *DC Aware*, select `CONFIG_SPI_FLASH_HPM_DC_AUTO`. This allows the usage of flash chips that adopted *Dummy Cycle adjustment* strategy.
  - If bootloader doesn't support *DC Aware*, select `CONFIG_SPI_FLASH_HPM_DC_DISABLE`. It avoid consequences caused by running HPM-DC with non-DC-aware bootloaders. But please avoid using flash chips that adopts *Dummy Cycle adjustment* strategy if `CONFIG_SPI_FLASH_HPM_DC_DISABLE` is selected. See list of flash models that adopt DC strategy below.

Check whether the bootloader supports *DC Aware* in the following way:

- If you are starting a new project, it's suggested to enable *DC Aware* by selecting [CONFIG\\_BOOTLOADER\\_FLASH\\_DC\\_AWARE](#) option in the bootloader menu. Please note that, you won't be able to modify this option via OTA, because the support is in the bootloader.
- If you are working on an existing project and want to update *HPM-DC* config option in the app via OTA, check the sdkconfig file used to build your bootloader: (Upgrading ESP-IDF version may make this file different from the one used by bootloader to build.)
  - For latest version (ESP-IDF v4.4.7+, v5.2 and above), if [CONFIG\\_BOOTLOADER\\_FLASH\\_DC\\_AWARE](#) is selected, the bootloader supports *DC Aware*.
  - For versions in this range: (v4.4.4-v4.4.6, v5.0+, and v5.1+), if `CONFIG_ESPTOOLPY_FLASHFREQ_120M` is selected, the bootloader supports *DC Aware*. In this case, enable [CONFIG\\_BOOTLOADER\\_FLASH\\_DC\\_AWARE](#) to confirm this (though it will not affect bootloader in devices in the field).
  - For versions below v4.4.4, the bootloader doesn't support *DC Aware*.

**Quad Flash HPM support list** Flash chips that don't need HPM-DC:

1. GD25Q64C (ID: 0xC84017)
2. GD25Q32C (ID: 0xC84016)
3. ZB25VQ32B (ID: 0x5E4016)

Following flash chips also have HPM feature, but requires the bootloader to support *DC Aware*:

1. GD25Q64E (ID: 0xC84017)
2. GD25Q128E (ID: 0xC84018)

**OPI flash support** This feature is only supported on ESP32-S3 for now.

OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

---

**Note:** To know how to configure menuconfig for a board with different Flash and PSRAM, please refer to the [SPI Flash and External SPI RAM Configuration](#)

---

List of Flash chips that support this feature:

1. MX25UM25645G
2. MX25UM12345G

**32-bit Address Flash Chips** This feature is supported on all Espressif chips (with various restrictions to application).

Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regretfully, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

List of Flash chips that support this feature:

1. W25Q256
2. GD25Q256

---

**Important:** Over 16 MBytes space on flash mentioned above can be only used for data saving, like file system. If your data/instructions over 16 MBytes spaces need to be mapped to MMU (so as to be accessed by the CPU), please upgrade to ESP-IDF v5.2 and read the latest docs.

---

There are some features that are not supported by all flash models, or not supported by all Espressif chips. These features include:

- OPI flash - means that flash supports octal mode.
- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16MB) that needs longer address to access.
- High performance mode (HPM) - means that flash works under high frequency which is higher than 80MHz.
- Flash unique ID - means that flash supports its unique 64-bits ID.

If you want to use these features, you need to ensure ESP32-S3 supports this feature, and ALL the flash chips in your product have this feature. For more details, refer [Optional features for flash](#).

Users can also customize their own flash chip driver, see [Overriding Default Chip Drivers](#) for more details.

**Warning:** Customizing SPI Flash Chip Drivers is considered an “expert” feature. Users should only do so at their own risk. (See the notes below)

**Overriding Default Chip Drivers** During the SPI Flash driver’s initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated in together with each IDF version. However IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.

- If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

### Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List

- Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This will prevent compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by IDF. Instead, the linker will search for the structure of the same name (`default_registered_chips`) that must be provided by the user.
- Add a new component in your project, e.g. `custom_chip_driver`.
- Copy the necessary chip driver files from the `spi_flash` component in IDF. This may include:
  - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
  - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
  - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly.

#### Note:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
  - Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
  - Write a function named `spi_flash_chip_***(vendor)_get_caps`. Take the example below as a reference. (if the flash support `suspend` and `read unique id`).
  - Points the the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```
spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash_suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example [storage/custom\\_flash\\_driver](#).

- Add linking dependency from `spi_flash` component to the new `custom_chip_driver` component, by adding the following lines after the `idf_component_register`, in the `CMakeLists.txt` file of the `custom_chip_driver` component:

```
idf_component_get_property(spi_flash_lib      spi_flash      COMPONENT_LIB)
set_property(TARGET      ${spi_flash_lib}      APPEND      PROPERTY      INTER-
FACE_LINK_LIBRARIES $<LINK_ONLY:${COMPONENT_LIB}>)
```

- The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See [Linker Script Generation](#) for more details. Make sure this file covers all the source files that you add.
- Build your project, and you will see the new flash driver is used.

**Example** See also [storage/custom\\_flash\\_driver](#).

## Initializing a flash device

To use `esp_flash_*` APIs, you need to have a chip initialized on a certain SPI bus.

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This functions initialize the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device onto the bus. This allocates memory, and fill the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This will also detect the chip type, and influence the following operations.

---

**Note:** Multiple flash chips can be attached to the same bus now. However, using `esp_flash_*` devices and `spi_device_*` devices on the same SPI bus is not supported yet.

---

## SPI flash access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of *partition-specific functions*.

## SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000.

By default, the SPI flash size is detected by `esptool.py` when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

## Concurrency Constraints for flash on SPI1

**Concurrency Constraints for flash on SPI1** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32-S3, these caches must be disabled while reading/writing/erasing.

**When the caches are disabled** This means that all CPUs must be running code from IRAM and must only be reading data from DRAM while flash write operations occur. If you use the API functions documented here, then the caches will be disabled automatically and transparently. However, note that it will have some performance impact on other tasks in the system.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between IRAM, DRAM, and flash cache, please refer to the *application memory layout* documentation.

To avoid reading flash cache accidentally, when one CPU initiates a flash write or erase operation, the other CPU is put into a blocked state, and all non-IRAM-safe interrupts are disabled on all CPUs until the flash operation completes.

See also *OS functions*, *SPI Bus Lock*.

**IRAM-Safe Interrupt Handlers** If you have an interrupt handler that you want to execute while a flash operation is in progress (for example, for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the *interrupt handler is registered*.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See *How to place code in IRAM*.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

---

**Note:** When working with string in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both TAG and format string are placed into DRAM in that case.

---

**Attention:** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) will cause significant influence to the whole system. See *Concurrency Constraints for flash on SPI1* for more details.

## Partition table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information on partition tables can be found *here*.

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find`.
- `esp_partition_find_first()` - a convenience function which returns the structure describing the first partition found by `esp_partition_find`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `spi_flash_read()`, `spi_flash_write()`, `spi_flash_erase_range()`, but operate within partition boundaries.

---

**Note:** Application code should mostly use these `esp_partition_*` API functions instead of lower level `esp_flash_*` API functions. Partition table API functions do bounds checking and calculate correct offsets in flash, based on data stored in a partition table.

---

## SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the *Flash Encryption documentation* for more details.

## Memory mapping API

ESP32-S3 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when *flash encryption* is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `esp_spi_flash.h` and `esp_partition.h`:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition, it will adjust the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

---

**Note:** `mmap` is supported by cache, so it can only be used on main flash.

---

## SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g. lock, delay) in different stages (1st/2nd boot, or the app).

**Host driver** The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_types.h` (in the `hal/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32-S3 memory-spi functionalities. However due to the speed limitations of ESP32-S3, the HAL layer can't provide high-speed implementations to some reading commands (So we didn't do it at all). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the `esp_flash` API can access to the flash regardless of the low-level hardware.

**Chip driver** The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status after. Some chips need different command or value, or need special communication ways.

There is a type of chip called `generic_chip` which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

**OS functions** Currently the OS function layer provides entries of a lock and delay.

The lock (see [SPI Bus Lock](#)) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may requires to use the bus monopolized during a period. (especially when the device doesn't have CS wire, or the wire is controlled by the software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

### See also

- [Partition Table documentation](#)
- [Over The Air Update \(OTA\) API](#) provides high-level API for updating app firmware stored in flash.
- [Non-Volatile Storage \(NVS\) API](#) provides a structured API for storing small pieces of data in SPI flash.

### Implementation details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation: - In a single-core setup, the SDK does it by disabling interrupts/scheduler before performing the flash operation. - In a dual-core setup, this is slightly more complicated as the SDK needs to make sure that the other CPU is not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment ([CONFIG\\_FREERTOS\\_UNICORE](#) enabled), you need to disable both caches, so that no inter-CPU communication can take place.

## API Reference - SPI Flash

### Header File

- `components/spi_flash/include/esp_flash_spi_init.h`

### Functions

*esp\_err\_t* **spi\_bus\_add\_flash\_device** (*esp\_flash\_t* \*\*out\_chip, const *esp\_flash\_spi\_device\_config\_t* \*config)

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

#### Parameters

- **out\_chip** –Pointer to hold the initialized chip.
- **config** –Configuration of the chips to initialize.

#### Returns

- `ESP_ERR_INVALID_ARG`: out\_chip is NULL, or some field in the config is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

*esp\_err\_t* **spi\_bus\_remove\_flash\_device** (*esp\_flash\_t* \*chip)

Remove a SPI Flash device from the SPI bus.

**Parameters** **chip** –The flash device to remove.

#### Returns

- `ESP_ERR_INVALID_ARG`: The chip is invalid.
- `ESP_OK`: success.

### Structures

struct **esp\_flash\_spi\_device\_config\_t**

Configurations for the SPI Flash to init.

### Public Members

*spi\_host\_device\_t* **host\_id**

Bus to use.

int **cs\_io\_num**

GPIO pin to output the CS signal.

*esp\_flash\_io\_mode\_t* **io\_mode**

IO mode to read from the Flash.

*esp\_flash\_speed\_t* **speed**

Speed of the Flash clock.

int **input\_delay\_ns**

Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs\_id**

CS line ID, ignored when not `host_id` is not `SPI1_HOST`, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

## Header File

- `components/spi_flash/include/esp_flash.h`

## Functions

*esp\_err\_t* **esp\_flash\_init** (*esp\_flash\_t* \*chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

---

**Note:** Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

---

---

**Note:** If the `chip->drv` pointer is NULL, chip `chip_drv` will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

---

**Parameters** **chip** –Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

**Returns** `ESP_OK` on success, or a flash error code if initialisation fails.

bool **esp\_flash\_chip\_driver\_initialized** (const *esp\_flash\_t* \*chip)

Check if appropriate chip driver is set.

**Parameters** **chip** –Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

**Returns** true if set, otherwise false.

*esp\_err\_t* **esp\_flash\_read\_id** (*esp\_flash\_t* \*chip, uint32\_t \*out\_id)

Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

### Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out\_id** –[out] Pointer to receive ID value.

**Returns** `ESP_OK` on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_size** (*esp\_flash\_t* \*chip, uint32\_t \*out\_size)

Detect flash size based on flash ID.

---

**Note:** 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

- a. The `out_size` returned only stands for The `out_size` stands for the size in the binary image header. If you want to get the real size of the chip, please call `esp_flash_get_physical_size` instead.
- 

### Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out\_size** –[out] Detected size in bytes, standing for the size in the binary image header.

**Returns** `ESP_OK` on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_physical\_size** (*esp\_flash\_t* \*chip, uint32\_t \*flash\_size)

Detect flash size based on flash ID.

---

**Note:** Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

---

**Parameters**

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **flash\_size** –[out] Detected size in bytes.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_read\_unique\_chip\_id** (*esp\_flash\_t* \*chip, uint64\_t \*out\_id)

Read flash unique ID via the common “RDUID” SPI flash command.

ID is a 64-bit value.

---

**Note:** This is an optional feature, which is not supported on all flash chips. READ PROGRAMMING GUIDE FIRST!

---

**Parameters**

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`.
- **out\_id** –[out] Pointer to receive unique ID value.

**Returns**

- ESP\_OK on success, or a flash error code if operation failed.
- ESP\_ERR\_NOT\_SUPPORTED if the chip doesn't support read id.

*esp\_err\_t* **esp\_flash\_erase\_chip** (*esp\_flash\_t* \*chip)

Erase flash chip contents.

**Parameters** **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

**Returns**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_erase\_region** (*esp\_flash\_t* \*chip, uint32\_t start, uint32\_t len)

Erase a region of the flash chip.

Sector size is specified in `chip->drv->sector_size` field (typically 4096 bytes.) ESP\_ERR\_INVALID\_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in `chip->drv->block_erase_size` field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**Parameters**

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **start** –Address to start erasing flash. Must be sector aligned.
- **len** –Length of region to erase. Must also be sector aligned.

**Returns**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_chip\_write\_protect** (*esp\_flash\_t* \*chip, bool \*write\_protected)

Read if the entire chip is write protected.

---

**Note:** A correct result for this flag depends on the SPI flash chip model and chip\_drv in use (via the 'chip->drv' field).

---

**Parameters**

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp\_flash\_init()
- **write\_protected** –[out] Pointer to boolean, set to the value of the write protect flag.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_set\_chip\_write\_protect** (*esp\_flash\_t* \*chip, bool write\_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip\_drv in use (via the 'chip->drv' field).

---

**Parameters**

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp\_flash\_init()
- **write\_protect** –Boolean value for the write protect flag

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_protectable\_regions** (const *esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*\*out\_regions, uint32\_t \*out\_num\_regions)

Read the list of individually protectable regions of this SPI flash chip.

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip\_drv in use (via the 'chip->drv' field).

---

**Parameters**

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp\_flash\_init()
- **out\_regions** –[out] Pointer to receive a pointer to the array of protectable regions of the chip.
- **out\_num\_regions** –[out] Pointer to an integer receiving the count of protectable regions in the array returned in 'regions'.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_protected\_region** (*esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*region, bool \*out\_protected)

Detect if a region of the SPI flash chip is protected.

---

**Note:** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

---

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

---

#### Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **region** –Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- **out\_protected** –[out] Pointer to a flag which is set based on the protected status for this region.

**Returns** `ESP_OK` on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_set\_protected\_region** (*esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*region, bool protect)

Update the protected status for a region of the SPI flash chip.

---

**Note:** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

---

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the `'chip->drv'` field).

---

#### Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **region** –Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions(...)`.
- **protect** –Write protection flag to set.

**Returns** `ESP_OK` on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_read** (*esp\_flash\_t* \*chip, void \*buffer, uint32\_t address, uint32\_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

---

**Note:** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

---

#### Parameters

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **buffer** –Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.

- **address** –Address on flash to read from. Must be less than chip->size field.
- **length** –Length (in bytes) of data to read.

**Returns**

- ESP\_OK: success
- ESP\_ERR\_NO\_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_write** (*esp\_flash\_t* \*chip, const void \*buffer, uint32\_t address, uint32\_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**

- **chip** –Pointer to identify flash chip. Must have been successfully initialised via esp\_flash\_init()
- **address** –Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** –Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** –Length (in bytes) of data to write.

**Returns**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_write\_encrypted** (*esp\_flash\_t* \*chip, uint32\_t address, const void \*buffer, uint32\_t length)

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

---

**Note:** Both address & length must be 16 byte aligned, as this is the encryption block size

---

**Parameters**

- **chip** –Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** –Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** –Pointer to a buffer with the data to write.
- **length** –Length (in bytes) of data to write. 16 byte aligned.

**Returns**

- ESP\_OK: on success
- ESP\_ERR\_NOT\_SUPPORTED: encrypted write not supported for this chip.
- ESP\_ERR\_INVALID\_ARG: Either the address, buffer or length is invalid.
- or other flash error code from spi\_flash\_write\_encrypted().

*esp\_err\_t* **esp\_flash\_read\_encrypted** (*esp\_flash\_t* \*chip, uint32\_t address, void \*out\_buffer, uint32\_t length)

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

**Parameters**

- **chip** –Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** –Address on flash to read from.
- **out\_buffer** –Pointer to a buffer for the data to read to.
- **length** –Length (in bytes) of data to read.

**Returns**

- ESP\_OK: on success
- ESP\_ERR\_NOT\_SUPPORTED: encrypted read not supported for this chip.
- or other flash error code from spi\_flash\_read\_encrypted().

static inline bool **esp\_flash\_is\_quad\_mode** (const *esp\_flash\_t* \*chip)

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Parameters** **chip** –Pointer to SPI flash chip to use. If NULL, esp\_flash\_default\_chip is substituted.

**Returns** true if flash works in quad mode, otherwise false

**Structures**

struct **esp\_flash\_region\_t**

Structure for describing a region of flash.

**Public Members**

uint32\_t **offset**

Start address of this region.

uint32\_t **size**

Size of the region.

struct **esp\_flash\_os\_functions\_t**

OS-level integration hooks for accessing flash chips inside a running OS.

It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

**Public Members**

*esp\_err\_t* (\***start**)(void \*arg)

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to 'end').

*esp\_err\_t* (\***end**)(void \*arg)

Called after completing any flash operation.

*esp\_err\_t* (\***region\_protected**)(void \*arg, size\_t start\_addr, size\_t size)

Called before any erase/write operations to check whether the region is limited by the OS

*esp\_err\_t* (\***delay\_us**)(void \*arg, uint32\_t us)

Delay for at least 'us' microseconds. Called in between 'start' and 'end'.

void \*(\***get\_temp\_buffer**)(void \*arg, size\_t request\_size, size\_t \*out\_size)

Called for get temp buffer when buffer from application cannot be directly read into/write from.

`void (*release_temp_buffer)(void *arg, void *temp_buf)`

Called for release temp buffer.

`esp_err_t (*check_yield)(void *arg, uint32_t chip_status, uint32_t *out_request)`

Yield to other tasks. Called during erase operations.

**Return** `ESP_OK` means yield needs to be called (got an event to handle), while `ESP_ERR_TIMEOUT` means skip yield.

`esp_err_t (*yield)(void *arg, uint32_t *out_status)`

Yield to other tasks. Called during erase operations.

`int64_t (*get_system_time)(void *arg)`

Called for get system time.

struct **esp\_flash\_t**

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to `esp_flash_init()`). It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

### Public Members

`spi_flash_host_inst_t *host`

Pointer to hardware-specific "host\_driver" structure. Must be initialized before used.

const `spi_flash_chip_t *chip_drv`

Pointer to chip-model-specific "adapter" structure. If NULL, will be detected during initialisation.

const `esp_flash_os_functions_t *os_func`

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void `*os_func_data`

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

`esp_flash_io_mode_t read_mode`

Configured SPI flash read mode. Set before `esp_flash_init` is called.

uint32\_t `size`

Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call `esp_flash_get_physical_size`.

uint32\_t `chip_id`

Detected chip id.

uint32\_t **busy**

This flag is used to verify chip' s status.

uint32\_t **hpm\_dummy\_ena**

This flag is used to verify whether flash works under HPM status.

uint32\_t **reserved\_flags**

reserved.

## Macros

**SPI\_FLASH\_YIELD\_REQ\_YIELD**

**SPI\_FLASH\_YIELD\_REQ\_SUSPEND**

**SPI\_FLASH\_YIELD\_STA\_RESUME**

## Type Definitions

typedef struct *spi\_flash\_chip\_t* **spi\_flash\_chip\_t**

typedef struct *esp\_flash\_t* **esp\_flash\_t**

## Header File

- [components/hal/include/hal/spi\\_flash\\_types.h](#)

## Structures

struct **spi\_flash\_trans\_t**

Definition of a common transaction. Also holds the return value.

## Public Members

uint8\_t **reserved**

Reserved, must be 0.

uint8\_t **mosi\_len**

Output data length, in bytes.

uint8\_t **miso\_len**

Input data length, in bytes.

uint8\_t **address\_bitlen**

Length of address in bits, set to 0 if command does not need an address.

uint32\_t **address**

Address to perform operation on.

const uint8\_t \***mosi\_data**

Output data to salve.

uint8\_t \***miso\_data**

[out] Input data from slave, little endian

uint32\_t **flags**

Flags for this transaction. Set to 0 for now.

uint16\_t **command**

Command to send.

uint8\_t **dummy\_bitlen**

Basic dummy bits to use.

uint32\_t **io\_mode**

Flash working mode when `SPI_FLASH_IGNORE_BASEIO` is specified.

struct **spi\_flash\_sus\_cmd\_conf**

Configuration structure for the flash chip suspend feature.

### Public Members

uint32\_t **sus\_mask**

SUS/SUS1/SUS2 bit in flash register.

uint32\_t **cmd\_rdsr**

Read flash status register(2) command.

uint32\_t **sus\_cmd**

Flash suspend command.

uint32\_t **res\_cmd**

Flash resume command.

uint32\_t **reserved**

Reserved, set to 0.

struct **spi\_flash\_encryption\_t**

Structure for flash encryption operations.

### Public Members

void (\***flash\_encryption\_enable**)(void)

Enable the flash encryption.

void (\***flash\_encryption\_disable**)(void)

Disable the flash encryption.

void (**\*flash\_encryption\_data\_prepare**)(uint32\_t address, const uint32\_t \*buffer, uint32\_t size)  
Prepare flash encryption before operation.

---

**Note:** address and buffer must be 8-word aligned.

---

**Param address** The destination address in flash for the write operation.

**Param buffer** Data for programming

**Param size** Size to program.

void (**\*flash\_encryption\_done**)(void)  
flash data encryption operation is done.

void (**\*flash\_encryption\_destroy**)(void)  
Destroy encrypted result

bool (**\*flash\_encryption\_check**)(uint32\_t address, uint32\_t length)  
Check if is qualified to encrypt the buffer

**Param address** the address of written flash partition.

**Param length** Buffer size.

struct **spi\_flash\_host\_inst\_t**  
SPI Flash Host driver instance

### Public Members

const struct *spi\_flash\_host\_driver\_s* \***driver**  
Pointer to the implementation function table.

struct **spi\_flash\_host\_driver\_s**  
Host driver configuration and context structure.

### Public Members

*esp\_err\_t* (**\*dev\_config**)(*spi\_flash\_host\_inst\_t* \*host)

Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

*esp\_err\_t* (**\*common\_command**)(*spi\_flash\_host\_inst\_t* \*host, *spi\_flash\_trans\_t* \*t)

Send an user-defined spi transaction to the device.

*esp\_err\_t* (**\*read\_id**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t \*id)

Read flash ID.

void (**\*erase\_chip**)(*spi\_flash\_host\_inst\_t* \*host)

Erase whole flash chip.

`void (*erase_sector)(spi_flash_host_inst_t *host, uint32_t start_address)`

Erase a specific sector by its start address.

`void (*erase_block)(spi_flash_host_inst_t *host, uint32_t start_address)`

Erase a specific block by its start address.

`esp_err_t (*read_status)(spi_flash_host_inst_t *host, uint8_t *out_sr)`

Read the status of the flash chip.

`esp_err_t (*set_write_protect)(spi_flash_host_inst_t *host, bool wp)`

Disable write protection.

`void (*program_page)(spi_flash_host_inst_t *host, const void *buffer, uint32_t address, uint32_t length)`

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

`bool (*supports_direct_write)(spi_flash_host_inst_t *host, const void *p)`

Check whether given buffer can be directly used to write

`int (*write_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)`

Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

**Param address** Beginning flash address to write

**Param len** Length request to write

**Param align\_addr** Output of the aligned address to write to

**Param page\_size** Physical page size of the flash chip

**Return** Length that can be actually written in one `program_page` call

`esp_err_t (*read)(spi_flash_host_inst_t *host, void *buffer, uint32_t address, uint32_t read_len)`

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

`bool (*supports_direct_read)(spi_flash_host_inst_t *host, const void *p)`

Check whether given buffer can be directly used to read

`int (*read_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)`

Slicer for read data. The `read` should be called iteratively with the return value of this function.

**Param address** Beginning flash address to read

**Param len** Length request to read

**Param align\_addr** Output of the aligned address to read

**Param page\_size** Physical page size of the flash chip

**Return** Length that can be actually read in one `read` call

`uint32_t (*host_status)(spi_flash_host_inst_t *host)`

Check the host status, 0:busy, 1:idle, 2:suspended.

`esp_err_t (*configure_host_io_mode)(spi_flash_host_inst_t *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, spi_flash_io_mode_t io_mode)`

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (\***poll\_cmd\_done**)(*spi\_flash\_host\_inst\_t* \*host)

Internal use, poll the HW until the last operation is done.

*esp\_err\_t* (\***flush\_cache**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t addr, uint32\_t size)

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

void (\***check\_suspend**)(*spi\_flash\_host\_inst\_t* \*host)

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (\***resume**)(*spi\_flash\_host\_inst\_t* \*host)

Resume flash from suspend manually

void (\***suspend**)(*spi\_flash\_host\_inst\_t* \*host)

Set flash in suspend status manually

*esp\_err\_t* (\***sus\_setup**)(*spi\_flash\_host\_inst\_t* \*host, const *spi\_flash\_sus\_cmd\_conf* \*sus\_conf)

Suspend feature setup for setting cmd and status register mask.

## Macros

**SPI\_FLASH\_TRANS\_FLAG\_CMD16**

Send command of 16 bits.

**SPI\_FLASH\_TRANS\_FLAG\_IGNORE\_BASEIO**

Not applying the basic io mode configuration for this transaction.

**SPI\_FLASH\_TRANS\_FLAG\_BYTE\_SWAP**

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

**ESP\_FLASH\_SPEED\_MIN**

Lowest speed supported by the driver, currently 5 MHz.

**SPI\_FLASH\_CONFIG\_CONF\_BITS**

OR the `io_mode` with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

**SPI\_FLASH\_OPI\_FLAG**

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

**SPI\_FLASH\_READ\_MODE\_MIN**

Slowest io mode supported by ESP32, currently SlowRd.

## Type Definitions

typedef struct *spi\_flash\_host\_driver\_s* **spi\_flash\_host\_driver\_t**

## Enumerations

enum **esp\_flash\_speed\_t**

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

*Values:*

enumerator **ESP\_FLASH\_5MHZ**

The flash runs under 5MHz.

enumerator **ESP\_FLASH\_10MHZ**

The flash runs under 10MHz.

enumerator **ESP\_FLASH\_20MHZ**

The flash runs under 20MHz.

enumerator **ESP\_FLASH\_26MHZ**

The flash runs under 26MHz.

enumerator **ESP\_FLASH\_40MHZ**

The flash runs under 40MHz.

enumerator **ESP\_FLASH\_80MHZ**

The flash runs under 80MHz.

enumerator **ESP\_FLASH\_120MHZ**

The flash runs under 120MHz, 120MHz can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator **ESP\_FLASH\_SPEED\_MAX**

The maximum frequency supported by the host is `ESP_FLASH_SPEED_MAX-1`.

enum **esp\_flash\_io\_mode\_t**

Mode used for reading from SPI flash.

*Values:*

enumerator **SPI\_FLASH\_SLOWRD**

Data read using single I/O, some limits on speed.

enumerator **SPI\_FLASH\_FASTRD**

Data read using single I/O, no limit on speed.

enumerator **SPI\_FLASH\_DOUT**

Data read using dual I/O.

enumerator **SPI\_FLASH\_DIO**

Both address & data transferred using dual I/O.

enumerator **SPI\_FLASH\_QOUT**

Data read using quad I/O.

enumerator **SPI\_FLASH\_QIO**

Both address & data transferred using quad I/O.

enumerator **SPI\_FLASH\_OPI\_STR**

Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI\_FLASH\_OPI\_DTR**

Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI\_FLASH\_READ\_MODE\_MAX**

The fastest io mode supported by the host is `ESP_FLASH_READ_MODE_MAX-1`.

## API Reference - Partition Table

### Header File

- [components/spi\\_flash/include/esp\\_partition.h](#)

### Functions

*esp\_partition\_iterator\_t* **esp\_partition\_find** (*esp\_partition\_type\_t* type, *esp\_partition\_subtype\_t* subtype, const char \*label)

Find partition based on one or more parameters.

#### Parameters

- **type** –Partition type, one of *esp\_partition\_type\_t* values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** –Partition subtype, one of *esp\_partition\_subtype\_t* values or an 8-bit unsigned integer. To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** –(optional) Partition label. Set this value if looking for partition with a specific name. Pass `NULL` otherwise.

**Returns** iterator which can be used to enumerate all the partitions found, or `NULL` if no partitions were found. Iterator obtained through this function has to be released using `esp_partition_iterator_release` when not used any more.

const *esp\_partition\_t* \***esp\_partition\_find\_first** (*esp\_partition\_type\_t* type, *esp\_partition\_subtype\_t* subtype, const char \*label)

Find first partition based on one or more parameters.

#### Parameters

- **type** –Partition type, one of *esp\_partition\_type\_t* values or an 8-bit unsigned integer. To find all partitions, no matter the type, use `ESP_PARTITION_TYPE_ANY`, and set subtype argument to `ESP_PARTITION_SUBTYPE_ANY`.
- **subtype** –Partition subtype, one of *esp\_partition\_subtype\_t* values or an 8-bit unsigned integer To find all partitions of given type, use `ESP_PARTITION_SUBTYPE_ANY`.
- **label** –(optional) Partition label. Set this value if looking for partition with a specific name. Pass `NULL` otherwise.

**Returns** pointer to *esp\_partition\_t* structure, or `NULL` if no partition is found. This pointer is valid for the lifetime of the application.

const *esp\_partition\_t* \***esp\_partition\_get** (*esp\_partition\_iterator\_t* iterator)

Get *esp\_partition\_t* structure for given partition.

**Parameters** *iterator* –Iterator obtained using `esp_partition_find`. Must be non-NULL.

**Returns** pointer to `esp_partition_t` structure. This pointer is valid for the lifetime of the application.

`esp_partition_iterator_t esp_partition_next (esp_partition_iterator_t iterator)`

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

**Parameters** *iterator* –Iterator obtained using `esp_partition_find`. Must be non-NULL.

**Returns** NULL if no partition was found, valid `esp_partition_iterator_t` otherwise.

void `esp_partition_iterator_release (esp_partition_iterator_t iterator)`

Release partition iterator.

**Parameters** *iterator* –Iterator obtained using `esp_partition_find`. The iterator is allowed to be NULL, so it is not necessary to check its value before calling this function.

const `esp_partition_t *esp_partition_verify (const esp_partition_t *partition)`

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from `esp_partition_get()`, as a test for equality.

**Parameters** *partition* –Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

**Returns**

- If partition not found, returns NULL.
- If found, returns a pointer to the `esp_partition_t` structure in flash. This pointer is always valid for the lifetime of the application.

`esp_err_t esp_partition_read (const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)`

Read data from the partition.

Partitions marked with an encryption flag will automatically be read and decrypted via a cache mapping.

**Parameters**

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst** –Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src\_offset** –Address of the data to be read, relative to the beginning of the partition.
- **size** –Size of data to be read, in bytes.

**Returns** ESP\_OK, if data was read successfully; ESP\_ERR\_INVALID\_ARG, if `src_offset` exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

`esp_err_t esp_partition_write (const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)`

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

Partitions marked with an encryption flag will automatically be written via the `spi_flash_write_encrypted()` function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the `spi_flash_write_encrypted()` function for more details. Unencrypted partitions do not have this restriction.

---

**Note:** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

---

**Parameters**

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst\_offset** –Address where the data should be written, relative to the beginning of the partition.
- **src** –Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** –Size of data to be written, in bytes.

**Returns** ESP\_OK, if data was written successfully; ESP\_ERR\_INVALID\_ARG, if `dst_offset` exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if write would go out of bounds of the partition; or one of error codes from lower-level flash driver.

*esp\_err\_t* **esp\_partition\_read\_raw** (const *esp\_partition\_t* \*partition, size\_t src\_offset, void \*dst, size\_t size)

Read data from the partition without any transformation/decryption.

---

**Note:** This function is essentially the same as `esp_partition_read()` above. It just never decrypts data but returns it as is.

---

**Parameters**

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst** –Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src\_offset** –Address of the data to be read, relative to the beginning of the partition.
- **size** –Size of data to be read, in bytes.

**Returns** ESP\_OK, if data was read successfully; ESP\_ERR\_INVALID\_ARG, if `src_offset` exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

*esp\_err\_t* **esp\_partition\_write\_raw** (const *esp\_partition\_t* \*partition, size\_t dst\_offset, const void \*src, size\_t size)

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

---

**Note:** This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

---

---

**Note:** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

---

**Parameters**

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **dst\_offset** –Address where the data should be written, relative to the beginning of the partition.
- **src** –Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** –Size of data to be written, in bytes.

**Returns** ESP\_OK, if data was written successfully; ESP\_ERR\_INVALID\_ARG, if `dst_offset` exceeds partition size; ESP\_ERR\_INVALID\_SIZE, if write would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

`esp_err_t esp_partition_erase_range` (const `esp_partition_t` \*partition, size\_t offset, size\_t size)

Erase part of the partition.

#### Parameters

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** –Offset from the beginning of partition where erase operation should start. Must be aligned to 4 kilobytes.
- **size** –Size of the range which should be erased, in bytes. Must be divisible by 4 kilobytes.

**Returns** ESP\_OK, if the range was erased successfully; ESP\_ERR\_INVALID\_ARG, if iterator or `dst` are NULL; ESP\_ERR\_INVALID\_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

`esp_err_t esp_partition_mmap` (const `esp_partition_t` \*partition, size\_t offset, size\_t size, spi\_flash\_mmap\_memory\_t memory, const void \*\*out\_ptr, spi\_flash\_mmap\_handle\_t \*out\_handle)

Configure MMU to map partition into data memory.

Unlike `spi_flash_mmap` function, which requires a 64kB aligned base address, this function doesn't impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via `out_ptr` argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via `out_handle` argument to `spi_flash_munmap` function.

#### Parameters

- **partition** –Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- **offset** –Offset from the beginning of partition where mapping should start.
- **size** –Size of the area to be mapped.
- **memory** –Memory space where the region should be mapped
- **out\_ptr** –Output, pointer to the mapped memory region
- **out\_handle** –Output, handle which should be used for `spi_flash_munmap` call

**Returns** ESP\_OK, if successful

`esp_err_t esp_partition_get_sha256` (const `esp_partition_t` \*partition, uint8\_t \*sha\_256)

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP\_ERR\_IMAGE\_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

#### Parameters

- **partition** –[in] Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- **sha\_256** –[out] Returned SHA-256 digest for a given partition.

#### Returns

- ESP\_OK: In case of successful operation.
- ESP\_ERR\_INVALID\_ARG: The size was 0 or the sha\_256 was NULL.
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for sha256 operation.
- ESP\_ERR\_IMAGE\_INVALID: App partition doesn't contain a valid app image.
- ESP\_FAIL: An allocation error occurred.

bool `esp_partition_check_identity` (const `esp_partition_t` \*partition\_1, const `esp_partition_t` \*partition\_2)

Check for the identity of two partitions by SHA-256 digest.

**Parameters**

- **partition\_1** –[in] Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- **partition\_2** –[in] Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

**Returns**

- True: In case of the two firmware is equal.
- False: Otherwise

*esp\_err\_t* **esp\_partition\_register\_external** (*esp\_flash\_t* \*flash\_chip, size\_t offset, size\_t size, const char \*label, *esp\_partition\_type\_t* type, *esp\_partition\_subtype\_t* subtype, const *esp\_partition\_t* \*\*out\_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the *esp\_flash\_t* structure) as partitions. This allows using them with components which access SPI flash through the *esp\_partition* API.

**Parameters**

- **flash\_chip** –Pointer to the structure identifying the flash chip
- **offset** –Address in bytes, where the partition starts
- **size** –Size of the partition in bytes
- **label** –Partition name
- **type** –One of the partition types (ESP\_PARTITION\_TYPE\_\*), or an integer. Note that applications can not be booted from external flash chips, so using ESP\_PARTITION\_TYPE\_APP is not supported.
- **subtype** –One of the partition subtypes (ESP\_PARTITION\_SUBTYPE\_\*), or an integer.
- **out\_partition** –[out] Output, if non-NULL, receives the pointer to the resulting *esp\_partition\_t* structure

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_CONFIG\_SPI\_FLASH\_USE\_LEGACY\_IMPL is enabled
- ESP\_ERR\_NO\_MEM if memory allocation has failed
- ESP\_ERR\_INVALID\_ARG if the new partition overlaps another partition on the same flash chip
- ESP\_ERR\_INVALID\_SIZE if the partition doesn't fit into the flash chip size

*esp\_err\_t* **esp\_partition\_deregister\_external** (const *esp\_partition\_t* \*partition)

Deregister the partition previously registered using *esp\_partition\_register\_external*.

**Parameters** **partition** –pointer to the partition structure obtained from *esp\_partition\_register\_external*,

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition pointer is not found
- ESP\_ERR\_INVALID\_ARG if the partition comes from the partition table
- ESP\_ERR\_INVALID\_ARG if the partition was not registered using *esp\_partition\_register\_external* function.

**Structures**

struct **esp\_partition\_t**

partition information structure

This is not the format in flash, that format is *esp\_partition\_info\_t*.

However, this is the format used by this API.

## Public Members

*esp\_flash\_t* \***flash\_chip**

SPI flash chip on which the partition resides

*esp\_partition\_type\_t* **type**

partition type (app/data)

*esp\_partition\_subtype\_t* **subtype**

partition subtype

uint32\_t **address**

starting address of the partition in flash

uint32\_t **size**

size of the partition, in bytes

char **label**[17]

partition label, zero-terminated ASCII string

bool **encrypted**

flag is set to true if partition is encrypted

## Macros

**ESP\_PARTITION\_SUBTYPE\_OTA** (i)

Convenience macro to get *esp\_partition\_subtype\_t* value for the i-th OTA partition.

## Type Definitions

typedef struct *esp\_partition\_iterator\_opaque\_* \***esp\_partition\_iterator\_t**

Opaque partition iterator type.

## Enumerations

enum **esp\_partition\_type\_t**

Partition type.

---

**Note:** Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

---

*Values:*

enumerator **ESP\_PARTITION\_TYPE\_APP**

Application partition type.

enumerator **ESP\_PARTITION\_TYPE\_DATA**

Data partition type.

enumerator **ESP\_PARTITION\_TYPE\_ANY**

Used to search for partitions with any type.

enum **esp\_partition\_subtype\_t**

Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

---

**Note:** These ESP-IDF-defined partition subtypes apply to partitions of type `ESP_PARTITION_TYPE_APP` and `ESP_PARTITION_TYPE_DATA`.

---

*Values:*

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_FACTORY**

Factory application partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MIN**

Base for OTA partition subtypes.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_0**

OTA partition 0.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_1**

OTA partition 1.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_2**

OTA partition 2.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_3**

OTA partition 3.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_4**

OTA partition 4.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_5**

OTA partition 5.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_6**

OTA partition 6.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_7**

OTA partition 7.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_8**

OTA partition 8.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_9**

OTA partition 9.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_10**

OTA partition 10.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_11**

OTA partition 11.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_12**

OTA partition 12.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_13**

OTA partition 13.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_14**

OTA partition 14.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_15**

OTA partition 15.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_OTA\_MAX**

Max subtype of OTA partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_APP\_TEST**

Test application partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_OTA**

OTA selection partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_PHY**

PHY init data partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_NVS**

NVS partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_COREDUMP**

COREDUMP partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_NVS\_KEYS**

Partition for NVS keys.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_EFUSE\_EM**

Partition for emulate eFuse bits.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_UNDEFINED**

Undefined (or unspecified) data partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_ESPHTTPD**

ESPHTTPD partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_FAT**

FAT partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_DATA\_SPIFFS**

SPIFFS partition.

enumerator **ESP\_PARTITION\_SUBTYPE\_ANY**

Used to search for partitions with any subtype.

## API Reference - Flash Encrypt

### Header File

- [components/bootloader\\_support/include/esp\\_flash\\_encrypt.h](#)

### Functions

static inline bool **esp\_flash\_encryption\_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH\_CRYPT\_CNT efuse has an odd number of bits set.

**Returns** true if flash encryption is enabled.

*esp\_err\_t* **esp\_flash\_encrypt\_check\_and\_update** (void)

*esp\_err\_t* **esp\_flash\_encrypt\_region** (uint32\_t src\_addr, size\_t data\_length)

Encrypt-in-place a block of flash sectors.

---

**Note:** This function resets RTC\_WDT between operations with sectors.

---

### Parameters

- **src\_addr** –Source offset in flash. Should be multiple of 4096 bytes.
- **data\_length** –Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

**Returns** ESP\_OK if all operations succeeded, ESP\_ERR\_FLASH\_OP\_FAIL if SPI flash fails, ESP\_ERR\_FLASH\_OP\_TIMEOUT if flash times out.

void **esp\_flash\_write\_protect\_crypt\_cnt** (void)

Write protect FLASH\_CRYPT\_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

---

**Note:** On ESP32 V3 only, write protecting FLASH\_CRYPT\_CNT will also prevent disabling UART Download Mode. If both are wanted, call `esp_efuse_disable_rom_download_mode()` before calling this function.

---

*esp\_flash\_enc\_mode\_t* **esp\_get\_flash\_encryption\_mode** (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

### Returns

void **esp\_flash\_encryption\_init\_checks** (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

---

**Note:** This function is called automatically during app startup, it doesn't need to be called from the app.

---

*esp\_err\_t* **esp\_flash\_encryption\_enable\_secure\_features** (void)

Set all secure eFuse features related to flash encryption.

**Returns**

- ESP\_OK - Successfully

void **esp\_flash\_encryption\_set\_release\_mode** (void)

Switches Flash Encryption from “Development” to “Release” .

If already in “Release” mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- ” disable encrypt in dl mode”
- set FLASH\_CRYPT\_CNT efuse to max

## Enumerations

enum **esp\_flash\_enc\_mode\_t**

*Values:*

enumerator **ESP\_FLASH\_ENC\_MODE\_DISABLED**

enumerator **ESP\_FLASH\_ENC\_MODE\_DEVELOPMENT**

enumerator **ESP\_FLASH\_ENC\_MODE\_RELEASE**

## 2.6.7 SPIFFS Filesystem

### Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

### Notes

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under `/spiffs`, then creating a file with the path `/spiffs/tmp/myfile.txt` will create a file called `/tmp/myfile.txt` in SPIFFS, instead of `myfile.txt` in the directory `/spiffs/tmp`.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.

- SPIFFS is able to reliably utilize only around 75% of assigned partition space.
- When the filesystem is running out of space, the garbage collector is trying to find free space by scanning the filesystem multiple times, which can take up to several seconds per write function call, depending on required space. This is caused by the SPIFFS design and the issue has been reported multiple times (e.g. [here](#)) and in the official [SPIFFS github repository](#). The issue can be partially mitigated by the [SPIFFS configuration](#).
- Deleting a file does not always remove the whole file, which leaves unusable sections throughout the filesystem.
- When the chip experiences a power loss during a file system operation it could result in SPIFFS corruption. However the file system still might be recovered via `esp_spiffs_check` function. More details in the official SPIFFS [FAQ](#).

## Tools

**spiffsgen.py** `spiffsgen.py` is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use `spiffsgen.py`, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image\_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base\_dir**: directory for which the SPIFFS image needs to be created.
- **output\_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool's help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using `esptool.py` or `parttool.py`.

Aside from invoking the `spiffsgen.py` standalone by manually running it from the command line or a script, it is also possible to invoke `spiffsgen.py` directly from the build system by calling `spiffs_create_partition_image`.

Make:

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := ...
SPIFFS_IMAGE_DEPENDS := ...
$(eval $(call spiffs_create_partition_image,<partition>,<base_dir>))
```

CMake:

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS_
↪dep dep dep...])
```

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the `image_size` is required for the standalone invocation, only the `partition` name is required when using `spiffs_create_partition_image`—the image size is automatically obtained from the project's partition table.

Due to the differences in structure between Make and CMake, it is important to note that:

- for Make `spiffs_create_partition_image` must be called from the project Makefile
- for CMake `spiffs_create_partition_image` must be called from one of the component CMake-Lists.txt files

Optionally, user can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash` or `make flash` by specifying `FLASH_IN_PROJECT`. For example,

in Make:

```
SPIFFS_IMAGE_FLASH_IN_PROJECT := 1
$(eval $(call spiffs_create_partition_image, <partition>, <base_dir>))
```

in CMake:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py`, `parttool.py`, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use `DEPENDS/SPIFFS_IMAGE_DEPENDS` to specify targets that should be executed before generating the image.

in Make:

```
dep:
    ...

SPIFFS_IMAGE_DEPENDS := dep
$(eval $(call spiffs_create_partition_image, <partition>, <base_dir>))
```

in CMake:

```
add_custom_target(dep COMMAND ...)

spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

For an example, see [storage/spiffsgen](#).

**mkspiffs** Another tool for creating SPIFFS partition images is [mkspiffs](#). Similar to `spiffsgen.py`, it can be used to create an image from a given folder and then flash that image using `esptool.py`

For that, you need to obtain the following parameters:

- **Block Size:** 4096 (standard for SPI Flash)
- **Page Size:** 256 (standard for SPI Flash)
- **Image Size:** Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset:** Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32-S3 at offset 0x110000, run:

```
python esptool.py --chip esp32s3 --port [port] --baud [baud] write_flash -z_
↳0x110000 spiffs.bin
```

**Notes on which SPIFFS tool to use** The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use `spiffsgen.py` in the following cases:

1. If you want to simply generate a SPIFFS image during the build. `spiffsgen.py` makes it very convenient by providing functions/commands from the build system itself.
2. If the host has no C/C++ compiler available, because `spiffsgen.py` does not require compilation.

Use `mkspiffs` in the following cases:

1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiffsgen.py`.

2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiiffs` binary can do the job. However, there is no build system integration for `mkspiiffs` and the user has to do the corresponding work: compiling `mkspiiffs` during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

### See also

- [Partition Table documentation](#)

### Application Example

An example of using SPIFFS is provided in the [storage/spiiffs](#) directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the `README.md` file in the example directory for more information.

### High-level API Reference

#### Header File

- [components/spiiffs/include/esp\\_spiiffs.h](#)

#### Functions

`esp_err_t esp_vfs_spiiffs_register` (const `esp_vfs_spiiffs_conf_t` \*conf)

Register and mount SPIFFS to VFS with given path prefix.

**Parameters** `conf` –Pointer to `esp_vfs_spiiffs_conf_t` configuration structure

**Returns**

- `ESP_OK` if success
- `ESP_ERR_NO_MEM` if objects could not be allocated
- `ESP_ERR_INVALID_STATE` if already mounted or partition is encrypted
- `ESP_ERR_NOT_FOUND` if partition for SPIFFS was not found
- `ESP_FAIL` if mount or format fails

`esp_err_t esp_vfs_spiiffs_unregister` (const char \*partition\_label)

Unregister and unmount SPIFFS from VFS

**Parameters** `partition_label` –Same label as passed to `esp_vfs_spiiffs_register`.

**Returns**

- `ESP_OK` if successful
- `ESP_ERR_INVALID_STATE` already unregistered

bool `esp_spiiffs_mounted` (const char \*partition\_label)

Check if SPIFFS is mounted

**Parameters** `partition_label` –Optional, label of the partition to check. If not specified, first partition with subtype=`spiiffs` is used.

**Returns**

- true if mounted
- false if not mounted

`esp_err_t esp_spiiffs_format` (const char \*partition\_label)

Format the SPIFFS partition

**Parameters** `partition_label` –Same label as passed to `esp_vfs_spiiffs_register`.

**Returns**

- `ESP_OK` if successful
- `ESP_FAIL` on error

*esp\_err\_t* **esp\_spiffs\_info** (const char \*partition\_label, size\_t \*total\_bytes, size\_t \*used\_bytes)

Get information for SPIFFS

**Parameters**

- **partition\_label** –Same label as passed to esp\_vfs\_spiffs\_register
- **total\_bytes** –[out] Size of the file system
- **used\_bytes** –[out] Current used bytes in the file system

**Returns**

- ESP\_OK if success
- ESP\_ERR\_INVALID\_STATE if not mounted

*esp\_err\_t* **esp\_spiffs\_check** (const char \*partition\_label)

Check integrity of SPIFFS

**Parameters** **partition\_label** –Same label as passed to esp\_vfs\_spiffs\_register

**Returns**

- ESP\_OK if successful
- ESP\_ERR\_INVALID\_STATE if not mounted
- ESP\_FAIL on error

## Structures

struct **esp\_vfs\_spiffs\_conf\_t**

Configuration structure for esp\_vfs\_spiffs\_register.

### Public Members

const char \***base\_path**

File path prefix associated with the filesystem.

const char \***partition\_label**

Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

size\_t **max\_files**

Maximum files that could be open at the same time.

bool **format\_if\_mount\_failed**

If true, it will format the file system if it fails to mount.

## 2.6.8 Virtual filesystem component

### Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as fopen and fprintf, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the `/fat` prefix and call `fopen("/fat/file.txt", "w")`. The VFS component will then call the function `open` of the FAT driver and pass the argument `/file.txt` to it together with appropriate mode flags. All subsequent calls to C library functions for the returned `FILE*` stream will also be forwarded to the FAT driver.

### FS registration

To register an FS driver, an application needs to define an instance of the `esp_vfs_t` structure and populate it with function pointers to FS APIs:

```
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};

ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way how the FS driver declares its API functions, either `read`, `write`, etc., or `read_p`, `write_p`, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```
ssize_t myfs_write(int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```
ssize_t myfs_write(myfs_t* fs, int fd, const void * data, size_t size);

// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
myfs_t* myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

**Synchronous input/output multiplexing** Synchronous input/output multiplexing by `select()` is supported in the VFS component. The implementation works in the following way.

1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.

3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()` described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.
5. Results are collected from each VFS driver and all drivers are stopped by deinitialization of the environment for checking events.
6. The `select()` call ends and returns the appropriate results.

**Non-socket VFS drivers** If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```
// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
// ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

`end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

---

**Note:** `end_select()` might be called without a previous `start_select()` call in some rare circumstances. `end_select()` should fail gracefully if this is the case.

---

Please refer to the reference implementation for the UART peripheral in `vfs/vfs_uart.c` and most particularly to the functions `esp_vfs_dev_uart_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

**Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:**

- [peripherals/uart/uart\\_select](#)
- [system/select](#)

**Socket VFS drivers** A socket VFS driver is using its own internal implementation of `select()` and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```
// In definition of esp_vfs_t:
    .socket_select = &lwip_select,
    .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
    .stop_socket_select = &lwip_stop_socket_select,
    .stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

`socket_select()` is the internal implementation of `select()` for the socket driver. It works only with file descriptors belonging to the socket VFS.

`get_socket_select_semaphore()` returns the signalization object (semaphore) which will be used in non-socket drivers to stop the waiting in `socket_select()`.

`stop_socket_select()` call is used to stop the waiting in `socket_select()` by passing the object returned by `get_socket_select_semaphore()`.

`stop_socket_select_isr()` has the same functionality as `stop_socket_select()` but it can be used from ISR.

Please see [lwip/port/esp32/vfs\\_lwip.c](#) for a reference socket driver implementation using LWIP.

---

**Note:** If you use `select()` for socket file descriptors only then you can enable the `CONFIG_LWIP_USE_ONLY_LWIP_SELECT` option to reduce the code size and improve performance.

---

---

**Note:** Don't change the socket driver during an active `select()` call or you might experience some undefined behavior.

---

## Paths

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on `/data`
- FS 2 on `/data/static`

Then:

- FS 1 will be used when opening a file called `/data/log.txt`
- FS 2 will be used when opening a file called `/data/static/index.html`
- Even if `/index.html` does not exist in FS 2, FS 1 will *not* be searched for `/static/index.html`.

As a general rule, mount point names must start with the path separator (`/`) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (`.`) in path names in any special way. VFS does not treat `..` as a reference to the parent directory. In the above example, using a path `/data/static/./log.txt` will not result in a call to FS 1 to open `/log.txt`. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The `myfs` driver is registered with `/data` as a path prefix.
2. The application calls `fopen("/data/config.json", ...)`.
3. The VFS component calls `myfs_open("/config.json", ...)`.
4. The `myfs` driver opens the `/config.json` file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to `ESP_VFS_PATH_MAX` characters. Individual FS drivers may have their own filename length limitations.

## File descriptors

File descriptors are small positive integers from 0 to `FD_SETSIZE - 1`, where `FD_SETSIZE` is defined in `newlib's sys/types.h`. The largest file descriptors (configured by `CONFIG_LWIP_MAX_SOCKETS`) are reserved for sockets. The VFS component contains a lookup-table called `s_fd_table` for mapping global file descriptors to VFS driver indexes registered in the `s_vfs` array.

## Standard IO streams (stdin, stdout, stderr)

If the menuconfig option `UART` for console output is not set to `None`, then `stdin`, `stdout`, and `stderr` are configured to read from, and write to, a UART. It is possible to use `UART0` or `UART1` for standard IO. By default, `UART0` is used with 115200 baud rate; TX pin is `GPIO1`; RX pin is `GPIO3`. These parameters can be changed in menuconfig.

Writing to `stdout` or `stderr` will send characters to the UART transmit FIFO. Reading from `stdin` will retrieve characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as `fscanf("%d\n", &var);`, might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver's interrupt driven, blocking read and write functions instead. This can be done using a call to the `esp_vfs_dev_uart_use_driver` function. It is also possible to revert to the basic non-blocking functions using a call to `esp_vfs_dev_uart_use_nonblocking`.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF ( `'\n'` ) character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via `menuconfig`, or by calls to the functions `esp_vfs_dev_uart_port_set_rx_line_endings` and `esp_vfs_dev_uart_port_set_tx_line_endings`.

**Standard streams and FreeRTOS tasks** FILE objects for `stdin`, `stdout`, and `stderr` are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task `struct _reent`.

The following code is transferred to `fprintf(__getreent()->_stderr, "42\n");` by the preprocessor:

```
fprintf(stderr, "42\n");
```

The `__getreent()` function returns a per-task pointer to `struct _reent` in `newlib` libc. This structure is allocated on the TCB of each task. When a task is initialized, `_stdin`, `_stdout`, and `_stderr` members of `struct _reent` are set to the values of `_stdin`, `_stdout`, and `_stderr` of `_GLOBAL_REENT` (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set `stdin`, `stdout`, and `stderr` for any given task without affecting other tasks, e.g., by doing `stdin = fopen("/dev/uart/1", "r")`.
- Closing default `stdin`, `stdout`, or `stderr` using `fclose` will close the FILE stream object, which will affect all other tasks.
- To change the default `stdin`, `stdout`, `stderr` streams for new tasks, modify `_GLOBAL_REENT->_stdin(_stdout,_stderr)` before creating the task.

## Event fds

`eventfd()` call is a powerful tool to notify a `select()` based loop of custom events. The `eventfd()` implementation in ESP-IDF is generally the same as described in `man(2) eventfd` except for:

- `esp_vfs_eventfd_register()` has to be called before calling `eventfd()`
- Options `EFD_CLOEXEC`, `EFD_NONBLOCK` and `EFD_SEMAPHORE` are not supported in flags.
- Option `EFD_SUPPORT_ISR` has been added in flags. This flag is required to read and the write the `eventfd` in an interrupt handler.

Note that creating an `eventfd` with `EFD_SUPPORT_ISR` will cause interrupts to be temporarily disabled when reading, writing the file and during the beginning and the ending of the `select()` when this file is set.

## API Reference

### Header File

- `components/vfs/include/esp_vfs.h`

**Functions**

`ssize_t esp_vfs_write` (struct `_reent` \*r, int fd, const void \*data, size\_t size)

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

`off_t esp_vfs_lseek` (struct `_reent` \*r, int fd, off\_t size, int mode)

`ssize_t esp_vfs_read` (struct `_reent` \*r, int fd, void \*dst, size\_t size)

`int esp_vfs_open` (struct `_reent` \*r, const char \*path, int flags, int mode)

`int esp_vfs_close` (struct `_reent` \*r, int fd)

`int esp_vfs_fstat` (struct `_reent` \*r, int fd, struct stat \*st)

`int esp_vfs_stat` (struct `_reent` \*r, const char \*path, struct stat \*st)

`int esp_vfs_link` (struct `_reent` \*r, const char \*n1, const char \*n2)

`int esp_vfs_unlink` (struct `_reent` \*r, const char \*path)

`int esp_vfs_rename` (struct `_reent` \*r, const char \*src, const char \*dst)

`int esp_vfs_utime` (const char \*path, const struct utimbuf \*times)

`esp_err_t esp_vfs_register` (const char \*base\_path, const `esp_vfs_t` \*vfs, void \*ctx)

Register a virtual filesystem for given path prefix.

**Parameters**

- **base\_path** –file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to `ESP_VFS_PATH_MAX` characters long, and at least 2 characters long. Name must start with a “/” and must not end with “/”. For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi/0”. In the special case of an empty `base_path`, a “fallback” VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
- **vfs** –Pointer to `esp_vfs_t`, a structure which maps syscalls to the filesystem driver functions. VFS component doesn't assume ownership of this pointer.
- **ctx** –If `vfs->flags` has `ESP_VFS_FLAG_CONTEXT_PTR` set, a pointer which should be passed to VFS functions. Otherwise, NULL.

**Returns** `ESP_OK` if successful, `ESP_ERR_NO_MEM` if too many VFSes are registered.

`esp_err_t esp_vfs_register_fd_range` (const `esp_vfs_t` \*vfs, void \*ctx, int min\_fd, int max\_fd)

Special case function for registering a VFS that uses a method other than `open()` to open new file descriptors from the interval `<min_fd; max_fd)`.

This is a special-purpose function intended for registering LWIP sockets to VFS.

**Parameters**

- **vfs** –Pointer to `esp_vfs_t`. Meaning is the same as for `esp_vfs_register()`.
- **ctx** –Pointer to context structure. Meaning is the same as for `esp_vfs_register()`.
- **min\_fd** –The smallest file descriptor this VFS will use.
- **max\_fd** –Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

**Returns** `ESP_OK` if successful, `ESP_ERR_NO_MEM` if too many VFSes are registered, `ESP_ERR_INVALID_ARG` if the file descriptor boundaries are incorrect.

`esp_err_t esp_vfs_register_with_id` (const `esp_vfs_t` \*vfs, void \*ctx, `esp_vfs_id_t` \*vfs\_id)

Special case function for registering a VFS that uses a method other than `open()` to open new file descriptors. In comparison with `esp_vfs_register_fd_range`, this function doesn't pre-register an interval of file descriptors. File descriptors can be registered later, by using `esp_vfs_register_fd`.

**Parameters**

- **vfs** –Pointer to `esp_vfs_t`. Meaning is the same as for `esp_vfs_register()`.

- **ctx** –Pointer to context structure. Meaning is the same as for `esp_vfs_register()`.
- **vfs\_id** –Here will be written the VFS ID which can be passed to `esp_vfs_register_fd` for registering file descriptors.

**Returns** `ESP_OK` if successful, `ESP_ERR_NO_MEM` if too many VFSes are registered, `ESP_ERR_INVALID_ARG` if the file descriptor boundaries are incorrect.

*esp\_err\_t* **esp\_vfs\_unregister** (const char \*base\_path)

Unregister a virtual filesystem for given path prefix

**Parameters** **base\_path** –file prefix previously used in `esp_vfs_register` call

**Returns** `ESP_OK` if successful, `ESP_ERR_INVALID_STATE` if VFS for given prefix hasn't been registered

*esp\_err\_t* **esp\_vfs\_unregister\_with\_id** (*esp\_vfs\_id\_t* vfs\_id)

Unregister a virtual filesystem with the given index

**Parameters** **vfs\_id** –The VFS ID returned by `esp_vfs_register_with_id`

**Returns** `ESP_OK` if successful, `ESP_ERR_INVALID_STATE` if VFS for the given index hasn't been registered

*esp\_err\_t* **esp\_vfs\_register\_fd** (*esp\_vfs\_id\_t* vfs\_id, int \*fd)

Special function for registering another file descriptor for a VFS registered by `esp_vfs_register_with_id`.

**Parameters**

- **vfs\_id** –VFS identifier returned by `esp_vfs_register_with_id`.
- **fd** –The registered file descriptor will be written to this address.

**Returns** `ESP_OK` if the registration is successful, `ESP_ERR_NO_MEM` if too many file descriptors are registered, `ESP_ERR_INVALID_ARG` if the arguments are incorrect.

*esp\_err\_t* **esp\_vfs\_register\_fd\_with\_local\_fd** (*esp\_vfs\_id\_t* vfs\_id, int local\_fd, bool permanent, int \*fd)

Special function for registering another file descriptor with given `local_fd` for a VFS registered by `esp_vfs_register_with_id`.

**Parameters**

- **vfs\_id** –VFS identifier returned by `esp_vfs_register_with_id`.
- **local\_fd** –The fd in the local vfs. Passing -1 will set the local fd as the (\*fd) value.
- **permanent** –Whether the fd should be treated as permanent (not removed after close()).
- **fd** –The registered file descriptor will be written to this address.

**Returns** `ESP_OK` if the registration is successful, `ESP_ERR_NO_MEM` if too many file descriptors are registered, `ESP_ERR_INVALID_ARG` if the arguments are incorrect.

*esp\_err\_t* **esp\_vfs\_unregister\_fd** (*esp\_vfs\_id\_t* vfs\_id, int fd)

Special function for unregistering a file descriptor belonging to a VFS registered by `esp_vfs_register_with_id`.

**Parameters**

- **vfs\_id** –VFS identifier returned by `esp_vfs_register_with_id`.
- **fd** –File descriptor which should be unregistered.

**Returns** `ESP_OK` if the registration is successful, `ESP_ERR_INVALID_ARG` if the arguments are incorrect.

int **esp\_vfs\_select** (int nfd, fd\_set \*readfds, fd\_set \*writefds, fd\_set \*errorfds, struct timeval \*timeout)

Synchronous I/O multiplexing which implements the functionality of POSIX `select()` for VFS.

**Parameters**

- **nfd** –Specifies the range of descriptors which should be checked. The first `nfd` descriptors will be checked in each set.
- **readfds** –If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- **writefds** –If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.

- **errorfds** –If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- **timeout** –If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

**Returns** The number of descriptors set in the descriptor sets, or -1 when an error (specified by `errno`) have occurred.

void **esp\_vfs\_select\_triggered** (*esp\_vfs\_select\_sem\_t* sem)

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.

**Parameters** **sem** –semaphore structure which was passed to the driver by the `start_select` call

void **esp\_vfs\_select\_triggered\_isr** (*esp\_vfs\_select\_sem\_t* sem, BaseType\_t \*woken)

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.

#### Parameters

- **sem** –semaphore structure which was passed to the driver by the `start_select` call
- **woken** –is set to `pdTRUE` if the function wakes up a task with higher priority

ssize\_t **esp\_vfs\_pread** (int fd, void \*dst, size\_t size, off\_t offset)

Implements the VFS layer of POSIX `pread()`

#### Parameters

- **fd** –File descriptor used for read
- **dst** –Pointer to the buffer where the output will be written
- **size** –Number of bytes to be read
- **offset** –Starting offset of the read

**Returns** A positive return value indicates the number of bytes read. -1 is return on failure and `errno` is set accordingly.

ssize\_t **esp\_vfs\_pwrite** (int fd, const void \*src, size\_t size, off\_t offset)

Implements the VFS layer of POSIX `pwrite()`

#### Parameters

- **fd** –File descriptor used for write
- **src** –Pointer to the buffer from where the output will be read
- **size** –Number of bytes to write
- **offset** –Starting offset of the write

**Returns** A positive return value indicates the number of bytes written. -1 is return on failure and `errno` is set accordingly.

## Structures

struct **esp\_vfs\_select\_sem\_t**

VFS semaphore type for `select()`

## Public Members

bool **is\_sem\_local**

type of “sem” is `SemaphoreHandle_t` when true, defined by socket driver otherwise

void **\*sem**  
semaphore instance

struct **esp\_vfs\_t**

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have `_p` suffix, set flags member to `ESP_VFS_FLAG_CONTEXT_PTR` and provide the context pointer to `esp_vfs_register` function. If the implementation doesn't use this extra argument, populate the members without `_p` suffix and set flags member to `ESP_VFS_FLAG_DEFAULT`.

If the FS driver doesn't provide some of the functions, set corresponding members to `NULL`.

### Public Members

int **flags**

`ESP_VFS_FLAG_CONTEXT_PTR` or `ESP_VFS_FLAG_DEFAULT`

`ssize_t (*write_p)(void *p, int fd, const void *data, size_t size)`

Write with context pointer

`ssize_t (*write)(int fd, const void *data, size_t size)`

Write without context pointer

`off_t (*lseek_p)(void *p, int fd, off_t size, int mode)`

Seek with context pointer

`off_t (*lseek)(int fd, off_t size, int mode)`

Seek without context pointer

`ssize_t (*read_p)(void *ctx, int fd, void *dst, size_t size)`

Read with context pointer

`ssize_t (*read)(int fd, void *dst, size_t size)`

Read without context pointer

`ssize_t (*pread_p)(void *ctx, int fd, void *dst, size_t size, off_t offset)`

pread with context pointer

`ssize_t (*pread)(int fd, void *dst, size_t size, off_t offset)`

pread without context pointer

`ssize_t (*pwrite_p)(void *ctx, int fd, const void *src, size_t size, off_t offset)`

pwrite with context pointer

ssize\_t (\***pwrite**)(int fd, const void \*src, size\_t size, off\_t offset)

pwrite without context pointer

int (\***open\_p**)(void \*ctx, const char \*path, int flags, int mode)

open with context pointer

int (\***open**)(const char \*path, int flags, int mode)

open without context pointer

int (\***close\_p**)(void \*ctx, int fd)

close with context pointer

int (\***close**)(int fd)

close without context pointer

int (\***fstat\_p**)(void \*ctx, int fd, struct *stat* \*st)

fstat with context pointer

int (\***fstat**)(int fd, struct *stat* \*st)

fstat without context pointer

int (\***stat\_p**)(void \*ctx, const char \*path, struct *stat* \*st)

stat with context pointer

int (\***stat**)(const char \*path, struct *stat* \*st)

stat without context pointer

int (\***link\_p**)(void \*ctx, const char \*n1, const char \*n2)

link with context pointer

int (\***link**)(const char \*n1, const char \*n2)

link without context pointer

int (\***unlink\_p**)(void \*ctx, const char \*path)

unlink with context pointer

int (\***unlink**)(const char \*path)

unlink without context pointer

int (\***rename\_p**)(void \*ctx, const char \*src, const char \*dst)

rename with context pointer

int (\***rename**)(const char \*src, const char \*dst)

rename without context pointer

DIR (\***opendir\_p**)(void \*ctx, const char \*name)

opendir with context pointer

DIR **(\*opendir)**(const char \*name)

opendir without context pointer

struct dirent **(\*readdir\_p)**(void \*ctx, DIR \*pdir)

readdir with context pointer

struct dirent **(\*readdir)**(DIR \*pdir)

readdir without context pointer

int **(\*readdir\_r\_p)**(void \*ctx, DIR \*pdir, struct dirent \*entry, struct dirent \*\*out\_dirent)

readdir\_r with context pointer

int **(\*readdir\_r)**(DIR \*pdir, struct dirent \*entry, struct dirent \*\*out\_dirent)

readdir\_r without context pointer

long **(\*telldir\_p)**(void \*ctx, DIR \*pdir)

telldir with context pointer

long **(\*telldir)**(DIR \*pdir)

telldir without context pointer

void **(\*seekdir\_p)**(void \*ctx, DIR \*pdir, long offset)

seekdir with context pointer

void **(\*seekdir)**(DIR \*pdir, long offset)

seekdir without context pointer

int **(\*closedir\_p)**(void \*ctx, DIR \*pdir)

closedir with context pointer

int **(\*closedir)**(DIR \*pdir)

closedir without context pointer

int **(\*mkdir\_p)**(void \*ctx, const char \*name, mode\_t mode)

mkdir with context pointer

int **(\*mkdir)**(const char \*name, mode\_t mode)

mkdir without context pointer

int **(\*rmdir\_p)**(void \*ctx, const char \*name)

rmdir with context pointer

int **(\*rmdir)**(const char \*name)

rmdir without context pointer

int **(\*fcntl\_p)**(void \*ctx, int fd, int cmd, int arg)

fcntl with context pointer

fcntl without context pointer

int (**\*ioctl\_p**)(void \*ctx, int fd, int cmd, va\_list args)

ioctl with context pointer

int (**\*ioctl**)(int fd, int cmd, va\_list args)

ioctl without context pointer

int (**\*fsync\_p**)(void \*ctx, int fd)

fsync with context pointer

int (**\*fsync**)(int fd)

fsync without context pointer

int (**\*access\_p**)(void \*ctx, const char \*path, int amode)

access with context pointer

int (**\*access**)(const char \*path, int amode)

access without context pointer

int (**\*truncate\_p**)(void \*ctx, const char \*path, off\_t length)

truncate with context pointer

int (**\*truncate**)(const char \*path, off\_t length)

truncate without context pointer

int (**\*ftruncate\_p**)(void \*ctx, int fd, off\_t length)

ftruncate with context pointer

int (**\*ftruncate**)(int fd, off\_t length)

ftruncate without context pointer

int (**\*utime\_p**)(void \*ctx, const char \*path, const struct utimbuf \*times)

utime with context pointer

int (**\*utime**)(const char \*path, const struct utimbuf \*times)

utime without context pointer

int (**\*tcsetattr\_p**)(void \*ctx, int fd, int optional\_actions, const struct termios \*p)

tcsetattr with context pointer

int (**\*tcsetattr**)(int fd, int optional\_actions, const struct termios \*p)

tcsetattr without context pointer

int (**\*tcgetattr\_p**)(void \*ctx, int fd, struct termios \*p)

tcgetattr with context pointer

int (**\*tcgetattr**)(int fd, struct termios \*p)  
tcgetattr without context pointer

int (**\*tcdrain\_p**)(void \*ctx, int fd)  
tcdrain with context pointer

int (**\*tcdrain**)(int fd)  
tcdrain without context pointer

int (**\*tcflush\_p**)(void \*ctx, int fd, int select)  
tcflush with context pointer

int (**\*tcflush**)(int fd, int select)  
tcflush without context pointer

int (**\*tcflow\_p**)(void \*ctx, int fd, int action)  
tcflow with context pointer

int (**\*tcflow**)(int fd, int action)  
tcflow without context pointer

pid\_t (**\*tcgetsid\_p**)(void \*ctx, int fd)  
tcgetsid with context pointer

pid\_t (**\*tcgetsid**)(int fd)  
tcgetsid without context pointer

int (**\*tcsendbreak\_p**)(void \*ctx, int fd, int duration)  
tcsendbreak with context pointer

int (**\*tcsendbreak**)(int fd, int duration)  
tcsendbreak without context pointer

*esp\_err\_t* (**\*start\_select**)(int nfds, fd\_set \*readfds, fd\_set \*writefds, fd\_set \*exceptfds,  
*esp\_vfs\_select\_sem\_t* sem, void \*\*end\_select\_args)

start\_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (**\*socket\_select**)(int nfds, fd\_set \*readfds, fd\_set \*writefds, fd\_set \*errorfds, struct timeval \*timeout)

socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (**\*stop\_socket\_select**)(void \*sem)

called by VFS to interrupt the socket\_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (**\*stop\_socket\_select\_isr**)(void \*sem, BaseType\_t \*woken)

stop\_socket\_select which can be called from ISR; set only for the socket driver

void **(\*get\_socket\_select\_semaphore)**(void)

end\_select is called to stop the I/O multiplexing and deinitialize the environment created by start\_select for the given VFS

*esp\_err\_t* **(\*end\_select)**(void \*end\_select\_args)

get\_socket\_select\_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

## Macros

### MAX\_FDS

Maximum number of (global) file descriptors.

### ESP\_VFS\_PATH\_MAX

Maximum length of path prefix (not including zero terminator)

### ESP\_VFS\_FLAG\_DEFAULT

Default value of flags member in *esp\_vfs\_t* structure.

### ESP\_VFS\_FLAG\_CONTEXT\_PTR

Flag which indicates that FS needs extra context pointer in syscalls.

## Type Definitions

typedef int **esp\_vfs\_id\_t**

## Header File

- [components/vfs/include/esp\\_vfs\\_dev.h](#)

## Functions

void **esp\_vfs\_dev\_uart\_register** (void)

add /dev/uart virtual filesystem driver

This function is called from startup code to enable serial output

void **esp\_vfs\_dev\_uart\_set\_rx\_line\_endings** (esp\_line\_endings\_t mode)

Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines ( ‘ ‘ , LF) passed into stdin:

- ESP\_LINE\_ENDINGS\_CRLF: convert CRLF to LF
- ESP\_LINE\_ENDINGS\_CR: convert CR to LF
- ESP\_LINE\_ENDINGS\_LF: no modification

---

**Note:** this function is not thread safe w.r.t. reading from UART

---

**Parameters** **mode** –line endings expected on UART

void **esp\_vfs\_dev\_uart\_set\_tx\_line\_endings** (esp\_line\_endings\_t mode)

Set the line endings to sent to UART.

This specifies the conversion between newlines ( ‘  
’, LF) on stdout and line endings sent over UART:

- **ESP\_LINE\_ENDINGS\_CRLF**: convert LF to CRLF
- **ESP\_LINE\_ENDINGS\_CR**: convert LF to CR
- **ESP\_LINE\_ENDINGS\_LF**: no modification

---

**Note:** this function is not thread safe w.r.t. writing to UART

---

**Parameters** **mode** –line endings to send to UART

int **esp\_vfs\_dev\_uart\_port\_set\_rx\_line\_endings** (int uart\_num, esp\_line\_endings\_t mode)

Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines ( ‘  
’, LF) passed into stdin:

- **ESP\_LINE\_ENDINGS\_CRLF**: convert CRLF to LF
- **ESP\_LINE\_ENDINGS\_CR**: convert CR to LF
- **ESP\_LINE\_ENDINGS\_LF**: no modification

---

**Note:** this function is not thread safe w.r.t. reading from UART

---

**Parameters**

- **uart\_num** –the UART number
- **mode** –line endings to send to UART

**Returns** 0 if succeeded, or -1 when an error (specified by errno) have occurred.

int **esp\_vfs\_dev\_uart\_port\_set\_tx\_line\_endings** (int uart\_num, esp\_line\_endings\_t mode)

Set the line endings to sent to specified UART.

This specifies the conversion between newlines ( ‘  
’, LF) on stdout and line endings sent over UART:

- **ESP\_LINE\_ENDINGS\_CRLF**: convert LF to CRLF
- **ESP\_LINE\_ENDINGS\_CR**: convert LF to CR
- **ESP\_LINE\_ENDINGS\_LF**: no modification

---

**Note:** this function is not thread safe w.r.t. writing to UART

---

**Parameters**

- **uart\_num** –the UART number

- **mode** –line endings to send to UART

**Returns** 0 if succeeded, or -1 when an error (specified by `errno`) have occurred.

void **esp\_vfs\_dev\_uart\_use\_nonblocking** (int `uart_num`)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Parameters** `uart_num` –UART peripheral number

void **esp\_vfs\_dev\_uart\_use\_driver** (int `uart_num`)

set VFS to use UART driver for reading and writing

---

**Note:** application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

---

**Parameters** `uart_num` –UART peripheral number

void **esp\_vfs\_usb\_serial\_jtag\_use\_driver** (void)

set VFS to use USB-SERIAL-JTAG driver for reading and writing

---

**Note:** application must configure USB-SERIAL-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

---

void **esp\_vfs\_usb\_serial\_jtag\_use\_nonblocking** (void)

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

## Header File

- [components/vfs/include/esp\\_vfs\\_eventfd.h](#)

## Functions

*esp\_err\_t* **esp\_vfs\_eventfd\_register** (const *esp\_vfs\_eventfd\_config\_t* \*`config`)

Registers the event vfs.

**Returns** `ESP_OK` if successful, `ESP_ERR_NO_MEM` if too many VFSes are registered.

*esp\_err\_t* **esp\_vfs\_eventfd\_unregister** (void)

Unregisters the event vfs.

**Returns** `ESP_OK` if successful, `ESP_ERR_INVALID_STATE` if VFS for given prefix hasn't been registered

int **eventfd** (unsigned int `initval`, int `flags`)

## Structures

struct **esp\_vfs\_eventfd\_config\_t**

Eventfd vfs initialization settings.

## Public Members

size\_t **max\_fds**

The maximum number of eventfds supported

## Macros

`EFD_SUPPORT_ISR`

`ESP_VFS_EVENTD_CONFIG_DEFAULT ()`

## 2.6.9 Wear Levelling API

### Overview

Most of flash memory and especially SPI flash that is used in ESP32-S3 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in *FAT filesystem*.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

- **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.
- **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows: - Sector size is 512 bytes - Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

### Wear Levelling access API functions

This is the set of API functions for working with data in flash:

- `wl_mount` - initializes the wear levelling module and mounts the specified partition
- `wl_unmount` - unmounts the partition and deinitializes the wear levelling module
- `wl_erase_range` - erases a range of addresses in flash
- `wl_write` - writes data to a partition
- `wl_read` - reads data from a partition
- `wl_size` - returns the size of available memory in bytes
- `wl_sector_size` - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

### Memory Size

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.

## See also

- [FAT Filesystem](#)
- [Partition Table documentation](#)

## Application Example

An example which combines the wear levelling driver with the FATFS library is provided in the [storage/wear\\_levelling](#) directory. This example initializes the wear levelling driver, mounts FATFS partition, as well as writes and reads data from it using POSIX and C library APIs. See the [storage/wear\\_levelling/README.md](#) file for more information.

## High level API Reference

### Header Files

- [fatfs/vfs/esp\\_vfs\\_fat.h](#)

### Functions

`esp_err_t esp_vfs_fat_spiflash_mount` (const char \*base\_path, const char \*partition\_label, const `esp_vfs_fat_mount_config_t` \*mount\_config, `wl_handle_t` \*wl\_handle)

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition\_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base\_prefix variable

This function is intended to make example code more compact.

#### Parameters

- **base\_path** –path where FATFS partition should be mounted (e.g. “/spiflash” )
- **partition\_label** –label of the partition which should be used
- **mount\_config** –pointer to structure with extra parameters for mounting FATFS
- **wl\_handle** –[out] wear levelling driver handle

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_FOUND if the partition table does not contain FATFS partition with given label
- ESP\_ERR\_INVALID\_STATE if esp\_vfs\_fat\_spiflash\_mount was already called
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- ESP\_FAIL if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

struct `esp_vfs_fat_mount_config_t`

Configuration arguments for `esp_vfs_fat_sdmmc_mount` and `esp_vfs_fat_spiflash_mount` functions.

## Public Members

bool `format_if_mount_failed`

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

**int max\_files**

Max number of open files.

**size\_t allocation\_unit\_size**

If `format_if_mount_failed` is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and `128 * sector size`. For SD cards, sector size is always 512 bytes. For wear\_levelling, sector size is determined by `CONFIG_WL_SECTOR_SIZE` option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

***esp\_err\_t esp\_vfs\_fat\_spiflash\_unmount*** (const char \*base\_path, *wl\_handle\_t* wl\_handle)

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_spiflash_mount`.

**Parameters**

- **base\_path** –path where partition should be registered (e.g. “/spiflash” )
- **wl\_handle** –wear levelling driver handle returned by `esp_vfs_fat_spiflash_mount`

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `esp_vfs_fat_spiflash_mount` hasn't been called

## Mid level API Reference

### Header File

- `components/wear_levelling/include/wear_levelling.h`

### Functions

***esp\_err\_t wl\_mount*** (const *esp\_partition\_t* \*partition, *wl\_handle\_t* \*out\_handle)

Mount WL for defined partition.

**Parameters**

- **partition** –that will be used for access
- **out\_handle** –handle of the WL instance

**Returns**

- `ESP_OK`, if the allocation was successfully;
- `ESP_ERR_INVALID_ARG`, if WL allocation was unsuccessful;
- `ESP_ERR_NO_MEM`, if there was no memory to allocate WL components;

***esp\_err\_t wl\_unmount*** (*wl\_handle\_t* handle)

Unmount WL for defined partition.

**Parameters** **handle** –WL partition handle

**Returns**

- `ESP_OK`, if the operation completed successfully;
- or one of error codes from lower-level flash driver.

***esp\_err\_t wl\_erase\_range*** (*wl\_handle\_t* handle, *size\_t* start\_addr, *size\_t* size)

Erase part of the WL storage.

**Parameters**

- **handle** –WL handle that are related to the partition
- **start\_addr** –Address where erase operation should start. Must be aligned to the result of function `wl_sector_size(...)`.
- **size** –Size of the range which should be erased, in bytes. Must be divisible by result of function `wl_sector_size(...)`.

**Returns**

- `ESP_OK`, if the range was erased successfully;

- ESP\_ERR\_INVALID\_ARG, if iterator or dst are NULL;
- ESP\_ERR\_INVALID\_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

*esp\_err\_t* **wl\_write** (*wl\_handle\_t* handle, *size\_t* dest\_addr, const void \*src, *size\_t* size)

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `wl_erase_range` function.

---

**Note:** Prior to writing to WL storage, make sure it has been erased with `wl_erase_range` call.

---

#### Parameters

- **handle** –WL handle that are related to the partition
- **dest\_addr** –Address where the data should be written, relative to the beginning of the partition.
- **src** –Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** –Size of data to be written, in bytes.

#### Returns

- ESP\_OK, if data was written successfully;
- ESP\_ERR\_INVALID\_ARG, if `dst_offset` exceeds partition size;
- ESP\_ERR\_INVALID\_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

*esp\_err\_t* **wl\_read** (*wl\_handle\_t* handle, *size\_t* src\_addr, void \*dest, *size\_t* size)

Read data from the WL storage.

#### Parameters

- **handle** –WL module instance that was initialized before
- **dest** –Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **src\_addr** –Address of the data to be read, relative to the beginning of the partition.
- **size** –Size of data to be read, in bytes.

#### Returns

- ESP\_OK, if data was read successfully;
- ESP\_ERR\_INVALID\_ARG, if `src_offset` exceeds partition size;
- ESP\_ERR\_INVALID\_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

*size\_t* **wl\_size** (*wl\_handle\_t* handle)

Get size of the WL storage.

**Parameters** **handle** –WL module handle that was initialized before

**Returns** usable size, in bytes

*size\_t* **wl\_sector\_size** (*wl\_handle\_t* handle)

Get sector size of the WL instance.

**Parameters** **handle** –WL module handle that was initialized before

**Returns** sector size, in bytes

## Macros

**WL\_INVALID\_HANDLE**

## Type Definitions

```
typedef int32_t wl_handle_t
```

```
    wear levelling handle
```

Code examples for this API section are provided in the [storage](#) directory of ESP-IDF examples.

## 2.7 System API

### 2.7.1 App Image Format

An application image consists of the following structures:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.
2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32-S3's memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:
  - offset for 0 Segment = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`.
  - offset for 1 Segment = offset for 0 Segment + length of 0 Segment + `sizeof(esp_image_segment_header_t)`.
  - offset for 2 Segment = offset for 1 Segment + length of 1 Segment + `sizeof(esp_image_segment_header_t)`.
  - ...

The count of each segment is defined in the `segment_count` field that is stored in `esp_image_header_t`. The count cannot be more than `ESP_IMAGE_MAX_SEGMENTS`.

To get the list of your image segments, please run the following command:

```
esptool.py --chip esp32s3 image_info build/app.bin
```

```
esptool.py v2.3.1
Image version: 1
Entry point: 40080ea4
13 segments
Segment 1: len 0x13ce0 load 0x3f400020 file_offs 0x00000018 SOC_DROM

↵0) load

```

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.
4. If the `hash_appended` field from `esp_image_header_t` is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from first byte and up to this field. The length of this field is 32 bytes.
5. If the options `CONFIG_SECURE_SIGNED_APPS_SCHEME` is set to ECDSA then the application image will have additional 68 bytes for an ECDSA signature, which includes:
  - version word (4 bytes),
  - signature data (64 bytes).

### Application Description

The DROM segment starts with the `esp_app_desc_t` structure which carries specific fields describing the application:

- `secure_version` - see [Anti-rollback](#).
- `version` - see [App version](#). \*
- `project_name` is filled from `PROJECT_NAME`. \*
- `time and date` - compile time and date.
- `idf_ver` - version of ESP-IDF. \*
- `app_elf_sha256` - contains sha256 for the elf application file.

\* - The maximum length is 32 characters, including null-termination character. For example, if the length of `PROJECT_NAME` exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`. As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

### Adding a Custom Structure to an Application

Customer also has the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```

const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_
↵app_desc = { ... }

```

Offset for custom structure is `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)`.

To guarantee that the custom structure is located in the image even if it is not used, you need to add:

- For Make: add `COMPONENT_ADD_LDFLAGS += -u custom_app_desc` into `component.mk`
- For Cmake: add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into `CMakeLists.txt`

## API Reference

### Header File

- `components/bootloader_support/include/esp_app_format.h`

### Structures

struct **esp\_image\_header\_t**

Main header of binary image.

#### Public Members

uint8\_t **magic**

Magic word `ESP_IMAGE_HEADER_MAGIC`

uint8\_t **segment\_count**

Count of memory segments

uint8\_t **spi\_mode**

flash read mode (`esp_image_spi_mode_t` as `uint8_t`)

uint8\_t **spi\_speed**

flash frequency (`esp_image_spi_freq_t` as `uint8_t`)

uint8\_t **spi\_size**

flash chip size (`esp_image_flash_size_t` as `uint8_t`)

uint32\_t **entry\_addr**

Entry address

uint8\_t **wp\_pin**

WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to `0xEE`=disabled)

uint8\_t **spi\_pin\_drv**[3]

Drive settings for the SPI flash pins (read by ROM bootloader)

*esp\_chip\_id\_t* **chip\_id**

Chip identification number

**uint8\_t min\_chip\_rev**

Minimal chip revision supported by image After the Major and Minor revision eFuses were introduced into the chips, this field is no longer used. But for compatibility reasons, we keep this field and the data in it. Use min\_chip\_rev\_full instead. The software interprets this as a Major version for most of the chips and as a Minor version for the ESP32-C3.

**uint16\_t min\_chip\_rev\_full**

Minimal chip revision supported by image, in format: major \* 100 + minor

**uint16\_t max\_chip\_rev\_full**

Maximal chip revision supported by image, in format: major \* 100 + minor

**uint8\_t reserved[4]**

Reserved bytes in additional header space, currently unused

**uint8\_t hash\_appended**

If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

**struct esp\_image\_segment\_header\_t**

Header of binary image segment.

**Public Members****uint32\_t load\_addr**

Address of segment

**uint32\_t data\_len**

Length of data

**struct esp\_app\_desc\_t**

Description about application.

**Public Members****uint32\_t magic\_word**

Magic word ESP\_APP\_DESC\_MAGIC\_WORD

**uint32\_t secure\_version**

Secure version

**uint32\_t reserv1[2]**

reserv1

**char version[32]**

Application version

char **project\_name**[32]

Project name

char **time**[16]

Compile time

char **date**[16]

Compile date

char **idf\_ver**[32]

Version IDF

uint8\_t **app\_elf\_sha256**[32]

sha256 of elf file

uint32\_t **reserv2**[20]

reserv2

## Macros

### **ESP\_IMAGE\_HEADER\_MAGIC**

The magic word for the *esp\_image\_header\_t* structure.

### **ESP\_IMAGE\_MAX\_SEGMENTS**

Max count of segments in the image.

### **ESP\_APP\_DESC\_MAGIC\_WORD**

The magic word for the *esp\_app\_desc* structure that is in DROM.

## Enumerations

enum **esp\_chip\_id\_t**

ESP chip ID.

*Values:*

enumerator **ESP\_CHIP\_ID\_ESP32**

chip ID: ESP32

enumerator **ESP\_CHIP\_ID\_ESP32S2**

chip ID: ESP32-S2

enumerator **ESP\_CHIP\_ID\_ESP32C3**

chip ID: ESP32-C3

enumerator **ESP\_CHIP\_ID\_ESP32S3**

chip ID: ESP32-S3

enumerator **ESP\_CHIP\_ID\_ESP32H2**

chip ID: ESP32-H2

enumerator **ESP\_CHIP\_ID\_INVALID**

Invalid chip ID (we defined it to make sure the `esp_chip_id_t` is 2 bytes size)

enum **esp\_image\_spi\_mode\_t**

SPI flash mode, used in [esp\\_image\\_header\\_t](#).

*Values:*

enumerator **ESP\_IMAGE\_SPI\_MODE\_QIO**

SPI mode QIO

enumerator **ESP\_IMAGE\_SPI\_MODE\_QOUT**

SPI mode QOUT

enumerator **ESP\_IMAGE\_SPI\_MODE\_DIO**

SPI mode DIO

enumerator **ESP\_IMAGE\_SPI\_MODE\_DOUT**

SPI mode DOUT

enumerator **ESP\_IMAGE\_SPI\_MODE\_FAST\_READ**

SPI mode FAST\_READ

enumerator **ESP\_IMAGE\_SPI\_MODE\_SLOW\_READ**

SPI mode SLOW\_READ

enum **esp\_image\_spi\_freq\_t**

SPI flash clock frequency.

*Values:*

enumerator **ESP\_IMAGE\_SPI\_SPEED\_40M**

SPI clock frequency 40 MHz

enumerator **ESP\_IMAGE\_SPI\_SPEED\_26M**

SPI clock frequency 26 MHz

enumerator **ESP\_IMAGE\_SPI\_SPEED\_20M**

SPI clock frequency 20 MHz

enumerator **ESP\_IMAGE\_SPI\_SPEED\_80M**

SPI clock frequency 80 MHz

enum **esp\_image\_flash\_size\_t**

Supported SPI flash sizes.

*Values:*

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_1MB**

SPI flash size 1 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_2MB**

SPI flash size 2 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_4MB**

SPI flash size 4 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_8MB**

SPI flash size 8 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_16MB**

SPI flash size 16 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_32MB**

SPI flash size 32 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_64MB**

SPI flash size 64 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_128MB**

SPI flash size 128 MB

enumerator **ESP\_IMAGE\_FLASH\_SIZE\_MAX**

SPI flash size MAX

## 2.7.2 Application Level Tracing

### Overview

IDF provides useful feature for program behaviour analysis: application level tracing. It is implemented in the corresponding library and can be enabled via menuconfig. This feature allows to transfer arbitrary data between host and ESP32-S3 via JTAG interface with small overhead on program execution. Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see [Application Specific Tracing](#)
2. Lightweight logging to the host, see [Logging to Host](#)
3. System behaviour analysis, see [System Behavior Analysis with SEGGER System View](#)

### API Reference

#### Header File

- [components/app\\_trace/include/esp\\_app\\_trace.h](#)

#### Functions

*esp\_err\_t* **esp\_apprtrace\_init** (void)

Initializes application tracing module.

---

**Note:** Should be called before any `esp_apprtrace_xxx` call.

---

**Returns** ESP\_OK on success, otherwise see esp\_err\_t

void **esp\_apptrace\_down\_buffer\_config** (uint8\_t \*buf, uint32\_t size)

Configures down buffer.

---

**Note:** Needs to be called before initiating any data transfer using esp\_apptrace\_buffer\_get and esp\_apptrace\_write. This function does not protect internal data by lock.

---

#### Parameters

- **buf** –Address of buffer to use for down channel (host to target) data.
- **size** –Size of the buffer.

uint8\_t \***esp\_apptrace\_buffer\_get** (*esp\_apptrace\_dest\_t* dest, uint32\_t size, uint32\_t tmo)

Allocates buffer for trace data. After data in buffer are ready to be sent off esp\_apptrace\_buffer\_put must be called to indicate it.

#### Parameters

- **dest** –Indicates HW interface to send data.
- **size** –Size of data to write to trace buffer.
- **tmo** –Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

**Returns** non-NULL on success, otherwise NULL.

*esp\_err\_t* **esp\_apptrace\_buffer\_put** (*esp\_apptrace\_dest\_t* dest, uint8\_t \*ptr, uint32\_t tmo)

Indicates that the data in buffer are ready to be sent off. This function is a counterpart of and must be preceded by esp\_apptrace\_buffer\_get.

#### Parameters

- **dest** –Indicates HW interface to send data. Should be identical to the same parameter in call to esp\_apptrace\_buffer\_get.
- **ptr** –Address of trace buffer to release. Should be the value returned by call to esp\_apptrace\_buffer\_get.
- **tmo** –Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

**Returns** ESP\_OK on success, otherwise see esp\_err\_t

*esp\_err\_t* **esp\_apptrace\_write** (*esp\_apptrace\_dest\_t* dest, const void \*data, uint32\_t size, uint32\_t tmo)

Writes data to trace buffer.

#### Parameters

- **dest** –Indicates HW interface to send data.
- **data** –Address of data to write to trace buffer.
- **size** –Size of data to write to trace buffer.
- **tmo** –Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

**Returns** ESP\_OK on success, otherwise see esp\_err\_t

int **esp\_apptrace\_vprintf\_to** (*esp\_apptrace\_dest\_t* dest, uint32\_t tmo, const char \*fmt, va\_list ap)

vprintf-like function to sent log messages to host via specified HW interface.

#### Parameters

- **dest** –Indicates HW interface to send data.
- **tmo** –Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.
- **fmt** –Address of format string.
- **ap** –List of arguments.

**Returns** Number of bytes written.

int **esp\_appttrace\_vprintf** (const char \*fmt, va\_list ap)

vprintf-like function to sent log messages to host.

**Parameters**

- **fmt** –Address of format string.
- **ap** –List of arguments.

**Returns** Number of bytes written.

*esp\_err\_t* **esp\_appttrace\_flush** (*esp\_appttrace\_dest\_t* dest, uint32\_t tmo)

Flushes remaining data in trace buffer to host.

**Parameters**

- **dest** –Indicates HW interface to flush data on.
- **tmo** –Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

**Returns** ESP\_OK on success, otherwise see esp\_err\_t

*esp\_err\_t* **esp\_appttrace\_flush\_nolock** (*esp\_appttrace\_dest\_t* dest, uint32\_t min\_sz, uint32\_t tmo)

Flushes remaining data in trace buffer to host without locking internal data. This is special version of esp\_appttrace\_flush which should be called from panic handler.

**Parameters**

- **dest** –Indicates HW interface to flush data on.
- **min\_sz** –Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- **tmo** –Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

**Returns** ESP\_OK on success, otherwise see esp\_err\_t

*esp\_err\_t* **esp\_appttrace\_read** (*esp\_appttrace\_dest\_t* dest, void \*data, uint32\_t \*size, uint32\_t tmo)

Reads host data from trace buffer.

**Parameters**

- **dest** –Indicates HW interface to read the data on.
- **data** –Address of buffer to put data from trace buffer.
- **size** –Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- **tmo** –Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

**Returns** ESP\_OK on success, otherwise see esp\_err\_t

uint8\_t \***esp\_appttrace\_down\_buffer\_get** (*esp\_appttrace\_dest\_t* dest, uint32\_t \*size, uint32\_t tmo)

Retrieves incoming data buffer if any. After data in buffer are processed esp\_appttrace\_down\_buffer\_put must be called to indicate it.

**Parameters**

- **dest** –Indicates HW interface to receive data.
- **size** –Address to store size of available data in down buffer. Must be initialized with requested value.
- **tmo** –Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

**Returns** non-NULL on success, otherwise NULL.

*esp\_err\_t* **esp\_appttrace\_down\_buffer\_put** (*esp\_appttrace\_dest\_t* dest, uint8\_t \*ptr, uint32\_t tmo)

Indicates that the data in down buffer are processed. This function is a counterpart of and must be preceded by esp\_appttrace\_down\_buffer\_get.

**Parameters**

- **dest** –Indicates HW interface to receive data. Should be identical to the same parameter in call to esp\_appttrace\_down\_buffer\_get.
- **ptr** –Address of trace buffer to release. Should be the value returned by call to esp\_appttrace\_down\_buffer\_get.

- **tmo** –Timeout for operation (in us). Use `ESP_APPTRACE_TMO_INFINITE` to wait indefinitely.

**Returns** `ESP_OK` on success, otherwise see `esp_err_t`

bool **esp\_apptrace\_host\_is\_connected** (*esp\_apptrace\_dest\_t* dest)

Checks whether host is connected.

**Parameters** **dest** –Indicates HW interface to use.

**Returns** true if host is connected, otherwise false

void \***esp\_apptrace\_fopen** (*esp\_apptrace\_dest\_t* dest, const char \*path, const char \*mode)

Opens file on host. This function has the same semantic as ‘fopen’ except for the first argument.

**Parameters**

- **dest** –Indicates HW interface to use.
- **path** –Path to file.
- **mode** –Mode string. See fopen for details.

**Returns** non zero file handle on success, otherwise 0

int **esp\_apptrace\_fclose** (*esp\_apptrace\_dest\_t* dest, void \*stream)

Closes file on host. This function has the same semantic as ‘fclose’ except for the first argument.

**Parameters**

- **dest** –Indicates HW interface to use.
- **stream** –File handle returned by `esp_apptrace_fopen`.

**Returns** Zero on success, otherwise non-zero. See fclose for details.

size\_t **esp\_apptrace\_fwrite** (*esp\_apptrace\_dest\_t* dest, const void \*ptr, size\_t size, size\_t nmemb, void \*stream)

Writes to file on host. This function has the same semantic as ‘fwrite’ except for the first argument.

**Parameters**

- **dest** –Indicates HW interface to use.
- **ptr** –Address of data to write.
- **size** –Size of an item.
- **nmemb** –Number of items to write.
- **stream** –File handle returned by `esp_apptrace_fopen`.

**Returns** Number of written items. See fwrite for details.

size\_t **esp\_apptrace\_fread** (*esp\_apptrace\_dest\_t* dest, void \*ptr, size\_t size, size\_t nmemb, void \*stream)

Read file on host. This function has the same semantic as ‘fread’ except for the first argument.

**Parameters**

- **dest** –Indicates HW interface to use.
- **ptr** –Address to store read data.
- **size** –Size of an item.
- **nmemb** –Number of items to read.
- **stream** –File handle returned by `esp_apptrace_fopen`.

**Returns** Number of read items. See fread for details.

int **esp\_apptrace\_fseek** (*esp\_apptrace\_dest\_t* dest, void \*stream, long offset, int whence)

Set position indicator in file on host. This function has the same semantic as ‘fseek’ except for the first argument.

**Parameters**

- **dest** –Indicates HW interface to use.
- **stream** –File handle returned by `esp_apptrace_fopen`.
- **offset** –Offset. See fseek for details.
- **whence** –Position in file. See fseek for details.

**Returns** Zero on success, otherwise non-zero. See fseek for details.

int **esp\_apptrace\_ftell** (*esp\_apptrace\_dest\_t* dest, void \*stream)

Get current position indicator for file on host. This function has the same semantic as ‘ftell’ except for the first argument.

**Parameters**

- **dest** –Indicates HW interface to use.
- **stream** –File handle returned by esp\_apptrace\_fopen.

**Returns** Current position in file. See ftell for details.

int **esp\_apptrace\_fstop** (*esp\_apptrace\_dest\_t* dest)

Indicates to the host that all file operations are completed. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

**Parameters** **dest** –Indicates HW interface to use.

**Returns** ESP\_OK on success, otherwise see esp\_err\_t

void **esp\_gcov\_dump** (void)

Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

## Enumerations

enum **esp\_apptrace\_dest\_t**

Application trace data destinations bits.

*Values:*

enumerator **ESP\_APPTRACE\_DEST\_JTAG**

JTAG destination.

enumerator **ESP\_APPTRACE\_DEST\_TRAX**

xxx\_TRAX name is obsolete, use more common xxx\_JTAG

enumerator **ESP\_APPTRACE\_DEST\_UART0**

UART0 destination.

enumerator **ESP\_APPTRACE\_DEST\_MAX**

enumerator **ESP\_APPTRACE\_DEST\_NUM**

## Header File

- [components/app\\_trace/include/esp\\_sysview\\_trace.h](#)

## Functions

static inline *esp\_err\_t* **esp\_sysview\_flush** (uint32\_t tmo)

Flushes remaining data in SystemView trace buffer to host.

**Parameters** **tmo** –Timeout for operation (in us). Use ESP\_APPTRACE\_TMO\_INFINITE to wait indefinitely.

**Returns** ESP\_OK.

int **esp\_sysview\_vprintf** (const char \*format, va\_list args)

vprintf-like function to sent log messages to the host.

**Parameters**

- **format** –Address of format string.
- **args** –List of arguments.

**Returns** Number of bytes written.

*esp\_err\_t* **esp\_sysview\_heap\_trace\_start** (uint32\_t tmo)

Starts SystemView heap tracing.

**Parameters** **tmo** –Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

**Returns** ESP\_OK on success, ESP\_ERR\_TIMEOUT if operation has been timed out.

*esp\_err\_t* **esp\_sysview\_heap\_trace\_stop** (void)

Stops SystemView heap tracing.

**Returns** ESP\_OK.

void **esp\_sysview\_heap\_trace\_alloc** (void \*addr, uint32\_t size, const void \*callers)

Sends heap allocation event to the host.

**Parameters**

- **addr** –Address of allocated block.
- **size** –Size of allocated block.
- **callers** –Pointer to array with callstack addresses. Array size must be CONFIG\_HEAP\_TRACING\_STACK\_DEPTH.

void **esp\_sysview\_heap\_trace\_free** (void \*addr, const void \*callers)

Sends heap de-allocation event to the host.

**Parameters**

- **addr** –Address of de-allocated block.
- **callers** –Pointer to array with callstack addresses. Array size must be CONFIG\_HEAP\_TRACING\_STACK\_DEPTH.

## 2.7.3 The Async memcpy API

### Overview

ESP32-S3 has a DMA engine which can help to offload internal memory copy operations from the CPU in an asynchronous way.

The async memcpy API wraps all DMA configurations and operations, the signature of *esp\_async\_memcpy()* is almost the same to the standard libc one.

Thanks to the benefit of the DMA, we don't have to wait for each memory copy to be done before we issue another memcpy request. By the way, it's still possible to know when memcpy is finished by listening in the memcpy callback function.

### Configure and Install driver

*esp\_async\_memcpy\_install()* is used to install the driver with user's configuration. Please note that async memcpy has to be called with the handle returned from *esp\_async\_memcpy\_install()*.

Driver configuration is described in *async\_memcpy\_config\_t*: **backlog**: This is used to configured the maximum number of DMA operation that can be working at the background at the same time. **sram\_trans\_align**: Declare SRAM alignment for both data address and copy size, set to zero if the data has no restriction in alignment. If set to a quadruple value (i.e. 4X), the driver will enable the burst mode internally, which is helpful for some performance related application. **psram\_trans\_align**: Declare PSRAM alignment for both data address and copy size. User has to give it a valid value (only 16, 32, 64 are supported) if the destination of memcpy is located in PSRAM. The default alignment (i.e. 16) will be applied if it's set to zero. Internally, the driver configures the size of block used by DMA to access PSRAM, according to the alignment. **flags**: This is used to enable some special driver features.

*ASYNC\_MEMCPY\_DEFAULT\_CONFIG* provides a default configuration, which specifies the backlog to 8.

```

async_memcpy_config_t config = ASYNC_MEMCPY_DEFAULT_CONFIG();
// update the maximum data stream supported by underlying DMA engine
config.backlog = 16;
async_memcpy_t driver = NULL;
ESP_ERROR_CHECK(esp_async_memcpy_install(&config, &driver)); // install driver,
↳return driver handle

```

### Send memory copy request

`esp_async_memcpy()` is the API to send memory copy request to DMA engine. It must be called after driver is installed successfully. This API is thread safe, so it can be called from different tasks.

Different from the libc version of `memcpy`, user should also pass a callback to `esp_async_memcpy()`, if it's necessary to be notified when the memory copy is done. The callback is executed in the ISR context, make sure you won't violate the restriction applied to ISR handler.

Besides that, the callback function should reside in IRAM space by applying `IRAM_ATTR` attribute. The prototype of the callback function is `async_memcpy_isr_cb_t`, please note that, the callback function should return true if it wakes up a high priority task by some API like `xSemaphoreGiveFromISR()`.

```

SemaphoreHandle_t semphr; //already initialized in somewhere

// Callback implementation, running in ISR context
static IRAM_ATTR bool my_async_memcpy_cb(async_memcpy_t mcp_hdl, async_memcpy_
↳event_t *event, void *cb_args)
{
    SemaphoreHandle_t sem = (SemaphoreHandle_t)cb_args;
    BaseType_t high_task_wakeup = pdFALSE;
    SemaphoreGiveInISR(semphr, &high_task_wakeup); // high_task_wakeup set to pdTRUE
↳if some high priority task unblocked
    return high_task_wakeup == pdTRUE;
}

// Called from user's context
ESP_ERROR_CHECK(esp_async_memcpy(driver_handle, to, from, copy_len, my_async_
↳memcpy_cb, my_semaphore));
//Do something else here
SemaphoreTake(my_semaphore, ...); //wait until the buffer copy is done

```

### Uninstall driver (optional)

`esp_async_memcpy_uninstall()` is used to uninstall asynchronous memcpy driver. It's not necessary to uninstall the driver after each memcpy operation. If you know your application won't use this driver anymore, then this API can recycle the memory for you.

## API Reference

### Header File

- `components/esp_hw_support/include/esp_async_memcpy.h`

### Functions

`esp_err_t esp_async_memcpy_install` (const `async_memcpy_config_t` \*config, `async_memcpy_t` \*asmcp)

Install async memcpy driver.

#### Parameters

- **config** –[in] Configuration of async memcpy

- **asmcp** –[out] Handle of async memcopy that returned from this API. If driver installation is failed, asmcp would be assigned to NULL.

**Returns**

- ESP\_OK: Install async memcopy driver successfully
- ESP\_ERR\_INVALID\_ARG: Install async memcopy driver failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Install async memcopy driver failed because out of memory
- ESP\_FAIL: Install async memcopy driver failed because of other error

*esp\_err\_t* **esp\_async\_memcopy\_uninstall** (*async\_memcopy\_t* asmcp)

Uninstall async memcopy driver.

**Parameters** **asmcp** –[in] Handle of async memcopy driver that returned from esp\_async\_memcopy\_install

**Returns**

- ESP\_OK: Uninstall async memcopy driver successfully
- ESP\_ERR\_INVALID\_ARG: Uninstall async memcopy driver failed because of invalid argument
- ESP\_FAIL: Uninstall async memcopy driver failed because of other error

*esp\_err\_t* **esp\_async\_memcopy** (*async\_memcopy\_t* asmcp, void \*dst, void \*src, size\_t n, *async\_memcopy\_isr\_cb\_t* cb\_isr, void \*cb\_args)

Send an asynchronous memory copy request.

---

**Note:** The callback function is invoked in interrupt context, never do blocking jobs in the callback.

---

**Parameters**

- **asmcp** –[in] Handle of async memcopy driver that returned from esp\_async\_memcopy\_install
- **dst** –[in] Destination address (copy to)
- **src** –[in] Source address (copy from)
- **n** –[in] Number of bytes to copy
- **cb\_isr** –[in] Callback function, which got invoked in interrupt context. Set to NULL can bypass the callback.
- **cb\_args** –[in] User defined argument to be passed to the callback function

**Returns**

- ESP\_OK: Send memory copy request successfully
- ESP\_ERR\_INVALID\_ARG: Send memory copy request failed because of invalid argument
- ESP\_FAIL: Send memory copy request failed because of other error

**Structures**

struct **async\_memcopy\_event\_t**

Type of async memcopy event object.

**Public Members**

void \***data**

Event data

struct **async\_memcopy\_config\_t**

Type of async memcopy configuration.

## Public Members

uint32\_t **backlog**

Maximum number of streams that can be handled simultaneously

size\_t **sram\_trans\_align**

DMA transfer alignment (both in size and address) for SRAM memory

size\_t **psram\_trans\_align**

DMA transfer alignment (both in size and address) for PSRAM memory

uint32\_t **flags**

Extra flags to control async memcopy feature

## Macros

**ASYNC\_MEMCPY\_DEFAULT\_CONFIG** ()

Default configuration for async memcopy.

## Type Definitions

typedef struct async\_memcopy\_context\_t \***async\_memcopy\_t**

Type of async memcopy handle.

typedef bool (\***async\_memcopy\_isr\_cb\_t**)(*async\_memcopy\_t* mcp\_hdl, *async\_memcopy\_event\_t* \*event, void \*cb\_args)

Type of async memcopy interrupt callback function.

---

**Note:** User can call OS primitives (semaphore, mutex, etc) in the callback function. Keep in mind, if any OS primitive wakes high priority task up, the callback should return true.

---

**Param mcp\_hdl** Handle of async memcopy

**Param event** Event object, which contains related data, reserved for future

**Param cb\_args** User defined arguments, passed from esp\_async\_memcopy function

**Return** Whether a high priority task is woken up by the callback function

## 2.7.4 Chip Revision

### Overview

A new chip versioning logic was introduced in new chips. Chips have several eFuse version fields:

- Major wafer version (*WAFER\_VERSION\_MAJOR* eFuse)
- Minor wafer version (*WAFER\_VERSION\_MINOR* eFuse)
- Ignore maximal revision (*DISABLE\_WAFER\_VERSION\_MAJOR* eFuse)

The new versioning logic is being introduced to distinguish changes in chips as breaking changes and non-breaking changes. Chips with non-breaking changes can run the same software as the previous chip. The previous chip means that the major version is the same.

If the newly released chip does not have breaking changes, that means it can run the same software as the previous chip, then in that chip we keep the same major version and increment the minor version by 1. Otherwise, if there is a breaking change in the newly released chip, meaning it can not run the same software as the previous chip, then in that chip we increase the major version and set the minor version to 0.

The software supports a number of revisions, from the minimum to the maximum (the min/max configs are defined in Kconfig). If the software is unaware of a new chip (when the chip version is out of range), it will refuse to run on it unless the Ignore maximum revision restrictions bit is set. This bit removes the upper revision limit.

Minimum versions limits the software to only run on a chip revision that is high enough to support some features. Maximum version is the maximum version that is well-supported by current software. When chip version is above the maximum version, software will reject to boot, because it may not work on, or work with risk on the chip.

Adding the major and minor wafer revision make the versioning logic is branchable.

---

**Note:** The previous versioning logic was based on a single eFuse version field (`WAFER_VERSION`). This approach makes it impossible to mark chips as breaking or non-breaking changes, and the versioning logic becomes linear.

---

Using the branched versioning scheme allows us to support more chips in the software without updating the software when a new released compatible chip is used. Thus, the software will be compatible with as many new chip revisions as possible. If the software is no longer compatible with a new chip with breaking changes, the software will abort.

## Revisions

ECO	Revision (Major.Minor)
ECO0	v0.0
ECO1	v0.1
ECO2	v0.2

Chip Revision  $vX.Y$ , where:

- X means Major wafer version. If it is changed, it means that the current software version is not compatible with this released chip and the software must be updated to use this chip.
- Y means Minor wafer version. If it is changed that means the current software version is compatible with the released chip, and there is no need to update the software.

The  $vX.Y$  chip version format will be used further instead of the ECO number.

## Representing Revision Requirement Of A Binary Image

The 2nd stage bootloader and the application binary images have the `esp_image_header_t` header, which stores the revision numbers of the chip on which the software can be run. This header has 3 fields related to revisions:

- `min_chip_rev` - Minimal chip MAJOR revision required by image (but for ESP32-C3 it is MINOR revision). Its value is determined by `CONFIG_ESP32S3_REV_MIN`.
- `min_chip_rev_full` - Minimal chip MINOR revision required by image in format: `major * 100 + minor`. Its value is determined by `CONFIG_ESP32S3_REV_MIN`.
- `max_chip_rev_full` - Maximal chip revision required by image in format: `major * 100 + minor`. Its value is determined by `CONFIG_ESP32S3_REV_MAX_FULL`. It can not be changed by user. Only Espressif can change it when a new version will be supported in IDF.

## Chip Revision APIs

These APIs helps to get chip revision from eFuses:

- `efuse_hal_chip_revision()`. It returns revision in the `major * 100 + minor` format.
- `efuse_hal_get_major_chip_version()`. It returns Major revision.
- `efuse_hal_get_minor_chip_version()`. It returns Minor revision.

The following Kconfig definitions (in `major * 100 + minor` format) that can help add the chip revision dependency to the code:

- `CONFIG_ESP32S3_REV_MIN_FULL`

- `CONFIG_ESP_REV_MIN_FULLL`
- `CONFIG_ESP32S3_REV_MAX_FULLL`
- `CONFIG_ESP_REV_MAX_FULLL`

### Maximal And Minimal Revision Restrictions

The order for checking the minimum and maximum revisions:

1. The 1st stage bootloader (ROM bootloader) does not check minimal and maximal revision fields from `esp_image_header_t` before running the 2nd stage bootloader.
2. The 2nd stage bootloader checks at the initialization phase that bootloader itself can be launched on the chip of this revision. It extracts the minimum revision from the header of the bootloader image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision, the bootloader refuses to boot up and aborts. The maximum revision is not checked at this phase.
3. Then the 2nd stage bootloader checks the revision requirements of the application. It extracts the minimum and maximum revisions from the header of the application image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision or higher than the maximum revision, the bootloader refuses to boot up and aborts. However, if the Ignore maximal revision bit is set, the maximum revision constraint can be ignored. The ignore bit is set by the customer themselves when there is confirmation that the software is able to work with this chip revision.
4. Further, at the OTA update stage, the running application checks if the new software matches the chip revision. It extracts the minimum and maximum revisions from the header of the new application image and checks against the chip revision from eFuses. It checks for revision matching in the same way that the bootloader does, so that the chip revision is between the min and max revisions (logic of ignoring max revision also applies).

### Issues

1. If the 2nd stage bootloader is run on the chip revision < minimum revision shown in the image, a reboot occurs. The following message will be printed:

```
Image requires chip rev >= v3.0, but chip is v1.0
```

To resolve this issue:

- make sure the chip you are using is suitable for the software, or use a chip with the required minimum revision or higher.
  - update the software with `CONFIG_ESP32S3_REV_MIN` to get it <= the revision of chip being used
2. If application does not match minimal and maximal chip revisions, a reboot occurs. The following message will be printed:

```
Image requires chip rev <= v2.99, but chip is v3.0
```

To resolve this issue, update the IDF to a newer version that supports the used chip (`CONFIG_ESP32S3_REV_MAX_FULLL`). Another way to fix this is to set the Ignore maximal revision bit in eFuse or use a chip that is suitable for the software.

### Backward Compatible With Bootloaders Built By Older ESP-IDF Versions

The old bootloaders (IDF < 5.0) do not know about Major and Minor wafer version eFuses. They use one single eFuse for this - wafer version.

ESP32-S3 chip support was added in IDF 4.2. ESP32-S3 chips have `rev_min` in `esp_image_header_t` header = 0 because Minimum Supported ESP32-S2 Revision Kconfig option was not introduced, it means that the old bootloader does not check the chip revision. Any app can be loaded by such bootloader in range v0.0 - v3.15.

Please check the chip version using `esptool chip_id` command.

## API Reference

### Header File

- [components/hal/include/hal/efuse\\_hal.h](#)

### Functions

uint32\_t **efuse\_hal\_chip\_revision** (void)

Returns chip version.

**Returns** Chip version in format: Major \* 100 + Minor

bool **efuse\_hal\_flash\_encryption\_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the FLASH\_CRYPT\_CNT efuse has an odd number of bits set.

**Returns** true if flash encryption is enabled.

uint32\_t **efuse\_hal\_get\_major\_chip\_version** (void)

Returns major chip version.

uint32\_t **efuse\_hal\_get\_minor\_chip\_version** (void)

Returns minor chip version.

## 2.7.5 Console

ESP-IDF provides `console` component, which includes building blocks needed to develop an interactive console over serial port. This component includes following facilities:

- Line editing, provided by [linenoise](#) library. This includes handling of backspace and arrow keys, scrolling through command history, command auto-completion, and argument hints.
- Splitting of command line into arguments.
- Argument parsing, provided by [argtable3](#) library. This library includes APIs used for parsing GNU style command line arguments.
- Functions for registration and dispatching of commands.
- Functions to establish a basic REPL (Read-Evaluate-Print-Loop) environment.

---

**Note:** These facilities can be used together or independently. For example, it is possible to use line editing and command registration features, but use `getopt` or custom code for argument parsing, instead of [argtable3](#). Likewise, it is possible to use simpler means of command input (such as `fgets`) together with the rest of the means for command splitting and argument parsing.

---

### Line editing

Line editing feature lets users compose commands by typing them, erasing symbols using ‘backspace’ key, navigating within the command using left/right keys, navigating to previously typed commands using up/down keys, and performing autocompletion using ‘tab’ key.

---

**Note:** This feature relies on ANSI escape sequence support in the terminal application. As such, serial monitors which display raw UART data can not be used together with the line editing library. If you see `[\b]` or similar escape sequence when running [system/console](#) example instead of a command prompt (e.g. `esp>`), it means that the serial monitor does not support escape sequences. Programs which are known to work are GNU `screen`, `minicom`, and `idf_monitor.py` (which can be invoked using `idf.py monitor` from project directory).

---

Here is an overview of functions provided by [linenoise](#) library.

**Configuration** Linenose library does not need explicit initialization. However, some configuration defaults may need to be changed before invoking the main line editing function.

**linenoseClearScreen()** Clear terminal screen using an escape sequence and position the cursor at the top left corner.

**linenoseSetMultiLine()** Switch between single line and multi line editing modes. In single line mode, if the length of the command exceeds the width of the terminal, the command text is scrolled within the line to show the end of the text. In this case the beginning of the text is hidden. Single line needs less data to be sent to refresh screen on each key press, so exhibits less glitching compared to the multi line mode. On the flip side, editing commands and copying command text from terminal in single line mode is harder. Default is single line mode.

**linenoseAllowEmpty()** Set whether linenose library will return a zero-length string (if `true`) or NULL (if `false`) for empty lines. By default, zero-length strings are returned.

**linenoseSetMaxLineLen()** Set maximum length of the line for linenose library. Default length is 4096. If you need optimize RAM memory usage, you can do it by this function by setting a value less than default 4kB.

### Main loop

**linenose()** In most cases, console applications have some form of read/eval loop. `linenose()` is the single function which handles user's key presses and returns completed line once 'enter' key is pressed. As such, it handles the 'read' part of the loop.

**linenoseFree()** This function must be called to release the command line buffer obtained from `linenose()` function.

### Hints and completions

**linenoseSetCompletionCallback()** When user presses 'tab' key, linenose library invokes completion callback. The callback should inspect the contents of the command typed so far and provide a list of possible completions using calls to `linenoseAddCompletion()` function. `linenoseSetCompletionCallback()` function should be called to register this completion callback, if completion feature is desired. `console` component provides a ready made function to provide completions for registered commands, `esp_console_get_completion()` (see below).

**linenoseAddCompletion()** Function to be called by completion callback to inform the library about possible completions of the currently typed command.

**linenoseSetHintsCallback()** Whenever user input changes, linenose invokes hints callback. This callback can inspect the command line typed so far, and provide a string with hints (which can include list of command arguments, for example). The library then displays the hint text on the same line where editing happens, possibly with a different color.

**linenoseSetFreeHintsCallback()** If hint string returned by hints callback is dynamically allocated or needs to be otherwise recycled, the function which performs such cleanup should be registered via `linenoseSetFreeHintsCallback()`.

### History

**linenoseHistorySetMaxLen()** This function sets the number of most recently typed commands to be kept in memory. Users can navigate the history using up/down arrows.

**linenoseHistoryAdd()** Linenose does not automatically add commands to history. Instead, applications need to call this function to add command strings to the history.

**linenoseHistorySave()** Function saves command history from RAM to a text file, for example on an SD card or on a filesystem in flash memory.

**linenoseHistoryLoad()** Counterpart to `linenoseHistorySave()`, loads history from a file.

**linenoseHistoryFree()** Releases memory used to store command history. Call this function when done working with linenose library.

### Splitting of command line into arguments

`console` component provides `esp_console_split_argv()` function to split command line string into arguments. The function returns the number of arguments found (`argc`) and fills an array of pointers which can be passed as `argv` argument to any function which accepts arguments in `argc, argv` format.

The command line is split into arguments according to the following rules:

- Arguments are separated by spaces
- If spaces within arguments are required, they can be escaped using `\` (backslash) character.
- Other escape sequences which are recognized are `\\` (which produces literal backslash) and `\"`, which produces a double quote.
- Arguments can be quoted using double quotes. Quotes may appear only in the beginning and at the end of the argument. Quotes within the argument must be escaped as mentioned above. Quotes surrounding the argument are stripped by `esp_console_split_argv` function.

Examples:

- `abc def 1 20 .3` → `[ abc, def, 1, 20, .3 ]`
- `abc "123 456" def` → `[ abc, 123 456, def ]`
- ``a\ b\\c\"` → `[ a b\c" ]`

### Argument parsing

For argument parsing, `console` component includes `argtable3` library. Please see [tutorial](#) for an introduction to `argtable3`. Github repository also includes [examples](#).

### Command registration and dispatching

`console` component includes utility functions which handle registration of commands, matching commands typed by the user to registered ones, and calling these commands with the arguments given on the command line.

Application first initializes command registration module using a call to `esp_console_init()`, and calls `esp_console_cmd_register()` function to register command handlers.

For each command, application provides the following information (in the form of `esp_console_cmd_t` structure):

- Command name (string without spaces)
- Help text explaining what the command does
- Optional hint text listing the arguments of the command. If application uses `Argtable3` for argument parsing, hint text can be generated automatically by providing a pointer to `argtable` argument definitions structure instead.
- The command handler function.

A few other functions are provided by the command registration module:

**`esp_console_run()`** This function takes the command line string, splits it into `argc/argv` argument list using `esp_console_split_argv()`, looks up the command in the list of registered components, and if it is found, executes its handler.

**`esp_console_register_help_command()`** Adds `help` command to the list of registered commands. This command prints the list of all the registered commands, along with their arguments and help texts.

**`esp_console_get_completion()`** Callback function to be used with `linenoiseSetCompletionCallback()` from `linenoise` library. Provides completions to `linenoise` based on the list of registered commands.

**`esp_console_get_hint()`** Callback function to be used with `linenoiseSetHintsCallback()` from `linenoise` library. Provides argument hints for registered commands to `linenoise`.

## Initialize console REPL environment

To establish a basic REPL environment, `console` component provides several useful APIs, combining those functions described above.

In a typical application, you only need to call `esp_console_new_repl_uart()` to initialize the REPL environment based on UART device, including driver install, basic console configuration, spawning a thread to do REPL task and register several useful commands (e.g. `help`).

After that, you can register your own commands with `esp_console_cmd_register()`. The REPL environment keeps in init state until you call `esp_console_start_repl()`.

## Application Example

Example application illustrating usage of the `console` component is available in `system/console` directory. This example shows how to initialize UART and VFS functions, set up linenoise library, read and handle commands from UART, and store command history in Flash. See README.md in the example directory for more details.

Besides that, ESP-IDF contains several useful examples which based on `console` component and can be treated as “tools” when developing applications. For example, `peripherals/i2c/i2c_tools`, `wifi/iperf`.

## API Reference

### Header File

- `components/console/esp_console.h`

### Functions

`esp_err_t esp_console_init` (const `esp_console_config_t` \*config)  
initialize console module

---

**Note:** Call this once before using other console module features

---

**Parameters** `config` –console configuration

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_ERR\_INVALID\_STATE if already initialized
- ESP\_ERR\_INVALID\_ARG if the configuration is invalid

`esp_err_t esp_console_deinit` (void)  
de-initialize console module

---

**Note:** Call this once when done using console module functions

---

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not initialized yet

`esp_err_t esp_console_cmd_register` (const `esp_console_cmd_t` \*cmd)  
Register console command.

**Parameters** `cmd` –pointer to the command description; can point to a temporary value

**Returns**

- ESP\_OK on success

- `ESP_ERR_NO_MEM` if out of memory
- `ESP_ERR_INVALID_ARG` if command description includes invalid arguments

`esp_err_t esp_console_run` (const char \*cmdline, int \*cmd\_ret)

Run command line.

#### Parameters

- `cmdline` –command line (command name followed by a number of arguments)
- `cmd_ret` –[out] return code from the command (set if command was run)

#### Returns

- `ESP_OK`, if command was run
- `ESP_ERR_INVALID_ARG`, if the command line is empty, or only contained whitespace
- `ESP_ERR_NOT_FOUND`, if command with given name wasn't registered
- `ESP_ERR_INVALID_STATE`, if `esp_console_init` wasn't called

`size_t esp_console_split_argv` (char \*line, char \*\*argv, size\_t argv\_size)

Split command line into arguments in place.

```
* - This function finds whitespace-separated arguments in the given input line.
*
*   'abc def 1 20 .3' -> [ 'abc', 'def', '1', '20', '.3' ]
*
* - Argument which include spaces may be surrounded with quotes. In this case
*   spaces are preserved and quotes are stripped.
*
*   'abc "123 456" def' -> [ 'abc', '123 456', 'def' ]
*
* - Escape sequences may be used to produce backslash, double quote, and space:
*
*   'a\ b\\c\"' -> [ 'a b\c"' ]
*
```

---

**Note:** Pointers to at most `argv_size - 1` arguments are returned in `argv` array. The pointer after the last one (i.e. `argv[argc]`) is set to `NULL`.

---

#### Parameters

- `line` –pointer to buffer to parse; it is modified in place
- `argv` –array where the pointers to arguments are written
- `argv_size` –number of elements in `argv_array` (max. number of arguments)

**Returns** number of arguments found (`argc`)

void `esp_console_get_completion` (const char \*buf, *linenoiseCompletions* \*lc)

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

```
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

#### Parameters

- `buf` –the string typed by the user
- `lc` –`linenoiseCompletions` to be filled in

const char \*`esp_console_get_hint` (const char \*buf, int \*color, int \*bold)

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:

```
linenoiseSetHintsCallback((linenoiseHintsCallback*) &esp_console_get_hint);
```

The extra cast is needed because `linenoiseHintsCallback` is defined as returning a `char*` instead of `const char*`.

**Parameters**

- **buf** –line typed by the user
- **color** –[out] ANSI color code to be used when displaying the hint
- **bold** –[out] set to 1 if hint has to be displayed in bold

**Returns** string containing the hint text. This string is persistent and should not be freed (i.e. `linenoiseSetFreeHintsCallback` should not be used).

*esp\_err\_t* **esp\_console\_register\_help\_command** (void)

Register a ‘help’ command.

Default ‘help’ command prints the list of registered commands along with hints and help strings.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE, if `esp_console_init` wasn’t called

*esp\_err\_t* **esp\_console\_new\_repl\_uart** (const *esp\_console\_dev\_uart\_config\_t* \*dev\_config, const *esp\_console\_repl\_config\_t* \*repl\_config, *esp\_console\_repl\_t* \*\*ret\_repl)

Establish a console REPL environment over UART driver.

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying `linenoise` and `esp_console` functions.

---

**Note:** This is a all-in-one function to establish the environment needed for REPL, includes:

- Install the UART driver on the console UART (8n1, 115200, REF\_TICK clock source)
  - Configures the stdin/stdout to go through the UART driver
  - Initializes `linenoise`
  - Spawn new thread to run REPL in the background
- 

**Parameters**

- **dev\_config** –[in] UART device configuration
- **repl\_config** –[in] REPL configuration
- **ret\_repl** –[out] return REPL handle after initialization succeed, return NULL otherwise

**Returns**

- ESP\_OK on success
- ESP\_FAIL Parameter error

*esp\_err\_t* **esp\_console\_new\_repl\_usb\_cdc** (const *esp\_console\_dev\_usb\_cdc\_config\_t* \*dev\_config, const *esp\_console\_repl\_config\_t* \*repl\_config, *esp\_console\_repl\_t* \*\*ret\_repl)

Establish a console REPL environment over USB CDC.

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying `linenoise` and `esp_console` functions.

---

**Note:** This is a all-in-one function to establish the environment needed for REPL, includes:

- Initializes `linenoise`
  - Spawn new thread to run REPL in the background
- 

**Parameters**

- **dev\_config** –[in] USB CDC configuration

- **repl\_config** –[in] REPL configuration
- **ret\_repl** –[out] return REPL handle after initialization succeed, return NULL otherwise

**Returns**

- ESP\_OK on success
- ESP\_FAIL Parameter error

*esp\_err\_t* **esp\_console\_new\_repl\_usb\_serial\_jtag** (const *esp\_console\_dev\_usb\_serial\_jtag\_config\_t* \*dev\_config, const *esp\_console\_repl\_config\_t* \*repl\_config, *esp\_console\_repl\_t* \*\*ret\_repl)

Establish a console REPL (Read-eval-print loop) environment over USB-SERIAL-JTAG.

**Attention** This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp\_console functions.

---

**Note:** This is a all-in-one function to establish the environment needed for REPL, includes:

- Initializes linenoise
  - Spawn new thread to run REPL in the background
- 

**Parameters**

- **dev\_config** –[in] USB-SERIAL-JTAG configuration
- **repl\_config** –[in] REPL configuration
- **ret\_repl** –[out] return REPL handle after initialization succeed, return NULL otherwise

**Returns**

- ESP\_OK on success
- ESP\_FAIL Parameter error

*esp\_err\_t* **esp\_console\_start\_repl** (*esp\_console\_repl\_t* \*repl)

Start REPL environment.

---

**Note:** Once the REPL got started, it won't be stopped until user call repl->del(repl) to destroy the REPL environment.

---

**Parameters** **repl** –[in] REPL handle returned from esp\_console\_new\_repl\_XXX

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE, if repl has started already

## Structures

struct **esp\_console\_config\_t**

Parameters for console initialization.

### Public Members

size\_t **max\_cmdline\_length**

length of command line buffer, in bytes

size\_t **max\_cmdline\_args**  
maximum number of command line arguments to parse

int **hint\_color**  
ASCII color code of hint text.

int **hint\_bold**  
Set to 1 to print hint text in bold.

struct **esp\_console\_repl\_config\_t**  
Parameters for console REPL (Read Eval Print Loop)

### Public Members

uint32\_t **max\_history\_len**  
maximum length for the history

const char \***history\_save\_path**  
file path used to save history commands, set to NULL won't save to file system

uint32\_t **task\_stack\_size**  
repl task stack size

uint32\_t **task\_priority**  
repl task priority

const char \***prompt**  
prompt (NULL represents default: "esp> ")

size\_t **max\_cmdline\_length**  
maximum length of a command line. If 0, default value will be used

struct **esp\_console\_dev\_uart\_config\_t**  
Parameters for console device: UART.

### Public Members

int **channel**  
UART channel number (count from zero)

int **baud\_rate**  
Communication baud rate.

int **tx\_gpio\_num**  
GPIO number for TX path, -1 means using default one.

int **rx\_gpio\_num**  
GPIO number for RX path, -1 means using default one.

struct **esp\_console\_dev\_usb\_cdc\_config\_t**

Parameters for console device: USB CDC.

---

**Note:** It's an empty structure for now, reserved for future

---

struct **esp\_console\_dev\_usb\_serial\_jtag\_config\_t**

Parameters for console device: USB-SERIAL-JTAG.

---

**Note:** It's an empty structure for now, reserved for future

---

struct **esp\_console\_cmd\_t**

Console command description.

### Public Members

const char \***command**

Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call to `esp_console_deinit`.

const char \***help**

Help text for the command, shown by help command. If set, the pointer must be valid until the call to `esp_console_deinit`. If not set, the command will not be listed in 'help' output.

const char \***hint**

Hint text, usually lists possible arguments. If set to NULL, and 'argtable' field is non-NULL, hint will be generated automatically

*esp\_console\_cmd\_func\_t* **func**

Pointer to a function which implements the command.

void \***argtable**

Array or structure of pointers to `arg_xxx` structures, may be NULL. Used to generate hint text if 'hint' is set to NULL. Array/structure which this field points to must end with an `arg_end`. Only used for the duration of `esp_console_cmd_register` call.

struct **esp\_console\_repl\_s**

Console REPL base structure.

### Public Members

*esp\_err\_t* (**\*del**)(*esp\_console\_repl\_t* \*repl)

Delete console REPL environment.

**Param repl [in]** REPL handle returned from `esp_console_new_repl_xxx`

#### Return

- ESP\_OK on success
- ESP\_FAIL on errors

## Macros

**ESP\_CONSOLE\_CONFIG\_DEFAULT** ()

Default console configuration value.

**ESP\_CONSOLE\_REPL\_CONFIG\_DEFAULT** ()

Default console repl configuration value.

**ESP\_CONSOLE\_DEV\_UART\_CONFIG\_DEFAULT** ()

**ESP\_CONSOLE\_DEV\_CDC\_CONFIG\_DEFAULT** ()

**ESP\_CONSOLE\_DEV\_USB\_SERIAL\_JTAG\_CONFIG\_DEFAULT** ()

## Type Definitions

typedef struct *linenoiseCompletions* **linenoiseCompletions**

typedef int (**\*esp\_console\_cmd\_func\_t**)(int argc, char \*\*argv)

Console command main function.

**Param argc** number of arguments

**Param argv** array with argc entries, each pointing to a zero-terminated string argument

**Return** console command return code, 0 indicates “success”

typedef struct *esp\_console\_repl\_s* **esp\_console\_repl\_t**

Type defined for console REPL.

## 2.7.6 eFuse Manager

### Introduction

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

### Hardware description

The ESP32-S3 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE\_BLK0).

For more details, see *ESP32-S3 Technical Reference Manual > eFuse Controller (eFuse)* [PDF]. Some eFuse bits are available for user applications.

ESP32-S3 has 11 eFuse blocks each of the size of 256 bits (not all bits are available):

- EFUSE\_BLK0 is used entirely for system purposes;
- EFUSE\_BLK1 is used entirely for system purposes;
- EFUSE\_BLK2 is used entirely for system purposes;
- EFUSE\_BLK3 (also named EFUSE\_BLK\_USER\_DATA) can be used for user purposes;
- EFUSE\_BLK4 (also named EFUSE\_BLK\_KEY0) can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK5 (also named EFUSE\_BLK\_KEY1) can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK6 (also named EFUSE\_BLK\_KEY2) can be used as key (for secure\_boot or flash\_encryption) or for user purposes;

- EFUSE\_BLK7 (also named EFUSE\_BLK\_KEY3) can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK8 (also named EFUSE\_BLK\_KEY4) can be used as key (for secure\_boot or flash\_encryption) or for user purposes;
- EFUSE\_BLK9 (also named EFUSE\_BLK\_KEY5) can be used for any purpose except for flash encryption (due to a HW bug);
- EFUSE\_BLK10 (also named EFUSE\_BLK\_SYS\_DATA\_PART2) is reserved for system purposes.

Each block is divided into 8 32-bits registers.

### eFuse Manager component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool *efuse\_table\_gen.py*. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a *custom* file from the user's project directory, the utility will check with the *common* CSV file.

CSV files:

- *common* (*esp\_efuse\_table.csv*) - contains eFuse fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse-common-table`). Note that changes in this file can lead to incorrect operation.
- *custom* - (optional and can be enabled by [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse-custom-table`.

### Description CSV file

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK10), bit_start(0..255), bit_
↪count(1..256), comment
```

Individual params in CSV file the following meanings:

**field\_name** Name of field. The prefix *ESP\_EFUSE\_* will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see *MAC\_FACTORY* field in the common table). The *field\_name* supports structured format using *.* to show that the field belongs to another field (see *WR\_DIS* and *RD\_DIS* in the common table).

**efuse\_block** Block number. It determines where the eFuse bits will be placed for this field. Available EFUSE\_BLK0..EFUSE\_BLK10.

**bit\_start** Start bit number (0..255). The *bit\_start* field can be omitted. In this case, it will be set to *bit\_start* + *bit\_count* from the previous record, if it has the same *efuse\_block*. Otherwise (if *efuse\_block* is different, or this is the first entry), an error will be generated.

**bit\_count** The number of bits to use in this field (1..-). This parameter can not be omitted. This field also may be *MAX\_BLK\_LEN* in this case, the field length will have the maximum block length.

**comment** This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields *MAC\_FACTORY* and *MAC\_FACTORY\_CRC*:

```
# Factory MAC address #
#####
MAC_FACTORY,          EFUSE_BLK0,    72,    8,    Factory MAC addr [0]
,                    EFUSE_BLK0,    64,    8,    Factory MAC addr [1]
,                    EFUSE_BLK0,    56,    8,    Factory MAC addr [2]
,                    EFUSE_BLK0,    48,    8,    Factory MAC addr [3]
,                    EFUSE_BLK0,    40,    8,    Factory MAC addr [4]
,                    EFUSE_BLK0,    32,    8,    Factory MAC addr [5]
MAC_FACTORY_CRC,     EFUSE_BLK0,    80,    8,    CRC8 for factory MAC address
```

This field will available in code as `ESP_EFUSE_MAC_FACTORY` and `ESP_EFUSE_MAC_FACTORY_CRC`.

### Structured efuse fields

```
WR_DIS,              EFUSE_BLK0,    0,    32,    Write protection
WR_DIS.RD_DIS,      EFUSE_BLK0,    0,    1,    Write protection for
↳RD_DIS
WR_DIS.FIELD_1,     EFUSE_BLK0,    1,    1,    Write protection for
↳FIELD_1
WR_DIS.FIELD_2,     EFUSE_BLK0,    2,    4,    Write protection for
↳FIELD_2 (includes B1 and B2)
WR_DIS.FIELD_2.B1,  EFUSE_BLK0,    2,    2,    Write protection for
↳FIELD_2.B1
WR_DIS.FIELD_2.B2,  EFUSE_BLK0,    4,    2,    Write protection for
↳FIELD_2.B2
WR_DIS.FIELD_3,     EFUSE_BLK0,    5,    1,    Write protection for
↳FIELD_3
WR_DIS.FIELD_3.ALIAS, EFUSE_BLK0,    5,    1,    Write protection for
↳FIELD_3 (just a alias for WR_DIS.FIELD_3)
WR_DIS.FIELD_4,     EFUSE_BLK0,    7,    1,    Write protection for
↳FIELD_4
```

The structured eFuse field looks like `WR_DIS.RD_DIS` where the dot points that this field belongs to the parent field - `WR_DIS` and can not be out of the parent's range.

It is possible to use some levels of structured fields as `WR_DIS.FIELD_2.B1` and `B2`. These fields should not be crossed each other and should be in the range of two fields: `WR_DIS` and `WR_DIS.FIELD_2`.

It is possible to create aliases for fields with the same range, see `WR_DIS.FIELD_3` and `WR_DIS.FIELD_3.ALIAS`.

The IDF names for structured efuse fields should be unique. The `efuse_table_gen` tool will generate the final names where the dot will be replaced by `_`. The names for using in IDF are `ESP_EFUSE_WR_DIS`, `ESP_EFUSE_WR_DIS_RD_DIS`, `ESP_EFUSE_WR_DIS_FIELD_2_B1`, etc.

### efuse\_table\_gen.py tool

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional *custom* file is used, it will be checked with the existing *common* file (`esp_efuse_table.csv`). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type `esp_efuse_desc_t`.

To generate a *common* files, use the following command `idf.py efuse-common-table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32s3/esp_efuse_table.csv
```

After generation in the folder `$IDF_PATH/components/efuse/esp32s3` create:

- `esp_efuse_table.c` file.
- In *include* folder `esp_efuse_table.c` file.

To generate a *custom* files, use the following command `idf.py efuse-custom-table` or:

```
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py esp32s3/esp_efuse_table.csv PROJECT_PATH/main/esp_efuse_
↳custom_table.csv
```

After generation in the folder `PROJECT_PATH/main` create:

- `esp_efuse_custom_table.c` file.
- In `include` folder `esp_efuse_custom_table.c` file.

To use the generated fields, you need to include two files:

```
#include "esp_efuse.h"
#include "esp_efuse_table.h" or "esp_efuse_custom_table.h"
```

### Supported coding scheme

Coding schemes are used to protect against data corruption. ESP32-S3 supports two coding schemes:

- None. EFUSE\_BLK0 is stored with four backups, meaning each bit is stored four times. This backup scheme is automatically applied by the hardware and is not visible to software. EFUSE\_BLK0 can be written many times.
- RS. EFUSE\_BLK1 - EFUSE\_BLK10 use Reed-Solomon coding scheme that supports up to 5 bytes of automatic error correction. Software will encode the 32-byte EFUSE\_BLKx using RS (44, 32) to generate a 12-byte check code, and then burn the EFUSE\_BLKx and the check code into eFuse at the same time. The eFuse Controller automatically decodes the RS encoding and applies error correction when reading back the eFuse block. Because the RS check codes are generated across the entire 256-bit eFuse block, each block can only be written to one time.

To write some fields into one block, or different blocks in one time, you need to use the `batch` writing mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual using the `esp_efuse_write_...` functions. At the end to burn them, call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

### eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as "1".
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as "1".
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
- `esp_efuse_write_reg()` - writes value to eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.
- `esp_efuse_get_key_dis_read()` - Returns a read protection for the key block.
- `esp_efuse_set_key_dis_read()` - Sets a read protection for the key block.
- `esp_efuse_get_key_dis_write()` - Returns a write protection for the key block.
- `esp_efuse_set_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_get_key_purpose()` - Returns the current purpose set for an eFuse key block.

- `esp_efuse_write_key()` - Programs a block of key data to an eFuse block
- `esp_efuse_write_keys()` - Programs keys to unused eFuse blocks
- `esp_efuse_find_purpose()` - Finds a key block with the particular purpose set.
- `esp_efuse_get_keypurpose_dis_write()` - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- `esp_efuse_key_block_unused()` - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this `esp_efuse_get_pkg_ver()`.

### eFuse API for keys

EFUSE\_BLK\_KEY0 - EFUSE\_BLK\_KEY5 are intended to keep up to 6 keys with a length of 256-bits. Each key has an ESP\_EFUSE\_KEY\_PURPOSE\_x field which defines the purpose of these keys. The purpose field is described in `esp_efuse_purpose_t`.

The purposes like ESP\_EFUSE\_KEY\_PURPOSE\_XTS\_AES... are used for flash encryption.

The purposes like ESP\_EFUSE\_KEY\_PURPOSE\_SECURE\_BOOT\_DIGEST... are used for secure boot.

There are some eFuse APIs useful to work with states of keys.

- `esp_efuse_get_purpose_field()` - Returns a pointer to a key purpose for an eFuse key block.
- `esp_efuse_get_key()` - Returns a pointer to a key block.
- `esp_efuse_set_key_purpose()` - Sets a key purpose for an eFuse key block.
- `esp_efuse_set_keypurpose_dis_write()` - Sets a write protection of the key purpose field for an eFuse key block.
- `esp_efuse_find_unused_key_block()` - Search for an unused key block and return the first one found.
- `esp_efuse_count_unused_key_blocks()` - Returns the number of unused eFuse key blocks in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX
- `esp_efuse_get_digest_revoke()` - Returns the status of the Secure Boot public key digest revocation bit.
- `esp_efuse_set_digest_revoke()` - Sets the Secure Boot public key digest revocation bit.
- `esp_efuse_get_write_protect_of_digest_revoke()` - Returns a write protection of the Secure Boot public key digest revocation bit.
- `esp_efuse_set_write_protect_of_digest_revoke()` - Sets a write protection of the Secure Boot public key digest revocation bit.

### How to add a new field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show-efuse-table` or the next command:

```
$ ./efuse_table_gen.py esp32s3/esp_efuse_table.csv --info
eFuse coding scheme: NONE
#      field_name      efuse_block      bit_start      bit_count
1      WR_DIS_FLASH_CRYPT_CNT      EFUSE_BLK0      2              1
2      WR_DIS_BLK1      EFUSE_BLK0      7              1
3      WR_DIS_BLK2      EFUSE_BLK0      8              1
4      WR_DIS_BLK3      EFUSE_BLK0      9              1
5      RD_DIS_BLK1      EFUSE_BLK0      16             1
6      RD_DIS_BLK2      EFUSE_BLK0      17             1
7      RD_DIS_BLK3      EFUSE_BLK0      18             1
8      FLASH_CRYPT_CNT      EFUSE_BLK0      20             7
9      MAC_FACTORY      EFUSE_BLK0      32             8
10     MAC_FACTORY      EFUSE_BLK0      40             8
11     MAC_FACTORY      EFUSE_BLK0      48             8
12     MAC_FACTORY      EFUSE_BLK0      56             8
13     MAC_FACTORY      EFUSE_BLK0      64             8
14     MAC_FACTORY      EFUSE_BLK0      72             8
```

Used bits in eFuse table:

EFUSE\_BLK0

[2 2] [7 9] [16 18] [20 27] [32 87] [96 97] [105 109] [111 111] [136 144] [188\_→  
→191] [194 194] [196 196] [198 201]

EFUSE\_BLK1

[0 255]

EFUSE\_BLK2

[0 255]

EFUSE\_BLK3

[0 55] [96 159] [184 191]

Note: Not printed ranges are free for using. (bits in EFUSE\_BLK0 are reserved for\_→  
→Espressif)

Parsing eFuse CSV input file \$IDF\_PATH/components/efuse/esp32s3/esp\_efuse\_table.

→csv ...

Verifying eFuse table...

The number of bits not included in square brackets is free (bits in EFUSE\_BLK0 are reserved for Espressif). All fields are checked for overlapping.

2. Fill a line for field: field\_name, efuse\_block, bit\_start, bit\_count, comment.
3. Run a show\_efuse\_table command to check eFuse table. To generate source files run efuse\_common\_table or efuse\_custom\_table command.

## Debug eFuse & Unit tests

**Virtual eFuses** The Kconfig option `CONFIG_EFUSE_VIRTUAL` will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and

unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the `CONFIG_EFUSE_VIRTUAL` option there is `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option that adds a feature to keep eFuses in flash memory. To use this mode the `partition_table` should have the `efuse` partition. `partition.csv`: `"efuse_em, data, efuse, , 0x2000, "`. During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test `secure_boot` and `flash_encryption` features with this option).

**Flash Encryption Testing** Flash Encryption (FE) is a hardware feature that requires the physical burning of eFuses: `key` and `FLASH_CRYPT_CNT`. If FE is not actually enabled then enabling the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option just gives testing possibilities and does not encrypt anything in the flash, even though the logs say encryption happens. The `bootloader_flash_write()` is adapted for this purpose. But if FE is already enabled on the chip and you run an application or bootloader created with the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option then the flash encryption/decryption operations will work properly (data are encrypted as it is written into an encrypted flash partition and decrypted when they are read from an encrypted partition).

**espefuse.py** `esptool` includes a useful tool for reading/writing ESP32-S3 eFuse bits - [espefuse.py](#).

```
espefuse.py -p PORT summary

Connecting...
Detecting chip type... ESP32-S3

## Header File

- [components/efuse/include/esp\\_efuse.h](#)

## Functions

*esp\_err\_t* **esp\_efuse\_read\_field\_blob** (const *esp\_efuse\_desc\_t* \*field[], void \*dst, size\_t dst\_size\_bits)

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst\_size\_bits” required size. Use “esp\_efuse\_get\_field\_size()” function to determine the length of the field.

---

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

---

**Parameters**

- **field** –[in] A pointer to the structure describing the fields of efuse.
- **dst** –[out] A pointer to array that will contain the result of reading.
- **dst\_size\_bits** –[in] The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

**Returns**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.

bool **esp\_efuse\_read\_field\_bit** (const *esp\_efuse\_desc\_t* \*field[])

Read a single bit eFuse field as a boolean value.

---

**Note:** The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call `esp_efuse_read_field_blob()` and check the returned value instead.

---

---

**Note:** If assertions are enabled and the parameter is invalid, execution will abort

---

---

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

---

**Parameters** **field** –[in] A pointer to the structure describing the fields of efuse.

**Returns**

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

*esp\_err\_t* **esp\_efuse\_read\_field\_cnt** (const *esp\_efuse\_desc\_t* \*field[], size\_t \*out\_cnt)

Reads bits from EFUSE field and returns number of bits programmed as “1” .

If the bits are set not sequentially, they will still be counted.

---

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

---

**Parameters**

- **field** –[in] A pointer to the structure describing the fields of efuse.
- **out\_cnt** –[out] A pointer that will contain the number of programmed as “1” bits.

**Returns**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.

*esp\_err\_t* **esp\_efuse\_write\_field\_blob** (const *esp\_efuse\_desc\_t* \*field[], const void \*src, size\_t src\_size\_bits)

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src\_size\_bits” required size. Use “`esp_efuse_get_field_size()`” function to determine the length of the field. After the function is completed, the writing registers are cleared.

**Parameters**

- **field** –[in] A pointer to the structure describing the fields of efuse.
- **src** –[in] A pointer to array that contains the data for writing.
- **src\_size\_bits** –[in] The number of bits required to write.

**Returns**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.

- `ESP_ERR_EFUSE_REPEATED_PROG`: Error repeated programming of programmed bits is strictly forbidden.
- `ESP_ERR_CODING`: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_write_field_cnt` (const `esp_efuse_desc_t` \*field[], size\_t cnt)

Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1”, `ESP_ERR_EFUSE_CNT_IS_FULL` error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

#### Parameters

- **field** –[in] A pointer to the structure describing the fields of efuse.
- **cnt** –[in] Required number of programmed as “1” bits.

#### Returns

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_CNT_IS_FULL`: Not all requested cnt bits is set.

`esp_err_t esp_efuse_write_field_bit` (const `esp_efuse_desc_t` \*field[])

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling `esp_efuse_write_field_cnt()` with the cnt parameter equal to 1, except that it will return `ESP_OK` if the field is already set to 1.

**Parameters** **field** –[in] Pointer to the structure describing the efuse field.

#### Returns

- `ESP_OK`: The operation was successfully completed, or the bit was already set to value 1.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments, including if the efuse field is not 1 bit wide.

`esp_err_t esp_efuse_set_write_protect` (`esp_efuse_block_t` blk)

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

**Parameters** **blk** –[in] Block number of eFuse. (`EFUSE_BLK1`, `EFUSE_BLK2` and `EFUSE_BLK3`)

#### Returns

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_CNT_IS_FULL`: Not all requested cnt bits is set.
- `ESP_ERR_NOT_SUPPORTED`: The block does not support this command.

`esp_err_t esp_efuse_set_read_protect` (`esp_efuse_block_t` blk)

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

**Parameters** **blk** –[in] Block number of eFuse. (`EFUSE_BLK1`, `EFUSE_BLK2` and `EFUSE_BLK3`)

#### Returns

- `ESP_OK`: The operation was successfully completed.
- `ESP_ERR_INVALID_ARG`: Error in the passed arguments.
- `ESP_ERR_EFUSE_CNT_IS_FULL`: Not all requested cnt bits is set.
- `ESP_ERR_NOT_SUPPORTED`: The block does not support this command.

`int esp_efuse_get_field_size` (const `esp_efuse_desc_t` \*field[])

Returns the number of bits used by field.

**Parameters** **field** –[in] A pointer to the structure describing the fields of efuse.

**Returns** Returns the number of bits used by field.

uint32\_t **esp\_efuse\_read\_reg** (esp\_efuse\_block\_t blk, unsigned int num\_reg)

Returns value of efuse register.

This is a thread-safe implementation. Example: EFUSE\_BLK2\_RDATA3\_REG where (blk=2, num\_reg=3)

---

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

---

#### Parameters

- **blk** –[in] Block number of eFuse.
- **num\_reg** –[in] The register number in the block.

**Returns** Value of register

*esp\_err\_t* **esp\_efuse\_write\_reg** (esp\_efuse\_block\_t blk, unsigned int num\_reg, uint32\_t val)

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE\_BLK3\_WDATA0\_REG where (blk=3, num\_reg=0)

#### Parameters

- **blk** –[in] Block number of eFuse.
- **num\_reg** –[in] The register number in the block.
- **val** –[in] Value to write.

#### Returns

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.

esp\_efuse\_coding\_scheme\_t **esp\_efuse\_get\_coding\_scheme** (esp\_efuse\_block\_t blk)

Return efuse coding scheme for blocks.

Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

**Parameters** **blk** –[in] Block number of eFuse.

**Returns** Return efuse coding scheme for blocks

*esp\_err\_t* **esp\_efuse\_read\_block** (esp\_efuse\_block\_t blk, void \*dst\_key, size\_t offset\_in\_bits, size\_t size\_bits)

Read key to efuse block starting at the offset and the required size.

---

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

---

#### Parameters

- **blk** –[in] Block number of eFuse.
- **dst\_key** –[in] A pointer to array that will contain the result of reading.
- **offset\_in\_bits** –[in] Start bit in block.
- **size\_bits** –[in] The number of bits required to read.

#### Returns

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

*esp\_err\_t* **esp\_efuse\_write\_block** (esp\_efuse\_block\_t blk, const void \*src\_key, size\_t offset\_in\_bits, size\_t size\_bits)

Write key to efuse block starting at the offset and the required size.

**Parameters**

- **blk** –[in] Block number of eFuse.
- **src\_key** –[in] A pointer to array that contains the key for writing.
- **offset\_in\_bits** –[in] Start bit in block.
- **size\_bits** –[in] The number of bits required to write.

**Returns**

- ESP\_OK: The operation was successfully completed.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits

uint32\_t **esp\_efuse\_get\_pkg\_ver** (void)

Returns chip package from efuse.

**Returns** chip package

void **esp\_efuse\_reset** (void)

Reset efuse write registers.

Efuse write registers are written to zero, to negate any changes that have been staged here.

---

**Note:** This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller's responsibility to serialise.

---

*esp\_err\_t* **esp\_efuse\_disable\_rom\_download\_mode** (void)

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

---

**Note:** Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

---

---

**Note:** If ROM Download Mode is already disabled, this function does nothing and returns success.

---

**Returns**

- ESP\_OK If the eFuse was successfully burned, or had already been burned.
- ESP\_ERR\_NOT\_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode
- ESP\_ERR\_INVALID\_STATE (ESP32 only) This eFuse is write protected and cannot be written

*esp\_err\_t* **esp\_efuse\_set\_rom\_log\_scheme** (*esp\_efuse\_rom\_log\_scheme\_t* log\_scheme)

Set boot ROM log scheme via eFuse.

---

**Note:** By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can't be changed again.

---

**Parameters** **log\_scheme** –Supported ROM log scheme

**Returns**

- ESP\_OK If the eFuse was successfully burned, or had already been burned.
- ESP\_ERR\_NOT\_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme

- `ESP_ERR_INVALID_STATE` This eFuse is write protected or has been burned already

*esp\_err\_t* **esp\_efuse\_enable\_rom\_secure\_download\_mode** (void)

Switch ROM Download Mode to Secure Download mode via eFuse.

Permanently enables Secure Download mode. This mode limits the use of ROM Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.

---

**Note:** If Secure Download mode is already enabled, this function does nothing and returns success.

---

---

**Note:** Disabling the ROM Download Mode also disables Secure Download Mode.

---

#### Returns

- `ESP_OK` If the eFuse was successfully burned, or had already been burned.
- `ESP_ERR_INVALID_STATE` ROM Download Mode has been disabled via eFuse, so Secure Download mode is unavailable.

*uint32\_t* **esp\_efuse\_read\_secure\_version** (void)

Return `secure_version` from efuse field.

**Returns** Secure version from efuse field

bool **esp\_efuse\_check\_secure\_version** (*uint32\_t* `secure_version`)

Check `secure_version` from app and `secure_version` and from efuse field.

**Parameters** `secure_version` – Secure version from app.

#### Returns

- True: If version of app is equal or more then `secure_version` from efuse.

*esp\_err\_t* **esp\_efuse\_update\_secure\_version** (*uint32\_t* `secure_version`)

Write efuse field by `secure_version` value.

Update the `secure_version` value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

**Parameters** `secure_version` –[in] Secure version from app.

#### Returns

- `ESP_OK`: Successful.
- `ESP_FAIL`: secure version of app cannot be set to efuse field.
- `ESP_ERR_NOT_SUPPORTED`: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

*esp\_err\_t* **esp\_efuse\_batch\_write\_begin** (void)

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call `begin()` then perform as usually the necessary operations read and write and at the end call `commit()` to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last `commit()` function. The number of `begin()` functions should be equal to the number of `commit()` functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

```

// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3); // ESP_EFUSE_1 == 1, here we write a new
↳value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1
↳because uncommitted changes are not readable, it will be available only
↳after commit.
...

// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be
↳done in the last commit().

...

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 3.

```

---

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

---

### Returns

- ESP\_OK: Successful.

*esp\_err\_t* **esp\_efuse\_batch\_write\_cancel** (void)

Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

### Returns

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_STATE: The batch mode was not set.

*esp\_err\_t* **esp\_efuse\_batch\_write\_commit** (void)

Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

### Returns

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_STATE: The deferred writing mode was not set.

bool **esp\_efuse\_block\_is\_empty** (esp\_efuse\_block\_t block)

Checks that the given block is empty.

### Returns

- True: The block is empty.
- False: The block is not empty or was an error.

bool **esp\_efuse\_get\_key\_dis\_read** (esp\_efuse\_block\_t block)

Returns a read protection for the key block.

**Parameters** **block** –[in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

**Returns** True: The key block is read protected False: The key block is readable.

*esp\_err\_t* **esp\_efuse\_set\_key\_dis\_read** (esp\_efuse\_block\_t block)

Sets a read protection for the key block.

**Parameters** **block** –[in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

**Returns**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

bool **esp\_efuse\_get\_key\_dis\_write** (esp\_efuse\_block\_t block)

Returns a write protection for the key block.

**Parameters** **block** –[in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

**Returns** True: The key block is write protected False: The key block is writeable.

*esp\_err\_t* **esp\_efuse\_set\_key\_dis\_write** (esp\_efuse\_block\_t block)

Sets a write protection for the key block.

**Parameters** **block** –[in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX

**Returns**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

bool **esp\_efuse\_key\_block\_unused** (esp\_efuse\_block\_t block)

Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0 (ESP\_EFUSE\_KEY\_PURPOSE\_USER)

**Parameters** **block** –key block to check.

**Returns**

- True if key block is unused,
- False if key block is used or the specified block index is not a key block.

bool **esp\_efuse\_find\_purpose** (esp\_efuse\_purpose\_t purpose, esp\_efuse\_block\_t \*block)

Find a key block with the particular purpose set.

**Parameters**

- **purpose** –[in] Purpose to search for.
- **block** –[out] Pointer in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX which will be set to the key block if found. Can be NULL, if only need to test the key block exists.

**Returns**

- True: If found,
- False: If not found (value at block pointer is unchanged).

bool **esp\_efuse\_get\_keypurpose\_dis\_write** (esp\_efuse\_block\_t block)

Returns a write protection of the key purpose field for an efuse key block.

---

**Note:** For ESP32: no keypurpose, it returns always True.

---

**Parameters** **block** –[in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX  
**Returns** True: The key purpose is write protected. False: The key purpose is writeable.

esp\_efuse\_purpose\_t **esp\_efuse\_get\_key\_purpose** (esp\_efuse\_block\_t block)

Returns the current purpose set for an efuse key block.

**Parameters** **block** –[in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX  
**Returns**

- Value: If Successful, it returns the value of the purpose related to the given key block.
- ESP\_EFUSE\_KEY\_PURPOSE\_MAX: Otherwise.

const esp\_efuse\_desc\_t \*\***esp\_efuse\_get\_purpose\_field** (esp\_efuse\_block\_t block)

Returns a pointer to a key purpose for an efuse key block.

To get the value of this field use esp\_efuse\_read\_field\_blob() or esp\_efuse\_get\_key\_purpose().

**Parameters** **block** –[in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX  
**Returns** Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

const esp\_efuse\_desc\_t \*\***esp\_efuse\_get\_key** (esp\_efuse\_block\_t block)

Returns a pointer to a key block.

**Parameters** **block** –[in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX  
**Returns** Pointer: If Successful returns a pointer to the corresponding efuse field otherwise NULL.

esp\_err\_t **esp\_efuse\_set\_key\_purpose** (esp\_efuse\_block\_t block, esp\_efuse\_purpose\_t purpose)

Sets a key purpose for an efuse key block.

**Parameters**

- **block** –[in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX
- **purpose** –[in] Key purpose.

**Returns**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

esp\_err\_t **esp\_efuse\_set\_keypurpose\_dis\_write** (esp\_efuse\_block\_t block)

Sets a write protection of the key purpose field for an efuse key block.

**Parameters** **block** –[in] A key block in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX  
**Returns**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

esp\_efuse\_block\_t **esp\_efuse\_find\_unused\_key\_block** (void)

Search for an unused key block and return the first one found.

See esp\_efuse\_key\_block\_unused for a description of an unused key block.

**Returns** First unused key block, or EFUSE\_BLK\_KEY\_MAX if no unused key block is found.

unsigned **esp\_efuse\_count\_unused\_key\_blocks** (void)

Return the number of unused efuse key blocks in the range EFUSE\_BLK\_KEY0..EFUSE\_BLK\_KEY\_MAX.

bool **esp\_efuse\_get\_digest\_revoke** (unsigned num\_digest)

Returns the status of the Secure Boot public key digest revocation bit.

**Parameters** **num\_digest** –[in] The number of digest in range 0..2

**Returns**

- True: If key digest is revoked,
- False; If key digest is not revoked.

*esp\_err\_t* **esp\_efuse\_set\_digest\_revoke** (unsigned num\_digest)

Sets the Secure Boot public key digest revocation bit.

**Parameters** num\_digest –[in] The number of digest in range 0..2

**Returns**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

bool **esp\_efuse\_get\_write\_protect\_of\_digest\_revoke** (unsigned num\_digest)

Returns a write protection of the Secure Boot public key digest revocation bit.

**Parameters** num\_digest –[in] The number of digest in range 0..2

**Returns** True: The revocation bit is write protected. False: The revocation bit is writeable.

*esp\_err\_t* **esp\_efuse\_set\_write\_protect\_of\_digest\_revoke** (unsigned num\_digest)

Sets a write protection of the Secure Boot public key digest revocation bit.

**Parameters** num\_digest –[in] The number of digest in range 0..2

**Returns**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

*esp\_err\_t* **esp\_efuse\_write\_key** (esp\_efuse\_block\_t block, esp\_efuse\_purpose\_t purpose, const void \*key, size\_t key\_size\_bytes)

Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

**Parameters**

- **block** –[in] Block to read purpose for. Must be in range EFUSE\_BLK\_KEY0 to EFUSE\_BLK\_KEY\_MAX. Key block must be unused (esp\_efuse\_key\_block\_unused).
- **purpose** –[in] Purpose to set for this key. Purpose must be already unset.
- **key** –[in] Pointer to data to write.
- **key\_size\_bytes** –[in] Bytes length of data to write.

**Returns**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_INVALID\_STATE: Error in efuses state, unused block not found.
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

*esp\_err\_t* **esp\_efuse\_write\_keys** (const esp\_efuse\_purpose\_t purposes[], uint8\_t keys[][32], unsigned number\_of\_keys)

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

**Parameters**

- **purposes** –[in] Array of purposes (purpose[number\_of\_keys]).
- **keys** –[in] Array of keys (uint8\_t keys[number\_of\_keys][32]). Each key is 32 bytes long.
- **number\_of\_keys** –[in] The number of keys to write (up to 6 keys).

**Returns**

- ESP\_OK: Successful.
- ESP\_ERR\_INVALID\_ARG: Error in the passed arguments.
- ESP\_ERR\_INVALID\_STATE: Error in efuses state, unused block not found.
- ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS: Error not enough unused key blocks available
- ESP\_ERR\_EFUSE\_REPEATED\_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP\_ERR\_CODING: Error range of data does not match the coding scheme.

*esp\_err\_t* **esp\_secure\_boot\_read\_key\_digests** (ets\_secure\_boot\_key\_digests\_t \*trusted\_keys)

Read key digests from efuse. Any revoked/missing digests will be marked as NULL.

**Parameters** *trusted\_keys* –[out] The number of digest in range 0..2

**Returns**

- ESP\_OK: Successful.
- ESP\_FAIL: If *trusted\_keys* is NULL or there is no valid digest.

*esp\_err\_t* **esp\_efuse\_check\_errors** (void)

Checks eFuse errors in BLOCK0.

It does a BLOCK0 check if eFuse EFUSE\_ERR\_RST\_ENABLE is set. If BLOCK0 has an error, it prints the error and returns ESP\_FAIL, which should be treated as esp\_restart.

---

**Note:** Refers to ESP32-C3 only.

---

**Returns**

- ESP\_OK: No errors in BLOCK0.
- ESP\_FAIL: Error in BLOCK0 requiring reboot.

**Structures**

struct **esp\_efuse\_desc\_t**

Type definition for an eFuse field.

**Public Members**

*esp\_efuse\_block\_t* **efuse\_block**

Block of eFuse

*uint8\_t* **bit\_start**

Start bit [0..255]

*uint16\_t* **bit\_count**

Length of bit field [1..-]

**Macros**

**ESP\_ERR\_EFUSE**

Base error code for efuse api.

**ESP\_OK\_EFUSE\_CNT**

OK the required number of bits is set.

**ESP\_ERR\_EFUSE\_CNT\_IS\_FULL**

Error field is full.

**ESP\_ERR\_EFUSE\_REPEATED\_PROG**

Error repeated programming of programmed bits is strictly forbidden.

**ESP\_ERR\_CODING**

Error while a encoding operation.

**ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS**

Error not enough unused key blocks available

**ESP\_ERR\_DAMAGED\_READING**

Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

**Enumerations**

enum **esp\_efuse\_rom\_log\_scheme\_t**

Type definition for ROM log scheme.

*Values:*

enumerator **ESP\_EFUSE\_ROM\_LOG\_ALWAYS\_ON**

Always enable ROM logging

enumerator **ESP\_EFUSE\_ROM\_LOG\_ON\_GPIO\_LOW**

ROM logging is enabled when specific GPIO level is low during start up

enumerator **ESP\_EFUSE\_ROM\_LOG\_ON\_GPIO\_HIGH**

ROM logging is enabled when specific GPIO level is high during start up

enumerator **ESP\_EFUSE\_ROM\_LOG\_ALWAYS\_OFF**

Disable ROM logging permanently

## 2.7.7 Error Codes and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling.

For general information about error codes in ESP-IDF, see [Error Handling](#).

For the full list of error codes defined in ESP-IDF, see [Error Code Reference](#).

### API Reference

#### Header File

- `components/esp_common/include/esp_err.h`

## Functions

const char \***esp\_err\_to\_name** (*esp\_err\_t* code)

Returns string for esp\_err\_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen\_esp\_err\_to\_name.py which should be run each time an esp\_err\_t error is modified, created or removed from the IDF project.

**Parameters** **code** –esp\_err\_t error code

**Returns** string error message

const char \***esp\_err\_to\_name\_r** (*esp\_err\_t* code, char \*buf, size\_t buflen)

Returns string for esp\_err\_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp\_err\_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen\_esp\_err\_to\_name.py which should be run each time an esp\_err\_t error is modified, created or removed from the IDF project.

### Parameters

- **code** –esp\_err\_t error code
- **buf** –[out] buffer where the error message should be written
- **buflen** –Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

**Returns** buf containing the string error message

## Macros

### ESP\_OK

esp\_err\_t value indicating success (no error)

### ESP\_FAIL

Generic esp\_err\_t code indicating failure

### ESP\_ERR\_NO\_MEM

Out of memory

### ESP\_ERR\_INVALID\_ARG

Invalid argument

### ESP\_ERR\_INVALID\_STATE

Invalid state

### ESP\_ERR\_INVALID\_SIZE

Invalid size

### ESP\_ERR\_NOT\_FOUND

Requested resource not found

### ESP\_ERR\_NOT\_SUPPORTED

Operation or feature not supported

### ESP\_ERR\_TIMEOUT

Operation timed out

**ESP\_ERR\_INVALID\_RESPONSE**

Received response was invalid

**ESP\_ERR\_INVALID\_CRC**

CRC or checksum was invalid

**ESP\_ERR\_INVALID\_VERSION**

Version was invalid

**ESP\_ERR\_INVALID\_MAC**

MAC address was invalid

**ESP\_ERR\_NOT\_FINISHED**

There are items remained to retrieve

**ESP\_ERR\_WIFI\_BASE**

Starting number of WiFi error codes

**ESP\_ERR\_MESH\_BASE**

Starting number of MESH error codes

**ESP\_ERR\_FLASH\_BASE**

Starting number of flash error codes

**ESP\_ERR\_HW\_CRYPTO\_BASE**

Starting number of HW cryptography module error codes

**ESP\_ERR\_MEMPROT\_BASE**

Starting number of Memory Protection API error codes

**ESP\_ERROR\_CHECK** (x)

Macro which can be used to check the error code, and terminate the program in case the code is not ESP\_OK. Prints the error code, error location, and the failed statement to serial output.

Disabled if assertions are disabled.

**ESP\_ERROR\_CHECK\_WITHOUT\_ABORT** (x)

Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP\_ERROR\_CHECK(), this prints the same error message but isn't terminating the program.

**Type Definitions**

```
typedef int esp_err_t
```

**2.7.8 ESP HTTPS OTA****Overview**

esp\_https\_ota provides simplified APIs to perform firmware upgrades over HTTPS. It's an abstraction layer over existing OTA APIs.

## Application Example

```
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_err_t ret = esp_https_ota(&config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

## Partial Image Download over HTTPS

To use partial image download feature, enable `partial_http_download` configuration in `esp_https_ota_config_t`. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified size. Maximum content length of each request can be specified by setting `max_http_request_size` to required value.

This option is useful while fetching image from a service like AWS S3, where mbedTLS Rx buffer size (`CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN`) can be set to lower value which is not possible without enabling this configuration.

Default value of mbedTLS Rx buffer size is set to 16K. By using `partial_http_download` with `max_http_request_size` of 4K, size of mbedTLS Rx buffer can be reduced to 4K. With this configuration, memory saving of around 12K is expected.

## Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer [Secure OTA Updates Without Secure boot](#)

## API Reference

### Header File

- `components/esp_https_ota/include/esp_https_ota.h`

### Functions

`esp_err_t esp_https_ota` (const `esp_http_client_config_t` \*config)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `config`.

---

**Note:** This API handles the entire OTA operation, so if this API is being used then no other APIs from `esp_https_ota` component should be called. If more information and control is needed during the HTTPS OTA process, then one can use `esp_https_ota_begin` and subsequent APIs. If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image.

---

**Parameters** `config` –[in] pointer to `esp_http_client_config_t` structure.

**Returns**

- ESP\_OK: OTA data updated, next reboot will use specified partition.
- ESP\_FAIL: For generic failure.
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_OTA\_VALIDATE\_FAILED: Invalid app image
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for OTA operation.
- ESP\_ERR\_FLASH\_OP\_TIMEOUT or ESP\_ERR\_FLASH\_OP\_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's app\_update component.

`esp_err_t esp_https_ota_begin(esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)`

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must be invoked first. If this function returns successfully, then `esp_https_ota_perform` should be called to continue with the OTA process and there should be a call to `esp_https_ota_finish` on completion of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert of URLs differ then it should be appended to `cert_pem` member of `http_config`, which is a part of `ota_config`. In case of error, this API explicitly sets `handle` to NULL.

---

**Note:** This API is blocking, so setting `is_async` member of `http_config` structure will result in an error.

---

**Parameters**

- `ota_config` –[in] pointer to `esp_https_ota_config_t` structure
- `handle` –[out] pointer to an allocated data of type `esp_https_ota_handle_t` which will be initialised in this function

**Returns**

- ESP\_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection established
- ESP\_FAIL: For generic failure.
- ESP\_ERR\_INVALID\_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in app\_update component and `esp_http_client` component in esp-idf.

`esp_err_t esp_https_ota_perform(esp_https_ota_handle_t https_ota_handle)`

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if `esp_https_ota_begin()` returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

**Parameters** `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure

**Returns**

- ESP\_ERR\_HTTPS\_OTA\_IN\_PROGRESS: OTA update is in progress, call this API again to continue.
- ESP\_OK: OTA update was successful
- ESP\_FAIL: OTA update failed
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_OTA\_VALIDATE\_FAILED: Invalid app image
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for OTA operation.
- ESP\_ERR\_FLASH\_OP\_TIMEOUT or ESP\_ERR\_FLASH\_OP\_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf's app\_update component.

`bool esp_https_ota_is_complete_data_received(esp_https_ota_handle_t https_ota_handle)`

Checks if complete data was received or not.

---

**Note:** This API can be called just before `esp_https_ota_finish()` to validate if the complete image was indeed received.

---

**Parameters** `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure

**Returns**

- false
- true

*esp\_err\_t* `esp_https_ota_finish` (*esp\_https\_ota\_handle\_t* `https_ota_handle`)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

---

**Note:** If this API returns successfully, `esp_restart()` must be called to boot from the new firmware image. `esp_https_ota_finish` should not be called after calling `esp_https_ota_abort`

---

**Parameters** `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure

**Returns**

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_OTA_VALIDATE_FAILED`: Invalid app image

*esp\_err\_t* `esp_https_ota_abort` (*esp\_https\_ota\_handle\_t* `https_ota_handle`)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

---

**Note:** `esp_https_ota_abort` should not be called after calling `esp_https_ota_finish`

---

**Parameters** `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure

**Returns**

- `ESP_OK`: Clean-up successful
- `ESP_ERR_INVALID_STATE`: Invalid ESP HTTPS OTA state
- `ESP_FAIL`: OTA not started
- `ESP_ERR_NOT_FOUND`: OTA handle not found
- `ESP_ERR_INVALID_ARG`: Invalid argument

*esp\_err\_t* `esp_https_ota_get_img_desc` (*esp\_https\_ota\_handle\_t* `https_ota_handle`, *esp\_app\_desc\_t* `*new_app_info`)

Reads app description from image header. The app description provides information like the “Firmware version” of the image.

---

**Note:** This API can be called only after `esp_https_ota_begin()` and before `esp_https_ota_perform()`. Calling this API is not mandatory.

---

**Parameters**

- `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure
- `new_app_info` –[out] pointer to an allocated `esp_app_desc_t` structure

**Returns**

- `ESP_ERR_INVALID_ARG`: Invalid arguments

- ESP\_FAIL: Failed to read image descriptor
- ESP\_OK: Successfully read image descriptor

int **esp\_https\_ota\_get\_image\_len\_read** (*esp\_https\_ota\_handle\_t* https\_ota\_handle)

This function returns OTA image data read so far.

---

**Note:** This API should be called only if `esp_https_ota_perform()` has been called atleast once or if `esp_https_ota_get_img_desc` has been called before.

---

**Parameters** `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure

**Returns**

- -1 On failure
- total bytes read so far

int **esp\_https\_ota\_get\_image\_size** (*esp\_https\_ota\_handle\_t* https\_ota\_handle)

This function returns OTA image total size.

---

**Note:** This API should be called after `esp_https_ota_begin()` has been already called. This can be used to create some sort of progress indication (in combination with `esp_https_ota_get_image_len_read()`)

---

**Parameters** `https_ota_handle` –[in] pointer to `esp_https_ota_handle_t` structure

**Returns**

- -1 On failure or chunked encoding
- total bytes of image

## Structures

struct **esp\_https\_ota\_config\_t**

ESP HTTPS OTA configuration.

## Public Members

const *esp\_http\_client\_config\_t* \***http\_config**

ESP HTTP client configuration

*http\_client\_init\_cb\_t* **http\_client\_init\_cb**

Callback after ESP HTTP client is initialised

bool **bulk\_flash\_erase**

Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

bool **partial\_http\_download**

Enable Firmware image to be downloaded over multiple HTTP requests

int **max\_http\_request\_size**

Maximum request size for partial HTTP download

## Macros

`ESP_ERR_HTTPS_OTA_BASE`

`ESP_ERR_HTTPS_OTA_IN_PROGRESS`

## Type Definitions

```
typedef void *esp_https_ota_handle_t
```

```
typedef esp_err_t (*http_client_init_cb_t)(esp_http_client_handle_t)
```

## 2.7.9 POSIX Threads Support

### Overview

ESP-IDF is based on FreeRTOS but offers a range of POSIX-compatible APIs that allow easy porting of third party code. This includes support for common parts of the POSIX Threads “pthreads” API.

POSIX Threads are implemented in ESP-IDF as wrappers around equivalent FreeRTOS features. The runtime memory or performance overhead of using the pthreads API is quite low, but not every feature available in either pthreads or FreeRTOS is available via the ESP-IDF pthreads support.

Pthreads can be used in ESP-IDF by including standard `pthread.h` header, which is included in the toolchain `libc`. An additional ESP-IDF specific header, `esp_pthread.h`, provides additional non-POSIX APIs for using some ESP-IDF features with pthreads.

C++ Standard Library implementations for `std::thread`, `std::mutex`, `std::condition_variable`, etc. are implemented using pthreads (via GCC `libstdc++`). Therefore, restrictions mentioned here also apply to the equivalent C++ standard library functionality.

### RTOS Integration

Unlike many operating systems using POSIX Threads, ESP-IDF is a real-time operating system with a real-time scheduler. This means that a thread will only stop running if a higher priority task is ready to run, the thread blocks on an OS synchronization structure like a mutex, or the thread calls any of the functions `sleep`, `vTaskDelay()`, or `usleep`.

---

**Note:** If calling a standard `libc` or C++ sleep function, such as `usleep` defined in `unistd.h`, then the task will only block and yield the CPU if the sleep time is longer than *one FreeRTOS tick period*. If the time is shorter, the thread will busy-wait instead of yielding to another RTOS task.

---

By default all POSIX Threads have the same RTOS priority, but it is possible to change this by calling a *custom API*.

### Standard features

The following standard APIs are implemented in ESP-IDF.

Refer to standard POSIX Threads documentation, or `pthread.h`, for details about the standard arguments and behaviour of each function. Differences or limitations compared to the standard APIs are noted below.

### Thread APIs

- `pthread_create()` - The `attr` argument is supported for setting stack size and detach state only. Other attribute fields are ignored. - Unlike FreeRTOS task functions, the `start_routine` function is allowed to return. A “detached” type thread is automatically deleted if the function returns. The default “joinable” type thread will be suspended until `pthread_join()` is called on it.
- `pthread_join()`
- `pthread_detach()`
- `pthread_exit()`
- `sched_yield()`
- `pthread_self()` - An assert will fail if this function is called from a FreeRTOS task which is not a pthread.
- `pthread_equal()`

### Thread Attributes

- `pthread_attr_init()`
- `pthread_attr_destroy()` - This function doesn't need to free any resources and instead resets the `attr` structure to defaults (implementation is same as `pthread_attr_init()`).
- `pthread_attr_getstacksize()` / `pthread_attr_setstacksize()`
- `pthread_attr_getdetachstate()` / `pthread_attr_setdetachstate()`

### Once

- `pthread_once()`

Static initializer constant `PTHREAD_ONCE_INIT` is supported.

---

**Note:** This function can be called from tasks created using either pthread or FreeRTOS APIs

---

**Mutexes** POSIX Mutexes are implemented as FreeRTOS Mutex Semaphores (normal type for “fast” or “error check” mutexes, and Recursive type for “recursive” mutexes). This means that they have the same priority inheritance behaviour as mutexes created with `xSemaphoreCreateMutex()`.

- `pthread_mutex_init()`
- `pthread_mutex_destroy()`
- `pthread_mutex_lock()`
- `pthread_mutex_timedlock()`
- `pthread_mutex_trylock()`
- `pthread_mutex_unlock()`
- `pthread_mutexattr_init()`
- `pthread_mutexattr_destroy()`
- `pthread_mutexattr_gettype()` / `pthread_mutexattr_settype()`

Static initializer constant `PTHREAD_MUTEX_INITIALIZER` is supported, but the non-standard static initializer constants for other mutex types are not supported.

---

**Note:** These functions can be called from tasks created using either pthread or FreeRTOS APIs

---

### Condition Variables

- `pthread_cond_init()` - The `attr` argument is not implemented and is ignored.
- `pthread_cond_destroy()`
- `pthread_cond_signal()`
- `pthread_cond_broadcast()`
- `pthread_cond_wait()`
- `pthread_cond_timedwait()`

Static initializer constant `PTHREAD_COND_INITIALIZER` is supported.

- The resolution of `pthread_cond_timedwait()` timeouts is the RTOS tick period (see [CONFIG\\_FREERTOS\\_HZ](#)). Timeouts may be delayed up to one tick period after the requested timeout.

---

**Note:** These functions can be called from tasks created using either `pthread` or FreeRTOS APIs

---

### Read/Write Locks

- `pthread_rwlock_init()` - The `attr` argument is not implemented and is ignored.
- `pthread_rwlock_destroy()`
- `pthread_rwlock_rdlock()`
- `pthread_rwlock_wrlock()`
- `pthread_rwlock_unlock()`

Static initializer constant `PTHREAD_RWLOCK_INITIALIZER` is supported.

---

**Note:** These functions can be called from tasks created using either `pthread` or FreeRTOS APIs. Note also that the current `pthread` reader-writer-locks implementation is based on the condition variable API. The performance is not optimal when locking only for a minimal amount of time like e.g. accessing a simple variable. In these cases with minimal locking time, a simple mutex might be faster.

---

### Thread-Specific Data

- `pthread_key_create()` - The `destr_function` argument is supported and will be called if a thread function exits normally, calls `pthread_exit()`, or if the underlying task is deleted directly using the FreeRTOS function `vTaskDelete()`.
- `pthread_key_delete()`
- `pthread_setspecific()` / `pthread_getspecific()`

---

**Note:** These functions can be called from tasks created using either `pthread` or FreeRTOS APIs

---

---

**Note:** There are other options for thread local storage in ESP-IDF, including options with higher performance. See [Thread Local Storage](#).

---

### Not Implemented

The `pthread.h` header is a standard header and includes additional APIs and features which are not implemented in ESP-IDF. These include:

- `pthread_cancel()` returns `ENOSYS` if called.
- `pthread_condattr_init()` returns `ENOSYS` if called.

Other POSIX Threads functions (not listed here) are not implemented and will produce either a compiler or a linker error if referenced from an ESP-IDF application. If you identify a useful API that you would like to see implemented in ESP-IDF, please open a *feature request on GitHub* <<https://github.com/espressif/esp-idf/issues>> with the details.

### ESP-IDF Extensions

The API `esp_pthread_set_cfg()` defined in the `esp_pthreads.h` header offers custom extensions to control how subsequent calls to `pthread_create()` will behave. Currently the following configuration can be set:

- Default stack size of new threads, if not specified when calling `pthread_create()` (overrides `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`).
- RTOS priority of new threads (overrides `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`).
- Core affinity / core pinning of new threads (overrides `CONFIG_PTHREAD_TASK_CORE_DEFAULT`).
- FreeRTOS task name for new threads (overrides `CONFIG_PTHREAD_TASK_NAME_DEFAULT`)

This configuration is scoped to the calling thread (or FreeRTOS task), meaning that `esp_thread_set_cfg()` can be called independently in different threads or tasks. If the `inherit_cfg` flag is set in the current configuration then any new thread created will inherit the creator's configuration (if that thread calls `pthread_create()` recursively), otherwise the new thread will have the default configuration.

## Examples

- [system/pthread](#) demonstrates using the pthreads API to create threads
- [cxx/pthread](#) demonstrates using C++ Standard Library functions with threads

## API Reference

### Header File

- [components/pthread/include/esp\\_thread.h](#)

### Functions

`esp_thread_cfg_t esp_thread_get_default_config` (void)

Creates a default pthread configuration based on the values set via menuconfig.

**Returns** A default configuration structure.

`esp_err_t esp_thread_set_cfg` (const `esp_thread_cfg_t` \*cfg)

Configure parameters for creating pthread.

This API allows you to configure how the subsequent `pthread_create()` call will behave. This call can be used to setup configuration parameters like stack size, priority, configuration inheritance etc.

If the 'inherit' flag in the configuration structure is enabled, then the same configuration is also inherited in the thread subtree.

---

**Note:** Passing non-NULL attributes to `pthread_create()` will override the `stack_size` parameter set using this API

---

**Parameters** `cfg` –The pthread config parameters

**Returns**

- `ESP_OK` if configuration was successfully set
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_ERR_INVALID_ARG` if `stack_size` is less than `PTHREAD_STACK_MIN`

`esp_err_t esp_thread_get_cfg` (`esp_thread_cfg_t` \*p)

Get current pthread creation configuration.

This will retrieve the current configuration that will be used for creating threads.

**Parameters** `p` –Pointer to the pthread config structure that will be updated with the currently configured parameters

**Returns**

- `ESP_OK` if the configuration was available
- `ESP_ERR_NOT_FOUND` if a configuration wasn't previously set

`esp_err_t esp_thread_init` (void)

Initialize pthread library.

## Structures

struct `esp_thread_cfg_t`

pthread configuration structure that influences pthread creation

### Public Members

size\_t `stack_size`

The stack size of the pthread.

size\_t `prio`

The thread's priority.

bool `inherit_cfg`

Inherit this configuration further.

const char \*`thread_name`

The thread name.

int `pin_to_core`

The core id to pin the thread to. Has the same value range as xCoreId argument of xTaskCreatePinnedToCore.

## Macros

`PTHREAD_STACK_MIN`

## 2.7.10 Event Loop Library

### Overview

The event loop library allows components to declare events to which other components can register handlers –code which will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the wifi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

### Using `esp_event` APIs

There are two objects of concern for users of this library: events and event loops.

Events are occurrences of note. For example, for WiFi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more [here](#). Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop library APIs.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as `esp_event_handler_t`.
2. An event loop is created using `esp_event_loop_create()`, which outputs a handle to the loop of type `esp_event_loop_handle_t`. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed [here](#).
3. Components register event handlers to the loop using `esp_event_handler_register_with()`. Handlers can be registered with multiple loops, more on that [here](#).
4. Event sources post an event to the loop using `esp_event_post_to()`.
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using `esp_event_handler_unregister_with()`.
6. Event loops which are no longer needed can be deleted using `esp_event_loop_delete()`.

In code, the flow above may look like as follows:

```
// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void*
↳event_data)
{
    // Event handler logic
}

void app_main()
{
    // 2. A configuration structure of type esp_event_loop_args_t is needed to
↳specify the properties of the loop to be
    // created. A handle of type esp_event_loop_handle_t is obtained, which is
↳needed by the other APIs to reference the loop
    // to perform their operations on.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...
        .task_priority = ...,
        .task_stack_size = ...,
        .task_core_id = ...
    };

    esp_event_loop_handle_t loop_handle;

    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID
↳specifies a hypothetical
    // event that handler run_on_event should execute on when it gets posted to
↳the loop.
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳on_event, ...);

    ...

    // 4. Post events to the loop. This queues the event on the event loop. At
↳some point in time
    // the event loop executes the event handler registered to the posted event,
↳in this case run_on_event.
    // For simplicity sake this example calls esp_event_post_to from app_main, but
↳posting can be done from
    // any other tasks (which is the more interesting use case).
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

    ...

    // 5. Unregistering an unneeded handler
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_
↳on_event);
```

(continues on next page)

```

...

// 6. Deleting an unneeded event loop
esp_event_loop_delete(loop_handle);
}

```

### Declaring and defining events

As mentioned previously, events consists of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person's last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:

```
ESP_EVENT_DECLARE_BASE(EVENT_BASE)
```

Event base definition:

```
ESP_EVENT_DEFINE_BASE(EVENT_BASE)
```

**Note:** In IDF, the base identifiers for system events are uppercase and are postfixed with `_EVENT`. For example, the base for wifi events is declared and defined as `WIFI_EVENT`, the ethernet event base `ETHERNET_EVENT`, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros `ESP_EVENT_DECLARE_BASE` and `ESP_EVENT_DEFINE_BASE`).

For event ID's, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```

enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}

```

### Default Event Loop

The default event loop is a special type of loop used for system events (WiFi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loops equivalent.

User Event Loops	Default Event Loops
<code>esp_event_loop_create()</code>	<code>esp_event_loop_create_default()</code>
<code>esp_event_loop_delete()</code>	<code>esp_event_loop_delete_default()</code>
<code>esp_event_handler_register_with()</code>	<code>esp_event_handler_register()</code>
<code>esp_event_handler_unregister_with()</code>	<code>esp_event_handler_unregister()</code>
<code>esp_event_post_to()</code>	<code>esp_event_post()</code>

If you compare the signatures for both, they are mostly similar except the for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

### Notes on Handler Registration

It is possible to register a single handler to multiple events individually, i.e. using multiple calls to `esp_event_handler_register_with()`. For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier `ESP_EVENT_ANY_BASE` and special event ID `ESP_EVENT_ANY_ID`. These special identifiers may be passed as the event base and event ID arguments for `esp_event_handler_register_with()`.

Therefore, the valid arguments to `esp_event_handler_register_with()` are:

1. <event base>, <event ID> - handler executes when the event with base <event base> and event ID <event ID> gets posted to the loop
2. <event base>, `ESP_EVENT_ANY_ID` - handler executes when any event with base <event base> gets posted to the loop
3. `ESP_EVENT_ANY_BASE`, `ESP_EVENT_ANY_ID` - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_
↳event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_
↳on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID,
↳run_on_event_3, ...);
```

If the hypothetical event `MY_EVENT_BASE`, `MY_EVENT_ID` is posted, all three handlers `run_on_event_1`, `run_on_event_2`, and `run_on_event_3` would execute.

If the hypothetical event `MY_EVENT_BASE`, `MY_OTHER_EVENT_ID` is posted, only `run_on_event_2` and `run_on_event_3` would execute.

If the hypothetical event `MY_OTHER_EVENT_BASE`, `MY_OTHER_EVENT_ID` is posted, only `run_on_event_3` would execute.

**Handler Registration and Handler Dispatch Order** The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also gets executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

### Event loop profiling

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

## Application Example

Examples on using the `esp_event` library can be found in [system/esp\\_event](#). The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt `esp_event` library:

- [NMEA Parser](#), which will decode the statements received from GPS.

## API Reference

### Header File

- [components/esp\\_event/include/esp\\_event.h](#)

### Functions

*esp\_err\_t* **esp\_event\_loop\_create** (const *esp\_event\_loop\_args\_t* \*event\_loop\_args, *esp\_event\_loop\_handle\_t* \*event\_loop)

Create a new event loop.

#### Parameters

- **event\_loop\_args** –[in] configuration structure for the event loop to create
- **event\_loop** –[out] handle to the created event loop

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_INVALID\_ARG: event\_loop\_args or event\_loop was NULL
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for event loops list
- ESP\_FAIL: Failed to create task loop
- Others: Fail

*esp\_err\_t* **esp\_event\_loop\_delete** (*esp\_event\_loop\_handle\_t* event\_loop)

Delete an existing event loop.

**Parameters** **event\_loop** –[in] event loop to delete, must not be NULL

#### Returns

- ESP\_OK: Success
- Others: Fail

*esp\_err\_t* **esp\_event\_loop\_create\_default** (void)

Create default event loop.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for event loops list
- ESP\_FAIL: Failed to create task loop
- Others: Fail

*esp\_err\_t* **esp\_event\_loop\_delete\_default** (void)

Delete the default event loop.

#### Returns

- ESP\_OK: Success
- Others: Fail

*esp\_err\_t* **esp\_event\_loop\_run** (*esp\_event\_loop\_handle\_t* event\_loop, TickType\_t ticks\_to\_run)

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e task name was set to NULL in event\_loop\_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all of the allotted time waiting on

the event queue. Once an event has been unqueued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the unqueued event, and (2) during dispatch of the unqueued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last unqueued event.

In cases where waiting on the queue times out, `ESP_OK` is returned and not `ESP_ERR_TIMEOUT`, since it is normal behavior.

---

**Note:** encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

---

#### Parameters

- **event\_loop** –[in] event loop to dispatch posted events from, must not be NULL
- **ticks\_to\_run** –[in] number of ticks to run the loop

#### Returns

- `ESP_OK`: Success
- Others: Fail

`esp_err_t esp_event_handler_register` (`esp_event_base_t` event\_base, `int32_t` event\_id, `esp_event_handler_t` event\_handler, `void *event_handler_arg`)

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event\_base and event\_id
- all events of a certain base: specify exact event\_base and use `ESP_EVENT_ANY_ID` as the event\_id
- all events known by the loop: use `ESP_EVENT_ANY_BASE` for event\_base and `ESP_EVENT_ANY_ID` as the event\_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

---

**Note:** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register()` instead.

---

---

**Note:** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

---

#### Parameters

- **event\_base** –[in] the base id of the event to register the handler for
- **event\_id** –[in] the id of the event to register the handler for
- **event\_handler** –[in] the handler function which gets called when the event is dispatched
- **event\_handler\_arg** –[in] data, aside from event data, that is passed to the handler when it is called

#### Returns

- `ESP_OK`: Success
- `ESP_ERR_NO_MEM`: Cannot allocate memory for the handler
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id

- Others: Fail

*esp\_err\_t* **esp\_event\_handler\_register\_with** (*esp\_event\_loop\_handle\_t* event\_loop, *esp\_event\_base\_t* event\_base, int32\_t event\_id, *esp\_event\_handler\_t* event\_handler, void \*event\_handler\_arg)

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as `esp_event_handler_register`, except the additional specification of the event loop to register the handler to.

---

**Note:** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register_with()` instead.

---

---

**Note:** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

---

#### Parameters

- **event\_loop** –[in] the event loop to register this handler function to, must not be NULL
- **event\_base** –[in] the base id of the event to register the handler for
- **event\_id** –[in] the id of the event to register the handler for
- **event\_handler** –[in] the handler function which gets called when the event is dispatched
- **event\_handler\_arg** –[in] data, aside from event data, that is passed to the handler when it is called

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for the handler
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event id
- Others: Fail

*esp\_err\_t* **esp\_event\_handler\_instance\_register\_with** (*esp\_event\_loop\_handle\_t* event\_loop, *esp\_event\_base\_t* event\_base, int32\_t event\_id, *esp\_event\_handler\_t* event\_handler, void \*event\_handler\_arg, *esp\_event\_handler\_instance\_t* \*instance)

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact `event_base` and `event_id`
- all events of a certain base: specify exact `event_base` and use `ESP_EVENT_ANY_ID` as the `event_id`
- all events known by the loop: use `ESP_EVENT_ANY_BASE` for `event_base` and `ESP_EVENT_ANY_ID` as the `event_id`

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

---

**Note:** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

---

#### Parameters

- **event\_loop** –[in] the event loop to register this handler function to, must not be NULL
- **event\_base** –[in] the base id of the event to register the handler for
- **event\_id** –[in] the id of the event to register the handler for
- **event\_handler** –[in] the handler function which gets called when the event is dispatched
- **event\_handler\_arg** –[in] data, aside from event data, that is passed to the handler when it is called
- **instance** –[out] An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed but the handler should be deleted when the event loop is deleted, instance can be NULL.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for the handler
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event id or instance is NULL
- Others: Fail

```
esp_err_t esp_event_handler_instance_register(esp_event_base_t event_base, int32_t event_id,  
                                             esp_event_handler_t event_handler, void  
                                             *event_handler_arg,  
                                             esp_event_handler_instance_t *instance)
```

Register an instance of event handler to the default loop.

This function does the same as `esp_event_handler_instance_register_with`, except that it registers the handler to the default event loop.

---

**Note:** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

---

#### Parameters

- **event\_base** –[in] the base id of the event to register the handler for
- **event\_id** –[in] the id of the event to register the handler for
- **event\_handler** –[in] the handler function which gets called when the event is dispatched
- **event\_handler\_arg** –[in] data, aside from event data, that is passed to the handler when it is called
- **instance** –[out] An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed but the handler should be deleted when the event loop is deleted, instance can be NULL.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for the handler
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event id or instance is NULL
- Others: Fail

*esp\_err\_t* **esp\_event\_handler\_unregister** (*esp\_event\_base\_t* event\_base, int32\_t event\_id, *esp\_event\_handler\_t* event\_handler)

Unregister a handler with the system event loop (legacy).

Unregisters a handler so it will no longer be called during dispatch. Handlers can be unregistered for any combination of event\_base and event\_id which were previously registered. To unregister a handler, the event\_base and event\_id arguments must match exactly the arguments passed to esp\_event\_handler\_register() when that handler was registered. Passing ESP\_EVENT\_ANY\_BASE and/or ESP\_EVENT\_ANY\_ID will only unregister handlers that were registered with the same wildcard arguments.

---

**Note:** This function is obsolete and will be deprecated soon, please use esp\_event\_handler\_instance\_unregister() instead.

---

---

**Note:** When using ESP\_EVENT\_ANY\_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP\_EVENT\_ANY\_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

---

#### Parameters

- **event\_base** –[in] the base of the event with which to unregister the handler
- **event\_id** –[in] the id of the event with which to unregister the handler
- **event\_handler** –[in] the handler to unregister

**Returns** ESP\_OK success

**Returns** ESP\_ERR\_INVALID\_ARG invalid combination of event base and event id

**Returns** others fail

*esp\_err\_t* **esp\_event\_handler\_unregister\_with** (*esp\_event\_loop\_handle\_t* event\_loop, *esp\_event\_base\_t* event\_base, int32\_t event\_id, *esp\_event\_handler\_t* event\_handler)

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as esp\_event\_handler\_unregister, except the additional specification of the event loop to unregister the handler with.

---

**Note:** This function is obsolete and will be deprecated soon, please use esp\_event\_handler\_instance\_unregister\_with() instead.

---

#### Parameters

- **event\_loop** –[in] the event loop with which to unregister this handler function, must not be NULL
- **event\_base** –[in] the base of the event with which to unregister the handler
- **event\_id** –[in] the id of the event with which to unregister the handler
- **event\_handler** –[in] the handler to unregister

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event id
- Others: Fail

*esp\_err\_t* **esp\_event\_handler\_instance\_unregister\_with** (*esp\_event\_loop\_handle\_t* event\_loop, *esp\_event\_base\_t* event\_base, int32\_t event\_id, *esp\_event\_handler\_instance\_t* instance)

Unregister a handler instance from a specific event loop.

Unregisters a handler instance so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of `event_base` and `event_id` which were previously registered. To unregister a handler instance, the `event_base` and `event_id` arguments must match exactly the arguments passed to `esp_event_handler_instance_register()` when that handler instance was registered. Passing `ESP_EVENT_ANY_BASE` and/or `ESP_EVENT_ANY_ID` will only unregister handler instances that were registered with the same wildcard arguments.

---

**Note:** When using `ESP_EVENT_ANY_ID`, handlers registered to specific event IDs using the same base will not be unregistered. When using `ESP_EVENT_ANY_BASE`, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

---

#### Parameters

- **event\_loop** –[in] the event loop with which to unregister this handler function, must not be NULL
- **event\_base** –[in] the base of the event with which to unregister the handler
- **event\_id** –[in] the id of the event with which to unregister the handler
- **instance** –[in] the instance object of the registration to be unregistered

#### Returns

- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id
- Others: Fail

*esp\_err\_t* **esp\_event\_handler\_instance\_unregister** (*esp\_event\_base\_t* event\_base, int32\_t event\_id, *esp\_event\_handler\_instance\_t* instance)

Unregister a handler from the system event loop.

This function does the same as `esp_event_handler_instance_unregister_with`, except that it unregisters the handler instance from the default event loop.

#### Parameters

- **event\_base** –[in] the base of the event with which to unregister the handler
- **event\_id** –[in] the id of the event with which to unregister the handler
- **instance** –[in] the instance object of the registration to be unregistered

#### Returns

- `ESP_OK`: Success
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id
- Others: Fail

*esp\_err\_t* **esp\_event\_post** (*esp\_event\_base\_t* event\_base, int32\_t event\_id, void \*event\_data, size\_t event\_data\_size, TickType\_t ticks\_to\_wait)

Posts an event to the system default event loop. The event loop library keeps a copy of `event_data` and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

#### Parameters

- **event\_base** –[in] the event base that identifies the event
- **event\_id** –[in] the event id that identifies the event
- **event\_data** –[in] the data, specific to the event occurrence, that gets passed to the handler
- **event\_data\_size** –[in] the size of the event data
- **ticks\_to\_wait** –[in] number of ticks to block on a full event queue

#### Returns

- `ESP_OK`: Success
- `ESP_ERR_TIMEOUT`: Time to wait for event queue to unblock expired, queue full when posting from ISR

- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event id
- Others: Fail

*esp\_err\_t* **esp\_event\_post\_to** (*esp\_event\_loop\_handle\_t* event\_loop, *esp\_event\_base\_t* event\_base, int32\_t event\_id, void \*event\_data, size\_t event\_data\_size, TickType\_t ticks\_to\_wait)

Posts an event to the specified event loop. The event loop library keeps a copy of event\_data and manages the copy's lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp\_event\_post\_to, except the additional specification of the event loop to post the event to.

#### Parameters

- **event\_loop** –[in] the event loop to post to, must not be NULL
- **event\_base** –[in] the event base that identifies the event
- **event\_id** –[in] the event id that identifies the event
- **event\_data** –[in] the data, specific to the event occurrence, that gets passed to the handler
- **event\_data\_size** –[in] the size of the event data
- **ticks\_to\_wait** –[in] number of ticks to block on a full event queue

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event id
- Others: Fail

*esp\_err\_t* **esp\_event\_isr\_post** (*esp\_event\_base\_t* event\_base, int32\_t event\_id, void \*event\_data, size\_t event\_data\_size, BaseType\_t \*task\_unblocked)

Special variant of esp\_event\_post for posting events from interrupt handlers.

---

**Note:** this function is only available when CONFIG\_ESP\_EVENT\_POST\_FROM\_ISR is enabled

---

---

**Note:** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling CONFIG\_ESP\_EVENT\_POST\_FROM\_IRAM\_ISR

---

#### Parameters

- **event\_base** –[in] the event base that identifies the event
- **event\_id** –[in] the event id that identifies the event
- **event\_data** –[in] the data, specific to the event occurrence, that gets passed to the handler
- **event\_data\_size** –[in] the size of the event data; max is 4 bytes
- **task\_unblocked** –[out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is executed.

#### Returns

- ESP\_OK: Success
- ESP\_FAIL: Event queue for the default event loop full
- ESP\_ERR\_INVALID\_ARG: Invalid combination of event base and event id, data size of more than 4 bytes
- Others: Fail

*esp\_err\_t* **esp\_event\_isr\_post\_to** (*esp\_event\_loop\_handle\_t* event\_loop, *esp\_event\_base\_t* event\_base, int32\_t event\_id, void \*event\_data, size\_t event\_data\_size, BaseType\_t \*task\_unblocked)

Special variant of `esp_event_post_to` for posting events from interrupt handlers.

---

**Note:** this function is only available when `CONFIG_ESP_EVENT_POST_FROM_ISR` is enabled

---

---

**Note:** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR`

---

### Parameters

- **event\_loop** –[in] the event loop to post to, must not be NULL
- **event\_base** –[in] the event base that identifies the event
- **event\_id** –[in] the event id that identifies the event
- **event\_data** –[in] the data, specific to the event occurrence, that gets passed to the handler
- **event\_data\_size** –[in] the size of the event data
- **task\_unblocked** –[out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

### Returns

- `ESP_OK`: Success
- `ESP_FAIL`: Event queue for the loop full
- `ESP_ERR_INVALID_ARG`: Invalid combination of event base and event id, data size of more than 4 bytes
- Others: Fail

`esp_err_t esp_event_dump` (FILE \*file)

Dumps statistics of all event loops.

Dumps event loop info in the format:

```

event loop
  handler
  handler
  ...
event loop
  handler
  handler
  ...

where:

event loop
  format: address,name rx:total_recieved dr:total_dropped
  where:
    address - memory address of the event loop
    name - name of the event loop, 'none' if no dedicated task
    total_recieved - number of successfully posted events
    total_dropped - number of events unsuccessfully posted due to queue
↳being full

handler
  format: address ev:base,id inv:total_invoked run:total_runtime
  where:
    address - address of the handler function
    base,id - the event specified by event base and id this handler
↳executes

```

(continues on next page)

(continued from previous page)

```
total_invoked - number of times this handler has been invoked
total_runtime - total amount of time used for invoking this handler
```

---

**Note:** this function is a noop when CONFIG\_ESP\_EVENT\_LOOP\_PROFILING is disabled

---

**Parameters** `file` `-[in]` the file stream to output to

**Returns**

- ESP\_OK: Success
- ESP\_ERR\_NO\_MEM: Cannot allocate memory for event loops list
- Others: Fail

## Structures

struct **esp\_event\_loop\_args\_t**

Configuration for creating event loops.

### Public Members

int32\_t **queue\_size**

size of the event loop queue

const char \***task\_name**

name of the event loop task; if NULL, a dedicated task is not created for event loop

UBaseType\_t **task\_priority**

priority of the event loop task, ignored if task name is NULL

uint32\_t **task\_stack\_size**

stack size of the event loop task, ignored if task name is NULL

BaseType\_t **task\_core\_id**

core to which the event loop task is pinned to, ignored if task name is NULL

## Header File

- [components/esp\\_event/include/esp\\_event\\_base.h](#)

## Macros

**ESP\_EVENT\_DECLARE\_BASE** (id)

**ESP\_EVENT\_DEFINE\_BASE** (id)

**ESP\_EVENT\_ANY\_BASE**

register handler for any event base

**ESP\_EVENT\_ANY\_ID**

register handler for any event id

## Type Definitions

typedef const char \***esp\_event\_base\_t**

unique pointer to a subsystem that exposes events

typedef void \***esp\_event\_loop\_handle\_t**

a number that identifies an event with respect to a base

typedef void (\***esp\_event\_handler\_t**)(void \*event\_handler\_arg, *esp\_event\_base\_t* event\_base, int32\_t event\_id, void \*event\_data)

function called when an event is posted to the queue

typedef void \***esp\_event\_handler\_instance\_t**

context identifying an instance of a registered event handler

### Legacy event loop

## API Reference

### Header File

- [components/esp\\_event/include/esp\\_event\\_legacy.h](#)

### Functions

*esp\_err\_t* **esp\_event\_send** (*system\_event\_t* \*event)

Send a event to event task.

Other task/modules, such as the `tcpip_adapter`, can call this API to send an event to event task

---

**Note:** This API is part of the legacy event system. New code should use event library API in `esp_event.h`

---

**Parameters** **event** –Event to send

**Returns** `ESP_OK` : succeed

**Returns** others : fail

*esp\_err\_t* **esp\_event\_send\_internal** (*esp\_event\_base\_t* event\_base, int32\_t event\_id, void \*event\_data, size\_t event\_data\_size, TickType\_t ticks\_to\_wait)

Send a event to event task.

Other task/modules, such as the `tcpip_adapter`, can call this API to send an event to event task

---

**Note:** This API is used by WiFi Driver only.

---

### Parameters

- **event\_base** –[in] the event base that identifies the event
- **event\_id** –[in] the event id that identifies the event
- **event\_data** –[in] the data, specific to the event occurrence, that gets passed to the handler

- **event\_data\_size** –[in] the size of the event data
  - **ticks\_to\_wait** –[in] number of ticks to block on a full event queue
- Returns** ESP\_OK : succeed  
**Returns** others : fail

*esp\_err\_t* **esp\_event\_process\_default** (*system\_event\_t* \*event)

Default event handler for system events.

This function performs default handling of system events. When using `esp_event_loop` APIs, it is called automatically before invoking the user-provided callback function.

Applications which implement a custom event loop must call this function as part of event processing.

---

**Note:** This API is part of the legacy event system. New code should use event library API in `esp_event.h`

---

- Parameters** **event** –pointer to event to be handled  
**Returns** ESP\_OK if an event was handled successfully

void **esp\_event\_set\_default\_eth\_handlers** (void)

Install default event handlers for Ethernet interface.

---

**Note:** This API is part of the legacy event system. New code should use event library API in `esp_event.h`

---

void **esp\_event\_set\_default\_wifi\_handlers** (void)

Install default event handlers for Wi-Fi interfaces (station and AP)

---

**Note:** This API is part of the legacy event system. New code should use event library API in `esp_event.h`

---

*esp\_err\_t* **esp\_event\_loop\_init** (*system\_event\_cb\_t* cb, void \*ctx)

Initialize event loop.

Create the event handler and task

---

**Note:** This API is part of the legacy event system. New code should use event library API in `esp_event.h`

---

**Parameters**

- **cb** –application specified event callback, it can be modified by call `esp_event_set_cb`
- **ctx** –reserved for user

**Returns**

- ESP\_OK: succeed
- others: fail

*system\_event\_cb\_t* **esp\_event\_loop\_set\_cb** (*system\_event\_cb\_t* cb, void \*ctx)

Set application specified event callback function.

**Attention** 1. If cb is NULL, means application don't need to handle If cb is not NULL, it will be call when an event is received, after the default event callback is completed

---

**Note:** This API is part of the legacy event system. New code should use event library API in `esp_event.h`

---

#### Parameters

- **cb** –application callback function
- **ctx** –argument to be passed to callback

**Returns** old callback

#### Unions

union **system\_event\_info\_t**

*#include <esp\_event\_legacy.h>* Union of all possible system\_event argument structures

#### Public Members

*system\_event\_sta\_connected\_t* **connected**

ESP32 station connected to AP

*system\_event\_sta\_disconnected\_t* **disconnected**

ESP32 station disconnected to AP

*system\_event\_sta\_scan\_done\_t* **scan\_done**

ESP32 station scan (APs) done

*system\_event\_sta\_authmode\_change\_t* **auth\_change**

the auth mode of AP ESP32 station connected to changed

*system\_event\_sta\_got\_ip\_t* **got\_ip**

ESP32 station got IP, first time got IP or when IP is changed

*system\_event\_sta\_wps\_er\_pin\_t* **sta\_er\_pin**

ESP32 station WPS enrollee mode PIN code received

*system\_event\_sta\_wps\_fail\_reason\_t* **sta\_er\_fail\_reason**

ESP32 station WPS enrollee mode failed reason code received

*system\_event\_sta\_wps\_er\_success\_t* **sta\_er\_success**

ESP32 station WPS enrollee success

*system\_event\_ap\_staconnected\_t* **sta\_connected**

a station connected to ESP32 soft-AP

*system\_event\_ap\_stadisconnected\_t* **sta\_disconnected**

a station disconnected to ESP32 soft-AP

*system\_event\_ap\_probe\_req\_rx\_t* **ap\_probereqrecved**

ESP32 soft-AP receive probe request packet

*system\_event\_ftm\_report\_t* **ftm\_report**

Report of FTM procedure

*system\_event\_ap\_staipassigned\_t* **ap\_staipassigned**

ESP32 soft-AP assign an IP to the station

*system\_event\_got\_ip6\_t* **got\_ip6**

ESP32 station or ap or ethernet ipv6 addr state change to preferred

## Structures

Argument structure of SYSTEM\_EVENT\_FTM\_REPORT event

typedef *ip\_event\_ap\_staipassigned\_t* **system\_event\_ap\_staipassigned\_t**

Argument structure of event

typedef *ip\_event\_got\_ip\_t* **system\_event\_sta\_got\_ip\_t**

Argument structure of event

typedef *ip\_event\_got\_ip6\_t* **system\_event\_got\_ip6\_t**

Argument structure of event

typedef *esp\_err\_t* (**\*system\_event\_handler\_t**)(*esp\_event\_base\_t* event\_base, int32\_t event\_id, void \*event\_data, size\_t event\_data\_size, TickType\_t ticks\_to\_wait)

Event handler function type

typedef *esp\_err\_t* (**\*system\_event\_cb\_t**)(void \*ctx, *system\_event\_t* \*event)

Application specified event callback function.

---

**Note:** This API is part of the legacy event system. New code should use event library API in esp\_event.h

---

**Param ctx** reserved for user

**Param event** event type defined in this file

**Return**

- ESP\_OK: succeed
- others: fail

## Enumerations

enum **system\_event\_id\_t**

System event types enumeration

*Values:*

enumerator **SYSTEM\_EVENT\_WIFI\_READY**

ESP32 WiFi ready

enumerator **SYSTEM\_EVENT\_SCAN\_DONE**

ESP32 finish scanning AP

enumerator **SYSTEM\_EVENT\_STA\_START**

ESP32 station start

enumerator **SYSTEM\_EVENT\_STA\_STOP**

ESP32 station stop

enumerator **SYSTEM\_EVENT\_STA\_CONNECTED**

ESP32 station connected to AP

enumerator **SYSTEM\_EVENT\_STA\_DISCONNECTED**

ESP32 station disconnected from AP

enumerator **SYSTEM\_EVENT\_STA\_AUTHMODE\_CHANGE**

the auth mode of AP connected by ESP32 station changed

enumerator **SYSTEM\_EVENT\_STA\_GOT\_IP**

ESP32 station got IP from connected AP

enumerator **SYSTEM\_EVENT\_STA\_LOST\_IP**

ESP32 station lost IP and the IP is reset to 0

enumerator **SYSTEM\_EVENT\_STA\_BSS\_RSSI\_LOW**

ESP32 station connected BSS rssi goes below threshold

enumerator **SYSTEM\_EVENT\_STA\_WPS\_ER\_SUCCESS**

ESP32 station wps succeeds in enrollee mode

enumerator **SYSTEM\_EVENT\_STA\_WPS\_ER\_FAILED**

ESP32 station wps fails in enrollee mode

enumerator **SYSTEM\_EVENT\_STA\_WPS\_ER\_TIMEOUT**

ESP32 station wps timeout in enrollee mode

enumerator **SYSTEM\_EVENT\_STA\_WPS\_ER\_PIN**

ESP32 station wps pin code in enrollee mode

Indicates the completion of Remain-on-Channel operation status
- enumerator **SYSTEM\_EVENT\_STA\_BEACON\_TIMEOUT**  
ESP32 station beacon timeout
- enumerator **SYSTEM\_EVENT\_FTM\_REPORT**  
Receive report of FTM procedure
- enumerator **SYSTEM\_EVENT\_GOT\_IP6**  
ESP32 station or ap or ethernet interface v6IP addr is preferred
- enumerator **SYSTEM\_EVENT\_ETH\_START**  
ESP32 ethernet start
- enumerator **SYSTEM\_EVENT\_ETH\_STOP**  
ESP32 ethernet stop
- enumerator **SYSTEM\_EVENT\_ETH\_CONNECTED**  
ESP32 ethernet phy link up
- enumerator **SYSTEM\_EVENT\_ETH\_DISCONNECTED**  
ESP32 ethernet phy link down
- enumerator **SYSTEM\_EVENT\_ETH\_GOT\_IP**  
ESP32 ethernet got IP from connected AP
- enumerator **SYSTEM\_EVENT\_ETH\_LOST\_IP**  
ESP32 ethernet lost IP and the IP is reset to 0
- enumerator **SYSTEM\_EVENT\_MAX**  
Number of members in this enum

### 2.7.11 FreeRTOS

## Overview

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

---

**Note:** ESP-IDF FreeRTOS is based on Vanilla FreeRTOS v10.4.3

---

- For more information about the SMP changes of ESP-IDF FreeRTOS, see [ESP-IDF FreeRTOS \(SMP\)](#)
- For more information about the features added to ESP-IDF FreeRTOS, see [FreeRTOS Additions](#).

## Configuration

Vanilla FreeRTOS allows ports and applications to configure the kernel by adding various `#define config...` macros to `FreeRTOSConfig.h`. Through these macros, the kernel's scheduling behavior and various kernel features can be enabled or disabled. **However, in ESP-IDF FreeRTOS, the `FreeRTOSConfig.h` file is considered a private and must not be modified by users.** Any FreeRTOS configuration that is exposed to the user will be done so via `menuconfig`.

ESP-IDF FreeRTOS can be configured in the project configuration menu (`idf.py menuconfig`) under `Component Config/FreeRTOS`. The following section highlights some of the ESP-IDF FreeRTOS configuration options. For a full list of ESP-IDF FreeRTOS configurations, see [Project Configuration](#)

- `CONFIG_FREERTOS_UNICORE` will run ESP-IDF FreeRTOS only on CPU0. Note that this is **not equivalent to running Vanilla FreeRTOS**. Furthermore, this option may affect behavior of components other than `freertos`. For more details regarding the effects of running ESP-IDF FreeRTOS on a single core, refer to [ESP-IDF FreeRTOS Single Core](#). Alternatively, users can also search for occurrences of `CONFIG_FREERTOS_UNICORE` in the ESP-IDF components.
- `CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION` will trigger a halt in functions in ESP-IDF FreeRTOS that have not been fully tested in an SMP context.
- `CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER` will enclose all task functions within a wrapper function. In the case that a task function mistakenly returns (i.e. does not call `vTaskDelete()`), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application, as illustrated below:

```
E (25) FreeRTOS: FreeRTOS task should not return. Aborting now!  
abort() was called at PC 0x40085c53 on core 0
```

## ESP-IDF FreeRTOS Applications

Unlike Vanilla FreeRTOS, users must not call `vTaskStartScheduler()`. Instead, ESP-IDF FreeRTOS is started automatically. The entry point is a user defined `void app_main(void)` function.

- Typically, users would spawn the rest of their applications task from `app_main`.
- The `app_main` function is allowed to return at any point (i.e., before the application terminates).
- The `app_main` function is called from the `main` task.

The `main` task is one of multiple tasks that are automatically spawned by ESP-IDF during startup. These tasks are:

Table 8: List of Tasks Created During Startup

Task Name	Affinity	Priority	Description
Main Task ( <code>main</code> )	CPU0	1	Task that simply calls <code>app_main</code> . This task will self delete when <code>app_main</code> returns
Idle Tasks ( <code>IDLEx</code> )	CPU0 and CPU1	0	Idle tasks created for (and pinned to) each CPU
IPC Tasks ( <code>ipcx</code> )	CPU0 and CPU1	24	IPC tasks created for (and pinned to) each CPU. IPC tasks are used to implement the IPC feature. See <i>Inter-Processor Call</i> for more details.

## Task API

### Header File

- `components/freertos/include/freertos/task.h`

### Functions

`BaseType_t xTaskCreatePinnedToCore` (`TaskFunction_t pvTaskCode`, `const char *const pcName`, `const uint32_t usStackDepth`, `void *const pvParameters`, `UBaseType_t uxPriority`, `TaskHandle_t *const pvCreatedTask`, `const BaseType_t xCoreID`)

Create a new task with a specified affinity.

This function is similar to `xTaskCreate`, but allows setting task affinity in SMP system.

#### Parameters

- **pvTaskCode** –Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using `vTaskDelete` function.
- **pcName** –A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by `configMAX_TASK_NAME_LEN` - default is 16.
- **usStackDepth** –The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** –Pointer that will be used as the parameter for the task being created.
- **uxPriority** –The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit `portPRIVILEGE_BIT` of the priority parameter. For example, to create a privileged task at priority 2 the `uxPriority` parameter should be set to `( 2 | portPRIVILEGE_BIT )`.
- **pvCreatedTask** –Used to pass back a handle by which the created task can be referenced.
- **xCoreID** –If the value is `tskNO_AFFINITY`, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than `(portNUM_PROCESSORS - 1)` will cause the function to fail.

**Returns** `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`

`static inline BaseType_t xTaskCreate` (`TaskFunction_t pvTaskCode`, `const char *const pcName`, `const uint32_t usStackDepth`, `void *const pvParameters`, `UBaseType_t uxPriority`, `TaskHandle_t *const pxCreatedTask`)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

See `xTaskCreateStatic()` for a version that does not use any dynamic memory allocation.

`xTaskCreate()` can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using `xTaskCreateRestricted()`.

Example usage:

```
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for ( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter
    ↪ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared
    ↪static. If it was just an
    // an automatic stack variable it might no longer exist, or at least have
    ↪been corrupted, by the time
    // the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_
    ↪PRIORITY, &xHandle );
    configASSERT( xHandle );

    // Use the handle to delete the task.
    if( xHandle != NULL )
    {
        vTaskDelete( xHandle );
    }
}
```

**Note:** If program uses thread local variables (ones specified with “`__thread`” keyword) then storage for them will be allocated on the task’s stack.

### Parameters

- **pvTaskCode** –Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using `vTaskDelete` function.
- **pcName** –A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by `configMAX_TASK_NAME_LEN` - default is 16.
- **usStackDepth** –The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** –Pointer that will be used as the parameter for the task being created.
- **uxPriority** –The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit `portPRIVILEGE_BIT` of the priority parameter. For example, to create a privileged task at priority 2 the `uxPriority` parameter should be set to `( 2 | portPRIVILEGE_BIT )`.
- **pxCreatedTask** –Used to pass back a handle by which the created task can be referenced.

**Returns** pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

*TaskHandle\_t* **xTaskCreateStaticPinnedToCore** (TaskFunction\_t pvTaskCode, const char \*const pcName, const uint32\_t ulStackDepth, void \*const pvParameters, UBaseType\_t uxPriority, StackType\_t \*const pxStackBuffer, StaticTask\_t \*const pxTaskBuffer, const BaseType\_t xCoreID)

Create a new task with a specified affinity.

This function is similar to xTaskCreateStatic, but allows specifying task affinity in an SMP system.

#### Parameters

- **pvTaskCode** –Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** –A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX\_TASK\_NAME\_LEN in FreeRTOSConfig.h.
- **ulStackDepth** –The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** –Pointer that will be used as the parameter for the task being created.
- **uxPriority** –The priority at which the task will run.
- **pxStackBuffer** –Must point to a StackType\_t array that has at least ulStackDepth indexes - the array will then be used as the task's stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** –Must point to a variable of type StaticTask\_t, which will then be used to hold the task's data structures, removing the need for the memory to be allocated dynamically.
- **xCoreID** –If the value is tskNO\_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM\_PROCESSORS - 1) will cause the function to fail.

**Returns** If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD\_NOT\_ALLOCATE\_REQUIRED\_MEMORY is returned.

static inline *TaskHandle\_t* **xTaskCreateStatic** (TaskFunction\_t pvTaskCode, const char \*const pcName, const uint32\_t ulStackDepth, void \*const pvParameters, UBaseType\_t uxPriority, StackType\_t \*const puxStackBuffer, StaticTask\_t \*const pxTaskBuffer)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see <http://www.freertos.org/a00111.html>). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```
// Dimensions the buffer that the task being created will use as its stack.
// NOTE: This is the number of bytes the stack will hold, not the number of
// words as found in vanilla FreeRTOS.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;
```

(continues on next page)

(continued from previous page)

```

// Buffer that the task being created will use as its stack. Note this is
// an array of StackType_t variables. The size of StackType_t is dependent on
// the RTOS port.
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the
    // pvParameters value in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic(
        vTaskCode,          // Function that implements the task.
        "NAME",            // Text name for the task.
        STACK_SIZE,       // Stack size in bytes, not words.
        ( void * ) 1,     // Parameter passed into the task.
        tskIDLE_PRIORITY, // Priority at which the task is created.
        xStack,           // Array to use as the task's stack.
        &xTaskBuffer );  // Variable to hold the task's data_
→structure.

    // puxStackBuffer and pxTaskBuffer were not NULL, so the task will have
    // been created, and xHandle will be the task's handle. Use the handle
    // to suspend the task.
    vTaskSuspend( xHandle );
}

```

---

**Note:** If program uses thread local variables (ones specified with “\_\_thread” keyword) then storage for them will be allocated on the task’s stack.

---

### Parameters

- **pvTaskCode** –Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** –A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX\_TASK\_NAME\_LEN in FreeRTOSConfig.h.
- **ulStackDepth** –The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** –Pointer that will be used as the parameter for the task being created.
- **uxPriority** –The priority at which the task will run.
- **puStackBuffer** –Must point to a StackType\_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** –Must point to a variable of type StaticTask\_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated

dynamically.

**Returns** If neither `pxStackBuffer` or `pxTaskBuffer` are NULL, then the task will be created and `pdPASS` is returned. If either `pxStackBuffer` or `pxTaskBuffer` are NULL then the task will not be created and `errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY` is returned.

`BaseType_t` **xTaskCreateRestricted** (const `TaskParameters_t` \*const `pxTaskDefinition`, `TaskHandle_t` \*`pxCreatedTask`)

Only available when `configSUPPORT_DYNAMIC_ALLOCATION` is set to 1.

`xTaskCreateRestricted()` should only be used in systems that include an MPU implementation.

Create a new task and add it to the list of tasks that are ready to run. The function parameters define the memory regions and associated access permissions allocated to the task.

See `xTaskCreateRestrictedStatic()` for a version that does not use any dynamic memory allocation.

return `pdPASS` if the task was successfully created and added to a ready list, otherwise an error code defined in the file `projdefs.h`

Example usage:

```
// Create an TaskParameters_t structure that defines the task to be created.
static const TaskParameters_t xCheckTaskParameters =
{
    vATask,          // pvTaskCode - the function that implements the task.
    "ATask",        // pcName - just a text name for the task to assist debugging.
    100,            // usStackDepth - the stack size DEFINED IN WORDS.
    NULL,           // pvParameters - passed into the task function as the function_
    ↪parameters.
    ( 1UL | portPRIVILEGE_BIT ), // uxPriority - task priority, set the_
    ↪portPRIVILEGE_BIT if the task should run in a privileged state.
    cStackBuffer, // puxStackBuffer - the buffer to be used as the task stack.

    // xRegions - Allocate up to three separate memory regions for access by
    // the task, with appropriate access permissions. Different processors have
    // different memory alignment requirements - refer to the FreeRTOS_
    ↪documentation
    // for full information.
    {
        // Base address          Length  Parameters
        { cReadWriteArray,      32,    portMPU_REGION_READ_WRITE },
        { cReadOnlyArray,       32,    portMPU_REGION_READ_ONLY },
        { cPrivilegedOnlyAccessArray, 128,  portMPU_REGION_PRIVILEGED_READ_
    ↪WRITE }
    }
};

int main( void )
{
    TaskHandle_t xHandle;

    // Create a task from the const structure defined above. The task handle
    // is requested (the second parameter is not NULL) but in this case just for
    // demonstration purposes as its not actually used.
    xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

    // Start the scheduler.
    vTaskStartScheduler();

    // Will only get here if there was insufficient memory to create the idle
    // and/or timer task.

```

(continues on next page)

(continued from previous page)

```

for( ;; );
}

```

### Parameters

- **pxTaskDefinition** –Pointer to a structure that contains a member for each of the normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an optional stack buffer and the memory region definitions.
- **pxCreatedTask** –Used to pass back a handle by which the created task can be referenced.

BaseType\_t **xTaskCreateRestrictedStatic** (const TaskParameters\_t \*const pxTaskDefinition, TaskHandle\_t \*pxCreatedTask)

Only available when configSUPPORT\_STATIC\_ALLOCATION is set to 1.

xTaskCreateRestrictedStatic() should only be used in systems that include an MPU implementation.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using xTaskCreateRestricted() then the stack is provided by the application writer, and the memory used to hold the task's data structure is automatically dynamically allocated inside the xTaskCreateRestricted() function. If a task is created using xTaskCreateRestrictedStatic() then the application writer must provide the memory used to hold the task's data structures too. xTaskCreateRestrictedStatic() therefore allows a memory protected task to be created without using any dynamic memory allocation.

return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Example usage:

```

// Create an TaskParameters_t structure that defines the task to be created.
// The StaticTask_t variable is only included in the structure when
// configSUPPORT_STATIC_ALLOCATION is set to 1. The PRIVILEGED_DATA macro can
// be used to force the variable into the RTOS kernel's privileged data area.
static PRIVILEGED_DATA StaticTask_t xTaskBuffer;
static const TaskParameters_t xCheckTaskParameters =
{
    vATask,          // pvTaskCode - the function that implements the task.
    "ATask",        // pcName - just a text name for the task to assist debugging.
    100,            // usStackDepth - the stack size DEFINED IN BYTES.
    NULL,           // pvParameters - passed into the task function as the function_
    ↪parameters.
    ( 1UL | portPRIVILEGE_BIT ), // uxPriority - task priority, set the_
    ↪portPRIVILEGE_BIT if the task should run in a privileged state.
    cStackBuffer, // puxStackBuffer - the buffer to be used as the task stack.

    // xRegions - Allocate up to three separate memory regions for access by
    // the task, with appropriate access permissions. Different processors have
    // different memory alignment requirements - refer to the FreeRTOS_
    ↪documentation
    // for full information.
    {
        // Base address          Length  Parameters
        { cReadWriteArray,      32,    portMPU_REGION_READ_WRITE },
        { cReadOnlyArray,      32,    portMPU_REGION_READ_ONLY },
        { cPrivilegedOnlyAccessArray, 128,   portMPU_REGION_PRIVILEGED_READ_
    ↪WRITE }
    }

    &xTaskBuffer; // Holds the task's data structure.

```

(continues on next page)

(continued from previous page)

```

};

int main( void )
{
TaskHandle_t xHandle;

// Create a task from the const structure defined above. The task handle
// is requested (the second parameter is not NULL) but in this case just for
// demonstration purposes as its not actually used.
xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

// Start the scheduler.
vTaskStartScheduler();

// Will only get here if there was insufficient memory to create the idle
// and/or timer task.
for( ;; );
}

```

### Parameters

- **pxTaskDefinition** –Pointer to a structure that contains a member for each of the normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an optional stack buffer and the memory region definitions. If configSUPPORT\_STATIC\_ALLOCATION is set to 1 the structure contains an additional member, which is used to point to a variable of type StaticTask\_t - which is then used to hold the task's data structure.
- **pxCreatedTask** –Used to pass back a handle by which the created task can be referenced.

void **vTaskAllocateMPURegions** (*TaskHandle\_t* xTask, const MemoryRegion\_t \*const pxRegions)

Memory regions are assigned to a restricted task when the task is created by a call to xTaskCreateRestricted(). These regions can be redefined using vTaskAllocateMPURegions().

Example usage:

```

// Define an array of MemoryRegion_t structures that configures an MPU region
// allowing read/write access for 1024 bytes starting at the beginning of the
// ucOneKByte array. The other two of the maximum 3 definable regions are
// unused so set to zero.
static const MemoryRegion_t xAltRegions[ portNUM_CONFIGURABLE_REGIONS ] =
{
// Base address      Length      Parameters
{ ucOneKByte,      1024,      portMPU_REGION_READ_WRITE },
{ 0,                0,         0 },
{ 0,                0,         0 }
};

void vATask( void *pvParameters )
{
// This task was created such that it has access to certain regions of
// memory as defined by the MPU configuration. At some point it is
// desired that these MPU regions are replaced with that defined in the
// xAltRegions const struct above. Use a call to vTaskAllocateMPURegions()
// for this purpose. NULL is used as the task handle to indicate that this
// function should modify the MPU regions of the calling task.
vTaskAllocateMPURegions( NULL, xAltRegions );

// Now the task can continue its function, but from this point on can only

```

(continues on next page)

(continued from previous page)

```

// access its stack and the ucOneKByte array (unless any other statically
// defined or shared regions have been declared elsewhere).
}

```

**Parameters**

- **xTask** –The handle of the task being updated.
- **pxRegions** –A pointer to an MemoryRegion\_t structure that contains the new memory region definitions.

void **vTaskDelete** (*TaskHandle\_t* xTaskToDelete)

INCLUDE\_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

Remove a task from the RTOS real time kernel's management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete (). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file death.c for sample code that utilises vTaskDelete ().

Example usage:

```

void vOtherFunction( void )
{
TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
→);

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}

```

**Parameters** **xTaskToDelete** –The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

void **vTaskDelay** (const TickType\_t xTicksToDelay)

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant portTICK\_PERIOD\_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDE\_vTaskDelay must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See xTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```

void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}

```

**Parameters** **xTicksToDelay** –The amount of time, in tick periods, that the calling task should block.

**BaseType\_t xTaskDelayUntil** (TickType\_t \*const pxPreviousWakeTime, const TickType\_t xTimeIncrement)

**INCLUDE\_xTaskDelayUntil** must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from `vTaskDelay()` in one important aspect: `vTaskDelay()` will cause a task to block for the specified number of ticks from the time `vTaskDelay()` is called. It is therefore difficult to use `vTaskDelay()` by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling `vTaskDelay()` may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas `vTaskDelay()` specifies a wake time relative to the time at which the function is called, `xTaskDelayUntil()` specifies the absolute (exact) time at which it wishes to unblock.

The macro `pdMS_TO_TICKS()` can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```

// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;
    BaseType_t xWasDelayed;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount ();
    for( ;; )
    {
        // Wait for the next cycle.
        xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here. xWasDelayed value can be used to determine
        // whether a deadline was missed if the code here took too long.
    }
}

```

**Parameters**

- **pxPreviousWakeTime** –Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first

use (see the example below). Following this the variable is automatically updated within `xTaskDelayUntil()`.

- **xTimeIncrement** –The cycle time period. The task will be unblocked at time `*pxPreviousWakeTime + xTimeIncrement`. Calling `xTaskDelayUntil` with the same `xTimeIncrement` parameter value will cause the task to execute with a fixed interface period.

**Returns** Value which can be used to check whether the task was actually delayed. Will be `pdTRUE` if the task was delayed and `pdFALSE` otherwise. A task will not be delayed if the next expected wake time is in the past.

`BaseType_t xTaskAbortDelay (TaskHandle_t xTask)`

`INCLUDE_xTaskAbortDelay` must be defined as 1 in `FreeRTOSConfig.h` for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when `vTaskDelay()` is called, or an event on an object, such as when `xQueueReceive()` or `ulTaskNotifyTake()` is called. If the handle of a task that is in the Blocked state is used in a call to `xTaskAbortDelay()` then the task will leave the Blocked state, and return from whichever function call placed the task into the Blocked state.

There is no ‘FromISR’ version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.

**Parameters** `xTask` –The handle of the task to remove from the Blocked state.

**Returns** If the task referenced by `xTask` was not in the Blocked state then `pdFAIL` is returned. Otherwise `pdPASS` is returned.

`UBaseType_t uxTaskPriorityGet (const TaskHandle_t xTask)`

`INCLUDE_uxTaskPriorityGet` must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the priority of any task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // ...

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed
    // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    {
        // The task has changed it's priority.
    }

    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

**Parameters** **xTask** –Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

**Returns** The priority of xTask.

UBaseType\_t **uxTaskPriorityGetFromISR** (const *TaskHandle\_t* xTask)

A version of uxTaskPriorityGet() that can be used from an ISR.

*eTaskState* **eTaskGetState** (*TaskHandle\_t* xTask)

INCLUDE\_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the state of any task. States are encoded by the eTaskState enumerated type.

**Parameters** **xTask** –Handle of the task to be queried.

**Returns** The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

void **vTaskGetInfo** (*TaskHandle\_t* xTask, TaskStatus\_t \*pxTaskStatus, BaseType\_t xGetFreeStackSize, *eTaskState* eState)

configUSE\_TRACE\_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus\_t structure with information about a task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;
    TaskStatus_t xTaskDetails;

    // Obtain the handle of a task from its name.
    xHandle = xTaskGetHandle( "Task_Name" );

    // Check the handle is not NULL.
    configASSERT( xHandle );

    // Use the handle to obtain further information about the task.
    vTaskGetInfo( xHandle,
                  &xTaskDetails,
                  pdTRUE, // Include the high water mark in xTaskDetails.
                  eInvalid ); // Include the task state in xTaskDetails.
}
```

### Parameters

- **xTask** –Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus** –A pointer to the TaskStatus\_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSize** –The TaskStatus\_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSize parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus\_t structure if xGetFreeStackSize is not set to pdFALSE;
- **eState** –The TaskStatus\_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus\_t

structure. To obtain state information then set `eState` to `eInvalid` - otherwise the value passed in `eState` will be reported as the task state in the `TaskStatus_t` structure.

void **vTaskPrioritySet** (*TaskHandle\_t* xTask, UBaseType\_t uxNewPriority)

`INCLUDE_vTaskPrioritySet` must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // ...

    // Use the handle to raise the priority of the created task.
    vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

    // ...

    // Use a NULL handle to raise our priority to the same value.
    vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}
```

#### Parameters

- **xTask** –Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- **uxNewPriority** –The priority to which the task will be set.

void **vTaskSuspend** (*TaskHandle\_t* xTaskToSuspend)

`INCLUDE_vTaskSuspend` must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to `vTaskSuspend` are not accumulative - i.e. calling `vTaskSuspend()` twice on the same task still only requires one call to `vTaskResume()` to ready the suspended task.

Example usage:

```
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
    ↪);

    // ...
```

(continues on next page)

(continued from previous page)

```

// Use the handle to suspend the created task.
vTaskSuspend( xHandle );

// ...

// The created task will not run during this period, unless
// another task calls vTaskResume( xHandle ).

//...

// Suspend ourselves.
vTaskSuspend( NULL );

// We cannot get here unless another task calls vTaskResume
// with our handle as the parameter.
}

```

**Parameters** **xTaskToSuspend** –Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

void **vTaskResume** (*TaskHandle\_t* xTaskToResume)

INCLUDE\_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Resumes a suspended task.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to vTaskResume ().

Example usage:

```

void vAFunction( void )
{
TaskHandle_t xHandle;

// Create a task, storing the handle.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_
→);

// ...

// Use the handle to suspend the created task.
vTaskSuspend( xHandle );

// ...

// The created task will not run during this period, unless
// another task calls vTaskResume( xHandle ).

//...

// Resume the suspended task ourselves.
vTaskResume( xHandle );

// The created task will once again get microcontroller processing
// time in accordance with its priority within the system.
}

```

**Parameters** **xTaskToResume** –Handle to the task being readied.

BaseType\_t **xTaskResumeFromISR** (*TaskHandle\_t* xTaskToResume)

INCLUDE\_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of vTaskResume() that can be called from within an ISR.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to xTaskResumeFromISR ().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

**Parameters** **xTaskToResume** –Handle to the task being readied.

**Returns** pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

void **vTaskStartScheduler** (void)

Starts the real time kernel tick processing. After calling the kernel has control over which tasks are executed and when.

NOTE: In ESP-IDF the scheduler is started automatically during application startup, vTaskStartScheduler() should not be called from ESP-IDF applications.

See the demo application file main.c for an example of creating tasks and starting the kernel.

Example usage:

```
void vFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

    // Start the real time kernel with preemption.
    vTaskStartScheduler ();

    // Will not get here unless a task calls vTaskEndScheduler ()
}
```

void **vTaskEndScheduler** (void)

NOTE: At the time of writing only the x86 real mode port, which runs on a PC in place of DOS, implements this function.

Stops the real time kernel tick. All created tasks will be automatically deleted and multitasking (either preemptive or cooperative) will stop. Execution then resumes from the point where vTaskStartScheduler () was called, as if vTaskStartScheduler () had just returned.

See the demo application file main.c in the demo/PC directory for an example that uses vTaskEndScheduler ().

vTaskEndScheduler () requires an exit function to be defined within the portable layer (see vPortEndScheduler () in port.c for the PC port). This performs hardware specific operations such as stopping the kernel tick.

vTaskEndScheduler () will cause all of the resources allocated by the kernel to be freed - but will not free resources allocated by application tasks.

Example usage:

```
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}
```

(continues on next page)

(continued from previous page)

```

        // At some point we want to end the real time kernel processing
        // so call ...
        vTaskEndScheduler ();
    }
}

void vAFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

    // Start the real time kernel with preemption.
    vTaskStartScheduler ();

    // Will only get here when the vTaskCode () task has called
    // vTaskEndScheduler (). When we get here we are back to single task
    // execution.
}

```

**void vTaskSuspendAll** (void)

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is suspended.

After calling vTaskSuspendAll () the calling task will continue to execute without risk of being swapped out until a call to xTaskResumeAll () has been made.

API functions that have the potential to cause a context switch (for example, vTaskDelayUntil(), xQueueSend(), etc.) must not be called while the scheduler is suspended.

Example usage:

```

void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.

        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the kernel
        // tick count will be maintained.

        // ...

        // The operation is complete. Restart the kernel.
        xTaskResumeAll ();
    }
}

```

 **BaseType\_t xTaskResumeAll** (void)

Resumes scheduler activity after it was suspended by a call to `vTaskSuspendAll()`.

`xTaskResumeAll()` only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to `vTaskSuspend()`.

Example usage:

```
void vTask1( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.

        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the real
        // time kernel tick count will be maintained.

        // ...

        // The operation is complete. Restart the kernel. We want to force
        // a context switch - but there is no point if resuming the scheduler
        // caused a context switch already.
        if( !xTaskResumeAll () )
        {
            taskYIELD ();
        }
    }
}
```

**Returns** If resuming the scheduler caused a context switch then `pdTRUE` is returned, otherwise `pdFALSE` is returned.

TickType\_t **xTaskGetTickCount** (void)

**Returns** The count of ticks since `vTaskStartScheduler` was called.

TickType\_t **xTaskGetTickCountFromISR** (void)

This is a version of `xTaskGetTickCount()` that is safe to be called from an ISR - provided that `TickType_t` is the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being used.

**Returns** The count of ticks since `vTaskStartScheduler` was called.

UBaseType\_t **uxTaskGetNumberOfTasks** (void)

**Returns** The number of tasks that the real time kernel is currently managing. This includes all ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle task will also be included in the count.

char \***pcTaskGetName** (*TaskHandle\_t* xTaskToQuery)

**Returns** The text (human readable) name of the task referenced by the handle xTaskToQuery. A task can query its own name by either passing in its own handle, or by setting xTaskToQuery to NULL.

*TaskHandle\_t* **xTaskGetHandle** (const char \*pcNameToQuery)

NOTE: This function takes a relatively long time to complete and should be used sparingly.

**Returns** The handle of the task that has the human readable name pcNameToQuery. NULL is returned if no matching name is found. INCLUDE\_xTaskGetHandle must be set to 1 in FreeRTOSConfig.h for pcTaskGetHandle() to be available.

UBaseType\_t **uxTaskGetStackHighWaterMark** (*TaskHandle\_t* xTask)

Returns the high water mark of the stack associated with xTask.

INCLUDE\_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK\_DEPTH\_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

**Parameters** **xTask** –Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

**Returns** The smallest amount of free stack space there has been (in bytes not words, unlike vanilla FreeRTOS) since the task referenced by xTask was created.

configSTACK\_DEPTH\_TYPE **uxTaskGetStackHighWaterMark2** (*TaskHandle\_t* xTask)

Returns the start of the stack associated with xTask.

INCLUDE\_uxTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK\_DEPTH\_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

**Parameters** **xTask** –Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

**Returns** The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

uint8\_t \***pxTaskGetStackStart** (*TaskHandle\_t* xTask)

Returns the start of the stack associated with xTask.

INCLUDE\_pxTaskGetStackStart must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the lowest stack memory address, regardless of whether the stack grows up or down.

**Parameters** **xTask** –Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.

**Returns** A pointer to the start of the stack.

void **vTaskSetApplicationTaskTag** (*TaskHandle\_t* xTask, *TaskHookFunction\_t* pxHookFunction)

Sets pxHookFunction to be the task hook function used by the task xTask.

#### Parameters

- **xTask** –Handle of the task to set the hook function for Passing xTask as NULL has the effect of setting the calling tasks hook function.
- **pxHookFunction** –Pointer to the hook function.

*TaskHookFunction\_t* **xTaskGetApplicationTaskTag** (*TaskHandle\_t* xTask)

Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine - call xTaskGetApplicationTaskTagFromISR() instead.

*TaskHookFunction\_t* **xTaskGetApplicationTaskTagFromISR** (*TaskHandle\_t* xTask)

Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.

void **vTaskSetThreadLocalStoragePointer** (*TaskHandle\_t* xTaskToSet, BaseType\_t xIndex, void \*pvValue)

Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

#### Parameters

- **xTaskToSet** –Task to set thread local storage pointer for
- **xIndex** –The index of the pointer to set, from 0 to configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS - 1.
- **pvValue** –Pointer value to set.

void \***pvTaskGetThreadLocalStoragePointer** (*TaskHandle\_t* xTaskToQuery, BaseType\_t xIndex)

Get local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

#### Parameters

- **xTaskToQuery** –Task to get thread local storage pointer for
- **xIndex** –The index of the pointer to get, from 0 to configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS - 1.

**Returns** Pointer value

void **vTaskSetThreadLocalStoragePointerAndDelCallback** (*TaskHandle\_t* xTaskToSet, BaseType\_t xIndex, void \*pvValue, *TlsDeleteCallbackFunction\_t* pvDelCallback)

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

#### Parameters

- **xTaskToSet** –Task to set thread local storage pointer for
- **xIndex** –The index of the pointer to set, from 0 to configNUM\_THREAD\_LOCAL\_STORAGE\_POINTERS - 1.
- **pvValue** –Pointer value to set.

- **pvDelCallback** –Function to call to dispose of the local storage pointer when the task is deleted.

void **vApplicationGetIdleTaskMemory** (StaticTask\_t \*\*ppxIdleTaskTCBBuffer, StackType\_t \*\*ppxIdleTaskStackBuffer, uint32\_t \*pulIdleTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT\_STATIC\_ALLOCATION is set. For more information see this URI: [https://www.FreeRTOS.org/a00110.html#configSUPPORT\\_STATIC\\_ALLOCATION](https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION)

#### Parameters

- **ppxIdleTaskTCBBuffer** –A handle to a statically allocated TCB buffer
- **ppxIdleTaskStackBuffer** –A handle to a statically allocated Stack buffer for this idle task
- **pulIdleTaskStackSize** –A pointer to the number of elements that will fit in the allocated stack buffer

BaseType\_t **xTaskCallApplicationTaskHook** (*TaskHandle\_t* xTask, void \*pvParameter)

Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

#### Parameters

- **xTask** –Handle of the task to call the hook for.
- **pvParameter** –Parameter passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

*TaskHandle\_t* **xTaskGetIdleTaskHandle** (void)

xTaskGetIdleTaskHandle() is only available if INCLUDE\_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the idle task. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has been started.

UBaseType\_t **uxTaskGetSystemState** (TaskStatus\_t \*const pxTaskStatusArray, const UBaseType\_t uxArraySize, uint32\_t \*const pulTotalRunTime)

configUSE\_TRACE\_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to be available.

uxTaskGetSystemState() populates an TaskStatus\_t structure for each task in the system. TaskStatus\_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the TaskStatus\_t structure definition in this file for the full member list.

NOTE: This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

Example usage:

```
// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    uint32_t ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
    *pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
```

(continues on next page)

(continued from previous page)

```

// function is executing.
uxArraySize = uxTaskGetNumberOfTasks();

// Allocate a TaskStatus_t structure for each task. An array could be
// allocated statically at compile time.
pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

if( pxTaskStatusArray != NULL )
{
    // Generate raw status information about each task.
    uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &
↪ulTotalRunTime );

    // For percentage calculations.
    ulTotalRunTime /= 100UL;

    // Avoid divide by zero errors.
    if( ulTotalRunTime > 0 )
    {
        // For each populated position in the pxTaskStatusArray array,
        // format the raw data as human readable ASCII data
        for( x = 0; x < uxArraySize; x++ )
        {
            // What percentage of the total run time has the task used?
            // This will always be rounded down to the nearest integer.
            // ulTotalRunTimeDiv100 has already been divided by 100.
            ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter_
↪/ ulTotalRunTime;

            if( ulStatsAsPercentage > 0UL )
            {
                sprintf( pcWriteBuffer, "%s\t\t%lu\t\t%lu%%\r\n",
↪pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,
↪ulStatsAsPercentage );
            }
            else
            {
                // If the percentage is zero here then the task has
                // consumed less than 1% of the total run time.
                sprintf( pcWriteBuffer, "%s\t\t%lu\t\t<1%\r\n",
↪pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
            }

            pcWriteBuffer += strlen( ( char * ) pcWriteBuffer );
        }

        // The array is no longer needed, free the memory it consumes.
        vPortFree( pxTaskStatusArray );
    }
}

```

**Parameters**

- **pxTaskStatusArray** –A pointer to an array of TaskStatus\_t structures. The array must contain at least one TaskStatus\_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.
- **uxArraySize** –The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus\_t structures contained in the array, not by the number of bytes in the array.
- **pulTotalRunTime** –If configGENERATE\_RUN\_TIME\_STATS is set to 1 in FreeR-

TOSConfig.h then `*pulTotalRunTime` is set by `uxTaskGetSystemState()` to the total run time (as defined by the run time stats clock, see <https://www.FreeRTOS.org/rtos-run-time-stats.html>) since the target booted. `pulTotalRunTime` can be set to NULL to omit the total run time information.

**Returns** The number of `TaskStatus_t` structures that were populated by `uxTaskGetSystemState()`. This should equal the number returned by the `uxTaskGetNumberOfTasks()` API function, but will be zero if the value passed in the `uxArraySize` parameter was too small.

void **vTaskList** (char \*pcWriteBuffer)

List all the current tasks.

`configUSE_TRACE_FACILITY` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark.

Tasks are reported as blocked ( 'B' ), ready ( 'R' ), deleted ( 'D' ) or suspended ( 'S' ).

PLEASE NOTE:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

`vTaskList()` calls `uxTaskGetSystemState()`, then formats part of the `uxTaskGetSystemState()` output into a human readable table that displays task names, states and stack usage.

`vTaskList()` has a dependency on the `sprintf()` C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of `sprintf()` is provided in many of the FreeRTOS/Demo sub-directories in a file called `printf-stdarg.c` (note `printf-stdarg.c` does not provide a full `snprintf()` implementation!).

It is recommended that production systems call `uxTaskGetSystemState()` directly to get access to raw stats data, rather than indirectly through a call to `vTaskList()`.

**Parameters** `pcWriteBuffer` –A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

void **vTaskGetRunTimeStats** (char \*pcWriteBuffer)

Get the state of running tasks as a string

`configGENERATE_RUN_TIME_STATS` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. The application must also then provide definitions for `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Setting `configGENERATE_RUN_TIME_STATS` to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` macro. Calling `vTaskGetRunTimeStats()` writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

NOTE 2:

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

`vTaskGetRunTimeStats()` calls `uxTaskGetSystemState()`, then formats part of the `uxTaskGetSystemState()` output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

`vTaskGetRunTimeStats()` has a dependency on the `sprintf()` C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of `sprintf()` is provided in many of the FreeRTOS/Demo sub-directories in a file called `printf-stdarg.c` (note `printf-stdarg.c` does not provide a full `snprintf()` implementation!).

It is recommended that production systems call `uxTaskGetSystemState()` directly to get access to raw stats data, rather than indirectly through a call to `vTaskGetRunTimeStats()`.

**Parameters** `pcWriteBuffer` –A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

`uint32_t` **ulTaskGetIdleRunTimeCounter** (void)

`configGENERATE_RUN_TIME_STATS` and `configUSE_STATS_FORMATTING_FUNCTIONS` must both be defined as 1 for this function to be available. The application must also then provide definitions for `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` to configure a peripheral timer/counter and return the timers current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting `configGENERATE_RUN_TIME_STATS` to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` macro. While `uxTaskGetSystemState()` and `vTaskGetRunTimeStats()` writes the total execution time of each task into a buffer, `ulTaskGetIdleRunTimeCounter()` returns the total execution time of just the idle task.

**Returns** The total run time of the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the `portCONFIGURE_TIMER_FOR_RUN_TIME_STATS()` and `portGET_RUN_TIME_COUNTER_VALUE()` macros.

`BaseType_t` **xTaskGenericNotify** (*TaskHandle\_t* xTaskToNotify, `UBaseType_t` uxIndexToNotify, `uint32_t` ulValue, *eNotifyAction* eAction, `uint32_t` \*pulPreviousNotificationValue)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use `xTaskNotifyWaitIndexed()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWaitIndexed()` or `ulTaskNotifyTakeIndexed()` (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotify()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotify()` is equivalent to calling `xTaskNotifyIndexed()` with the `uxIndexToNotify` parameter set to 0.

**eSetBits** - The target notification value is bitwise ORed with `ulValue`. `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

**eIncrement** - The target notification value is incremented. `ulValue` is not used and `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

**eSetValueWithOverwrite** - The target notification value is set to the value of `ulValue`, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

**eSetValueWithoutOverwrite** - If the task being notified did not already have a notification pending at the same array index then the target notification value is set to `ulValue` and `xTaskNotifyIndexed()` will return `pdPASS`. If the task being notified already had a notification pending at the same array index then no action is performed and `pdFAIL` is returned.

**eNoAction** - The task receives a notification at the specified array index without the notification value at that index being updated. `ulValue` is not used and `xTaskNotifyIndexed()` always returns `pdPASS` in this case.

#### Parameters

- **xTaskToNotify** –The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **uxIndexToNotify** –The index within the target task’s array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotify()` does not have this parameter and always sends notifications to index 0.
- **ulValue** –Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.
- **eAction** –Specifies how the notification updates the task’s notification value, if at all. Valid values for `eAction` are as follows:
- **pdPreviousNotificationValue** – Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.

**Returns** Dependent on the value of `eAction`. See the description of the `eAction` parameter.

```
BaseType_t xTaskGenericNotifyFromISR (TaskHandle_t xTaskToNotify, UBaseType_t
                                     uxIndexToNotify, uint32_t ulValue, eNotifyAction eAction,
                                     uint32_t *pulPreviousNotificationValue, BaseType_t
                                     *pxHigherPriorityTaskWoken)
```

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

A version of `xTaskNotifyIndexed()` that can be used from an interrupt service routine (ISR).

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use `xTaskNotifyWaitIndexed()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWaitIndexed()` or `ulTaskNotifyTakeIndexed()` (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyFromISR()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyFromISR()` is equivalent to calling `xTaskNotifyIndexedFromISR()` with the `uxIndexToNotify` parameter set to 0.

**eSetBits** - The task's notification value is bitwise ORed with `ulValue`. `xTaskNotify()` always returns `pdPASS` in this case.

**eIncrement** - The task's notification value is incremented. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.

**eSetValueWithOverwrite** - The task's notification value is set to the value of `ulValue`, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). `xTaskNotify()` always returns `pdPASS` in this case.

**eSetValueWithoutOverwrite** - If the task being notified did not already have a notification pending then the task's notification value is set to `ulValue` and `xTaskNotify()` will return `pdPASS`. If the task being notified already had a notification pending then no action is performed and `pdFAIL` is returned.

**eNoAction** - The task receives a notification without its notification value being updated. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.

#### Parameters

- **uxIndexToNotify** - The index within the target task's array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyFromISR()` does not have this parameter and always sends notifications to index 0.
- **xTaskToNotify** - The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **ulValue** - Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.
- **eAction** - Specifies how the notification updates the task's notification value, if at all. Valid values for `eAction` are as follows:
- **pxHigherPriorityTaskWoken** - `xTaskNotifyFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If `xTaskNotifyFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.
- **pulPreviousNotificationValue** - Can be used to pass out the subject task's notification value before any bits are modified by the notify function.

**Returns** Dependent on the value of `eAction`. See the description of the `eAction` parameter.

BaseType\_t **xTaskGenericNotifyWait** (UBaseType\_t uxIndexToWaitOn, uint32\_t ulBitsToClearOnEntry, uint32\_t ulBitsToClearOnExit, uint32\_t \*pulNotificationValue, TickType\_t xTicksToWait)

Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

configUSE\_TASK\_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32\_t). The constant configTASK\_NOTIFICATION\_ARRAY\_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyWait() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyWait() is equivalent to calling xTaskNotifyWaitIndexed() with the uxIndexToWaitOn parameter set to 0.

#### Parameters

- **uxIndexToWaitOn** –The index within the calling task’s array of notification values on which the calling task will wait for a notification to be received. uxIndexToWaitOn must be less than configTASK\_NOTIFICATION\_ARRAY\_ENTRIES. xTaskNotifyWait() does not have this parameter and always waits for notifications on index 0.
- **ulBitsToClearOnEntry** –Bits that are set in ulBitsToClearOnEntry value will be cleared in the calling task’s notification value before the task is marked as waiting for a new notification (provided a notification is not already pending). Optionally blocks if no notifications are pending. Setting ulBitsToClearOnEntry to ULONG\_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0. Setting ulBitsToClearOnEntry to 0 will leave the task’s notification value unchanged.
- **ulBitsToClearOnExit** –If a notification is pending or received before the calling task exits the xTaskNotifyWait() function then the task’s notification value (see the xTaskNotify() API function) is passed out using the pulNotificationValue parameter. Then any bits that are set in ulBitsToClearOnExit will be cleared in the task’s notification value (note \*pulNotificationValue is set before any bits are cleared). Setting ulBitsToClearOnExit to ULONG\_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0 before the function exits. Setting ulBitsToClearOnExit to 0 will leave the task’s notification value unchanged when the function exits (in which case the value passed out in pulNotificationValue will match the task’s notification value).

- **pulNotificationValue** –Used to pass the task’s notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by `ulBitsToClearOnExit` being non-zero.
- **xTicksToWait** –The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when `xTaskNotifyWait()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS( value_in_ms )` can be used to convert a time specified in milliseconds to a time specified in ticks.

**Returns** If a notification was received (including notifications that were already pending when `xTaskNotifyWait` was called) then `pdPASS` is returned. Otherwise `pdFAIL` is returned.

void **vTaskGenericNotifyGiveFromISR** (*TaskHandle\_t* xTaskToNotify, *UBaseType\_t* uxIndexToNotify, *BaseType\_t* \*pxHigherPriorityTaskWoken)

A version of `xTaskNotifyGiveIndexed()` that can be called from an interrupt service routine (ISR).

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for more details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this macro to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`vTaskNotifyGiveIndexedFromISR()` is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the `xSemaphoreGiveFromISR()` API function, the equivalent action that instead uses a task notification is `vTaskNotifyGiveIndexedFromISR()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotificationTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyFromISR()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyGiveFromISR()` is equivalent to calling `xTaskNotifyGiveIndexedFromISR()` with the `uxIndexToNotify` parameter set to 0.

#### Parameters

- **xTaskToNotify** –The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **uxIndexToNotify** –The index within the target task’s array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyGiveFromISR()` does not have this parameter and always sends notifications to index 0.
- **pxHigherPriorityTaskWoken** –`vTaskNotifyGiveFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher

than the currently running task. If `vTaskNotifyGiveFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

`uint32_t ulTaskGenericNotifyTake` (`UBaseType_t uxIndexToWaitOn`, `BaseType_t xClearCountOnExit`, `TickType_t xTicksToWait`)

Waits for a direct to task notification on a particular index in the calling task's notification array in a manner similar to taking a counting semaphore.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for this function to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

`ulTaskNotifyTakeIndexed()` is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the `xSemaphoreTake()` API function, the equivalent action that instead uses a task notification is `ulTaskNotifyTakeIndexed()`.

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the `xTaskNotifyGiveIndexed()` macro, or `xTaskNotifyIndex()` function with the `eAction` parameter set to `eIncrement`.

`ulTaskNotifyTakeIndexed()` can either clear the task's notification value at the array index specified by the `uxIndexToWaitOn` parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for the task's notification value to be non-zero. The task does not consume any CPU time while it is in the Blocked state.

Where as `xTaskNotifyWaitIndexed()` will return when a notification is pending, `ulTaskNotifyTakeIndexed()` will return when the task's notification value is not zero.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single "notification value", and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `ulTaskNotifyTake()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `ulTaskNotifyTake()` is equivalent to calling `ulTaskNotifyTakeIndexed()` with the `uxIndexToWaitOn` parameter set to 0.

#### Parameters

- **`uxIndexToWaitOn`** –The index within the calling task's array of notification values on which the calling task will wait for a notification to be non-zero. `uxIndexToWaitOn` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyTake()` does not have this parameter and always waits for notifications on index 0.
- **`xClearCountOnExit`** –if `xClearCountOnExit` is `pdFALSE` then the task's notification value is decremented when the function exits. In this way the notification value acts

like a counting semaphore. If `xClearCountOnExit` is not `pdFALSE` then the task's notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.

- **xTicksToWait** –The maximum amount of time that the task should wait in the Blocked state for the task's notification value to be greater than zero, should the count not already be greater than zero when `ulTaskNotifyTake()` was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro `pdMS_TO_TICKS( value_in_ms )` can be used to convert a time specified in milliseconds to a time specified in ticks.

**Returns** The task's notification count before it is either cleared to zero or decremented (see the `xClearCountOnExit` parameter).

`BaseType_t xTaskGenericNotifyStateClear` (*TaskHandle\_t* xTask, `UBaseType_t` uxIndexToClear)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be ‘pending’ until it is read or explicitly cleared by the receiving task. `xTaskNotifyStateClearIndexed()` is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set xTask to NULL to clear the notification state of the calling task.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyStateClear()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyStateClear()` is equivalent to calling `xTaskNotifyStateClearIndexed()` with the `uxIndexToNotify` parameter set to 0.

#### Parameters

- **xTask** –The handle of the RTOS task that will have a notification state cleared. Set xTask to NULL to clear a notification state in the calling task. To obtain a task's handle create the task using `xTaskCreate()` and make use of the `pxCreatedTask` parameter, or create the task using `xTaskCreateStatic()` and store the returned value, or use the task's name in a call to `xTaskGetHandle()`.
- **uxIndexToClear** –The index within the target task's array of notification values to act upon. For example, setting `uxIndexToClear` to 1 will clear the state of the notification at index 1 within the array. `uxIndexToClear` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `ulTaskNotifyStateClear()` does not have this parameter and always acts on the notification at index 0.

**Returns** `pdTRUE` if the task's notification state was set to `eNotWaitingNotification`, otherwise `pdFALSE`.

`uint32_t ulTaskGenericNotifyValueClear` (*TaskHandle\_t* xTask, `UBaseType_t` uxIndexToClear, `uint32_t` ulBitsToClear)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

`configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (`uint32_t`). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

`ulTaskNotifyValueClearIndexed()` clears the bits specified by the `ulBitsToClear` bit mask in the notification value at array index `uxIndexToClear` of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `ulTaskNotifyValueClear()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `ulTaskNotifyValueClear()` is equivalent to calling `ulTaskNotifyValueClearIndexed()` with the `uxIndexToClear` parameter set to 0.

#### Parameters

- **xTask** –The handle of the RTOS task that will have bits in one of its notification values cleared. Set `xTask` to `NULL` to clear bits in a notification value of the calling task. To obtain a task’s handle create the task using `xTaskCreate()` and make use of the `pxCreatedTask` parameter, or create the task using `xTaskCreateStatic()` and store the returned value, or use the task’s name in a call to `xTaskGetHandle()`.
- **uxIndexToClear** –The index within the target task’s array of notification values in which to clear the bits. `uxIndexToClear` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `ulTaskNotifyValueClear()` does not have this parameter and always clears bits in the notification value at index 0.
- **ulBitsToClear** –Bit mask of the bits to clear in the notification value of `xTask`. Set a bit to 1 to clear the corresponding bits in the task’s notification value. Set `ulBitsToClear` to `0xffffffff` (UINT\_MAX on 32-bit architectures) to clear the notification value to 0. Set `ulBitsToClear` to 0 to query the task’s notification value without clearing any bits.

**Returns** The value of the target task’s notification value before the bits specified by `ulBitsToClear` were cleared.

void **vTaskSetTimeoutState** (Timeout\_t \*const pxTimeout)

BaseType\_t **xTaskCheckForTimeout** (Timeout\_t \*const pxTimeout, TickType\_t \*const pxTicksToWait)

Determines if `pxTicksToWait` ticks has passed since a time was captured using a call to `vTaskSetTimeoutState()`. The captured time includes the tick count and the number of times the tick count has overflowed.

#### Example Usage:

```
// Driver library function used to receive uxWantedBytes from an Rx buffer
// that is filled by a UART interrupt. If there are not enough bytes in the
// Rx buffer then the task enters the Blocked state until it is notified that
// more data has been placed into the buffer. If there is still not enough
// data then the task re-enters the Blocked state, and xTaskCheckForTimeout()
// is used to re-calculate the Block time to ensure the total amount of time
// spent in the Blocked state does not exceed MAX_TIME_TO_WAIT. This
// continues until either the buffer contains at least uxWantedBytes bytes,
// or the total amount of time spent in the Blocked state reaches
// MAX_TIME_TO_WAIT - at which point the task reads however many bytes are
// available up to a maximum of uxWantedBytes.
```

```
size_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    Timeout_t xTimeout;

    // Initialize xTimeout. This records the time at which this function
    // was entered.
    vTaskSetTimeoutState( &xTimeout );

    // Loop until the buffer contains the wanted number of bytes, or a
    // timeout occurs.
    while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
    {
        // The buffer didn't contain enough data so this task is going to
        // enter the Blocked state. Adjusting xTicksToWait to account for
```

(continues on next page)

(continued from previous page)

```

// any time that has been spent in the Blocked state within this
// function so far to ensure the total amount of time spent in the
// Blocked state does not exceed MAX_TIME_TO_WAIT.
if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
{
    //Timed out before the wanted number of bytes were available,
    // exit the loop.
    break;
}

// Wait for a maximum of xTicksToWait ticks to be notified that the
// receive interrupt has placed more data into the buffer.
ulTaskNotifyTake( pdTRUE, xTicksToWait );
}

// Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
// The actual number of bytes read (which might be less than
// uxWantedBytes) is returned.
uxReceived = UART_read_from_receive_buffer( pxUARTInstance,
                                             pucBuffer,
                                             uxWantedBytes );

return uxReceived;
}

```

**See also:**

<https://www.FreeRTOS.org/xTaskCheckForTimeOut.html>

**Parameters**

- **pxTimeOut** –The time status as captured previously using `vTaskSetTimeOutState`. If the timeout has not yet occurred, it is updated to reflect the current time status.
- **pxTicksToWait** –The number of ticks to check for timeout i.e. if `pxTicksToWait` ticks have passed since `pxTimeOut` was last updated (either by `vTaskSetTimeOutState()` or `xTaskCheckForTimeOut()`), the timeout has occurred. If the timeout has not occurred, `pxTicksToWait` is updated to reflect the number of remaining ticks.

**Returns** If timeout has occurred, `pdTRUE` is returned. Otherwise `pdFALSE` is returned and `pxTicksToWait` is updated to reflect the number of remaining ticks.

BaseType\_t **xTaskCatchUpTicks** (TickType\_t xTicksToCatchUp)

**Macros**

`tskKERNEL_VERSION_NUMBER`

`tskKERNEL_VERSION_MAJOR`

`tskKERNEL_VERSION_MINOR`

`tskKERNEL_VERSION_BUILD`

**tskDEFAULT\_INDEX\_TO\_NOTIFY**

**tskNO\_AFFINITY**

**tskIDLE\_PRIORITY**

Defines the priority used by the idle task. This must not be modified.

**taskYIELD ()**

Macro for forcing a context switch.

**taskENTER\_CRITICAL ()**

Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

---

**Note:** This may alter the stack (depending on the portable implementation) so must be used with care!

---

**taskENTER\_CRITICAL\_FROM\_ISR ()**

**taskENTER\_CRITICAL\_ISR ()**

**taskEXIT\_CRITICAL ()**

Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

---

**Note:** This may alter the stack (depending on the portable implementation) so must be used with care!

---

**taskEXIT\_CRITICAL\_FROM\_ISR (x)**

**taskEXIT\_CRITICAL\_ISR ()**

**taskDISABLE\_INTERRUPTS ()**

Macro to disable all maskable interrupts.

**taskENABLE\_INTERRUPTS ()**

Macro to enable microcontroller interrupts.

**taskSCHEDULER\_SUSPENDED**

**taskSCHEDULER\_NOT\_STARTED**

**taskSCHEDULER\_RUNNING**

**vTaskDelayUntil** (pxPreviousWakeTime, xTimeIncrement)

**xTaskNotify** (xTaskToNotify, ulValue, eAction)

**xTaskNotifyIndexed** (xTaskToNotify, uxIndexToNotify, ulValue, eAction)

**xTaskNotifyAndQuery** (xTaskToNotify, ulValue, eAction, pulPreviousNotifyValue)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

xTaskNotifyAndQueryIndexed() performs the same operation as xTaskNotifyIndexed() with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyAndQuery() performs the same operation as xTaskNotify() with the addition that it also returns the subject task's prior notification value (the notification value as it was at the time the function is called, rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

**xTaskNotifyAndQueryIndexed** (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotifyValue)

**xTaskNotifyFromISR** (xTaskToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)

**xTaskNotifyIndexedFromISR** (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)

**xTaskNotifyAndQueryIndexedFromISR** (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for details.

xTaskNotifyAndQueryIndexedFromISR() performs the same operation as xTaskNotifyIndexedFromISR() with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyAndQueryFromISR() performs the same operation as xTaskNotifyFromISR() with the addition that it also returns the subject task's prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotifyValue parameter.

**xTaskNotifyAndQueryFromISR** (xTaskToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)

**xTaskNotifyWait** (ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

**xTaskNotifyWaitIndexed** (uxIndexToWaitOn, ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

**xTaskNotifyGiveIndexed** (xTaskToNotify, uxIndexToNotify)

Sends a direct to task notification to a particular index in the target task's notification array in a manner similar to giving a counting semaphore.

See <https://www.FreeRTOS.org/RTOS-task-notifications.html> for more details.

configUSE\_TASK\_NOTIFICATIONS must be undefined or defined as 1 for these macros to be available.

Each task has a private array of "notification values" (or 'notifications'), each of which is a 32-bit unsigned integer (uint32\_t). The constant configTASK\_NOTIFICATION\_ARRAY\_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task's notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

xTaskNotifyGiveIndexed() is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the

`xSemaphoreGive()` API function, the equivalent action that instead uses a task notification is `xTaskNotifyGiveIndexed()`.

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the `ulTaskNotificationTakeIndexed()` API function rather than the `xTaskNotifyWaitIndexed()` API function.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyGive()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling `xTaskNotifyGive()` is equivalent to calling `xTaskNotifyGiveIndexed()` with the `uxIndexToNotify` parameter set to 0.

#### Parameters

- **`xTaskToNotify`** –The handle of the task being notified. The handle to a task can be returned from the `xTaskCreate()` API function used to create the task, and the handle of the currently running task can be obtained by calling `xTaskGetCurrentTaskHandle()`.
- **`uxIndexToNotify`** –The index within the target task’s array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotifyGive()` does not have this parameter and always sends notifications to index 0.

**Returns** `xTaskNotifyGive()` is a macro that calls `xTaskNotify()` with the `eAction` parameter set to `eIncrement` - so `pdPASS` is always returned.

**`xTaskNotifyGive`** (`xTaskToNotify`)

**`vTaskNotifyGiveFromISR`** (`xTaskToNotify`, `pxHigherPriorityTaskWoken`)

**`vTaskNotifyGiveIndexedFromISR`** (`xTaskToNotify`, `uxIndexToNotify`, `pxHigherPriorityTaskWoken`)

**`ulTaskNotifyTake`** (`xClearCountOnExit`, `xTicksToWait`)

**`ulTaskNotifyTakeIndexed`** (`uxIndexToWaitOn`, `xClearCountOnExit`, `xTicksToWait`)

**`xTaskNotifyStateClear`** (`xTask`)

**`xTaskNotifyStateClearIndexed`** (`xTask`, `uxIndexToClear`)

**`ulTaskNotifyValueClear`** (`xTask`, `ulBitsToClear`)

**`ulTaskNotifyValueClearIndexed`** (`xTask`, `uxIndexToClear`, `ulBitsToClear`)

#### Type Definitions

```
typedef struct tskTaskControlBlock *TaskHandle_t
```

```
typedef BaseType_t (*TaskHookFunction_t)(void*)
```

Defines the prototype to which the application task hook function must conform.

```
typedef void (*TlsDeleteCallbackFunction_t)(int, void*)
```

Prototype of local storage pointer deletion callback.

#### Enumerations

enum **eTaskState**

Task states returned by eTaskGetState.

*Values:*

enumerator **eRunning**

enumerator **eReady**

enumerator **eBlocked**

enumerator **eSuspended**

enumerator **eDeleted**

enumerator **eInvalid**

enum **eNotifyAction**

*Values:*

enumerator **eNoAction**

enumerator **eSetBits**

enumerator **eIncrement**

enumerator **eSetValueWithOverwrite**

enumerator **eSetValueWithoutOverwrite**

enum **eSleepModeStatus**

Possible return values for eTaskConfirmSleepModeStatus().

*Values:*

enumerator **eAbortSleep**

enumerator **eStandardSleep**

enumerator **eNoTasksWaitingTimeout**

## Queue API

### Header File

- [components/freertos/include/freertos/queue.h](#)

**Functions**

BaseType\_t **xQueueGenericSend** (*QueueHandle\_t* xQueue, const void \*const pvItemToQueue, TickType\_t xTicksToWait, const BaseType\_t xCopyPosition)

It is preferred that the macros `xQueueSend()`, `xQueueSendToFront()` and `xQueueSendToBack()` are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See `xQueueSendFromISR()` for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10, ←
queueSEND_TO_BACK ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueGenericSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0, ←
queueSEND_TO_BACK );
    }

    // ... Rest of task code.
}

```

**Parameters**

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.

- **xTicksToWait** –The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required.
- **xCopyPosition** –Can take the value queueSEND\_TO\_BACK to place the item at the back of the queue, or queueSEND\_TO\_FRONT to place the item at the front of the queue (for high priority messages).

**Returns** pdTRUE if the item was successfully posted, otherwise errQUEUE\_FULL.

BaseType\_t **xQueuePeek** (*QueueHandle\_t* xQueue, void \*const pvBuffer, TickType\_t xTicksToWait)

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

This macro must not be used in an interrupt service routine. See xQueuePeekFromISR() for an alternative that can be called from an interrupt service routine.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxdMessage;

    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a

```

(continues on next page)

(continued from previous page)

```

// message is not immediately available.
if( xQueuePeek( xQueue, &( pxRxdMessage ), ( TickType_t ) 10 ) )
{
    // pcRxdMessage now points to the struct AMessage variable posted
    // by vATask, but the item still remains on the queue.
}
}

// ... Rest of task code.
}

```

**Parameters**

- **xQueue** –The handle to the queue from which the item is to be received.
- **pvBuffer** –Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** –The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

**Returns** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType\_t **xQueuePeekFromISR** (*QueueHandle\_t* xQueue, void \*const pvBuffer)

A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

**Parameters**

- **xQueue** –The handle to the queue from which the item is to be received.
- **pvBuffer** –Pointer to the buffer into which the received item will be copied.

**Returns** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType\_t **xQueueReceive** (*QueueHandle\_t* xQueue, void \*const pvBuffer, TickType\_t xTicksToWait)

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

```

(continues on next page)

(continued from previous page)

```

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
if( xQueue == 0 )
{
    // Failed to create the queue.
}

// ...

// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
pxMessage = & xMessage;
xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

// ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxdMessage;

    if( xQueue != 0 )
    {
        // Receive a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if( xQueueReceive( xQueue, &( pxRxdMessage ), ( TickType_t ) 10 ) )
        {
            // pxRxdMessage now points to the struct AMessage variable posted
            // by vATask.
        }
    }

    // ... Rest of task code.
}

```

**Parameters**

- **xQueue** –The handle to the queue from which the item is to be received.
- **pvBuffer** –Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** –The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. `xQueueReceive()` will return immediately if `xTicksToWait` is zero and the queue is empty. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

**Returns** `pdTRUE` if an item was successfully received from the queue, otherwise `pdFALSE`.

`UBaseType_t uxQueueMessagesWaiting` (const *QueueHandle\_t* xQueue)

Return the number of messages stored in a queue.

**Parameters** **xQueue** –A handle to the queue being queried.

**Returns** The number of messages available in the queue.

`UBaseType_t uxQueueSpacesAvailable` (const *QueueHandle\_t* xQueue)

Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

**Parameters** **xQueue** –A handle to the queue being queried.

**Returns** The number of spaces available in the queue.

void **vQueueDelete** (*QueueHandle\_t* xQueue)

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

**Parameters** **xQueue** –A handle to the queue to be deleted.

BaseType\_t **xQueueGenericSendFromISR** (*QueueHandle\_t* xQueue, const void \*const pvItemToQueue, BaseType\_t \*const pxHigherPriorityTaskWoken, const BaseType\_t xCopyPosition)

It is preferred that the macros `xQueueSendFromISR()`, `xQueueSendToFrontFromISR()` and `xQueueSendToBackFromISR()` be used in place of calling this function directly. `xQueueGiveFromISR()` is an equivalent for use by semaphores that don't actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
char cIn;
BaseType_t xHigherPriorityTaskWokenByPost;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWokenByPost = pdFALSE;

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post each byte.
xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost,
→ queueSEND_TO_BACK );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary. Note that the
// name of the yield function required is port specific.
if( xHigherPriorityTaskWokenByPost )
{
taskYIELD_YIELD_FROM_ISR();
}
}
```

#### Parameters

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- **pxHigherPriorityTaskWoken** –[out] `xQueueGenericSendFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueGenericSendFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.
- **xCopyPosition** –Can take the value `queueSEND_TO_BACK` to place the item at the back of the queue, or `queueSEND_TO_FRONT` to place the item at the front of the queue (for high priority messages).

**Returns** `pdTRUE` if the data was successfully sent to the queue, otherwise `errQUEUE_FULL`.

BaseType\_t **xQueueGiveFromISR** (*QueueHandle\_t* xQueue, BaseType\_t \*const pxHigherPriorityTaskWoken)

BaseType\_t **xQueueReceiveFromISR** (*QueueHandle\_t* xQueue, void \*const pvBuffer, BaseType\_t \*const pxHigherPriorityTaskWoken)

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

```
QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction( void *pvParameters )
{
    char cValueToPost;
    const TickType_t xTicksToWait = ( TickType_t )0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate( 10, sizeof( char ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }

    // ...

    // Post some characters that will be used within an ISR.  If the queue
    // is full then this task will block for xTicksToWait ticks.
    cValueToPost = 'a';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
    cValueToPost = 'b';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

    // ... keep posting characters ... this task may block when the queue
    // becomes full.

    cValueToPost = 'c';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.
void vISR_Routine( void )
{
    BaseType_t xTaskWokenByReceive = pdFALSE;
    char cRxdChar;

    while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxdChar, &
    ↪xTaskWokenByReceive) )
    {
        // A character was received.  Output the character now.
        vOutputCharacter( cRxdChar );

        // If removing the character from the queue woke the task that was
        // posting onto the queue cTaskWokenByReceive will have been set to
        // pdTRUE.  No matter how many times this loop iterates only one
        // task will be woken.
    }

    if( cTaskWokenByPost != ( char ) pdFALSE;
    {
        taskYIELD ();
    }
}
```

(continues on next page)

```
}

```

**Parameters**

- **xQueue** –The handle to the queue from which the item is to be received.
- **pvBuffer** –Pointer to the buffer into which the received item will be copied.
- **pxHigherPriorityTaskWoken** –[out] A task may be blocked waiting for space to become available on the queue. If xQueueReceiveFromISR causes such a task to unblock \*pxTaskWoken will get set to pdTRUE, otherwise \*pxTaskWoken will remain unchanged.

**Returns** pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType\_t **xQueueIsQueueEmptyFromISR** (const *QueueHandle\_t* xQueue)

BaseType\_t **xQueueIsQueueFullFromISR** (const *QueueHandle\_t* xQueue)

UBaseType\_t **uxQueueMessagesWaitingFromISR** (const *QueueHandle\_t* xQueue)

void **vQueueAddToRegistry** (*QueueHandle\_t* xQueue, const char \*pcQueueName)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

configQUEUE\_REGISTRY\_SIZE defines the maximum number of handles the registry can hold. configQUEUE\_REGISTRY\_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not effect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

**Parameters**

- **xQueue** –The handle of the queue being added to the registry. This is the handle returned by a call to xQueueCreate(). Semaphore and mutex handles can also be passed in here.
- **pcQueueName** –The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

void **vQueueUnregisterQueue** (*QueueHandle\_t* xQueue)

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and vQueueUnregisterQueue() to remove the queue, semaphore or mutex from the register. If you are not using a kernel aware debugger then this function can be ignored.

**Parameters** **xQueue** –The handle of the queue being removed from the registry.

const char \***pcQueueGetName** (*QueueHandle\_t* xQueue)

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call pcQueueGetName() to look up and return the name of a queue in the queue registry from the queue's handle.

**Parameters** **xQueue** –The handle of the queue the name of which will be returned.

**Returns** If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

*QueueHandle\_t* **xQueueGenericCreate** (const UBaseType\_t uxQueueLength, const UBaseType\_t uxItemSize, const uint8\_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

*QueueHandle\_t* **xQueueGenericCreateStatic** (const UBaseType\_t uxQueueLength, const UBaseType\_t uxItemSize, uint8\_t \*pucQueueStorage, StaticQueue\_t \*pxStaticQueue, const uint8\_t ucQueueType)

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

*QueueSetHandle\_t* **xQueueCreateSet** (const UBaseType\_t uxEventQueueLength)

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to `xQueueCreateSet()` before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to `xQueueAddToSet()`. `xQueueSelectFromSet()` is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on <https://www.FreeRTOS.org/RTOS-queue-sets.html> for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

**Parameters** **uxEventQueueLength** –Queue sets store events that occur on the queues and semaphores contained in the set. `uxEventQueueLength` specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost `uxEventQueueLength` should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:

- If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then `uxEventQueueLength` should be set to  $(5 + 12 + 1)$ , or 18.
- If a queue set is to hold three binary semaphores then `uxEventQueueLength` should be set to  $(1 + 1 + 1)$ , or 3.
- If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then `uxEventQueueLength` should be set to  $(5 + 3)$ , or 8.

**Returns** If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

BaseType\_t **xQueueAddToSet** (*QueueSetMemberHandle\_t* xQueueOrSemaphore, *QueueSetHandle\_t* xQueueSet)

Adds a queue or semaphore to a queue set that was previously created by a call to `xQueueCreateSet()`.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

**Parameters**

- **xQueueOrSemaphore** –The handle of the queue or semaphore being added to the queue set (cast to an `QueueSetMemberHandle_t` type).
- **xQueueSet** –The handle of the queue set to which the queue or semaphore is being added.

**Returns** If the queue or semaphore was successfully added to the queue set then `pdPASS` is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then `pdFAIL` is returned.

BaseType\_t **xQueueRemoveFromSet** (*QueueSetMemberHandle\_t* xQueueOrSemaphore, *QueueSetHandle\_t* xQueueSet)

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

#### Parameters

- **xQueueOrSemaphore** –The handle of the queue or semaphore being removed from the queue set (cast to an *QueueSetMemberHandle\_t* type).
- **xQueueSet** –The handle of the queue set in which the queue or semaphore is included.

**Returns** If the queue or semaphore was successfully removed from the queue set then pdPASS is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then pdFAIL is returned.

*QueueSetMemberHandle\_t* **xQueueSelectFromSet** (*QueueSetHandle\_t* xQueueSet, const TickType\_t xTicksToWait)

xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet() effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: See the documentation on <https://www.FreeRTOS.org/RTOS-queue-sets.html> for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

#### Parameters

- **xQueueSet** –The queue set on which the task will (potentially) block.
- **xTicksToWait** –The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

**Returns** xQueueSelectFromSet() will return the handle of a queue (cast to a *QueueSetMemberHandle\_t* type) contained in the queue set that contains data, or the handle of a semaphore (cast to a *QueueSetMemberHandle\_t* type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before the specified block time expires.

*QueueSetMemberHandle\_t* **xQueueSelectFromSetFromISR** (*QueueSetHandle\_t* xQueueSet)

A version of xQueueSelectFromSet() that can be used from an ISR.

## Macros

**xQueueCreate** (uxQueueLength, uxItemSize)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

<https://www.FreeRTOS.org/Embedded-RTOS-Queues.html>

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue2 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // ... Rest of task code.
}

```

**Parameters**

- **uxQueueLength** –The maximum number of items that the queue can contain.
- **uxItemSize** –The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

**Returns** If the queue is successfully create then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

**xQueueCreateStatic** (uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue's data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

<https://www.FreeRTOS.org/Embedded-RTOS-Queues.html>

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.

```

(continues on next page)

(continued from previous page)

```

StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [(queue length) * ( queue item size)] bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can
    →hold.
                            ITEM_SIZE // The size of each item in the queue
    →hold the items in the queue.
                            &( ucQueueStorage[ 0 ] ), // The buffer that will
    →queue structure.
                            &xQueueBuffer ); // The buffer that will hold the

    // The queue is guaranteed to be created successfully as no dynamic memory
    // allocation is used. Therefore xQueue1 is now a handle to a valid queue.

    // ... Rest of task code.
}

```

**Parameters**

- **uxQueueLength** –The maximum number of items that the queue can contain.
- **uxItemSize** –The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
- **pucQueueStorage** –If uxItemSize is not zero then pucQueueStorageBuffer must point to a uint8\_t array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is ( uxQueueLength \* uxItemsSize ) bytes. If uxItemSize is zero then pucQueueStorageBuffer can be NULL.
- **pxQueueBuffer** –Must point to a variable of type StaticQueue\_t, which will be used to hold the queue's data structure.

**Returns** If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL then NULL is returned.

**xQueueSendToFront** (xQueue, pvItemToQueue, xTicksToWait)

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

```

(continues on next page)

(continued from previous page)

```

struct AMessage *pxMessage;

// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...

if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become
    // available if necessary.
    if( xQueueSendToFront( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSendToFront( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}

```

**Parameters**

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** –The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required.

**Returns** pdTRUE if the item was successfully posted, otherwise errQUEUE\_FULL.

**xQueueSendToBack** (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

```

(continues on next page)

(continued from previous page)

```

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
QueueHandle_t xQueue1, xQueue2;
struct AMessage *pxMessage;

// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...

if( xQueue1 != 0 )
{
// Send an uint32_t. Wait for 10 ticks for space to become
// available if necessary.
if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) !=_
↳pdPASS )
{
// Failed to post the message, even after 10 ticks.
}
}

if( xQueue2 != 0 )
{
// Send a pointer to a struct AMessage object. Don't block if the
// queue is already full.
pxMessage = & xMessage;
xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.
}

```

**Parameters**

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** –The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required.

**Returns** pdTRUE if the item was successfully posted, otherwise errQUEUE\_FULL.

**xQueueSend** (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equivalent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```

struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    // ...

    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become
        // available if necessary.
        if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS_
↪)
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the
        // queue is already full.
        pxMessage = &xMessage;
        xQueueSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
    }

    // ... Rest of task code.
}

```

**Parameters**

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** –The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS should be used to convert to real time if this is required.

**Returns** pdTRUE if the item was successfully posted, otherwise errQUEUE\_FULL.

**xQueueOverwrite** (xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See `xQueueOverwriteFromISR()` for an alternative which may be used in an ISR.

Example usage:

```
void vFunction( void *pvParameters )
{
    QueueHandle_t xQueue;
    uint32_t ulVarToSend, ulValReceived;

    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwrite() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

    // Write the value 10 to the queue using xQueueOverwrite().
    ulVarToSend = 10;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // Peeking the queue should now return 10, but leave the value 10 in
    // the queue. A block time of zero is used as it is known that the
    // queue holds a value.
    ulValReceived = 0;
    xQueuePeek( xQueue, &ulValReceived, 0 );

    if( ulValReceived != 10 )
    {
        // Error unless the item was removed by a different task.
    }

    // The queue is still full. Use xQueueOverwrite() to overwrite the
    // value held in the queue with 100.
    ulVarToSend = 100;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // This time read from the queue, leaving the queue empty once more.
    // A block time of 0 is used again.
    xQueueReceive( xQueue, &ulValReceived, 0 );

    // The value read should be the last value written, even though the
    // queue was already full when the value was written.
    if( ulValReceived != 100 )
    {
        // Error!
    }

    // ...
}
```

#### Parameters

- **xQueue** –The handle of the queue to which the data is being sent.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.

**Returns** `xQueueOverwrite()` is a macro that calls `xQueueGenericSend()`, and therefore has the same return values as `xQueueSendToFront()`. However, `pdPASS` is the only value that can be returned because `xQueueOverwrite()` will write to the queue even when the queue is already full.

**xQueueSendToFrontFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```
void vBufferISR( void )
{
char cIn;
 BaseType_t xHigherPriorityTaskWoken;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWoken = pdFALSE;

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post the byte.
xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

} while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
portYIELD_FROM_ISR ();
}
}
```

**Parameters**

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –[out] xQueueSendToFrontFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**Returns** pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE\_FULL.

**xQueueSendToBackFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```

void vBufferISR( void )
{
char cIn;
BaseType_t xHigherPriorityTaskWoken;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWoken = pdFALSE;

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post the byte.
xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

} while ( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
portYIELD_FROM_ISR ();
}
}

```

### Parameters

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –[out] xQueueSendToBackFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**Returns** pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE\_FULL.

**xQueueOverwriteFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

Example usage:

```

QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
// Create a queue to hold one uint32_t value. It is strongly
// recommended *not* to use xQueueOverwriteFromISR() on queues that can
// contain more than one value, and doing so will trigger an assertion
// if configASSERT() is defined.
xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

```

(continues on next page)

(continued from previous page)

```

void vAnInterruptHandler( void )
{
// xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
BaseType_t xHigherPriorityTaskWoken = pdFALSE;
uint32_t ulVarToSend, ulValReceived;

// Write the value 10 to the queue using xQueueOverwriteFromISR().
ulVarToSend = 10;
xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

// The queue is full, but calling xQueueOverwriteFromISR() again will still
// pass because the value held in the queue will be overwritten with the
// new value.
ulVarToSend = 100;
xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

// Reading from the queue will now return 100.

// ...

if( xHigherPriorityTaskWoken == pdTRUE )
{
// Writing to the queue caused a task to unblock and the unblocked task
// has a priority higher than or equal to the priority of the currently
// executing task (the task this interrupt interrupted). Perform a
↪context
// switch so this interrupt returns directly to the unblocked task.
portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
}
}

```

**Parameters**

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –[out] xQueueOverwriteFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**Returns** xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

**xQueueSendFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```

void vBufferISR( void )
{
char cIn;
BaseType_t xHigherPriorityTaskWoken;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWoken = pdFALSE;

// Loop until the buffer is empty.
do
{
// Obtain a byte from the buffer.
cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

// Post the byte.
xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );

} while ( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary.
if( xHigherPriorityTaskWoken )
{
// Actual macro used here is port specific.
portYIELD_FROM_ISR ();
}
}

```

**Parameters**

- **xQueue** –The handle to the queue on which the item is to be posted.
- **pvItemToQueue** –A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** –[out] xQueueSendFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**Returns** pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE\_FULL.

**xQueueReset** (xQueue)

Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.

**Type Definitions**

```
typedef struct QueueDefinition *QueueHandle_t
```

```
typedef struct QueueDefinition *QueueSetHandle_t
```

Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an xQueueSet variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.

```
typedef struct QueueDefinition *QueueSetMemberHandle_t
```

Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle\_t is defined as a type to be used where a parameter or return value can be either an QueueHandle\_t or an SemaphoreHandle\_t.

**Semaphore API****Header File**

- [components/freertos/include/freertos/semphr.h](#)

## Macros

**semBINARY\_SEMAPHORE\_QUEUE\_LENGTH**

**semSEMAPHORE\_QUEUE\_ITEM\_LENGTH**

**semGIVE\_BLOCK\_TIME**

**vSemaphoreCreateBinary** (xSemaphore)

**xSemaphoreCreateBinary** ()

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using `xSemaphoreCreateBinary()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateBinary()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a binary semaphore is created using `xSemaphoreCreateBinaryStatic()` then the application writer must provide the memory. `xSemaphoreCreateBinaryStatic()` therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old `vSemaphoreCreateBinary()` macro is now deprecated in favour of this `xSemaphoreCreateBinary()` function. Note that binary semaphores created using the `vSemaphoreCreateBinary()` macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using `xSemaphoreCreateBinary()` are created in a state such that the the semaphore must first be ‘given’ before it can be ‘taken’ .

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see `xSemaphoreCreateMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Returns** Handle to the created semaphore, or NULL if the memory required to hold the semaphore’s data structures could not be allocated.

**xSemaphoreCreateBinaryStatic** (pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

NOTE: In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see <https://www.FreeRTOS.org/a00111.html>). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary() or
    // xSemaphoreCreateBinaryStatic().
    // The semaphore's data structures will be placed in the xSemaphoreBuffer
    // variable, the address of which is passed into the function. The
    // function's parameter is not NULL, so the function will not attempt any
    // dynamic memory allocation, and therefore the function will not return
    // return NULL.
    xSemaphore = xSemaphoreCreateBinaryStatic( &xSemaphoreBuffer );

    // Rest of task code goes here.
}
```

**Parameters**

- **pxStaticSemaphore** – Must point to a variable of type StaticSemaphore\_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

**Returns** If the semaphore is created then a handle to the created semaphore is returned. If pxSemaphoreBuffer is NULL then NULL is returned.

**xSemaphoreTake** (xSemaphore, xBlockTime)

*Macro* to obtain a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

param xSemaphore A handle to the semaphore being taken - obtained when the semaphore was created.

param xBlockTime The time in ticks to wait for the semaphore to become available. The macro portTICK\_PERIOD\_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX\_DELAY can be used to block indefinitely (provided INCLUDE\_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

Example usage:

```

SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore.  If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.

            // ...

            // We have finished accessing the shared resource.  Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
        else
        {
            // We could not obtain the semaphore and can therefore not access
            // the shared resource safely.
        }
    }
}

```

**Returns** pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

#### **xSemaphoreTakeRecursive** (xMutex, xBlockTime)

*Macro* to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE\_RECURSIVE\_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{

```

(continues on next page)

```

// Create the mutex to guard a shared resource.
xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex.  If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex.  In real
            // code these would not be just sequential calls as this would make
            // no sense.  Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times.  Again it is unlikely that real code would have
            // these calls sequentially, but instead buried in a more complex
            // call structure.  This is just for illustrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}

```

**Parameters**

- **xMutex** –A handle to the mutex being obtained. This is the handle returned by `xSemaphoreCreateRecursiveMutex()`;
- **xBlockTime** –The time in ticks to wait for the semaphore to become available. The macro `portTICK_PERIOD_MS` can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. If the task already owns the semaphore then `xSemaphoreTakeRecursive()` will return immediately no matter what the value of `xBlockTime`.

**Returns** `pdTRUE` if the semaphore was obtained. `pdFALSE` if `xBlockTime` expired without the semaphore becoming available.

**xSemaphoreGive** (xSemaphore)

*Macro* to release a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()`, `xSemaphoreCreateMutex()` or `xSemaphoreCreateCounting()`. and obtained us-

ing `sSemaphoreTake()`.

This macro must not be used from an ISR. See `xSemaphoreGiveFromISR()` for an alternative which can be used from an ISR.

This macro must also not be used on semaphores created using `xSemaphoreCreateRecursiveMutex()`.

Example usage:

```
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        if( xSemaphoreGive( xSemaphore ) != pdTRUE )
        {
            // We would expect this call to fail because we cannot give
            // a semaphore without first "taking" it!
        }

        // Obtain the semaphore - don't block if the semaphore is not
        // immediately available.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
        {
            // We now have the semaphore and can access the shared resource.

            // ...

            // We have finished accessing the shared resource so can free the
            // semaphore.
            if( xSemaphoreGive( xSemaphore ) != pdTRUE )
            {
                // We would not expect this call to fail because we must have
                // obtained the semaphore to get here.
            }
        }
    }
}
```

#### Parameters

- **xSemaphore** – A handle to the semaphore being released. This is the handle returned when the semaphore was created.

**Returns** `pdTRUE` if the semaphore was released. `pdFALSE` if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

#### **xSemaphoreGiveRecursive** (xMutex)

*Macro* to recursively release, or ‘give’, a mutex type semaphore. The mutex must have previously been created using a call to `xSemaphoreCreateRecursiveMutex()`;

`configUSE_RECURSIVE_MUTEXES` must be set to 1 in `FreeRTOSConfig.h` for this macro to be available.

This macro must not be used on mutexes created using `xSemaphoreCreateMutex()`.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

## Example usage:

```

SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex.  If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex.  In real
            // code these would not be just sequential calls as this would make
            // no sense.  Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times.  Again it is unlikely that real code would have
            // these calls sequentially, it would be more likely that the calls
            // to xSemaphoreGiveRecursive() would be called as a call stack
            // unwound.  This is just for demonstrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}

```

**Parameters**

- **xMutex** –A handle to the mutex being released, or ‘given’. This is the handle returned by xSemaphoreCreateMutex();

**Returns** pdTRUE if the semaphore was given.

**xSemaphoreGiveFromISR** (xSemaphore, pxHigherPriorityTaskWoken)

*Macro* to release a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()` or `xSemaphoreCreateCounting()`.

Mutex type semaphores (those created using a call to `xSemaphoreCreateMutex()`) must not be used with this macro.

This macro can be used from an ISR.

Example usage:

```
#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
void vATask( void * pvParameters )
{
    for( ;; )
    {
        // We want this task to run every 10 ticks of a timer. The semaphore
        // was created before this task was started.

        // Block waiting for the semaphore to become available.
        if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
        {
            // It is time to execute.

            // ...

            // We have finished our task. Return to the top of the loop where
            // we will block on the semaphore until it is time to execute
            // again. Note when using the semaphore for synchronisation with an
            // ISR in this manner there is no need to 'give' the semaphore back.
        }
    }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;

    // A timer tick has occurred.

    // ... Do other time functions.

    // Is it time for vATask () to run?
    xHigherPriorityTaskWoken = pdFALSE;
    ucLocalTickCount++;
    if( ucLocalTickCount >= TICKS_TO_WAIT )
    {
        // Unblock the task by releasing the semaphore.
        xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

        // Reset the count so we release the semaphore again in 10 ticks time.
        ucLocalTickCount = 0;
    }

    if( xHigherPriorityTaskWoken != pdFALSE )
    {
        // We can force a context switch here. Context switching from an
```

(continues on next page)

(continued from previous page)

```

// ISR uses port specific syntax. Check the demo task for your port
// to find the syntax required.
}
}

```

**Parameters**

- **xSemaphore** –A handle to the semaphore being released. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** –xSemaphoreGiveFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**Returns** pdTRUE if the semaphore was successfully given, otherwise errQUEUE\_FULL.

**xSemaphoreTakeFromISR** (xSemaphore, pxHigherPriorityTaskWoken)

*Macro* to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

**Parameters**

- **xSemaphore** –A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** –[out] xSemaphoreTakeFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**Returns** pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

**xSemaphoreCreateMutex** ()

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see <https://www.FreeRTOS.org/a00111.html>). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```

SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}

```

**Returns** If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.

#### **xSemaphoreCreateMutexStatic** (pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see <https://www.FreeRTOS.org/a00111.html>). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task 'taking' a semaphore MUST ALWAYS 'give' the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always 'gives' the semaphore and another always 'takes' the semaphore) and from within interrupt service routines.

Example usage:

```

SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}

```

#### **Parameters**

- **pxMutexBuffer** –Must point to a variable of type StaticSemaphore\_t, which will be used to hold the mutex's data structure, removing the need for the memory to be allocated dynamically.

**Returns** If the mutex was successfully created then a handle to the created mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

#### **xSemaphoreCreateRecursiveMutex()**

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see <http://www.freertos.org/a00111.html>). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See vSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Returns** xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle\_t.

#### **xSemaphoreCreateRecursiveMutexStatic()** (pxStaticSemaphore)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see <https://www.FreeRTOS.org/a00111.html>). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex.

`xSemaphoreCreateRecursiveMutexStatic()` therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the `xSemaphoreTakeRecursive()` and `xSemaphoreGiveRecursive()` macros. The `xSemaphoreTake()` and `xSemaphoreGive()` macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called `xSemaphoreGiveRecursive()` for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore **MUST ALWAYS** ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See `xSemaphoreCreateBinary()` for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a
    // recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold
    // the mutexes data structures - so no dynamic memory allocation will be
    // attempted.
    xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

#### Parameters

- **pxStaticSemaphore** –Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the recursive mutex’s data structure, removing the need for the memory to be allocated dynamically.

**Returns** If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If `pxMutexBuffer` was `NULL` then `NULL` is returned.

#### **xSemaphoreCreateCounting** (uxMaxCount, uxInitialCount)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer can instead optionally provide the memory that will get used by the counting semaphore. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

## 1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

## 2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
    // The max value to which the semaphore can count should be 10, and the
    // initial value assigned to the count should be 0.
    xSemaphore = xSemaphoreCreateCounting( 10, 0 );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Parameters**

- **uxMaxCount** –The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- **uxInitialCount** –The count value assigned to the semaphore when it is created.

**Returns** Handle to the created semaphore. Null if the semaphore could not be created.

**xSemaphoreCreateCountingStatic** (uxMaxCount, uxInitialCount, pxSemaphoreBuffer)

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! <https://www.FreeRTOS.org/RTOS-task-notifications.html>

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see <https://www.FreeRTOS.org/a00111.html>). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer must provide the memory. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

## 1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

## 2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

### Example usage:

```
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Counting semaphore cannot be used before they have been created. Create
    // a counting semaphore using xSemaphoreCreateCountingStatic(). The max
    // value to which the semaphore can count is 10, and the initial value
    // assigned to the count will be 0. The address of xSemaphoreBuffer is
    // passed in and will be used to hold the semaphore structure, so no dynamic
    // memory allocation will be used.
    xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );

    // No memory allocation was attempted so xSemaphore cannot be NULL, so there
    // is no need to check its value.
}
```

### Parameters

- **uxMaxCount** –The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- **uxInitialCount** –The count value assigned to the semaphore when it is created.
- **pxSemaphoreBuffer** –Must point to a variable of type StaticSemaphore\_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

**Returns** If the counting semaphore was successfully created then a handle to the created counting semaphore is returned. If pxSemaphoreBuffer was NULL then NULL is returned.

### vSemaphoreDelete (xSemaphore)

Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore if the mutex is held by a task.

### Parameters

- **xSemaphore** –A handle to the semaphore to be deleted.

### xSemaphoreGetMutexHolder (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of determining the identity of the mutex holder as the holder may change between the function exiting and the returned value being tested.

**xSemaphoreGetMutexHolderFromISR** (xSemaphore)

If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

**uxSemaphoreGetCount** (xSemaphore)

If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

**Type Definitions**

```
typedef QueueHandle_t SemaphoreHandle_t
```

**Timer API****Header File**

- [components/freertos/include/freertos/timers.h](#)

**Functions**

*TimerHandle\_t* **xTimerCreate** (const char \*const pcTimerName, const TickType\_t xTimerPeriodInTicks, const UBaseType\_t uxAutoReload, void \*const pvTimerID, *TimerCallbackFunction\_t* pxCallbackFunction)

*TimerHandle\_t* xTimerCreate( const char \* const pcTimerName, TickType\_t xTimerPeriodInTicks, UBaseType\_t uxAutoReload, void \* pvTimerID, *TimerCallbackFunction\_t* pxCallbackFunction );

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```
* #define NUM_TIMERS 5
*
* // An array to hold handles to the created timers.
* TimerHandle_t xTimers[ NUM_TIMERS ];
*
* // An array to hold a count of the number of times each timer expires.
* int32_t lExpireCounters[ NUM_TIMERS ] = { 0 };
*
* // Define a callback function that will be used by multiple timer instances.
* // The callback function does nothing but count the number of times the
* // associated timer expires, and stop the timer once the timer has expired
* // 10 times.
* void vTimerCallback( TimerHandle_t pxTimer )
* {
* int32_t lArrayIndex;
```

(continues on next page)

(continued from previous page)

```

* const int32_t xMaxExpiryCountBeforeStopping = 10;
*
* // Optionally do something if the pxTimer parameter is NULL.
* configASSERT( pxTimer );
*
* // Which timer expired?
* lArrayIndex = ( int32_t ) pvTimerGetTimerID( pxTimer );
*
* // Increment the number of times that pxTimer has expired.
* lExpireCounters[ lArrayIndex ] += 1;
*
* // If the timer has expired 10 times then stop it from running.
* if( lExpireCounters[ lArrayIndex ] == xMaxExpiryCountBeforeStopping )
* {
*     // Do not use a block time if calling a timer API function from a
*     // timer callback function, as doing so could cause a deadlock!
*     xTimerStop( pxTimer, 0 );
* }
* }
*
* void main( void )
* {
*     int32_t x;
*
*     // Create then start some timers. Starting the timers before the
*     ↪ scheduler
*     // has been started means the timers will start running immediately that
*     // the scheduler starts.
*     for( x = 0; x < NUM_TIMERS; x++ )
*     {
*         xTimers[ x ] = xTimerCreate( "Timer", // Just a text name,
*     ↪ not used by the kernel.
*                                     ( 100 * x ), // The timer period
*     ↪ in ticks.
*                                     pdTRUE, // The timers will
*     ↪ auto-reload themselves when they expire.
*                                     ( void * ) x, // Assign each timer
*     ↪ a unique id equal to its array index.
*                                     vTimerCallback // Each timer calls
*     ↪ the same callback when it expires.
*                                     );
*
*         if( xTimers[ x ] == NULL )
*         {
*             // The timer was not created.
*         }
*         else
*         {
*             // Start the timer. No block time is specified, and even if one
*     ↪ was
*             // it would be ignored because the scheduler has not yet been
*             // started.
*             if( xTimerStart( xTimers[ x ], 0 ) != pdPASS )
*             {
*                 // The timer could not be set into the Active state.
*             }
*         }
*     }
*
*     // ...
*     // Create tasks here.

```

(continues on next page)

(continued from previous page)

```

* // ...
*
* // Starting the scheduler will start the timers running as they have
* ↪already
* // been set into the active state.
* vTaskStartScheduler();
*
* // Should not reach here.
* for( ;; );
* }
*

```

### Parameters

- **pcTimerName** –A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks** –The timer period. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to ( 500 / portTICK\_PERIOD\_MS ) provided configTICK\_RATE\_HZ is less than or equal to 1000. Time timer period must be greater than 0.
- **uxAutoReload** –If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** –An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** –The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction\_t, which is “void vCallbackFunction( TimerHandle\_t xTimer );” .

**Returns** If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created (because either there is insufficient FreeRTOS heap remaining to allocate the timer structures, or the timer period was set to 0) then NULL is returned.

*TimerHandle\_t* **xTimerCreateStatic** (const char \*const pcTimerName, const TickType\_t xTimerPeriodInTicks, const UBaseType\_t uxAutoReload, void \*const pvTimerID, *TimerCallbackFunction\_t* pxCallbackFunction, StaticTimer\_t \*pxTimerBuffer)

```
TimerHandle_t xTimerCreateStatic(const char * const pcTimerName, TickType_t xTimerPeriodInTicks,
UBaseType_t uxAutoReload, void * pvTimerID, TimerCallbackFunction_t pxCallbackFunction, Static-
Timer_t *pxTimerBuffer );
```

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

## Example usage:

```

*
* // The buffer used to hold the software timer's data structure.
* static StaticTimer_t xTimerBuffer;
*
* // A variable that will be incremented by the software timer's callback
* // function.
* UBaseType_t uxVariableToIncrement = 0;
*
* // A software timer callback function that increments a variable passed to
* // it when the software timer was created. After the 5th increment the
* // callback function stops the software timer.
* static void prvTimerCallback( TimerHandle_t xExpiredTimer )
* {
*     UBaseType_t *puxVariableToIncrement;
*     BaseType_t xReturned;
*
*     // Obtain the address of the variable to increment from the timer ID.
*     puxVariableToIncrement = ( UBaseType_t * ) pvTimerGetTimerID(
↳xExpiredTimer );
*
*     // Increment the variable to show the timer callback has executed.
*     ( *puxVariableToIncrement )++;
*
*     // If this callback has executed the required number of times, stop the
*     // timer.
*     if( *puxVariableToIncrement == 5 )
*     {
*         // This is called from a timer callback so must not block.
*         xTimerStop( xExpiredTimer, staticDONT_BLOCK );
*     }
* }
*
* void main( void )
* {
*     // Create the software time. xTimerCreateStatic() has an extra parameter
*     // than the normal xTimerCreate() API function. The parameter is a
↳pointer
*     // to the StaticTimer_t structure that will hold the software timer
*     // structure. If the parameter is passed as NULL then the structure
↳will be
*     // allocated dynamically, just as if xTimerCreate() had been called.
*     xTimer = xTimerCreateStatic( "T1", // Text name for the task.
↳ Helps debugging only. Not used by FreeRTOS.
*     xTimerPeriod, // The period of the
↳timer in ticks.
*     pdTRUE, // This is an auto-reload
↳timer.
*     ( void * ) &uxVariableToIncrement, // A
↳variable incremented by the software timer's callback function
*     prvTimerCallback, // The function to
↳execute when the timer expires.
*     &xTimerBuffer ); // The buffer that will
↳hold the software timer structure.
*
*     // The scheduler has not started yet so a block time is not used.
*     xReturned = xTimerStart( xTimer, 0 );
*
*     // ...
*     // Create tasks here.
*     // ...

```

(continues on next page)

```

*
* // Starting the scheduler will start the timers running as they have
* ↪already
* // been set into the active state.
* vTaskStartScheduler();
*
* // Should not reach here.
* for( ;; );
* }
*

```

### Parameters

- **pcTimerName** –A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.
- **xTimerPeriodInTicks** –The timer period. The time is defined in tick periods so the constant portTICK\_PERIOD\_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to ( 500 / portTICK\_PERIOD\_MS ) provided configTICK\_RATE\_HZ is less than or equal to 1000. The timer period must be greater than 0.
- **uxAutoReload** –If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.
- **pvTimerID** –An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.
- **pxCallbackFunction** –The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction\_t, which is “void vCallbackFunction( TimerHandle\_t xTimer );” .
- **pxTimerBuffer** –Must point to a variable of type StaticTimer\_t, which will be then be used to hold the software timer’s data structures, removing the need for the memory to be allocated dynamically.

**Returns** If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

```

void *pvTimerGetTimerID (const TimerHandle_t xTimer)
void *pvTimerGetTimerID( TimerHandle_t xTimer );

```

Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer, and by calling the vTimerSetTimerID() API function.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

**Parameters** **xTimer** –The timer being queried.

**Returns** The ID assigned to the timer being queried.

```

void vTimerSetTimerID ( TimerHandle_t xTimer, void *pvNewID)
void vTimerSetTimerID( TimerHandle_t xTimer, void *pvNewID );

```

Sets the ID assigned to the timer.

IDs are assigned to timers using the `pvTimerID` parameter of the call to `xTimerCreated()` that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the `xTimerCreate()` API function example usage scenario.

#### Parameters

- **xTimer** –The timer being updated.
- **pvNewID** –The ID to assign to the timer.

BaseType\_t **xTimerIsTimerActive** (*TimerHandle\_t* xTimer)

BaseType\_t xTimerIsTimerActive( TimerHandle\_t xTimer );

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The `xTimerStart()`, `xTimerReset()`, `xTimerStartFromISR()`, `xTimerResetFromISR()`, `xTimerChangePeriod()` and `xTimerChangePeriodFromISR()` API functions can all be used to transition a timer into the active state.

Example usage:

```
* // This function assumes xTimer has already been created.
* void vAFunction( TimerHandle_t xTimer )
* {
*     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
*     →equivalently "if( xTimerIsTimerActive( xTimer ) )"
*     {
*         // xTimer is active, do something.
*     }
*     else
*     {
*         // xTimer is not active, do something else.
*     }
* }
*
```

**Parameters** **xTimer** –The timer being queried.

**Returns** `pdFALSE` will be returned if the timer is dormant. A value other than `pdFALSE` will be returned if the timer is active.

*TaskHandle\_t* **xTimerGetTimerDaemonTaskHandle** (void)

`xTimerGetTimerDaemonTaskHandle()` is only available if `INCLUDE_xTimerGetTimerDaemonTaskHandle` is set to 1 in `FreeRTOSConfig.h`.

Simply returns the handle of the timer service/daemon task. It is not valid to call `xTimerGetTimerDaemonTaskHandle()` before the scheduler has been started.

BaseType\_t **xTimerPendFunctionCallFromISR** (*PendedFunction\_t* xFunctionToPend, void \*pvParameter1, uint32\_t ulParameter2, BaseType\_t \*pxHigherPriorityTaskWoken)

BaseType\_t xTimerPendFunctionCallFromISR( PendedFunction\_t xFunctionToPend, void \*pvParameter1, uint32\_t ulParameter2, BaseType\_t \*pxHigherPriorityTaskWoken );

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in `timers.c` and is prefixed with ‘Timer’ ).

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases `xTimerPendFunctionCallFromISR()` can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

```
*
* // The callback function that will execute in the context of the daemon_
* →task.
* // Note callback functions must all use this same prototype.
* void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
* {
*     BaseType_t xInterfaceToService;
*
*     // The interface that requires servicing is passed in the second
*     // parameter. The first parameter is not used in this case.
*     xInterfaceToService = ( BaseType_t ) ulParameter2;
*
*     // ...Perform the processing here...
* }
*
* // An ISR that receives data packets from multiple interfaces
* void vAnISR( void )
* {
*     BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;
*
*     // Query the hardware to determine which interface needs processing.
*     xInterfaceToService = prvCheckInterfaces();
*
*     // The actual processing is to be deferred to a task. Request the
*     // vProcessInterface() callback function is executed, passing in the
*     // number of the interface that needs processing. The interface to
*     // service is passed in the second parameter. The first parameter is
*     // not used in this case.
*     xHigherPriorityTaskWoken = pdFALSE;
*     xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )_
* →xInterfaceToService, &xHigherPriorityTaskWoken );
*
*     // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
*     // switch should be requested. The macro used is port specific and will
*     // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
*     // the documentation page for the port being used.
*     portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
* }
*
```

### Parameters

- **xFunctionToPend** –The function to execute from the timer service/ daemon task. The function must conform to the `PendedFunction_t` prototype.
- **pvParameter1** –The value of the callback function’ s first parameter. The parameter has a `void *` type to allow it to be used to pass any type. For example, unsigned longs can be cast to a `void *`, or the `void *` can be used to point to a structure.
- **ulParameter2** –The value of the callback function’ s second parameter.

- **pxHigherPriorityTaskWoken** –As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using configTIMER\_TASK\_PRIORITY in FreeRTOSConfig.h) is higher than the priority of the currently running task (the task the interrupt interrupted) then \*pxHigherPriorityTaskWoken will be set to pdTRUE within xTimerPendFunctionCallFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason \*pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

**Returns** pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

```
BaseType_t xTimerPendFunctionCall( PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait)
```

```
BaseType_t xTimerPendFunctionCall( PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait );
```

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’ ).

#### Parameters

- **xFunctionToPend** –The function to execute from the timer service/ daemon task. The function must conform to the PendedFunction\_t prototype.
- **pvParameter1** –The value of the callback function’ s first parameter. The parameter has a void \* type to allow it to be used to pass any type. For example, unsigned longs can be cast to a void \*, or the void \* can be used to point to a structure.
- **ulParameter2** –The value of the callback function’ s second parameter.
- **xTicksToWait** –Calling this function will result in a message being sent to the timer daemon task on a queue. xTicksToWait is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

**Returns** pdPASS is returned if the message was successfully sent to the timer daemon task, otherwise pdFALSE is returned.

```
const char *pcTimerGetName( TimerHandle_t xTimer )
const char * const pcTimerGetName( TimerHandle_t xTimer );
```

Returns the name that was assigned to a timer when the timer was created.

**Parameters** **xTimer** –The handle of the timer being queried.

**Returns** The name assigned to the timer specified by the xTimer parameter.

```
void vTimerSetReloadMode( TimerHandle_t xTimer, const UBaseType_t uxAutoReload )
void vTimerSetReloadMode( TimerHandle_t xTimer, const UBaseType_t uxAutoReload );
```

Updates a timer to be either an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

#### Parameters

- **xTimer** –The handle of the timer being updated.
- **uxAutoReload** –If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the timer’ s period (see the xTimerPeriodInTicks parameter of the xTimerCreate() API function). If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

```
UBaseType_t uxTimerGetReloadMode( TimerHandle_t xTimer )
UBaseType_t uxTimerGetReloadMode( TimerHandle_t xTimer );
```

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

**Parameters** **xTimer** –The handle of the timer being queried.

**Returns** If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

TickType\_t **xTimerGetPeriod** (*TimerHandle\_t* xTimer)

TickType\_t xTimerGetPeriod( TimerHandle\_t xTimer );

Returns the period of a timer.

**Parameters** **xTimer** –The handle of the timer being queried.

**Returns** The period of the timer in ticks.

TickType\_t **xTimerGetExpiryTime** (*TimerHandle\_t* xTimer)

TickType\_t xTimerGetExpiryTime( TimerHandle\_t xTimer );

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

**Parameters** **xTimer** –The handle of the timer being queried.

**Returns** If the timer is running then the time in ticks at which the timer will next expire is returned. If the timer is not running then the return value is undefined.

void **vApplicationGetTimerTaskMemory** (StaticTask\_t \*\*ppxTimerTaskTCBBuffer, StackType\_t \*\*ppxTimerTaskStackBuffer, uint32\_t \*pulTimerTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Timer Task TCB. This function is required when configSUPPORT\_STATIC\_ALLOCATION is set. For more information see this URI: [https://www.FreeRTOS.org/a00110.html#configSUPPORT\\_STATIC\\_ALLOCATION](https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION)

#### Parameters

- **ppxTimerTaskTCBBuffer** –A handle to a statically allocated TCB buffer
- **ppxTimerTaskStackBuffer** –A handle to a statically allocated Stack buffer for this idle task
- **pulTimerTaskStackSize** –A pointer to the number of elements that will fit in the allocated stack buffer

## Macros

**tmrCOMMAND\_EXECUTE\_CALLBACK\_FROM\_ISR**

**tmrCOMMAND\_EXECUTE\_CALLBACK**

**tmrCOMMAND\_START\_DONT\_TRACE**

**tmrCOMMAND\_START**

**tmrCOMMAND\_RESET**

**tmrCOMMAND\_STOP**

**tmrCOMMAND\_CHANGE\_PERIOD**

**tmrCOMMAND\_DELETE**

**tmrFIRST\_FROM\_ISR\_COMMAND**

**tmrCOMMAND\_START\_FROM\_ISR**

**tmrCOMMAND\_RESET\_FROM\_ISR**

**tmrCOMMAND\_STOP\_FROM\_ISR**

**tmrCOMMAND\_CHANGE\_PERIOD\_FROM\_ISR**

**xTimerStart** (xTimer, xTicksToWait)

BaseType\_t xTimerStart( TimerHandle\_t xTimer, TickType\_t xTicksToWait );

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER\_QUEUE\_LENGTH configuration constant.

xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called 'n' ticks after xTimerStart() was called, where 'n' is the timers defined period.

It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerStart() was called.

The configUSE\_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.

Example usage:

See the xTimerCreate() API function example usage scenario.

#### Parameters

- **xTimer** –The handle of the timer being started/restarted.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when xTimerStart() was called. xTicksToWait is ignored if xTimerStart() is called before the scheduler is started.

**Returns** pdFAIL will be returned if the start command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

**xTimerStop** (xTimer, xTicksToWait)

BaseType\_t xTimerStop( TimerHandle\_t xTimer, TickType\_t xTicksToWait );

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER\_QUEUE\_LENGTH configuration constant.

xTimerStop() stops a timer that was previously started using either of the The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() or xTimerChangePeriodFromISR() API functions.

Stopping a timer ensures the timer is not in the active state.

The configUSE\_TIMERS configuration constant must be set to 1 for xTimerStop() to be available.

Example usage:

See the xTimerCreate() API function example usage scenario.

#### Parameters

- **xTimer** –The handle of the timer being stopped.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when xTimerStop() was called. xTicksToWait is ignored if xTimerStop() is called before the scheduler is started.

**Returns** pdFAIL will be returned if the stop command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

#### xTimerChangePeriod (xTimer, xNewPeriod, xTicksToWait)

```
 BaseType_t xTimerChangePeriod( TimerHandle_t xTimer, TickType_t xNewPeriod, TickType_t xTicksToWait );
```

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER\_QUEUE\_LENGTH configuration constant.

xTimerChangePeriod() changes the period of a timer that was previously created using the xTimerCreate() API function.

xTimerChangePeriod() can be called to change the period of an active or dormant state timer.

The configUSE\_TIMERS configuration constant must be set to 1 for xTimerChangePeriod() to be available.

Example usage:

```
* // This function assumes xTimer has already been created.  If the timer
* // referenced by xTimer is already active when it is called, then the timer
* // is deleted.  If the timer referenced by xTimer is not active when it is
* // called, then the period of the timer is set to 500ms and the timer is
* // started.
* void vAFunction( TimerHandle_t xTimer )
* {
*     if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and
*     ↪equivalently "if( xTimerIsTimerActive( xTimer ) )"
*     {
*         // xTimer is already active - delete it.
*         xTimerDelete( xTimer );
*     }
*     else
*     {
*         // xTimer is not active, change its period to 500ms.  This will also
*         // cause the timer to start.  Block for a maximum of 100 ticks if the
*         // change period command cannot immediately be sent to the timer
*         // command queue.
*         if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) ==
*         ↪pdPASS )
*         {
*             // The command was successfully sent.
*         }
*     }
*     else
```

(continues on next page)

```

*      {
*          // The command could not be sent, even after waiting for 100
↳ticks
*          // to pass. Take appropriate action here.
*      }
*  }
* }
*

```

### Parameters

- **xTimer** –The handle of the timer that is having its period changed.
- **xNewPeriod** –The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK\_PERIOD\_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to ( 500 / portTICK\_PERIOD\_MS ) provided configTICK\_RATE\_HZ is less than or equal to 1000.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when xTimerChangePeriod() was called. xTicksToWait is ignored if xTimerChangePeriod() is called before the scheduler is started.

**Returns** pdFAIL will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

### **xTimerDelete** (xTimer, xTicksToWait)

BaseType\_t xTimerDelete( TimerHandle\_t xTimer, TickType\_t xTicksToWait );

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER\_QUEUE\_LENGTH configuration constant.

xTimerDelete() deletes a timer that was previously created using the xTimerCreate() API function.

The configUSE\_TIMERS configuration constant must be set to 1 for xTimerDelete() to be available.

Example usage:

See the xTimerChangePeriod() API function example usage scenario.

### Parameters

- **xTimer** –The handle of the timer being deleted.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when xTimerDelete() was called. xTicksToWait is ignored if xTimerDelete() is called before the scheduler is started.

**Returns** pdFAIL will be returned if the delete command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

**xTimerReset** (xTimer, xTicksToWait)

```
BaseType_t xTimerReset( TimerHandle_t xTimer, TickType_t xTicksToWait );
```

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER\_QUEUE\_LENGTH configuration constant.

xTimerReset() re-starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerReset() will cause the timer to re-evaluate its expiry time so that it is relative to when xTimerReset() was called. If the timer was in the dormant state then xTimerReset() has equivalent functionality to the xTimerStart() API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called 'n' ticks after xTimerReset() was called, where 'n' is the timers defined period.

It is valid to call xTimerReset() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerReset() was called.

The configUSE\_TIMERS configuration constant must be set to 1 for xTimerReset() to be available.

Example usage:

```
* // When a key is pressed, an LCD back-light is switched on. If 5 seconds_
↳pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer.
*
* TimerHandle_t xBacklightTimer = NULL;
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press event handler.
* void vKeyPressEventHandler( char cKey )
* {
*     // Ensure the LCD back-light is on, then reset the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. Wait 10 ticks for the command to be successfully sent
*     // if it cannot be sent immediately.
*     vSetBacklightState( BACKLIGHT_ON );
*     if( xTimerReset( xBacklightTimer, 100 ) != pdPASS )
*     {
*         // The reset command was not executed successfully. Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
* }
*
* void main( void )
* {
*     int32_t x;
```

(continues on next page)

(continued from previous page)

```

* // Create then start the one-shot timer that is responsible for turning
* // the back-light off if no keys are pressed within a 5 second period.
* xBacklightTimer = xTimerCreate( "BacklightTimer", // Just a
↳text name, not used by the kernel.
* ( 5000 / portTICK_PERIOD_MS), // The
↳timer period in ticks.
* pdFALSE, // The timer
↳is a one-shot timer.
* 0, // The id is
↳not used by the callback so can take any value.
* vBacklightTimerCallback // The
↳callback function that switches the LCD back-light off.
* );
*
* if( xBacklightTimer == NULL )
* {
* // The timer was not created.
* }
* else
* {
* // Start the timer. No block time is specified, and even if one was
* // it would be ignored because the scheduler has not yet been
* // started.
* if( xTimerStart( xBacklightTimer, 0 ) != pdPASS )
* {
* // The timer could not be set into the Active state.
* }
* }
*
* // ...
* // Create tasks here.
* // ...
*
* // Starting the scheduler will start the timer running as it has already
* // been set into the active state.
* vTaskStartScheduler();
*
* // Should not reach here.
* for( ;; );
* }
*

```

**Parameters**

- **xTimer** –The handle of the timer being reset/started/restarted.
- **xTicksToWait** –Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is ignored if xTimerReset() is called before the scheduler is started.

**Returns** pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

**xTimerStartFromISR** (xTimer, pxHigherPriorityTaskWoken)

BaseType\_t xTimerStartFromISR( TimerHandle\_t xTimer, BaseType\_t \*pxHigherPriorityTaskWoken );

A version of xTimerStart() that can be called from an interrupt service routine.

## Example usage:

```

* // This scenario assumes xBacklightTimer has already been created.  When a
* // key is pressed, an LCD back-light is switched on.  If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off.  In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
*
* // The callback function assigned to the one-shot timer.  In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed.  Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
* {
*     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // Ensure the LCD back-light is on, then restart the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity.  This is an interrupt service routine so can only
*     // call FreeRTOS API functions that end in "FromISR".
*     vSetBacklightState( BACKLIGHT_ON );
*
*     // xTimerStartFromISR() or xTimerResetFromISR() could be called here
*     // as both cause the timer to re-calculate its expiry time.
*     // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
*     // declared (in this function).
*     if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=_
↳pdPASS )
*     {
*         // The start command was not executed successfully.  Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
*
*     // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*     // should be performed.  The syntax required to perform a context switch
*     // from inside an ISR varies from port to port, and from compiler to
*     // compiler.  Inspect the demos for the port you are using to find the
*     // actual syntax required.
*     if( xHigherPriorityTaskWoken != pdFALSE )
*     {
*         // Call the interrupt safe yield function here (actual function
*         // depends on the FreeRTOS port being used).
*     }
* }
*

```

**Parameters**

- **xTimer** –The handle of the timer being started/restarted.
- **pxHigherPriorityTaskWoken** –The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerStartFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling

`xTimerStartFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` internally within the `xTimerStartFromISR()` function. If `xTimerStartFromISR()` sets this value to `pdTRUE` then a context switch should be performed before the interrupt exits.

**Returns** `pdFAIL` will be returned if the start command could not be sent to the timer command queue. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerStartFromISR()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

**xTimerStopFromISR** (`xTimer`, `pxHigherPriorityTaskWoken`)

`BaseType_t xTimerStopFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken );`

A version of `xTimerStop()` that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xTimer has already been created and started. When
* // an interrupt occurs, the timer should be simply stopped.
*
* // The interrupt service routine that stops the timer.
* void vAnExampleInterruptServiceRoutine( void )
* {
*   BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*   // The interrupt has occurred - simply stop the timer.
*   // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
*   // (within this function). As this is an interrupt service routine, only
*   // FreeRTOS API functions that end in "FromISR" can be used.
*   if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
*   {
*       // The stop command was not executed successfully. Take appropriate
*       // action here.
*   }
*
*   // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
*   // should be performed. The syntax required to perform a context switch
*   // from inside an ISR varies from port to port, and from compiler to
*   // compiler. Inspect the demos for the port you are using to find the
*   // actual syntax required.
*   if( xHigherPriorityTaskWoken != pdFALSE )
*   {
*       // Call the interrupt safe yield function here (actual function
*       // depends on the FreeRTOS port being used).
*   }
* }
*
```

#### Parameters

- **xTimer** –The handle of the timer being stopped.
- **pxHigherPriorityTaskWoken** –The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerStopFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerStopFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken`

will get set to pdTRUE internally within the xTimerStopFromISR() function. If xTimerStopFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

**Returns** pdFAIL will be returned if the stop command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

**xTimerChangePeriodFromISR** (xTimer, xNewPeriod, pxHigherPriorityTaskWoken)

```
BaseType_t xTimerChangePeriodFromISR( TimerHandle_t xTimer, TickType_t xNewPeriod, BaseType_t
*pxHigherPriorityTaskWoken );
```

A version of xTimerChangePeriod() that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xTimer has already been created and started. When
* // an interrupt occurs, the period of xTimer should be changed to 500ms.
*
* // The interrupt service routine that changes the period of xTimer.
* void vAnExampleInterruptServiceRoutine( void )
* {
* BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
* // The interrupt has occurred - change the period of xTimer to 500ms.
* // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
* // (within this function). As this is an interrupt service routine, only
* // FreeRTOS API functions that end in "FromISR" can be used.
* if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
* {
* // The command to change the timers period was not executed
* // successfully. Take appropriate action here.
* }
*
* // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
* // should be performed. The syntax required to perform a context switch
* // from inside an ISR varies from port to port, and from compiler to
* // compiler. Inspect the demos for the port you are using to find the
* // actual syntax required.
* if( xHigherPriorityTaskWoken != pdFALSE )
* {
* // Call the interrupt safe yield function here (actual function
* // depends on the FreeRTOS port being used).
* }
* }
*
```

### Parameters

- **xTimer** –The handle of the timer that is having its period changed.
- **xNewPeriod** –The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK\_PERIOD\_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to ( 500 / portTICK\_PERIOD\_MS ) provided configTICK\_RATE\_HZ is less than or equal to 1000.
- **pxHigherPriorityTaskWoken** –The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerChangePeriodFromISR() writes a message to the timer command queue,

so has the potential to transition the timer service/ daemon task out of the Blocked state. If calling `xTimerChangePeriodFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` internally within the `xTimerChangePeriodFromISR()` function. If `xTimerChangePeriodFromISR()` sets this value to `pdTRUE` then a context switch should be performed before the interrupt exits.

**Returns** `pdFAIL` will be returned if the command to change the timers period could not be sent to the timer command queue. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

**xTimerResetFromISR** (`xTimer`, `pxHigherPriorityTaskWoken`)

`BaseType_t xTimerResetFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken );`

A version of `xTimerReset()` that can be called from an interrupt service routine.

Example usage:

```
* // This scenario assumes xBacklightTimer has already been created. When a
* // key is pressed, an LCD back-light is switched on. If 5 seconds pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer, and unlike the example given for
* // the xTimerReset() function, the key press event handler is an interrupt
* // service routine.
*
* // The callback function assigned to the one-shot timer. In this case the
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*     // The timer expired, therefore 5 seconds must have passed since a key
*     // was pressed. Switch off the LCD back-light.
*     vSetBacklightState( BACKLIGHT_OFF );
* }
*
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
* {
*     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
*
*     // Ensure the LCD back-light is on, then reset the timer that is
*     // responsible for turning the back-light off after 5 seconds of
*     // key inactivity. This is an interrupt service routine so can only
*     // call FreeRTOS API functions that end in "FromISR".
*     vSetBacklightState( BACKLIGHT_ON );
*
*     // xTimerStartFromISR() or xTimerResetFromISR() could be called here
*     // as both cause the timer to re-calculate its expiry time.
*     // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
*     // declared (in this function).
*     if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) !=
↳pdPASS )
*     {
*         // The reset command was not executed successfully. Take appropriate
*         // action here.
*     }
*
*     // Perform the rest of the key processing here.
```

(continues on next page)

(continued from previous page)

```

*
* // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
* // should be performed. The syntax required to perform a context switch
* // from inside an ISR varies from port to port, and from compiler to
* // compiler. Inspect the demos for the port you are using to find the
* // actual syntax required.
* if( xHigherPriorityTaskWoken != pdFALSE )
* {
*     // Call the interrupt safe yield function here (actual function
*     // depends on the FreeRTOS port being used).
* }
* }
*

```

### Parameters

- **xTimer** –The handle of the timer that is to be started, reset, or restarted.
- **pxHigherPriorityTaskWoken** –The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerResetFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerResetFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/ daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then \*pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerResetFromISR() function. If xTimerResetFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

**Returns** pdFAIL will be returned if the reset command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerResetFromISR() is actually called. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

### Type Definitions

```
typedef struct tmrTimerControl *TimerHandle_t
```

```
typedef void (*TimerCallbackFunction_t)(TimerHandle_t xTimer)
```

```
typedef void (*PendedFunction_t)(void*, uint32_t)
```

### Event Group API

#### Header File

- [components/freertos/include/freertos/event\\_groups.h](#)

#### Functions

*EventGroupHandle\_t* **xEventGroupCreate** (void)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event groups is created using xEventGroupCreate() then the required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see <https://www.FreeRTOS.org/a00111.html>). If an event group is created using xEventGroupCreateStatic() then

the application writer must instead provide the memory that will get used by the event group. `xEventGroupCreateStatic()` therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the `configUSE_16_BIT_TICKS` setting in `FreeRTOSConfig.h`. If `configUSE_16_BIT_TICKS` is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If `configUSE_16_BIT_TICKS` is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The `EventBits_t` type is used to store event bits within an event group.

Example usage:

```
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
    // The event group was not created because there was insufficient
    // FreeRTOS heap available.
}
else
{
    // The event group was created.
}
```

**Returns** If the event group was created then a handle to the event group is returned. If there was insufficient FreeRTOS heap available to create the event group then NULL is returned. See <https://www.FreeRTOS.org/a00111.html>

*EventGroupHandle\_t* **xEventGroupCreateStatic** (StaticEventGroup\_t \*pxEventGroupBuffer)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which the event group's structure is stored. If an event group is created using `xEventGroupCreate()` then the required memory is automatically dynamically allocated inside the `xEventGroupCreate()` function. (see <https://www.FreeRTOS.org/a00111.html>). If an event group is created using `xEventGroupCreateStatic()` then the application writer must instead provide the memory that will get used by the event group. `xEventGroupCreateStatic()` therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the `configUSE_16_BIT_TICKS` setting in `FreeRTOSConfig.h`. If `configUSE_16_BIT_TICKS` is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If `configUSE_16_BIT_TICKS` is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The `EventBits_t` type is used to store event bits within an event group.

Example usage:

```
// StaticEventGroup_t is a publicly accessible structure that has the same
// size and alignment requirements as the real event group structure. It is
// provided as a mechanism for applications to know the size of the event
// group (which is dependent on the architecture and configuration file
// settings) without breaking the strict data hiding policy by exposing the
// real event group internals. This StaticEventGroup_t variable is passed
// into the xSemaphoreCreateEventGroupStatic() function and is used to store
// the event group's data structures
StaticEventGroup_t xEventGroupBuffer;
```

(continues on next page)

(continued from previous page)

```
// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );
```

**Parameters** **pxEventGroupBuffer** –pxEventGroupBuffer must point to a variable of type StaticEventGroup\_t, which will be then be used to hold the event group's data structures, removing the need for the memory to be allocated dynamically.

**Returns** If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

*EventBits\_t* **xEventGroupWaitBits** (*EventGroupHandle\_t* xEventGroup, const *EventBits\_t* uxBitsToWaitFor, const BaseType\_t xClearOnExit, const BaseType\_t xWaitForAllBits, TickType\_t xTicksToWait)

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within
    // the event group. Clear the bits before exiting.
    uxBits = xEventGroupWaitBits(
        xEventGroup, // The event group being tested.
        BIT_0 | BIT_4, // The bits within the event group to wait
        for.
        pdTRUE, // BIT_0 and BIT_4 should be cleared before
        returning.
        pdFALSE, // Don't wait for both bits, either bit will
        do.
        xTicksToWait ); // Wait a maximum of 100ms for either bit to
        be set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // xEventGroupWaitBits() returned because both bits were set.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_0 was set.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // xEventGroupWaitBits() returned because just BIT_4 was set.
    }
    else
    {
        // xEventGroupWaitBits() returned because xTicksToWait ticks passed
        // without either BIT_0 or BIT_4 becoming set.
    }
}
```

**Parameters**

- **xEventGroup** –The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- **uxBitsToWaitFor** –A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set `uxBitsToWaitFor` to `0x05`. To wait for bits 0 and/or bit 1 and/or bit 2 set `uxBitsToWaitFor` to `0x07`. Etc.
- **xClearOnExit** –If `xClearOnExit` is set to `pdTRUE` then any bits within `uxBitsToWaitFor` that are set within the event group will be cleared before `xEventGroupWaitBits()` returns if the wait condition was met (if the function returns for a reason other than a timeout). If `xClearOnExit` is set to `pdFALSE` then the bits set in the event group are not altered when the call to `xEventGroupWaitBits()` returns.
- **xWaitForAllBits** –If `xWaitForAllBits` is set to `pdTRUE` then `xEventGroupWaitBits()` will return when either all the bits in `uxBitsToWaitFor` are set or the specified block time expires. If `xWaitForAllBits` is set to `pdFALSE` then `xEventGroupWaitBits()` will return when any one of the bits set in `uxBitsToWaitFor` is set or the specified block time expires. The block time is specified by the `xTicksToWait` parameter.
- **xTicksToWait** –The maximum amount of time (specified in ‘ticks’) to wait for one/all (depending on the `xWaitForAllBits` value) of the bits specified by `uxBitsToWaitFor` to become set.

**Returns** The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupWaitBits()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupWaitBits()` returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that `xClearOnExit` parameter was set to `pdTRUE`.

*EventBits\_t* **xEventGroupClearBits** (*EventGroupHandle\_t* xEventGroup, const *EventBits\_t* uxBitsToClear)

Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Clear bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupClearBits(
                xEventGroup, // The event group being updated.
                BIT_0 | BIT_4 ); // The bits being cleared.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 were set before xEventGroupClearBits() was
        // called. Both will now be clear (not set).
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 was set before xEventGroupClearBits() was called. It will
        // now be clear.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 was set before xEventGroupClearBits() was called. It will
        // now be clear.
    }
    else
```

(continues on next page)

(continued from previous page)

```

{
    // Neither bit 0 nor bit 4 were set in the first place.
}
}

```

**Parameters**

- **xEventGroup** –The event group in which the bits are to be cleared.
- **uxBitsToClear** –A bitwise value that indicates the bit or bits to clear in the event group. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

**Returns** The value of the event group before the specified bits were cleared.

*EventBits\_t* **xEventGroupSetBits** (*EventGroupHandle\_t* xEventGroup, const *EventBits\_t* uxBitsToSet)

Set bits within an event group. This function cannot be called from an interrupt. xEventGroupSetBitsFromISR() is a version that can be called from an interrupt.

Setting bits in an event group will automatically unblock tasks that are blocked waiting for the bits.

Example usage:

```

#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Set bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupSetBits(
                xEventGroup,    // The event group being updated.
                BIT_0 | BIT_4 ); // The bits being set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 remained set when the function returned.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 remained set when the function returned, but bit 4 was
        // cleared. It might be that bit 4 was cleared automatically as a
        // task that was waiting for bit 4 was removed from the Blocked
        // state.
    }
    else if( ( uxBits & BIT_4 ) != 0 )
    {
        // Bit 4 remained set when the function returned, but bit 0 was
        // cleared. It might be that bit 0 was cleared automatically as a
        // task that was waiting for bit 0 was removed from the Blocked
        // state.
    }
    else
    {
        // Neither bit 0 nor bit 4 remained set. It might be that a task
        // was waiting for both of the bits to be set, and the bits were
        // cleared as the task left the Blocked state.
    }
}

```

**Parameters**

- **xEventGroup** –The event group in which the bits are to be set.
- **uxBitsToSet** –A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

**Returns** The value of the event group at the time the call to xEventGroupSetBits() returns. There are two reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called xEventGroupSetBits() will execute and may change the event group value before the call to xEventGroupSetBits() returns.

*EventBits\_t* **xEventGroupSync** (*EventGroupHandle\_t* xEventGroup, const *EventBits\_t* uxBitsToSet, const *EventBits\_t* uxBitsToWaitFor, *TickType\_t* xTicksToWait)

Atomically set bits within an event group, then wait for a combination of bits to be set within the same event group. This functionality is typically used to synchronise multiple tasks, where each task has to wait for the other tasks to reach a synchronisation point before proceeding.

This function cannot be used from an interrupt.

The function will return before its block time expires if the bits specified by the uxBitsToWait parameter are set, or become set within that time. In this case all the bits specified by uxBitsToWait will be automatically cleared before the function returns.

Example usage:

```
// Bits used by the three tasks.
#define TASK_0_BIT      ( 1 << 0 )
#define TASK_1_BIT      ( 1 << 1 )
#define TASK_2_BIT      ( 1 << 2 )

#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event
// group has already been created elsewhere.
EventGroupHandle_t xEventBits;

void vTask0( void *pvParameters )
{
    EventBits_t uxReturn;
    TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 0 in the event flag to note this task has reached the
        // sync point. The other two tasks will set the other two bits defined
        // by ALL_SYNC_BITS. All three tasks have reached the synchronisation
        // point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms
        // for this to happen.
        uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS, ↵
        ↵xTicksToWait );

        if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
        {
            // All three tasks reached the synchronisation point before the call
            // to xEventGroupSync() timed out.
        }
    }
}
```

(continues on next page)

```

void vTask1( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 1 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}

void vTask2( void *pvParameters )
{
    for( ;; )
    {
        // Perform task functionality here.

        // Set bit 2 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}

```

**Parameters**

- **xEventGroup** –The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- **uxBitsToSet** –The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the `uxBitsToWait` parameter are set.
- **uxBitsToWaitFor** –A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and bit 2 set `uxBitsToWaitFor` to `0x05`. To wait for bits 0 and bit 1 and bit 2 set `uxBitsToWaitFor` to `0x07`. Etc.
- **xTicksToWait** –The maximum amount of time (specified in ‘ticks’) to wait for all of the bits specified by `uxBitsToWaitFor` to become set.

**Returns** The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupSync()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupSync()` returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

*EventBits\_t* **xEventGroupGetBitsFromISR** (*EventGroupHandle\_t* xEventGroup)

A version of `xEventGroupGetBits()` that can be called from an ISR.

**Parameters** **xEventGroup** –The event group being queried.

**Returns** The event group bits at the time `xEventGroupGetBitsFromISR()` was called.

void **vEventGroupDelete** (*EventGroupHandle\_t* xEventGroup)

Delete an event group that was previously created by a call to `xEventGroupCreate()`. Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group's value.

**Parameters** `xEventGroup` –The event group being deleted.

## Macros

**xEventGroupClearBitsFromISR** (`xEventGroup`, `uxBitsToClear`)

A version of `xEventGroupClearBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore `xEventGroupClearBitsFromISR()` sends a message to the timer task to have the clear operation performed in the context of the timer task.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(
                xEventGroup, // The event group being updated.
                BIT_0 | BIT_4 ); // The bits being set.

    if( xResult == pdPASS )
    {
        // The message was posted successfully.
    }
}
```

### Parameters

- **xEventGroup** –The event group in which the bits are to be cleared.
- **uxBitsToClear** –A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set `uxBitsToClear` to `0x08`. To clear bit 3 and bit 0 set `uxBitsToClear` to `0x09`.

**Returns** If the request to execute the function was posted successfully then `pdPASS` is returned, otherwise `pdFALSE` is returned. `pdFALSE` will be returned if the timer service queue was full.

**xEventGroupSetBitsFromISR** (`xEventGroup`, `uxBitsToSet`, `pxHigherPriorityTaskWoken`)

A version of `xEventGroupSetBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore `xEventGroupSetBitsFromISR()` sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```

#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken, xResult;

    // xHigherPriorityTaskWoken must be initialised to pdFALSE.
    xHigherPriorityTaskWoken = pdFALSE;

    // Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR(
        xEventGroup,    // The event group being updated.
        BIT_0 | BIT_4  // The bits being set.
        &xHigherPriorityTaskWoken );

    // Was the message posted successfully?
    if( xResult == pdPASS )
    {
        // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
        // switch should be requested. The macro used is port specific and
        // will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
        // refer to the documentation page for the port being used.
        portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
    }
}

```

**Parameters**

- **xEventGroup** –The event group in which the bits are to be set.
- **uxBitsToSet** –A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.
- **pxHigherPriorityTaskWoken** –As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then \*pxHigherPriorityTaskWoken will be set to pdTRUE by xEventGroupSetBitsFromISR(), indicating that a context switch should be requested before the interrupt exits. For that reason \*pxHigherPriorityTaskWoken must be initialised to pdFALSE. See the example code below.

**Returns** If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

**xEventGroupGetBits** (xEventGroup)

Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

**Parameters**

- **xEventGroup** –The event group being queried.

**Returns** The event group bits at the time xEventGroupGetBits() was called.

**Type Definitions**

```
typedef struct EventGroupDef_t *EventGroupHandle_t
```

```
typedef TickType_t EventBits_t
```

## Stream Buffer API

### Header File

- `components/freertos/include/freertos/stream_buffer.h`

### Functions

`size_t xStreamBufferSend( StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, TickType_t xTicksToWait)`

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

**\*\*\*NOTE\*\*\*:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xStreamBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xStreamBufferReceive()`) inside a critical section and set the receive block time to 0.

Use `xStreamBufferSend()` to write to a stream buffer from a task. Use `xStreamBufferSendFromISR()` to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( StreamBufferHandle_t xStreamBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the stream buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the stream buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend,
    ↪ sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xStreamBufferSend() times out before there was enough
        // space in the buffer for the data to be written, but it did
        // successfully write xBytesSent bytes.
    }

    // Send the string to the stream buffer. Return immediately if there is not
    // enough space in the buffer.
    xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend,
    ↪ strlen( pcStringToSend ), 0 );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The entire string could not be added to the stream buffer because
        // there was not enough free space in the buffer, but xBytesSent bytes
        // were sent. Could try again to send the remaining bytes.
    }
}
```

### Parameters

- **xStreamBuffer** –The handle of the stream buffer to which a stream is being sent.

- **pvTxData** –A pointer to the buffer that holds the bytes to be copied into the stream buffer.
- **xDataLengthBytes** –The maximum number of bytes to copy from pvTxData into the stream buffer.
- **xTicksToWait** –The maximum amount of time the task should remain in the Blocked state to wait for enough space to become available in the stream buffer, should the stream buffer contain too little space to hold the another xDataLengthBytes bytes. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS\_TO\_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to port-MAX\_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE\_vTaskSuspend is set to 1 in FreeRTOSConfig.h. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible. A task does not use any CPU time when it is in the blocked state.

**Returns** The number of bytes written to the stream buffer. If a task times out before it can write all xDataLengthBytes into the buffer it will still write as many bytes as possible.

size\_t **xStreamBufferSendFromISR** (*StreamBufferHandle\_t* xStreamBuffer, const void \*pvTxData, size\_t xDataLengthBytes, BaseType\_t \*const pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

\*\*\*NOTE\*\*\*: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write to a stream buffer from an interrupt service routine (ISR).

Example use:

```
// A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the stream buffer.
    xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
                                           ( void * ) pcStringToSend,
                                           strlen( pcStringToSend ),
                                           &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // There was not enough free space in the stream buffer for the entire
        // string to be written, ut xBytesSent bytes were written.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
```

(continues on next page)

(continued from previous page)

```

// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

**Parameters**

- **xStreamBuffer** –The handle of the stream buffer to which a stream is being sent.
- **pvTxData** –A pointer to the data that is to be copied into the stream buffer.
- **xDataLengthBytes** –The maximum number of bytes to copy from pvTxData into the stream buffer.
- **pxHigherPriorityTaskWoken** –It is possible that a stream buffer will have a task blocked on it waiting for data. Calling xStreamBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xStreamBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferSendFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. \*pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the example code below for an example.

**Returns** The number of bytes actually written to the stream buffer, which will be less than xDataLengthBytes if the stream buffer didn't have enough free space for all the bytes to be written.

size\_t **xStreamBufferReceive** (*StreamBufferHandle\_t* xStreamBuffer, void \*pvRxData, size\_t xBufferLengthBytes, TickType\_t xTicksToWait)

Receives bytes from a stream buffer.

**\*\*\*NOTE\*\*\*:** Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferReceive() to read from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read from a stream buffer from an interrupt service routine (ISR).

Example use:

```

void vAFunction( StreamBuffer_t xStreamBuffer )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

// Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
// Wait in the Blocked state (so not using any CPU processing time) for a
// maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
// available.
xReceivedBytes = xStreamBufferReceive( xStreamBuffer,

```

(continues on next page)

(continued from previous page)

```

( void * ) ucRxData,
sizeof( ucRxData ),
xBlockTime );

if( xReceivedBytes > 0 )
{
    // A ucRxData contains another xReceievedBytes bytes of data, which can
    // be processed here....
}
}

```

**Parameters**

- **xStreamBuffer** –The handle of the stream buffer from which bytes are to be received.
- **pvRxData** –A pointer to the buffer into which the received bytes will be copied.
- **xBufferLengthBytes** –The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **xTicksToWait** –The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. xStreamBufferReceive() will return immediately if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS\_TO\_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX\_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE\_vTaskSuspend is set to 1 in FreeRTOSConfig.h. A task does not use any CPU time when it is in the Blocked state.

**Returns** The number of bytes actually read from the stream buffer, which will be less than xBufferLengthBytes if the call to xStreamBufferReceive() timed out before xBufferLengthBytes were available.

size\_t **xStreamBufferReceiveFromISR** (*StreamBufferHandle\_t* xStreamBuffer, void \*pvRxData, size\_t xBufferLengthBytes, BaseType\_t \*const pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives bytes from a stream buffer.

Use xStreamBufferReceive() to read bytes from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```

// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next stream from the stream buffer.
    xReceivedBytes = xStreamBufferReceiveFromISR( xStreamBuffer,
( void * ) ucRxData,
sizeof( ucRxData ),
&xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // ucRxData contains xReceivedBytes read from the stream buffer.
    }
}

```

(continues on next page)

(continued from previous page)

```

    // Process the stream here....
}

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xStreamBufferReceiveFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

**Parameters**

- **xStreamBuffer** –The handle of the stream buffer from which a stream is being received.
- **pvRxData** –A pointer to the buffer into which the received bytes are copied.
- **xBufferLengthBytes** –The length of the buffer pointed to by the pvRxData parameter. This sets the maximum number of bytes to receive in one call. xStreamBufferReceive will return as many bytes as possible up to a maximum set by xBufferLengthBytes.
- **pxHigherPriorityTaskWoken** –It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling xStreamBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xStreamBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xStreamBufferReceiveFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE. If xStreamBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. \*pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

**Returns** The number of bytes read from the stream buffer, if any.

void **vStreamBufferDelete** (*StreamBufferHandle\_t* xStreamBuffer)

Deletes a stream buffer that was previously created using a call to xStreamBufferCreate() or xStreamBufferCreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

**Parameters** **xStreamBuffer** –The handle of the stream buffer to be deleted.

BaseType\_t **xStreamBufferIsFull** (*StreamBufferHandle\_t* xStreamBuffer)

Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

**Parameters** **xStreamBuffer** –The handle of the stream buffer being queried.

**Returns** If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType\_t **xStreamBufferIsEmpty** (*StreamBufferHandle\_t* xStreamBuffer)

Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

**Parameters** **xStreamBuffer** –The handle of the stream buffer being queried.

**Returns** If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType\_t **xStreamBufferReset** (*StreamBufferHandle\_t* xStreamBuffer)

Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

**Parameters** **xStreamBuffer** –The handle of the stream buffer being reset.

**Returns** If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

size\_t **xStreamBufferSpacesAvailable** (*StreamBufferHandle\_t* xStreamBuffer)

Queries a stream buffer to see how much free space it contains, which is equal to the amount of data that can be sent to the stream buffer before it is full.

**Parameters** **xStreamBuffer** –The handle of the stream buffer being queried.

**Returns** The number of bytes that can be written to the stream buffer before the stream buffer would be full.

size\_t **xStreamBufferBytesAvailable** (*StreamBufferHandle\_t* xStreamBuffer)

Queries a stream buffer to see how much data it contains, which is equal to the number of bytes that can be read from the stream buffer before the stream buffer would be empty.

**Parameters** **xStreamBuffer** –The handle of the stream buffer being queried.

**Returns** The number of bytes that can be read from the stream buffer before the stream buffer would be empty.

BaseType\_t **xStreamBufferSetTriggerLevel** (*StreamBufferHandle\_t* xStreamBuffer, size\_t xTriggerLevel)

A stream buffer's trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

**Parameters**

- **xStreamBuffer** –The handle of the stream buffer being updated.
- **xTriggerLevel** –The new trigger level for the stream buffer.

**Returns** If xTriggerLevel was less than or equal to the stream buffer's length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType\_t **xStreamBufferSendCompletedFromISR** (*StreamBufferHandle\_t* xStreamBuffer, BaseType\_t \*pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND\_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND\_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND\_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Parameters**

- **xStreamBuffer** –The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** –\*pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferSendCompletedFromISR(). If calling xStreamBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then \*pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**Returns** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

BaseType\_t **xStreamBufferReceiveCompletedFromISR** (*StreamBufferHandle\_t* xStreamBuffer, BaseType\_t \*pxHigherPriorityTaskWoken)

For advanced users only.

The sbRECEIVE\_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE\_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE\_COMPLETED(), and **MUST NOT BE USED AT ANY OTHER TIME**.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

#### Parameters

- **xStreamBuffer** –The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken** –\*pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferReceiveCompletedFromISR(). If calling xStreamBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then \*pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**Returns** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

#### Macros

**xStreamBufferCreate** (xBufferSizeBytes, xTriggerLevelBytes)

Creates a new stream buffer using dynamically allocated memory. See xStreamBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT\_DYNAMIC\_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xStreamBufferCreate() to be available.

Example use:

```
void vAFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

// Create a stream buffer that can hold 100 bytes. The memory used to hold
// both the stream buffer structure and the data in the stream buffer is
// allocated dynamically.
xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes, xTriggerLevel );

if( xStreamBuffer == NULL )
{
// There was not enough heap memory space available to create the
// stream buffer.
}
else
{
// The stream buffer was created successfully and can now be used.
}
}
```

#### Parameters

- **xBufferSizeBytes** –The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes** –The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task's block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task's block time expires. If a reading task's block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

**Returns** If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

**xStreamBufferCreateStatic** (xBufferSizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea, pxStaticStreamBuffer)

Creates a new stream buffer using statically allocated memory. See xStreamBufferCreate() for a version that uses dynamically allocated memory.

configSUPPORT\_STATIC\_ALLOCATION must be set to 1 in FreeRTOSConfig.h for xStreamBufferCreateStatic() to be available.

Example use:

```
// Used to dimension the array used to hold the streams. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the stream buffer structure.
StaticStreamBuffer_t xStreamBufferStruct;

void MyFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xTriggerLevel = 1;

    xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucBufferStorage ),
                                              xTriggerLevel,
                                              ucBufferStorage,
                                              &xStreamBufferStruct );

    // As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
    // parameters were NULL, xStreamBuffer will not be NULL, and can be used to
    // reference the created stream buffer in other stream buffer API calls.

    // Other code that uses the stream buffer can go here.
}
```

#### Parameters

- **xBufferSizeBytes** –The size, in bytes, of the buffer pointed to by the pucStream-BufferStorageArea parameter.

- **xTriggerLevelBytes** –The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’ s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’ s block time expires. If a reading task’ s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pucStreamBufferStorageArea** –Must point to a uint8\_t array that is at least xBufferSizeBytes + 1 big. This is the array to which streams are copied when they are written to the stream buffer.
- **pxStaticStreamBuffer** –Must point to a variable of type StaticStreamBuffer\_t, which will be used to hold the stream buffer’ s data structure.

**Returns** If the stream buffer is created successfully then a handle to the created stream buffer is returned. If either pucStreamBufferStorageArea or pxStaticstreamBuffer are NULL then NULL is returned.

### Type Definitions

```
typedef struct StreamBufferDef_t *StreamBufferHandle_t
```

### Message Buffer API

#### Header File

- [components/freertos/include/freertos/message\\_buffer.h](#)

#### Macros

**xMessageBufferCreate** (xBufferSizeBytes)

Creates a new message buffer using dynamically allocated memory. See xMessageBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT\_DYNAMIC\_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xMessageBufferCreate() to be available.

Example use:

```
void vAFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;

    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

    if( xMessageBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // message buffer.
    }
}
```

(continues on next page)

(continued from previous page)

```

else
{
    // The message buffer was created successfully and can now be used.
}

```

**Parameters**

- **xBufferSizeBytes** –The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the message buffer an additional sizeof( size\_t ) bytes are also written to store the message' s length. sizeof( size\_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.

**Returns** If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.

**xMessageBufferCreateStatic** (xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMessageBuffer)

Creates a new message buffer using statically allocated memory. See xMessageBufferCreate() for a version that uses dynamically allocated memory.

Example use:

```

// Used to dimension the array used to hold the messages. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;

    xMessageBuffer = xMessageBufferCreateStatic( sizeof( ucBufferStorage ),
                                                ucBufferStorage,
                                                &xMessageBufferStruct );

    // As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer
    // parameters were NULL, xMessageBuffer will not be NULL, and can be used to
    // reference the created message buffer in other message buffer API calls.

    // Other code that uses the message buffer can go here.
}

```

**Parameters**

- **xBufferSizeBytes** –The size, in bytes, of the buffer pointed to by the pucMessage-BufferStorageArea parameter. When a message is written to the message buffer an additional sizeof( size\_t ) bytes are also written to store the message' s length. sizeof( size\_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually (xBufferSizeBytes - 1).

- **pucMessageBufferStorageArea** –Must point to a uint8\_t array that is at least xBufferSizeBytes + 1 big. This is the array to which messages are copied when they are written to the message buffer.
- **pxStaticMessageBuffer** –Must point to a variable of type StaticMessageBuffer\_t, which will be used to hold the message buffer's data structure.

**Returns** If the message buffer is created successfully then a handle to the created message buffer is returned. If either pucMessageBufferStorageArea or pxStaticmessageBuffer are NULL then NULL is returned.

**xMessageBufferSend** (xMessageBuffer, pvTxData, xDataLengthBytes, xTicksToWait)

Sends a discrete message to the message buffer. The message can be any length that fits within the buffer's free space, and is copied into the buffer.

\*\*\*NOTE\*\*\*: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( MessageBufferHandle_t xMessageBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );

    // Send an array to the message buffer, blocking for a maximum of 100ms to
    // wait for enough space to be available in the message buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend,
    ↪ sizeof( ucArrayToSend ), x100ms );

    if( xBytesSent != sizeof( ucArrayToSend ) )
    {
        // The call to xMessageBufferSend() times out before there was enough
        // space in the buffer for the data to be written.
    }

    // Send the string to the message buffer. Return immediately if there is
    // not enough space in the buffer.
    xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend,
    ↪ strlen( pcStringToSend ), 0 );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }
}
```

#### Parameters

- **xMessageBuffer** –The handle of the message buffer to which a message is being sent.

- **pvTxData** –A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** –The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof( size\_t ) bytes are also written to store the message' s length. sizeof( size\_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **xTicksToWait** –The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when xMessageBufferSend() is called. The calling task will never block if xTicksToWait is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS\_TO\_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX\_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE\_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

**Returns** The number of bytes written to the message buffer. If the call to xMessageBufferSend() times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then xDataLengthBytes is returned.

**xMessageBufferSendFromISR** (xMessageBuffer, pvTxData, xDataLengthBytes, pxHigherPriorityTaskWoken)

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer' s free space, and is copied into the buffer.

\*\*\*NOTE\*\*\*: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
size_t xBytesSent;
char *pcStringToSend = "String to send";
 BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

// Attempt to send the string to the message buffer.
xBytesSent = xMessageBufferSendFromISR( xMessageBuffer,
                                        ( void * ) pcStringToSend,
                                        strlen( pcStringToSend ),
                                        &xHigherPriorityTaskWoken );

if( xBytesSent != strlen( pcStringToSend ) )
{
// The string could not be added to the message buffer because there was
// not enough free space in the buffer.

```

(continues on next page)

```

}

// If xHigherPriorityTaskWoken was set to pdTRUE inside
// xMessageBufferSendFromISR() then a task that has a priority above the
// priority of the currently executing task was unblocked and a context
// switch should be performed to ensure the ISR returns to the unblocked
// task. In most FreeRTOS ports this is done by simply passing
// xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
// variables value, and perform the context switch if necessary. Check the
// documentation for the port in use for port specific instructions.
portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}

```

### Parameters

- **xMessageBuffer** –The handle of the message buffer to which a message is being sent.
- **pvTxData** –A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** –The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizeof( size\_t ) bytes are also written to store the message' s length. sizeof( size\_t ) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **pxHigherPriorityTaskWoken** –It is possible that a message buffer will have a task blocked on it waiting for data. Calling xMessageBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xMessageBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferSendFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. \*pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

**Returns** The number of bytes actually written to the message buffer. If the message buffer didn' t have enough free space for the message to be stored then 0 is returned, otherwise xDataLengthBytes is returned.

### **xMessageBufferReceive** (xMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)

Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

\*\*\*NOTE\*\*\*: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```

void vAFunction( MessageBuffer_t xMessageBuffer )
{
uint8_t ucRxData[ 20 ];
size_t xReceivedBytes;
const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

// Receive the next message from the message buffer. Wait in the Blocked
// state (so not using any CPU processing time) for a maximum of 100ms for
// a message to become available.
xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
                                        ( void * ) ucRxData,
                                        sizeof( ucRxData ),
                                        xBlockTime );

if( xReceivedBytes > 0 )
{
    // A ucRxData contains a message that is xReceivedBytes long. Process
    // the message here....
}
}

```

### Parameters

- **xMessageBuffer** –The handle of the message buffer from which a message is being received.
- **pvRxData** –A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** –The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **xTicksToWait** –The maximum amount of time the task should remain in the Blocked state to wait for a message, should the message buffer be empty. xMessageBufferReceive() will return immediately if xTicksToWait is zero and the message buffer is empty. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS\_TO\_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX\_DELAY will cause the task to wait indefinitely (without timing out), provided INCLUDE\_vTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

**Returns** The length, in bytes, of the message read from the message buffer, if any. If xMessageBufferReceive() times out before a message became available then zero is returned. If the length of the message is greater than xBufferLengthBytes then the message will be left in the message buffer and zero is returned.

**xMessageBufferReceiveFromISR** (xMessageBuffer, pvRxData, xBufferLengthBytes, pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

\*\*\*NOTE\*\*\*: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceive-

FromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```
// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next message from the message buffer.
    xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
                                                    ( void * ) ucRxData,
                                                    sizeof( ucRxData ),
                                                    &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

### Parameters

- **xMessageBuffer** –The handle of the message buffer from which a message is being received.
- **pvRxData** –A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** –The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **pxHigherPriorityTaskWoken** –It is possible that a message buffer will have a task blocked on it waiting for space to become available. Calling xMessageBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xMessageBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferReceiveFromISR() will set \*pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. \*pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

**Returns** The length, in bytes, of the message read from the message buffer, if any.

**vMessageBufferDelete** (xMessageBuffer)

Deletes a message buffer that was previously created using a call to xMessageBufferCreate() or xMessage-

BufferCreateStatic(). If the message buffer was created using dynamic memory (that is, by xMessageBufferCreate()), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

#### Parameters

- **xMessageBuffer** –The handle of the message buffer to be deleted.

#### **xMessageBufferIsFull** (xMessageBuffer)

Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any size, until space is made available by a message being removed from the message buffer.

#### Parameters

- **xMessageBuffer** –The handle of the message buffer being queried.

**Returns** If the message buffer referenced by xMessageBuffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

#### **xMessageBufferIsEmpty** (xMessageBuffer)

Tests to see if a message buffer is empty (does not contain any messages).

#### Parameters

- **xMessageBuffer** –The handle of the message buffer being queried.

**Returns** If the message buffer referenced by xMessageBuffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

#### **xMessageBufferReset** (xMessageBuffer)

Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

#### Parameters

- **xMessageBuffer** –The handle of the message buffer being reset.

**Returns** If the message buffer was reset then pdPASS is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a message to be available, then pdFAIL is returned.

#### **xMessageBufferSpaceAvailable** (xMessageBuffer)

Returns the number of bytes of free space in the message buffer.

#### Parameters

- **xMessageBuffer** –The handle of the message buffer being queried.

**Returns** The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional sizeof( size\_t ) bytes are also written to store the message's length. sizeof( size\_t ) is typically 4 bytes on a 32-bit architecture, so if xMessageBufferSpacesAvailable() returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

#### **xMessageBufferSpacesAvailable** (xMessageBuffer)

#### **xMessageBufferNextLengthBytes** (xMessageBuffer)

Returns the length (in bytes) of the next message in a message buffer. Useful if xMessageBufferReceive() returned 0 because the size of the buffer passed into xMessageBufferReceive() was too small to hold the next message.

#### Parameters

- **xMessageBuffer** –The handle of the message buffer being queried.

**Returns** The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.

#### **xMessageBufferSendCompletedFromISR** (xMessageBuffer, pxHigherPriorityTaskWoken)

For advanced users only.

The sbSEND\_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to

arrive then the `sbSEND_COMPLETED()` macro sends a notification to the task to remove it from the Blocked state. `xMessageBufferSendCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of `sbSEND_COMPLETED()`, and **MUST NOT BE USED AT ANY OTHER TIME**.

See the example implemented in `FreeRTOS/Demo/Minimal/MessageBufferAMP.c` for additional information.

#### Parameters

- **xMessageBuffer** –The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** –\*pxHigherPriorityTaskWoken should be initialised to `pdFALSE` before it is passed into `xMessageBufferSendCompletedFromISR()`. If calling `xMessageBufferSendCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then \*pxHigherPriorityTaskWoken will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

**Returns** If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

**xMessageBufferReceiveCompletedFromISR** (`xMessageBuffer`, `pxHigherPriorityTaskWoken`)

For advanced users only.

The `sbRECEIVE_COMPLETED()` macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the `sbRECEIVE_COMPLETED()` macro sends a notification to the task to remove it from the Blocked state. `xMessageBufferReceiveCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of `sbRECEIVE_COMPLETED()`, and **MUST NOT BE USED AT ANY OTHER TIME**.

See the example implemented in `FreeRTOS/Demo/Minimal/MessageBufferAMP.c` for additional information.

#### Parameters

- **xMessageBuffer** –The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken** –\*pxHigherPriorityTaskWoken should be initialised to `pdFALSE` before it is passed into `xMessageBufferReceiveCompletedFromISR()`. If calling `xMessageBufferReceiveCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then \*pxHigherPriorityTaskWoken will get set to `pdTRUE` indicating that a context switch should be performed before exiting the ISR.

**Returns** If a task was removed from the Blocked state then `pdTRUE` is returned. Otherwise `pdFALSE` is returned.

### Type Definitions

```
typedef void *MessageBufferHandle_t
```

Type by which message buffers are referenced. For example, a call to `xMessageBufferCreate()` returns an `MessageBufferHandle_t` variable that can then be used as a parameter to `xMessageBufferSend()`, `xMessageBufferReceive()`, etc.

## 2.7.12 FreeRTOS Additions

This document describes the additional features added to ESP-IDF FreeRTOS. This document is split into the following parts:

#### Contents

- *FreeRTOS Additions*
  - *Overview*
  - *Ring Buffers*

- [Hooks](#)
- [TLSP Deletion Callbacks](#)
- [Component Specific Properties](#)
- [API Reference](#)

## Overview

ESP-IDF FreeRTOS is modified version of based on the Xtensa port of FreeRTOS v10.4.3 with significant modifications for SMP compatibility (see [ESP-IDF FreeRTOS SMP Changes](#)). However, various new features specific to ESP-IDF FreeRTOS have been added. The features are as follows:

- **Ring buffers:** Ring buffers provide a FIFO buffer that can accept entries of arbitrary lengths.
- **Hooks:** ESP-IDF FreeRTOS hooks provides support for registering extra Idle and Tick hooks at run time. Moreover, the hooks can be asymmetric among both CPUs.
- **Thread Local Storage Pointer (TLSP) Deletion Callbacks:** TLSP Deletion callbacks are run automatically when a task is deleted, thus allowing users to clean up their TLSPs automatically.
- **Component Specific Properties:** Currently added only one component specific property `ORIG_INCLUDE_PATH`.

## Ring Buffers

The ESP-IDF FreeRTOS ring buffer is a strictly FIFO buffer that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items. The ring buffer provides API to send an item, or to allocate space for an item in the ring buffer to be filled manually by the user. For efficiency reasons, **items are always retrieved from the ring buffer by reference**. As a result, all retrieved items *must also be returned* to the ring buffer by using `vRingbufferReturnItem()` or `vRingbufferReturnItemFromISR()`, in order for them to be removed from the ring buffer completely. The ring buffers are split into the three following types:

**No-Split buffers** will guarantee that an item is stored in contiguous memory and will not attempt to split an item under any circumstances. Use No-Split buffers when items must occupy contiguous memory. *Only this buffer type allows you to get the data item address and write to the item by yourself*. Refer the documentation of the functions `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` for more details.

**Allow-Split buffers** will allow an item to be split in two parts when wrapping around the end of the buffer if there is enough space at the tail and the head of the buffer combined to store the item. Allow-Split buffers are more memory efficient than No-Split buffers but can return an item in two parts when retrieving.

**Byte buffers** do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes can be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained (e.g. a byte stream).

---

**Note:** No-Split buffers and Allow-Split buffers will always store items at 32-bit aligned addresses. Therefore, when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

---

---

**Note:** Each item stored in No-Split or Allow-Split buffers will **require an additional 8 bytes for a header**. Item sizes will also be rounded up to a 32-bit aligned size (multiple of 4 bytes), however the true item size is recorded within the header. The sizes of No-Split and Allow-Split buffers will also be rounded up when created.

---

**Usage** The following example demonstrates the usage of `xRingbufferCreate()` and `xRingbufferSend()` to create a ring buffer and then send an item to it.

```

#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";

...

//Create ring buffer
RingbufHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer\n");
}

//Send an item
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_
↪TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

```

The following example demonstrates the usage of `xRingbufferSendAcquire()` and `xRingbufferSendComplete()` instead of `xRingbufferSend()` to acquire memory on the ring buffer (of type `RINGBUF_TYPE_NOSPLIT`) and then send an item to it. This adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```

#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
    uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+(((N)+3)&(~3)))

...

//Retrieve space for DMA descriptor and corresponding data buffer
//This has to be done with SendAcquire, or the address may be different when_
↪we copy
dma_item_t item;
UBaseType_t res = xRingbufferSendAcquire(buf_handle,
    &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to acquire memory for item\n");
}
item->dma_desc = (lldesc_t) {
    .size = buffer_size,
    .length = buffer_size,
    .eof = 0,
    .owner = 1,
    .buf = &item->buf,
};
//Actually send to the ring buffer for consumer to use
res = xRingbufferSendComplete(buf_handle, &item);
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

```

The following example demonstrates retrieving and returning an item from a **No-Split ring buffer** using `xRingbufferReceive()` and `vRingbufferReturnItem()`

```

...

//Receive an item from no-split ring buffer
size_t item_size;
char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_
↳TICKS(1000));

//Check received item
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

```

The following example demonstrates retrieving and returning an item from an **Allow-Split** ring buffer using `xRingbufferReceiveSplit()` and `vRingbufferReturnItem()`

```

...

//Receive an item from allow-split ring buffer
size_t item_size1, item_size2;
char *item1, *item2;
 BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)&item1, (void_
↳*)&item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

//Check received item
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
    //Check if item was split
    if (item2 != NULL) {
        for (int i = 0; i < item_size2; i++) {
            printf("%c", item2[i]);
        }
        vRingbufferReturnItem(buf_handle, (void *)item2);
    }
    printf("\n");
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

```

The following example demonstrates retrieving and returning an item from a **byte** buffer using `xRingbufferReceiveUpTo()` and `vRingbufferReturnItem()`

```

...

//Receive data from byte buffer
size_t item_size;
char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_
↳TICKS(1000), sizeof(tx_item));

//Check received data

```

(continues on next page)

(continued from previous page)

```

if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, (void *)item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}

```

For ISR safe versions of the functions used above, call `xRingbufferSendFromISR()`, `xRingbufferReceiveFromISR()`, `xRingbufferReceiveSplitFromISR()`, `xRingbufferReceiveUpToFromISR()`, and `vRingbufferReturnItemFromISR()`

**Note:** Two calls to `RingbufferReceive[UpTo][FromISR]()` are required if the bytes wraps around the end of the ring buffer.

**Sending to Ring Buffer** The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers with regard to sending items/data. The diagrams assume that three items of sizes **18, 3, and 27 bytes** are sent respectively to a **buffer of 128 bytes**.

Fig. 28: Sending items to No-Split or Allow-Split ring buffers

For No-Split and Allow-Split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is **rounded up to the nearest 32-bit aligned size** in order to maintain overall 32-bit alignment. However, the true size of the item is recorded inside the header which will be returned when the item is retrieved.

Referring to the diagram above, the 18, 3, and 27 byte items are **rounded up to 20, 4, and 28 bytes** respectively. An 8 byte header is then added in front of each item.

Fig. 29: Sending items to byte buffers

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item.

Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and **merged into a single item of 48 bytes**.

**Using SendAcquire and SendComplete** Items in No-Split buffers are acquired (by `SendAcquire`) in strict FIFO order and must be sent to the buffer by `SendComplete` for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling `SendComplete`, and the items do not necessarily need to be completed in the order they were acquired. However, the receiving of data items must occur in FIFO order, therefore not calling `SendComplete` for the earliest acquired item will prevent the subsequent items from being received.

The following diagrams illustrate what will happen when `SendAcquire` and `SendComplete` don't happen in the same order. At the beginning, there is already a data item of 16 bytes sent to the ring buffer. Then `SendAcquire` is called to acquire space of 20, 8, 24 bytes on the ring buffer.

Fig. 30: SendAcquire/SendComplete items in No-Split ring buffers

After that, we fill (use) the buffers, and send them to the ring buffer by `SendComplete` in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Hence, if `SendComplete` is not called for the 20 bytes, it will not be available, nor will the data items following the 20 bytes item.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-Split buffers and byte buffers do not allow using `SendAcquire` or `SendComplete` since acquired buffers are required to be complete (not wrapped).

**Wrap around** The following diagrams illustrate the differences between No-Split, Allow-Split, and byte buffers when a sent item requires a wrap around. The diagrams assume a buffer of **128 bytes with 56 bytes of free space that wraps around** and a sent item of **28 bytes**.

Fig. 31: Wrap around in No-Split buffers

No-Split buffers will **only store an item in continuous free space and will not split an item under any circumstances**. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be **marked as dummy data**. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

Fig. 32: Wrap around in Allow-Split buffers

Allow-Split buffers will attempt to **split the item into two parts** when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers (therefore incurring an extra 8 bytes of overhead).

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

---

**Note:** Allow-Split buffers treat both parts of the split item as two separate items, therefore call `xRingbufferReceiveSplit()` instead of `xRingbufferReceive()` to receive both parts of a split item in a thread safe manner.

---

Fig. 33: Wrap around in byte buffers

Byte buffers will **store as much data as possible into the free space at the tail of buffer**. The remaining data will then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore, the 16 bytes of free space is filled with data, and the remaining 12 bytes are written to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each continuous part will be treated as a separate item by the byte buffer.

**Retrieving/Returning** The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers in retrieving and returning data.

Items in No-Split buffers and Allow-Split buffers are **retrieved in strict FIFO order** and **must be returned** for the occupied space to be freed. Multiple items can be retrieved before returning, and the items do not necessarily need to be returned in the order they were retrieved. However, the freeing of space must occur in FIFO order, therefore not returning the earliest retrieved item will prevent the space of subsequent items from being freed.

Referring to the diagram above, the **16, 20, and 8 byte items are retrieved in FIFO order**. However, the items are not returned in the order they were retrieved. First, the 20 byte item is returned followed by the 8 byte and the 16 byte items. The space is not freed until the first item, i.e., the 16 byte item is returned.

Fig. 34: Retrieving/Returning items in No-Split and Allow-Split ring buffers

Fig. 35: Retrieving/Returning data in byte buffers

Byte buffers **do not allow multiple retrievals before returning** (every retrieval must be followed by a return before another retrieval is permitted). When using `xRingbufferReceive()` or `xRingbufferReceiveFromISR()`, all continuous stored data will be retrieved. `xRingbufferReceiveUpTo()` or `xRingbufferReceiveUpToFromISR()` can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space will be freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to `xRingbufferReceive()` or `xRingbufferReceiveFromISR()` then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.

**Ring Buffers with Queue Sets** Ring buffers can be added to FreeRTOS queue sets using `xRingbufferAddToQueueSetRead()` such that every time a ring buffer receives an item or data, the queue set is notified. Once added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to `xQueueSelectFromSet()`. To check whether the selected queue set member is the ring buffer, call `xRingbufferCanRead()`.

The following example demonstrates queue set usage with ring buffers.

```
#include "freertos/queue.h"
#include "freertos/ringbuf.h"

...

//Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

//Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
```

(continues on next page)

(continued from previous page)

```

    printf("Failed to add to queue set\n");
}
...

//Block on queue set
xQueueSetMemberHandle member = xQueueSelectFromSet(queue_set, pdMS_TO_
↳TICKS(1000));

//Check if member is ring buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);

    //Handle item
    ...
} else {
    ...
}

```

**Ring Buffers with Static Allocation** The `xRingbufferCreateStatic()` can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand then passed to the `xRingbufferCreateStatic()` to be initialized as a ring buffer. These blocks include the following:

- The ring buffer's data structure of type `StaticRingbuffer_t`
- The ring buffer's storage area of size `xBufferSize`. Note that `xBufferSize` must be 32-bit aligned for No-Split and Allow-Split buffers.

The manner in which these blocks are allocated will depend on the users requirements (e.g. all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

---

**Note:** When deleting a ring buffer created via `xRingbufferCreateStatic()`, the function `vRingbufferDelete()` will not free any of the memory blocks. This must be done manually by the user after `vRingbufferDelete()` is called.

---

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.

```

#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"

#define BUFFER_SIZE    400        //32-bit aligned size
#define BUFFER_TYPE    RINGBUF_TYPE_NOSPLIT
...

//Allocate ring buffer data structure and storage area into external RAM
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_
↳malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t)*BUFFER_SIZE,
↳MALLOC_CAP_SPIRAM);

//Create a ring buffer with manually allocated memory
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_
↳storage, buffer_struct);

```

(continues on next page)

```
...  
  
//Delete the ring buffer after used  
vRingbufferDelete(handle);  
  
//Manually free all blocks of memory  
free(buffer_struct);  
free(buffer_storage);
```

**Priority Inversion** Ideally, ring buffers can be used with multiple tasks in an SMP fashion where the **highest priority task will always be serviced first**. However due to the usage of binary semaphores in the ring buffer's underlying implementation, priority inversion may occur under very specific circumstances.

The ring buffer governs sending by a binary semaphore which is given whenever space is freed on the ring buffer. The highest priority task waiting to send will repeatedly take the semaphore until sufficient free space becomes available or until it times out. Ideally this should prevent any lower priority tasks from being serviced as the semaphore should always be given to the highest priority task.

However, in between iterations of acquiring the semaphore, there is a **gap in the critical section** which may permit another task (on the other core or with an even higher priority) to free some space on the ring buffer and as a result give the semaphore. Therefore, the semaphore will be given before the highest priority task can re-acquire the semaphore. This will result in the **semaphore being acquired by the second-highest priority task** waiting to send, hence causing priority inversion.

This side effect will not affect ring buffer performance drastically given if the number of tasks using the ring buffer simultaneously is low, and the ring buffer is not operating near maximum capacity.

## Hooks

FreeRTOS consists of Idle Hooks and Tick Hooks which allow for application specific functionality to be added to the Idle Task and Tick Interrupt. ESP-IDF provides its own Idle and Tick Hook API in addition to the hooks provided by vanilla FreeRTOS. ESP-IDF hooks have the added benefit of being run time configurable and asymmetrical.

**Vanilla FreeRTOS Hooks** Idle and Tick Hooks in vanilla FreeRTOS are implemented by the user defining the functions `vApplicationIdleHook()` and `vApplicationTickHook()` respectively somewhere in the application. Vanilla FreeRTOS will run the user defined Idle Hook and Tick Hook on every iteration of the Idle Task and Tick Interrupt respectively.

Vanilla FreeRTOS hooks are referred to as **Legacy Hooks** in ESP-IDF FreeRTOS. To enable legacy hooks, [CONFIG\\_FREERTOS\\_LEGACY\\_HOOKS](#) should be enabled in *project configuration menu*.

Due to vanilla FreeRTOS being designed for single core, `vApplicationIdleHook()` and `vApplicationTickHook()` can only be defined once. However, the ESP32-S3 is dual-core in nature, therefore same Idle Hook and Tick Hook are used for both cores (in other words, the hooks are symmetrical for both cores).

**ESP-IDF Idle and Tick Hooks** For some use-cases it may be necessary for the Idle Tasks or Tick Interrupts to execute multiple hooks that are configurable at run time.

Furthermore, due to the dual-core nature of the ESP32-S3, it may be necessary for some applications to have separate hooks for each core.

Therefore, ESP-IDF provides its own hooks API in addition to the legacy hooks provided by vanilla FreeRTOS.

The ESP-IDF tick and idle hooks are registered at run time. Each tick hook and idle hook must be registered to a specific CPU. When the idle task runs or a tick interrupt occurs on a particular CPU, the CPU will run each of its registered idle hook and tick hook in turn.

**Note:** Tick interrupt stays active whilst cache is disabled and hence `vApplicationTickHook()` (legacy case) or ESP-IDF tick hooks must be placed in internal RAM. Please refer to the [SPI flash API documentation](#) for more details.

---

### TLSP Deletion Callbacks

Vanilla FreeRTOS provides a Thread Local Storage Pointers (TLSP) feature. These are pointers stored directly in the Task Control Block (TCB) of a particular task. TLSPs allow each task to have its own unique set of pointers to data structures. Vanilla FreeRTOS expects users to...

- set a task's TLSPs by calling `vTaskSetThreadLocalStoragePointer()` after the task has been created.
- get a task's TLSPs by calling `pvTaskGetThreadLocalStoragePointer()` during the task's lifetime.
- free the memory pointed to by the TLSPs before the task is deleted.

However, there can be instances where users may want the freeing of TLSP memory to be automatic. Therefore, ESP-IDF FreeRTOS provides the additional feature of TLSP deletion callbacks. These user provided deletion callbacks are called automatically when a task is deleted, thus allows the TLSP memory to be cleaned up without needing to add the cleanup logic explicitly to the code of every task.

The TLSP deletion callbacks are set in a similar fashion to the TLSPs themselves.

- `vTaskSetThreadLocalStoragePointerAndDelCallback()` sets both a particular TLSP and its associated callback.
- Calling the Vanilla FreeRTOS function `vTaskSetThreadLocalStoragePointer()` will simply set the TLSP's associated Deletion Callback to `NULL` meaning that no callback will be called for that TLSP during task deletion.

When implementing TLSP callbacks, users should note the following:

- The callback **must never attempt to block or yield** and critical sections should be kept as short as possible
- The callback is called shortly before a deleted task's memory is freed. Thus, the callback can either be called from `vTaskDelete()` itself, or from the idle task.

### Component Specific Properties

Besides standard component variables that are available with basic cmake build properties, FreeRTOS component also provides arguments (only one so far) for simpler integration with other modules:

- `ORIG_INCLUDE_PATH` - contains an absolute path to freertos root include folder. Thus instead of `#include "freertos/FreeRTOS.h"` you can refer to headers directly: `#include "FreeRTOS.h"`.

### API Reference

#### Ring Buffer API

#### Header File

- `components/esp_ringbuf/include/freertos/ringbuf.h`

#### Functions

*RingbufHandle\_t* **xRingbufferCreate** (size\_t xBufferSize, *RingbufferType\_t* xBufferType)

Create a ring buffer.

---

**Note:** xBufferSize of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

---

**Parameters**

- **xBufferSize** –[in] Size of the buffer in bytes. Note that items require space for overhead in no-split/allow-split buffers
- **xBufferType** –[in] Type of ring buffer, see documentation.

**Returns** A handle to the created ring buffer, or NULL in case of error.

*RingbufHandle\_t* **xRingbufferCreateNoSplit** (size\_t xItemSize, size\_t xItemNum)

Create a ring buffer of type RINGBUF\_TYPE\_NOSPLIT for a fixed item\_size.

This API is similar to xRingbufferCreate(), but it will internally allocate additional space for the headers.

**Parameters**

- **xItemSize** –[in] Size of each item to be put into the ring buffer
- **xItemNum** –[in] Maximum number of items the buffer needs to hold simultaneously

**Returns** A *RingbufHandle\_t* handle to the created ring buffer, or NULL in case of error.

*RingbufHandle\_t* **xRingbufferCreateStatic** (size\_t xBufferSize, *RingbufferType\_t* xBufferType, uint8\_t \*pucRingbufferStorage, *StaticRingbuffer\_t* \*pxStaticRingbuffer)

Create a ring buffer but manually provide the required memory.

---

**Note:** xBufferSize of no-split/allow-split buffers MUST be 32-bit aligned.

---

**Parameters**

- **xBufferSize** –[in] Size of the buffer in bytes.
- **xBufferType** –[in] Type of ring buffer, see documentation
- **pucRingbufferStorage** –[in] Pointer to the ring buffer's storage area. Storage area must of the same size as specified by xBufferSize
- **pxStaticRingbuffer** –[in] Pointed to a struct of type *StaticRingbuffer\_t* which will be used to hold the ring buffer's data structure

**Returns** A handle to the created ring buffer

BaseType\_t **xRingbufferSend** (*RingbufHandle\_t* xRingbuffer, const void \*pvItem, size\_t xItemSize, TickType\_t xTicksToWait)

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.

---

**Note:** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

---

**Parameters**

- **xRingbuffer** –[in] Ring buffer to insert the item into
- **pvItem** –[in] Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **xItemSize** –[in] Size of data to insert.
- **xTicksToWait** –[in] Ticks to wait for room in the ring buffer.

**Returns**

- pdTRUE if succeeded

- `pdFALSE` on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType\_t **xRingbufferSendFromISR** (*RingbufHandle\_t* xRingbuffer, const void \*pvItem, size\_t xItemSize, BaseType\_t \*pxHigherPriorityTaskWoken)

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

---

**Note:** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

---

#### Parameters

- **xRingbuffer** –[in] Ring buffer to insert the item into
- **pvItem** –[in] Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **xItemSize** –[in] Size of data to insert.
- **pxHigherPriorityTaskWoken** –[out] Value pointed to will be set to `pdTRUE` if the function woke up a higher priority task.

#### Returns

- `pdTRUE` if succeeded
- `pdFALSE` when the ring buffer does not have space.

BaseType\_t **xRingbufferSendAcquire** (*RingbufHandle\_t* xRingbuffer, void \*\*ppvItem, size\_t xItemSize, TickType\_t xTicksToWait)

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it timesout.

The item, as well as the following items `SendAcquire` or `Send` after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

---

**Note:** Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

---

#### Parameters

- **xRingbuffer** –[in] Ring buffer to allocate the memory
- **ppvItem** –[out] Double pointer to memory acquired (set to NULL if no memory were retrieved)
- **xItemSize** –[in] Size of item to acquire.
- **xTicksToWait** –[in] Ticks to wait for room in the ring buffer.

#### Returns

- `pdTRUE` if succeeded
- `pdFALSE` on time-out or when the data is larger than the maximum permissible size of the buffer

BaseType\_t **xRingbufferSendComplete** (*RingbufHandle\_t* xRingbuffer, void \*pvItem)

Actually send an item into the ring buffer allocated before by `xRingbufferSendAcquire`.

---

**Note:** Only applicable for no-split ring buffers. Only call for items allocated by `xRingbufferSendAcquire`.

---

**Parameters**

- **xRingbuffer** –[in] Ring buffer to insert the item into
- **pvItem** –[in] Pointer to item in allocated memory to insert.

**Returns**

- pdTRUE if succeeded
- pdFALSE if fail for some reason.

void \***xRingbufferReceive** (*RingbufHandle\_t* xRingbuffer, size\_t \*pxItemSize, TickType\_t xTicksToWait)

Retrieve an item from the ring buffer.

Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

---

**Note:** A call to vRingbufferReturnItem() is required after this to free the item retrieved.

---

**Parameters**

- **xRingbuffer** –[in] Ring buffer to retrieve the item from
- **pxItemSize** –[out] Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** –[in] Ticks to wait for items in the ring buffer.

**Returns**

- Pointer to the retrieved item on success; \*pxItemSize filled with the length of the item.
- NULL on timeout, \*pxItemSize is untouched in that case.

void \***xRingbufferReceiveFromISR** (*RingbufHandle\_t* xRingbuffer, size\_t \*pxItemSize)

Retrieve an item from the ring buffer in an ISR.

Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval

---

**Note:** A call to vRingbufferReturnItemFromISR() is required after this to free the item retrieved.

---

---

**Note:** Byte buffers do not allow multiple retrievals before returning an item

---

---

**Note:** Two calls to RingbufferReceiveFromISR() are required if the bytes wrap around the end of the ring buffer.

---

**Parameters**

- **xRingbuffer** –[in] Ring buffer to retrieve the item from
- **pxItemSize** –[out] Pointer to a variable to which the size of the retrieved item will be written.

**Returns**

- Pointer to the retrieved item on success; \*pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, \*pxItemSize is untouched in that case.

BaseType\_t **xRingbufferReceiveSplit** (*RingbufHandle\_t* xRingbuffer, void \*\*ppvHeadItem, void \*\*ppvTailItem, size\_t \*pxHeadItemSize, size\_t \*pxTailItemSize, TickType\_t xTicksToWait)

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retried. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

---

**Note:** Call(s) to `vRingbufferReturnItem()` is required after this to free up the item(s) retrieved.

---

---

**Note:** This function should only be called on allow-split buffers

---

#### Parameters

- **xRingbuffer** –[in] Ring buffer to retrieve the item from
- **ppvHeadItem** –[out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** –[out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** –[out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** –[out] Pointer to size of second part (unmodified if item is not split)
- **xTicksToWait** –[in] Ticks to wait for items in the ring buffer.

#### Returns

- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved

BaseType\_t **xRingbufferReceiveSplitFromISR** (*RingbufHandle\_t* xRingbuffer, void \*\*ppvHeadItem, void \*\*ppvTailItem, size\_t \*pxHeadItemSize, size\_t \*pxTailItemSize)

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval

---

**Note:** Calls to `vRingbufferReturnItemFromISR()` is required after this to free up the item(s) retrieved.

---

---

**Note:** This function should only be called on allow-split buffers

---

#### Parameters

- **xRingbuffer** –[in] Ring buffer to retrieve the item from
- **ppvHeadItem** –[out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** –[out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** –[out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** –[out] Pointer to size of second part (unmodified if item is not split)

#### Returns

- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved

void \***xRingbufferReceiveUpTo** (*RingbufHandle\_t* xRingbuffer, size\_t \*pxItemSize, TickType\_t xTicksToWait, size\_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

---

**Note:** A call to `vRingbufferReturnItem()` is required after this to free up the data retrieved.

---

---

**Note:** This function should only be called on byte buffers

---

---

**Note:** Byte buffers do not allow multiple retrievals before returning an item

---

---

**Note:** Two calls to `RingbufferReceiveUpTo()` are required if the bytes wrap around the end of the ring buffer.

---

#### Parameters

- **xRingbuffer** –[in] Ring buffer to retrieve the item from
- **pxItemSize** –[out] Pointer to a variable to which the size of the retrieved item will be written.
- **xTicksToWait** –[in] Ticks to wait for items in the ring buffer.
- **xMaxSize** –[in] Maximum number of bytes to return.

#### Returns

- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
- NULL on timeout, `*pxItemSize` is untouched in that case.

void **xRingbufferReceiveUpToFromISR** (*RingbufHandle\_t* xRingbuffer, size\_t \*pxItemSize, size\_t xMaxSize)

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

---

**Note:** A call to `vRingbufferReturnItemFromISR()` is required after this to free up the data received.

---

---

**Note:** This function should only be called on byte buffers

---

---

**Note:** Byte buffers do not allow multiple retrievals before returning an item

---

#### Parameters

- **xRingbuffer** –[in] Ring buffer to retrieve the item from
- **pxItemSize** –[out] Pointer to a variable to which the size of the retrieved item will be written.
- **xMaxSize** –[in] Maximum number of bytes to return.

#### Returns

- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
- NULL when the ring buffer is empty, `*pxItemSize` is untouched in that case.

void **vRingbufferReturnItem** (*RingbufHandle\_t* xRingbuffer, void \*pvItem)

Return a previously-retrieved item to the ring buffer.

---

**Note:** If a split item is retrieved, both parts should be returned by calling this function twice

---

#### Parameters

- **xRingbuffer** –[in] Ring buffer the item was retrieved from
- **pvItem** –[in] Item that was received earlier

void **vRingbufferReturnItemFromISR** (*RingbufHandle\_t* xRingbuffer, void \*pvItem, BaseType\_t \*pxHigherPriorityTaskWoken)

Return a previously-retrieved item to the ring buffer from an ISR.

---

**Note:** If a split item is retrieved, both parts should be returned by calling this function twice

---

**Parameters**

- **xRingbuffer** –[in] Ring buffer the item was retrieved from
- **pvItem** –[in] Item that was received earlier
- **pxHigherPriorityTaskWoken** –[out] Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

void **vRingbufferDelete** (*RingbufHandle\_t* xRingbuffer)

Delete a ring buffer.

---

**Note:** This function will not deallocate any memory if the ring buffer was created using `xRingbufferCreateStatic()`. Deallocation must be done manually by the user.

---

**Parameters** **xRingbuffer** –[in] Ring buffer to delete

size\_t **xRingbufferGetMaxItemSize** (*RingbufHandle\_t* xRingbuffer)

Get maximum size of an item that can be placed in the ring buffer.

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

---

**Note:** The max item size for a no-split buffer is limited to  $((\text{buffer\_size}/2) - \text{header\_size})$ . This limit is imposed so that an item of max item size can always be sent to the an empty no-split buffer regardless of the internal positions of the buffer's read/write/free pointers.

---

**Parameters** **xRingbuffer** –[in] Ring buffer to query

**Returns** Maximum size, in bytes, of an item that can be placed in a ring buffer.

size\_t **xRingbufferGetCurFreeSize** (*RingbufHandle\_t* xRingbuffer)

Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

---

**Note:** An empty no-split buffer has a max current free size for an item that is limited to  $((\text{buffer\_size}/2) - \text{header\_size})$ . See API reference for `xRingbufferGetMaxItemSize()`.

---

**Warning:** This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application's responsibility to ensure atomic access to this API and the subsequent Send

**Parameters** **xRingbuffer** –[in] Ring buffer to query

**Returns** Current free size, in bytes, available for an entry

BaseType\_t **xRingbufferAddToQueueSetRead** (*RingbufHandle\_t* xRingbuffer, *QueueSetHandle\_t* xQueueSet)

Add the ring buffer's read semaphore to a queue set.

The ring buffer's read semaphore indicates that data has been written to the ring buffer. This function adds the ring buffer's read semaphore to a queue set.

#### Parameters

- **xRingbuffer** –[in] Ring buffer to add to the queue set
- **xQueueSet** –[in] Queue set to add the ring buffer's read semaphore to

#### Returns

- pdTRUE on success, pdFALSE otherwise

BaseType\_t **xRingbufferCanRead** (*RingbufHandle\_t* xRingbuffer, *QueueSetMemberHandle\_t* xMember)

Check if the selected queue set member is the ring buffer's read semaphore.

This API checks if queue set member returned from xQueueSelectFromSet() is the read semaphore of this ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

#### Parameters

- **xRingbuffer** –[in] Ring buffer which should be checked
- **xMember** –[in] Member returned from xQueueSelectFromSet

#### Returns

- pdTRUE when semaphore belongs to ring buffer
- pdFALSE otherwise.

BaseType\_t **xRingbufferRemoveFromQueueSetRead** (*RingbufHandle\_t* xRingbuffer, *QueueSetHandle\_t* xQueueSet)

Remove the ring buffer's read semaphore from a queue set.

This specifically removes a ring buffer's read semaphore from a queue set. The read semaphore is used to indicate when data has been written to the ring buffer

#### Parameters

- **xRingbuffer** –[in] Ring buffer to remove from the queue set
- **xQueueSet** –[in] Queue set to remove the ring buffer's read semaphore from

#### Returns

- pdTRUE on success
- pdFALSE otherwise

void **vRingbufferGetInfo** (*RingbufHandle\_t* xRingbuffer, UBaseType\_t \*uxFree, UBaseType\_t \*uxRead, UBaseType\_t \*uxWrite, UBaseType\_t \*uxAcquire, UBaseType\_t \*uxItemsWaiting)

Get information about ring buffer status.

Get information of the a ring buffer's current status such as free/read/write pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

#### Parameters

- **xRingbuffer** –[in] Ring buffer to remove from the queue set
- **uxFree** –[out] Pointer use to store free pointer position
- **uxRead** –[out] Pointer use to store read pointer position
- **uxWrite** –[out] Pointer use to store write pointer position
- **uxAcquire** –[out] Pointer use to store acquire pointer position
- **uxItemsWaiting** –[out] Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

void **xRingbufferPrintInfo** (*RingbufHandle\_t* xRingbuffer)

Debugging function to print the internal pointers in the ring buffer.

**Parameters** **xRingbuffer** –Ring buffer to show

## Structures

**struct `xSTATIC_RINGBUFFER`**

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

**Type Definitions**

```
typedef void *RingbufHandle_t
```

Type by which ring buffers are referenced. For example, a call to `xRingbufferCreate()` returns a `RingbufHandle_t` variable that can then be used as a parameter to `xRingbufferSend()`, `xRingbufferReceive()`, etc.

```
typedef struct xSTATIC_RINGBUFFER StaticRingbuffer_t
```

Struct that is equivalent in size to the ring buffer's data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer's control data structure.

**Enumerations**

```
enum RingbufferType_t
```

*Values:*

```
enumerator RINGBUF_TYPE_NOSPLIT
```

No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

```
enumerator RINGBUF_TYPE_ALLOWSPLIT
```

Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.

```
enumerator RINGBUF_TYPE_BYTEBUF
```

Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

```
enumerator RINGBUF_TYPE_MAX
```

**Hooks API****Header File**

- [components/esp\\_system/include/esp\\_freertos\\_hooks.h](#)

**Functions**

```
esp_err_t esp_register_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t new_idle_cb,  
                                                  UBaseType_t cpuid)
```

Register a callback to be called from the specified core's idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning:** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

#### Parameters

- **new\_idle\_cb** –[in] Callback to be called
- **cpuid** –[in] id of the core

#### Returns

- ESP\_OK: Callback registered to the specified core' s idle hook
- ESP\_ERR\_NO\_MEM: No more space on the specified core' s idle hook to register callback
- ESP\_ERR\_INVALID\_ARG: cpuid is invalid

*esp\_err\_t* **esp\_register\_freertos\_idle\_hook** (*esp\_freertos\_idle\_cb\_t* new\_idle\_cb)

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning:** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**Parameters** **new\_idle\_cb** –[in] Callback to be called

#### Returns

- ESP\_OK: Callback registered to the calling core' s idle hook
- ESP\_ERR\_NO\_MEM: No more space on the calling core' s idle hook to register callback

*esp\_err\_t* **esp\_register\_freertos\_tick\_hook\_for\_cpu** (*esp\_freertos\_tick\_cb\_t* new\_tick\_cb, UBaseType\_t cpuid)

Register a callback to be called from the specified core' s tick hook.

#### Parameters

- **new\_tick\_cb** –[in] Callback to be called
- **cpuid** –[in] id of the core

#### Returns

- ESP\_OK: Callback registered to specified core' s tick hook
- ESP\_ERR\_NO\_MEM: No more space on the specified core' s tick hook to register the callback
- ESP\_ERR\_INVALID\_ARG: cpuid is invalid

*esp\_err\_t* **esp\_register\_freertos\_tick\_hook** (*esp\_freertos\_tick\_cb\_t* new\_tick\_cb)

Register a callback to be called from the calling core' s tick hook.

**Parameters** **new\_tick\_cb** –[in] Callback to be called

#### Returns

- ESP\_OK: Callback registered to the calling core' s tick hook
- ESP\_ERR\_NO\_MEM: No more space on the calling core' s tick hook to register the callback

void **esp\_deregister\_freertos\_idle\_hook\_for\_cpu** (*esp\_freertos\_idle\_cb\_t* old\_idle\_cb, UBaseType\_t cpuid)

Unregister an idle callback from the idle hook of the specified core.

#### Parameters

- **old\_idle\_cb** –[in] Callback to be unregistered
- **cpuid** –[in] id of the core

void **esp\_deregister\_freertos\_idle\_hook** (*esp\_freertos\_idle\_cb\_t* old\_idle\_cb)

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

**Parameters** `old_idle_cb` –[in] Callback to be unregistered

void `esp_deregister_freertos_tick_hook_for_cpu` (`esp_freertos_tick_cb_t` `old_tick_cb`,  
UBaseType\_t `cpuid`)

Unregister a tick callback from the tick hook of the specified core.

**Parameters**

- `old_tick_cb` –[in] Callback to be unregistered
- `cpuid` –[in] id of the core

void `esp_deregister_freertos_tick_hook` (`esp_freertos_tick_cb_t` `old_tick_cb`)

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

**Parameters** `old_tick_cb` –[in] Callback to be unregistered

### Type Definitions

```
typedef bool (*esp_freertos_idle_cb_t)(void)
```

```
typedef void (*esp_freertos_tick_cb_t)(void)
```

## 2.7.13 Heap Memory Allocation

### Stack and Heap

ESP-IDF applications use the common computer architecture patterns of *stack* (dynamic memory allocated by program control flow) and *heap* (dynamic memory allocated by function calls), as well as statically allocated memory (allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. (See `xTaskCreateStatic()` for the alternative where stacks are statically allocated.)

Because ESP32-S3 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the standard libc `malloc()` and `free()` functions can be used for heap allocation without any special consideration.

However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have memory with certain properties (for example, *DMA-Capable Memory* or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.

### Memory Capabilities

The ESP32-S3 contains multiple types of RAM:

- DRAM (Data RAM) is memory used to hold data. This is the most common kind of memory accessed as heap.
- IRAM (Instruction RAM) usually holds executable data only. If accessed as generic memory, all accesses must be *32-bit aligned*.
- D/IRAM is RAM which can be used as either Instruction or Data RAM.

For more details on these internal memory types, see *Memory Types*.

It's also possible to connect external SPI RAM to the ESP32-S3 - *external RAM* can be integrated into the ESP32-S3's memory map using the flash cache, and accessed similarly to DRAM.

DRAM uses capability `MALLOC_CAP_8BIT` (accessible in single byte reads and writes). To test the free DRAM heap size at runtime, call `cpp:func:heap_caps_get_free_size(MALLOC_CAP_8BIT)`.

When calling `malloc()`, the ESP-IDF `malloc()` implementation internally calls `cpp:func:heap_caps_malloc_default(size)`. This will allocate memory with capability `MALLOC_CAP_DEFAULT`, which is byte-addressable.

Because `malloc` uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.

### Available Heap

**DRAM** At startup, the DRAM heap contains all data memory which is not statically allocated by the app. Reducing statically allocated buffers will increase the amount of available free heap.

To find the amount of statically allocated memory, use the `idf.py size` command.

---

**Note:** At runtime, the available heap DRAM may be less than calculated at compile time, because at startup some memory is allocated from the heap before the FreeRTOS scheduler is started (including memory for the stacks of initial FreeRTOS tasks).

---

**IRAM** At startup, the IRAM heap contains all instruction memory which is not used by the app executable code.

The `idf.py size` command can be used to find the amount of IRAM used by the app.

**D/IRAM** Some memory in the ESP32-S3 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.

**Heap Sizes** At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

```
I (252) heap_init: Initializing. RAM available for dynamic allocation:
I (259) heap_init: At 3FFAE6E0 len 00001920 (6 KiB): DRAM
I (265) heap_init: At 3FFB2EC8 len 0002D138 (180 KiB): DRAM
I (272) heap_init: At 3FFE0440 len 00003AE0 (14 KiB): D/IRAM
I (278) heap_init: At 3FFE4350 len 0001BCB0 (111 KiB): D/IRAM
I (284) heap_init: At 4008944C len 00016BB4 (90 KiB): IRAM
```

**Finding available heap** See [Heap Information](#).

### Special Capabilities

**DMA-Capable Memory** Use the `MALLOC_CAP_DMA` flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

**32-Bit Accessible Memory** If a certain memory structure is only addressed in 32-bit units, for example an array of ints or pointers, it can be useful to allocate it with the `MALLOC_CAP_32BIT` flag. This also allows the allocator to give out IRAM memory; something which it can't do for a normal `malloc()` call. This can help to use all the available memory in the ESP32-S3.

Memory allocated with `MALLOC_CAP_32BIT` can *only* be accessed via 32-bit reads and writes, any other type of access will generate a fatal `LoadStoreError` exception.

**External SPI Memory** When *external RAM* is enabled, external SPI RAM under 4MiB in size can be allocated using standard `malloc` calls, or via `heap_caps_malloc (MALLOC_CAP_SPIRAM)`, depending on configuration. See [Configuring External RAM](#) for more details.

### Thread Safety

Heap functions are thread safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call `malloc`, `free`, and related functions from interrupt handler (ISR) context (see [Calling heap related functions from ISR](#)). However this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

### Calling heap related functions from ISR

The following functions from the heap component can be called from interrupt handler (ISR):

- `heap_caps_malloc()`
- `heap_caps_malloc_default()`
- `heap_caps_realloc_default()`
- `heap_caps_malloc_prefer()`
- `heap_caps_realloc_prefer()`
- `heap_caps_calloc_prefer()`
- `heap_caps_free()`
- `heap_caps_realloc()`
- `heap_caps_calloc()`
- `heap_caps_aligned_alloc()`
- `heap_caps_aligned_free()`

Note however this practice is strongly discouraged.

### Heap Tracing & Debugging

The following features are documented on the [Heap Memory Debugging](#) page:

- [Heap Information](#) (free space, etc.)
- [Heap Corruption Detection](#)
- [Heap Tracing](#) (memory leak detection, monitoring, etc.)

### Implementation Notes

Knowledge about the regions of memory in the chip comes from the “soc” component, which contains memory layout information for the chip, and the different capabilities of each region. Each region’s capabilities are prioritised, so that (for example) dedicated DRAM and IRAM regions will be used for allocations ahead of the more versatile D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the [multi\\_heap](#) functionality. `multi_heap` allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation (based on desired capabilities, available space, and preferences for each region’s use) and then calling `multi_heap_malloc()` or `multi_heap_calloc()` for the heap situated in that particular region.

Calling `free()` involves finding the particular heap corresponding to the freed address, and then calling `multi_heap_free()` on that particular `multi_heap` instance.

## API Reference - Heap Allocation

### Header File

- `components/heap/include/esp_heap_caps.h`

### Functions

`esp_err_t heap_caps_register_failed_alloc_callback` (`esp_alloc_failed_hook_t` callback)

registers a callback function to be invoked if a memory allocation operation fails

**Parameters** `callback` – caller defined callback to be invoked

**Returns** `ESP_OK` if callback was registered.

void `*heap_caps_malloc` (`size_t` size, `uint32_t` caps)

Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to `libc malloc()`, for capability-aware memory.

**Parameters**

- **size** – Size, in bytes, of the amount of memory to allocate
- **caps** – Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

**Returns** A pointer to the memory allocated on success, `NULL` on failure

void `heap_caps_free` (`void *`ptr)

Free memory previously allocated via `heap_caps_malloc()` or `heap_caps_realloc()`.

Equivalent semantics to `libc free()`, for capability-aware memory.

In IDF, `free (p)` is equivalent to `heap_caps_free (p)`.

**Parameters** `ptr` – Pointer to memory previously returned from `heap_caps_malloc()` or `heap_caps_realloc()`. Can be `NULL`.

void `*heap_caps_realloc` (`void *`ptr, `size_t` size, `uint32_t` caps)

Reallocate memory previously allocated via `heap_caps_malloc()` or `heap_caps_realloc()`.

Equivalent semantics to `libc realloc()`, for capability-aware memory.

In IDF, `realloc (p, s)` is equivalent to `heap_caps_realloc (p, s, MALLOC_CAP_8BIT)`.

‘caps’ parameter can be different to the capabilities that any original ‘ptr’ was allocated with. In this way, `realloc` can be used to “move” a buffer if necessary to ensure it meets a new set of capabilities.

**Parameters**

- **ptr** – Pointer to previously allocated memory, or `NULL` for a new allocation.
- **size** – Size of the new buffer requested, or 0 to free the buffer.
- **caps** – Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory desired for the new allocation.

**Returns** Pointer to a new buffer of size ‘size’ with capabilities ‘caps’, or `NULL` if allocation failed.

void `*heap_caps_aligned_alloc` (`size_t` alignment, `size_t` size, `uint32_t` caps)

Allocate a aligned chunk of memory which has the given capabilities.

Equivalent semantics to `libc aligned_alloc()`, for capability-aware memory.

**Parameters**

- **alignment** – How the pointer received needs to be aligned must be a power of two
- **size** – Size, in bytes, of the amount of memory to allocate
- **caps** – Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

**Returns** A pointer to the memory allocated on success, `NULL` on failure

void **heap\_caps\_aligned\_free** (void \*ptr)

Used to deallocate memory previously allocated with `heap_caps_aligned_alloc`.

---

**Note:** This function is deprecated, please consider using `heap_caps_free()` instead

---

**Parameters** **ptr** –Pointer to the memory allocated

void \***heap\_caps\_aligned\_malloc** (size\_t alignment, size\_t n, size\_t size, uint32\_t caps)

Allocate a aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

**Parameters**

- **alignment** –How the pointer received needs to be aligned must be a power of two
- **n** –Number of continuing chunks of memory to allocate
- **size** –Size, in bytes, of a chunk of memory to allocate
- **caps** –Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

**Returns** A pointer to the memory allocated on success, NULL on failure

void \***heap\_caps\_malloc** (size\_t n, size\_t size, uint32\_t caps)

Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Equivalent semantics to `libc calloc()`, for capability-aware memory.

In IDF, `calloc(p)` is equivalent to `heap_caps_malloc(p, MALLOC_CAP_8BIT)`.

**Parameters**

- **n** –Number of continuing chunks of memory to allocate
- **size** –Size, in bytes, of a chunk of memory to allocate
- **caps** –Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory to be returned

**Returns** A pointer to the memory allocated on success, NULL on failure

size\_t **heap\_caps\_get\_total\_size** (uint32\_t caps)

Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

**Parameters** **caps** –Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

**Returns** total size in bytes

size\_t **heap\_caps\_get\_free\_size** (uint32\_t caps)

Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use `heap_caps_get_largest_free_block()` for this purpose.

**Parameters** **caps** –Bitwise OR of `MALLOC_CAP_*` flags indicating the type of memory

**Returns** Amount of free bytes in the regions

size\_t **heap\_caps\_get\_minimum\_free\_size** (uint32\_t caps)

Get the total minimum free memory of all regions with the given capabilities.

This adds all the low water marks of the regions capable of delivering the memory with the given capabilities.

Note the result may be less than the global all-time minimum available heap of this kind, as “low water marks” are tracked per-region. Individual regions’ heaps may have reached their “low water marks” at different points in time. However this result still gives a “worst case” indication for all-time minimum free heap.

**Parameters** **caps** –Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory

**Returns** Amount of free bytes in the regions

size\_t **heap\_caps\_get\_largest\_free\_block** (uint32\_t caps)

Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of *s* for which `heap_caps_malloc(s, caps)` will succeed.

**Parameters** **caps** –Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory

**Returns** Size of largest free block in bytes.

void **heap\_caps\_get\_info** (*multi\_heap\_info\_t* \*info, uint32\_t caps)

Get heap info for all regions with the given capabilities.

Calls `multi_heap_info()` on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for *multi\_heap\_info\_t*, except that `minimum_free_bytes` has the same caveats described in `heap_caps_get_minimum_free_size()`.

**Parameters**

- **info** –Pointer to a structure which will be filled with relevant heap metadata.
- **caps** –Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory

void **heap\_caps\_print\_heap\_info** (uint32\_t caps)

Print a summary of all memory with the given capabilities.

Calls `multi_heap_info` on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.

**Parameters** **caps** –Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory

bool **heap\_caps\_check\_integrity\_all** (bool print\_errors)

Check integrity of all heap memory in the system.

Calls `multi_heap_check` on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling `heap_caps_check_integrity` with the `caps` argument set to `MALLOC_CAP_INVALID`.

**Parameters** **print\_errors** –Print specific errors if heap corruption is found.

**Returns** True if all heaps are valid, False if at least one heap is corrupt.

bool **heap\_caps\_check\_integrity** (uint32\_t caps, bool print\_errors)

Check integrity of all heaps with the given capabilities.

Calls `multi_heap_check` on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also `heap_caps_check_integrity_all` to check all heap memory in the system and `heap_caps_check_integrity_addr` to check memory around a single address.

**Parameters**

- **caps** –Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory
- **print\_errors** –Print specific errors if heap corruption is found.

**Returns** True if all heaps are valid, False if at least one heap is corrupt.

bool **heap\_caps\_check\_integrity\_addr** (intptr\_t addr, bool print\_errors)

Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won't work and you should call `heap_caps_check_integrity` or `heap_caps_check_integrity_all` instead.

---

**Note:** The entire heap region around the address is checked, not only the adjacent heap blocks.

---

**Parameters**

- **addr** –Address in memory. Check for corruption in region containing this address.
- **print\_errors** –Print specific errors if heap corruption is found.

**Returns** True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn't belong to a heap region.

void **heap\_caps\_malloc\_extmem\_enable** (size\_t limit)

Enable malloc() in external memory and set limit below which malloc() attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

**Parameters** **limit** –Limit, in bytes.

void \***heap\_caps\_malloc\_prefer** (size\_t size, size\_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

**Attention** The variable parameters are bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory. This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.

**Parameters**

- **size** –Size, in bytes, of the amount of memory to allocate
- **num** –Number of variable paramters

**Returns** A pointer to the memory allocated on success, NULL on failure

void \***heap\_caps\_realloc\_prefer** (void \*ptr, size\_t size, size\_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

**Parameters**

- **ptr** –Pointer to previously allocated memory, or NULL for a new allocation.
- **size** –Size of the new buffer requested, or 0 to free the buffer.
- **num** –Number of variable paramters

**Returns** Pointer to a new buffer of size 'size', or NULL if allocation failed.

void \***heap\_caps\_calloc\_prefer** (size\_t n, size\_t size, size\_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

**Parameters**

- **n** –Number of continuing chunks of memory to allocate
- **size** –Size, in bytes, of a chunk of memory to allocate
- **num** –Number of variable paramters

**Returns** A pointer to the memory allocated on success, NULL on failure

void **heap\_caps\_dump** (uint32\_t caps)

Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr). For each (variable sized) block in each matching heap, the following output is printed on a single line:

- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).

- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

**Parameters** **caps** –Bitwise OR of MALLOC\_CAP\_\* flags indicating the type of memory

void **heap\_caps\_dump\_all** (void)

Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for heap\_caps\_dump.

size\_t **heap\_caps\_get\_allocated\_size** (void \*ptr)

Return the size that a particular pointer was allocated with.

---

**Note:** The app will crash with an assertion failure if the pointer is not valid.

---

**Parameters** **ptr** –Pointer to currently allocated heap memory. Must be a pointer value previously returned by heap\_caps\_malloc, malloc, calloc, etc. and not yet freed.

**Returns** Size of the memory allocated at this block.

## Macros

### MALLOC\_CAP\_EXEC

Flags to indicate the capabilities of the various memory systems.

Memory must be able to run executable code

### MALLOC\_CAP\_32BIT

Memory must allow for aligned 32-bit data accesses.

### MALLOC\_CAP\_8BIT

Memory must allow for 8/16/...-bit data accesses.

### MALLOC\_CAP\_DMA

Memory must be able to accessed by DMA.

### MALLOC\_CAP\_PID2

Memory must be mapped to PID2 memory space (PIDs are not currently used)

### MALLOC\_CAP\_PID3

Memory must be mapped to PID3 memory space (PIDs are not currently used)

### MALLOC\_CAP\_PID4

Memory must be mapped to PID4 memory space (PIDs are not currently used)

### MALLOC\_CAP\_PID5

Memory must be mapped to PID5 memory space (PIDs are not currently used)

### MALLOC\_CAP\_PID6

Memory must be mapped to PID6 memory space (PIDs are not currently used)

**MALLOC\_CAP\_PID7**

Memory must be mapped to PID7 memory space (PIDs are not currently used)

**MALLOC\_CAP\_SPIRAM**

Memory must be in SPI RAM.

**MALLOC\_CAP\_INTERNAL**

Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

**MALLOC\_CAP\_DEFAULT**

Memory can be returned in a non-capability-specific memory allocation (e.g. malloc(), calloc()) call.

**MALLOC\_CAP\_IRAM\_8BIT**

Memory must be in IRAM and allow unaligned access.

**MALLOC\_CAP\_RETENTION**

Memory must be able to accessed by retention DMA.

**MALLOC\_CAP\_RTCRAM**

Memory must be in RTC fast memory.

**MALLOC\_CAP\_INVALID**

Memory can't be used / list end marker.

## Type Definitions

```
typedef void (*esp_alloc_failed_hook_t)(size_t size, uint32_t caps, const char *function_name)
```

callback called when a allocation operation fails, if registered

**Param size** in bytes of failed allocation

**Param caps** capabillites requested of failed allocation

**Param function\_name** function which generated the failure

## API Reference - Initialisation

### Header File

- [components/heap/include/esp\\_heap\\_caps\\_init.h](#)

### Functions

void **heap\_caps\_init** (void)

Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

void **heap\_caps\_enable\_nonos\_stack\_heaps** (void)

Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

*esp\_err\_t* **heap\_caps\_add\_region** (intptr\_t start, intptr\_t end)

Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in `soc_memory_layout.c` for the SoC, and are registered via `heap_caps_init()`. Some regions can't be used immediately and are later enabled via `heap_caps_enable_nonos_stack_heaps()`.

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the "reserved" regions or other data in `soc_memory_layout`, caller needs to consider this themselves.

All memory within the region specified by `start` & `end` parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in `soc_memory_layout.c`.

Use `heap_caps_add_region_with_caps()` to register a region with custom capabilities.

#### Parameters

- **start** –Start address of new region.
- **end** –End address of new region.

**Returns** `ESP_OK` on success, `ESP_ERR_INVALID_ARG` if a parameter is invalid, `ESP_ERR_NOT_FOUND` if the specified start address doesn't reside in a known region, or any error returned by `heap_caps_add_region_with_caps()`.

*esp\_err\_t* **heap\_caps\_add\_region\_with\_caps** (const uint32\_t caps[], intptr\_t start, intptr\_t end)

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to `heap_caps_add_region()`, only custom memory capabilities are specified by the caller.

#### Parameters

- **caps** –Ordered array of capability masks for the new region, in order of priority. Must have length `SOC_MEMORY_TYPE_NO_PRIOS`. Does not need to remain valid after the call returns.
- **start** –Start address of new region.
- **end** –End address of new region.

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if a parameter is invalid
- `ESP_ERR_NO_MEM` if no memory to register new heap.
- `ESP_ERR_INVALID_SIZE` if the memory region is too small to fit a heap
- `ESP_FAIL` if region overlaps the start and/or end of an existing region

## API Reference - Multi Heap API

(Note: The multi heap API is used internally by the heap capabilities allocator. Most IDF programs will never need to call this API directly.)

### Header File

- [components/heap/include/multi\\_heap.h](#)

### Functions

void \***multi\_heap\_aligned\_alloc** (*multi\_heap\_handle\_t* heap, size\_t size, size\_t alignment)

allocate a chunk of memory with specific alignment

#### Parameters

- **heap** –Handle to a registered heap.
- **size** –size in bytes of memory chunk
- **alignment** –how the memory must be aligned

**Returns** pointer to the memory allocated, `NULL` on failure

void **\*multi\_heap\_malloc** (*multi\_heap\_handle\_t* heap, size\_t size)

malloc() a buffer in a given heap

Semantics are the same as standard malloc(), only the returned buffer will be allocated in the specified heap.

**Parameters**

- **heap** –Handle to a registered heap.
- **size** –Size of desired buffer.

**Returns** Pointer to new memory, or NULL if allocation fails.

void **multi\_heap\_aligned\_free** (*multi\_heap\_handle\_t* heap, void \*p)

free() a buffer aligned in a given heap.

---

**Note:** This function is deprecated, consider using multi\_heap\_free() instead

---

**Parameters**

- **heap** –Handle to a registered heap.
- **p** –NULL, or a pointer previously returned from multi\_heap\_aligned\_alloc() for the same heap.

void **multi\_heap\_free** (*multi\_heap\_handle\_t* heap, void \*p)

free() a buffer in a given heap.

Semantics are the same as standard free(), only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Parameters**

- **heap** –Handle to a registered heap.
- **p** –NULL, or a pointer previously returned from multi\_heap\_malloc() or multi\_heap\_realloc() for the same heap.

void **\*multi\_heap\_realloc** (*multi\_heap\_handle\_t* heap, void \*p, size\_t size)

realloc() a buffer in a given heap.

Semantics are the same as standard realloc(), only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Parameters**

- **heap** –Handle to a registered heap.
- **p** –NULL, or a pointer previously returned from multi\_heap\_malloc() or multi\_heap\_realloc() for the same heap.
- **size** –Desired new size for buffer.

**Returns** New buffer of ‘size’ containing contents of ‘p’, or NULL if reallocation failed.

size\_t **multi\_heap\_get\_allocated\_size** (*multi\_heap\_handle\_t* heap, void \*p)

Return the size that a particular pointer was allocated with.

**Parameters**

- **heap** –Handle to a registered heap.
- **p** –Pointer, must have been previously returned from multi\_heap\_malloc() or multi\_heap\_realloc() for the same heap.

**Returns** Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

*multi\_heap\_handle\_t* **multi\_heap\_register** (void \*start, size\_t size)

Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.

There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

**Parameters**

- **start** –Start address of the memory to use for a new heap.
- **size** –Size (in bytes) of the new heap.

**Returns** Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

void **multi\_heap\_set\_lock** (*multi\_heap\_handle\_t* heap, void \*lock)

Associate a private lock pointer with a heap.

The lock argument is supplied to the MULTI\_HEAP\_LOCK() and MULTI\_HEAP\_UNLOCK() macros, defined in multi\_heap\_platform.h.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

**Parameters**

- **heap** –Handle to a registered heap.
- **lock** –Optional pointer to a locking structure to associate with this heap.

void **multi\_heap\_dump** (*multi\_heap\_handle\_t* heap)

Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

**Parameters** **heap** –Handle to a registered heap.

bool **multi\_heap\_check** (*multi\_heap\_handle\_t* heap, bool print\_errors)

Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining MULTI\_CHECK\_FAIL\_PRINTF in multi\_heap\_platform.h.

**Parameters**

- **heap** –Handle to a registered heap.
- **print\_errors** –If true, errors will be printed to stderr.

**Returns** true if heap is valid, false otherwise.

size\_t **multi\_heap\_free\_size** (*multi\_heap\_handle\_t* heap)

Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the total\_free\_bytes member returned by multi\_heap\_get\_heap\_info().

Note that the heap may be fragmented, so the actual maximum size for a single malloc() may be lower. To know this size, see the largest\_free\_block member returned by multi\_heap\_get\_heap\_info().

**Parameters** **heap** –Handle to a registered heap.

**Returns** Number of free bytes.

size\_t **multi\_heap\_minimum\_free\_size** (*multi\_heap\_handle\_t* heap)

Return the lifetime minimum free heap size.

Equivalent to the minimum\_free\_bytes member returned by multi\_heap\_get\_info().

Returns the lifetime “low water mark” of possible values returned from multi\_free\_heap\_size(), for the specified heap.

**Parameters** **heap** –Handle to a registered heap.

**Returns** Number of free bytes.

void **multi\_heap\_get\_info** (*multi\_heap\_handle\_t* heap, *multi\_heap\_info\_t* \*info)

Return metadata about a given heap.

Fills a *multi\_heap\_info\_t* structure with information about the specified heap.

**Parameters**

- **heap** –Handle to a registered heap.
- **info** –Pointer to a structure to fill with heap metadata.

**Structures**

struct **multi\_heap\_info\_t**

Structure to access heap metadata via `multi_heap_get_info`.

**Public Members**

size\_t **total\_free\_bytes**

Total free bytes in the heap. Equivalent to `multi_free_heap_size()`.

size\_t **total\_allocated\_bytes**

Total bytes allocated to data in the heap.

size\_t **largest\_free\_block**

Size of largest free block in the heap. This is the largest malloc-able size.

size\_t **minimum\_free\_bytes**

Lifetime minimum free heap size. Equivalent to `multi_minimum_free_heap_size()`.

size\_t **allocated\_blocks**

Number of (variable size) blocks allocated in the heap.

size\_t **free\_blocks**

Number of (variable size) free blocks in the heap.

size\_t **total\_blocks**

Total number of (variable size) blocks in the heap.

**Type Definitions**

typedef struct multi\_heap\_info \***multi\_heap\_handle\_t**

Opaque handle to a registered heap.

## 2.7.14 Heap Memory Debugging

**Overview**

ESP-IDF integrates tools for requesting *heap information*, *detecting heap corruption*, and *tracing memory leaks*. These can help track down memory-related bugs.

For general information about the heap memory allocator, see the [Heap Memory Allocation](#) page.

## Heap Information

To obtain information about the state of the heap:

- `xPortGetFreeHeapSize()` is a FreeRTOS function which returns the number of free bytes in the (data memory) heap. This is equivalent to calling `heap_caps_get_free_size(MALLOC_CAP_8BIT)`.
- `heap_caps_get_free_size()` can also be used to return the current free memory for different memory capabilities.
- `heap_caps_get_largest_free_block()` can be used to return the largest free block in the heap. This is the largest single allocation which is currently possible. Tracking this value and comparing to total free heap allows you to detect heap fragmentation.
- `xPortGetMinimumEverFreeHeapSize()` and the related `heap_caps_get_minimum_free_size()` can be used to track the heap “low water mark” since boot.
- `heap_caps_get_info()` returns a `multi_heap_info_t` structure which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- `heap_caps_print_heap_info()` prints a summary to stdout of the information returned by `heap_caps_get_info()`.
- `heap_caps_dump()` and `heap_caps_dump_all()` will output detailed information about the structure of each block in the heap. Note that this can be large amount of output.

## Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

- Out of bounds writes & buffer overflow.
- Writes to freed memory.
- Reads from freed or uninitialized memory,

**Assertions** The heap implementation (`multi_heap.c`, etc.) includes a lot of assertions which will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration menu under `Compiler options` -> `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`.

If a heap integrity assertion fails, a line will be printed like `CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c`. The memory address which is printed is the address of the heap structure which has corrupt content.

It's also possible to manually check heap integrity by calling `heap_caps_check_integrity_all()` or related functions. This function checks all of requested heap memory for integrity, and can be used even if assertions are disabled. If the integrity check prints an error, it will also contain the address(es) of corrupt heap structures.

**Memory Allocation Failed Hook** Users can use `heap_caps_register_failed_alloc_callback()` to register a callback that will be invoked every time a allocation operation fails.

Additionally user can enable a generation of a system abort if allocation operation fails by following the steps below: - In the project configuration menu, navigate to `Component config` -> `Heap Memory Debugging` and select `Abort if memory allocation fails` option (see `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`).

The example below show how to register a allocation failure callback:

```
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char_
↳*function_name)
{
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities. \n
↳",function_name, requested_size, caps);
}
```

(continues on next page)

```

void app_main()
{
    ...
    esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_
↪failed_hook);
    ...
    void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
    ...
}

```

**Finding Heap Corruption** Memory corruption can be one of the hardest classes of bugs to find and fix, as one area of memory can be corrupted from a totally different place. Some tips:

- A crash with a `CORRUPT HEAP` message will usually include a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realises the heap is corrupt, but usually the corruption happened elsewhere and earlier in time.
- Increasing the Heap memory debugging [Configuration](#) level to “Light impact” or “Comprehensive” can give you a more accurate message with the first corrupt memory address.
- Adding regular calls to [heap\\_caps\\_check\\_integrity\\_all\(\)](#) or [heap\\_caps\\_check\\_integrity\\_addr\(\)](#) in your code will help you pin down the exact time that the corruption happened. You can move these checks around to “close in on” the section of code that corrupted the heap.
- Based on the memory address which is being corrupted, you can use [JTAG debugging](#) to set a watchpoint on this address and have the CPU halt when it is written to.
- If you don’t have JTAG, but you do know roughly when the corruption happens, then you can set a watchpoint in software just beforehand via [esp\\_cpu\\_set\\_watchpoint\(\)](#). A fatal exception will occur when the watchpoint triggers. For example `esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE)`. Note that watchpoints are per-CPU and are set on the current running CPU only, so if you don’t know which CPU is corrupting memory then you will need to call this function on both CPUs.
- For buffer overflows, [heap tracing](#) in `HEAP_TRACE_ALL` mode lets you see which callers are allocating which addresses from the heap. See [Heap Tracing To Find Heap Corruption](#) for more details. If you can find the function which allocates memory with an address immediately before the address which is corrupted, this will probably be the function which overflows the buffer.
- Calling [heap\\_caps\\_dump\(\)](#) or [heap\\_caps\\_dump\\_all\(\)](#) can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed/underflowed/etc.

**Configuration** Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.

In the project configuration menu, under `Component config` there is a menu `Heap memory debugging`. The setting [CONFIG\\_HEAP\\_CORRUPTION\\_DETECTION](#) can be set to one of three levels:

**Basic (no poisoning)** This is the default level. No special heap corruption features are enabled, but provided assertions are enabled (the default configuration) then a heap corruption error will be printed if any of the heap’s internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out of bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice).

Calling [heap\\_caps\\_check\\_integrity\(\)](#) in Basic mode will check the integrity of all heap structures, and print errors if any appear to be corrupted.

**Light Impact** At this level, heap memory is additionally “poisoned” with head and tail “canary bytes” before and after each block which is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted and the integrity check will fail.

The head canary word is 0xABBA1234 (3412BAAB in byte order), and the tail canary word is 0xBAAD5678 (7856ADBA in byte order).

“Basic” heap corruption checks can also detect most out of bounds writes, but this setting is more precise as even a single byte overrun can be detected. With Basic heap checks, the number of overrun bytes before a failure is detected will depend on the properties of the heap.

Enabling “Light Impact” checking increases memory usage, each individual allocation will use 9 to 12 additional bytes of memory (depending on alignment).

Each time `free()` is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When `heap_caps_check_integrity()` is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

In both cases, the check is that the first 4 bytes of an allocated block (before the buffer returned to the user) should be the word 0xABBA1234. Then the last 4 bytes of the allocated block (after the buffer returned to the user) should be the word 0xBAAD5678.

Different values usually indicate buffer underrun or overrun, respectively.

**Comprehensive** This level incorporates the “light impact” detection features plus additional checks for uninitialised-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling “Comprehensive” detection has a substantial runtime performance impact (as all memory needs to be set to the allocation patterns each time a malloc/free completes, and the memory also needs to be checked each time.) However it allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.

**Crashes in Comprehensive Mode** If an application crashes reading/writing an address related to 0xCECECECE in Comprehensive mode, this indicates it has read uninitialized memory. The application should be changed to either use `calloc()` (which zeroes memory), or initialize the memory before using it. The value 0xCECECECE may also be seen in stack-allocated automatic variables, because in IDF most task stacks are originally allocated from the heap and in C stack memory is uninitialized by default.

If an application crashes and the exception register dump indicates that some addresses or values were 0xFEFEFEFE, this indicates it is reading heap memory after it has been freed (a “use after free bug” .) The application should be changed to not access heap memory after it has been freed.

If a call to `malloc()` or `realloc()` causes a crash because it expected to find the pattern 0xFEFEFEFE in free memory and a different pattern was found, then this indicates the app has a use-after-free bug where it is writing to memory which has already been freed.

**Manual Heap Checks in Comprehensive Mode** Calls to `heap_caps_check_integrity()` may print errors relating to 0xFEFEFEFE, 0xABBA1234 or 0xBAAD5678. In each case the checker is expecting to find a given pattern, and will error out if this is not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behaviour is the same as for *Light Impact* mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun/underrun.

## Heap Task Tracking

Heap Task Tracking can be used to get per task info for heap memory allocation. Application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in [system/heap\\_task\\_tracking](#)

## Heap Tracing

Heap Tracing allows tracing of code which allocates/frees memory. Two tracing modes are supported:

- **Standalone.** In this mode trace data are kept on-board, so the size of gathered information is limited by the buffer assigned for that purposes. Analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- **Host-based.** This mode does not have the limitation of the standalone mode, because trace data are sent to the host over JTAG connection using `app_trace` library. Later on they can be analysed using special tools.

Heap tracing can perform two functions:

- **Leak checking:** find memory which is allocated and never freed.
- **Heap use analysis:** show all functions that are allocating/freeing memory while the trace is running.

**How To Diagnose Memory Leaks** If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the `xPortGetFreeHeapSize()`, `heap_caps_get_free_size()`, or *related functions* to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.

**Standalone Mode** Once you've identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> Heap tracing and select Standalone option (see `CONFIG_HEAP_TRACING_DEST`).
- Call the function `heap_trace_init_standalone()` early in the program, to register a buffer which can be used to record the memory trace.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.
- Call the function `heap_trace_dump()` to dump the results of the heap trace.

An example:

```
#include "esp_heap_trace.h"

#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in
↳ internal RAM

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );

    do_something_you_suspect_is_leaking();

    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}
```

The output from the heap trace will look something like this:

```

2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccount 0x2e9b7384 caller_
↳0x400d276d:0x400d27c1
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./
↳blink.c:27

0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/./blink.c:52

8 bytes (@ 0x3ffaf804) allocated CPU 0 ccount 0x2e9b79c0 caller_
↳0x400d2776:0x400d27c1
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/./
↳blink.c:29

0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/./blink.c:52

40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0

```

(Above example output is using *IDF Monitor* to automatically decode PC addresses to their source files & line number.)

The first line indicates how many allocation entries are in the buffer, compared to its total size.

In `HEAP_TRACE_LEAKS` mode, for each traced memory allocation which has not already been freed a line is printed with:

- `XX bytes` is number of bytes allocated
- `@ 0x...` is the heap address returned from `malloc/calloc`.
- `CPU x` is the CPU (0 or 1) running when the allocation was made.
- `ccount 0x...` is the `CCOUNT` (CPU cycle count) register value when the allocation was made. Is different for CPU 0 vs CPU 1.
- `caller 0x...` gives the call stack of the call to `malloc()/free()`, as a list of PC addresses. These can be decoded to source files and line numbers, as shown above.

The depth of the call stack recorded for each trace entry can be configured in the project configuration menu, under `Heap Memory Debugging` -> `Enable heap tracing` -> `Heap tracing stack depth`. Up to 10 stack frames can be recorded for each allocation (the default is 2). Each additional stack frame increases the memory usage of each `heap_trace_record_t` record by eight bytes.

Finally, the total number of ‘leaked’ bytes (bytes allocated but not freed while trace was running) is printed, and the total number of allocations this represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations which happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

**Host-Based Mode** Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to `Component settings` -> `Heap Memory Debugging` -> `CONFIG_HEAP_TRACING_DEST` and select `Host-Based`.
- In the project configuration menu, navigate to `Component settings` -> `Application Level Tracing` -> `CONFIG_APPTRACE_DESTINATION` and select `Trace memory`.
- In the project configuration menu, navigate to `Component settings` -> `Application Level Tracing` -> `FreeRTOS SystemView Tracing` and enable `CONFIG_APPTRACE_SV_ENABLE`.
- Call the function `heap_trace_init_tohost()` early in the program, to initialize JTAG heap tracing module.
- Call the function `heap_trace_start()` to begin recording all `mallocs/frees` in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode argument to this function is ignored and heap tracing module behaves like `HEAP_TRACE_ALL` was passed: all allocations and deallocations are sent to the host.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.

An example:

```
#include "esp_heap_trace.h"

...

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );

    do_something_you_suspect_is_leaking();

    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```

To gather and analyse heap trace do the following on the host:

1. Build the program and download it to the target as described in [Getting Started Guide](#).
2. Run OpenOCD (see [JTAG Debugging](#)).

---

**Note:** In order to use this feature you need OpenOCD version *v0.10.0-esp32-20181105* or later.

---

3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare special gdbinit file:

```
target remote :3333

mon reset halt
flushregs

tb heap_trace_start
commands
mon esp sysview start file:///tmp/heap.svdat
c
end

tb heap_trace_stop
commands
mon esp sysview stop
end

c
```

Using this file GDB will connect to the target, reset it, and start tracing when program hits breakpoint at [heap\\_trace\\_start\(\)](#). Trace data will be saved to `/tmp/heap_log.svdat`. Tracing will be stopped when program hits breakpoint at [heap\\_trace\\_stop\(\)](#).

4. Run GDB using the following command `xtensa-esp32s3-elf-gdb -x gdbinit </path/to/program/elf>`
5. Quit GDB when program stops at [heap\\_trace\\_stop\(\)](#). Trace data are saved in `/tmp/heap.svdat`
6. Run processing script `$IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b </path/to/program/elf> /tmp/heap_log.svdat`

The output from the heap trace will look something like this:

```
Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '['/tmp/heap.svdat']'...

**Heap Tracing To Find Heap Corruption** Heap tracing can also be used to help track down heap corruption. When a region in heap is corrupted, it may be from some other part of the program which allocated memory at a nearby address.

If you have some idea at what time the corruption occurred, enabling heap tracing in `HEAP_TRACE_ALL` mode allows you to record all of the functions which allocated memory, and the addresses of the allocations.

Using heap tracing in this way is very similar to memory leak detection as described above. For memory which is allocated and not freed, the output is the same. However, records will also be shown for memory which has been freed.

**Performance Impact** Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on performance of heap allocation/free operations even when heap tracing is not running.

When heap tracing is running, heap allocation/free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) will also increase this performance impact.

**False-Positive Memory Leaks** Not everything printed by `heap_trace_dump()` is necessarily a memory leak. Among things which may show up here, but are not memory leaks:

- Any memory which is allocated after `heap_trace_start()` but then freed after `heap_trace_stop()` will appear in the leak dump.

- Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it's quite possible this memory is freed after `heap_trace_stop()` is called.
- The first time a task uses stdio - for example, when it calls `printf()` - a lock (RTOS mutex semaphore) is allocated by the libc. This allocation lasts until the task is deleted.
- Certain uses of `printf()`, such as printing floating point numbers, will allocate some memory from the heap on demand. These allocations last until the task is deleted.
- The Bluetooth, WiFi, and TCP/IP libraries will allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short lived, but some may be shown in the heap leak trace if the data was received/transmitted by the lower levels of the network while the leak trace was running.
- TCP connections will continue to use some memory after they are closed, because of the `TIME_WAIT` state. After the `TIME_WAIT` period has completed, this memory will be freed.

One way to differentiate between “real” and “false positive” memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

## API Reference - Heap Tracing

### Header File

- [components/heap/include/esp\\_heap\\_trace.h](#)

### Functions

`esp_err_t heap_trace_init_standalone(heap_trace_record_t *record_buffer, size_t num_records)`

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0)`;

#### Parameters

- **record\_buffer** –Provide a buffer to use for heap trace data. Must remain valid any time heap tracing is enabled, meaning it must be allocated from internal memory not in PSRAM.
- **num\_records** –Size of the heap trace buffer, as number of record structures.

#### Returns

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in menuconfig.
- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

`esp_err_t heap_trace_init_tohost(void)`

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

#### Returns

- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

`esp_err_t heap_trace_start(heap_trace_mode_t mode)`

Start heap tracing. All heap allocations & frees will be traced, until `heap_trace_stop()` is called.

---

**Note:** `heap_trace_init_standalone()` must be called to provide a valid buffer, before this function is called.

---

---

**Note:** Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

---

**Parameters mode** –Mode for tracing.

- `HEAP_TRACE_ALL` means all heap allocations and frees are traced.
- `HEAP_TRACE_LEAKS` means only suspected memory leaks are traced. (When memory is freed, the record is removed from the trace buffer.)

**Returns**

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` A non-zero-length buffer has not been set via `heap_trace_init_standalone()`.
- `ESP_OK` Tracing is started.

*esp\_err\_t* **heap\_trace\_stop** (void)

Stop heap tracing.

**Returns**

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` Heap tracing was not in progress.
- `ESP_OK` Heap tracing stopped..

*esp\_err\_t* **heap\_trace\_resume** (void)

Resume heap tracing which was previously stopped.

Unlike `heap_trace_start()`, this function does not clear the buffer of any pre-existing trace records.

The heap trace mode is the same as when `heap_trace_start()` was last called (or `HEAP_TRACE_ALL` if `heap_trace_start()` was never called).

**Returns**

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` Heap tracing was already started.
- `ESP_OK` Heap tracing resumed.

*size\_t* **heap\_trace\_get\_count** (void)

Return number of records in the heap trace buffer.

It is safe to call this function while heap tracing is running.

*esp\_err\_t* **heap\_trace\_get** (*size\_t* index, *heap\_trace\_record\_t* \*record)

Return a raw record from the heap trace buffer.

---

**Note:** It is safe to call this function while heap tracing is running, however in `HEAP_TRACE_LEAK` mode record indexing may skip entries unless heap tracing is stopped first.

---

**Parameters**

- **index** –Index (zero-based) of the record to return.
- **record** –[out] Record where the heap trace record will be copied.

**Returns**

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in `menuconfig`.
- `ESP_ERR_INVALID_STATE` Heap tracing was not initialised.
- `ESP_ERR_INVALID_ARG` Index is out of bounds for current heap trace record count.
- `ESP_OK` Record returned successfully.

void **heap\_trace\_dump** (void)

Dump heap trace record data to stdout.

---

**Note:** It is safe to call this function while heap tracing is running, however in `HEAP_TRACE_LEAK` mode the dump may skip entries unless heap tracing is stopped first.

---

## Structures

struct **heap\_trace\_record\_t**

Trace record data type. Stores information about an allocated region of memory.

### Public Members

uint32\_t **ccount**

CCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

void \***address**

Address which was allocated.

size\_t **size**

Size of the allocation.

void \***allocated\_by**[0]

Call stack of the caller which allocated the memory.

void \***freed\_by**[0]

Call stack of the caller which freed the memory (all zero if not freed.)

## Macros

**CONFIG\_HEAP\_TRACING\_STACK\_DEPTH**

## Enumerations

enum **heap\_trace\_mode\_t**

*Values:*

enumerator **HEAP\_TRACE\_ALL**

enumerator **HEAP\_TRACE\_LEAKS**

## 2.7.15 High Resolution Timer

### Overview

Although FreeRTOS provides software timers, these timers have a few limitations:

- Maximum resolution is equal to RTOS tick period
- Timer callbacks are dispatched from a low-priority task

Hardware timers are free from both of the limitations, but often they are less convenient to use. For example, application components may need timer events to fire at certain times in the future, but the hardware timer only contains one “compare” value used for interrupt generation. This means that some facility needs to be built on top of the hardware timer to manage the list of pending events can dispatch the callbacks for these events as corresponding hardware interrupts happen.

An interrupt level of the handler depends on the `CONFIG_ESP_TIMER_INTERRUPT_LEVEL` option. It allows to set this: 1, 2 or 3 level (by default 1). Raising the level, the interrupt handler can reduce the timer processing delay.

`esp_timer` set of APIs provides one-shot and periodic timers, microsecond time resolution, and 64-bit range.

Internally, `esp_timer` uses a 64-bit hardware timer, where the implementation depends on `CONFIG_ESP_TIMER_IMPL`. Available options are:

- `SYSTIMER`

Timer callbacks can be dispatched by two methods:

- `ESP_TIMER_TASK`
- `ESP_TIMER_ISR`. Available only if `CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD` is enabled (by default disabled).

`ESP_TIMER_TASK`. Timer callbacks are dispatched from a high-priority `esp_timer` task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower priority task using a queue instead.

If other tasks with priority higher than `esp_timer` are running, callback dispatching will be delayed until `esp_timer` task has a chance to run. For example, this will happen if a SPI Flash operation is in progress.

`ESP_TIMER_ISR`. Timer callbacks are dispatched directly from the timer interrupt handler. This method is useful for some simple callbacks which aim for lower latency.

Creating and starting a timer, and dispatching the callback takes some time. Therefore there is a lower limit to the timeout value of one-shot `esp_timer`. If `esp_timer_start_once()` is called with a timeout value less than 20us, the callback will be dispatched only after approximately 20us.

Periodic `esp_timer` also imposes a 50us restriction on the minimal timer period. Periodic software timers with period of less than 50us are not practical since they would consume most of the CPU time. Consider using dedicated hardware peripherals or DMA features if you find that a timer with small period is required.

## Using `esp_timer` APIs

Single timer is represented by `esp_timer_handle_t` type. Timer has a callback function associated with it. This callback function is called from the `esp_timer` task each time the timer elapses.

- To create a timer, call `esp_timer_create()`.
- To delete the timer when it is no longer needed, call `esp_timer_delete()`.

The timer can be started in one-shot mode or in periodic mode.

- To start the timer in one-shot mode, call `esp_timer_start_once()`, passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.
- To start the timer in periodic mode, call `esp_timer_start_periodic()`, passing the period with which the callback should be called. The timer keeps running until `esp_timer_stop()` is called.

Note that the timer must not be running when `esp_timer_start_once()` or `esp_timer_start_periodic()` is called. To restart a running timer, call `esp_timer_stop()` first, then call one of the start functions.

## Callback functions

Timer callbacks which are processed by `ESP_TIMER_ISR` method should not call the context switch call - `portYIELD_FROM_ISR()`, instead of this you should use the

`esp_timer_isr_dispatch_need_yield()` function. The context switch will be done after all ISR dispatch timers have been processed, if required by the system.

### **esp\_timer during the light sleep**

During light sleep, the `esp_timer` counter stops and no callback functions are called. Instead, the time is counted by the RTC counter. Upon waking up, the system gets the difference between the counters and calls a function that advances the `esp_timer` counter. Since the counter has been advanced, the system starts calling callbacks that were not called during sleep. The number of callbacks depends on the duration of the sleep and the period of the timers. It can lead to overflow of some queues. This only applies to periodic timers, one-shot timers will be called once.

This behavior can be changed by calling `esp_timer_stop()` before sleeping. In some cases, this can be inconvenient, and instead of the stop function, you can use the `skip_unhandled_events` option during `esp_timer_create()`. When the `skip_unhandled_events` is true, if a periodic timer expires one or more times during light sleep then only one callback is called on wake.

Using the `skip_unhandled_events` option with *automatic light sleep* (see [Power Management APIs](#)) helps to reduce the consumption of the system when it is in light sleep. The duration of light sleep is also determined by `esp_timer`s. Timers with `skip_unhandled_events` option will not wake up the system.

### **Handling callbacks**

`esp_timer` is designed to achieve a high-resolution low latency timer and the ability to handle delayed events. If the timer is late then the callback will be called as soon as possible, it will not be lost. In the worst case, when the timer has not been processed for more than one period (for periodic timers), in this case the callbacks will be called one after the other without waiting for the set period. This can be bad for some applications, and the `skip_unhandled_events` option was introduced to eliminate this behavior. If `skip_unhandled_events` is set then a periodic timer that has expired multiple times without being able to call the callback will still result in only one callback event once processing is possible.

### **Obtaining Current Time**

`esp_timer` also provides a convenience function to obtain the time passed since start-up, with microsecond precision: `esp_timer_get_time()`. This function returns the number of microseconds since `esp_timer` was initialized, which usually happens shortly before `app_main` function is called.

Unlike `gettimeofday` function, values returned by `esp_timer_get_time()`:

- Start from zero after the chip wakes up from deep sleep
- Do not have timezone or DST adjustments applied

### **Application Example**

The following example illustrates usage of `esp_timer` APIs: [system/esp\\_timer](#).

### **API Reference**

#### **Header File**

- [components/esp\\_timer/include/esp\\_timer.h](#)

#### **Functions**

*esp\_err\_t* **esp\_timer\_early\_init** (void)

Minimal initialization of esp\_timer.

This function can be called very early in startup process, after this call only esp\_timer\_get\_time function can be used.

---

**Note:** This function is called from startup code. Applications do not need to call this function before using other esp\_timer APIs.

---

#### Returns

- ESP\_OK on success

*esp\_err\_t* **esp\_timer\_init** (void)

Initialize esp\_timer library.

---

**Note:** This function is called from startup code. Applications do not need to call this function before using other esp\_timer APIs. Before calling this function, esp\_timer\_early\_init must be called by the startup code.

---

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_ERR\_INVALID\_STATE if already initialized
- other errors from interrupt allocator

*esp\_err\_t* **esp\_timer\_deinit** (void)

De-initialize esp\_timer library.

---

**Note:** Normally this function should not be called from applications

---

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not yet initialized

*esp\_err\_t* **esp\_timer\_create** (const *esp\_timer\_create\_args\_t* \*create\_args, *esp\_timer\_handle\_t* \*out\_handle)

Create an esp\_timer instance.

---

**Note:** When done using the timer, delete it with esp\_timer\_delete function.

---

#### Parameters

- **create\_args** –Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- **out\_handle** –[out] Output, pointer to esp\_timer\_handle\_t variable which will hold the created timer handle.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if some of the create\_args are not valid
- ESP\_ERR\_INVALID\_STATE if esp\_timer library is not initialized yet
- ESP\_ERR\_NO\_MEM if memory allocation fails

*esp\_err\_t* **esp\_timer\_start\_once** (*esp\_timer\_handle\_t* timer, uint64\_t timeout\_us)

Start one-shot timer.

Timer should not be running when this function is called.

**Parameters**

- **timer** –timer handle created using `esp_timer_create`
- **timeout\_us** –timer timeout, in microseconds relative to the current moment

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle is invalid
- ESP\_ERR\_INVALID\_STATE if the timer is already running

*esp\_err\_t* **esp\_timer\_start\_periodic** (*esp\_timer\_handle\_t* timer, uint64\_t period)

Start a periodic timer.

Timer should not be running when this function is called. This function will start the timer which will trigger every ‘period’ microseconds.

**Parameters**

- **timer** –timer handle created using `esp_timer_create`
- **period** –timer period, in microseconds

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle is invalid
- ESP\_ERR\_INVALID\_STATE if the timer is already running

*esp\_err\_t* **esp\_timer\_stop** (*esp\_timer\_handle\_t* timer)

Stop the timer.

This function stops the timer previously started using `esp_timer_start_once` or `esp_timer_start_periodic`.

**Parameters** **timer** –timer handle created using `esp_timer_create`

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if the timer is not running

*esp\_err\_t* **esp\_timer\_delete** (*esp\_timer\_handle\_t* timer)

Delete an `esp_timer` instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

**Parameters** **timer** –timer handle allocated using `esp_timer_create`

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if the timer is running

int64\_t **esp\_timer\_get\_time** (void)

Get time in microseconds since boot.

**Returns** number of microseconds since underlying timer has been started

int64\_t **esp\_timer\_get\_next\_alarm** (void)

Get the timestamp when the next timeout is expected to occur.

**Returns** Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by `esp_timer_get_time`.

int64\_t **esp\_timer\_get\_next\_alarm\_for\_wake\_up** (void)

Get the timestamp when the next timeout is expected to occur skipping those which have `skip_unhandled_events` flag.

**Returns** Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by `esp_timer_get_time`.

*esp\_err\_t* **esp\_timer\_dump** (FILE \*stream)

Dump the list of timers to a stream.

If CONFIG\_ESP\_TIMER\_PROFILING option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.

The format is:

name period alarm times\_armed times\_triggered total\_callback\_run\_time

where:

name —timer name (if CONFIG\_ESP\_TIMER\_PROFILING is defined), or timer pointer period —period of timer, in microseconds, or 0 for one-shot timer alarm - time of the next alarm, in microseconds since boot, or 0 if the timer is not started

The following fields are printed if CONFIG\_ESP\_TIMER\_PROFILING is defined:

times\_armed —number of times the timer was armed via esp\_timer\_start\_X times\_triggered - number of times the callback was called total\_callback\_run\_time - total time taken by callback to execute, across all calls

**Parameters** *stream* –stream (such as stdout) to dump the information to

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if can not allocate temporary buffer for the output

bool **esp\_timer\_is\_active** (*esp\_timer\_handle\_t* timer)

Returns status of a timer, active or not.

This function is used to identify if the timer is still active or not.

**Parameters** *timer* –timer handle created using esp\_timer\_create

**Returns**

- 1 if timer is still active
- 0 if timer is not active.

## Structures

struct **esp\_timer\_create\_args\_t**

Timer configuration passed to esp\_timer\_create.

## Public Members

*esp\_timer\_cb\_t* **callback**

Function to call when timer expires.

void \***arg**

Argument to pass to the callback.

*esp\_timer\_dispatch\_t* **dispatch\_method**

Call the callback from task or from ISR.

const char \***name**

Timer name, used in esp\_timer\_dump function.

bool **skip\_unhandled\_events**

Skip unhandled events for periodic timers.

### Type Definitions

typedef struct esp\_timer \***esp\_timer\_handle\_t**

Opaque type representing a single esp\_timer.

typedef void (\***esp\_timer\_cb\_t**)(void \*arg)

Timer callback function type.

**Param arg** pointer to opaque user-specific data

### Enumerations

enum **esp\_timer\_dispatch\_t**

Method for dispatching timer callback.

*Values:*

enumerator **ESP\_TIMER\_TASK**

Callback is called from timer task.

enumerator **ESP\_TIMER\_MAX**

Count of the methods for dispatching timer callback.

## 2.7.16 Inter-Processor Call

---

**Note:** The IPC is an **Inter-Processor Call** and **NOT Inter-Process Communication** as found on other operating systems.

---

### Overview

Due to the dual core nature of the ESP32-S3, there are instances where a certain callback must be run in the context of a particular CPU such as:

- When allocating an ISR to an interrupt source of a particular CPU (applies to freeing a particular CPU's interrupt source as well).
- On particular chips (such as the ESP32), accessing memory that is exclusive to a particular CPU (such as RTC Fast Memory).
- Reading the registers/state of another CPU.

The IPC (Inter-Processor Call) feature allows a particular CPU (the calling CPU) to trigger the execution of a callback function on another CPU (the target CPU). The IPC feature allows execution of a callback function on the target CPU in either a task context, or a High Priority Interrupt context (see [High-Level Interrupts](#) for more details). Depending on the context that the callback function is executed in, different restrictions apply to the implementation of the callback function.

### IPC in Task Context

The IPC feature implements callback execution in a task context by creating an IPC task for each CPU during application startup. When the calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the target CPU's IPC task.

When using IPCs in a task context, users need to consider the following:

- IPC callbacks should ideally be simple and short. **An IPC callback should avoid attempting to block or yield.**

- The IPC tasks are created at the highest possible priority (i.e., `configMAX_PRIORITIES - 1`) thus the callback should also run at that priority as a result. However, [CONFIG\\_ESP\\_IPC\\_USES\\_CALLERS\\_PRIORITY](#) is enabled by default which will temporarily lower the priority of the target CPU's IPC task to the calling CPU before executing the callback.
- Depending on the complexity of the callback, users may need to configure the stack size of the IPC task via [CONFIG\\_ESP\\_IPC\\_TASK\\_STACK\\_SIZE](#).
- The IPC feature is internally protected by a mutex. Therefore, simultaneous IPC calls from two or more calling CPUs will be handled on a first come first serve basis.

**API Usage** Task Context IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)`
- The callback should avoid attempting to block or yield as this will result in the target CPU's IPC task blocking or yielding.
- The callback must avoid changing any aspect of the IPC task (e.g., by calling `vTaskPrioritySet(NULL, x)`).

The IPC feature offers the API listed below to execute a callback in a task context on a target CPU. The API allows the calling CPU to block until the callback's execution has completed, or return immediately once the callback's execution has started.

- [esp\\_ipc\\_call\(\)](#) will trigger an IPC call on the target CPU. This function will block until the target CPU's IPC task **begins** execution of the callback.
- [esp\\_ipc\\_call\\_blocking\(\)](#) will trigger an IPC on the target CPU. This function will block until the target CPU's IPC task **completes** execution of the callback.

### IPC in ISR Context

In some cases, we need to quickly obtain the state of another CPU such as in a core dump, GDB stub, various unit tests, and DPORT workaround. For such scenarios, the IPC feature supports execution of callbacks in a [High Priority Interrupt](#) context. The IPC feature implements the High Priority Interrupt context by reserving a High Priority Interrupt on each CPU for IPC usage. When a calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the High Priority Interrupt of the target CPU.

When using IPCs in High Priority Interrupt context, users need to consider the following:

- Since the callback is executed in a High Priority Interrupt context, the callback must be written entirely in assembly. See the API Usage below for more details regarding writing assembly callbacks.
- The priority of the reserved High Priority Interrupt is dependent on the [CONFIG\\_ESP\\_SYSTEM\\_CHECK\\_INT\\_LEVEL](#) option
- **When the callback executes:**
  - The calling CPU will disable interrupts of level 3 and lower
  - Although the priority of the reserved interrupt depends on [CONFIG\\_ESP\\_SYSTEM\\_CHECK\\_INT\\_LEVEL](#), during the execution IPC ISR callback, the target CPU will disable interrupts of level 5 and lower regardless of what [CONFIG\\_ESP\\_SYSTEM\\_CHECK\\_INT\\_LEVEL](#) is set to.

**API Usage** High Priority Interrupt IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)` but implemented entirely in assembly
- **The callback is invoked via the CALLX0 instruction with register windowing disabled, thus the callback:**
  - Must not call any register window related instructions (e.g., `entry` and `retw`).
  - Must not call other C functions as register windowing is disabled
- The callback should be placed in IRAM at a 4-byte aligned address
- **(On invocation of/after returning from) the callback, the registers a2, a3, a4 are (saved/restored) automatically thus:**
  - a2 will contain the `void *arg` of the callback
  - a3/a4 are free to use as scratch registers

The IPC feature offers the API listed below to execute a callback in a High Priority Interrupt context.

- `esp_ipc_isr_asm_call()` will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU begins execution of the callback.
- `esp_ipc_isr_asm_call_blocking()` will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU completes execution of the callback.

The following code-blocks demonstrates a High Priority Interrupt IPC callback written in assembly that simply reads the target CPU's cycle count.

```
/* esp_test_ipc_isr_get_cycle_count_other_cpu(void *arg) */
// this function reads CCOUNT of the target CPU and stores it in arg.
// use only a2, a3 and a4 regs here.
.section .iram1, "ax"
.align 4
.global esp_test_ipc_isr_get_cycle_count_other_cpu
.type esp_test_ipc_isr_get_cycle_count_other_cpu, @function
// Args:
// a2 - void* arg
esp_test_ipc_isr_get_cycle_count_other_cpu:
rsrcount a3
s32i a3, a2, 0
ret
```

```
unit32_t cycle_count;
esp_ipc_isr_asm_call_blocking(esp_test_ipc_isr_get_cycle_count_other_cpu, (void_
↪*)cycle_count);
```

**Note:** The number of scratch registers available for use is sufficient for most simple use cases. But if your callback requires more scratch registers, `void *arg` can point to a buffer that is used as a register save area. The callback can then save and restore more registers. See the [system/ipc/ipc\\_isr](#).

**Note:** For more examples of High Priority Interrupt IPC callbacks, see [components/esp\\_ipc/src/esp\\_ipc\\_isr/esp\\_ipc\\_isr\\_routines.S](#) and [:components/esp\\_system/test/test\\_ipc\\_isr.S](#)

The High Priority Interrupt IPC API also provides the following convenience functions that can stall/resume the target CPU. These API utilize the High Priority Interrupt IPC, but supply their own internal callbacks:

- `esp_ipc_isr_stall_other_cpu()` stalls the target CPU. The calling CPU disables interrupts of level 3 and lower while the target CPU will busy-wait with interrupts of level 5 and lower disabled. The target CPU will busy-wait until `esp_ipc_isr_release_other_cpu()` is called.
- `esp_ipc_isr_release_other_cpu()` resumes the target CPU.

## API Reference

### Header File

- [components/esp\\_ipc/include/esp\\_ipc.h](#)

### Functions

`esp_err_t esp_ipc_call` (uint32\_t cpu\_id, `esp_ipc_func_t` func, void \*arg)

Execute a callback on a given CPU.

Execute a given callback on a particular CPU. The callback must be of type “`esp_ipc_func_t`” and will be invoked in the context of the target CPU's IPC task.

- This function will block the target CPU' s IPC task has begun execution of the callback
- If another IPC call is ongoing, this function will block until the ongoing IPC call completes
- The stack size of the IPC task can be configured via the CONFIG\_ESP\_IPC\_TASK\_STACK\_SIZE option

---

**Note:** In single-core mode, returns ESP\_ERR\_INVALID\_ARG for cpu\_id 1.

---

#### Parameters

- **cpu\_id** –[in] CPU where the given function should be executed (0 or 1)
- **func** –[in] Pointer to a function of type void func(void\* arg) to be executed
- **arg** –[in] Arbitrary argument of type void\* to be passed into the function

#### Returns

- ESP\_ERR\_INVALID\_ARG if cpu\_id is invalid
- ESP\_ERR\_INVALID\_STATE if the FreeRTOS scheduler is not running
- ESP\_OK otherwise

*esp\_err\_t* **esp\_ipc\_call\_blocking** (uint32\_t cpu\_id, *esp\_ipc\_func\_t* func, void \*arg)

Execute a callback on a given CPU until and block until it completes.

This function is identical to esp\_ipc\_call() except that this function will block until the execution of the callback completes.

---

**Note:** In single-core mode, returns ESP\_ERR\_INVALID\_ARG for cpu\_id 1.

---

#### Parameters

- **cpu\_id** –[in] CPU where the given function should be executed (0 or 1)
- **func** –[in] Pointer to a function of type void func(void\* arg) to be executed
- **arg** –[in] Arbitrary argument of type void\* to be passed into the function

#### Returns

- ESP\_ERR\_INVALID\_ARG if cpu\_id is invalid
- ESP\_ERR\_INVALID\_STATE if the FreeRTOS scheduler is not running
- ESP\_OK otherwise

### Type Definitions

```
typedef void (*esp_ipc_func_t)(void *arg)
```

IPC Callback.

A callback of this type should be provided as an argument when calling esp\_ipc\_call() or esp\_ipc\_call\_blocking().

### Header File

- [components/esp\\_ipc/include/esp\\_ipc\\_isr.h](#)

### Functions

void **esp\_ipc\_isr\_asm\_call** (*esp\_ipc\_isr\_func\_t* func, void \*arg)

Execute an assembly callback on the other CPU.

Execute a given callback on the other CPU in the context of a High Priority Interrupt.

- This function will busy-wait in a critical section until the other CPU has started execution of the callback
- The callback must be written in assembly, is invoked using a CALLX0 instruction, and has a2, a3, a4 as scratch registers. See docs for more details

---

**Note:** This function is not available in single-core mode.

---

#### Parameters

- **func** –[in] Pointer to a function of type `void func(void* arg)` to be executed
- **arg** –[in] Arbitrary argument of type `void*` to be passed into the function

void **esp\_ipc\_isr\_asm\_call\_blocking** (*esp\_ipc\_isr\_func\_t* func, void \*arg)

Execute an assembly callback on the other CPU and busy-wait until it completes.

This function is identical to `esp_ipc_isr_asm_call()` except that this function will busy-wait until the execution of the callback completes.

---

**Note:** This function is not available in single-core mode.

---

#### Parameters

- **func** –[in] Pointer to a function of type `void func(void* arg)` to be executed
- **arg** –[in] Arbitrary argument of type `void*` to be passed into the function

void **esp\_ipc\_isr\_stall\_other\_cpu** (void)

Stall the other CPU.

This function will stall the other CPU. The other CPU is stalled by busy-waiting in the context of a High Priority Interrupt. The other CPU will not be resumed until `esp_ipc_isr_release_other_cpu()` is called.

- This function is internally implemented using IPC ISR
- This function is used for DPORT workaround.
- If the stall feature is paused using `esp_ipc_isr_stall_pause()`, this function will have no effect

---

**Note:** This function is not available in single-core mode.

---

---

**Note:** It is the caller's responsibility to avoid deadlocking on spinlocks

---

void **esp\_ipc\_isr\_release\_other\_cpu** (void)

Release the other CPU.

This function will release the other CPU that was previously stalled from calling `esp_ipc_isr_stall_other_cpu()`

- This function is used for DPORT workaround.
- If the stall feature is paused using `esp_ipc_isr_stall_pause()`, this function will have no effect

---

**Note:** This function is not available in single-core mode.

---

void **esp\_ipc\_isr\_stall\_pause** (void)

Pause the CPU stall feature.

This function will pause the CPU stall feature. Once paused, calls to `esp_ipc_isr_stall_other_cpu()` and `esp_ipc_isr_release_other_cpu()` will have no effect. If a IPC ISR call is already in progress, this function will busy-wait until the call completes before pausing the CPU stall feature.

void **esp\_ipc\_isr\_stall\_abort** (void)

Abort a CPU stall.

This function will abort any stalling routine of the other CPU due to a pervious call to `esp_ipc_isr_stall_other_cpu()`. This function aborts the stall in a non-recoverable manner, thus should only be called in case of a `panic()`.

- This function is used in panic handling code

void **esp\_ipc\_isr\_stall\_resume** (void)

Resume the CPU stall feature.

This function will resume the CPU stall feature that was previously paused by calling `esp_ipc_isr_stall_pause()`. Once resumed, calls to `esp_ipc_isr_stall_other_cpu()` and `esp_ipc_isr_release_other_cpu()` will have effect again.

### Type Definitions

typedef void (\***esp\_ipc\_isr\_func\_t**)(void \*arg)

IPC ISR Callback.

A callback of this type should be provided as an argument when calling `esp_ipc_isr_asm_call()` or `esp_ipc_isr_asm_call_blocking()`.

## 2.7.17 Call function with external stack

### Overview

A given function can be executed with a user allocated stack space which is independent of current task stack, this mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as `printf`. The given function can be called inside the shared stack space which is a callback function deferred by calling `esp_execute_shared_stack_function()`, passing that function as parameter

### Usage

`esp_execute_shared_stack_function()` takes four arguments, a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack, a pointer to the top of stack used to that fuction, the size in bytes of stack and, a pointer to a user function where the shared stack space will reside, after calling the function, the user defined function will be deferred as a callback where functions can be called using the user allocated space without taking space from current task stack.

The usage may looks like the code below:

```
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let's suppose we wanting to call printf using a separated stack space
//allowing app to reduce its stack size.
void app_main()
{
    //Allocate a stack buffer, from heap or as a static form:
    portSTACK_TYPE *shared_stack = malloc(8192 * sizeof(portSTACK_TYPE));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
```

(continues on next page)

(continued from previous page)

```

SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
assert(printf_lock != NULL);

//Call the desired function using the macro helper:
esp_execute_shared_stack_function(printf_lock,
                                  shared_stack,
                                  8192,
                                  external_stack_function);

vSemaphoreDelete(printf_lock);
free(shared_stack);
}

```

## API Reference

### Header File

- [components/esp\\_system/include/esp\\_expression\\_with\\_stack.h](#)

### Functions

void **esp\_execute\_shared\_stack\_function** (*SemaphoreHandle\_t* lock, void \*stack, size\_t stack\_size, *shared\_stack\_function* function)

Calls user defined shared stack space function.

---

**Note:** if either lock, stack or stack size is invalid, the expression will be called using the current stack.

---

#### Parameters

- **lock** –Mutex object to protect in case of shared stack
- **stack** –Pointer to user allocated stack
- **stack\_size** –Size of current stack in bytes
- **function** –pointer to the shared stack function to be executed

### Macros

**ESP\_EXECUTE\_EXPRESSION\_WITH\_STACK** (lock, stack, stack\_size, expression)

### Type Definitions

```
typedef void (*shared_stack_function)(void)
```

## 2.7.18 Interrupt allocation

### Overview

The ESP32-S3 has two cores, with 32 interrupts. Each interrupt has a certain priority level, most (but not all) interrupts are connected to the interrupt mux.

Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The *esp\_intr\_alloc()* abstraction exists to hide all these implementation details.

A driver can allocate an interrupt for a certain peripheral by calling *esp\_intr\_alloc()* (or *esp\_intr\_alloc\_intrstatus()*). It can use the flags passed to this function to set the type of interrupt allocated, specifying a particular level or trigger method. The interrupt allocation code will then find an

applicable interrupt, use the interrupt mux to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

This code presents two different types of interrupts, handled differently: shared interrupts and non-shared interrupts. The simplest ones are non-shared interrupts: a separate interrupt is allocated per `esp_intr_alloc()` call and this interrupt is solely used for the peripheral attached to it, with only one ISR that will get called. On the other hand, shared interrupts can have multiple peripherals triggering them, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to check if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts due to the chance of missed interrupts when edge interrupts are used.

For example, let's say DevA and DevB share an interrupt. DevB signals an interrupt, so INT line goes high. The ISR handler calls code for DevA but does nothing. Then, ISR handler calls code for DevB, but while doing that, DevA signals an interrupt. DevB's ISR is done, it clears interrupt status for DevB and exits interrupt code. Now, an interrupt for DevA is still pending, but because the INT line never went low, as DevA kept it high even when the interrupt for DevB was cleared, the interrupt is never serviced.

### Multicore issues

Peripherals that can generate interrupts can be divided in two types:

- External peripherals, within the ESP32-S3 but outside the Xtensa cores themselves. Most ESP32-S3 peripherals are of this type.
- Internal peripherals, part of the Xtensa CPU cores themselves.

Interrupt handling differs slightly between these two types of peripherals.

**Internal peripheral interrupts** Each Xtensa CPU core has its own set of six internal peripherals:

- Three timer comparators
- A performance monitor
- Two software interrupts.

Internal interrupt sources are defined in `esp_intr_alloc.h` as `ETS_INTERNAL_*_INTR_SOURCE`.

These peripherals can only be configured from the core they are associated with. When generating an interrupt, the interrupt they generate is hard-wired to their associated core; it's not possible to have, for example, an internal timer comparator of one core generate an interrupt on another core. That is why these sources can only be managed using a task running on that specific core. Internal interrupt sources are still allocatable using `esp_intr_alloc()` as normal, but they cannot be shared and will always have a fixed interrupt level (namely, the one associated in hardware with the peripheral).

**External Peripheral Interrupts** The remaining interrupt sources are from external peripherals. These are defined in `soc/soc.h` as `ETS_*_INTR_SOURCE`.

Non-internal interrupt slots in both CPU cores are wired to an interrupt multiplexer, which can be used to route any external interrupt source to any of these interrupt slots.

- Allocating an external interrupt will always allocate it on the core that does the allocation.
- Freeing an external interrupt must always happen on the same core it was allocated on.
- Disabling and enabling external interrupts from another core is allowed.
- Multiple external interrupt sources can share an interrupt slot by passing `ESP_INTR_FLAG_SHARED` as a flag to `esp_intr_alloc()`.

Care should be taken when calling `esp_intr_alloc()` from a task which is not pinned to a core. During task switching, these tasks can migrate between cores. Therefore it is impossible to tell which CPU the interrupt is allocated on, which makes it difficult to free the interrupt handle and may also cause debugging difficulties. It is advised to use `xTaskCreatePinnedToCore()` with a specific CoreID argument to create tasks that will allocate interrupts. In the case of internal interrupt sources, this is required.

## IRAM-Safe Interrupt Handlers

The `ESP_INTR_FLAG_IRAM` flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erases can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses.

Refer to the [SPI flash API documentation](#) for more details.

## Multiple Handlers Sharing A Source

Several handlers can be assigned to a same source, given that all handlers are allocated using the `ESP_INTR_FLAG_SHARED` flag. They will all be allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while **its source may still be triggered** if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework support this feature, you have to use it *very carefully*. There usually exist two ways to stop an interrupt from being triggered: *disable the source* or *mask peripheral interrupt status*. IDF only handles enabling and disabling of the source itself, leaving status and mask bits to be handled by users. **Status bits shall either be masked before the handler responsible for it is disabled, either be masked and then properly handled in another enabled interrupt.** Please note that leaving some status bits unhandled without masking them, while disabling the handlers for them, will cause the interrupt(s) to be triggered indefinitely, resulting therefore in a system crash.

## API Reference

### Header File

- [components/esp\\_hw\\_support/include/esp\\_intr\\_alloc.h](#)

### Functions

`esp_err_t esp_intr_mark_shared` (int intno, int cpu, bool is\_in\_iram)

Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

#### Parameters

- **intno** –The number of the interrupt (0-31)
- **cpu** –CPU on which the interrupt should be marked as shared (0 or 1)
- **is\_in\_iram** –Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

**Returns** `ESP_ERR_INVALID_ARG` if cpu or intno is invalid `ESP_OK` otherwise

`esp_err_t esp_intr_reserve` (int intno, int cpu)

Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

#### Parameters

- **intno** –The number of the interrupt (0-31)
- **cpu** –CPU on which the interrupt should be marked as shared (0 or 1)

**Returns** `ESP_ERR_INVALID_ARG` if cpu or intno is invalid `ESP_OK` otherwise

*esp\_err\_t* **esp\_intr\_alloc** (int source, int flags, *intr\_handler\_t* handler, void \*arg, *intr\_handle\_t* \*ret\_handle)

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP\_INTR\_FLAG\_IRAM flag is used, and handler address is not in IRAM or RTC\_FAST\_MEM, then ESP\_ERR\_INVALID\_ARG is returned.

#### Parameters

- **source** –The interrupt source. One of the ETS\*\_INTR\_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS\_INTERNAL\*\_INTR\_SOURCE sources as defined in this header.
- **flags** –An ORred mask of the ESP\_INTR\_FLAG\_\* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP\_INTR\_FLAG\_SHARED, it will allocate a shared interrupt of level 1. Setting ESP\_INTR\_FLAG\_INTRDISABLED will return from this function with the interrupt disabled.
- **handler** –The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- **arg** –Optional argument for passed to the interrupt handler
- **ret\_handle** –Pointer to an *intr\_handle\_t* to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

**Returns** ESP\_ERR\_INVALID\_ARG if the combination of arguments is invalid.  
ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags  
ESP\_OK otherwise

*esp\_err\_t* **esp\_intr\_alloc\_intrstatus** (int source, int flags, uint32\_t intrstatusreg, uint32\_t intrstatusmask, *intr\_handler\_t* handler, void \*arg, *intr\_handle\_t* \*ret\_handle)

Allocate an interrupt with the given parameters.

This essentially does the same as *esp\_intr\_alloc*, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped

#### Parameters

- **source** –The interrupt source. One of the ETS\*\_INTR\_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS\_INTERNAL\*\_INTR\_SOURCE sources as defined in this header.
- **flags** –An ORred mask of the ESP\_INTR\_FLAG\_\* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP\_INTR\_FLAG\_SHARED, it will allocate a shared interrupt of level 1. Setting ESP\_INTR\_FLAG\_INTRDISABLED will return from this function with the interrupt disabled.
- **intrstatusreg** –The address of an interrupt status register
- **intrstatusmask** –A mask. If a read of address *intrstatusreg* has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.
- **handler** –The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren't C-callable.
- **arg** –Optional argument for passed to the interrupt handler
- **ret\_handle** –Pointer to an *intr\_handle\_t* to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

**Returns** ESP\_ERR\_INVALID\_ARG if the combination of arguments is invalid.  
ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags  
ESP\_OK otherwise

*esp\_err\_t* **esp\_intr\_free** (*intr\_handle\_t* handle)

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

---

**Note:** When the handler shares its source with other handlers, the interrupt status bits it's responsible for should be managed properly before freeing it. see `esp_intr_disable` for more details. Please do not call this function in `esp_ipc_call_blocking`.

---

**Parameters** **handle** –The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns** `ESP_ERR_INVALID_ARG` the handle is NULL `ESP_FAIL` failed to release this handle  
`ESP_OK` otherwise

int **esp\_intr\_get\_cpu** (*intr\_handle\_t* handle)

Get CPU number an interrupt is tied to.

**Parameters** **handle** –The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns** The core number where the interrupt is allocated

int **esp\_intr\_get\_intno** (*intr\_handle\_t* handle)

Get the allocated interrupt for a certain handle.

**Parameters** **handle** –The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns** The interrupt number

*esp\_err\_t* **esp\_intr\_disable** (*intr\_handle\_t* handle)

Disable the interrupt associated with the handle.

---

**Note:**

- For local interrupts (`ESP_INTERNAL_*` sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.
  - When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.
- 

**Parameters** **handle** –The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns** `ESP_ERR_INVALID_ARG` if the combination of arguments is invalid. `ESP_OK` otherwise

*esp\_err\_t* **esp\_intr\_enable** (*intr\_handle\_t* handle)

Enable the interrupt associated with the handle.

---

**Note:** For local interrupts (`ESP_INTERNAL_*` sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

---

**Parameters** **handle** –The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`

**Returns** `ESP_ERR_INVALID_ARG` if the combination of arguments is invalid. `ESP_OK` otherwise

`esp_err_t esp_intr_set_in_iram` (`intr_handle_t` handle, bool is\_in\_iram)

Set the “in IRAM” status of the handler.

---

**Note:** Does not work on shared interrupts.

---

#### Parameters

- **handle** –The handle, as obtained by `esp_intr_alloc` or `esp_intr_alloc_intrstatus`
- **is\_in\_iram** –Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

**Returns** `ESP_ERR_INVALID_ARG` if the combination of arguments is invalid. `ESP_OK` otherwise

void `esp_intr_noniram_disable` (void)

Disable interrupts that aren't specifically marked as running from IRAM.

void `esp_intr_noniram_enable` (void)

Re-enable interrupts disabled by `esp_intr_noniram_disable`.

void `esp_intr_enable_source` (int inum)

enable the interrupt source based on its number

**Parameters** `inum` –interrupt number from 0 to 31

void `esp_intr_disable_source` (int inum)

disable the interrupt source based on its number

**Parameters** `inum` –interrupt number from 0 to 31

static inline int `esp_intr_flags_to_level` (int flags)

Get the lowest interrupt level from the flags.

**Parameters** `flags` –The same flags that pass to `esp_intr_alloc_intrstatus` API

## Macros

**ESP\_INTR\_FLAG\_LEVEL1**

Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling `esp_intr_alloc*` needs. Accept a Level 1 interrupt vector (lowest priority)

**ESP\_INTR\_FLAG\_LEVEL2**

Accept a Level 2 interrupt vector.

**ESP\_INTR\_FLAG\_LEVEL3**

Accept a Level 3 interrupt vector.

**ESP\_INTR\_FLAG\_LEVEL4**

Accept a Level 4 interrupt vector.

**ESP\_INTR\_FLAG\_LEVEL5**

Accept a Level 5 interrupt vector.

**ESP\_INTR\_FLAG\_LEVEL6**

Accept a Level 6 interrupt vector.

**ESP\_INTR\_FLAG\_NMI**

Accept a Level 7 interrupt vector (highest priority)

**ESP\_INTR\_FLAG\_SHARED**

Interrupt can be shared between ISRs.

**ESP\_INTR\_FLAG\_EDGE**

Edge-triggered interrupt.

**ESP\_INTR\_FLAG\_IRAM**

ISR can be called if cache is disabled.

**ESP\_INTR\_FLAG\_INTRDISABLED**

Return with this interrupt disabled.

**ESP\_INTR\_FLAG\_LOWMED**

Low and medium prio interrupts. These can be handled in C.

**ESP\_INTR\_FLAG\_HIGH**

High level interrupts. Need to be handled in assembly.

**ESP\_INTR\_FLAG\_LEVELMASK**

Mask for all level flags.

**ETS\_INTERNAL\_TIMER0\_INTR\_SOURCE**

Platform timer 0 interrupt source.

The `esp_intr_alloc*` functions can allocate an int for all `ETS_*_INTR_SOURCE` interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.

**ETS\_INTERNAL\_TIMER1\_INTR\_SOURCE**

Platform timer 1 interrupt source.

**ETS\_INTERNAL\_TIMER2\_INTR\_SOURCE**

Platform timer 2 interrupt source.

**ETS\_INTERNAL\_SW0\_INTR\_SOURCE**

Software int source 1.

**ETS\_INTERNAL\_SW1\_INTR\_SOURCE**

Software int source 2.

**ETS\_INTERNAL\_PROFILING\_INTR\_SOURCE**

Int source for profiling.

**ETS\_INTERNAL\_UNUSED\_INTR\_SOURCE**

Interrupt is not assigned to any source.

**ETS\_INTERNAL\_INTR\_SOURCE\_OFF**

Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly

**ESP\_INTR\_ENABLE** (inum)

Enable interrupt by interrupt number

**ESP\_INTR\_DISABLE** (inum)

Disable interrupt by interrupt number

**Type Definitions**

```
typedef void (*intr_handler_t)(void *arg)
```

Function prototype for interrupt handler function

```
typedef struct intr_handle_data_t intr_handle_data_t
```

Interrupt handler associated data structure

```
typedef intr_handle_data_t *intr_handle_t
```

Handle to an interrupt handler

## 2.7.19 Logging library

### Overview

The logging library provides two ways for setting log verbosity:

- **At compile time:** in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`.
- Optionally, also in menuconfig, set the maximum verbosity level using the option `CONFIG_LOG_MAXIMUM_LEVEL`. By default this is the same as the default level, but it can be set higher in order to compile more optional logs into the firmware.
- **At runtime:** all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

---

**Note:** The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_MAXIMUM_LEVEL`. To increase log level for a specific file above this maximum at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).

---

### How to use this library

In each C file that uses logging functionality, define the TAG variable as shown below:

```
static const char* TAG = "MyModule";
```

Then use one of logging macros to produce output, e.g:

```
ESP_LOGW(TAG, "Baud rate error %.1f%%. Requested: %d baud, actual: %d baud", error_
↳ * 100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- `ESP_LOGE` - error (lowest)
- `ESP_LOGW` - warning
- `ESP_LOGI` - info
- `ESP_LOGD` - debug
- `ESP_LOGV` - verbose (highest)

Additionally, there are `ESP_EARLY_LOGx` versions for each of these macros, e.g. `ESP_EARLY_LOGE`. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal `ESP_LOGx` macros can also be used while compiling the bootloader, but they will fall back to the same implementation as `ESP_EARLY_LOGx` macros.

There are also `ESP_DRAM_LOGx` versions for each of these macros, e.g. `ESP_DRAM_LOGE`. These versions are used in some places where logging may occur with interrupts disabled or with flash cache inaccessible. Use of this macros should be as sparing as possible, as logging in these types of code should be avoided for performance reasons.

---

**Note:** Inside critical sections interrupts are disabled so it's only possible to use `ESP_DRAM_LOGx` (preferred) or `ESP_EARLY_LOGx`. Even though it's possible to log in these situations, it's better if your program can be structured not to require it.

---

To override default verbosity level at file or component scope, define the `LOG_LOCAL_LEVEL` macro.

At file scope, define it before including `esp_log.h`, e.g.:

```
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component makefile:

```
target_compile_definitions(${COMPONENT_LIB} PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG_
↳ VERBOSE")
```

To configure logging output per module at runtime, add calls to the function `esp_log_level_set()` as follows:

```
esp_log_level_set("*", ESP_LOG_ERROR);           // set all components to ERROR level
esp_log_level_set("wifi", ESP_LOG_WARN);        // enable WARN logs from WiFi stack
esp_log_level_set("dhcpc", ESP_LOG_INFO);       // enable INFO logs from DHCP client
```

---

**Note:** The “DRAM” and “EARLY” log macro variants documented above do not support per module setting of log verbosity. These macros will always log at the “default” verbosity level, which can only be changed at runtime by calling `esp_log_level_set("*", level)`.

---

**Logging to Host via JTAG** By default, the logging library uses the `vprintf`-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section [Logging to Host](#).

### Application Example

The logging library is commonly used by most esp-idf components and examples. For demonstration of log functionality, check ESP-IDF's [examples](#) directory. The most relevant examples that deal with logging are the following:

- [system/ota](#)
- [storage/sd\\_card](#)

- [protocols/https\\_request](#)

## API Reference

### Header File

- [components/log/include/esp\\_log.h](#)

### Functions

void **esp\_log\_level\_set** (const char \*tag, *esp\_log\_level\_t* level)

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.

Note that this function can not raise log level above the level set using CONFIG\_LOG\_MAXIMUM\_LEVEL setting in menuconfig.

To raise log level above the default one for a given file, define LOG\_LOCAL\_LEVEL to one of the ESP\_LOG\_\* values, before including esp\_log.h in this file.

#### Parameters

- **tag** –Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value “\*” resets log level for all tags to the given value.
- **level** –Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

*esp\_log\_level\_t* **esp\_log\_level\_get** (const char \*tag)

Get log level for given tag, can be used to avoid expensive log statements.

**Parameters tag** –Tag of the log to query current level. Must be a non-NULL zero terminated string.

**Returns** The current log level for the given tag

*vprintf\_like\_t* **esp\_log\_set\_vprintf** (*vprintf\_like\_t* func)

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

---

**Note:** Please note that function callback here must be re-entrant as it can be invoked in parallel from multiple thread context.

---

**Parameters func** –new Function used for output. Must have same signature as vprintf.

**Returns** func old Function used for output.

uint32\_t **esp\_log\_timestamp** (void)

Function which returns timestamp to be used in log output.

This function is used in expansion of ESP\_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

**Returns** timestamp, in milliseconds

char \***esp\_log\_system\_timestamp** (void)

Function which returns system timestamp to be used in log output.

This function is used in expansion of ESP\_LOGx macros to print the system time as “HH:MM:SS.sss” . The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will still print the RTOS tick time.

**Returns** timestamp, in “HH:MM:SS.sss”

uint32\_t **esp\_log\_early\_timestamp** (void)

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.

**Returns** timestamp, in milliseconds

void **esp\_log\_write** (*esp\_log\_level\_t* level, const char \*tag, const char \*format, ...)

Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP\_LOGE, ESP\_LOGW, ESP\_LOGI, ESP\_LOGD, ESP\_LOGV macros.

This function or these macros should not be used from an interrupt.

void **esp\_log\_writev** (*esp\_log\_level\_t* level, const char \*tag, const char \*format, va\_list args)

Write message into the log, va\_list variant.

This function is provided to ease integration toward other logging framework, so that esp\_log can be used as a log sink.

**See also:**

esp\_log\_write()

## Macros

**ESP\_LOG\_BUFFER\_HEX\_LEVEL** (tag, buffer, buff\_len, level)

Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

### Parameters

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff\_len** –length of buffer in bytes
- **level** –level of the log

**ESP\_LOG\_BUFFER\_CHAR\_LEVEL** (tag, buffer, buff\_len, level)

Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

### Parameters

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff\_len** –length of buffer in bytes
- **level** –level of the log

**ESP\_LOG\_BUFFER\_HEXDUMP** (tag, buffer, buff\_len, level)

Dump a buffer to the log at specified level.

The dump log shows just like the one below:

```

W (195) log_example: 0x3ffb4280 45 53 50 33 32 20 69 73 20 67 72 65 61 74_
↪2c 20 |ESP32 is great, |
W (195) log_example: 0x3ffb4290 77 6f 72 6b 69 6e 67 20 61 6c 6f 6e 67 20_
↪77 69 |working along wi|
W (205) log_example: 0x3ffb42a0 74 68 20 74 68 65 20 49 44 46 2e 00 _
↪ |th the IDF..|

```

It is highly recommend to use terminals with over 102 text width.

#### Parameters

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff\_len** –length of buffer in bytes
- **level** –level of the log

**ESP\_LOG\_BUFFER\_HEX** (tag, buffer, buff\_len)

Log a buffer of hex bytes at Info level.

#### See also:

esp\_log\_buffer\_hex\_level

#### Parameters

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff\_len** –length of buffer in bytes

**ESP\_LOG\_BUFFER\_CHAR** (tag, buffer, buff\_len)

Log a buffer of characters at Info level. Buffer should contain only printable characters.

#### See also:

esp\_log\_buffer\_char\_level

#### Parameters

- **tag** –description tag
- **buffer** –Pointer to the buffer array
- **buff\_len** –length of buffer in bytes

**portGET\_ARGUMENT\_COUNT\_INNER** (zero, one, count, ...)

macro to output logs in startup code, before heap allocator and syscalls have been initialized. log at ESP\_LOG\_ERROR level.

#### See also:

printf,ESP\_LOGE,ESP\_DRAM\_LOGE

**ESP\_EARLY\_LOGE** (tag, format, ...)

In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension `##__VA_ARGS__`. The second one is using the C++20 feature `VA_OPT(.)`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven't found any good alternative to using `##__VA_ARGS__`.

**ESP\_EARLY\_LOGW** (tag, format, ...)

macro to output logs in startup code at ESP\_LOG\_WARN level.

**See also:**

ESP\_EARLY\_LOGE, ESP\_LOGE, printf

**ESP\_EARLY\_LOGI** (tag, format, ...)

macro to output logs in startup code at ESP\_LOG\_INFO level.

**See also:**

ESP\_EARLY\_LOGE, ESP\_LOGE, printf

**ESP\_EARLY\_LOGD** (tag, format, ...)

macro to output logs in startup code at ESP\_LOG\_DEBUG level.

**See also:**

ESP\_EARLY\_LOGE, ESP\_LOGE, printf

**ESP\_EARLY\_LOGV** (tag, format, ...)

macro to output logs in startup code at ESP\_LOG\_VERBOSE level.

**See also:**

ESP\_EARLY\_LOGE, ESP\_LOGE, printf

**\_ESP\_LOG\_EARLY\_ENABLED** (log\_level)

**ESP\_LOG\_EARLY\_IMPL** (tag, format, log\_level, log\_tag\_letter, ...)

**ESP\_LOGE** (tag, format, ...)

**ESP\_LOGW** (tag, format, ...)

**ESP\_LOGI** (tag, format, ...)

**ESP\_LOGD** (tag, format, ...)

**ESP\_LOGV** (tag, format, ...)

**ESP\_LOG\_LEVEL** (level, tag, format, ...)

runtime macro to output logs at a specified level.

**See also:**

printf

**Parameters**

- **tag** –tag of the log, which can be used to change the log level by `esp_log_level_set` at runtime.
- **level** –level of the output log.
- **format** –format of the output log. see `printf`
- **...** –variables to be replaced into the log. see `printf`

**ESP\_LOG\_LEVEL\_LOCAL** (level, tag, format, ...)

runtime macro to output logs at a specified level. Also check the level with `LOG_LOCAL_LEVEL`.

**See also:**

`printf`, `ESP_LOG_LEVEL`

**ESP\_DRAM\_LOGE** (tag, format, ...)

Macro to output logs when the cache is disabled. log at `ESP_LOG_ERROR` level.

Similar to

Usage: `ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", or ESP_DRAM_LOGE(TAG, "format", ...)`, where TAG is a char\* that points to a str in the DRAM.

**See also:**

`ESP_EARLY_LOGE`, the log level cannot be changed per-tag, however `esp_log_level_set("*", level)` will set the default level which controls these log lines also.

**See also:**

`esp_rom_printf`, `ESP_LOGE`

---

**Note:** Unlike normal logging macros, it's possible to use this macro when interrupts are disabled or inside an ISR.

---

---

**Note:** Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

---

**ESP\_DRAM\_LOGW** (tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_WARN` level.

**See also:**

`ESP_DRAM_LOGW`, `ESP_LOGW`, `esp_rom_printf`

**ESP\_DRAM\_LOGI** (tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_INFO` level.

**See also:**

`ESP_DRAM_LOGI`, `ESP_LOGI`, `esp_rom_printf`

**ESP\_DRAM\_LOGD** (tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_DEBUG` level.

**See also:**

`ESP_DRAM_LOGD`, `ESP_LOGD`, `esp_rom_printf`

**ESP\_DRAM\_LOGV** (tag, format, ...)

macro to output logs when the cache is disabled at `ESP_LOG_VERBOSE` level.

**See also:**

`ESP_DRAM_LOGV`, `ESP_LOGV`, `esp_rom_printf`

### Type Definitions

typedef int (**\*vprintf\_like\_t**)(const char\*, va\_list)

### Enumerations

enum **esp\_log\_level\_t**

Log level.

*Values:*

enumerator **ESP\_LOG\_NONE**

No log output

enumerator **ESP\_LOG\_ERROR**

Critical errors, software module can not recover on its own

enumerator **ESP\_LOG\_WARN**

Error conditions from which recovery measures have been taken

enumerator **ESP\_LOG\_INFO**

Information messages which describe normal flow of events

enumerator **ESP\_LOG\_DEBUG**

Extra information which is not necessary for normal use (values, pointers, sizes, etc).

enumerator **ESP\_LOG\_VERBOSE**

Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

## 2.7.20 Miscellaneous System APIs

### Software reset

To perform software reset of the chip, `esp_restart()` function is provided. When the function is called, execution of the program will stop, both CPUs will be reset, application will be loaded by the bootloader and started again.

Additionally, `esp_register_shutdown_handler()` function is provided to register a routine which needs to be called prior to restart (when done by `esp_restart()`). This is similar to the functionality of `atexit` POSIX function.

### Reset reason

ESP-IDF application can be started or restarted due to a variety of reasons. To get the last reset reason, call `esp_reset_reason()` function. See description of `esp_reset_reason_t` for the list of possible reset reasons.

## Heap memory

Two heap memory related functions are provided:

- `esp_get_free_heap_size()` returns the current size of free heap memory
- `esp_get_minimum_free_heap_size()` returns the minimum size of free heap memory that was available during program execution.

Note that ESP-IDF supports multiple heaps with different capabilities. Functions mentioned in this section return the size of heap memory which can be allocated using `malloc` family of functions. For further information about heap memory see [Heap Memory Allocation](#).

## MAC Address

These APIs allow querying and customizing MAC addresses for different network interfaces that supported (e.g. Wi-Fi, Bluetooth, Ethernet).

To fetch MAC address for a specific interface (e.g. Wi-Fi, Bluetooth, Ethernet), call the function `esp_read_mac()` function.

In ESP-IDF these addresses are calculated from a single *Base MAC address*. By default, the Espressif base MAC address is used. This MAC is pre-programmed into ESP32-S3 eFuse from the factory.

Interface	MAC address (4 universally administered, default)	MAC address (2 universally administered)
Wi-Fi Station	<code>base_mac</code>	<code>base_mac</code>
Wi-Fi SoftAP	<code>base_mac</code> , +1 to the last octet	<i>Local MAC</i> derived from Wi-Fi Station MAC)
Bluetooth	<code>base_mac</code> , +2 to the last octet	<code>base_mac</code> , +1 to the last octet
Ethernet	<code>base_mac</code> , +3 to the last octet	<i>Local MAC</i> (derived from Bluetooth MAC)

---

**Note:** The default [configuration](#) is 4 universally administered MAC addresses, and this is recommended when using Espressif-provided MAC addresses.

---

**Note:** ESP32-S3 has no integrated Ethernet MAC, but it's still possible to calculate an Ethernet MAC address. This MAC address can only be used with an external interface such as a SPI-Ethernet device, see [Ethernet](#).

---

**Custom Base MAC** The default Base MAC is pre-programmed by Espressif in eFuse BLK1. To set a custom Base MAC instead, call the function `esp_base_mac_addr_set()` before initializing any network interfaces or calling the `esp_read_mac()` function. The customized MAC address can be stored in any supported storage device (e.g. Flash, NVS, etc).

The custom base MAC addresses should be allocated such that derived MAC addresses will not overlap. Configure the option `CONFIG_ESP32S3_UNIVERSAL_MAC_ADDRESSES` to set the number of valid universal MAC addresses that can be derived from the custom base MAC, according to the table above.

---

**Note:** It is also possible to call the function `esp_netif_set_mac()` to set the specific MAC used by a network interface, after network initialization. It's recommended to use the Base MAC approach documented here instead, to avoid the possibility of the original MAC address briefly appearing on the network before it is changed.

---

**Custom MAC address in eFuse** When reading custom MAC addresses from eFuse, ESP-IDF provides a helper function `esp_efuse_mac_get_custom()`. This loads the MAC address from eFuse BLK3. This function assumes that the custom base MAC address is stored in the following format:

Field	# of bits	Range of bits
MAC address	48	200:248

**Note:** The eFuse BLK3 uses RS-coding during a burn operation it means that all eFuse fields in this block must be burnt at the same time.

Once MAC address has been obtained using `esp_efuse_mac_get_custom()`, call `esp_base_mac_addr_set()` to set this MAC address as base MAC address.

**Local vs Universal MAC addresses** ESP32-S3 comes pre-programmed with enough valid Espressif universally administered MAC addresses for all internal interfaces. The specific calculations to derive an interface's MAC address from the base MAC address is shown in the table above..

When using a custom MAC address scheme, it's possible that not all interfaces can be assigned a universally administered MAC address. In these cases, a locally administered MAC address is assigned. Note that these addresses are intended for use on a single local network, only.

See [this article](#) for the definition of local and universally administered MAC addresses.

Function `esp_derive_local_mac()` is called internally to derive a local MAC address from a universal MAC address. The process is as follows:

1. The U/L bit (bit value 0x2) is set in the first octet of the universal MAC address, creating a local MAC address.
2. If this bit is already set in the supplied universal MAC address (meaning: the supplied "universal" MAC address was in fact already a local MAC address), then the first octet of the local MAC address is XORed with 0x4.

### Chip version

`esp_chip_info()` function fills `esp_chip_info_t` structure with information about the chip. This includes the chip revision, number of CPU cores, and a bit mask of features enabled in the chip.

### SDK version

`esp_get_idf_version()` returns a string describing the IDF version which was used to compile the application. This is the same value as the one available through `IDF_VER` variable of the build system. The version string generally has the format of `git describe` output.

To get the version at build time, additional version macros are provided. They can be used to enable or disable parts of the program depending on IDF version.

- `ESP_IDF_VERSION_MAJOR`, `ESP_IDF_VERSION_MINOR`, `ESP_IDF_VERSION_PATCH` are defined to integers representing major, minor, and patch version.
- `ESP_IDF_VERSION_VAL` and `ESP_IDF_VERSION` can be used when implementing version checks:

```
#include "esp_idf_version.h"

#if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
    // enable functionality present in IDF v4.0
#endif
```

## App version

Application version is stored in `esp_app_desc_t` structure. It is located in DROM sector and has a fixed offset from the beginning of the binary file. The structure is located after `esp_image_header_t` and `esp_image_segment_header_t` structures. The field version has string type and max length 32 chars.

To set version in your project manually you need to set `PROJECT_VER` variable in your project CMakeLists.txt/Makefile:

- In application CMakeLists.txt put `set (PROJECT_VER "0.1.0.1")` before including `project.cmake`.

(For legacy GNU Make build system: in application Makefile put `PROJECT_VER = "0.1.0.1"` before including `project.mk`.)

If `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used. Otherwise if `PROJECT_VER` variable is not set in the project then it will be retrieved from either `$(PROJECT_PATH)/version.txt` file (if present) else using git command `git describe`. If neither is available then `PROJECT_VER` will be set to "1". Application can make use of this by calling `esp_ota_get_app_description()` or `esp_ota_get_partition_description()` functions.

## API Reference

### Header File

- `components/esp_system/include/esp_system.h`

### Functions

`esp_err_t esp_register_shutdown_handler (shutdown_handler_t handle)`

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using `esp_restart` function.

**Parameters** `handle` –function to execute on restart

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if the handler has already been registered
- `ESP_ERR_NO_MEM` if no more shutdown handler slots are available

`esp_err_t esp_unregister_shutdown_handler (shutdown_handler_t handle)`

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using `esp_register_shutdown_handler` function.

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if the given handler hasn't been registered before

void `esp_restart` (void)

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be `SW_CPU_RESET`. Peripherals (except for WiFi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

`esp_reset_reason_t esp_reset_reason` (void)

Get reason of last reset.

**Returns** See description of `esp_reset_reason_t` for explanation of each value.

uint32\_t **esp\_get\_free\_heap\_size** (void)

Get the size of available heap.

Note that the returned value may be larger than the maximum contiguous block which can be allocated.

**Returns** Available heap size, in bytes.

uint32\_t **esp\_get\_free\_internal\_heap\_size** (void)

Get the size of available internal heap.

Note that the returned value may be larger than the maximum contiguous block which can be allocated.

**Returns** Available internal heap size, in bytes.

uint32\_t **esp\_get\_minimum\_free\_heap\_size** (void)

Get the minimum heap that has ever been available.

**Returns** Minimum free heap ever available

void **esp\_system\_abort** (const char \*details)

Trigger a software abort.

**Parameters** **details** –Details that will be displayed during panic handling.

### Type Definitions

typedef void (\***shutdown\_handler\_t**)(void)

Shutdown handler type

### Enumerations

enum **esp\_reset\_reason\_t**

Reset reasons.

*Values:*

enumerator **ESP\_RST\_UNKNOWN**

Reset reason can not be determined.

enumerator **ESP\_RST\_POWERON**

Reset due to power-on event.

enumerator **ESP\_RST\_EXT**

Reset by external pin (not applicable for ESP32)

enumerator **ESP\_RST\_SW**

Software reset via esp\_restart.

enumerator **ESP\_RST\_PANIC**

Software reset due to exception/panic.

enumerator **ESP\_RST\_INT\_WDT**

Reset (software or hardware) due to interrupt watchdog.

enumerator **ESP\_RST\_TASK\_WDT**

Reset due to task watchdog.

enumerator **ESP\_RST\_WDT**

Reset due to other watchdogs.

enumerator **ESP\_RST\_DEEPSLEEP**

Reset after exiting deep sleep mode.

enumerator **ESP\_RST\_BROWNOUT**

Brownout reset (software or hardware)

enumerator **ESP\_RST\_SDIO**

Reset over SDIO.

### Header File

- [components/esp\\_common/include/esp\\_idf\\_version.h](#)

### Functions

const char \***esp\_get\_idf\_version** (void)

Return full IDF version string, same as ‘git describe’ output.

---

**Note:** If you are printing the ESP-IDF version in a log file or other information, this function provides more information than using the numerical version macros. For example, numerical version macros don't differentiate between development, pre-release and release versions, but the output of this function does.

---

**Returns** constant string from IDF\_VER

### Macros

**ESP\_IDF\_VERSION\_MAJOR**

Major version number (X.x.x)

**ESP\_IDF\_VERSION\_MINOR**

Minor version number (x.X.x)

**ESP\_IDF\_VERSION\_PATCH**

Patch version number (x.x.X)

**ESP\_IDF\_VERSION\_VAL** (major, minor, patch)

Macro to convert IDF version number into an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

**ESP\_IDF\_VERSION**

Current IDF version, as an integer

To be used in comparisons, such as `ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)`

## 2.7.21 Over The Air Updates (OTA)

## OTA Process Overview

The OTA update mechanism allows a device to update itself based on data received while the normal firmware is running (for example, over Wi-Fi or Bluetooth.)

OTA requires configuring the *Partition Table* of the device with at least two “OTA app slot” partitions (i.e. *ota\_0* and *ota\_1*) and an “OTA Data Partition” .

The OTA operation functions write a new app firmware image to whichever OTA app slot that is currently not selected for booting. Once the image is verified, the OTA Data partition is updated to specify that this image should be used for the next boot.

## OTA Data Partition

An OTA data partition (type `data`, subtype `ota`) must be included in the *Partition Table* of any project which uses the OTA functions.

For factory boot settings, the OTA data partition should contain no data (all bytes erased to 0xFF). In this case the esp-idf software bootloader will boot the factory app if it is present in the the partition table. If no factory app is included in the partition table, the first available OTA slot (usually *ota\_0*) is booted.

After the first OTA update, the OTA data partition is updated to specify which OTA app slot partition should be booted next.

The OTA data partition is two flash sectors (0x2000 bytes) in size, to prevent problems if there is a power failure while it is being written. Sectors are independently erased and written with matching data, and if they disagree a counter field is used to determine which sector was written more recently.

## App rollback

The main purpose of the application rollback is to keep the device working after the update. This feature allows you to roll back to the previous working application in case a new application has critical errors. When the rollback process is enabled and an OTA update provides a new version of the app, one of three things can happen:

- The application works fine, `esp_ota_mark_app_valid_cancel_rollback()` marks the running application with the state `ESP_OTA_IMG_VALID`. There are no restrictions on booting this application.
- The application has critical errors and further work is not possible, a rollback to the previous application is required, `esp_ota_mark_app_invalid_rollback_and_reboot()` marks the running application with the state `ESP_OTA_IMG_INVALID` and reset. This application will not be selected by the bootloader for boot and will boot the previously working application.
- If the `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is set, and a reset occurs without calling either function then the application is rolled back.

Note: The state is not written to the binary image of the application it is written to the `otadata` partition. The partition contains a `ota_seq` counter which is a pointer to the slot (*ota\_0*, *ota\_1*, ...) from which the application will be selected for boot.

**App OTA State** States control the process of selecting a boot app:

States	Restriction of selecting a boot app in bootloader
<code>ESP_OTA_IMG_VALID</code>	No restriction. Will be selected.
<code>ESP_OTA_IMG_PENDING_VERIFY</code>	No restriction. Will be selected.
<code>ESP_OTA_IMG_INVALID</code>	Will not be selected.
<code>ESP_OTA_IMG_ABORTED</code>	Will not be selected.
<code>ESP_OTA_IMG_NEW</code>	If <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> option is set it will be selected only once. In bootloader the state immediately changes to <code>ESP_OTA_IMG_PENDING_VERIFY</code> .
<code>ESP_OTA_IMG_PENDING_VERIFY</code>	If <code>CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE</code> option is set it will not be selected and the state will change to <code>ESP_OTA_IMG_ABORTED</code> .

If `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled (by default), then the use of the following functions `esp_ota_mark_app_valid_cancel_rollback()` and `esp_ota_mark_app_invalid_rollback_and_reboot()` are optional, and `ESP_OTA_IMG_NEW` and `ESP_OTA_IMG_PENDING_VERIFY` states are not used.

An option in Kconfig `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` allows you to track the first boot of a new application. In this case, the application must confirm its operability by calling `esp_ota_mark_app_valid_cancel_rollback()` function, otherwise the application will be rolled back upon reboot. It allows you to control the operability of the application during the boot phase. Thus, a new application has only one attempt to boot successfully.

**Rollback Process** The description of the rollback process when `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled:

- The new application successfully downloaded and `esp_ota_set_boot_partition()` function makes this partition bootable and sets the state `ESP_OTA_IMG_NEW`. This state means that the application is new and should be monitored for its first boot.
- Reboot `esp_restart()`.
- The bootloader checks for the `ESP_OTA_IMG_PENDING_VERIFY` state if it is set, then it will be written to `ESP_OTA_IMG_ABORTED`.
- The bootloader selects a new application to boot so that the state is not set as `ESP_OTA_IMG_INVALID` or `ESP_OTA_IMG_ABORTED`.
- The bootloader checks the selected application for `ESP_OTA_IMG_NEW` state if it is set, then it will be written to `ESP_OTA_IMG_PENDING_VERIFY`. This state means that the application requires confirmation of its operability, if this does not happen and a reboot occurs, this state will be overwritten to `ESP_OTA_IMG_ABORTED` (see above) and this application will no longer be able to start, i.e. there will be a rollback to the previous work application.
- A new application has started and should make a self-test.
- If the self-test has completed successfully, then you must call the function `esp_ota_mark_app_valid_cancel_rollback()` because the application is awaiting confirmation of operability (`ESP_OTA_IMG_PENDING_VERIFY` state).
- If the self-test fails then call `esp_ota_mark_app_invalid_rollback_and_reboot()` function to roll back to the previous working application, while the invalid application is set `ESP_OTA_IMG_INVALID` state.
- If the application has not been confirmed, the state remains `ESP_OTA_IMG_PENDING_VERIFY`, and the next boot it will be changed to `ESP_OTA_IMG_ABORTED`. That will prevent re-boot of this application. There will be a rollback to the previous working application.

**Unexpected Reset** If a power loss or an unexpected crash occurs at the time of the first boot of a new application, it will roll back the application.

Recommendation: Perform the self-test procedure as quickly as possible, to prevent rollback due to power loss.

Only OTA partitions can be rolled back. Factory partition is not rolled back.

**Booting invalid/aborted apps** Booting an application which was previously set to `ESP_OTA_IMG_INVALID` or `ESP_OTA_IMG_ABORTED` is possible:

- Get the last invalid application partition `esp_ota_get_last_invalid_partition()`.
- Pass the received partition to `esp_ota_set_boot_partition()`, this will update the `otadata`.
- Restart `esp_restart()`. The bootloader will boot the specified application.

To determine if self-tests should be run during startup of an application, call the `esp_ota_get_state_partition()` function. If result is `ESP_OTA_IMG_PENDING_VERIFY` then self-testing and subsequent confirmation of operability is required.

**Where the states are set** A brief description of where the states are set:

- ESP\_OTA\_IMG\_VALID state is set by `esp_ota_mark_app_valid_cancel_rollback()` function.
- ESP\_OTA\_IMG\_UNDEFINED state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is not enabled.
- ESP\_OTA\_IMG\_NEW state is set by `esp_ota_set_boot_partition()` function if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled.
- ESP\_OTA\_IMG\_INVALID state is set by `esp_ota_mark_app_invalid_rollback_and_reboot()` function.
- ESP\_OTA\_IMG\_ABORTED state is set if there was no confirmation of the application operability and occurs reboots (if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled).
- ESP\_OTA\_IMG\_PENDING\_VERIFY state is set in a bootloader if `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` option is enabled and selected app has ESP\_OTA\_IMG\_NEW state.

### Anti-rollback

Anti-rollback prevents rollback to application with security version lower than one programmed in eFuse of chip.

This function works if set `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` option. In the bootloader, when selecting a bootable application, an additional security version check is added which is on the chip and in the application image. The version in the bootable firmware must be greater than or equal to the version in the chip.

`CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK` and `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE` options are used together. In this case, rollback is possible only on the security version which is equal or higher than the version in the chip.

### A typical anti-rollback scheme is

- New firmware released with the elimination of vulnerabilities with the previous version of security.
- After the developer makes sure that this firmware is working. He can increase the security version and release a new firmware.
- Download new application.
- To make it bootable, run the function `esp_ota_set_boot_partition()`. If the security version of the new application is smaller than the version in the chip, the new application will be erased. Update to new firmware is not possible.
- Reboot.
- In the bootloader, an application with a security version greater than or equal to the version in the chip will be selected. If otadata is in the initial state, and one firmware was loaded via a serial channel, whose secure version is higher than the chip, then the secure version of efuse will be immediately updated in the bootloader.
- New application booted. Then the application should perform diagnostics of the operation and if it is completed successfully, you should call `esp_ota_mark_app_valid_cancel_rollback()` function to mark the running application with the ESP\_OTA\_IMG\_VALID state and update the secure version on chip. Note that if was called `esp_ota_mark_app_invalid_rollback_and_reboot()` function a rollback may not happen due to the device may not have any bootable apps then it will return ESP\_ERR\_OTA\_ROLLBACK\_FAILED error and stay in the ESP\_OTA\_IMG\_PENDING\_VERIFY state.
- The next update of app is possible if a running app is in the ESP\_OTA\_IMG\_VALID state.

Recommendation:

If you want to avoid the download/erase overhead in case of the app from the server has security version lower than running app you have to get `new_app_info.secure_version` from the first package of an image and compare it with the secure version of efuse. Use `esp_efuse_check_secure_version(new_app_info.secure_version)` function if it is true then continue downloading otherwise abort.

```
....
bool image_header_was_checked = false;
while (1) {
    int data_read = esp_http_client_read(client, ota_write_data, BUFFSIZE);
    ...
```

(continues on next page)

(continued from previous page)

```

    if (data_read > 0) {
        if (image_header_was_checked == false) {
            esp_app_desc_t new_app_info;
            if (data_read > sizeof(esp_image_header_t) + sizeof(esp_image_segment_
↪header_t) + sizeof(esp_app_desc_t)) {
                // check current version with downloading
                if (esp_efuse_check_secure_version(new_app_info.secure_version) ==_
↪false) {
                    ESP_LOGE(TAG, "This a new app can not be downloaded due to a_
↪secure version is lower than stored in efuse.");
                    http_cleanup(client);
                    task_fatal_error();
                }

                image_header_was_checked = true;

                esp_ota_begin(update_partition, OTA_SIZE_UNKNOWN, &update_handle);
            }
        }
        esp_ota_write( update_handle, (const void *)ota_write_data, data_read);
    }
}
...

```

**Restrictions:**

- The number of bits in the `secure_version` field is limited to 32 bits. This means that only 32 times you can do an anti-rollback. You can reduce the length of this efuse field use [CONFIG\\_BOOTLOADER\\_APP\\_SEC\\_VER\\_SIZE\\_EFUSE\\_FIELD](#) option.
- Anti-rollback only works if the encoding scheme for efuse is set to NONE.
- The partition table should not have a factory partition, only two of the app.

**security\_version:**

- In application image it is stored in `esp_app_desc` structure. The number is set [CONFIG\\_BOOTLOADER\\_APP\\_SECURE\\_VERSION](#).

**Secure OTA Updates Without Secure boot**

The verification of signed OTA updates can be performed even without enabling hardware secure boot. This can be achieved by setting [CONFIG\\_SECURE\\_SIGNED\\_APPS\\_NO\\_SECURE\\_BOOT](#) and [CONFIG\\_SECURE\\_SIGNED\\_ON\\_UPDATE\\_NO\\_SECURE\\_BOOT](#)

**OTA Tool (otatool.py)**

The component `app_update` provides a tool [otatool.py](#) for performing OTA partition-related operations on a target device. The following operations can be performed using the tool:

- read contents of otadata partition (`read_otadata`)
- erase otadata partition, effectively resetting device to factory app (`erase_otadata`)
- switch OTA partitions (`switch_ota_partition`)
- erasing OTA partition (`erase_ota_partition`)
- write to OTA partition (`write_ota_partition`)
- read contents of OTA partition (`read_ota_partition`)

The tool can either be imported and used from another Python script or invoked from shell script for users wanting to perform operation programmatically. This is facilitated by the tool's Python API and command-line interface, respectively.

**Python API** Before anything else, make sure that the *otatool* module is imported.

```
import sys
import os

idf_path = os.environ["IDF_PATH"] # get value of IDF_PATH from environment
otatool_dir = os.path.join(idf_path, "components", "app_update") # otatool.py_
↳ lives in $IDF_PATH/components/app_update

sys.path.append(otatool_dir) # this enables Python to find otatool module
from otatool import * # import all names inside otatool module
```

The starting point for using the tool's Python API to do is create a *OtatoolTarget* object:

```
# Create a partool.py target device connected on serial port /dev/ttyUSB1
target = OtatoolTarget("/dev/ttyUSB1")
```

The created object can now be used to perform operations on the target device:

```
# Erase otadata, resetting the device to factory app
target.erase_otadata()

# Erase contents of OTA app slot 0
target.erase_ota_partition(0)

# Switch boot partition to that of app slot 1
target.switch_ota_partition(1)

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
target.read_ota_partition("ota_3", "ota_3.bin")
```

The OTA partition to operate on is specified using either the app slot number or the partition name.

More information on the Python API is available in the docstrings for the tool.

**Command-line Interface** The command-line interface of *otatool.py* has the following structure:

```
otatool.py [command-args] [subcommand] [subcommand-args]

- command-args - these are arguments that are needed for executing the main_
↳ command (partool.py), mostly pertaining to the target device
- subcommand - this is the operation to be performed
- subcommand-args - these are arguments that are specific to the chosen operation
```

```
# Erase otadata, resetting the device to factory app
otatool.py --port "/dev/ttyUSB1" erase_otadata

# Erase contents of OTA app slot 0
otatool.py --port "/dev/ttyUSB1" erase_ota_partition --slot 0

# Switch boot partition to that of app slot 1
otatool.py --port "/dev/ttyUSB1" switch_ota_partition --slot 1

# Read OTA partition 'ota_3' and save contents to a file named 'ota_3.bin'
otatool.py --port "/dev/ttyUSB1" read_ota_partition --name=ota_3 --output=ota_3.bin
```

More information can be obtained by specifying *-help* as argument:

```
# Display possible subcommands and show main command argument descriptions
otatool.py --help
```

(continues on next page)

```
# Show descriptions for specific subcommand arguments
otatool.py [subcommand] --help
```

### Application Example

End-to-end example of OTA firmware update workflow: [system/ota](#).

### API Reference

#### Header File

- [components/app\\_update/include/esp\\_ota\\_ops.h](#)

#### Functions

const [esp\\_app\\_desc\\_t](#) \***esp\_ota\_get\_app\_description** (void)

Return esp\_app\_desc structure. This structure includes app version.

Return description for running app.

**Returns** Pointer to esp\_app\_desc structure.

int **esp\_ota\_get\_app\_elf\_sha256** (char \*dst, size\_t size)

Fill the provided buffer with SHA256 of the ELF file, formatted as hexadecimal, null-terminated. If the buffer size is not sufficient to fit the entire SHA256 in hex plus a null terminator, the largest possible number of bytes will be written followed by a null.

#### Parameters

- **dst** –Destination buffer
- **size** –Size of the buffer

**Returns** Number of bytes written to dst (including null terminator)

[esp\\_err\\_t](#) **esp\_ota\_begin** (const [esp\\_partition\\_t](#) \*partition, size\_t image\_size, [esp\\_ota\\_handle\\_t](#) \*out\_handle)

Commence an OTA update writing to the specified partition.

The specified partition is erased to the specified image size.

If image size is not yet known, pass OTA\_SIZE\_UNKNOWN which will cause the entire partition to be erased.

On success, this function allocates memory that remains in use until esp\_ota\_end() is called with the returned handle.

Note: If the rollback option is enabled and the running application has the ESP\_OTA\_IMG\_PENDING\_VERIFY state then it will lead to the ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE error. Confirm the running app before to run download a new app, use esp\_ota\_mark\_app\_valid\_cancel\_rollback() function for it (this should be done as early as possible when you first download a new application).

#### Parameters

- **partition** –Pointer to info for partition which will receive the OTA update. Required.
- **image\_size** –Size of new OTA app image. Partition will be erased in order to receive this size of image. If 0 or OTA\_SIZE\_UNKNOWN, the entire partition is erased.
- **out\_handle** –On success, returns a handle which should be used for subsequent esp\_ota\_write() and esp\_ota\_end() calls.

**Returns**

- **ESP\_OK**: OTA operation commenced successfully.
- **ESP\_ERR\_INVALID\_ARG**: partition or out\_handle arguments were NULL, or partition doesn't point to an OTA app partition.
- **ESP\_ERR\_NO\_MEM**: Cannot allocate memory for OTA operation.
- **ESP\_ERR\_OTA\_PARTITION\_CONFLICT**: Partition holds the currently running firmware, cannot update in place.
- **ESP\_ERR\_NOT\_FOUND**: Partition argument not found in partition table.
- **ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID**: The OTA data partition contains invalid data.
- **ESP\_ERR\_INVALID\_SIZE**: Partition doesn't fit in configured flash size.
- **ESP\_ERR\_FLASH\_OP\_TIMEOUT** or **ESP\_ERR\_FLASH\_OP\_FAIL**: Flash write failed.
- **ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE**: If the running app has not confirmed state. Before performing an update, the application must be valid.

*esp\_err\_t* **esp\_ota\_write** (*esp\_ota\_handle\_t* handle, const void \*data, size\_t size)

Write OTA update data to partition.

This function can be called multiple times as data is received during the OTA operation. Data is written sequentially to the partition.

**Parameters**

- **handle** –Handle obtained from esp\_ota\_begin
- **data** –Data buffer to write
- **size** –Size of data buffer in bytes.

**Returns**

- **ESP\_OK**: Data was written to flash successfully, or size = 0
- **ESP\_ERR\_INVALID\_ARG**: handle is invalid.
- **ESP\_ERR\_OTA\_VALIDATE\_FAILED**: First byte of image contains invalid app image magic byte.
- **ESP\_ERR\_FLASH\_OP\_TIMEOUT** or **ESP\_ERR\_FLASH\_OP\_FAIL**: Flash write failed.
- **ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID**: OTA data partition has invalid contents

*esp\_err\_t* **esp\_ota\_write\_with\_offset** (*esp\_ota\_handle\_t* handle, const void \*data, size\_t size, uint32\_t offset)

Write OTA update data to partition.

This function can write data in non contiguous manner. If flash encryption is enabled, data should be 16 byte aligned.

---

**Note:** While performing OTA, if the packets arrive out of order, esp\_ota\_write\_with\_offset() can be used to write data in non contiguous manner. Use of esp\_ota\_write\_with\_offset() in combination with esp\_ota\_write() is not recommended.

---

**Parameters**

- **handle** –Handle obtained from esp\_ota\_begin
- **data** –Data buffer to write
- **size** –Size of data buffer in bytes
- **offset** –Offset in flash partition

**Returns**

- **ESP\_OK**: Data was written to flash successfully.
- **ESP\_ERR\_INVALID\_ARG**: handle is invalid.
- **ESP\_ERR\_OTA\_VALIDATE\_FAILED**: First byte of image contains invalid app image magic byte.
- **ESP\_ERR\_FLASH\_OP\_TIMEOUT** or **ESP\_ERR\_FLASH\_OP\_FAIL**: Flash write failed.
- **ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID**: OTA data partition has invalid contents

*esp\_err\_t* **esp\_ota\_end** (*esp\_ota\_handle\_t* handle)

Finish OTA update and validate newly written app image.

---

**Note:** After calling `esp_ota_end()`, the handle is no longer valid and any memory associated with it is freed (regardless of result).

---

**Parameters** **handle** –Handle obtained from `esp_ota_begin()`.

**Returns**

- `ESP_OK`: Newly written OTA app image is valid.
- `ESP_ERR_NOT_FOUND`: OTA handle was not found.
- `ESP_ERR_INVALID_ARG`: Handle was never written to.
- `ESP_ERR_OTA_VALIDATE_FAILED`: OTA image is invalid (either not a valid app image, or - if secure boot is enabled - signature failed to verify.)
- `ESP_ERR_INVALID_STATE`: If flash encryption is enabled, this result indicates an internal error writing the final encrypted bytes to flash.

*esp\_err\_t* **esp\_ota\_abort** (*esp\_ota\_handle\_t* handle)

Abort OTA update, free the handle and memory associated with it.

**Parameters** **handle** –obtained from `esp_ota_begin()`.

**Returns**

- `ESP_OK`: Handle and its associated memory is freed successfully.
- `ESP_ERR_NOT_FOUND`: OTA handle was not found.

*esp\_err\_t* **esp\_ota\_set\_boot\_partition** (const *esp\_partition\_t* \*partition)

Configure OTA data for a new boot partition.

---

**Note:** If this function returns `ESP_OK`, calling `esp_restart()` will boot the newly configured app partition.

---

**Parameters** **partition** –Pointer to info for partition containing app image to boot.

**Returns**

- `ESP_OK`: OTA data updated, next reboot will use specified partition.
- `ESP_ERR_INVALID_ARG`: partition argument was `NULL` or didn't point to a valid OTA partition of type "app".
- `ESP_ERR_OTA_VALIDATE_FAILED`: Partition contained invalid app image. Also returned if secure boot is enabled and signature validation failed.
- `ESP_ERR_NOT_FOUND`: OTA data partition not found.
- `ESP_ERR_FLASH_OP_TIMEOUT` or `ESP_ERR_FLASH_OP_FAIL`: Flash erase or write failed.

const *esp\_partition\_t* \***esp\_ota\_get\_boot\_partition** (void)

Get partition info of currently configured boot app.

If `esp_ota_set_boot_partition()` has been called, the partition which was set by that function will be returned.

If `esp_ota_set_boot_partition()` has not been called, the result is usually the same as `esp_ota_get_running_partition()`. The two results are not equal if the configured boot partition does not contain a valid app (meaning that the running partition will be an app that the bootloader chose via fallback).

If the OTA data partition is not present or not valid then the result is the first app partition found in the partition table. In priority order, this means: the factory app, the first OTA app slot, or the test app partition.

Note that there is no guarantee the returned partition is a valid app. Use `esp_image_verify(ESP_IMAGE_VERIFY, ...)` to verify if the returned partition contains a bootable image.

**Returns** Pointer to info for partition structure, or NULL if partition table is invalid or a flash read operation failed. Any returned pointer is valid for the lifetime of the application.

const *esp\_partition\_t* \***esp\_ota\_get\_running\_partition** (void)

Get partition info of currently running app.

This function is different to `esp_ota_get_boot_partition()` in that it ignores any change of selected boot partition caused by `esp_ota_set_boot_partition()`. Only the app whose code is currently running will have its partition information returned.

The partition returned by this function may also differ from `esp_ota_get_boot_partition()` if the configured boot partition is somehow invalid, and the bootloader fell back to a different app partition at boot.

**Returns** Pointer to info for partition structure, or NULL if no partition is found or flash read operation failed. Returned pointer is valid for the lifetime of the application.

const *esp\_partition\_t* \***esp\_ota\_get\_next\_update\_partition** (const *esp\_partition\_t* \*start\_from)

Return the next OTA app partition which should be written with a new firmware.

Call this function to find an OTA app partition which can be passed to `esp_ota_begin()`.

Finds next partition round-robin, starting from the current running partition.

**Parameters** **start\_from** –If set, treat this partition info as describing the current running partition. Can be NULL, in which case `esp_ota_get_running_partition()` is used to find the currently running partition. The result of this function is never the same as this argument.

**Returns** Pointer to info for partition which should be updated next. NULL result indicates invalid OTA data partition, or that no eligible OTA app slot partition was found.

*esp\_err\_t* **esp\_ota\_get\_partition\_description** (const *esp\_partition\_t* \*partition, *esp\_app\_desc\_t* \*app\_desc)

Returns `esp_app_desc` structure for app partition. This structure includes app version.

Returns a description for the requested app partition.

#### Parameters

- **partition** –[in] Pointer to app partition. (only app partition)
- **app\_desc** –[out] Structure of info about app.

#### Returns

- ESP\_OK Successful.
- ESP\_ERR\_NOT\_FOUND `app_desc` structure is not found. Magic word is incorrect.
- ESP\_ERR\_NOT\_SUPPORTED Partition is not application.
- ESP\_ERR\_INVALID\_ARG Arguments is NULL or if partition 's offset exceeds partition size.
- ESP\_ERR\_INVALID\_SIZE Read would go out of bounds of the partition.
- or one of error codes from lower-level flash driver.

uint8\_t **esp\_ota\_get\_app\_partition\_count** (void)

Returns number of ota partitions provided in partition table.

#### Returns

- Number of OTA partitions

*esp\_err\_t* **esp\_ota\_mark\_app\_valid\_cancel\_rollback** (void)

This function is called to indicate that the running app is working well.

#### Returns

- ESP\_OK: if successful.

*esp\_err\_t* **esp\_ota\_mark\_app\_invalid\_rollback\_and\_reboot** (void)

This function is called to roll back to the previously workable app with reboot.

If rollback is successful then device will reset else API will return with error code. Checks applications on a flash drive that can be booted in case of rollback. If the flash does not have at least one app (except the running app) then rollback is not possible.

**Returns**

- `ESP_FAIL`: if not successful.
- `ESP_ERR_OTA_ROLLBACK_FAILED`: The rollback is not possible due to flash does not have any apps.

const *esp\_partition\_t* \***esp\_ota\_get\_last\_invalid\_partition** (void)

Returns last partition with invalid state (`ESP_OTA_IMG_INVALID` or `ESP_OTA_IMG_ABORTED`).

**Returns** partition.

*esp\_err\_t* **esp\_ota\_get\_state\_partition** (const *esp\_partition\_t* \*partition, *esp\_ota\_img\_states\_t* \*ota\_state)

Returns state for given partition.

**Parameters**

- **partition** **–[in]** Pointer to partition.
- **ota\_state** **–[out]** state of partition (if this partition has a record in otadata).

**Returns**

- `ESP_OK`: Successful.
- `ESP_ERR_INVALID_ARG`: partition or ota\_state arguments were NULL.
- `ESP_ERR_NOT_SUPPORTED`: partition is not ota.
- `ESP_ERR_NOT_FOUND`: Partition table does not have otadata or state was not found for given partition.

*esp\_err\_t* **esp\_ota\_erase\_last\_boot\_app\_partition** (void)

Erase previous boot app partition and corresponding otadata select for this partition.

When current app is marked to as valid then you can erase previous app partition.

**Returns**

- `ESP_OK`: Successful, otherwise `ESP_ERR`.

bool **esp\_ota\_check\_rollback\_is\_possible** (void)

Checks applications on the slots which can be booted in case of rollback.

These applications should be valid (marked in otadata as not `UNDEFINED`, `INVALID` or `ABORTED` and crc is good) and be able booted, and `secure_version` of app  $\geq$  `secure_version` of efuse (if anti-rollback is enabled).

**Returns**

- True: Returns true if the slots have at least one app (except the running app).
- False: The rollback is not possible.

*esp\_err\_t* **esp\_ota\_revoke\_secure\_boot\_public\_key** (*esp\_ota\_secure\_boot\_public\_key\_index\_t* index)

Revokes the old signature digest. To be called in the application after the rollback logic.

Relevant for Secure boot v2 on ESP32-S2, ESP32-S3, ESP32-C3 where upto 3 key digests can be stored (Key #N-1, Key #N, Key #N+1). When key #N-1 used to sign an app is invalidated, an OTA update is to be sent with an app signed with key #N-1 & Key #N. After successfully booting the OTA app should call this function to revoke Key #N-1.

**Parameters** **index** -- The index of the signature block to be revoked

**Returns**

- `ESP_OK`: If revocation is successful.
- `ESP_ERR_INVALID_ARG`: If the index of the public key to be revoked is incorrect.
- `ESP_FAIL`: If secure boot v2 has not been enabled.

**Macros****OTA\_SIZE\_UNKNOWN**

Used for `esp_ota_begin()` if new image size is unknown

**OTA\_WITH\_SEQUENTIAL\_WRITES**

Used for `esp_ota_begin()` if new image size is unknown and erase can be done in incremental manner (assuming write operation is in continuous sequence)

**ESP\_ERR\_OTA\_BASE**

Base error code for `ota_ops` api

**ESP\_ERR\_OTA\_PARTITION\_CONFLICT**

Error if request was to write or erase the current running partition

**ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID**

Error if OTA data partition contains invalid content

**ESP\_ERR\_OTA\_VALIDATE\_FAILED**

Error if OTA app image is invalid

**ESP\_ERR\_OTA\_SMALL\_SEC\_VER**

Error if the firmware has a secure version less than the running firmware.

**ESP\_ERR\_OTA\_ROLLBACK\_FAILED**

Error if flash does not have valid firmware in passive partition and hence rollback is not possible

**ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE**

Error if current active firmware is still marked in pending validation state (`ESP_OTA_IMG_PENDING_VERIFY`), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

**Type Definitions**

```
typedef uint32_t esp_ota_handle_t
```

Opaque handle for an application OTA update.

`esp_ota_begin()` returns a handle which is then used for subsequent calls to `esp_ota_write()` and `esp_ota_end()`.

**Enumerations**

```
enum esp_ota_secure_boot_public_key_index_t
```

Secure Boot V2 public key indexes.

*Values:*

```
enumerator SECURE_BOOT_PUBLIC_KEY_INDEX_0
```

Points to the 0th index of the Secure Boot v2 public key

```
enumerator SECURE_BOOT_PUBLIC_KEY_INDEX_1
```

Points to the 1st index of the Secure Boot v2 public key

```
enumerator SECURE_BOOT_PUBLIC_KEY_INDEX_2
```

Points to the 2nd index of the Secure Boot v2 public key

## Debugging OTA Failure

### 2.7.22 Performance Monitor

The Performance Monitor component provides APIs to use ESP32-S3 internal performance counters to profile functions and applications.

#### Application Example

An example which combines performance monitor is provided in `examples/system/perfmon` directory. This example initializes the performance monitor structure and execute them with printing the statistics.

#### High level API Reference

##### Header Files

- [perfmon/include/perfmon.h](#)

##### API Reference

##### Header File

- [components/perfmon/include/xtensa\\_perfmon\\_access.h](#)

##### Functions

*esp\_err\_t* **xtensa\_perfmon\_init** (int id, uint16\_t select, uint16\_t mask, int kernelcnt, int tracelevel)

Init Performance Monitor.

Initialize performance monitor register with define values

##### Parameters

- **id** –[in] performance counter number
- **select** –[in] select value from PMCTRLx register
- **mask** –[in] mask value from PMCTRLx register
- **kernelcnt** –[in] kernelcnt value from PMCTRLx register
- **tracelevel** –[in] tracelevel value from PMCTRLx register

##### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if one of the arguments is not correct

*esp\_err\_t* **xtensa\_perfmon\_reset** (int id)

Reset PM counter.

Reset PM counter. Writes 0 to the PMx register.

**Parameters** **id** –[in] performance counter number

##### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if id out of range

void **xtensa\_perfmon\_start** (void)

Start PM counters.

Start all PM counters synchronously. Write 1 to the PGM register

void **xtensa\_perfmon\_stop** (void)

Stop PM counters.

Stop all PM counters synchronously. Write 0 to the PGM register

uint32\_t **xtensa\_perfmon\_value** (int id)

Read PM counter.

Read value of defined PM counter.

**Parameters** **id** –[in] performance counter number

**Returns**

- Performance counter value

*esp\_err\_t* **xtensa\_perfmon\_overflow** (int id)

Read PM overflow state.

Read overflow value of defined PM counter.

**Parameters** **id** –[in] performance counter number

**Returns**

- ESP\_OK if there is no overflow (overflow = 0)
- ESP\_FAIL if overflow occur (overflow = 1)

void **xtensa\_perfmon\_dump** (void)

Dump PM values.

Dump all PM register to the console.

## Header File

- [components/perfmon/include/xtensa\\_perfmon\\_apis.h](#)

## Functions

*esp\_err\_t* **xtensa\_perfmon\_exec** (const *xtensa\_perfmon\_config\_t* \*config)

Execute PM.

Execute performance counter for dedicated function with defined parameters

**Parameters** **config** –[in] pointer to the configuration structure

**Returns**

- ESP\_OK if no errors
- ESP\_ERR\_INVALID\_ARG if one of the required parameters not defined
- ESP\_FAIL - counter overflow

void **xtensa\_perfmon\_view\_cb** (void \*params, uint32\_t select, uint32\_t mask, uint32\_t value)

Dump PM results.

Callback to dump perfmon result to a FILE\* stream specified in *perfmon\_config\_t::callback\_params*. If *callback\_params* is set to NULL, will print to stdout

**Parameters**

- **params** –[in] used parameters passed from configuration (*callback\_params*). This parameter expected as FILE\* handle, where data will be stored. If this parameter NULL, then data will be stored to the stdout.
- **select** –[in] select value for current counter
- **mask** –[in] mask value for current counter
- **value** –[in] counter value for current counter

## Structures

struct **xtensa\_perfmon\_config**

Performance monitor configuration structure.

Structure to configure performance counter to measure dedicated function

## Public Members

int **repeat\_count**

how much times function will be called before the callback will be repeated

float **max\_deviation**

Difference between min and max counter number 0..1, 0 - no difference, 1 - not used

void **\*call\_params**

This pointer will be passed to the call\_function as a parameter

void (**\*call\_function**)(void \*params)

pointer to the function that have to be called

void (**\*callback**)(void \*params, uint32\_t select, uint32\_t mask, uint32\_t value)

pointer to the function that will be called with result parameters

void **\*callback\_params**

parameter that will be passed to the callback

int **tracelevel**

trace level for all counters. In case of negative value, the filter will be ignored. If it's  $\geq 0$ , then the perfmon will count only when interrupt level  $>$  tracelevel. It's useful to monitor interrupts.

uint32\_t **counters\_size**

amount of counter in the list

const uint32\_t **\*select\_mask**

list of the select/mask parameters

## Type Definitions

typedef struct *xtensa\_perfmon\_config* **xtensa\_perfmon\_config\_t**

Performance monitor configuration structure.

Structure to configure performance counter to measure dedicated function

### 2.7.23 Power Management

#### Overview

Power management algorithm included in ESP-IDF can adjust the advanced peripheral bus (APB) frequency, CPU frequency, and put the chip into light sleep mode to run an application at smallest possible power consumption, given the requirements of application components.

Application components can express their requirements by creating and acquiring power management locks.

For example:

- Driver for a peripheral clocked from APB can request the APB frequency to be set to 80 MHz while the peripheral is used.

- RTOS can request the CPU to run at the highest configured frequency while there are tasks ready to run.
- A peripheral driver may need interrupts to be enabled, which means it will have to request disabling light sleep.

Since requesting higher APB or CPU frequencies or disabling light sleep causes higher current consumption, please keep the usage of power management locks by components to a minimum.

### Configuration

Power management can be enabled at compile time, using the option `CONFIG_PM_ENABLE`.

Enabling power management features comes at the cost of increased interrupt latency. Extra latency depends on a number of factors, such as the CPU frequency, single/dual core mode, whether or not frequency switch needs to be done. Minimum extra latency is 0.2 us (when the CPU frequency is 240 MHz and frequency scaling is not enabled). Maximum extra latency is 40 us (when frequency scaling is enabled, and a switch from 40 MHz to 80 MHz is performed on interrupt entry).

Dynamic frequency scaling (DFS) and automatic light sleep can be enabled in an application by calling the function `esp_pm_configure()`. Its argument is a structure defining the frequency scaling settings, `esp_pm_config_esp32s3_t`. In this structure, three fields need to be initialized:

- `max_freq_mhz`: Maximum CPU frequency in MHz, i.e., the frequency used when the `ESP_PM_CPU_FREQ_MAX` lock is acquired. This field will usually be set to the default CPU frequency.
- `min_freq_mhz`: Minimum CPU frequency in MHz, i.e., the frequency used when only the `ESP_PM_APB_FREQ_MAX` lock is acquired. This field can be set to the XTAL frequency value, or the XTAL frequency divided by an integer. Note that 10 MHz is the lowest frequency at which the default `REF_TICK` clock of 1 MHz can be generated.
- `light_sleep_enable`: Whether the system should automatically enter light sleep when no locks are acquired (`true/false`).

Alternatively, if you enable the option `CONFIG_PM_DFS_INIT_AUTO` in menuconfig, the maximum CPU frequency will be determined by the `CONFIG_ESP32S3_DEFAULT_CPU_FREQ_MHZ` setting, and the minimum CPU frequency will be locked to the XTAL frequency.

---

**Note:** Automatic light sleep is based on FreeRTOS Tickless Idle functionality. If automatic light sleep is requested while the option `CONFIG_FREERTOS_USE_TICKLESS_IDLE` is not enabled in menuconfig, `esp_pm_configure()` will return the error `ESP_ERR_NOT_SUPPORTED`.

---

---

**Note:** In light sleep, peripherals are clock gated, and interrupts (from GPIOs and internal peripherals) will not be generated. A wakeup source described in the *Sleep Modes* documentation can be used to trigger wakeup from the light sleep state.

---

For example, the EXT0 and EXT1 wakeup sources can be used to wake up the chip via a GPIO.

### Power Management Locks

Applications have the ability to acquire/release locks in order to control the power management algorithm. When an application acquires a lock, the power management algorithm operation is restricted in a way described below. When the lock is released, such restrictions are removed.

Power management locks have acquire/release counters. If the lock has been acquired a number of times, it needs to be released the same number of times to remove associated restrictions.

ESP32-S3 supports three types of locks described in the table below.

Lock	Description
ESP_PM_CPU_FREQ_MAX	Requests CPU frequency to be at the maximum value set with <i>esp_pm_configure()</i> . For ESP32-S3, this value can be set to 80 MHz, 160 MHz, or 240 MHz.
ESP_PM_APB_FREQ_MAX	Requests the APB frequency to be at the maximum supported value. For ESP32-S3, this is 80 MHz.
ESP_PM_NO_LIGHT_SLEEP	Disables automatic switching to light sleep.

### ESP32-S3 Power Management Algorithm

The table below shows how CPU and APB frequencies will be switched if dynamic frequency scaling is enabled. You can specify the maximum CPU frequency with either *esp\_pm\_configure()* or *CONFIG\_ESP32S3\_DEFAULT\_CPU\_FREQ\_MHZ*.

Max CPU Frequency Set	Lock Acquisition	CPU and APB Frequencies
240	ESP_PM_CPU_FREQ_MAX acquired	CPU: 240 MHz APB: 80 MHz
	ESP_PM_APB_FREQ_MAX acquired, ESP_PM_CPU_FREQ_MAX not acquired	CPU: 80 MHz APB: 80 MHz
	None	Min values for both frequencies set with <i>esp_pm_configure()</i>
160	ESP_PM_CPU_FREQ_MAX acquired	CPU: 160 MHz APB: 80 MHz
	ESP_PM_APB_FREQ_MAX acquired, ESP_PM_CPU_FREQ_MAX not acquired	CPU: 80 MHz APB: 80 MHz
	None	Min values for both frequencies set with <i>esp_pm_configure()</i>
80	Any of ESP_PM_CPU_FREQ_MAX or ESP_PM_APB_FREQ_MAX acquired	CPU: 80 MHz APB: 80 MHz
	None	Min values for both frequencies set with <i>esp_pm_configure()</i>

If none of the locks are acquired, and light sleep is enabled in a call to *esp\_pm\_configure()*, the system will go into light sleep mode. The duration of light sleep will be determined by:

- FreeRTOS tasks blocked with finite timeouts
- Timers registered with *High resolution timer* APIs

Light sleep duration will be chosen to wake up the chip before the nearest event (task being unblocked, or timer elapses).

To skip unnecessary wake-up you can consider initializing an `esp_timer` with the `skip_unhandled_events` option as true. Timers with this flag will not wake up the system and it helps to reduce consumption.

### Dynamic Frequency Scaling and Peripheral Drivers

When DFS is enabled, the APB frequency can be changed multiple times within a single RTOS tick. The APB frequency change does not affect the operation of some peripherals, while other peripherals may have issues. For example, Timer Group peripheral timers will keep counting, however, the speed at which they count will change proportionally to the APB frequency.

The following peripherals work normally even when the APB frequency is changing:

- **UART:** if REF\_TICK is used as a clock source. See `use_ref_tick` member of `uart_config_t`.
- **LEDC:** if REF\_TICK is used as a clock source. See `ledc_timer_config()` function.
- **RMT:** if REF\_TICK or XTAL is used as a clock source. See `flags` member of `rmt_config_t` and macro `RMT_CHANNEL_FLAGS_AWARE_DFS`.

Currently, the following peripheral drivers are aware of DFS and will use the `ESP_PM_APB_FREQ_MAX` lock for the duration of the transaction:

- SPI master
- I2C
- I2S (If the APLL clock is used, then it will use the `ESP_PM_NO_LIGHT_SLEEP` lock)
- SDMMC

The following drivers will hold the `ESP_PM_APB_FREQ_MAX` lock while the driver is enabled:

- **SPI slave:** between calls to `spi_slave_initialize()` and `spi_slave_free()`.
- **Ethernet:** between calls to `esp_eth_driver_install()` and `esp_eth_driver_uninstall()`.
- **WiFi:** between calls to `esp_wifi_start()` and `esp_wifi_stop()`. If modem sleep is enabled, the lock will be released for the periods of time when radio is disabled.
- **TWAI:** between calls to `twai_driver_install()` and `twai_driver_uninstall()`.
- **Bluetooth:** between calls to `esp_bt_controller_enable()` and `esp_bt_controller_disable()`. If Bluetooth modem sleep is enabled, the `ESP_PM_APB_FREQ_MAX` lock will be released for the periods of time when radio is disabled. However the `ESP_PM_NO_LIGHT_SLEEP` lock will still be held.

The following peripheral drivers are not aware of DFS yet. Applications need to acquire/release locks themselves, when necessary:

- PCNT
- Sigma-delta
- Timer group
- MCPWM

## API Reference

### Header File

- `components/esp_pm/include/esp_pm.h`

### Functions

`esp_err_t esp_pm_configure` (const void \*config)

Set implementation-specific power management configuration.

**Parameters** `config` –pointer to implementation-specific configuration structure (e.g. `esp_pm_config_esp32`)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the configuration values are not correct
- ESP\_ERR\_NOT\_SUPPORTED if certain combination of values is not supported, or if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

*esp\_err\_t* **esp\_pm\_get\_configuration** (void \*config)

Get implementation-specific power management configuration.

**Parameters** **config** –pointer to implementation-specific configuration structure (e.g. esp\_pm\_config\_esp32)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the pointer is null

*esp\_err\_t* **esp\_pm\_lock\_create** (*esp\_pm\_lock\_type\_t* lock\_type, int arg, const char \*name, *esp\_pm\_lock\_handle\_t* \*out\_handle)

Initialize a lock handle for certain power management parameter.

When lock is created, initially it is not taken. Call esp\_pm\_lock\_acquire to take the lock.

This function must not be called from an ISR.

**Parameters**

- **lock\_type** –Power management constraint which the lock should control
- **arg** –argument, value depends on lock\_type, see esp\_pm\_lock\_type\_t
- **name** –arbitrary string identifying the lock (e.g. “wifi” or “spi” ). Used by the esp\_pm\_dump\_locks function to list existing locks. May be set to NULL. If not set to NULL, must point to a string which is valid for the lifetime of the lock.
- **out\_handle** –[out] handle returned from this function. Use this handle when calling esp\_pm\_lock\_delete, esp\_pm\_lock\_acquire, esp\_pm\_lock\_release. Must not be NULL.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if the lock structure can not be allocated
- ESP\_ERR\_INVALID\_ARG if out\_handle is NULL or type argument is not valid
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

*esp\_err\_t* **esp\_pm\_lock\_acquire** (*esp\_pm\_lock\_handle\_t* handle)

Take a power management lock.

Once the lock is taken, power management algorithm will not switch to the mode specified in a call to esp\_pm\_lock\_create, or any of the lower power modes (higher numeric values of ‘mode’ ).

The lock is recursive, in the sense that if esp\_pm\_lock\_acquire is called a number of times, esp\_pm\_lock\_release has to be called the same number of times in order to release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp\_pm\_lock\_\* functions for the same handle.

**Parameters** **handle** –handle obtained from esp\_pm\_lock\_create function

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the handle is invalid
- ESP\_ERR\_NOT\_SUPPORTED if CONFIG\_PM\_ENABLE is not enabled in sdkconfig

*esp\_err\_t* **esp\_pm\_lock\_release** (*esp\_pm\_lock\_handle\_t* handle)

Release the lock taken using esp\_pm\_lock\_acquire.

Call to this functions removes power management restrictions placed when taking the lock.

Locks are recursive, so if esp\_pm\_lock\_acquire is called a number of times, esp\_pm\_lock\_release has to be called the same number of times in order to actually release the lock.

This function may be called from an ISR.

This function is not thread-safe w.r.t. calls to other esp\_pm\_lock\_\* functions for the same handle.

**Parameters** **handle** –handle obtained from `esp_pm_lock_create` function

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if the handle is invalid
- `ESP_ERR_INVALID_STATE` if lock is not acquired
- `ESP_ERR_NOT_SUPPORTED` if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

*esp\_err\_t* **esp\_pm\_lock\_delete** (*esp\_pm\_lock\_handle\_t* handle)

Delete a lock created using `esp_pm_lock`.

The lock must be released before calling this function.

This function must not be called from an ISR.

**Parameters** **handle** –handle obtained from `esp_pm_lock_create` function

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if the handle argument is `NULL`
- `ESP_ERR_INVALID_STATE` if the lock is still acquired
- `ESP_ERR_NOT_SUPPORTED` if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

*esp\_err\_t* **esp\_pm\_dump\_locks** (`FILE *stream`)

Dump the list of all locks to `stderr`

This function dumps debugging information about locks created using `esp_pm_lock_create` to an output stream.

This function must not be called from an ISR. If `esp_pm_lock_acquire/release` are called while this function is running, inconsistent results may be reported.

**Parameters** **stream** –stream to print information to; use `stdout` or `stderr` to print to the console; use `fmemopen/open_memstream` to print to a string buffer.

**Returns**

- `ESP_OK` on success
- `ESP_ERR_NOT_SUPPORTED` if `CONFIG_PM_ENABLE` is not enabled in `sdkconfig`

## Type Definitions

```
typedef struct esp_pm_lock *esp_pm_lock_handle_t
```

Opaque handle to the power management lock.

## Enumerations

```
enum esp_pm_lock_type_t
```

Power management constraints.

*Values:*

enumerator **ESP\_PM\_CPU\_FREQ\_MAX**

Require CPU frequency to be at the maximum value set via `esp_pm_configure`. Argument is unused and should be set to 0.

enumerator **ESP\_PM\_APB\_FREQ\_MAX**

Require APB frequency to be at the maximum value supported by the chip. Argument is unused and should be set to 0.

enumerator **ESP\_PM\_NO\_LIGHT\_SLEEP**

Prevent the system from going into light sleep. Argument is unused and should be set to 0.

## Header File

- [components/esp\\_pm/include/esp32s3/pm.h](#)

## Structures

struct **esp\_pm\_config\_esp32s3\_t**

Power management config for ESP32.

Pass a pointer to this structure as an argument to `esp_pm_configure` function.

## Public Members

int **max\_freq\_mhz**

Maximum CPU frequency, in MHz

int **min\_freq\_mhz**

Minimum CPU frequency to use when no locks are taken, in MHz

bool **light\_sleep\_enable**

Enter light sleep when no locks are taken

## 2.7.24 Random Number Generation

ESP32-S3 contains a hardware random number generator, values from it can be obtained using the APIs [esp\\_random\(\)](#) and [esp\\_fill\\_random\(\)](#).

The hardware RNG produces true random numbers under any of the following conditions:

- RF subsystem is enabled (i.e. Wi-Fi or Bluetooth are enabled).
- An internal entropy source has been enabled by calling [bootloader\\_random\\_enable\(\)](#) and not yet disabled by calling [bootloader\\_random\\_disable\(\)](#).
- While the ESP-IDF *Second stage bootloader* is running. This is because the default ESP-IDF bootloader implementation calls [bootloader\\_random\\_enable\(\)](#) when the bootloader starts, and [bootloader\\_random\\_disable\(\)](#) before executing the app.

When any of these conditions are true, samples of physical noise are continuously mixed into the internal hardware RNG state to provide entropy. Consult the *ESP32-S3 Technical Reference Manual > Random Number Generator (RNG)* [PDF] chapter for more details.

If none of the above conditions are true, the output of the RNG should be considered pseudo-random only.

## Startup

During startup, ESP-IDF bootloader temporarily enables a non-RF entropy source (internal reference voltage noise) that provides entropy for any first boot key generation. However, after the app starts executing then normally only pseudo-random numbers are available until Wi-Fi or Bluetooth are initialized.

To re-enable the entropy source temporarily during app startup, or for an application that does not use Wi-Fi or Bluetooth, call the function [bootloader\\_random\\_enable\(\)](#) to re-enable the internal entropy source. The function [bootloader\\_random\\_disable\(\)](#) must be called to disable the entropy source again before using ADC, Wi-Fi or Bluetooth.

---

**Note:** The entropy source enabled during the boot process by the ESP-IDF Second Stage Bootloader will seed the internal RNG state with some entropy. However, the internal hardware RNG state is not large enough to provide a

continuous stream of true random numbers. This is why a continuous entropy source must be enabled whenever true random numbers are required.

---

**Note:** If an application requires a source of true random numbers but it is not possible to permanently enable a hardware entropy source, consider using a strong software DRBG implementation such as the mbedTLS CTR-DRBG or HMAC-DRBG, with an initial seed of entropy from hardware RNG true random numbers.

---

## Secondary Entropy

ESP32-S3 RNG contains a secondary entropy source, based on sampling an asynchronous 8MHz internal oscillator (see the Technical Reference Manual for details). This entropy source is always enabled in ESP-IDF and continuously mixed into the RNG state by hardware. In testing, this secondary entropy source was sufficient to pass the [Dieharder](#) random number test suite without the main entropy source enabled (test input was created by concatenating short samples from a continuously resetting ESP32-S3). However, it is currently only guaranteed that true random numbers will be produced when the main entropy source is also enabled as described above.

## API Reference

### Header File

- [components/esp\\_hw\\_support/include/esp\\_random.h](#)

### Functions

uint32\_t **esp\_random** (void)

Get one random 32-bit word from hardware RNG.

If Wi-Fi or Bluetooth are enabled, this function returns true random numbers. In other situations, if true random numbers are required then consult the ESP-IDF Programming Guide “Random Number Generation” section for necessary prerequisites.

This function automatically busy-waits to ensure enough external entropy has been introduced into the hardware RNG state, before returning a new random number. This delay is very short (always less than 100 CPU cycles).

**Returns** Random value between 0 and UINT32\_MAX

void **esp\_fill\_random** (void \*buf, size\_t len)

Fill a buffer with random bytes from hardware RNG.

---

**Note:** This function is implemented via calls to `esp_random()`, so the same constraints apply.

---

### Parameters

- **buf** –Pointer to buffer to fill with random numbers.
- **len** –Length of buffer in bytes

### Header File

- [components/bootloader\\_support/include/bootloader\\_random.h](#)

### Functions

void **bootloader\_random\_enable** (void)

Enable an entropy source for RNG if RF is disabled.

The exact internal entropy source mechanism depends on the chip in use but all SoCs use the SAR ADC to continuously mix random bits (an internal noise reading) into the HWRNG. Consult the SoC Technical Reference Manual for more information.

Can also be used from app code early during operation, if true random numbers are required before RF is initialised. Consult ESP-IDF Programming Guide “Random Number Generation” section for details.

void **bootloader\_random\_disable** (void)

Disable entropy source for RNG.

Disables internal entropy source. Must be called after `bootloader_random_enable()` and before RF features, ADC, or I2S (ESP32 only) are initialized.

Consult the ESP-IDF Programming Guide “Random Number Generation” section for details.

void **bootloader\_fill\_random** (void \*buffer, size\_t length)

Fill buffer with ‘length’ random bytes.

---

**Note:** If this function is being called from app code only, and never from the bootloader, then it’s better to call `esp_fill_random()`.

---

#### Parameters

- **buffer** –Pointer to buffer
- **length** –This many bytes of random data will be copied to buffer

### getrandom

A compatible version of the Linux `getrandom()` function is also provided for ease of porting:

```
#include <sys/random.h>

ssize_t getrandom(void *buf, size_t buflen, unsigned int flags);
```

This function is implemented by calling `esp_fill_random()` internally.

The `flags` argument is ignored, this function is always non-blocking but the strength of any random numbers is dependent on the same conditions described above.

Return value is -1 (with `errno` set to `EFAULT`) if the `buf` argument is `NULL`, and equal to `buflen` otherwise.

## 2.7.25 Sleep Modes

### Overview

ESP32-S3 is capable of light sleep and deep sleep power saving modes.

In light sleep mode, digital peripherals, most of the RAM, and CPUs are clock-gated, and supply voltage is reduced. Upon exit from light sleep, peripherals and CPUs resume operation, their internal state is preserved.

In deep sleep mode, CPUs, most of the RAM, and all the digital peripherals which are clocked from `APB_CLK` are powered off. The only parts of the chip which can still be powered on are:

- RTC controller
- RTC peripherals
- ULP coprocessor
- RTC fast memory

- RTC slow memory

Wakeup from deep and light sleep modes can be done using several sources. These sources can be combined, in this case the chip will wake up when any one of the sources is triggered. Wakeup sources can be enabled using `esp_sleep_enable_X_wakeup` APIs and can be disabled using `esp_sleep_disable_wakeup_source()` API. Next section describes these APIs in detail. Wakeup sources can be configured at any moment before entering light or deep sleep mode.

Additionally, the application can force specific powerdown modes for the RTC peripherals and RTC memories using `esp_sleep_pd_config()` API.

Once wakeup sources are configured, application can enter sleep mode using `esp_light_sleep_start()` or `esp_deep_sleep_start()` APIs. At this point the hardware will be configured according to the requested wakeup sources, and RTC controller will either power down or power off the CPUs and digital peripherals.

### WiFi/BT and sleep modes

In deep sleep and light sleep modes, wireless peripherals are powered down. Before entering light sleep modes, applications must disable WiFi and BT using appropriate calls (`esp_bluedroid_disable()`, `esp_bt_controller_disable()`, `esp_wifi_stop()`). WiFi and BT connections will not be maintained in deep sleep or light sleep, even if these functions are not called.

If Wi-Fi/Bluetooth connections need to be maintained, enable Wi-Fi/Bluetooth Modem-sleep mode and automatic Light-sleep feature (see [Power Management APIs](#)). This will allow the system to wake up from sleep automatically when required by the Wi-Fi/Bluetooth driver, thereby maintaining the connection.

### Wakeup sources

**Timer** RTC controller has a built in timer which can be used to wake up the chip after a predefined amount of time. Time is specified at microsecond precision, but the actual resolution depends on the clock source selected for RTC SLOW\_CLK.

For details on RTC clock options, see *ESP32-S3 Technical Reference Manual > ULP Coprocessor* [PDF].

This wakeup mode doesn't require RTC peripherals or RTC memories to be powered on during sleep.

`esp_sleep_enable_timer_wakeup()` function can be used to enable deep sleep wakeup using a timer.

**Touch pad** RTC IO module contains logic to trigger wakeup when a touch sensor interrupt occurs. You need to configure the touch pad interrupt before the chip starts deep sleep.

`esp_sleep_enable_touchpad_wakeup()` function can be used to enable this wakeup source.

**External wakeup (ext0)** RTC IO module contains logic to trigger wakeup when one of RTC GPIOs is set to a predefined logic level. RTC IO is part of RTC peripherals power domain, so RTC peripherals will be kept powered on during deep sleep if this wakeup source is requested.

Because RTC IO module is enabled in this mode, internal pullup or pulldown resistors can also be used. They need to be configured by the application using `rtc_gpio_pullup_en()` and `rtc_gpio_pulldown_en()` functions, before calling `esp_sleep_start()`.

`esp_sleep_enable_ext0_wakeup()` function can be used to enable this wakeup source.

**Warning:** After wake up from sleep, IO pad used for wakeup will be configured as RTC IO. Before using this pad as digital GPIO, reconfigure it using `rtc_gpio_deinit(gpio_num)` function.

**External wakeup (ext1)** RTC controller contains logic to trigger wakeup using multiple RTC GPIOs. One of the two logic functions can be used to trigger wakeup:

- wake up if any of the selected pins is high (ESP\_EXT1\_WAKEUP\_ANY\_HIGH)
- wake up if any of the selected pins is low (ESP\_EXT1\_WAKEUP\_ANY\_LOW)

This wakeup source is implemented by the RTC controller. As such, RTC peripherals and RTC memories can be powered down in this mode. However, if RTC peripherals are powered down, internal pullup and pulldown resistors will be disabled. To use internal pullup or pulldown resistors, request RTC peripherals power domain to be kept on during sleep, and configure pullup/pulldown resistors using `rtc_gpio_` functions, before entering sleep:

```
esp_sleep_pd_config(ESP_PD_DOMAIN_RTC_PERIPH, ESP_PD_OPTION_ON);
rtc_gpio_pullup_dis(gpio_num);
rtc_gpio_pulldown_en(gpio_num);
```

**Warning:**

- To use the EXT1 wakeup, the IO pad(s) are configured as RTC IO. Thus if these pads want to be used as digital GPIOs after waking up from sleep, `rtc_gpio_deinit(gpio_num)` function needs to be called first.
- If the RTC peripherals are configured to be powered down (which is by default), the wakeup IOs will be set to holding state before entering sleep. Therefore, after waking up from Light-sleep, please call `rtc_gpio_hold_dis` to disable the hold function to perform any pin re-configuration. For Deep-sleep wakeup, this is already being handled at the application startup stage.

`esp_sleep_enable_ext1_wakeup()` function can be used to enable this wakeup source.

**ULP coprocessor wakeup** ULP coprocessor can run while the chip is in sleep mode, and may be used to poll sensors, monitor ADC or touch sensor values, and wake up the chip when a specific event is detected. ULP coprocessor is part of RTC peripherals power domain, and it runs the program stored in RTC slow memory. RTC slow memory will be powered on during sleep if this wakeup mode is requested. RTC peripherals will be automatically powered on before ULP coprocessor starts running the program; once the program stops running, RTC peripherals are automatically powered down again.

`esp_sleep_enable_ulp_wakeup()` function can be used to enable this wakeup source.

**GPIO wakeup (light sleep only)** In addition to EXT0 and EXT1 wakeup sources described above, one more method of wakeup from external inputs is available in light sleep mode. With this wakeup source, each pin can be individually configured to trigger wakeup on high or low level using `gpio_wakeup_enable()` function. Unlike EXT0 and EXT1 wakeup sources, which can only be used with RTC IOs, this wakeup source can be used with any IO (RTC or digital).

`esp_sleep_enable_gpio_wakeup()` function can be used to enable this wakeup source.

**Warning:** Before entering light sleep mode, check if any GPIO pin to be driven is part of the VDD\_SPI power domain. If so, this power domain must be configured to remain ON during sleep.

For example, on ESP32-WROOM-32 board, GPIO16 and GPIO17 are linked to VDD\_SPI power domain. If they are configured to remain high during light sleep, the power domain should be configured to remain powered ON. This can be done with `esp_sleep_pd_config()`:

```
esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_ON);
```

**UART wakeup (light sleep only)** When ESP32-S3 receives UART input from external devices, it is often required to wake up the chip when input data is available. UART peripheral contains a feature which allows waking up the chip from light sleep when a certain number of positive edges on RX pin are seen. This number of positive edges

can be set using `uart_set_wakeup_threshold()` function. Note that the character which triggers wakeup (and any characters before it) will not be received by the UART after wakeup. This means that the external device typically needs to send an extra character to the ESP32-S3 to trigger wakeup, before sending the data.

`esp_sleep_enable_uart_wakeup()` function can be used to enable this wakeup source.

### Power-down of RTC peripherals and memories

By default, `esp_deep_sleep_start()` and `esp_light_sleep_start()` functions will power down all RTC power domains which are not needed by the enabled wakeup sources. To override this behaviour, `esp_sleep_pd_config()` function is provided.

If some variables in the program are placed into RTC slow memory (for example, using `RTC_DATA_ATTR` attribute), RTC slow memory will be kept powered on by default. This can be overridden using `esp_sleep_pd_config()` function, if desired.

### Power-down of Flash

By default, to avoid potential issues, `esp_light_sleep_start()` function will **not** power down flash. To be more specific, it takes time to power down the flash and during this period the system may be woken up, which then actually powers up the flash before this flash could be powered down completely. As a result, there is a chance that the flash may not work properly.

So, in theory, it's ok if you only wake up the system after the flash is completely powered down. However, in reality, the flash power-down period can be hard to predict (for example, this period can be much longer when you add filter capacitors to the flash's power supply circuit) and uncontrollable (for example, the asynchronous wake-up signals make the actual sleep time uncontrollable).

**Warning:** If a filter capacitor is added to your flash power supply circuit, please do everything possible to avoid powering down flash.

Therefore, it's recommended not to power down flash when using ESP-IDF. For power-sensitive applications, it's recommended to use Kconfig option `CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND` to reduce the power consumption of the flash during light sleep, instead of powering down the flash.

It is worth mentioning that PSRAM has a similar Kconfig option `CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND`.

However, for those who have fully understood the risk and are still willing to power down the flash to further reduce the power consumption, please check the following mechanisms:

- Setting Kconfig option `CONFIG_ESP_SLEEP_POWER_DOWN_FLASH` only powers down the flash when the RTC timer is the only wake-up source **and** the sleep time is longer than the flash power-down period.
- Calling `esp_sleep_pd_config(ESP_PD_DOMAIN_VDDSDIO, ESP_PD_OPTION_OFF)` powers down flash when the RTC timer is not enabled as a wakeup source **or** the sleep time is longer than the flash power-down period.

---

#### Note:

- ESP-IDF does not provide any mechanism that can power down the flash in all conditions when light sleep.
  - `esp_deep_sleep_start()` function will force power down flash regardless of user configuration.
-

### Entering light sleep

`esp_light_sleep_start()` function can be used to enter light sleep once wakeup sources are configured. It is also possible to go into light sleep with no wakeup sources configured, in this case the chip will be in light sleep mode indefinitely, until external reset is applied.

### Entering deep sleep

`esp_deep_sleep_start()` function can be used to enter deep sleep once wakeup sources are configured. It is also possible to go into deep sleep with no wakeup sources configured, in this case the chip will be in deep sleep mode indefinitely, until external reset is applied.

### Configuring IOs

Some ESP32-S3 IOs have internal pullups or pulldowns, which are enabled by default. If an external circuit drives this pin in deep sleep mode, current consumption may increase due to current flowing through these pullups and pulldowns.

To isolate a pin, preventing extra current draw, call `rtc_gpio_isolate()` function.

For example, on ESP32-WROVER module, GPIO12 is pulled up externally. GPIO12 also has an internal pull-down in the ESP32 chip. This means that in deep sleep, some current will flow through these external and internal resistors, increasing deep sleep current above the minimal possible value. Add the following code before `esp_deep_sleep_start()` to remove this extra current:

```
rtc_gpio_isolate(GPIO_NUM_12);
```

### UART output handling

Before entering sleep mode, `esp_deep_sleep_start()` will flush the contents of UART FIFOs.

When entering light sleep mode using `esp_light_sleep_start()`, UART FIFOs will not be flushed. Instead, UART output will be suspended, and remaining characters in the FIFO will be sent out after wakeup from light sleep.

### Checking sleep wakeup cause

`esp_sleep_get_wakeup_cause()` function can be used to check which wakeup source has triggered wakeup from sleep mode.

For touch pad, it is possible to identify touch pad which has caused wakeup using `esp_sleep_get_touchpad_wakeup_status()` functions.

For ext1 wakeup sources, it is possible to identify pin which has caused wakeup using `esp_sleep_get_ext1_wakeup_status()` functions.

### Disable sleep wakeup source

Previously configured wakeup source can be disabled later using `esp_sleep_disable_wakeup_source()` API. This function deactivates trigger for the given wakeup source. Additionally it can disable all triggers if the argument is `ESP_SLEEP_WAKEUP_ALL`.

## Application Example

Implementation of basic functionality of deep sleep is shown in [protocols/sntp](#) example, where ESP module is periodically waken up to retrieve time from NTP server.

More extensive example in [system/deep\\_sleep](#) illustrates usage of various deep sleep wakeup triggers and ULP co-processor programming.

## API Reference

### Header File

- [components/esp\\_hw\\_support/include/esp\\_sleep.h](#)

### Functions

*esp\_err\_t* **esp\_sleep\_disable\_wakeup\_source** (*esp\_sleep\_source\_t* source)

Disable wakeup source.

This function is used to deactivate wake up trigger for source defined as parameter of the function.

See docs/sleep-modes.rst for details.

---

**Note:** This function does not modify wake up configuration in RTC. It will be performed in `esp_sleep_start` function.

---

**Parameters** `source` -- number of source to disable of type `esp_sleep_source_t`

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if trigger was not active

*esp\_err\_t* **esp\_sleep\_enable\_ulp\_wakeup** (void)

Enable wakeup by ULP coprocessor.

---

**Note:** On ESP32, ULP wakeup source cannot be used when RTC\_PERIPH power domain is forced, to be powered on (ESP\_PD\_OPTION\_ON) or when ext0 wakeup source is used.

---

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if additional current by touch (CONFIG\_ESP32\_RTC\_EXT\_CRYST\_ADDIT\_CURRENT) is enabled.
- ESP\_ERR\_INVALID\_STATE if ULP co-processor is not enabled or if wakeup triggers conflict

*esp\_err\_t* **esp\_sleep\_enable\_timer\_wakeup** (uint64\_t time\_in\_us)

Enable wakeup by timer.

**Parameters** `time_in_us` --time before wakeup, in microseconds

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if value is out of range (TBD)

*esp\_err\_t* **esp\_sleep\_enable\_touchpad\_wakeup** (void)

Enable wakeup by touch sensor.

---

**Note:** On ESP32, touch wakeup source can not be used when RTC\_PERIPH power domain is forced to be powered on (ESP\_PD\_OPTION\_ON) or when ext0 wakeup source is used.

---

---

**Note:** The FSM mode of the touch button should be configured as the timer trigger mode.

---

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if additional current by touch (CONFIG\_ESP32\_RTC\_EXT\_CRYST\_ADDIT\_CURRENT) is enabled.
- ESP\_ERR\_INVALID\_STATE if wakeup triggers conflict

*touch\_pad\_t* **esp\_sleep\_get\_touchpad\_wakeup\_status** (void)

Get the touch pad which caused wakeup.

If wakeup was caused by another source, this function will return TOUCH\_PAD\_MAX;

**Returns** touch pad which caused wakeup

bool **esp\_sleep\_is\_valid\_wakeup\_gpio** (*gpio\_num\_t* gpio\_num)

Returns true if a GPIO number is valid for use as wakeup source.

---

**Note:** For SoCs with RTC IO capability, this can be any valid RTC IO input pin.

---

**Parameters** *gpio\_num* –Number of the GPIO to test for wakeup source capability

**Returns** True if this GPIO number will be accepted as a sleep wakeup source.

*esp\_err\_t* **esp\_sleep\_enable\_ext0\_wakeup** (*gpio\_num\_t* gpio\_num, int level)

Enable wakeup using a pin.

This function uses external wakeup feature of RTC\_IO peripheral. It will work only if RTC peripherals are kept on during sleep.

This feature can monitor any pin which is an RTC IO. Once the pin transitions into the state given by level argument, the chip will be woken up.

---

**Note:** This function does not modify pin configuration. The pin is configured in esp\_sleep\_start, immediately before entering sleep mode.

---

---

**Note:** On ESP32, ext0 wakeup source can not be used together with touch or ULP wakeup sources.

---

**Parameters**

- *gpio\_num* –GPIO number used as wakeup source. Only GPIOs which are have RTC functionality can be used: 0,2,4,12-15,25-27,32-39.
- *level* –input level which will trigger wakeup (0=low, 1=high)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if the selected GPIO is not an RTC GPIO, or the mode is invalid
- ESP\_ERR\_INVALID\_STATE if wakeup triggers conflict

*esp\_err\_t* **esp\_sleep\_enable\_ext1\_wakeup** (uint64\_t mask, *esp\_sleep\_ext1\_wakeup\_mode\_t* mode)

Enable wakeup using multiple pins.

This function uses external wakeup feature of RTC controller. It will work even if RTC peripherals are shut down during sleep.

This feature can monitor any number of pins which are in RTC IOs. Once any of the selected pins goes into the state given by mode argument, the chip will be woken up.

---

**Note:** This function does not modify pin configuration. The pins are configured in `esp_sleep_start`, immediately before entering sleep mode.

---

---

**Note:** internal pullups and pulldowns don't work when RTC peripherals are shut down. In this case, external resistors need to be added. Alternatively, RTC peripherals (and pullups/pulldowns) may be kept enabled using `esp_sleep_pd_config` function.

---

#### Parameters

- **mask** –bit mask of GPIO numbers which will cause wakeup. Only GPIOs which are have RTC functionality can be used in this bit map: 0,2,4,12-15,25-27,32-39.
- **mode** –select logic function used to determine wakeup condition:
  - `ESP_EXT1_WAKEUP_ALL_LOW`: wake up when all selected GPIOs are low
  - `ESP_EXT1_WAKEUP_ANY_HIGH`: wake up when any of the selected GPIOs is high

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_ARG` if any of the selected GPIOs is not an RTC GPIO, or mode is invalid

*esp\_err\_t* **esp\_sleep\_enable\_gpio\_wakeup** (void)

Enable wakeup from light sleep using GPIOs.

Each GPIO supports wakeup function, which can be triggered on either low level or high level. Unlike EXT0 and EXT1 wakeup sources, this method can be used both for all IOs: RTC IOs and digital IOs. It can only be used to wakeup from light sleep though.

To enable wakeup, first call `gpio_wakeup_enable`, specifying gpio number and wakeup level, for each GPIO which is used for wakeup. Then call this function to enable wakeup feature.

---

**Note:** On ESP32, GPIO wakeup source can not be used together with touch or ULP wakeup sources.

---

#### Returns

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if wakeup triggers conflict

*esp\_err\_t* **esp\_sleep\_enable\_uart\_wakeup** (int uart\_num)

Enable wakeup from light sleep using UART.

Use `uart_set_wakeup_threshold` function to configure UART wakeup threshold.

Wakeup from light sleep takes some time, so not every character sent to the UART can be received by the application.

---

**Note:** ESP32 does not support wakeup from UART2.

---

**Parameters** `uart_num` –UART port to wake up from

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if wakeup from given UART is not supported

*esp\_err\_t* **esp\_sleep\_enable\_wifi\_wakeup** (void)

Enable wakeup by WiFi MAC.

**Returns**

- ESP\_OK on success

*esp\_err\_t* **esp\_sleep\_disable\_wifi\_wakeup** (void)

Disable wakeup by WiFi MAC.

**Returns**

- ESP\_OK on success

uint64\_t **esp\_sleep\_get\_ext1\_wakeup\_status** (void)

Get the bit mask of GPIOs which caused wakeup (ext1)

If wakeup was caused by another source, this function will return 0.

**Returns** bit mask, if GPIO n caused wakeup, BIT(n) will be set

*esp\_err\_t* **esp\_sleep\_pd\_config** (*esp\_sleep\_pd\_domain\_t* domain, *esp\_sleep\_pd\_option\_t* option)

Set power down mode for an RTC power domain in sleep mode.

If not set using this API, all power domains default to ESP\_PD\_OPTION\_AUTO.

**Parameters**

- **domain** –power domain to configure
- **option** –power down option (ESP\_PD\_OPTION\_OFF, ESP\_PD\_OPTION\_ON, or ESP\_PD\_OPTION\_AUTO)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if either of the arguments is out of range

void **esp\_deep\_sleep\_start** (void)

Enter deep sleep with the configured wakeup options.

This function does not return.

*esp\_err\_t* **esp\_light\_sleep\_start** (void)

Enter light sleep with the configured wakeup options.

**Returns**

- ESP\_OK on success (returned after wakeup)
- ESP\_ERR\_SLEEP\_REJECT sleep request is rejected (wakeup source set before the sleep request)
- ESP\_ERR\_SLEEP\_TOO\_SHORT\_SLEEP\_DURATION after deducting the sleep flow overhead, the final sleep duration is too short to cover the minimum sleep duration of the chip, when rtc timer wakeup source enabled

void **esp\_deep\_sleep** (uint64\_t time\_in\_us)

Enter deep-sleep mode.

The device will automatically wake up after the deep-sleep time. Upon waking up, the device calls deep sleep wake stub, and then proceeds to load application.

Call to this function is equivalent to a call to esp\_deep\_sleep\_enable\_timer\_wakeup followed by a call to esp\_deep\_sleep\_start.

esp\_deep\_sleep does not shut down WiFi, BT, and higher level protocol connections gracefully. Make sure relevant WiFi and BT stack functions are called to close any connections and deinitialize the peripherals. These include:

- esp\_bluedroid\_disable

- `esp_bt_controller_disable`
- `esp_wifi_stop`

This function does not return.

---

**Note:** The device will wake up immediately if the deep-sleep time is set to 0

---

**Parameters** `time_in_us` –deep-sleep time, unit: microsecond

*esp\_sleep\_wakeup\_cause\_t* **esp\_sleep\_get\_wakeup\_cause** (void)

Get the wakeup source which caused wakeup from sleep.

**Returns** cause of wake up from last sleep (deep sleep or light sleep)

void **esp\_wake\_deep\_sleep** (void)

Default stub to run on wake from deep sleep.

Allows for executing code immediately on wake from sleep, before the software bootloader or ESP-IDF app has started up.

This function is weak-linked, so you can implement your own version to run code immediately when the chip wakes from sleep.

See docs/deep-sleep-stub.rst for details.

void **esp\_set\_deep\_sleep\_wake\_stub** (*esp\_deep\_sleep\_wake\_stub\_fn\_t* new\_stub)

Install a new stub at runtime to run on wake from deep sleep.

If implementing `esp_wake_deep_sleep()` then it is not necessary to call this function.

However, it is possible to call this function to substitute a different deep sleep stub. Any function used as a deep sleep stub must be marked `RTC_IRAM_ATTR`, and must obey the same rules given for `esp_wake_deep_sleep()`.

*esp\_deep\_sleep\_wake\_stub\_fn\_t* **esp\_get\_deep\_sleep\_wake\_stub** (void)

Get current wake from deep sleep stub.

**Returns** Return current wake from deep sleep stub, or NULL if no stub is installed.

void **esp\_default\_wake\_deep\_sleep** (void)

The default esp-idf-provided `esp_wake_deep_sleep()` stub.

See docs/deep-sleep-stub.rst for details.

void **esp\_deep\_sleep\_disable\_rom\_logging** (void)

Disable logging from the ROM code after deep sleep.

Using LSB of `RTC_STORE4`.

*esp\_err\_t* **esp\_sleep\_cpu\_pd\_low\_init** (bool enable)

CPU Power down low-level initialize.

**Parameters** `enable` –enable or disable CPU power down during light sleep

**Returns**

- `ESP_OK` on success
- `ESP_ERR_NO_MEM` not enough retention memory

void **esp\_sleep\_config\_gpio\_isolate** (void)

Configure to isolate all GPIO pins in sleep state.

void **esp\_sleep\_enable\_gpio\_switch** (bool enable)

Enable or disable GPIO pins status switching between slept status and waked status.

**Parameters** `enable` –decide whether to switch status or not

## Type Definitions

typedef *esp\_sleep\_source\_t* **esp\_sleep\_wakeup\_cause\_t**

typedef void (\***esp\_deep\_sleep\_wake\_stub\_fn\_t**)(void)

Function type for stub to run on wake from sleep.

## Enumerations

enum **esp\_sleep\_ext1\_wakeup\_mode\_t**

Logic function used for EXT1 wakeup mode.

*Values:*

enumerator **ESP\_EXT1\_WAKEUP\_ANY\_LOW**

Wake the chip when any of the selected GPIOs go low.

enumerator **ESP\_EXT1\_WAKEUP\_ANY\_HIGH**

Wake the chip when any of the selected GPIOs go high.

enumerator **ESP\_EXT1\_WAKEUP\_ALL\_LOW**

enum **esp\_sleep\_pd\_domain\_t**

Power domains which can be powered down in sleep mode.

*Values:*

enumerator **ESP\_PD\_DOMAIN\_RTC\_PERIPH**

RTC IO, sensors and ULP co-processor.

enumerator **ESP\_PD\_DOMAIN\_RTC\_SLOW\_MEM**

RTC slow memory.

enumerator **ESP\_PD\_DOMAIN\_RTC\_FAST\_MEM**

RTC fast memory.

enumerator **ESP\_PD\_DOMAIN\_XTAL**

XTAL oscillator.

enumerator **ESP\_PD\_DOMAIN\_CPU**

CPU core.

enumerator **ESP\_PD\_DOMAIN\_RTC8M**

Internal 8M oscillator.

enumerator **ESP\_PD\_DOMAIN\_VDDSDIO**

VDD\_SDIO.

enumerator **ESP\_PD\_DOMAIN\_MAX**

Number of domains.

enum **esp\_sleep\_pd\_option\_t**

Power down options.

*Values:*

enumerator **ESP\_PD\_OPTION\_OFF**

Power down the power domain in sleep mode.

enumerator **ESP\_PD\_OPTION\_ON**

Keep power domain enabled during sleep mode.

enumerator **ESP\_PD\_OPTION\_AUTO**

Keep power domain enabled in sleep mode, if it is needed by one of the wakeup options. Otherwise power it down.

enum **esp\_sleep\_source\_t**

Sleep wakeup cause.

*Values:*

enumerator **ESP\_SLEEP\_WAKEUP\_UNDEFINED**

In case of deep sleep, reset was not caused by exit from deep sleep.

enumerator **ESP\_SLEEP\_WAKEUP\_ALL**

Not a wakeup cause, used to disable all wakeup sources with `esp_sleep_disable_wakeup_source`.

enumerator **ESP\_SLEEP\_WAKEUP\_EXT0**

Wakeup caused by external signal using RTC\_IO.

enumerator **ESP\_SLEEP\_WAKEUP\_EXT1**

Wakeup caused by external signal using RTC\_CNTL.

enumerator **ESP\_SLEEP\_WAKEUP\_TIMER**

Wakeup caused by timer.

enumerator **ESP\_SLEEP\_WAKEUP\_TOUCHPAD**

Wakeup caused by touchpad.

enumerator **ESP\_SLEEP\_WAKEUP\_ULP**

Wakeup caused by ULP program.

enumerator **ESP\_SLEEP\_WAKEUP\_GPIO**

Wakeup caused by GPIO (light sleep only on ESP32, S2 and S3)

enumerator **ESP\_SLEEP\_WAKEUP\_UART**

Wakeup caused by UART (light sleep only)

enumerator **ESP\_SLEEP\_WAKEUP\_WIFI**

Wakeup caused by WIFI (light sleep only)

enumerator **ESP\_SLEEP\_WAKEUP\_COCPU**

Wakeup caused by COCPU int.

enumerator **ESP\_SLEEP\_WAKEUP\_COCPU\_TRAP\_TRIG**

Wakeup caused by COCPU crash.

enumerator **ESP\_SLEEP\_WAKEUP\_BT**

Wakeup caused by BT (light sleep only)

enum [**anonymous**]

*Values:*

enumerator **ESP\_ERR\_SLEEP\_REJECT**

enumerator **ESP\_ERR\_SLEEP\_TOO\_SHORT\_SLEEP\_DURATION**

## 2.7.26 Watchdogs

### Overview

The ESP-IDF has support for multiple types of watchdogs, with the two main ones being: The Interrupt Watchdog Timer and the Task Watchdog Timer (TWDT). The Interrupt Watchdog Timer and the TWDT can both be enabled using [Project Configuration Menu](#), however the TWDT can also be enabled during runtime. The Interrupt Watchdog is responsible for detecting instances where FreeRTOS task switching is blocked for a prolonged period of time. The TWDT is responsible for detecting instances of tasks running without yielding for a prolonged period.

**Interrupt watchdog** The interrupt watchdog makes sure the FreeRTOS task switching interrupt isn't blocked for a long time. This is bad because no other tasks, including potentially important ones like the WiFi task and the idle task, can't get any CPU runtime. A blocked task switching interrupt can happen because a program runs into an infinite loop with interrupts disabled or hangs in an interrupt.

The default action of the interrupt watchdog is to invoke the panic handler, causing a register dump and an opportunity for the programmer to find out, using either OpenOCD or gdbstub, what bit of code is stuck with interrupts disabled. Depending on the configuration of the panic handler, it can also blindly reset the CPU, which may be preferred in a production environment.

The interrupt watchdog is built around the hardware watchdog in timer group 1. If this watchdog for some reason cannot execute the NMI handler that invokes the panic handler (e.g. because IRAM is overwritten by garbage), it will hard-reset the SOC. If the panic handler executes, it will display the panic reason as "Interrupt wdt timeout on CPU0" or "Interrupt wdt timeout on CPU1" (as applicable).

**Configuration** The interrupt watchdog is enabled by default via the [CONFIG\\_ESP\\_INT\\_WDT](#) configuration flag. The timeout is configured by setting [CONFIG\\_ESP\\_INT\\_WDT\\_TIMEOUT\\_MS](#). The default timeout is higher if PSRAM support is enabled, as a critical section or interrupt routine that accesses a large amount of PSRAM will take longer to complete in some circumstances. The INT WDT timeout should always be longer than the period between FreeRTOS ticks (see [CONFIG\\_FREERTOS\\_HZ](#)).

**Tuning** If you find the Interrupt watchdog timeout is triggering because an interrupt or critical section is running longer than the timeout period, consider rewriting the code: critical sections should be made as short as possible, with non-critical computation happening outside the critical section. Interrupt handlers should also perform the minimum possible amount of computation, consider pushing data into a queue from the ISR and processing it in a task instead. Neither critical sections or interrupt handlers should ever block waiting for another event to occur.

If changing the code to reduce the processing time is not possible or desirable, it's possible to increase the `CONFIG_ESP_INT_WDT_TIMEOUT_MS` setting instead.

**Task Watchdog Timer** The Task Watchdog Timer (TWDT) is responsible for detecting instances of tasks running for a prolonged period of time without yielding. This is a symptom of CPU starvation and is usually caused by a higher priority task looping without yielding to a lower-priority task thus starving the lower priority task from CPU time. This can be an indicator of poorly written code that spinloops on a peripheral, or a task that is stuck in an infinite loop.

By default the TWDT will watch the Idle task, however any task can subscribe to be watched by the TWDT. Each watched task must 'reset' the TWDT periodically to indicate that they have been allocated CPU time. If a task does not reset within the TWDT timeout period, a warning will be printed with information about which tasks failed to reset the TWDT in time and which tasks are currently running.

It is also possible to redefine the function `esp_task_wdt_isr_user_handler` in the user code, in order to receive the timeout event and handle it differently.

The TWDT is built around the Hardware Watchdog Timer in Timer Group 0. The TWDT can be initialized by calling `esp_task_wdt_init()` which will configure the hardware timer. A task can then subscribe to the TWDT using `esp_task_wdt_add()` in order to be watched. Each subscribed task must periodically call `esp_task_wdt_reset()` to reset the TWDT. Failure by any subscribed tasks to periodically call `esp_task_wdt_reset()` indicates that one or more tasks have been starved of CPU time or are stuck in a loop somewhere.

A watched task can be unsubscribed from the TWDT using `esp_task_wdt_delete()`. A task that has been unsubscribed should no longer call `esp_task_wdt_reset()`. Once all tasks have unsubscribed from the TWDT, the TWDT can be deinitialized by calling `esp_task_wdt_deinit()`.

The default timeout period for the TWDT is set using config item `CONFIG_ESP_TASK_WDT_TIMEOUT_S`. This should be set to at least as long as you expect any single task will need to monopolise the CPU (for example, if you expect the app will do a long intensive calculation and should not yield to other tasks). It is also possible to change this timeout at runtime by calling `esp_task_wdt_init()`.

The following config options control TWDT configuration at startup. They are all enabled by default:

- `CONFIG_ESP_TASK_WDT` - the TWDT is initialized automatically during startup. If this option is disabled, it is still possible to initialize the Task WDT at runtime by calling `esp_task_wdt_init()`.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0` - CPU0 Idle task is subscribed to the TWDT during startup. If this option is disabled, it is still possible to subscribe the idle task by calling `esp_task_wdt_add()` at any time.
- `CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1` - CPU1 Idle task is subscribed to the TWDT during startup.

**JTAG and watchdogs** While debugging using OpenOCD, the CPUs will be halted every time a breakpoint is reached. However if the watchdog timers continue to run when a breakpoint is encountered, they will eventually trigger a reset making it very difficult to debug code. Therefore OpenOCD will disable the hardware timers of both the interrupt and task watchdogs at every breakpoint. Moreover, OpenOCD will not reenale them upon leaving the breakpoint. This means that interrupt watchdog and task watchdog functionality will essentially be disabled. No warnings or panics from either watchdogs will be generated when the ESP32-S3 is connected to OpenOCD via JTAG.

**XTAL32K Watchdog Timer (XTWDT)** The XTAL32K watchdog makes sure the (optional) external 32 KHz crystal or oscillator is functioning correctly.

When `XTAL32K_CLK` works as the clock source of `RTC_SLOW_CLK` and stops oscillating, the XTAL32K watchdog timer will detect this and generate an interrupt. It also provides functionality for automatically switching over to the internal, but less accurate oscillator as the `RTC_SLOW_CLK` source.

Since the switch to the backup clock is done in hardware it can also happen during deep sleep. This means that even if `XTAL32K_CLK` stops functioning while the chip in deep sleep, waiting for a timer to expire, it will still be able to wake-up as planned.

If the `XTAL32K_CLK` starts functioning normally again, you can call `esp_xt_wdt_restore_clk` to switch back to this clock source and re-enable the watchdog timer.

**Configuration** When the external 32KHz crystal or oscillator is selected (`CONFIG_ESP32S3_RTC_CLK_SRC`) the XTAL32K watchdog can be enabled via the `CONFIG_ESP_XT_WDT` configuration flag. The timeout is configured by setting `CONFIG_ESP_XT_WDT_TIMEOUT`. The automatic backup clock functionality is enabled via the ref:`CONFIG_ESP_XT_WDT_BACKUP_CLK_ENABLE` configuration.

## Interrupt Watchdog API Reference

### Header File

- [esp\\_system/include/esp\\_int\\_wdt.h](#)

### Functions

void `esp_int_wdt_init` (void)

Initialize the non-CPU-specific parts of interrupt watchdog. This is called in the init code if the interrupt watchdog is enabled in menuconfig.

## Task Watchdog API Reference

A full example using the Task Watchdog is available in esp-idf: [system/task\\_watchdog](#)

### Header File

- [components/esp\\_system/include/esp\\_task\\_wdt.h](#)

### Functions

`esp_err_t esp_task_wdt_init` (uint32\_t timeout, bool panic)

Initialize the Task Watchdog Timer (TWDT)

This function configures and initializes the TWDT. If the TWDT is already initialized when this function is called, this function will update the TWDT's timeout period and panic configurations instead. After initializing the TWDT, any task can elect to be watched by the TWDT by subscribing to it using `esp_task_wdt_add`().

---

**Note:** `esp_task_wdt_init`() must only be called after the scheduler started

---

#### Parameters

- `timeout` **–[in]** Timeout period of TWDT in seconds
- `panic` **–[in]** Flag that controls whether the panic handler will be executed when the TWDT times out

#### Returns

- `ESP_OK`: Initialization was successful
- `ESP_ERR_NO_MEM`: Initialization failed due to lack of memory

***esp\_err\_t* esp\_task\_wdt\_deinit** (void)

Deinitialize the Task Watchdog Timer (TWDT)

This function will deinitialize the TWDT. Calling this function whilst tasks are still subscribed to the TWDT, or when the TWDT is already deinitialized, will result in an error code being returned.

**Returns**

- ESP\_OK: TWDT successfully deinitialized
- ESP\_ERR\_INVALID\_STATE: Error, tasks are still subscribed to the TWDT
- ESP\_ERR\_NOT\_FOUND: Error, TWDT has already been deinitialized

***esp\_err\_t* esp\_task\_wdt\_add** (*TaskHandle\_t* handle)

Subscribe a task to the Task Watchdog Timer (TWDT)

This function subscribes a task to the TWDT. Each subscribed task must periodically call `esp_task_wdt_reset()` to prevent the TWDT from elapsing its timeout period. Failure to do so will result in a TWDT timeout. If the task being subscribed is one of the Idle Tasks, this function will automatically enable `esp_task_wdt_reset()` to be called from the Idle Hook of the Idle Task. Calling this function whilst the TWDT is uninitialized or attempting to subscribe an already subscribed task will result in an error code being returned.

**Parameters** **handle** –[in] Handle of the task. Input NULL to subscribe the current running task to the TWDT

**Returns**

- ESP\_OK: Successfully subscribed the task to the TWDT
- ESP\_ERR\_INVALID\_ARG: Error, the task is already subscribed
- ESP\_ERR\_NO\_MEM: Error, could not subscribe the task due to lack of memory
- ESP\_ERR\_INVALID\_STATE: Error, the TWDT has not been initialized yet

***esp\_err\_t* esp\_task\_wdt\_reset** (void)

Reset the Task Watchdog Timer (TWDT) on behalf of the currently running task.

This function will reset the TWDT on behalf of the currently running task. Each subscribed task must periodically call this function to prevent the TWDT from timing out. If one or more subscribed tasks fail to reset the TWDT on their own behalf, a TWDT timeout will occur. If the IDLE tasks have been subscribed to the TWDT, they will automatically call this function from their idle hooks. Calling this function from a task that has not subscribed to the TWDT, or when the TWDT is uninitialized will result in an error code being returned.

**Returns**

- ESP\_OK: Successfully reset the TWDT on behalf of the currently running task
- ESP\_ERR\_NOT\_FOUND: Error, the current running task has not subscribed to the TWDT
- ESP\_ERR\_INVALID\_STATE: Error, the TWDT has not been initialized yet

***esp\_err\_t* esp\_task\_wdt\_delete** (*TaskHandle\_t* handle)

Unsubscribes a task from the Task Watchdog Timer (TWDT)

This function will unsubscribe a task from the TWDT. After being unsubscribed, the task should no longer call `esp_task_wdt_reset()`. If the task is an IDLE task, this function will automatically disable the calling of `esp_task_wdt_reset()` from the Idle Hook. Calling this function whilst the TWDT is uninitialized or attempting to unsubscribe an already unsubscribed task from the TWDT will result in an error code being returned.

**Parameters** **handle** –[in] Handle of the task. Input NULL to unsubscribe the current running task.

**Returns**

- ESP\_OK: Successfully unsubscribed the task from the TWDT
- ESP\_ERR\_INVALID\_ARG: Error, the task is already unsubscribed
- ESP\_ERR\_INVALID\_STATE: Error, the TWDT has not been initialized yet

***esp\_err\_t* esp\_task\_wdt\_status** (*TaskHandle\_t* handle)

Query whether a task is subscribed to the Task Watchdog Timer (TWDT)

This function will query whether a task is currently subscribed to the TWDT, or whether the TWDT is initialized.

**Parameters** `handle` `–[in]` Handle of the task. Input NULL to query the current running task.

**Returns** :

- `ESP_OK`: The task is currently subscribed to the TWDT
- `ESP_ERR_NOT_FOUND`: The task is currently not subscribed to the TWDT
- `ESP_ERR_INVALID_STATE`: The TWDT is not initialized, therefore no tasks can be subscribed

## 2.7.27 System Time

### Overview

System time can be kept using either one time source or two time sources simultaneously. The choice depends on the application purpose and accuracy requirements for system time.

There are the following two time sources:

- **RTC timer**: Allows keeping the system time during any resets and sleep modes, only the power-up reset leads to resetting the RTC timer. The frequency deviation depends on an *RTC Clock Source* and affects accuracy only in sleep modes, in which case the time will be measured at 6.6667 us resolution.
- **High-resolution timer**: Not available during any reset and sleep modes. The reason for using this timer is to achieve greater accuracy. It uses the `APB_CLK` clock source (typically 80 MHz), which has a frequency deviation of less than  $\pm 10$  ppm. Time will be measured at 1 us resolution.

The settings for the system time source are as follows:

- RTC and high-resolution timer (default)
- RTC
- High-resolution timer
- None

It is recommended to stick to the default setting which provides maximum accuracy. If you want to choose a different timer, configure `CONFIG_ESP32S3_TIME_SYSCALL` in project configuration.

### RTC Clock Source

The RTC timer has the following clock sources:

- **Internal 150kHz RC oscillator (default)**: Features lowest deep sleep current consumption and no dependence on any external components. However, as frequency stability is affected by temperature fluctuations, time may drift in both Deep and Light sleep modes.
- **External 32kHz crystal**: Requires a 32kHz crystal to be connected to the `32K_XP` and `32K_XN` pins. Provides better frequency stability at the expense of slightly higher (by 1 uA) Deep sleep current consumption.
- **External 32kHz oscillator at `32K_XN` pin**: Allows using 32kHz clock generated by an external circuit. The external clock signal must be connected to the `32K_XN` pin. The amplitude should be less than 1.2 V for sine wave signal and less than 1 V for square wave signal. Common mode voltage should be in the range of  $0.1 < V_{cm} < 0.5 \times V_{amp}$ , where  $V_{amp}$  is signal amplitude. Additionally, a 1 nF capacitor must be placed between the `32K_XP` pin and ground. In this case, the `32K_XP` pin cannot be used as a GPIO pin.
- **Internal 8.5MHz oscillator, divided by 256 (~33kHz)**: Provides better frequency stability than the internal 150kHz RC oscillator at the expense of higher (by 5 uA) deep sleep current consumption. It also does not require external components.

The choice depends on your requirements for system time accuracy and power consumption in sleep modes. To modify the RTC clock source, set `CONFIG_ESP32S3_RTC_CLK_SRC` in project configuration.

More details on wiring requirements for the External 32kHz crystal and External 32kHz oscillator at `32K_XN` pin sources can be found in Section *Crystal Oscillator* of [ESP32 Hardware Design Guidelines](#).

## Get Current Time

To get the current time, use the POSIX function `gettimeofday()`. Additionally, you can use the following standard C library functions to obtain time and manipulate it:

```
gettimeofday
time
asctime
clock
ctime
difftime
gmtime
localtime
mktime
strftime
adjtime*
```

\* -To stop smooth time adjustment and update the current time immediately, use the POSIX function `settimeofday()`.

If you need to obtain time with one second resolution, use the following method:

```
time_t now;
char strftime_buf[64];
struct tm timeinfo;

time(&now);
// Set timezone to China Standard Time
setenv("TZ", "CST-8", 1);

/* According to the posix standard localtime/mktime should use timezone_
↳ information as though localtime/mktime() calls tzset(),
   but this is not the case in older versions of Newlib. We manually call tzset to_
↳ ensure the timezone info is updated*/
tzset();

localtime_r(&now, &timeinfo);
strftime(strftime_buf, sizeof(strftime_buf), "%c", &timeinfo);
ESP_LOGI(TAG, "The current date/time in Shanghai is: %s", strftime_buf);
```

If you need to obtain time with one microsecond resolution, use the code snippet below:

```
struct timeval tv_now;
gettimeofday(&tv_now, NULL);
int64_t time_us = (int64_t)tv_now.tv_sec * 1000000L + (int64_t)tv_now.tv_usec;
```

## SNTP Time Synchronization

To set the current time, you can use the POSIX functions `settimeofday()` and `adjtime()`. They are used internally in the lwIP SNTP library to set current time when a response from the NTP server is received. These functions can also be used separately from the lwIP SNTP library.

A function to use inside the lwIP SNTP library depends on a sync mode for system time. Use the function `sntp_set_sync_mode()` to set one of the following sync modes:

- `SNTP_SYNC_MODE_IMMED` (default) updates system time immediately upon receiving a response from the SNTP server after using `settimeofday()`.
- `SNTP_SYNC_MODE_SMOOTH` updates time smoothly by gradually reducing time error using the function `adjtime()`. If the difference between the SNTP response time and system time is more than 35 minutes, update system time immediately by using `settimeofday()`.

The lwIP SNTP library has API functions for setting a callback function for a certain event. You might need the following functions:

- `sntp_set_time_sync_notification_cb()` - use it for setting a callback function that will notify of the time synchronization process
- `sntp_get_sync_status()` and `sntp_set_sync_status()` - use it to get/set time synchronization status

To start synchronization via SNTP, just call the following three functions.

```
esp_sntp_setoperatingmode(ESP_SNTP_OPMODE_POLL);
esp_sntp_setservername(0, "pool.ntp.org");
esp_sntp_init();
```

An application with this initialization code will periodically synchronize the time. The time synchronization period is determined by `CONFIG_LWIP_SNTP_UPDATE_DELAY` (default value is one hour). To modify the variable, set [\*CONFIG\\_LWIP\\_SNTP\\_UPDATE\\_DELAY\*](#) in project configuration.

A code example that demonstrates the implementation of time synchronization based on the lwIP SNTP library is provided in [protocols/sntp](#) directory.

## Timezones

To set local timezone, use the following POSIX functions:

1. Call `setenv()` to set the TZ environment variable to the correct value depending on the device location. The format of the time string is the same as described in the [GNU libc documentation](#) (although the implementation is different).
2. Call `tzset()` to update C library runtime data for the new time zone.

Once these steps are completed, call the standard C library function `localtime()`, and it will return correct local time taking into account the time zone offset and daylight saving time.

## API Reference

### Header File

- [components/lwip/include/apps/esp\\_sntp.h](#)

### Functions

void **sntp\_sync\_time** (struct timeval \*tv)

This function updates the system time.

This is a weak-linked function. It is possible to replace all SNTP update functionality by placing a `sntp_sync_time()` function in the app firmware source. If the default implementation is used, calling `sntp_set_sync_mode()` allows the time synchronization mode to be changed to instant or smooth. If a callback function is registered via `sntp_set_time_sync_notification_cb()`, it will be called following time synchronization.

**Parameters** *tv* –Time received from SNTP server.

void **sntp\_set\_sync\_mode** (*sntp\_sync\_mode\_t* sync\_mode)

Set the sync mode.

Allowable two mode: `SNTP_SYNC_MODE_IMMED` and `SNTP_SYNC_MODE_SMOOTH`.

**Parameters** *sync\_mode* –Sync mode.

*sntp\_sync\_mode\_t* **sntp\_get\_sync\_mode** (void)

Get set sync mode.

**Returns** `SNTP_SYNC_MODE_IMMED`: Update time immediately.  
`SNTP_SYNC_MODE_SMOOTH`: Smooth time updating.

*sntp\_sync\_status\_t* **sntp\_get\_sync\_status** (void)

Get status of time sync.

After the update is completed, the status will be returned as `SNTP_SYNC_STATUS_COMPLETED`. After that, the status will be reset to `SNTP_SYNC_STATUS_RESET`. If the update operation is not completed yet, the status will be `SNTP_SYNC_STATUS_RESET`. If a smooth mode was chosen and the synchronization is still continuing (adjtime works), then it will be `SNTP_SYNC_STATUS_IN_PROGRESS`.

**Returns** `SNTP_SYNC_STATUS_RESET`: Reset status. `SNTP_SYNC_STATUS_COMPLETED`: Time is synchronized. `SNTP_SYNC_STATUS_IN_PROGRESS`: Smooth time sync in progress.

void **sntp\_set\_sync\_status** (*sntp\_sync\_status\_t* sync\_status)

Set status of time sync.

**Parameters** **sync\_status** –status of time sync (see `sntp_sync_status_t`)

void **sntp\_set\_time\_sync\_notification\_cb** (*sntp\_sync\_time\_cb\_t* callback)

Set a callback function for time synchronization notification.

**Parameters** **callback** –a callback function

void **sntp\_set\_sync\_interval** (uint32\_t interval\_ms)

Set the sync interval of SNTP operation.

Note: SNTPv4 RFC 4330 enforces a minimum sync interval of 15 seconds. This sync interval will be used in the next attempt update time through SNTP. To apply the new sync interval call the `sntp_restart()` function, otherwise, it will be applied after the last interval expired.

**Parameters** **interval\_ms** –The sync interval in ms. It cannot be lower than 15 seconds, otherwise 15 seconds will be set.

uint32\_t **sntp\_get\_sync\_interval** (void)

Get the sync interval of SNTP operation.

**Returns** the sync interval

bool **sntp\_restart** (void)

Restart SNTP.

**Returns** True - Restart False - SNTP was not initialized yet

void **esp\_sntp\_setoperatingmode** (*esp\_sntp\_operatingmode\_t* operating\_mode)

Sets SNTP operating mode. The mode has to be set before init.

**Parameters** **operating\_mode** –Desired operating mode

void **esp\_sntp\_init** (void)

Init and start SNTP service.

void **esp\_sntp\_stop** (void)

Stops SNTP service.

void **esp\_sntp\_setserver** (u8\_t idx, const ip\_addr\_t \*addr)

Sets SNTP server address.

**Parameters**

- **idx** –Index of the server
- **addr** –IP address of the server

void **esp\_sntp\_setservername** (u8\_t idx, const char \*server)

Sets SNTP hostname.

**Parameters**

- **idx** –Index of the server
- **server** –Name of the server

const char \***esp\_sntp\_getservername** (u8\_t idx)

Gets SNTP server name.

**Parameters** **idx** –Index of the server

**Returns** Name of the server

const ip\_addr\_t \***esp\_sntp\_getserver** (u8\_t idx)

Get SNTP server IP.

**Parameters** **idx** –Index of the server

**Returns** IP address of the server

bool **esp\_sntp\_enabled** (void)

Checks if sntp is enabled.

**Returns** true if sntp module is enabled

## Macros

**esp\_sntp\_sync\_time**

Aliases for esp\_sntp prefixed API (inherently thread safe)

**esp\_sntp\_set\_sync\_mode**

**esp\_sntp\_get\_sync\_mode**

**esp\_sntp\_get\_sync\_status**

**esp\_sntp\_set\_sync\_status**

**esp\_sntp\_set\_time\_sync\_notification\_cb**

**esp\_sntp\_set\_sync\_interval**

**esp\_sntp\_get\_sync\_interval**

**esp\_sntp\_restart**

## Type Definitions

typedef void (\***sntp\_sync\_time\_cb\_t**)(struct timeval \*tv)

SNTP callback function for notifying about time sync event.

**Param tv** Time received from SNTP server.

## Enumerations

enum **sntp\_sync\_mode\_t**

SNTP time update mode.

*Values:*

enumerator **SNTP\_SYNC\_MODE\_IMMED**

Update system time immediately when receiving a response from the SNTP server.

enumerator **SNTP\_SYNC\_MODE\_SMOOTH**

Smooth time updating. Time error is gradually reduced using adjtime function. If the difference between SNTP response time and system time is large (more than 35 minutes) then update immediately.

enum **sntp\_sync\_status\_t**

SNTP sync status.

*Values:*

enumerator **SNTP\_SYNC\_STATUS\_RESET**

enumerator **SNTP\_SYNC\_STATUS\_COMPLETED**

enumerator **SNTP\_SYNC\_STATUS\_IN\_PROGRESS**

enum **esp\_sntp\_operatingmode\_t**

SNTP operating modes per lwip SNTP module.

*Values:*

enumerator **ESP\_SNTP\_OPMODE\_POLL**

enumerator **ESP\_SNTP\_OPMODE\_LISTENONLY**

## 2.7.28 Internal and Unstable APIs

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.

### API Reference

#### Header File

- [components/esp\\_rom/include/esp\\_rom\\_sys.h](#)

#### Functions

int **esp\_rom\_printf** (const char \*fmt, ...)

Print formatted string to console device.

---

**Note:** float and long long data are not supported!

---

#### Parameters

- **fmt** –Format string
- **...** –Additional arguments, depending on the format string

**Returns** int: Total number of characters written on success; A negative number on failure.

void **esp\_rom\_delay\_us** (uint32\_t us)

Pauses execution for us microseconds.

**Parameters** **us** –Number of microseconds to pause

void **esp\_rom\_install\_channel\_putc** (int channel, void (\*putc)(char c))

esp\_rom\_printf can print message to different channels simultaneously. This function can help install the low level putc function for esp\_rom\_printf.

**Parameters**

- **channel** –Channel number (starting from 1)
- **putc** –Function pointer to the putc implementation. Set NULL can disconnect esp\_rom\_printf with putc.

void **esp\_rom\_install\_uart\_printf** (void)

Install UART1 as the default console channel, equivalent to esp\_rom\_install\_channel\_putc(1, esp\_rom\_uart\_putc)

soc\_reset\_reason\_t **esp\_rom\_get\_reset\_reason** (int cpu\_no)

Get reset reason of CPU.

**Parameters** **cpu\_no** –CPU number

**Returns** Reset reason code (see in soc/reset\_reasons.h)

Code examples for this API section are provided in the [system](#) directory of ESP-IDF examples.

## 2.8 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures and types.
- Build system functions, predefined variables and options. These are documented in the [build system guide](#).
- *Kconfig* options can be used in code and in the build system (CMakeLists.txt) files.
- *Host tools* and their command line parameters are also part of ESP-IDF interface.

ESP-IDF consists of components written specifically for ESP-IDF as well as third-party libraries. In some cases, an ESP-IDF-specific wrapper is added to the third-party library, providing an interface that is either simpler or better integrated with the rest of ESP-IDF facilities. In other cases, the original API of the third-party library is presented to the application developers.

Following sections explain some of the aspects of ESP-IDF APIs and their usage.

### 2.8.1 Error handling

Most ESP-IDF APIs return error codes defined with `esp_err_t` type. See [Error Handling](#) section for more information about error handling approaches. [Error Code Reference](#) contains the list of error codes returned by ESP-IDF components.

### 2.8.2 Configuration structures

---

**Important:** Correct initialization of configuration structures is an important part in making the application compatible with future versions of ESP-IDF.

---

Most initialization or configuration functions in ESP-IDF take as an argument a pointer to a configuration structure. For example:

```

const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);

```

Initialization functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```

esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);

```

Most ESP-IDF examples use C99 [designated initializers](#) for structure initialization, since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```

const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};

```

C++ language doesn't support the designated initializers syntax until C++20, however GCC compiler partially supports it as an extension. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```

esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;

```

### Default initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```

httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer.
   Now all fields are set to the default values.
   Any field can still be modified: */
config.server_port = 8081;
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);

```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

## 2.8.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code, and not by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as `hal` only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

## 2.8.4 Components in example projects

ESP-IDF examples contain a variety of projects demonstrating usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples.

This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Take time to read the code and understand if it applicable to your use case.

## 2.8.5 API Stability

ESP-IDF uses [Semantic Versioning](#) as explained in the [versions page](#).

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

### Source level compatibility

ESP-IDF guarantees source level compatibility of C functions, structures, enums, type definitions and preprocessor macros declared in public header files of ESP-IDF components. Source level compatibility implies that the application can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however this is not mandatory. Deprecated functions and files can be removed in major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system [renaming mechanism](#) ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files and source code.

### Lack of binary compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See [Configuration structures](#) for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

### Other exceptions from compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issue reports about any unintended breaking changes that don't fall into the categories below.

- [Private APIs](#).
- [Components in example projects](#).
- Features clearly marked as “beta”, “preview”, or “experimental”.
- Changes made to mitigate security issues or to replace insecure default behaviors with a secure ones.

- Features which were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features which depend on non-functional chip hardware features.
- Unexpected or undefined behavior (for example, due to missing validation of argument ranges) that is not documented explicitly may be fixed/changed.
- Location of *Kconfig* options in menuconfig.
- Location and names of example projects.

## 2.9 Project Configuration

### 2.9.1 Introduction

ESP-IDF uses [kconfiglib](#) which is a Python-based extension to the [Kconfig](#) system which provides a compile-time project configuration mechanism. Kconfig is based around options of several types: integer, string, boolean. Kconfig files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see [Kconfig](#) and [kconfiglib](#) extensions.

### 2.9.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved inside `sdkconfig` file in the project root directory. Based on `sd-kconfig`, application build targets will generate `sdkconfig.h` file in the build directory, and will make `sdkconfig` options available to the project build system and source files.

(For the legacy GNU Make build system, the project configuration menu is opened with `make menuconfig`.)

### 2.9.3 Using `sdkconfig.defaults`

In some cases, such as when `sdkconfig` file is under revision control, the fact that `sdkconfig` file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of `sdkconfig.defaults` file. This file is never touched by the build system, and must be created manually. It can contain all the options which matter for the given application. The format is the same as that of the `sdkconfig` file. Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted and added to the ignore list of the revision control system (e.g. `.gitignore` file for git). Project build targets will automatically create `sdkconfig` file, populated with the settings from `sdkconfig.defaults` file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in `sdkconfig` by ones from `sdkconfig.defaults`. For more information, see [Custom sdkconfig defaults](#).

### 2.9.4 Kconfig Formatting Rules

The following attributes of Kconfig files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 characters, the `config` inside of the menu by 4 characters, the `help` of the `config` by 8 characters and the text of the `help` by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.

- Lines cannot be wrapped by backslash (because there is a bug in earlier versions of `conf-idf` which causes that Windows line endings are not recognized after a backslash).

### Format checker

`tools/check_kconfigs.py` is provided for checking the `Kconfig` formatting rules. The checker checks all `Kconfig` and `Kconfig.projbuild` files in the ESP-IDF directory and generates a new file with suffix `.new` with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For example, indentations will be corrected if there isn't some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

## 2.9.5 Backward Compatibility of Kconfig Options

The standard `Kconfig` tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `confgen.py` is used by the tool chain to pre-process `sdkconfig` files before anything else, for example `menuconfig`, would read them. As the consequence, the settings for old options will be kept and not ignored.
2. `confgen.py` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new `Kconfig` option names. Old options are replaced by new ones in the `sdkconfig` file.
3. `confgen.py` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, `auto.conf`) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.
4. *Deprecated options and their replacements* are automatically generated by `confgen.py`.

## 2.9.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from `Kconfig` files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of `menuconfig`.

By convention, all option names are upper case with underscores. When `Kconfig` generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a `Kconfig` file and selected in `menuconfig`, then `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In this reference, option names are also prefixed with `CONFIG_`, same as in the source code.

### SDK tool configuration

Contains:

- `CONFIG_SDK_MAKE_WARN_UNDEFINED_VARIABLES`
- `CONFIG_SDK_TOOLPREFIX`
- `CONFIG_SDK_PYTHON`
- `CONFIG_SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS`

### CONFIG\_SDK\_TOOLPREFIX

Compiler toolchain path/prefix

*Found in: SDK tool configuration*

The prefix/path that is used to call the toolchain. The default setting assumes a `crosstool-ng` gcc setup that is in your `PATH`.

**Default value:**

- “xtensa-esp32s3-elf- “

**CONFIG\_SDK\_PYTHON**

Python interpreter

*Found in: SDK tool configuration*

The executable name/path that is used to run python.

(Note: This option is used with the legacy GNU Make build system only.)

**Default value:**

- “python”

**CONFIG\_SDK\_MAKE\_WARN\_UNDEFINED\_VARIABLES**

‘make’ warns on undefined variables

*Found in: SDK tool configuration*

Adds `-warn-undefined-variables` to `MAKEFLAGS`. This causes make to print a warning any time an undefined variable is referenced.

This option helps find places where a variable reference is misspelled or otherwise missing, but it can be unwanted if you have Makefiles which depend on undefined variables expanding to an empty string.

(Note: this option is used with the legacy GNU Make build system only.)

**Default value:**

- Yes (enabled)

**CONFIG\_SDK\_TOOLCHAIN\_SUPPORTS\_TIME\_WIDE\_64\_BITS**

Toolchain supports `time_t` wide 64-bits

*Found in: SDK tool configuration*

Enable this option in case you have a custom toolchain which supports `time_t` wide 64-bits. This option checks `time_t` is 64-bits and disables ROM time functions to use the time functions from the toolchain instead. This option allows resolving the Y2K38 problem. See “Setup Linux Toolchain from Scratch” to build a custom toolchain which supports 64-bits `time_t`.

Note: ESP-IDF does not currently come with any pre-compiled toolchain that supports 64-bit wide `time_t`. This will change in a future major release, but currently 64-bit `time_t` requires a custom built toolchain.

**Default value:**

- No (disabled)

**Build type**

Contains:

- *CONFIG\_APP\_BUILD\_TYPE*

**CONFIG\_APP\_BUILD\_TYPE**

Application build type

*Found in: Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in tools/test\_apps/system/gdb\_loadable\_elf/

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG\_APP\_BUILD\_TYPE\_ELF\_RAM is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_ELF_RAM=y CONFIG_VFS_SUPPORT_TERMIOS=
CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

#### Available options:

- Default (binary application + 2nd stage bootloader) (APP\_BUILD\_TYPE\_APP\_2NDBOOT)
- ELF file, loadable into RAM (EXPERIMENTAL)) (APP\_BUILD\_TYPE\_ELF\_RAM)

## Application manager

Contains:

- [CONFIG\\_APP\\_EXCLUDE\\_PROJECT\\_NAME\\_VAR](#)
- [CONFIG\\_APP\\_EXCLUDE\\_PROJECT\\_VER\\_VAR](#)
- [CONFIG\\_APP\\_PROJECT\\_VER\\_FROM\\_CONFIG](#)
- [CONFIG\\_APP\\_RETRIEVE\\_LEN\\_ELF\\_SHA](#)
- [CONFIG\\_APP\\_COMPILE\\_TIME\\_DATE](#)

### CONFIG\_APP\_COMPILE\_TIME\_DATE

Use time/date stamp for app

Found in: [Application manager](#)

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

#### Default value:

- Yes (enabled)

### CONFIG\_APP\_EXCLUDE\_PROJECT\_VER\_VAR

Exclude PROJECT\_VER from firmware image

*Found in: Application manager*

The PROJECT\_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp\_app\_desc structure.

**Default value:**

- No (disabled)

### **CONFIG\_APP\_EXCLUDE\_PROJECT\_NAME\_VAR**

Exclude PROJECT\_NAME from firmware image

*Found in: Application manager*

The PROJECT\_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp\_app\_desc structure.

**Default value:**

- No (disabled)

### **CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG**

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP\_PROJECT\_VER will be used for the variable PROJECT\_VER. Other ways to set PROJECT\_VER will be ignored.

**Default value:**

- No (disabled)

### **CONFIG\_APP\_PROJECT\_VER**

Project version

*Found in: Application manager > CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

Project version

**Default value:**

- 1 if *CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

### **CONFIG\_APP\_RETRIEVE\_LEN\_ELF\_SHA**

The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

**Range:**

- from 8 to 64

**Default value:**

- 16

## Bootloader config

Contains:

- `CONFIG_BOOTLOADER_LOG_LEVEL`
- `CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`
- `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`
- `CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE`
- `CONFIG_BOOTLOADER_APP_TEST`
- `CONFIG_BOOTLOADER_FACTORY_RESET`
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO`
- `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`
- *Serial Flash Configurations*
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP`
- `CONFIG_BOOTLOADER_WDT_ENABLE`
- `CONFIG_BOOTLOADER_VDDSDIO_BOOST`

## CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION

Bootloader optimization Level

Found in: *Bootloader config*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

### Available options:

- Size (-Os) (BOOTLOADER\_COMPILER\_OPTIMIZATION\_SIZE)
- Debug (-Og) (BOOTLOADER\_COMPILER\_OPTIMIZATION\_DEBUG)
- Optimize for performance (-O2) (BOOTLOADER\_COMPILER\_OPTIMIZATION\_PERF)
- Debug without optimization (-O0) (BOOTLOADER\_COMPILER\_OPTIMIZATION\_NONE)

## CONFIG\_BOOTLOADER\_LOG\_LEVEL

Bootloader log verbosity

Found in: *Bootloader config*

Specify how much output to see in bootloader logs.

### Available options:

- No output (BOOTLOADER\_LOG\_LEVEL\_NONE)
- Error (BOOTLOADER\_LOG\_LEVEL\_ERROR)
- Warning (BOOTLOADER\_LOG\_LEVEL\_WARN)
- Info (BOOTLOADER\_LOG\_LEVEL\_INFO)
- Debug (BOOTLOADER\_LOG\_LEVEL\_DEBUG)
- Verbose (BOOTLOADER\_LOG\_LEVEL\_VERBOSE)

**Serial Flash Configurations** Contains:

- `CONFIG_BOOTLOADER_FLASH_DC_AWARE`
- `CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT`

### CONFIG\_BOOTLOADER\_FLASH\_DC\_AWARE

Allow app adjust Dummy Cycle bits in SPI Flash for higher frequency (READ HELP FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

This will force 2nd bootloader to be loaded by DOUT mode, and will restore Dummy Cycle setting by resetting the Flash

### CONFIG\_BOOTLOADER\_FLASH\_XMC\_SUPPORT

Enable the support for flash chips of XMC (READ DOCS FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON'T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

comment "Features below require specific hardware (READ DOCS FIRST!)"

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST

VDDSDIO LDO voltage

*Found in: [Bootloader config](#)*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

**Available options:**

- 1.8V (BOOTLOADER\_VDDSDIO\_BOOST\_1\_8V)
- 1.9V (BOOTLOADER\_VDDSDIO\_BOOST\_1\_9V)

### CONFIG\_BOOTLOADER\_FACTORY\_RESET

GPIO triggers factory reset

*Found in: [Bootloader config](#)*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from "factory" partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_NUM\_PIN\_FACTORY\_RESET

Number of the GPIO input for factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Default value:**

- 4 if *CONFIG\_BOOTLOADER\_FACTORY\_RESET*

### **CONFIG\_BOOTLOADER\_FACTORY\_RESET\_PIN\_LEVEL**

Factory reset GPIO level

*Found in: Bootloader config > CONFIG\_BOOTLOADER\_FACTORY\_RESET*

Pin level for factory reset, can be triggered on low or high.

**Available options:**

- Reset on GPIO low (BOOTLOADER\_FACTORY\_RESET\_PIN\_LOW)
- Reset on GPIO high (BOOTLOADER\_FACTORY\_RESET\_PIN\_HIGH)

### **CONFIG\_BOOTLOADER\_OTA\_DATA\_ERASE**

Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG\_BOOTLOADER\_FACTORY\_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

### **CONFIG\_BOOTLOADER\_DATA\_FACTORY\_RESET**

Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG\_BOOTLOADER\_FACTORY\_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy\_init, …” ) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**Default value:**

- “nvs” if *CONFIG\_BOOTLOADER\_FACTORY\_RESET*

### **CONFIG\_BOOTLOADER\_APP\_TEST**

GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**Default value:**

- No (disabled) if *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

### **CONFIG\_BOOTLOADER\_NUM\_PIN\_APP\_TEST**

Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG\_BOOTLOADER\_APP\_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**

- from 0 to 39 if *CONFIG\_BOOTLOADER\_APP\_TEST*

**Default value:**

- 18 if *CONFIG\_BOOTLOADER\_APP\_TEST*

### CONFIG\_BOOTLOADER\_HOLD\_TIME\_GPIO

Hold time of GPIO for reset/test mode (seconds)

Found in: *Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**

- 5 if *CONFIG\_BOOTLOADER\_FACTORY\_RESET* || *CONFIG\_BOOTLOADER\_APP\_TEST*

### CONFIG\_BOOTLOADER\_REGION\_PROTECTION\_ENABLE

Enable protection for unmapped memory regions

Found in: *Bootloader config*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_WDT\_ENABLE

Use RTC watchdog in start code

Found in: *Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC\_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow\_clk - and ends calling app\_main. Re-set timeout is needed due to WDT uses a SLOW\_CLK clock source. After changing a frequency slow\_clk a time of WDT needs to re-set for new frequency. slow\_clk depends on ESP32\_RTC\_CLK\_SRC (INTERNAL\_RC or EXTERNAL\_CRYSTAL).

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_WDT\_DISABLE\_IN\_USER\_CODE

Allows RTC watchdog disable in user code

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_WDT\_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc\_wdt in the app's own code. If this option is not set (default), then rtc\_wdt will be disabled by ESP-IDF before calling the app\_main() function.

Use function rtc\_wdt\_feed() for resetting counter of rtc\_wdt. Use function rtc\_wdt\_disable() for disabling rtc\_wdt.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_WDT\_TIME\_MS

Timeout for RTC watchdog (ms)

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_WDT\_ENABLE*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC\_WDT will reset while encryption operations will be performed.

**Range:**

- from 0 to 120000

**Default value:**

- 9000

### CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE

Enable app rollback support

*Found in:* [Bootloader config](#)

After updating the app, the bootloader runs a new app with the “ESP\_OTA\_IMG\_PENDING\_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK

Enable app anti-rollback support

*Found in:* [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#)

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#)

### CONFIG\_BOOTLOADER\_APP\_SECURE\_VERSION

eFuse secure version of app

*Found in:* [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#) > [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see [BOOTLOADER\\_APP\\_SEC\\_VER\\_SIZE\\_EFUSE\\_FIELD](#) option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota\_0 + ota\_1 (without factory).

**Default value:**

- 0 if [CONFIG\\_BOOTLOADER\\_APP\\_ANTI\\_ROLLBACK](#)

### CONFIG\_BOOTLOADER\_APP\_SEC\_VER\_SIZE\_EFUSE\_FIELD

Size of the efuse secure version field

*Found in:* `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**

- from 1 to 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**Default value:**

- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### CONFIG\_BOOTLOADER\_EFUSE\_SECURE\_VERSION\_EMULATE

Emulate operations with efuse secure version(only test)

*Found in:* `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: `EFUSE_VIRTUAL` and `EFUSE_VIRTUAL_KEEP_IN_FLASH`.

**Default value:**

- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_IN\_DEEP\_SLEEP

Skip image validation when exiting deep sleep

*Found in:* `Bootloader config`

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**

- No (disabled) if `(CONFIG_SECURE_BOOT && CONFIG_SECURE_BOOT_INSECURE) || CONFIG_SECURE_BOOT`

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON

Skip image validation from power on reset (READ HELP FIRST)

*Found in:* `Bootloader config`

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS**

Skip image validation always (READ HELP FIRST)

*Found in:* [Bootloader config](#)

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC**

Reserve RTC FAST memory for custom purposes

*Found in:* [Bootloader config](#)

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through `PRO_CPU`.

**Default value:**

- No (disabled)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_IN\_CRC**

Include custom memory in the CRC calculation

*Found in:* [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

This option allows the customer to use the legacy bootloader behavior when the RTC FAST memory CRC calculation takes place. When this option is enabled, the allocated user custom data will be taken into account in the CRC calculation. This means that any change to the custom data would need a CRC update to prevent the bootloader from marking this data as corrupted. If this option is disabled, the custom data will not be taken into account when calculating the RTC FAST memory CRC. The user custom data can be changed freely, without the need to update the CRC. **THIS OPTION MUST BE THE SAME FOR BOTH THE BOOTLOADER AND THE APPLICATION BUILDS.**

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

### **CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_SIZE**

Size in bytes for custom purposes

*Found in:* [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (`rtc_retain_mem_t`) is reserved and has access from the bootloader and an application.

**Default value:**

- 0 if `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`

**Security features**

Contains:

- `CONFIG_SECURE_BOOT_INSECURE`
- `CONFIG_SECURE_SIGNED_APPS_SCHEME`
- `CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP`
- `CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE`
- `CONFIG_SECURE_FLASH_ENC_ENABLED`
- `CONFIG_SECURE_BOOT`
- *Potentially insecure options*
- `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`
- `CONFIG_SECURE_BOOT_VERIFICATION_KEY`
- `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`
- `CONFIG_SECURE_UART_ROM_DL_MODE`
- `CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT`

**CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT**

Require signed app images

*Found in: Security features*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

**CONFIG\_SECURE\_SIGNED\_APPS\_SCHEME**

App Signing Scheme

*Found in: Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two options: 1. ECDSA based secure boot scheme. (Only choice for Secure Boot V1) Supported in ESP32 and ESP32-ECO3. 2. The RSA based secure boot scheme. (Only choice for Secure Boot V2) Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3.

**Available options:**

- ECDSA (`SECURE_SIGNED_APPS_ECDSA_SCHEME`)  
Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key.  
Refer to the documentation before enabling.
- RSA (`SECURE_SIGNED_APPS_RSA_SCHEME`)  
Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.

## CONFIG\_SECURE\_SIGNED\_ON\_UPDATE\_NO\_SECURE\_BOOT

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the `esp_ota_ops.h` APIs are used for OTA updates, or `esp_image_format.h` APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

### Default value:

- Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

## CONFIG\_SECURE\_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

### Default value:

- No (disabled)

## CONFIG\_SECURE\_BOOT\_VERSION

Select secure boot version

*Found in: Security features > CONFIG\_SECURE\_BOOT*

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3 ECO3. Secure Boot V1 is the AES based secure boot scheme. Supported in ESP32 and ESP32-ECO3.

### Available options:

- Enable Secure Boot version 1 (`SECURE_BOOT_V1_ENABLED`)  
Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.
- Enable Secure Boot version 2 (`SECURE_BOOT_V2_ENABLED`)  
Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer's Guide for this version before enabling.

## CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in "Secure boot private signing key" will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using `espsecure.py`. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

### **CONFIG\_SECURE\_BOOT\_SIGNING\_KEY**

Secure boot private signing key

*Found in: Security features > CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: `espsecure.py generate_signing_key secure_boot_signing_key.pem`

See the Secure Boot section of the ESP-IDF Programmer's Guide for this version for details.

**Default value:**

- “secure\_boot\_signing\_key.pem” if `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

### **CONFIG\_SECURE\_BOOT\_VERIFICATION\_KEY**

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images. Secure Boot V2: This RSA public key is compiled into the signature block at the end of the bootloader/app.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

### **CONFIG\_SECURE\_BOOT\_ENABLE\_AGGRESSIVE\_KEY\_REVOKE**

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT`

### **CONFIG\_SECURE\_BOOT\_INSECURE**

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT`

### **CONFIG\_SECURE\_FLASH\_ENC\_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

**Default value:**

- No (disabled)

### **CONFIG\_SECURE\_FLASH\_ENCRYPTION\_KEYSIZE**

Size of generated AES-XTS key

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

Size of generated AES-XTS key.

AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block. AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

**Available options:**

- AES-128 (256-bit key) (`SECURE_FLASH_ENCRYPTION_AES128`)
- AES-256 (512-bit key) (`SECURE_FLASH_ENCRYPTION_AES256`)

### **CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE**

Enable usage mode

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it's possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it's no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

Refer to the Flash Encryption section of the ESP-IDF Programmer's Guide for details.

**Available options:**

- Development (NOT SECURE) (`SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`)
- Release (`SECURE_FLASH_ENCRYPTION_MODE_RELEASE`)

**Potentially insecure options** Contains:

- `CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS`
- `CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION`
- `CONFIG_SECURE_BOOT_ALLOW_JTAG`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`
- `CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE`
- `CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS`
- `CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED`

**CONFIG\_SECURE\_BOOT\_ALLOW\_JTAG**

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG\_SECURE\_BOOT\_ALLOW\_SHORT\_APP\_PARTITION**

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn't support 64KB aligned partition lengths.

**CONFIG\_SECURE\_BOOT\_V2\_ALLOW\_EFUSE\_RD\_DIS**

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the `WR_DIS_RD_DIS` efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the `EFUSE_RD_DIS` efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the `BLK2` efuse (for ESP32) and `BLOCK4-BLOCK10` (i.e. `BLOCK_KEY0-BLOCK_KEY5`) (for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a `BLOCK` is read-protected, the application will read all zeros from that block

NOTE: If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is `__NOT__` possible to read/write efuses using `espefuse.py` utility. However, efuse can be read/written from the application

### CONFIG\_SECURE\_BOOT\_ALLOW\_UNUSED\_DIGEST\_SLOTS

Leave unused digest slots available (not revoke)

*Found in: [Security features](#) > [Potentially insecure options](#)*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called `esp_efuse_set_digest_revoke(num_digest)` for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE`

### CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_ENC

Leave UART bootloader encryption enabled

*Found in: [Security features](#) > [Potentially insecure options](#)*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_CACHE

Leave UART bootloader flash cache enabled

*Found in: [Security features](#) > [Potentially insecure options](#)*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### CONFIG\_SECURE\_FLASH\_REQUIRE\_ALREADY\_ENABLED

Require flash encryption to be already enabled

*Found in: [Security features](#) > [Potentially insecure options](#)*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using `espefuse.py`.

**Default value:**

- No (disabled) if `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

### CONFIG\_SECURE\_FLASH\_CHECK\_ENC\_EN\_IN\_APP

Check Flash Encryption enabled on app startup

*Found in: [Security features](#)*

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

**Default value:**

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

## CONFIG\_SECURE\_UART\_ROM\_DL\_MODE

UART ROM download mode

Found in: *Security features*

**Available options:**

- UART ROM download mode (Permanently disabled (recommended)) (`SECURE_DISABLE_ROM_DL_MODE`)

If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of `esptool.py`, `espefuse.py` and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.

It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.

- UART ROM download mode (Permanently switch to Secure mode (recommended)) (`SECURE_ENABLE_SECURE_ROM_DL_MODE`)

If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.

Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (`get_security_info`).

Secure Download mode is not compatible with the `esptool.py` flasher stub feature, `espefuse.py`, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.

Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.

It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`

Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

- UART ROM download mode (Enabled (not recommended)) (`SECURE_INSECURE_ALLOW_DL_MODE`)

This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

## Boot ROM Behavior

Contains:

- `CONFIG_BOOT_ROM_LOG_SCHEME`

## CONFIG\_BOOT\_ROM\_LOG\_SCHEME

Permanently change Boot ROM output

Found in: *Boot ROM Behavior*

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

**Available options:**

- Always Log (BOOT\_ROM\_LOG\_ALWAYS\_ON)  
Always print ROM logs, this is the default behavior.
- Permanently disable logging (BOOT\_ROM\_LOG\_ALWAYS\_OFF)  
Don't print ROM logs.
- Log on GPIO High (BOOT\_ROM\_LOG\_ON\_GPIO\_HIGH)  
Print ROM logs when GPIO level is high during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.
- Log on GPIO Low (BOOT\_ROM\_LOG\_ON\_GPIO\_LOW)  
Print ROM logs when GPIO level is low during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

**Serial flasher config**

Contains:

- [CONFIG\\_ESPTOOLPY\\_MONITOR\\_BAUD](#)
- [CONFIG\\_ESPTOOLPY\\_AFTER](#)
- [CONFIG\\_ESPTOOLPY\\_BEFORE](#)
- [CONFIG\\_ESPTOOLPY\\_MONITOR\\_BAUD\\_OTHER\\_VAL](#)
- [CONFIG\\_ESPTOOLPY\\_BAUD](#)
- [CONFIG\\_ESPTOOLPY\\_PORT](#)
- [CONFIG\\_ESPTOOLPY\\_FLASHSIZE\\_DETECT](#)
- [CONFIG\\_ESPTOOLPY\\_NO\\_STUB](#)
- [CONFIG\\_ESPTOOLPY\\_OCT\\_FLASH](#)
- [CONFIG\\_ESPTOOLPY\\_FLASH\\_SAMPLE\\_MODE](#)
- [CONFIG\\_ESPTOOLPY\\_FLASHSIZE](#)
- [CONFIG\\_ESPTOOLPY\\_FLASHMODE](#)
- [CONFIG\\_ESPTOOLPY\\_FLASHFREQ](#)
- [CONFIG\\_ESPTOOLPY\\_BAUD\\_OTHER\\_VAL](#)
- [CONFIG\\_ESPTOOLPY\\_COMPRESSED](#)

**CONFIG\_ESPTOOLPY\_PORT**

Default serial port

*Found in: [Serial flasher config](#)*

The serial port that's connected to the ESP chip. This can be overridden by setting the ESPPORT environment variable.

This value is ignored when using the CMake-based build system or idf.py.

**Default value:**

- `"/dev/ttyUSB0"`

**CONFIG\_ESPTOOLPY\_BAUD**

Default baud rate

*Found in: [Serial flasher config](#)*

Default baud rate to use while communicating with the ESP chip. Can be overridden by setting the ESPBAUD variable.

This value is ignored when using the CMake-based build system or idf.py.

**Available options:**

- 115200 baud (ESPTOOLPY\_BAUD\_115200B)

- 230400 baud (ESPTOOLPY\_BAUD\_230400B)
- 921600 baud (ESPTOOLPY\_BAUD\_921600B)
- 2Mbaud (ESPTOOLPY\_BAUD\_2MB)
- Other baud rate (ESPTOOLPY\_BAUD\_OTHER)

### CONFIG\_ESPTOOLPY\_BAUD\_OTHER\_VAL

Other baud rate value

*Found in: Serial flasher config*

**Default value:**

- 115200

### CONFIG\_ESPTOOLPY\_COMPRESSED

Use compressed upload

*Found in: Serial flasher config*

The flasher tool can send data compressed using zlib, letting the ROM on the ESP chip decompress it on the fly before flashing it. For most payloads, this should result in a speed increase.

**Default value:**

- Yes (enabled)

### CONFIG\_ESPTOOLPY\_NO\_STUB

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

**Default value:**

- No (disabled)

### CONFIG\_ESPTOOLPY\_OCT\_FLASH

Enable Octal Flash

*Found in: Serial flasher config*

**Default value:**

- No (disabled)

### CONFIG\_ESPTOOLPY\_FLASHMODE

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

**Available options:**

- QIO (ESPTOOLPY\_FLASHMODE\_QIO)
- QOUT (ESPTOOLPY\_FLASHMODE\_QOUT)
- DIO (ESPTOOLPY\_FLASHMODE\_DIO)
- DOUT (ESPTOOLPY\_FLASHMODE\_DOUT)
- OPI (ESPTOOLPY\_FLASHMODE\_OPI)

## CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE

Flash Sampling Mode

*Found in: Serial flasher config*

### Available options:

- STR Mode (ESPTOOLPY\_FLASH\_SAMPLE\_MODE\_STR)
- DTR Mode (ESPTOOLPY\_FLASH\_SAMPLE\_MODE\_DTR)

## CONFIG\_ESPTOOLPY\_FLASHFREQ

Flash SPI speed

*Found in: Serial flasher config*

The SPI flash frequency to be used.

### Available options:

- 120 MHz (READ DOCS FIRST) (ESPTOOLPY\_FLASHFREQ\_120M)
  - Optional feature for QSPI Flash. Read docs and enable `CONFIG_SPI_FLASH_HPM_ENA` first!
- 80 MHz (ESPTOOLPY\_FLASHFREQ\_80M)
- 40 MHz (ESPTOOLPY\_FLASHFREQ\_40M)
- 26 MHz (ESPTOOLPY\_FLASHFREQ\_26M)
- 20 MHz (ESPTOOLPY\_FLASHFREQ\_20M)

## CONFIG\_ESPTOOLPY\_FLASHSIZE

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

### Available options:

- 1 MB (ESPTOOLPY\_FLASHSIZE\_1MB)
- 2 MB (ESPTOOLPY\_FLASHSIZE\_2MB)
- 4 MB (ESPTOOLPY\_FLASHSIZE\_4MB)
- 8 MB (ESPTOOLPY\_FLASHSIZE\_8MB)
- 16 MB (ESPTOOLPY\_FLASHSIZE\_16MB)
- 32 MB (ESPTOOLPY\_FLASHSIZE\_32MB)
- 64 MB (ESPTOOLPY\_FLASHSIZE\_64MB)
- 128 MB (ESPTOOLPY\_FLASHSIZE\_128MB)

## CONFIG\_ESPTOOLPY\_FLASHSIZE\_DETECT

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

### Default value:

- Yes (enabled)

## CONFIG\_ESPTOOLPY\_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset to bootloader (ESPTOOLPY\_BEFORE\_RESET)
- No reset (ESPTOOLPY\_BEFORE\_NORESET)

**CONFIG\_ESPTOOLPY\_AFTER**

After flashing

*Found in: [Serial flasher config](#)*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**

- Reset after flashing (ESPTOOLPY\_AFTER\_RESET)
- Stay in bootloader (ESPTOOLPY\_AFTER\_NORESET)

**CONFIG\_ESPTOOLPY\_MONITOR\_BAUD**

‘idf.py monitor’ baud rate

*Found in: [Serial flasher config](#)*

Baud rate to use when running ‘idf.py monitor’ or ‘make monitor’ to view serial output from a running chip.

If “Same as UART Console baud rate” is chosen then the value will follow the “UART Console baud rate” config item.

Can override by setting the MONITORBAUD environment variable.

**Available options:**

- Same as UART console baud rate (ESPTOOLPY\_MONITOR\_BAUD\_CONSOLE)
- 9600 bps (ESPTOOLPY\_MONITOR\_BAUD\_9600B)
- 57600 bps (ESPTOOLPY\_MONITOR\_BAUD\_57600B)
- 115200 bps (ESPTOOLPY\_MONITOR\_BAUD\_115200B)
- 230400 bps (ESPTOOLPY\_MONITOR\_BAUD\_230400B)
- 921600 bps (ESPTOOLPY\_MONITOR\_BAUD\_921600B)
- 2 Mbps (ESPTOOLPY\_MONITOR\_BAUD\_2MB)
- Custom baud rate (ESPTOOLPY\_MONITOR\_BAUD\_OTHER)

**CONFIG\_ESPTOOLPY\_MONITOR\_BAUD\_OTHER\_VAL**

Custom baud rate value

*Found in: [Serial flasher config](#)*

**Default value:**

- 115200

**Partition Table**

Contains:

- [CONFIG\\_PARTITION\\_TABLE\\_CUSTOM\\_FILENAME](#)
- [CONFIG\\_PARTITION\\_TABLE\\_MD5](#)
- [CONFIG\\_PARTITION\\_TABLE\\_OFFSET](#)
- [CONFIG\\_PARTITION\\_TABLE\\_TYPE](#)

## CONFIG\_PARTITION\_TABLE\_TYPE

Partition Table

Found in: [Partition Table](#)

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition\_table directory. These are mostly intended for example and development use, it's expected that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

### Available options:

- Single factory app, no OTA (PARTITION\_TABLE\_SINGLE\_APP)  
This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Single factory app (large), no OTA (PARTITION\_TABLE\_SINGLE\_APP\_LARGE)  
This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_large.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Factory app, two OTA definitions (PARTITION\_TABLE\_TWO\_OTA)  
This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_two\_ota.csv
- Custom partition table CSV (PARTITION\_TABLE\_CUSTOM)  
Specify the path to the partition table CSV to use for your project.  
Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- Single factory app, no OTA, encrypted NVS (PARTITION\_TABLE\_SINGLE\_APP\_ENCRYPTED\_NVS)  
This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_encr\_nvs.csv
- Single factory app (large), no OTA, encrypted NVS (PARTITION\_TABLE\_SINGLE\_APP\_LARGE\_ENC\_NVS)  
This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_large\_encr\_nvs.csv
- Factory app, two OTA definitions, encrypted NVS (PARTITION\_TABLE\_TWO\_OTA\_ENCRYPTED\_NVS)  
This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_two\_ota\_encr\_nvs.csv

## CONFIG\_PARTITION\_TABLE\_CUSTOM\_FILENAME

Custom partition CSV file

Found in: [Partition Table](#)

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- “partitions.csv”

### CONFIG\_PARTITION\_TABLE\_OFFSET

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION\_TABLE\_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**

- “0x8000”

### CONFIG\_PARTITION\_TABLE\_MD5

Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**

- Yes (enabled) if ESP32\_COMPATIBLE\_PRE\_V3\_1\_BOOTLOADERS

### Compiler options

Contains:

- [CONFIG\\_COMPILER\\_OPTIMIZATION\\_ASSERTION\\_LEVEL](#)
- [CONFIG\\_COMPILER\\_OPTIMIZATION\\_CHECKS\\_SILENT](#)
- [CONFIG\\_COMPILER\\_DISABLE\\_GCC8\\_WARNINGS](#)
- [CONFIG\\_COMPILER\\_DUMP\\_RTL\\_FILES](#)
- [CONFIG\\_COMPILER\\_WARN\\_WRITE\\_STRINGS](#)
- [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)
- [CONFIG\\_COMPILER\\_CXX\\_RTTI](#)
- [CONFIG\\_COMPILER\\_OPTIMIZATION](#)
- [CONFIG\\_COMPILER\\_HIDE\\_PATHS\\_MACROS](#)
- [CONFIG\\_COMPILER\\_STACK\\_CHECK\\_MODE](#)

### CONFIG\_COMPILER\_OPTIMIZATION

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.

- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOT-LOADER\_COMPILER\_OPTIMIZATION setting.

**Available options:**

- Debug (-Og) (COMPILER\_OPTIMIZATION\_DEFAULT)
- Optimize for size (-Os) (COMPILER\_OPTIMIZATION\_SIZE)
- Optimize for performance (-O2) (COMPILER\_OPTIMIZATION\_PERF)
- Debug without optimization (-O0) (COMPILER\_OPTIMIZATION\_NONE)

## CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTION\_LEVEL

Assertion level

*Found in: [Compiler options](#)*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

**Available options:**

- Enabled (COMPILER\_OPTIMIZATION\_ASSERTIONS\_ENABLE)  
Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (COMPILER\_OPTIMIZATION\_ASSERTIONS\_SILENT)  
Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (COMPILER\_OPTIMIZATION\_ASSERTIONS\_DISABLE)  
If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

## CONFIG\_COMPILER\_OPTIMIZATION\_CHECKS\_SILENT

Disable messages in ESP\_RETURN\_ON\_\* and ESP\_EXIT\_ON\_\* macros

*Found in: [Compiler options](#)*

If enabled, the error messages will be discarded in following check macros: - ESP\_RETURN\_ON\_ERROR - ESP\_EXIT\_ON\_ERROR - ESP\_RETURN\_ON\_FALSE - ESP\_EXIT\_ON\_FALSE

**Default value:**

- No (disabled)

## CONFIG\_COMPILER\_HIDE\_PATHS\_MACROS

Replace ESP-IDF and project paths in binaries

*Found in: [Compiler options](#)*

When expanding the \_\_FILE\_\_ and \_\_BASE\_FILE\_\_ macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes `-macro-prefix-map` options to the GCC command line. To replace additional paths in your binaries, modify the project `CMakeLists.txt` file to pass custom `-macro-prefix-map` or `-file-prefix-map` arguments.

### CONFIG\_COMPILER\_CXX\_EXCEPTIONS

Enable C++ exceptions

*Found in: [Compiler options](#)*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any `libstdc++` code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS\\_EMG\\_POOL\\_SIZE](#)

### CONFIG\_COMPILER\_CXX\_EXCEPTIONS\_EMG\_POOL\_SIZE

Emergency Pool Size

*Found in: [Compiler options](#) > [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**

- 0 if [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)

### CONFIG\_COMPILER\_CXX\_RTTI

Enable C++ run-time type info (RTTI)

*Found in: [Compiler options](#)*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_STACK\_CHECK\_MODE

Stack smashing protection mode

*Found in: [Compiler options](#)*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.

- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected –those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

**Available options:**

- None (COMPILER\_STACK\_CHECK\_MODE\_NONE)
- Normal (COMPILER\_STACK\_CHECK\_MODE\_NORM)
- Strong (COMPILER\_STACK\_CHECK\_MODE\_STRONG)
- Overall (COMPILER\_STACK\_CHECK\_MODE\_ALL)

### CONFIG\_COMPILER\_WARN\_WRITE\_STRINGS

Enable `-Wwrite-strings` warning flag

Found in: *Compiler options*

Adds `-Wwrite-strings` flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DISABLE\_GCC8\_WARNINGS

Disable new warnings introduced in GCC 6 - 8

Found in: *Compiler options*

Enable this option if using GCC 6 or newer, and wanting to disable warnings which don't appear with GCC 5.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DUMP\_RTL\_FILES

Dump RTL files during compilation

Found in: *Compiler options*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

### Component config

Contains:

- *ADC-Calibration*
- *Application Level Tracing*
- *Bluetooth*
- *CoAP Configuration*

- *Common ESP-related*
- *Core dump*
- *Driver configurations*
- *eFuse Bit Manager*
- *CONFIG\_BLE\_MESH*
- *ESP HTTP client*
- *ESP HTTPS OTA*
- *ESP HTTPS server*
- *ESP NETIF Adapter*
- *ESP Ringbuf*
- *ESP System Settings*
- *ESP-ASIO*
- *ESP-MQTT Configurations*
- *ESP-TLS*
- *ESP32S3-Specific*
- *Ethernet*
- *Event Loop Library*
- *FAT Filesystem support*
- *FreeRTOS*
- *GDB Stub*
- *Hardware Abstraction Layer (HAL) and Low Level (LL)*
- *Hardware Settings*
- *Heap memory debugging*
- *High resolution timer (esp\_timer)*
- *HTTP Server*
- *IPC (Inter-Processor Call)*
- *jsmn*
- *LCD and Touch Panel*
- *libsodium*
- *Log output*
- *LWIP*
- *Main Flash configuration*
- *mbedTLS*
- *mDNS*
- *Modbus configuration*
- *Newlib*
- *NVS*
- *OpenSSL*
- *OpenThread*
- *PHY*
- *Power Management*
- *PThreads*
- *SPI Flash driver*
- *SPIFFS Configuration*
- *Supplicant*
- *TCP Transport*
- *TinyUSB Stack*
- *Unity unit testing library*
- *USB-OTG*
- *Virtual file system*
- *Wear Levelling*
- *Wi-Fi*
- *Wi-Fi Provisioning Manager*

**Application Level Tracing** Contains:

- *CONFIG\_APPTRACE\_DESTINATION*
- *FreeRTOS System View Tracing*

- [CONFIG\\_APPTRACE\\_GCOV\\_ENABLE](#)
- [CONFIG\\_APPTRACE\\_BUF\\_SIZE](#)
- [CONFIG\\_APPTRACE\\_PENDING\\_DATA\\_SIZE\\_MAX](#)
- [CONFIG\\_APPTRACE\\_POSTMORTEM\\_FLUSH\\_THRESH](#)
- [CONFIG\\_APPTRACE\\_ONPANIC\\_HOST\\_FLUSH\\_TMO](#)

### CONFIG\_APPTRACE\_DESTINATION

Data Destination

*Found in: [Component config](#) > [Application Level Tracing](#)*

Select destination for application trace: JTAG or none (to disable).

**Available options:**

- JTAG (APPTRACE\_DEST\_JTAG)
- None (APPTRACE\_DEST\_NONE)

### CONFIG\_APPTRACE\_ONPANIC\_HOST\_FLUSH\_TMO

Timeout for flushing last trace data to host on panic

*Found in: [Component config](#) > [Application Level Tracing](#)*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

### CONFIG\_APPTRACE\_POSTMORTEM\_FLUSH\_THRESH

Threshold for flushing last trace data to host on panic

*Found in: [Component config](#) > [Application Level Tracing](#)*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

### CONFIG\_APPTRACE\_BUF\_SIZE

Size of the apptrace buffer

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the memory buffer for trace data in bytes.

### CONFIG\_APPTRACE\_PENDING\_DATA\_SIZE\_MAX

Size of the pending data buffer

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing** Contains:

- [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)

### **CONFIG\_APPTRACE\_SV\_ENABLE**

SystemView Tracing Enable

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#)*

Enables support for SEGGER SystemView tracing functionality.

### **CONFIG\_APPTRACE\_SV\_TS\_SOURCE**

Timer to use as timestamp source

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

**Available options:**

- CPU cycle counter (CCOUNT) (APPTRACE\_SV\_TS\_SOURCE\_CCOUNT)
- Timer 0, Group 0 (APPTRACE\_SV\_TS\_SOURCE\_TIMER\_00)
- Timer 1, Group 0 (APPTRACE\_SV\_TS\_SOURCE\_TIMER\_01)
- Timer 0, Group 1 (APPTRACE\_SV\_TS\_SOURCE\_TIMER\_10)
- Timer 1, Group 1 (APPTRACE\_SV\_TS\_SOURCE\_TIMER\_11)
- esp\_timer high resolution timer (APPTRACE\_SV\_TS\_SOURCE\_ESP\_TIMER)

### **CONFIG\_APPTRACE\_SV\_MAX\_TASKS**

Maximum supported tasks

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

Configures maximum supported tasks in sysview debug

### **CONFIG\_APPTRACE\_SV\_BUF\_WAIT\_TMO**

Trace buffer wait timeout

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

### **CONFIG\_APPTRACE\_SV\_EVT\_OVERFLOW\_ENABLE**

Trace Buffer Overflow Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

Enables “Trace Buffer Overflow” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_ENTER\_ENABLE**

ISR Enter Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS SystemView Tracing](#) > [CONFIG\\_APPTRACE\\_SV\\_ENABLE](#)*

Enables “ISR Enter” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_EXIT\_ENABLE**

ISR Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “ISR Exit” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_TO\_SCHED\_ENABLE**

ISR Exit to Scheduler Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “ISR to Scheduler” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_EXEC\_ENABLE**

Task Start Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Task Start Execution” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_EXEC\_ENABLE**

Task Stop Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Task Stop Execution” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_READY\_ENABLE**

Task Start Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Task Start Ready State” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_READY\_ENABLE**

Task Stop Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Task Stop Ready State” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_CREATE\_ENABLE**

Task Create Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Task Create” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_TERMINATE\_ENABLE**

Task Terminate Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Task Terminate” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_IDLE\_ENABLE**

System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “System Idle” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_ENTER\_ENABLE**

Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Timer Enter” event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_EXIT\_ENABLE**

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

Enables “Timer Exit” event.

### **CONFIG\_APPTRACE\_GCOV\_ENABLE**

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

### **ESP-ASIO** Contains:

- *CONFIG\_ASIO\_SSL\_SUPPORT*

### **CONFIG\_ASIO\_SSL\_SUPPORT**

Enable SSL/TLS support of ASIO

*Found in: Component config > ESP-ASIO*

Enable support for basic SSL/TLS features, available for mbedTLS/OpenSSL as well as wolfSSL TLS library.

#### **Default value:**

- No (disabled)

## CONFIG\_ASIO\_SSL\_LIBRARY\_CHOICE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-ASIO > CONFIG\_ASIO\_SSL\_SUPPORT*

The ASIO support multiple backend TLS libraries. Currently the mbedTLS with a thin ESP-OpenSSL port layer (default choice) and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

### Available options:

- esp-openssl (ASIO\_USE\_ESP\_OPENSSL)
- wolfSSL (License info in wolfSSL directory README) (ASIO\_USE\_ESP\_WOLFSSL)

## Bluetooth Contains:

- *Bluedroid Options*
- *CONFIG\_BT\_ENABLED*
- *CONFIG\_BT\_HCI\_LOG\_DEBUG\_EN*
- *NimBLE Options*

## CONFIG\_BT\_ENABLED

Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

## Bluetooth controller Contains:

- *CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP*
- *CONFIG\_BT\_BLE\_CCA\_MODE*
- *CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL*
- *CONFIG\_BT\_CTRL\_BLE\_MAX\_ACT*
- *CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL*
- *CONFIG\_BT\_CTRL\_BLE\_STATIC\_ACL\_TX\_BUF\_NB*
- *CONFIG\_BT\_CTRL\_HW\_CCA\_VAL*
- *CONFIG\_BT\_CTRL\_COEX\_PHY\_CODED\_TX\_RX\_TLIM*
- *CONFIG\_BT\_CTRL\_CE\_LENGTH\_TYPE*
- *CONFIG\_BT\_CTRL\_RX\_ANTENNA\_INDEX*
- *CONFIG\_BT\_CTRL\_TX\_ANTENNA\_INDEX*
- *CONFIG\_BT\_CTRL\_SCAN\_BACKOFF\_UPPERLIMITMAX*
- *CONFIG\_BT\_BLE\_ADV\_DATA\_LENGTH\_ZERO\_AUX*
- *CONFIG\_BT\_CTRL\_CHAN\_ASS\_EN*
- *CONFIG\_BT\_CTRL\_AGC\_RECORRECT\_EN*
- *CONFIG\_BT\_CTRL\_LE\_PING\_EN*
- *CONFIG\_BT\_CTRL\_HCI\_MODE\_CHOICE*
- *MODEM SLEEP Options*
- *CONFIG\_BT\_CTRL\_PINNED\_TO\_CORE\_CHOICE*
- *CONFIG\_BT\_CTRL\_ADV\_DUP\_FILT\_MAX*

## CONFIG\_BT\_CTRL\_BLE\_MAX\_ACT

BLE Max Instances

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

BLE maximum activities of bluetooth controller, both of connections, scan, sync and adv(periodic adv, multi-adv). Each instance needs to consume 828 bytes, you can save RAM by modifying the instance value according to actual needs.

**Range:**

- from 1 to 10 if `CONFIG_BT_ENABLED`

**Default value:**

- 6 if `CONFIG_BT_ENABLED`

### **CONFIG\_BT\_CTRL\_BLE\_STATIC\_ACL\_TX\_BUF\_NB**

BLE static ACL TX buffer numbers

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

BLE ACL buffer have two methods to be allocated. One is persistent allocating (allocate when controller initialise, never free until controller de-initialise) another is dynamically allocating (allocate before TX and free after TX).

**Range:**

- from 0 to 12 if `CONFIG_BT_ENABLED`

**Default value:**

- 0 if `CONFIG_BT_ENABLED`

### **CONFIG\_BT\_CTRL\_PINNED\_TO\_CORE\_CHOICE**

The cpu core which bluetooth controller run

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

**Available options:**

- Core 0 (PRO CPU) (`BT_CTRL_PINNED_TO_CORE_0`)
- Core 1 (APP CPU) (`BT_CTRL_PINNED_TO_CORE_1`)

### **CONFIG\_BT\_CTRL\_HCI\_MODE\_CHOICE**

HCI mode

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Specify HCI mode as VHCI or UART(H4)

**Available options:**

- VHCI (`BT_CTRL_HCI_MODE_VHCI`)  
Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32S3 or ESP32C3.
- UART(H4) (`BT_CTRL_HCI_MODE_UART_H4`)  
If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

### **CONFIG\_BT\_CTRL\_ADV\_DUP\_FILTER\_MAX**

The maximum number of 5.0 extend duplicate scan filter

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

The maximum number of duplicate scan filter

**Range:**

- from 1 to 500 if `CONFIG_BT_ENABLED`

**Default value:**

- 30 if `CONFIG_BT_ENABLED`

### CONFIG\_BT\_BLE\_CCA\_MODE

BLE CCA mode

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Define BT BLE CCA mode

**Available options:**

- NONE (BT\_BLE\_CCA\_MODE\_NONE)
- Hardware (BT\_BLE\_CCA\_MODE\_HW)
- Software (BT\_BLE\_CCA\_MODE\_SW)

### CONFIG\_BT\_CTRL\_HW\_CCA\_VAL

CCA threshold value

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

It is the threshold value of HW CCA, if the value is 30, it means CCA threshold is -30 dBm.

**Range:**

- from 20 to 100 if *CONFIG\_BT\_ENABLED*

**Default value:**

- 20 if *CONFIG\_BT\_ENABLED*

### CONFIG\_BT\_CTRL\_CE\_LENGTH\_TYPE

Connection event length determination method

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Specify connection event length determination

**Available options:**

- ORIGINAL (BT\_CTRL\_CE\_LENGTH\_TYPE\_ORIG)
- Use CE parameter for HCI command (BT\_CTRL\_CE\_LENGTH\_TYPE\_CE)
- Use Espressif self-defined method (BT\_CTRL\_CE\_LENGTH\_TYPE\_SD)

### CONFIG\_BT\_CTRL\_TX\_ANTENNA\_INDEX

default Tx antenna used

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Specify default Tx antenna used for bluetooth

**Available options:**

- Antenna 0 (BT\_CTRL\_TX\_ANTENNA\_INDEX\_0)
- Antenna 1 (BT\_CTRL\_TX\_ANTENNA\_INDEX\_1)

### CONFIG\_BT\_CTRL\_RX\_ANTENNA\_INDEX

default Rx antenna used

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Specify default Rx antenna used for bluetooth

**Available options:**

- Antenna 0 (BT\_CTRL\_RX\_ANTENNA\_INDEX\_0)
- Antenna 1 (BT\_CTRL\_RX\_ANTENNA\_INDEX\_1)

**CONFIG\_BT\_CTRL\_DFT\_TX\_POWER\_LEVEL**

BLE default Tx power level

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Specify default Tx power level

**Available options:**

- -24dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N24)
- -21dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N21)
- -18dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N18)
- -15dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N15)
- -12dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N12)
- **-9dBm** (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N9)
- **-6dBm** (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N6)
- **-3dBm** (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N3)
- 0dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_N0)
- **+3dBm** (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P3)
- **+6dBm** (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P6)
- **+9dBm** (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P9)
- +12dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P12)
- +15dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P15)
- +18dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P18)
- +21dBm (BT\_CTRL\_DFT\_TX\_POWER\_LEVEL\_P21)

**CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP**

BLE adv report flow control supported

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_ENABLED*

**CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_NUM**

BLE adv report flow control number

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP*

The number of unprocessed advertising report that bluetooth host can save. If you set *BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_NUM* to a small value, this may cause adv packets lost. If you set *BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_NUM* to a large value, bluetooth host may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 \* 50 bytes. Please set *BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_NUM* according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**Range:**

- from 50 to 1000 if *CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP* && *CONFIG\_BT\_ENABLED*

**Default value:**

- 100 if *CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP* && *CONFIG\_BT\_ENABLED*

## CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_DISCARD\_THRSHOLD

BLE adv lost event threshold value

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#) > [CONFIG\\_BT\\_CTRL\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_SUPP](#)

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set [BT\\_CTRL\\_BLE\\_ADV\\_REPORT\\_DISCARD\\_THRSHOLD](#) to a small value or printf every adv lost event, it may cause adv packets lost more.

**Range:**

- from 1 to 1000 if [CONFIG\\_BT\\_CTRL\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_SUPP](#) && [CONFIG\\_BT\\_ENABLED](#)

**Default value:**

- 20 if [CONFIG\\_BT\\_CTRL\\_BLE\\_ADV\\_REPORT\\_FLOW\\_CTRL\\_SUPP](#) && [CONFIG\\_BT\\_ENABLED](#)

## CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL

BLE Scan Duplicate Options

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#)

This select enables parameters setting of BLE scan duplicate.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_ENABLED](#)

## CONFIG\_BT\_CTRL\_SCAN\_DUPL\_TYPE

Scan Duplicate Type

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#) > [CONFIG\\_BT\\_CTRL\\_BLE\\_SCAN\\_DUPL](#)

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”, This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data” . This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data” . This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

**Available options:**

- Scan Duplicate By Device Address ([BT\\_CTRL\\_SCAN\\_DUPL\\_TYPE\\_DEVICE](#))  
Advertising packets with the same address, address type, and advertising type are reported once.
- Scan Duplicate By Advertising Data ([BT\\_CTRL\\_SCAN\\_DUPL\\_TYPE\\_DATA](#))  
Advertising packets with identical advertising data, address type, and advertising type are reported only once, even if they originate from different devices.
- Scan Duplicate By Device Address And Advertising Data ([BT\\_CTRL\\_SCAN\\_DUPL\\_TYPE\\_DATA\\_DEVICE](#))  
Advertising packets with the same address, advertising data, address type, and advertising type are reported only once.

## CONFIG\_BT\_CTRL\_SCAN\_DUPL\_CACHE\_SIZE

Maximum number of devices in scan duplicate filter

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#) > [CONFIG\\_BT\\_CTRL\\_BLE\\_SCAN\\_DUPL](#)

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**

- from 10 to 1000 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_ENABLED`

**Default value:**

- 100 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_ENABLED`

**CONFIG\_BT\_CTRL\_DUPL\_SCAN\_CACHE\_REFRESH\_PERIOD**

Duplicate scan list refresh period (seconds)

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL*

If the period value is non-zero, the controller will periodically clear the device information stored in the scan duplicate filter. If it is 0, the scan duplicate filter will not be cleared until the scanning is disabled. Duplicate advertisements for this period should not be sent to the Host in advertising report events. There are two scenarios where the ADV packet will be repeatedly reported: 1. The duplicate scan cache is full, the controller will delete the oldest device information and add new device information. 2. When the refresh period is up, the controller will clear all device information and start filtering again.

**Range:**

- from 0 to 1000 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_ENABLED`

**Default value:**

- 0 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_ENABLED`

**CONFIG\_BT\_CTRL\_BLE\_MESH\_SCAN\_DUPL\_EN**

Special duplicate scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL*

This enables the BLE scan duplicate for special BLE Mesh scan.

**Default value:**

- No (disabled) if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_ENABLED`

**CONFIG\_BT\_CTRL\_MESH\_DUPL\_SCAN\_CACHE\_SIZE**

Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > CONFIG\_BT\_CTRL\_BLE\_SCAN\_DUPL > CONFIG\_BT\_CTRL\_BLE\_MESH\_SCAN\_DUPL\_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**

- from 10 to 1000 if `CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_ENABLED`

**Default value:**

- 100 if `CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_ENABLED`

**CONFIG\_BT\_CTRL\_COEX\_PHY\_CODED\_TX\_RX\_TLIM**

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

**Available options:**

- Force Enable (BT\_CTRL\_COEX\_PHY\_CODED\_TX\_RX\_TLIM\_EN)  
Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (BT\_CTRL\_COEX\_PHY\_CODED\_TX\_RX\_TLIM\_DIS)  
Disable the limitation on max tx/rx time for Coded-PHY connection

**MODEM SLEEP Options** Contains:

- [CONFIG\\_BT\\_CTRL\\_MODEM\\_SLEEP](#)
- [CONFIG\\_BT\\_CTRL\\_MAIN\\_XTAL\\_PU\\_DURING\\_LIGHT\\_SLEEP](#)

**CONFIG\_BT\_CTRL\_MODEM\_SLEEP**

Bluetooth modem sleep

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#) > [MODEM SLEEP Options](#)

Enable/disable bluetooth controller low power mode. Modem sleep is not supported to be used with UART HCI.

**Default value:**

- No (disabled) if [BT\\_CTRL\\_HCI\\_MODE\\_UART\\_H4](#) && [CONFIG\\_BT\\_ENABLED](#)

**CONFIG\_BT\_CTRL\_MODEM\_SLEEP\_MODE\_1**

Bluetooth Modem sleep Mode 1

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#) > [MODEM SLEEP Options](#) > [CONFIG\\_BT\\_CTRL\\_MODEM\\_SLEEP](#)

Mode 1 is the currently supported sleep mode. In this mode, bluetooth controller sleeps between and BLE events. A low power clock is used to maintain bluetooth reference clock.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_CTRL\\_MODEM\\_SLEEP](#) && [CONFIG\\_BT\\_ENABLED](#)

**CONFIG\_BT\_CTRL\_LOW\_POWER\_CLOCK**

Bluetooth low power clock

*Found in:* [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_ENABLED](#) > [Bluetooth controller](#) > [MODEM SLEEP Options](#) > [CONFIG\\_BT\\_CTRL\\_MODEM\\_SLEEP](#) > [CONFIG\\_BT\\_CTRL\\_MODEM\\_SLEEP\\_MODE\\_1](#)

Select the low power clock source for bluetooth controller

**Available options:**

- Main crystal (BT\_CTRL\_LPCLK\_SEL\_MAIN\_XTAL)  
Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling(DFS) enabled, and bluetooth can work under light sleep enabled. Main crystal has a relatively better performance than other bluetooth low power clock sources.
- External 32kHz crystal (BT\_CTRL\_LPCLK\_SEL\_EXT\_32K\_XTAL)  
External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.
- Internal 150kHz RC oscillator (BT\_CTRL\_LPCLK\_SEL\_RTC\_SLOW)  
Internal 150kHz RC oscillator. The accuracy of this clock is a lot larger than 500ppm which is required in Bluetooth communication, so don't select this option in scenarios such as BLE connection state.

**CONFIG\_BT\_CTRL\_MAIN\_XTAL\_PU\_DURING\_LIGHT\_SLEEP**

power up main XTAL during light sleep

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > MODEM SLEEP Options*

If this option is selected, the main crystal will power up during light sleep when the low power clock selects an external 32kHz crystal but the external 32kHz crystal does not exist or the low power clock selects the main crystal.

**Default value:**

- No (disabled) if (BT\_CTRL\_LPCLK\_SEL\_MAIN\_XTAL || BT\_CTRL\_LPCLK\_SEL\_EXT\_32K\_XTAL) && CONFIG\_BT\_ENABLED && CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE && CONFIG\_BT\_ENABLED

**CONFIG\_BT\_CTRL\_AGC\_RECORRECT\_EN**

Enable HW AGC recorrect

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Enable uncoded phy AGC recorrect

**Default value:**

- No (disabled) if CONFIG\_BT\_ENABLED

**CONFIG\_BT\_CTRL\_CODED\_AGC\_RECORRECT\_EN**

Enable coded phy AGC recorrect

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller > CONFIG\_BT\_CTRL\_AGC\_RECORRECT\_EN*

Enable coded phy AGC recorrect

**Default value:**

- No (disabled) if CONFIG\_BT\_CTRL\_AGC\_RECORRECT\_EN && CONFIG\_BT\_ENABLED

**CONFIG\_BT\_CTRL\_SCAN\_BACKOFF\_UPPERLIMITMAX**

Disable active scan backoff

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

Disable active scan backoff. The bluetooth spec requires that scanners should run a backoff procedure to minimize collision of scan request PDUs from multiple scanners. If scan backoff is disabled, in active scanning, scan request PDU will be sent every time when HW receives scannable ADV PDU.

**Default value:**

- No (disabled) if CONFIG\_BT\_ENABLED

**CONFIG\_BT\_BLE\_ADV\_DATA\_LENGTH\_ZERO\_AUX**

Enable aux packet when ext adv data length is zero

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

When this option is enabled, auxiliary packets will be present in the events of ‘Non-Connectable and Non-Scannable’ regardless of whether the advertising length is 0. If this option is not enabled, auxiliary packets will only be present when the advertising length is not 0.

**Default value:**

- No (disabled) if CONFIG\_BT\_ENABLED

## CONFIG\_BT\_CTRL\_CHAN\_ASS\_EN

Enable channel assessment

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

If this option is enabled, The Controller will records the communication quality for each channel and then start a timer to check and update the channel map every 4 seconds.

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_ENABLED*

## CONFIG\_BT\_CTRL\_LE\_PING\_EN

Enable LE Ping procedure

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED > Bluetooth controller*

If this option is disabled, The Controller will not start the LE authenticated payload timer. This option is used for some compatibility problems related to LE ping procedure.

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_ENABLED*

## CONFIG\_BT\_HOST

Bluetooth Host

*Found in: Component config > Bluetooth > CONFIG\_BT\_ENABLED*

This helps to choose Bluetooth host stack

**Available options:**

- **Bluedroid** - Dual-mode (*BT\_BLUEDROID\_ENABLED*)  
This option is recommended for classic Bluetooth or for dual-mode usecases
- **NimBLE** - BLE only (*BT\_NIMBLE\_ENABLED*)  
This option is recommended for BLE only usecases to save on memory
- **Controller Only** (*BT\_CONTROLLER\_ONLY*)  
This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

### Bluedroid Options

 Contains:

- *CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK*
- *CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG*
- *CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE*
- *CONFIG\_BT\_BTC\_TASK\_STACK\_SIZE*
- *CONFIG\_BT\_BLE\_ENABLED*
- *BT\_DEBUG\_LOG\_LEVEL*
- *CONFIG\_BT\_ACL\_CONNECTIONS*
- *CONFIG\_BT\_SMP\_MAX BONDS*
- *CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST*
- *CONFIG\_BT\_STACK\_NO\_LOG*
- *CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED*
- *CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED*
- *CONFIG\_BT\_BLE\_HIGH\_DUTY\_ADV\_INTERVAL*
- *CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE*
- *CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_SYNC\_TRANSFER*
- *CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_ENH*
- *CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN*
- *CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN*

- `CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT`
- `CONFIG_BT_BLE_RPA_TIMEOUT`
- `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY`

### **CONFIG\_BT\_BTC\_TASK\_STACK\_SIZE**

Bluetooth event (callback to application) task stack size

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This select btc task stack size

**Default value:**

- 3072 if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE**

The cpu core which Bluedroid run

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

**Available options:**

- Core 0 (PRO CPU) (`BT_BLUEDROID_PINNED_TO_CORE_0`)
- Core 1 (APP CPU) (`BT_BLUEDROID_PINNED_TO_CORE_1`)

### **CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE**

Bluetooth Bluedroid Host Stack task stack size

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This select btu task stack size

**Default value:**

- 4352 if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG**

Bluedroid memory debug

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

Bluedroid memory debug

**Default value:**

- No (disabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLE\_ENABLED**

Bluetooth Low Energy

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This enables Bluetooth Low Energy

**Default value:**

- Yes (enabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_GATTS\_ENABLE

Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTS\_PPCP\_CHAR\_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_BLUFI\_ENABLE

Include blufi function

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option can be close when the app does not require blufi function.

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATT\_MAX\_SR\_PROFILES

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Server Profiles Count

**Range:**

- from 1 to 32 if *CONFIG\_BT\_GATTS\_ENABLE* && BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**Default value:**

- 8 if *CONFIG\_BT\_GATTS\_ENABLE* && BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATT\_MAX\_SR\_ATTRIBUTES

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Service Attributes Count

**Range:**

- from 1 to 500 if *CONFIG\_BT\_GATTS\_ENABLE* && BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**Default value:**

- 100 if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MODE**

GATTS Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Service change indication mode for GATT Server.

**Available options:**

- GATTS manually send service change indication (`BT_GATTS_SEND_SERVICE_CHANGE_MANUAL`)  
Manually send service change indication through API `esp_ble_gatts_send_service_change_indication()`
- GATTS automatically send service change indication (`BT_GATTS_SEND_SERVICE_CHANGE_AUTO`)  
Let Bluedroid handle the service change indication internally

**CONFIG\_BT\_GATTS\_ROBUST\_CACHING\_ENABLED**

Enable Robust Caching on Server Side

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option enables the GATT robust caching feature on the server. if turned on, the Client Supported Features characteristic, Database Hash characteristic, and Server Supported Features characteristic will be included in the GAP SERVICE.

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_GATTS\_DEVICE\_NAME\_WRITABLE**

Allow to write device name by GATT clients

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Enabling this option allows remote GATT clients to write device name

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_GATTS\_APPEARANCE\_WRITABLE**

Allow to write appearance by GATT clients

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Enabling this option allows remote GATT clients to write appearance

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_GATTC\_ENABLE

Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app work only on gatt server mode

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTC\_MAX\_CACHE\_CHAR

Max gattc cache characteristic for discover

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

Maximum GATTC cache characteristic count

**Range:**

- from 1 to 500 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

**Default value:**

- 40 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTC\_NOTIF\_REG\_MAX

Max gattc notify(indication) register number

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

Maximum GATTC notify(indication) register number

**Range:**

- from 1 to 64 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

**Default value:**

- 5 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTC\_CACHE\_NVS\_FLASH

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_GATTC\_CONNECT\_RETRY\_COUNT

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**

- from 0 to 255 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

**Default value:**

- 3 if *CONFIG\_BT\_GATTC\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_BLE\_SMP\_ENABLE

Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_SMP\_SLAVE\_CON\_PARAMS\_UPD\_ENABLE

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_BLE\_SMP\_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**

- No (disabled) if *CONFIG\_BT\_BLE\_SMP\_ENABLE* && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_STACK\_NO\_LOG

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Blueroid Options*

This select can save the rodata code size

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### BT DEBUG LOG LEVEL Contains:

- *CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL*

### CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL

HCI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for HCI layer

**Available options:**

- NONE (BT\_LOG\_HCI\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_HCI\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_HCI\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_HCI\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_HCI\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_HCI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_HCI\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL**

BTM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTM layer

**Available options:**

- NONE (BT\_LOG\_BTM\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BTM\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BTM\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BTM\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BTM\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BTM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BTM\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL**

L2CAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for L2CAP layer

**Available options:**

- NONE (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_L2CAP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL**

RFCOMM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for RFCOMM layer

**Available options:**

- NONE (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_EVENT)

- DEBUG (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL

SDP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SDP layer

**Available options:**

- NONE (BT\_LOG\_SDP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_SDP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_SDP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_SDP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_SDP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_SDP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_SDP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL

GAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GAP layer

**Available options:**

- NONE (BT\_LOG\_GAP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_GAP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_GAP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_GAP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_GAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_GAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_GAP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL

BNEP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BNEP layer

**Available options:**

- NONE (BT\_LOG\_BNEP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BNEP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BNEP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BNEP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BNEP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BNEP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BNEP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL

PAN layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluebird Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for PAN layer

**Available options:**

- NONE (BT\_LOG\_PAN\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_PAN\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_PAN\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_PAN\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_PAN\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_PAN\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_PAN\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL

A2D layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for A2D layer

**Available options:**

- NONE (BT\_LOG\_A2D\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_A2D\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_A2D\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_A2D\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_A2D\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_A2D\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_A2D\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL

AVDT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVDT layer

**Available options:**

- NONE (BT\_LOG\_AVDT\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_AVDT\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_AVDT\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_AVDT\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_AVDT\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_AVDT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_AVDT\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL

AVCT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVCT layer

**Available options:**

- NONE (BT\_LOG\_AVCT\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_AVCT\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_AVCT\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_AVCT\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_AVCT\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_AVCT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_AVCT\_TRACE\_LEVEL\_VERBOSE)

## CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL

AVRC layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for AVRC layer

### Available options:

- NONE (BT\_LOG\_AVRC\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_AVRC\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_AVRC\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_AVRC\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_AVRC\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_AVRC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_AVRC\_TRACE\_LEVEL\_VERBOSE)

## CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL

MCA layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for MCA layer

### Available options:

- NONE (BT\_LOG\_MCA\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_MCA\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_MCA\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_MCA\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_MCA\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_MCA\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_MCA\_TRACE\_LEVEL\_VERBOSE)

## CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL

HID layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for HID layer

### Available options:

- NONE (BT\_LOG\_HID\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_HID\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_HID\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_HID\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_HID\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_HID\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_HID\_TRACE\_LEVEL\_VERBOSE)

## CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL

APPL layer

Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)

Define BT trace level for APPL layer

### Available options:

- NONE (BT\_LOG\_APPL\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_APPL\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_APPL\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_APPL\_TRACE\_LEVEL\_API)

- EVENT (BT\_LOG\_APPL\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_APPL\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_APPL\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL

GATT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GATT layer

**Available options:**

- NONE (BT\_LOG\_GATT\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_GATT\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_GATT\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_GATT\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_GATT\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_GATT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_GATT\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL

SMP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SMP layer

**Available options:**

- NONE (BT\_LOG\_SMP\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_SMP\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_SMP\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_SMP\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_SMP\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_SMP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_SMP\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL

BTIF layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTIF layer

**Available options:**

- NONE (BT\_LOG\_BTIF\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BTIF\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BTIF\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BTIF\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BTIF\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BTIF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BTIF\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL

BTC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTC layer

**Available options:**

- NONE (BT\_LOG\_BTC\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BTC\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BTC\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BTC\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BTC\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BTC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BTC\_TRACE\_LEVEL\_VERBOSE)

**CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL**

OSI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for OSI layer

**Available options:**

- NONE (BT\_LOG\_OSI\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_OSI\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_OSI\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_OSI\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_OSI\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_OSI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_OSI\_TRACE\_LEVEL\_VERBOSE)

**CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL**

BLUFI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BLUFI layer

**Available options:**

- NONE (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_NONE)
- ERROR (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_ERROR)
- WARNING (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_WARNING)
- API (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_API)
- EVENT (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_EVENT)
- DEBUG (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BT\_LOG\_BLUFI\_TRACE\_LEVEL\_VERBOSE)

**CONFIG\_BT\_ACL\_CONNECTIONS**

BT/BLE MAX ACL CONNECTIONS(1~9)

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

**Range:**

- from 1 to 9 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

**Default value:**

- 4 if BT\_BLUEDROID\_ENABLED && BT\_BLUEDROID\_ENABLED

### CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE

Enable BLE multi-connections

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

Enable this option if there are multiple connections

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST

BT/BLE will first malloc the memory from the PSRAM

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This select can save the internal RAM if there have the PSRAM

**Default value:**

- No (disabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_DYNAMIC\_ENV\_MEMORY

Use dynamic memory allocation in BT/BLE stack

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

This select can make the allocation of memory will become more flexible

**Default value:**

- No (disabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK

BLE queue congestion check

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_SMP\_MAX BONDS

BT/BLE maximum bond device count

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

The number of security records for peer devices.

### CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN

Report adv data and scan response individually when BLE active scan

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#)*

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

**Default value:**

- No (disabled) if `BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT**

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, `ESP_GATTC_OPEN_EVT` or `ESP_GATTS_OPEN_EVT` is triggered.

**Range:**

- from 1 to 60 if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

**Default value:**

- 30 if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN**

length of bluetooth device name

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can't fit in will be truncated.

**Range:**

- from 32 to 248 if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

**Default value:**

- 32 if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLE\_RPA\_TIMEOUT**

Timeout of resolvable private address

*Found in: Component config > Bluetooth > Bluedroid Options*

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

**Range:**

- from 1 to 3600 if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

**Default value:**

- 900 if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED**

Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED**

Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_SYNC\_TRANSFER**

Enable BLE periodic advertising sync transfer feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE periodic advertising sync transfer feature

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `SOC_ESP_NIMBLE_CONTROLLER` && `BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_ENH**

Enable periodic adv enhancements(adi support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the periodic advertising enhancements

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `SOC_ESP_NIMBLE_CONTROLLER` && `BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_HIGH\_DUTY\_ADV\_INTERVAL**

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enable BLE high duty advertising interval feature

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

**NimBLE Options** Contains:

- `CONFIG_BT_NIMBLE_ACL_BUF_COUNT`
- `CONFIG_BT_NIMBLE_ACL_BUF_SIZE`
- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_ROLE_BROADCASTER`
- `CONFIG_BT_NIMBLE_ROLE_CENTRAL`
- `CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL`
- `CONFIG_BT_NIMBLE_MESH`
- `CONFIG_BT_NIMBLE_ROLE_OBSERVER`
- `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL`
- `CONFIG_BT_NIMBLE_BLUFI_ENABLE`
- `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`
- `CONFIG_BT_NIMBLE_USE_ESP_TIMER`
- `CONFIG_BT_NIMBLE_DEBUG`
- `CONFIG_BT_NIMBLE_HS_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_VS_SUPPORT`
- `CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE`
- `CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE`
- `CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT`
- `CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT`
- `CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN`

- `CONFIG_BT_NIMBLE_MAX_BONDS`
- `CONFIG_BT_NIMBLE_MAX_CCCDS`
- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS`
- `CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM`
- `CONFIG_BT_NIMBLE_MEM_ALLOC_MODE`
- `CONFIG_BT_NIMBLE_MSYS1_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_LOG_LEVEL`
- `CONFIG_BT_NIMBLE_TASK_STACK_SIZE`
- `CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS`
- `CONFIG_BT_NIMBLE_NVS_PERSIST`
- `CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU`
- `CONFIG_BT_NIMBLE_RPA_TIMEOUT`
- `CONFIG_BT_NIMBLE_SM_LEGACY`
- `CONFIG_BT_NIMBLE_SM_SC`
- `CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS`

### **CONFIG\_BT\_NIMBLE\_MEM\_ALLOC\_MODE**

Memory allocation strategy

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

#### **Available options:**

- Internal memory (`BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL`)
- External SPIRAM (`BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL`)
- Default alloc mode (`BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT`)
- Internal IRAM (`BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT`)

Allows to use IRAM memory region as 8bit accessible region.

Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### **CONFIG\_BT\_NIMBLE\_LOG\_LEVEL**

NimBLE Host log verbosity

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config -> Log output -> Default log verbosity” .

#### **Available options:**

- No logs (`BT_NIMBLE_LOG_LEVEL_NONE`)
- Error logs (`BT_NIMBLE_LOG_LEVEL_ERROR`)
- Warning logs (`BT_NIMBLE_LOG_LEVEL_WARNING`)
- Info logs (`BT_NIMBLE_LOG_LEVEL_INFO`)
- Debug logs (`BT_NIMBLE_LOG_LEVEL_DEBUG`)

### **CONFIG\_BT\_NIMBLE\_MAX\_CONNECTIONS**

Maximum number of concurrent connections

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM\_CTRL\_BLE\_MAX\_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT\_CTRL\_BLE\_MAX\_ACT from controller menu.

**Range:**

- from 1 to 9 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**Default value:**

- 3 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MAX\_BONDS

Maximum number of bonds to save across reboots

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Defines maximum number of bonds to save for peer security and our security

**Default value:**

- 3 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MAX\_CCCDS

Maximum number of CCC descriptors to save across reboots

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Defines maximum number of CCC descriptors to save

**Default value:**

- 8 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_L2CAP\_COC\_MAX\_NUM

Maximum number of connection oriented channels

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

**Range:**

- from 0 to 9 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**Default value:**

- 0 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_PINNED\_TO\_CORE\_CHOICE

The CPU core on which NimBLE host will run

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

**Available options:**

- Core 0 (PRO CPU) (BT\_NIMBLE\_PINNED\_TO\_CORE\_0)
- Core 1 (APP CPU) (BT\_NIMBLE\_PINNED\_TO\_CORE\_1)

### CONFIG\_BT\_NIMBLE\_TASK\_STACK\_SIZE

NimBLE Host task stack size

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This configures stack size of NimBLE host task

**Default value:**

- 5120 if `CONFIG_BLE_MESH` && `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`
- 4096 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_ROLE\_CENTRAL**

Enable BLE Central role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_ROLE\_PERIPHERAL**

Enable BLE Peripheral role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_ROLE\_BROADCASTER**

Enable BLE Broadcaster role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_ROLE\_OBSERVER**

Enable BLE Observer role

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_NVS\_PERSIST**

Persist the BLE Bonding keys in NVS

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable this flag to make bonding persistent across device reboots

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_SM\_LEGACY**

Security manager legacy pairing

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable security manager legacy pairing

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SM\_SC

Security manager secure connections (4.2)

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable security manager secure connections

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_DEBUG

Enable extra runtime asserts and host debugging

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This enables extra runtime asserts and host debugging

**Default value:**

- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SM\_SC\_DEBUG\_KEYS

Use predefined public-private key pair

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SM_SC` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_DEVICE\_NAME

BLE GAP default device name

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

**Default value:**

- “nimble” if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_GAP\_DEVICE\_NAME\_MAX\_LEN

Maximum length of BLE device name in octets

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**

- 31 if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ATT\_PREFERRED\_MTU

Preferred MTU size in octets

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

**Default value:**

- 256 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEARANCE

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**

- 0 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_ACL\_BUF\_COUNT

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

The number of ACL data buffers.

**Default value:**

- 20 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_ACL\_BUF\_SIZE

ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**

- 255 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HCI\_EVT\_BUF\_SIZE

HCI Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**

- 257 if `CONFIG_BT_NIMBLE_EXT_ADV` && BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED
- 70 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HCI\_EVT\_HI\_BUF\_COUNT

High Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options*

This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

**Default value:**

- 30 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HCI\_EVT\_LO\_BUF\_COUNT

Low Priority HCI Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This is the low priority HCI events' buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

**Default value:**

- 8 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MSYS1\_BLOCK\_COUNT

MSYS\_1 Block Count

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

MSYS is a system level mbuf registry. For prepare write & prepare responses Mbufs are allocated out of msys\_1 pool. For NIMBLE\_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**

- 12 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL

Enable Host Flow control

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable Host Flow control

**Default value:**

- Yes (enabled) if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_ITVL

Host Flow control interval

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#)*

Host flow control interval in msecs

**Default value:**

- 1000 if [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_THRESH

Host Flow control threshold

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#)*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**

- 2 if [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_TX\_ON\_DISCONNECT

Host Flow control on disconnect

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#)*

Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_HS\\_FLOW\\_CTRL](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_RPA\_TIMEOUT

RPA timeout in seconds

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Time interval between RPA address change.

**Range:**

- from 1 to 41400 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

**Default value:**

- 900 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH

Enable BLE mesh functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: [.doc../esp32/api-guides/esp-ble-mesh/ble-mesh-index`](#)

**Default value:**

- No (disabled) if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

Contains:

- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROVISIONER](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROV](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_GATT\\_PROXY](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_FRIEND](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_LOW\\_POWER](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROXY](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_RELAY](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_DEVICE\\_NAME](#)
- [CONFIG\\_BT\\_NIMBLE\\_MESH\\_NODE\\_COUNT](#)

### CONFIG\_BT\_NIMBLE\_MESH\_PROXY

Enable mesh proxy functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

Enable proxy. This is automatically set whenever NIMBLE\_MESH\_PB\_GATT or NIMBLE\_MESH\_GATT\_PROXY is set

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_MESH](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_PROV

Enable BLE mesh provisioning

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

Enable mesh provisioning

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_MESH](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_PB\_ADV

Enable mesh provisioning over advertising bearer

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROV](#)*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROV](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_PB\_GATT

Enable mesh provisioning over GATT bearer

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROV](#)*

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROV](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_GATT\_PROXY

Enable GATT Proxy functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_MESH](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_RELAY

Enable mesh relay functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

Support for acting as a Mesh Relay Node

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_MESH](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MESH\_LOW\_POWER

Enable mesh low power mode

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

Enable this option to be able to act as a Low Power Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_FRIEND**

Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_DEVICE\_NAME**

Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**

- “nimble-mesh-node” if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_NODE\_COUNT**

Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Defines mesh node count.

**Default value:**

- 1 if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_PROVISIONER**

Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable mesh provisioner.

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_CRYPTO\_STACK\_MBEDTLS**

Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_HS\_STOP\_TIMEOUT\_MS**

BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*

BLE Host stop procedure timeout in milliseconds.

**Default value:**

- 2000 if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_ENABLE\_CONN\_REATTEMPT

Enable connection reattempts on connection establishment error

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**

- Yes (enabled) if BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MAX\_CONN\_REATTEMPT

Maximum number connection reattempts

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#)

Defines maximum number of connection reattempts.

**Range:**

- from 1 to 255 if BT\_NIMBLE\_ENABLED && [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#) && BT\_NIMBLE\_ENABLED

**Default value:**

- 3 if BT\_NIMBLE\_ENABLED && [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT

Enable BLE 5 feature

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable BLE 5 features

**Default value:**

- Yes (enabled) if BT\_NIMBLE\_ENABLED && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_EXT\_ADV

Enable extended advertising.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

**Default value:**

- No (disabled) if BT\_NIMBLE\_ENABLED && [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_MAX\_EXT\_ADV\_INSTANCES

Maximum number of extended advertising instances.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want.

**Range:**

- from 0 to 4 if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**Default value:**

- 1 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MAX\_EXT\_ADV\_DATA\_LEN**

Maximum length of the advertising data.

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV`

Defines size of extended advertising data. Size should not increase 1650.

**Range:**

- from 0 to 1650 if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**Default value:**

- 1650 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_ENABLE\_PERIODIC\_ADV**

Enable periodic advertisement.

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV`

Enable this option to start periodic advertisement.

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MAX\_PERIODIC\_SYNCS**

Maximum number of periodic advertising syncs.

*Found in:* `Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV > CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV`

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

**Range:**

- from 1 to 8 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `BT_NIMBLE_ENABLED`

**Default value:**

- 1 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_BLUFI\_ENABLE**

Enable blufi functionality

*Found in:* `Component config > Bluetooth > NimBLE Options`

Set this option to enable blufi functionality.

**Default value:**

- No (disabled) if `BT_NIMBLE_ENABLED` && `BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_USE\_ESP\_TIMER

Enable Esp Timer for Nimble

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

**Default value:**

- Yes (enabled) if BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_NIMBLE\_HIGH\_DUTY\_ADV\_ITVL

Enable BLE high duty advertising interval feature

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This enables BLE high duty advertising interval feature

### CONFIG\_BT\_NIMBLE\_VS\_SUPPORT

Enable support for VSC and VSE

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

This option is used to enable support for sending Vendor Specific HCI commands and handling Vendor Specific HCI Events.

### CONFIG\_BT\_HCI\_LOG\_DEBUG\_EN

Enable Bluetooth HCI debug mode

*Found in: [Component config](#) > [Bluetooth](#)*

This option is used to enable bluetooth debug mode, which saves the hci layer data stream.

**Default value:**

- No (disabled) if BT\_BLUEDROID\_ENABLED || BT\_NIMBLE\_ENABLED

### CONFIG\_BT\_HCI\_LOG\_DATA\_BUFFER\_SIZE

Size of the cache used for HCI data in Bluetooth HCI debug mode (N\*1024 bytes)

*Found in: [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)*

This option is to configure the buffer size of the hci data steam cache in hci debug mode. This is a ring buffer, the new data will overwrite the oldest data if the buffer is full.

**Range:**

- from 1 to 100 if [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

**Default value:**

- 5 if [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

### CONFIG\_BT\_HCI\_LOG\_ADV\_BUFFER\_SIZE

Size of the cache used for adv report in Bluetooth HCI debug mode (N\*1024 bytes)

*Found in: [Component config](#) > [Bluetooth](#) > [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)*

This option is to configure the buffer size of the hci adv report cache in hci debug mode. This is a ring buffer, the new data will overwrite the oldest data if the buffer is full.

**Range:**

- from 1 to 100 if [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

**Default value:**

- 8 if [CONFIG\\_BT\\_HCI\\_LOG\\_DEBUG\\_EN](#)

## CONFIG\_BLE\_MESH

ESP BLE Mesh Support

*Found in: Component config*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- *BLE Mesh and BLE coexistence support*
- *CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT*
- *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*
- *BLE Mesh NET BUF DEBUG LOG LEVEL*
- *CONFIG\_BLE\_MESH\_PROV*
- *CONFIG\_BLE\_MESH\_PROXY*
- *BLE Mesh specific test option*
- *BLE Mesh STACK DEBUG LOG LEVEL*
- *CONFIG\_BLE\_MESH\_NO\_LOG*
- *CONFIG\_BLE\_MESH\_IVU\_DIVIDER*
- *CONFIG\_BLE\_MESH\_FAST\_PROV*
- *CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC*
- *CONFIG\_BLE\_MESH\_EXPERIMENTAL*
- *CONFIG\_BLE\_MESH\_CRPL*
- *CONFIG\_BLE\_MESH\_RX\_SDU\_MAX*
- *CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT*
- *CONFIG\_BLE\_MESH\_APP\_KEY\_COUNT*
- *CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT*
- *CONFIG\_BLE\_MESH\_LABEL\_COUNT*
- *CONFIG\_BLE\_MESH\_SUBNET\_COUNT*
- *CONFIG\_BLE\_MESH\_TX\_SEG\_MAX*
- *CONFIG\_BLE\_MESH\_RX\_SEG\_MSG\_COUNT*
- *CONFIG\_BLE\_MESH\_TX\_SEG\_MSG\_COUNT*
- *CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE*
- *CONFIG\_BLE\_MESH\_MSG\_CACHE\_SIZE*
- *CONFIG\_BLE\_MESH\_NOT\_RELAY\_REPLAY\_MSG*
- *CONFIG\_BLE\_MESH\_ADV\_BUF\_COUNT*
- *CONFIG\_BLE\_MESH\_PB\_GATT*
- *CONFIG\_BLE\_MESH\_PB\_ADV*
- *CONFIG\_BLE\_MESH\_IVU\_RECOVERY\_IVI*
- *CONFIG\_BLE\_MESH\_RELAY*
- *CONFIG\_BLE\_MESH\_SETTINGS*
- *CONFIG\_BLE\_MESH\_DEINIT*
- *CONFIG\_BLE\_MESH\_USE\_DUPLICATE\_SCAN*
- *Support for BLE Mesh Client/Server models*
- *Support for BLE Mesh Foundation models*
- *CONFIG\_BLE\_MESH\_NODE*
- *CONFIG\_BLE\_MESH\_PROVISIONER*
- *CONFIG\_BLE\_MESH\_FRIEND*
- *CONFIG\_BLE\_MESH\_LOW\_POWER*
- *CONFIG\_BLE\_MESH\_HCI\_5\_0*
- *CONFIG\_BLE\_MESH\_RANDOM\_ADV\_INTERVAL*
- *CONFIG\_BLE\_MESH\_IV\_UPDATE\_TEST*
- *CONFIG\_BLE\_MESH\_CLIENT\_MSG\_TIMEOUT*

## CONFIG\_BLE\_MESH\_HCI\_5\_0

Support sending 20ms non-connectable adv packets

Found in: *Component config* > *CONFIG\_BLE\_MESH*

It is a temporary solution and needs further modifications.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_RANDOM\_ADV\_INTERVAL**

Support using random adv interval for mesh packets

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to allow using random advertising interval for mesh packets. And this could help avoid collision of advertising packets.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_USE\_DUPLICATE\_SCAN**

Support Duplicate Scan in BLE Mesh

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data” .

**Default value:**

- Yes (enabled) if *BT\_BLUEDROID\_ENABLED* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE**

Memory allocation strategy

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

**Available options:**

- Internal DRAM (*BLE\_MESH\_MEM\_ALLOC\_MODE\_INTERNAL*)
- External SPIRAM (*BLE\_MESH\_MEM\_ALLOC\_MODE\_EXTERNAL*)
- Default alloc mode (*BLE\_MESH\_MEM\_ALLOC\_MODE\_DEFAULT*)  
Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM (*BLE\_MESH\_MEM\_ALLOC\_MODE\_IRAM\_8BIT*)  
Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

## CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC

Enable FreeRTOS static allocation

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**Default value:**

- No (disabled) if (ESP32\_SPIRAM\_SUPPORT || ESP32\_IRAM\_AS\_8BIT\_ACCESSIBLE\_MEMORY) && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_MODE

Memory allocation for FreeRTOS objects

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC*

Choose the memory to be used for FreeRTOS objects.

**Available options:**

- External SPIRAM (BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_EXTERNAL)  
If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM\_ALLOW\_STACK\_EXTERNAL\_MEMORY is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_IRAM\_8BIT)  
If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

## CONFIG\_BLE\_MESH\_DEINIT

Support de-initialize BLE Mesh stack

Found in: *Component config* > *CONFIG\_BLE\_MESH*

If enabled, users can use the function `esp_ble_mesh_deinit()` to de-initialize the whole BLE Mesh stack.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

## BLE Mesh and BLE coexistence support

 Contains:

- *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_SCAN*
- *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV*

## CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV

Support sending normal BLE advertising packets

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *BLE Mesh and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_BLE\_ADV\_BUF\_COUNT

Number of advertising buffers for BLE advertising packets

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh and BLE coexistence support](#) > [CONFIG\\_BLE\\_MESH\\_SUPPORT\\_BLE\\_ADV](#)*

Number of advertising buffers for BLE packets available.

**Range:**

- from 1 to 255 if [CONFIG\\_BLE\\_MESH\\_SUPPORT\\_BLE\\_ADV](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 3 if [CONFIG\\_BLE\\_MESH\\_SUPPORT\\_BLE\\_ADV](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_SCAN

Support scanning normal BLE advertising packets

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh and BLE coexistence support](#)*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_FAST\_PROV

Enable BLE Mesh Fast Provisioning

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_NODE

Support for BLE Mesh Node

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

### CONFIG\_BLE\_MESH\_PROVISIONER

Support for BLE Mesh Provisioner

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

### CONFIG\_BLE\_MESH\_WAIT\_FOR\_PROV\_MAX\_DEV\_NUM

Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**

- from 1 to 100 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_MAX\_PROV\_NODES

Maximum number of devices that can be provisioned by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PBA\_SAME\_TIME

Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

**Range:**

- from 1 to 10 if *CONFIG\_BLE\_MESH\_PB\_ADV* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_PB\_ADV* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PBG\_SAME\_TIME

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

**Range:**

- from 1 to 5 if *CONFIG\_BLE\_MESH\_PB\_GATT* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_SUBNET\_COUNT**

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_APP\_KEY\_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB**

Support receiving Heartbeat messages

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB\_FILTER\_SIZE**

Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER > CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**Range:**

- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER_RECV_HB` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PROV

BLE Mesh Provisioning support

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_PB\_ADV

Provisioning support using the advertising bearer (PB-ADV)

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_UNPROVISIONED\_BEACON\_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#)*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE\_MESH\_FAST\_PROV is selected, the value is better to be 3 seconds, or less.

**Range:**

- from 1 to 100 if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 5 if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#) && [CONFIG\\_BLE\\_MESH](#)
- 3 if [CONFIG\\_BLE\\_MESH\\_FAST\\_PROV](#) && [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH\\_PB\\_ADV](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_PB\_GATT

Provisioning support using GATT (PB-GATT)

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

### CONFIG\_BLE\_MESH\_PROXY

BLE Mesh Proxy protocol support

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER**

BLE Mesh GATT Proxy Server

*Found in:* `Component config > CONFIG_BLE_MESH`

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_NODE\_ID\_TIMEOUT**

Node Identity advertising timeout

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER`

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**

- from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**Default value:**

- 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROXY\_FILTER\_SIZE**

Maximum number of filter entries per Proxy Client

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER`

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**Range:**

- from 1 to 32767 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**Default value:**

- 4 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT**

BLE Mesh GATT Proxy Client

*Found in:* `Component config > CONFIG_BLE_MESH`

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

## CONFIG\_BLE\_MESH\_SETTINGS

Store BLE Mesh configuration persistently

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_STORE\_TIMEOUT

Delay (in seconds) before storing anything persistently

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**

- from 0 to 1000000 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 0 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_SEQ\_STORE\_RATE

How often the sequence number gets updated in storage

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that's guaranteed to be larger than the last one used before power off.

**Range:**

- from 0 to 1000000 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 0 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_RPL\_STORE\_TIMEOUT

Minimum frequency that the RPL gets updated in storage

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

**Range:**

- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_SETTINGS\_BACKWARD\_COMPATIBILITY

A specific option for settings backward compatibility

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS`

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_SPECIFIC\_PARTITION

Use a specific NVS partition for BLE Mesh

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS`

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exist in the csv file. When Provisioner needs to store a large amount of nodes' information in the flash (e.g. more than 20), this option is recommended to be enabled.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PARTITION\_NAME

Name of the NVS partition for BLE Mesh

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION`

This value defines the name of the specified NVS partition used by the mesh stack.

**Default value:**

- “ble\_mesh” if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_USE\_MULTIPLE\_NAMESPACE

Support using multiple NVS namespaces by Provisioner

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS`

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner

moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_MAX\_NVS\_NAMESPACE**

Maximum number of NVS namespaces

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE`

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**

- from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_SUBNET\_COUNT**

Maximum number of mesh subnets per network

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_APP\_KEY\_COUNT**

Maximum number of application keys per network

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT**

Maximum number of application keys per model

*Found in:* `Component config > CONFIG_BLE_MESH`

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT**

Maximum number of group address subscriptions per model

*Found in: `Component config` > `CONFIG_BLE_MESH`*

This option specifies the maximum number of addresses to which each model can be subscribed.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_LABEL\_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: `Component config` > `CONFIG_BLE_MESH`*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**Range:**

- from 0 to 4096 if `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_CRPL**

Maximum capacity of the replay protection list

*Found in: `Component config` > `CONFIG_BLE_MESH`*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

**Range:**

- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**

- 10 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_NOT\_RELAY\_REPLAY\_MSG**

Not relay replayed messages in a mesh network

*Found in: `Component config` > `CONFIG_BLE_MESH`*

There may be many expired messages in a complex mesh network that would be considered replayed messages. Enable this option will refuse to relay such messages, which could help to reduce invalid packets in the mesh network. However, it should be noted that enabling this option may result in packet loss in certain environments. Therefore, users need to decide whether to enable this option according to the actual usage situation.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_EXPERIMENTAL` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_MSG\_CACHE\_SIZE

Network message cache size

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

**Range:**

- from 2 to 65535 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 10 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_ADV\_BUF\_COUNT

Number of advertising buffers

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Number of advertising buffers available. The transport layer reserves ADV\_BUF\_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**

- from 6 to 256 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 60 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_IVU\_DIVIDER

Divider for IV Update state refresh timer

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn't necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**

- from 2 to 96 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 4 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_IVU\_RECOVERY\_IVI

Recovery the IV index when the latest whole IV update procedure is missed

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_TX\_SEG\_MSG\_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in:* `Component config > CONFIG_BLE_MESH`

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to if `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_RX\_SEG\_MSG\_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in:* `Component config > CONFIG_BLE_MESH`

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to 255 if `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_RX\_SDU\_MAX**

Maximum incoming Upper Transport Access PDU length

*Found in:* `Component config > CONFIG_BLE_MESH`

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

**Range:**

- from 36 to 384 if `CONFIG_BLE_MESH`

**Default value:**

- 384 if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_TX\_SEG\_MAX**

Maximum number of segments in outgoing messages

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what's the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers ([BLE\\_MESH\\_ADV\\_BUF\\_COUNT](#)) as there are outgoing segments.

**Range:**

- from 2 to 32 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 32 if [CONFIG\\_BLE\\_MESH](#)

## **CONFIG\_BLE\_MESH\_RELAY**

Relay support

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH](#)

## **CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF**

Use separate advertising buffers for relay packets

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_RELAY](#)*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_RELAY](#) && [CONFIG\\_BLE\\_MESH](#)

## **CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF\_COUNT**

Number of advertising buffers for relay packets

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_RELAY](#) > [CONFIG\\_BLE\\_MESH\\_RELAY\\_ADV\\_BUF](#)*

Number of advertising buffers for relay packets available.

**Range:**

- from 6 to 256 if [CONFIG\\_BLE\\_MESH\\_RELAY\\_ADV\\_BUF](#) && [CONFIG\\_BLE\\_MESH\\_RELAY](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 60 if [CONFIG\\_BLE\\_MESH\\_RELAY\\_ADV\\_BUF](#) && [CONFIG\\_BLE\\_MESH\\_RELAY](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LOW\_POWER

Support for Low Power features

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

## CONFIG\_BLE\_MESH\_LPN\_ESTABLISHMENT

Perform Friendship establishment using low power

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#)

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LPN\_AUTO

Automatically start looking for Friend nodes once provisioned

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#)

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LPN\_AUTO\_TIMEOUT

Time from last received message before going to LPN mode

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) > [CONFIG\\_BLE\\_MESH\\_LPN\\_AUTO](#)

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**

- from 0 to 3600 if [CONFIG\\_BLE\\_MESH\\_LPN\\_AUTO](#) && [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 15 if [CONFIG\\_BLE\\_MESH\\_LPN\\_AUTO](#) && [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#) && [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LPN\_RETRY\_TIMEOUT

Retry timeout for Friend requests

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_LOW\\_POWER](#)

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**

- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_RSSI\_FACTOR

RSSIFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_RECV\_WIN\_FACTOR

ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_MIN\_QUEUE\_SIZE

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The MinQueueSizeLog field is defined as  $\log_2(N)$ , where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.

**Range:**

- from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_RECV\_DELAY

Receive delay requested by the local node

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**

- from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 100 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_POLL\_TIMEOUT

The value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**

- from 10 to 244735 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 300 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_INIT\_POLL\_TIMEOUT

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**

- from 10 to if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_SCAN\_LATENCY

Latency for enabling scanning

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**

- from 0 to 50 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_GROUPS

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**

- from 0 to 16384 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 8 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_SUB\_ALL\_NODES\_ADDR

Automatically subscribe all nodes address

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Automatically subscribe all nodes address when friendship established.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_FRIEND**

Support for Friend feature

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to be able to act as a Friend Node.

### **CONFIG\_BLE\_MESH\_FRIEND\_RECV\_WIN**

Friend Receive Window

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_FRIEND\_QUEUE\_SIZE**

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**

- from 2 to 65536 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 16 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_FRIEND\_SUB\_LIST\_SIZE**

Friend Subscription List Size

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**

- from 0 to 1023 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_LPN\_COUNT

Number of supported LPN nodes

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_SEG\_RX

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of incomplete segment lists tracked for each Friends' LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_NO\_LOG

Disable BLE Mesh debug logs (minimize bin size)

*Found in: Component config > CONFIG\_BLE\_MESH*

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH* && *CONFIG\_BLE\_MESH*

### BLE Mesh STACK DEBUG LOG LEVEL

 Contains:

- *CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL*

### CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL

BLE\_MESH\_STACK

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh STACK DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh stack.

**Available options:**

- NONE (BLE\_MESH\_TRACE\_LEVEL\_NONE)
- ERROR (BLE\_MESH\_TRACE\_LEVEL\_ERROR)
- WARNING (BLE\_MESH\_TRACE\_LEVEL\_WARNING)
- INFO (BLE\_MESH\_TRACE\_LEVEL\_INFO)
- DEBUG (BLE\_MESH\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BLE\_MESH\_TRACE\_LEVEL\_VERBOSE)

### BLE Mesh NET BUF DEBUG LOG LEVEL

 Contains:

- *CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL*

## CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL

BLE\_MESH\_NET\_BUF

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

### Available options:

- NONE (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_NONE)
- ERROR (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_ERROR)
- WARNING (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_WARNING)
- INFO (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_INFO)
- DEBUG (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_VERBOSE)

## CONFIG\_BLE\_MESH\_CLIENT\_MSG\_TIMEOUT

Timeout(ms) for client message response

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

### Range:

- from 100 to 1200000 if *CONFIG\_BLE\_MESH*

### Default value:

- 4000 if *CONFIG\_BLE\_MESH*

**Support for BLE Mesh Foundation models** Contains:

- *CONFIG\_BLE\_MESH\_CFG\_CLI*
- *CONFIG\_BLE\_MESH\_HEALTH\_CLI*
- *CONFIG\_BLE\_MESH\_HEALTH\_SRV*

## CONFIG\_BLE\_MESH\_CFG\_CLI

Configuration Client model

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

## CONFIG\_BLE\_MESH\_HEALTH\_CLI

Health Client model

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *Support for BLE Mesh Foundation models*

Enable support for Health Client model.

## CONFIG\_BLE\_MESH\_HEALTH\_SRV

Health Server model

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *Support for BLE Mesh Foundation models*

Enable support for Health Server model.

### Default value:

- Yes (enabled) if *CONFIG\_BLE\_MESH*

**Support for BLE Mesh Client/Server models** Contains:

- *CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_SERVER*
- *CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHTING\_SERVER*
- *CONFIG\_BLE\_MESH\_SCENE\_CLI*
- *CONFIG\_BLE\_MESH\_SCHEDULER\_CLI*
- *CONFIG\_BLE\_MESH\_SENSOR\_CLI*
- *CONFIG\_BLE\_MESH\_SENSOR\_SERVER*
- *CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER*
- *CONFIG\_BLE\_MESH\_TIME\_CLI*

**CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI**

Generic OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

**CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI**

Generic Level Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Level Client model.

**CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI**

Generic Default Transition Time Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Default Transition Time Client model.

**CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI**

Generic Power OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power OnOff Client model.

**CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI**

Generic Power Level Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power Level Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI**

Generic Battery Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Battery Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI**

Generic Location Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Location Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_CLI**

Generic Property Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic Property Client model.

### **CONFIG\_BLE\_MESH\_SENSOR\_CLI**

Sensor Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Sensor Client model.

### **CONFIG\_BLE\_MESH\_TIME\_CLI**

Time Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Time Client model.

### **CONFIG\_BLE\_MESH\_SCENE\_CLI**

Scene Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Scene Client model.

### **CONFIG\_BLE\_MESH\_SCHEDULER\_CLI**

Scheduler Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Scheduler Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI**

Light Lightness Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light Lightness Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI**

Light CTL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light CTL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI**

Light HSL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light HSL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI**

Light XYL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light XYL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI**

Light LC Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light LC Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_SERVER**

Generic server models

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Generic server models.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### **CONFIG\_BLE\_MESH\_SENSOR\_SERVER**

Sensor server models

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Sensor server models.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

### **CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER**

Time and Scenes server models

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Time and Scenes server models.

**Default value:**

- Yes (enabled) if [CONFIG\\_BLE\\_MESH](#)

## CONFIG\_BLE\_MESH\_LIGHTING\_SERVER

Lighting server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_IV\_UPDATE\_TEST

Test the IV Update Procedure

*Found in: Component config > CONFIG\_BLE\_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

## BLE Mesh specific test option

 Contains:

- *CONFIG\_BLE\_MESH\_DEBUG*
- *CONFIG\_BLE\_MESH\_SHELL*
- *CONFIG\_BLE\_MESH\_BQB\_TEST*
- *CONFIG\_BLE\_MESH\_SELF\_TEST*
- *CONFIG\_BLE\_MESH\_TEST\_AUTO\_ENTER\_NETWORK*
- *CONFIG\_BLE\_MESH\_TEST\_USE\_WHITE\_LIST*

## CONFIG\_BLE\_MESH\_SELF\_TEST

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_BQB\_TEST

Enable BLE Mesh specific internal test

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option is used to enable some internal functions for auto-pts test.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_TEST\_AUTO\_ENTER\_NETWORK

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_TEST\_USE\_WHITE\_LIST**

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_SHELL**

Enable BLE Mesh shell

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_DEBUG**

Enable BLE Mesh debug logs

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_DEBUG\_NET**

Network layer debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Network layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_TRANS**

Transport layer debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Transport layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_BEACON**

Beacon debug

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option > CONFIG\_BLE\_MESH\_DEBUG*

Enable Beacon-related debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_CRYPTO**

Crypto debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable cryptographic debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_PROV**

Provisioning debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Provisioning debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_ACCESS**

Access layer debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Access layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_MODEL**

Foundation model debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Foundation Models debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_ADV**

Advertising debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable advertising debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_LOW\_POWER**

Low Power debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Low Power debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_FRIEND**

Friend debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Friend debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_PROXY

Proxy debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable Proxy protocol debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_EXPERIMENTAL

Make BLE Mesh experimental features visible

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Make BLE Mesh Experimental features visible. Experimental features list: - CONFIG\_BLE\_MESH\_NOT\_RELAY\_REPLAY\_MSG

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

**CoAP Configuration** Contains:

- [CONFIG\\_COAP\\_MBEDTLS\\_ENCRYPTION\\_MODE](#)
- [CONFIG\\_COAP\\_MBEDTLS\\_DEBUG](#)

### CONFIG\_COAP\_MBEDTLS\_ENCRYPTION\_MODE

CoAP Encryption method

*Found in:* [Component config](#) > [CoAP Configuration](#)

If the CoAP information is to be encrypted, the encryption environment can be set up in one of two ways (default being Pre-Shared key mode)

- Encrypt using defined Pre-Shared Keys (PSK if uri includes coaps://)
- Encrypt using defined Public Key Infrastructure (PKI if uri includes coaps://)

**Available options:**

- Pre-Shared Keys (COAP\_MBEDTLS\_PSK)
- PKI Certificates (COAP\_MBEDTLS\_PKI)

### CONFIG\_COAP\_MBEDTLS\_DEBUG

Enable CoAP debugging

*Found in:* [Component config](#) > [CoAP Configuration](#)

Enable CoAP debugging functions at compile time for the example code.

If this option is enabled, call `coap_set_log_level()` at runtime in order to enable CoAP debug output via the ESP log mechanism.

**Default value:**

- No (disabled)

### CONFIG\_COAP\_MBEDTLS\_DEBUG\_LEVEL

Set CoAP debugging level

*Found in:* [Component config](#) > [CoAP Configuration](#) > [CONFIG\\_COAP\\_MBEDTLS\\_DEBUG](#)

Set CoAP debugging level

**Available options:**

- Emergency (COAP\_LOG\_EMERG)

- Alert (COAP\_LOG\_ALERT)
- Critical (COAP\_LOG\_CRIT)
- Error (COAP\_LOG\_ERROR)
- Warning (COAP\_LOG\_WARNING)
- Notice (COAP\_LOG\_NOTICE)
- Info (COAP\_LOG\_INFO)
- Debug (COAP\_LOG\_DEBUG)
- mbedTLS (COAP\_LOG\_MBEDTLS)

**Driver configurations** Contains:

- *ADC configuration*
- *GDMA Configuration*
- *MCPWM configuration*
- *SPI configuration*
- *TWAI configuration*
- *UART configuration*

**ADC configuration** Contains:

- *CONFIG\_ADC\_DISABLE\_DAC*
- *CONFIG\_ADC\_CONTINUOUS\_FORCE\_USE\_ADC2\_ON\_C3\_S3*
- *CONFIG\_ADC\_FORCE\_XPD\_FSM*

### **CONFIG\_ADC\_FORCE\_XPD\_FSM**

Use the FSM to control ADC power

*Found in: Component config > Driver configurations > ADC configuration*

ADC power can be controlled by the FSM instead of software. This allows the ADC to be shut off when it is not working leading to lower power consumption. However using the FSM control ADC power will increase the noise of ADC.

**Default value:**

- No (disabled)

### **CONFIG\_ADC\_DISABLE\_DAC**

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: Component config > Driver configurations > ADC configuration*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**

- Yes (enabled)

### **CONFIG\_ADC\_CONTINUOUS\_FORCE\_USE\_ADC2\_ON\_C3\_S3**

Force use ADC2 continuous mode on ESP32S3 or ESP32C3

*Found in: Component config > Driver configurations > ADC configuration*

On ESP32C3 and ESP32S3, ADC2 Digital Controller is not stable. Therefore, ADC2 continuous mode is not suggested on ESP32S3 and ESP32C3

If you stick to this, you can enable this option to force use ADC2 under above conditions. For more details, you can search for errata on espressif website.

**Default value:**

- No (disabled)

**MCPWM configuration** Contains:

- [CONFIG\\_MCPWM\\_ISR\\_IN\\_IRAM](#)

**CONFIG\_MCPWM\_ISR\_IN\_IRAM**

Place MCPWM ISR function into IRAM

*Found in: [Component config](#) > [Driver configurations](#) > [MCPWM configuration](#)*

If this option is not selected, the MCPWM interrupt will be deferred when the Cache is in a disabled state (e.g. Flash write/erase operation).

Note that if this option is selected, all user registered ISR callbacks should never try to use cache as well. (with IRAM\_ATTR)

**Default value:**

- No (disabled)

**SPI configuration** Contains:

- [CONFIG\\_SPI\\_MASTER\\_ISR\\_IN\\_IRAM](#)
- [CONFIG\\_SPI\\_SLAVE\\_ISR\\_IN\\_IRAM](#)
- [CONFIG\\_SPI\\_MASTER\\_IN\\_IRAM](#)
- [CONFIG\\_SPI\\_SLAVE\\_IN\\_IRAM](#)

**CONFIG\_SPI\_MASTER\_IN\_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: [Component config](#) > [Driver configurations](#) > [SPI configuration](#)*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

**Default value:**

- No (disabled)

**CONFIG\_SPI\_MASTER\_ISR\_IN\_IRAM**

Place SPI master ISR function into IRAM

*Found in: [Component config](#) > [Driver configurations](#) > [SPI configuration](#)*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_SLAVE\_IN\_IRAM

Place transmitting functions of SPI slave into IRAM

*Found in: [Component config](#) > [Driver configurations](#) > [SPI configuration](#)*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**Default value:**

- No (disabled)

### CONFIG\_SPI\_SLAVE\_ISR\_IN\_IRAM

Place SPI slave ISR function into IRAM

*Found in: [Component config](#) > [Driver configurations](#) > [SPI configuration](#)*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**

- Yes (enabled)

**TWAI configuration** Contains:

- [CONFIG\\_TWAI\\_ERRATA\\_FIX\\_LISTEN\\_ONLY\\_DOM](#)
- [CONFIG\\_TWAI\\_ISR\\_IN\\_IRAM](#)

### CONFIG\_TWAI\_ISR\_IN\_IRAM

Place TWAI ISR function into IRAM

*Found in: [Component config](#) > [Driver configurations](#) > [TWAI configuration](#)*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the `ESP_INTR_FLAG_IRAM` in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the `TWAI_ALERT_AND_LOG` flag) will have no effect.

**Default value:**

- No (disabled)

### CONFIG\_TWAI\_ERRATA\_FIX\_LISTEN\_ONLY\_DOM

Add SW workaround for listen only transmits dominant bit errata

*Found in: [Component config](#) > [Driver configurations](#) > [TWAI configuration](#)*

When in the listen only mode, the TWAI controller must not influence the TWAI bus (i.e., must not send any dominant bits). However, while in listen only mode on the ESP32/ESP32-S2/ESP32-S3/ESP32-C3, the TWAI controller will still transmit dominant bits when it detects an error (i.e., as part of an active error frame). Enabling this option will add a workaround that forces the TWAI controller into an error passive state on initialization, thus preventing any dominant bits from being sent.

**Default value:**

- No (disabled)

**UART configuration** Contains:

- [CONFIG\\_UART\\_ISR\\_IN\\_IRAM](#)

### **CONFIG\_UART\_ISR\_IN\_IRAM**

Place UART ISR function into IRAM

*Found in: [Component config](#) > [Driver configurations](#) > [UART configuration](#)*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**Default value:**

- No (disabled) if [CONFIG\\_RINGBUF\\_PLACE\\_ISR\\_FUNCTIONS\\_INTO\\_FLASH](#)

**GDMA Configuration** Contains:

- [CONFIG\\_GDMA\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_GDMA\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### **CONFIG\_GDMA\_CTRL\_FUNC\_IN\_IRAM**

Place GDMA control functions into IRAM

*Found in: [Component config](#) > [Driver configurations](#) > [GDMA Configuration](#)*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### **CONFIG\_GDMA\_ISR\_IRAM\_SAFE**

GDMA ISR IRAM-Safe

*Found in: [Component config](#) > [Driver configurations](#) > [GDMA Configuration](#)*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

**Default value:**

- No (disabled)

**eFuse Bit Manager** Contains:

- [CONFIG\\_EFUSE\\_VIRTUAL](#)
- [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)

### **CONFIG\_EFUSE\_CUSTOM\_TABLE**

Use custom eFuse table

*Found in: [Component config](#) > [eFuse Bit Manager](#)*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**

- No (disabled)

### CONFIG\_EFUSE\_CUSTOM\_TABLE\_FILENAME

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG\_EFUSE\_CUSTOM\_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- “main/esp\_efuse\_custom\_table.csv” if *CONFIG\_EFUSE\_CUSTOM\_TABLE*

### CONFIG\_EFUSE\_VIRTUAL

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If “n” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**

- No (disabled)

### CONFIG\_EFUSE\_VIRTUAL\_KEEP\_IN\_FLASH

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG\_EFUSE\_VIRTUAL*

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition\_table should have the *efuse* partition. partition.csv: “efuse\_em, data, efuse, , 0x2000,”

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure\_boot and flash\_encryption).

### ESP-TLS Contains:

- *CONFIG\_ESP\_TLS\_INSECURE*
- *CONFIG\_ESP\_TLS\_LIBRARY\_CHOOSE*
- *CONFIG\_ESP\_TLS\_CLIENT\_SESSION\_TICKETS*
- *CONFIG\_ESP\_DEBUG\_WOLFSSL*
- *CONFIG\_ESP\_TLS\_SERVER*
- *CONFIG\_ESP\_TLS\_PSK\_VERIFICATION*
- *CONFIG\_ESP\_WOLFSSL\_SMALL\_CERT\_VERIFY*
- *CONFIG\_ESP\_TLS\_USE\_DS\_PERIPHERAL*

### CONFIG\_ESP\_TLS\_LIBRARY\_CHOOSE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

**Available options:**

- mbedTLS (ESP\_TLS\_USING\_MBEDTLS)

- wolfSSL (License info in wolfSSL directory README) (ESP\_TLS\_USING\_WOLFSSL)

### CONFIG\_ESP\_TLS\_USE\_DS\_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TLS\_CLIENT\_SESSION\_TICKETS

Enable client session tickets

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable session ticket support as specified in RFC5077.

### CONFIG\_ESP\_TLS\_SERVER

Enable ESP-TLS Server

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

### CONFIG\_ESP\_TLS\_SERVER\_SESSION\_TICKETS

Enable server session tickets

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)*

Enable session ticket support as specified in RFC5077

### CONFIG\_ESP\_TLS\_SERVER\_SESSION\_TICKET\_TIMEOUT

Server session ticket timeout in seconds

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#) > [CONFIG\\_ESP\\_TLS\\_SERVER\\_SESSION\\_TICKETS](#)*

Sets the session ticket timeout used in the tls server.

**Default value:**

- 86400 if [CONFIG\\_ESP\\_TLS\\_SERVER\\_SESSION\\_TICKETS](#)

### CONFIG\_ESP\_TLS\_SERVER\_MIN\_AUTH\_MODE\_OPTIONAL

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)*

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

`mbedtls_ssl_get_verify_result()` can be called after the handshake is complete to retrieve status of verification.

### CONFIG\_ESP\_TLS\_PSK\_VERIFICATION

Enable PSK verification

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

### CONFIG\_ESP\_TLS\_INSECURE

Allow potentially insecure options

*Found in: [Component config](#) > [ESP-TLS](#)*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

### CONFIG\_ESP\_TLS\_SKIP\_SERVER\_CERT\_VERIFY

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_INSECURE](#)*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. `crt_bundle_attach`, `use_global_ca_store` etc.). WARNING : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like `ca_store` etc.

### CONFIG\_ESP\_WOLFSSL\_SMALL\_CERT\_VERIFY

Enable SMALL\_CERT\_VERIFY

*Found in: [Component config](#) > [ESP-TLS](#)*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**

- Yes (enabled) if `ESP_TLS_USING_WOLFSSL`

### CONFIG\_ESP\_DEBUG\_WOLFSSL

Enable debug logs for wolfSSL

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable detailed debug prints for wolfSSL SSL library.

### ESP32S3-Specific

 Contains:

- [Cache config](#)
- [CONFIG\\_ESP32S3\\_DEFAULT\\_CPU\\_FREQ\\_MHZ](#)
- [CONFIG\\_ESP32S3\\_ULP\\_COPROC\\_ENABLED](#)
- [CONFIG\\_ESP32S3\\_DEEP\\_SLEEP\\_WAKEUP\\_DELAY](#)
- [CONFIG\\_ESP32S3\\_BROWNOUT\\_DET](#)
- [CONFIG\\_ESP32S3\\_DEBUG\\_OCDAWARE](#)
- [CONFIG\\_ESP32S3\\_REV\\_MAX\\_FULL\\_STR](#)
- [CONFIG\\_ESP32S3\\_REV\\_MIN](#)

- [CONFIG\\_ESP32S3\\_NO\\_BLOBS](#)
- [CONFIG\\_ESP32S3\\_RTC\\_CLK\\_CAL\\_CYCLES](#)
- [CONFIG\\_ESP32S3\\_RTCDATA\\_IN\\_FAST\\_MEM](#)
- [CONFIG\\_ESP32S3\\_RTC\\_CLK\\_SRC](#)
- [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#)
- [CONFIG\\_ESP32S3\\_TIME\\_SYSCALL](#)
- [CONFIG\\_ESP32S3\\_USE\\_FIXED\\_STATIC\\_RAM\\_SIZE](#)
- [CONFIG\\_ESP32S3\\_TRAX](#)

### **CONFIG\_ESP32S3\_REV\_MIN**

Minimum Supported ESP32-S3 Revision

*Found in: [Component config](#) > [ESP32S3-Specific](#)*

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

**Available options:**

- Rev v0.0 (ECO0) ([ESP32S3\\_REV\\_MIN\\_0](#))
- Rev v0.1 (ECO1) ([ESP32S3\\_REV\\_MIN\\_1](#))
- Rev v0.2 (ECO2) ([ESP32S3\\_REV\\_MIN\\_2](#))

### **CONFIG\_ESP32S3\_REV\_MAX\_FULL\_STR**

Maximum Supported ESP32-S3 Revision

*Found in: [Component config](#) > [ESP32S3-Specific](#)*

**Available options:**

- Rev v0.99 ([ESP32S3\\_REV\\_MAX\\_FULL\\_STR\\_OPT](#))

### **CONFIG\_ESP32S3\_DEFAULT\_CPU\_FREQ\_MHZ**

CPU frequency

*Found in: [Component config](#) > [ESP32S3-Specific](#)*

CPU frequency to be set on application startup.

**Available options:**

- 40 MHz ([ESP32S3\\_DEFAULT\\_CPU\\_FREQ\\_40](#))
- 80 MHz ([ESP32S3\\_DEFAULT\\_CPU\\_FREQ\\_80](#))
- 160 MHz ([ESP32S3\\_DEFAULT\\_CPU\\_FREQ\\_160](#))
- 240 MHz ([ESP32S3\\_DEFAULT\\_CPU\\_FREQ\\_240](#))

**Cache config** Contains:

- [CONFIG\\_ESP32S3\\_DCACHE\\_ASSOCIATED\\_WAYS](#)
- [CONFIG\\_ESP32S3\\_DATA\\_CACHE\\_LINE\\_SIZE](#)
- [CONFIG\\_ESP32S3\\_DATA\\_CACHE\\_SIZE](#)
- [CONFIG\\_ESP32S3\\_DATA\\_CACHE\\_WRAP](#)
- [CONFIG\\_ESP32S3\\_INSTRUCTION\\_CACHE\\_WRAP](#)
- [CONFIG\\_ESP32S3\\_ICACHE\\_ASSOCIATED\\_WAYS](#)
- [CONFIG\\_ESP32S3\\_INSTRUCTION\\_CACHE\\_LINE\\_SIZE](#)
- [CONFIG\\_ESP32S3\\_INSTRUCTION\\_CACHE\\_SIZE](#)

### CONFIG\_ESP32S3\_INSTRUCTION\_CACHE\_SIZE

Instruction cache size

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)*

Instruction cache size to be set on application startup. If you use 16KB instruction cache rather than 32KB instruction cache, then the other 16KB will be managed by heap allocator.

**Available options:**

- 16KB (ESP32S3\_INSTRUCTION\_CACHE\_16KB)
- 32KB (ESP32S3\_INSTRUCTION\_CACHE\_32KB)

### CONFIG\_ESP32S3\_ICACHE\_ASSOCIATED\_WAYS

Instruction cache associated ways

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)*

Instruction cache associated ways to be set on application startup.

**Available options:**

- 4 ways (ESP32S3\_INSTRUCTION\_CACHE\_4WAYS)
- 8 ways (ESP32S3\_INSTRUCTION\_CACHE\_8WAYS)

### CONFIG\_ESP32S3\_INSTRUCTION\_CACHE\_LINE\_SIZE

Instruction cache line size

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)*

Instruction cache line size to be set on application startup.

**Available options:**

- 16 Bytes (ESP32S3\_INSTRUCTION\_CACHE\_LINE\_16B)
- 32 Bytes (ESP32S3\_INSTRUCTION\_CACHE\_LINE\_32B)

### CONFIG\_ESP32S3\_INSTRUCTION\_CACHE\_WRAP

Enable instruction cache wrap mode

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)*

If enabled, instruction cache will use wrap mode to read spi flash or spi ram. The wrap length equals to ESP32S3\_INSTRUCTION\_CACHE\_LINE\_SIZE. However, it depends on complex conditions.

**Default value:**

- No (disabled)

### CONFIG\_ESP32S3\_DATA\_CACHE\_SIZE

Data cache size

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)*

Data cache size to be set on application startup. If you use 32KB data cache rather than 64KB data cache, the other 32KB will be added to the heap.

**Available options:**

- 16KB (ESP32S3\_DATA\_CACHE\_16KB)
- 32KB (ESP32S3\_DATA\_CACHE\_32KB)
- 64KB (ESP32S3\_DATA\_CACHE\_64KB)

### CONFIG\_ESP32S3\_DCACHE\_ASSOCIATED\_WAYS

Data cache associated ways

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)*

Data cache associated ways to be set on application startup.

**Available options:**

- 4 ways (ESP32S3\_DATA\_CACHE\_4WAYS)
- 8 ways (ESP32S3\_DATA\_CACHE\_8WAYS)

### CONFIG\_ESP32S3\_DATA\_CACHE\_LINE\_SIZE

Data cache line size

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)*

Data cache line size to be set on application startup.

**Available options:**

- 16 Bytes (ESP32S3\_DATA\_CACHE\_LINE\_16B)
- 32 Bytes (ESP32S3\_DATA\_CACHE\_LINE\_32B)
- 64 Bytes (ESP32S3\_DATA\_CACHE\_LINE\_64B)

### CONFIG\_ESP32S3\_DATA\_CACHE\_WRAP

Enable data cache wrap mode

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [Cache config](#)*

If enabled, data cache will use wrap mode to read spi flash or spi ram. The wrap length equals to ESP32S3\_DATA\_CACHE\_LINE\_SIZE. However, it depends on complex conditions.

**Default value:**

- No (disabled)

### CONFIG\_ESP32S3\_SPIRAM\_SUPPORT

Support for external, SPI-connected RAM

*Found in: [Component config](#) > [ESP32S3-Specific](#)*

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

**Default value:**

- No (disabled)

**SPI RAM config** Contains:

- [CONFIG\\_SPIRAM\\_ALLOW\\_STACK\\_EXTERNAL\\_MEMORY](#)
- [CONFIG\\_SPIRAM\\_FETCH\\_INSTRUCTIONS](#)
- [CONFIG\\_SPIRAM\\_RODATA](#)
- [CONFIG\\_SPIRAM\\_BOOT\\_INIT](#)
- [CONFIG\\_SPIRAM\\_MALLOC\\_ALWAYSINTERNAL](#)
- [CONFIG\\_SPIRAM\\_MODE](#)
- [CONFIG\\_SPIRAM\\_MALLOC\\_RESERVE\\_INTERNAL](#)
- [CONFIG\\_SPIRAM\\_MEMTEST](#)
- [CONFIG\\_SPIRAM\\_SPEED](#)
- [CONFIG\\_SPIRAM\\_USE](#)
- [CONFIG\\_SPIRAM\\_TRY\\_ALLOCATE\\_WIFI\\_LWIP](#)
- [CONFIG\\_SPIRAM\\_TYPE](#)

### CONFIG\_SPIRAM\_MODE

Mode (QUAD/OCT) of SPI RAM chip in use

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#) > [SPI RAM config](#)*

**Available options:**

- Quad Mode PSRAM (SPIRAM\_MODE\_QUAD)
- Octal Mode PSRAM (SPIRAM\_MODE\_OCT)

### CONFIG\_SPIRAM\_TYPE

Type of SPIRAM chip in use

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#) > [SPI RAM config](#)*

**Available options:**

- Auto-detect (SPIRAM\_TYPE\_AUTO)
- ESP-PSRAM16 or APS1604 (SPIRAM\_TYPE\_ESPPSRAM16)
- ESP-PSRAM32 or IS25WP032 (SPIRAM\_TYPE\_ESPPSRAM32)
- ESP-PSRAM64 , LY68L6400 or APS6408 (SPIRAM\_TYPE\_ESPPSRAM64)

### CONFIG\_SPIRAM\_FETCH\_INSTRUCTIONS

Cache fetch instructions from SPI RAM

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#) > [SPI RAM config](#)*

If enabled, instruction in flash will be copied into SPIRAM. If SPIRAM\_RODATA also enabled, you can run the instruction when erasing or programming the flash.

**Default value:**

- No (disabled) if [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#)

### CONFIG\_SPIRAM\_RODATA

Cache load read only data from SPI RAM

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#) > [SPI RAM config](#)*

If enabled, rodata in flash will be copied into SPIRAM. If SPIRAM\_FETCH\_INSTRUCTIONS is also enabled, you can run the instruction when erasing or programming the flash.

**Default value:**

- No (disabled) if [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#)

### CONFIG\_SPIRAM\_ALLOW\_STACK\_EXTERNAL\_MEMORY

Allow external memory as an argument to xTaskCreateStatic

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#) > [SPI RAM config](#)*

Accessing memory in SPIRAM has certain restrictions, so task stacks allocated by xTaskCreate are by default allocated from internal RAM.

This option allows for passing memory allocated from SPIRAM to be passed to xTaskCreateStatic. This should only be used for tasks where the stack is never accessed while the cache is disabled.

**Default value:**

- No (disabled) if [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#)

## CONFIG\_SPIRAM\_SPEED

Set RAM clock speed

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#) > [SPI RAM config](#)*

Select the speed for the SPI RAM chip.

### Available options:

- 120MHz clock speed (READ DOCS FIRST) (SPIRAM\_SPEED\_120M)
- 80MHz clock speed (SPIRAM\_SPEED\_80M)
- 40Mhz clock speed (SPIRAM\_SPEED\_40M)

## CONFIG\_SPIRAM\_BOOT\_INIT

Initialize SPI RAM during startup

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#) > [SPI RAM config](#)*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you' ll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

### Default value:

- Yes (enabled) if [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#)

## CONFIG\_SPIRAM\_IGNORE\_NOTFOUND

Ignore PSRAM when not found

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#) > [SPI RAM config](#) > [CONFIG\\_SPIRAM\\_BOOT\\_INIT](#)*

Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

### Default value:

- No (disabled) if [CONFIG\\_SPIRAM\\_BOOT\\_INIT](#) && [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#)

## CONFIG\_SPIRAM\_USE

SPI RAM access method

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#) > [SPI RAM config](#)*

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU' s memory map, by integrating it in the heap as 'special' memory needing heap\_caps\_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

### Available options:

- Integrate RAM into memory map (SPIRAM\_USE\_MEMMAP)
- Make RAM allocatable using heap\_caps\_malloc( ..., MALLOC\_CAP\_SPIRAM) (SPIRAM\_USE\_CAPS\_ALLOC)
- Make RAM allocatable using malloc() as well (SPIRAM\_USE\_MALLOC)

## CONFIG\_SPIRAM\_MEMTEST

Run memory test on SPI RAM initialization

*Found in: Component config > ESP32S3-Specific > CONFIG\_ESP32S3\_SPIRAM\_SUPPORT > SPI RAM config*

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

**Default value:**

- Yes (enabled) if `CONFIG_SPIRAM_BOOT_INIT` && `CONFIG_ESP32S3_SPIRAM_SUPPORT`

### CONFIG\_SPIRAM\_MALLOC\_ALWAYSINTERNAL

Maximum malloc() size, in bytes, to always put in internal memory

*Found in: Component config > ESP32S3-Specific > CONFIG\_ESP32S3\_SPIRAM\_SUPPORT > SPI RAM config*

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

**Range:**

- from 0 to 131072 if SPIRAM\_USE\_MALLOC && `CONFIG_ESP32S3_SPIRAM_SUPPORT`

**Default value:**

- 16384 if SPIRAM\_USE\_MALLOC && `CONFIG_ESP32S3_SPIRAM_SUPPORT`

### CONFIG\_SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

*Found in: Component config > ESP32S3-Specific > CONFIG\_ESP32S3\_SPIRAM\_SUPPORT > SPI RAM config*

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

**Default value:**

- No (disabled) if `(SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_ESP32S3_SPIRAM_SUPPORT`

### CONFIG\_SPIRAM\_MALLOC\_RESERVE\_INTERNAL

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

*Found in: Component config > ESP32S3-Specific > CONFIG\_ESP32S3\_SPIRAM\_SUPPORT > SPI RAM config*

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that's also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

**Range:**

- from 0 to 262144 if `SPIRAM_USE_MALLOC` && `CONFIG_ESP32S3_SPIRAM_SUPPORT`

**Default value:**

- 32768 if `SPIRAM_USE_MALLOC` && `CONFIG_ESP32S3_SPIRAM_SUPPORT`

### **CONFIG\_ESP32S3\_TRAX**

Use TRAX tracing feature

*Found in: [Component config](#) > [ESP32S3-Specific](#)*

The esp32-s3 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can't be used for general purposes anymore. Disable this if you do not know what this is.

**Default value:**

- No (disabled)

### **CONFIG\_ESP32S3\_TRAX\_TWOBANKS**

Reserve memory for tracing both pro as well as app cpu execution

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG\\_ESP32S3\\_TRAX](#)*

The esp32-s3 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can't be used for general purposes anymore. Disable this if you do not know what this is.

**Default value:**

- No (disabled) if `CONFIG_ESP32S3_TRAX` && `CONFIG_FREERTOS_UNICORE`

### **CONFIG\_ESP32S3\_ULP\_COPROC\_ENABLED**

Enable Ultra Low Power (ULP) Coprocessor

*Found in: [Component config](#) > [ESP32S3-Specific](#)*

Set to 'y' if you plan to load a firmware for the coprocessor.

If this option is enabled, further coprocessor configuration will appear in the Components menu.

**Default value:**

- No (disabled)

### **CONFIG\_ESP32S3\_ULP\_COPROC\_RESERVE\_MEM**

RTC slow memory reserved for coprocessor

*Found in: [Component config](#) > [ESP32S3-Specific](#) > [CONFIG\\_ESP32S3\\_ULP\\_COPROC\\_ENABLED](#)*

Bytes of memory to reserve for ULP coprocessor firmware & data.

Data is reserved at the beginning of RTC slow memory.

**Range:**

- from 32 to 8176 if `CONFIG_ESP32S3_ULP_COPROC_ENABLED`
- from 0 to 0 if `CONFIG_ESP32S3_ULP_COPROC_ENABLED`

**Default value:**

- 512 if `CONFIG_ESP32S3_ULP_COPROC_ENABLED`
- 0 if `CONFIG_ESP32S3_ULP_COPROC_ENABLED`

### CONFIG\_ESP32S3\_ULP\_COPROC\_RISCV

Enable RISC-V as ULP coprocessor

*Found in: Component config > ESP32S3-Specific > CONFIG\_ESP32S3\_ULP\_COPROC\_ENABLED*

Set this to y to use the RISC-V coprocessor instead of the FSM-ULP.

**Default value:**

- No (disabled) if *CONFIG\_ESP32S3\_ULP\_COPROC\_ENABLED*

### CONFIG\_ESP32S3\_DEBUG\_OCDAWARE

Make exception and panic handlers JTAG/OCD aware

*Found in: Component config > ESP32S3-Specific*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP32S3\_BROWNOUT\_DET

Hardware brownout detect & reset

*Found in: Component config > ESP32S3-Specific*

The ESP32-S3 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP32S3\_BROWNOUT\_DET\_LVL\_SEL

Brownout voltage level

*Found in: Component config > ESP32S3-Specific > CONFIG\_ESP32S3\_BROWNOUT\_DET*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP3-S3 chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

**Available options:**

- 2.44V (ESP32S3\_BROWNOUT\_DET\_LVL\_SEL\_7)
- 2.56V (ESP32S3\_BROWNOUT\_DET\_LVL\_SEL\_6)
- 2.67V (ESP32S3\_BROWNOUT\_DET\_LVL\_SEL\_5)
- 2.84V (ESP32S3\_BROWNOUT\_DET\_LVL\_SEL\_4)
- 2.98V (ESP32S3\_BROWNOUT\_DET\_LVL\_SEL\_3)
- 3.19V (ESP32S3\_BROWNOUT\_DET\_LVL\_SEL\_2)
- 3.30V (ESP32S3\_BROWNOUT\_DET\_LVL\_SEL\_1)

### CONFIG\_ESP32S3\_TIME\_SYSCALL

Timers used for gettimeofday function

*Found in: Component config > ESP32S3-Specific*

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.

- If both high-resolution and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- If only high-resolution timer is used, `gettimeofday` will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- If only RTC timer is used, timekeeping will continue in deep sleep, but time will be measured at 6.(6) microsecond resolution. Also the `gettimeofday` function itself may take longer to run.
- If no timers are used, `gettimeofday` and time functions return -1 and set `errno` to `ENOSYS`.
- When RTC is used for timekeeping, two `RTC_STORE` registers are used to keep time in deep sleep mode.

**Available options:**

- RTC and high-resolution timer (`ESP32S3_TIME_SYSCALL_USE_RTC_FRC1`)
- RTC (`ESP32S3_TIME_SYSCALL_USE_RTC`)
- High-resolution timer (`ESP32S3_TIME_SYSCALL_USE_FRC1`)
- None (`ESP32S3_TIME_SYSCALL_USE_NONE`)

**CONFIG\_ESP32S3\_RTC\_CLK\_SRC**

RTC clock source

Found in: *Component config* > *ESP32S3-Specific*

Choose which clock is used as RTC clock source.

**Available options:**

- Internal 150kHz RC oscillator (`ESP32S3_RTC_CLK_SRC_INT_RC`)
- External 32kHz crystal (`ESP32S3_RTC_CLK_SRC_EXT_CRYST`)
- External 32kHz oscillator at 32K\_XP pin (`ESP32S3_RTC_CLK_SRC_EXT_OSC`)
- Internal 8MHz oscillator, divided by 256 (~32kHz) (`ESP32S3_RTC_CLK_SRC_INT_8MD256`)

**CONFIG\_ESP32S3\_RTC\_CLK\_CAL\_CYCLES**

Number of cycles for `RTC_SLOW_CLK` calibration

Found in: *Component config* > *ESP32S3-Specific*

When the startup code initializes `RTC_SLOW_CLK`, it can perform calibration by comparing the `RTC_SLOW_CLK` frequency with main XTAL frequency. This option sets the number of `RTC_SLOW_CLK` cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- 32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

**Range:**

- from 0 to 27000 if `ESP32S3_RTC_CLK_SRC_EXT_CRYST` || `ESP32S3_RTC_CLK_SRC_EXT_OSC` || `ESP32S3_RTC_CLK_SRC_INT_8MD256`
- from 0 to 32766

**Default value:**

- 3000 if `ESP32S3_RTC_CLK_SRC_EXT_CRYST` || `ESP32S3_RTC_CLK_SRC_EXT_OSC` || `ESP32S3_RTC_CLK_SRC_INT_8MD256`
- 1024

### CONFIG\_ESP32S3\_DEEP\_SLEEP\_WAKEUP\_DELAY

Extra delay in deep sleep wake stub (in us)

*Found in: [Component config](#) > [ESP32S3-Specific](#)*

When ESP32S3 exits deep sleep, the CPU and the flash chip are powered on at the same time. CPU will run deep sleep stub first, and then proceed to load code from flash. Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

By default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing “flash read err, 1000” message printed to the console after deep sleep reset, try increasing this value.

**Range:**

- from 0 to 5000

**Default value:**

- 2000

### CONFIG\_ESP32S3\_NO\_BLOBS

No Binary Blobs

*Found in: [Component config](#) > [ESP32S3-Specific](#)*

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_ENABLED](#)

### CONFIG\_ESP32S3\_RTCDATA\_IN\_FAST\_MEM

Place RTC\_DATA\_ATTR and RTC\_RODATA\_ATTR variables into RTC fast memory segment

*Found in: [Component config](#) > [ESP32S3-Specific](#)*

This option allows to place .rtc\_data and .rtc\_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs.

**Default value:**

- No (disabled)

### CONFIG\_ESP32S3\_USE\_FIXED\_STATIC\_RAM\_SIZE

Use fixed static RAM size

*Found in: [Component config](#) > [ESP32S3-Specific](#)*

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0\_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0\_0 region, where its length is set with ESP32S3\_FIXED\_STATIC\_RAM\_SIZE

**Default value:**

- No (disabled)

### CONFIG\_ESP32S3\_FIXED\_STATIC\_RAM\_SIZE

Fixed Static RAM size

*Found in: Component config > ESP32S3-Specific > CONFIG\_ESP32S3\_USE\_FIXED\_STATIC\_RAM\_SIZE*

RAM size dedicated for static variables (.data & .bss sections).

**Range:**

- from 0 to 0x34000 if *CONFIG\_ESP32S3\_USE\_FIXED\_STATIC\_RAM\_SIZE*

**Default value:**

- “0x10000” if *CONFIG\_ESP32S3\_USE\_FIXED\_STATIC\_RAM\_SIZE*

### ADC-Calibration

**Common ESP-related** Contains:

- *CONFIG\_ESP\_ERR\_TO\_NAME\_LOOKUP*

### CONFIG\_ESP\_ERR\_TO\_NAME\_LOOKUP

Enable lookup of error code strings

*Found in: Component config > Common ESP-related*

Functions `esp_err_to_name()` and `esp_err_to_name_r()` return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**

- Yes (enabled)

**Ethernet** Contains:

- *CONFIG\_ETH\_USE\_OPENETH*
- *CONFIG\_ETH\_USE\_SPI\_ETHERNET*

### CONFIG\_ETH\_USE\_SPI\_ETHERNET

Support SPI to Ethernet Module

*Found in: Component config > Ethernet*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**

- Yes (enabled)

Contains:

- *CONFIG\_ETH\_SPI\_ETHERNET\_DM9051*
- *CONFIG\_ETH\_SPI\_ETHERNET\_KSZ8851SNL*
- *CONFIG\_ETH\_SPI\_ETHERNET\_W5500*

### CONFIG\_ETH\_SPI\_ETHERNET\_DM9051

Use DM9051

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_SPI\_ETHERNET*

DM9051 is a fast Ethernet controller with an SPI interface. It's also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

### CONFIG\_ETH\_SPI\_ETHERNET\_W5500

Use W5500 (MAC RAW)

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_SPI\_ETHERNET*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

### CONFIG\_ETH\_SPI\_ETHERNET\_KSZ8851SNL

Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_SPI\_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

### CONFIG\_ETH\_USE\_OPENETH

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**

- No (disabled)

Contains:

- *CONFIG\_ETH\_OPENETH\_DMA\_RX\_BUFFER\_NUM*
- *CONFIG\_ETH\_OPENETH\_DMA\_TX\_BUFFER\_NUM*

### CONFIG\_ETH\_OPENETH\_DMA\_RX\_BUFFER\_NUM

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if *CONFIG\_ETH\_USE\_OPENETH*

**Default value:**

- 4 if *CONFIG\_ETH\_USE\_OPENETH*

### CONFIG\_ETH\_OPENETH\_DMA\_TX\_BUFFER\_NUM

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if *CONFIG\_ETH\_USE\_OPENETH*

**Default value:**

- 1 if *CONFIG\_ETH\_USE\_OPENETH*

**Event Loop Library** Contains:

- [CONFIG\\_ESP\\_EVENT\\_LOOP\\_PROFILING](#)
- [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)

### CONFIG\_ESP\_EVENT\_LOOP\_PROFILING

Enable event loop profiling

*Found in:* [Component config](#) > [Event Loop Library](#)

Enables collections of statistics in the event loop library such as the number of events posted to/received by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_EVENT\_POST\_FROM\_ISR

Support posting events from ISRs

*Found in:* [Component config](#) > [Event Loop Library](#)

Enable posting events from interrupt handlers.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_EVENT\_POST\_FROM\_IRAM\_ISR

Support posting events from ISRs placed in IRAM

*Found in:* [Component config](#) > [Event Loop Library](#) > [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

**Default value:**

- Yes (enabled)

**GDB Stub** Contains:

- [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)

### CONFIG\_ESP\_GDBSTUB\_SUPPORT\_TASKS

Enable listing FreeRTOS tasks through GDB Stub

*Found in:* [Component config](#) > [GDB Stub](#)

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using 'info threads' command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

### CONFIG\_ESP\_GDBSTUB\_MAX\_TASKS

Maximum number of tasks supported by GDB Stub

*Found in:* [Component config](#) > [GDB Stub](#) > [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)

Set the number of tasks which GDB Stub will support.

**Default value:**

- 32 if [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)

**ESP HTTP client** Contains:

- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_BASIC\\_AUTH](#)
- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_DIGEST\\_AUTH](#)
- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_HTTPS](#)

### **CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_HTTPS**

Enable https

*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_BASIC\_AUTH**

Enable HTTP Basic Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_DIGEST\_AUTH**

Enable HTTP Digest Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

**Default value:**

- Yes (enabled)

**HTTP Server** Contains:

- [CONFIG\\_HTTPD\\_PURGE\\_BUF\\_LEN](#)
- [CONFIG\\_HTTPD\\_LOG\\_PURGE\\_DATA](#)
- [CONFIG\\_HTTPD\\_MAX\\_REQ\\_HDR\\_LEN](#)
- [CONFIG\\_HTTPD\\_MAX\\_URI\\_LEN](#)
- [CONFIG\\_HTTPD\\_ERR\\_RESP\\_NO\\_DELAY](#)
- [CONFIG\\_HTTPD\\_WS\\_SUPPORT](#)

### **CONFIG\_HTTPD\_MAX\_REQ\_HDR\_LEN**

Max HTTP Request Header Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**

- 512

### CONFIG\_HTTPD\_MAX\_URI\_LEN

Max HTTP URI Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of HTTP request URI to be processed by the server

**Default value:**

- 512

### CONFIG\_HTTPD\_ERR\_RESP\_NO\_DELAY

Use TCP\_NODELAY socket option when sending HTTP error responses

*Found in: [Component config](#) > [HTTP Server](#)*

Using TCP\_NODELAY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

**Default value:**

- Yes (enabled)

### CONFIG\_HTTPD\_PURGE\_BUF\_LEN

Length of temporary buffer for purging data

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

**Default value:**

- 32

### CONFIG\_HTTPD\_LOG\_PURGE\_DATA

Log purged content data at Debug level

*Found in: [Component config](#) > [HTTP Server](#)*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**

- No (disabled)

### CONFIG\_HTTPD\_WS\_SUPPORT

WebSocket server support

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the WebSocket server support.

**Default value:**

- No (disabled)

### ESP HTTPS OTA Contains:

- [CONFIG\\_OTA\\_ALLOW\\_HTTP](#)

## CONFIG\_OTA\_ALLOW\_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: *Component config > ESP HTTPS OTA*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

### Default value:

- No (disabled)

## ESP HTTPS server Contains:

- *CONFIG\_ESP\_HTTPS\_SERVER\_ENABLE*

## CONFIG\_ESP\_HTTPS\_SERVER\_ENABLE

Enable ESP\_HTTPS\_SERVER component

Found in: *Component config > ESP HTTPS server*

Enable ESP HTTPS server component

## Hardware Settings Contains:

- *ESP\_SLEEP\_WORKAROUND*
- *MAC Config*
- *RTC Clock Config*
- *Sleep Config*

## MAC Config Contains:

- *CONFIG\_ESP32S3\_UNIVERSAL\_MAC\_ADDRESSES*

## CONFIG\_ESP32S3\_UNIVERSAL\_MAC\_ADDRESSES

Number of universally administered (by IEEE) MAC address

Found in: *Component config > Hardware Settings > MAC Config*

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

### Available options:

- Two (ESP32S3\_UNIVERSAL\_MAC\_ADDRESSES\_TWO)
- Four (ESP32S3\_UNIVERSAL\_MAC\_ADDRESSES\_FOUR)

**Sleep Config** Contains:

- [CONFIG\\_ESP\\_SLEEP\\_MSPI\\_NEED\\_ALL\\_IO\\_PU](#)
- [CONFIG\\_ESP\\_SLEEP\\_GPIO\\_ENABLE\\_INTERNAL\\_RESISTORS](#)
- [CONFIG\\_ESP\\_SLEEP\\_FLASH\\_LEAKAGE\\_WORKAROUND](#)
- [CONFIG\\_ESP\\_SLEEP\\_GPIO\\_RESET\\_WORKAROUND](#)
- [CONFIG\\_ESP\\_SLEEP\\_POWER\\_DOWN\\_FLASH](#)
- [CONFIG\\_ESP\\_SLEEP\\_PSRAM\\_LEAKAGE\\_WORKAROUND](#)

### **CONFIG\_ESP\_SLEEP\_POWER\_DOWN\_FLASH**

Power down flash in light sleep when there is no SPIRAM

*Found in:* [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

If enabled, chip will try to power down flash as part of `esp_light_sleep_start()`, which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using `esp_sleep_pd_config()` to set `ESP_PD_DOMAIN_VDDSDIO` to `ESP_PD_OPTION_OFF`. It should be noted that there is a risk in powering down flash, you can refer *ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash* for more details.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_SLEEP\_GPIO\_RESET\_WORKAROUND**

light sleep GPIO reset workaround

*Found in:* [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

esp32c3, esp32s3 and esp32h2 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating, The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_SLEEP\_PSRAM\_LEAKAGE\_WORKAROUND**

PSRAM leakage current workaround in light sleep

*Found in:* [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)

When the CS pin of SPIRAM is not pulled up, the sleep current will increase during light sleep. If the CS pin of SPIRAM has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

### **CONFIG\_ESP\_SLEEP\_FLASH\_LEAKAGE\_WORKAROUND**

Flash leakage current workaround in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

When the CS pin of Flash is not pulled up, the sleep current will increase during light sleep. If the CS pin of Flash has an external pull-up, you do not need to select this option, otherwise, you should enable this option.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_SLEEP\_MSPI\_NEED\_ALL\_IO\_PU**

All pins of mspi need pull up

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_SLEEP\_GPIO\_ENABLE\_INTERNAL\_RESISTORS**

Allow to enable internal pull-up/downs for the Deep-Sleep wakeup IOs

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

When using rtc gpio wakeup source during deepsleep without external pull-up/downs, you may want to make use of the internal ones.

**Default value:**

- Yes (enabled)

### **ESP\_SLEEP\_WORKAROUND**

**RTC Clock Config** Contains:

- [CONFIG\\_RTC\\_CLOCK\\_BBPLL\\_POWER\\_ON\\_WITH\\_USB](#)

### **CONFIG\_RTC\_CLOCK\_BBPLL\_POWER\_ON\_WITH\_USB**

Keep BBPLL clock always work

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

When software switches the CPU clock source from BBPLL clock to XTAL, usually the BBPLL will be switched off. This helps to save some power consumption in sleep modes. However this may also happen during the software reset, resulting in the inactive (disconnected from host) of the USB\_SERIAL\_JTAG device during software reset.

When USB\_SERIAL\_JTAG is being used, whether to turn off the clock source during software reset and in sleep modes is determined by RTC\_CLOCK\_BBPLL\_POWER\_ON\_WITH\_USB.

- When RTC\_CLOCK\_BBPLL\_POWER\_ON\_WITH\_USB is enabled, the clock will be kept, so that the USB\_SERIAL\_JTAG will keep alive during software reset. The side-effect is the increasing of power consumption during sleep modes, even though USB\_SERIAL\_JTAG will not work in sleep modes.
- When RTC\_CLOCK\_BBPLL\_POWER\_ON\_WITH\_USB is disabled, the clock will be turned off. USB\_SERIAL\_JTAG will be inactive during software reset and in sleep modes. This saves some power consumption in sleep modes.

When `USB_SERIAL_JTAG` is not being used, software will always turn off BBPLL regardless of `RTC_CLOCK_BBPLL_POWER_ON_WITH_USB` is set or not.

**Default value:**

- Yes (enabled)

**IPC (Inter-Processor Call)** Contains:

- [\*CONFIG\\_ESP\\_IPC\\_TASK\\_STACK\\_SIZE\*](#)
- [\*CONFIG\\_ESP\\_IPC\\_USES\\_CALLERS\\_PRIORITY\*](#)

### **CONFIG\_ESP\_IPC\_TASK\_STACK\_SIZE**

Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**

- from 512 to 65536

**Default value:**

- 1536

### **CONFIG\_ESP\_IPC\_USES\_CALLERS\_PRIORITY**

IPC runs at caller's priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at  $(\text{configMAX\_PRIORITIES} - 1)$  priority.

**Default value:**

- Yes (enabled) if [\*CONFIG\\_FREERTOS\\_UNICORE\*](#)

**LCD and Touch Panel** Contains:

- [\*LCD Peripheral Configuration\*](#)

**LCD Peripheral Configuration** Contains:

- [\*CONFIG\\_LCD\\_PANEL\\_IO\\_FORMAT\\_BUF\\_SIZE\*](#)
- [\*CONFIG\\_LCD\\_RGB\\_ISR\\_IRAM\\_SAFE\*](#)

### **CONFIG\_LCD\_PANEL\_IO\_FORMAT\_BUF\_SIZE**

LCD panel io format buffer size

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

**Default value:**

- 32

### CONFIG\_LCD\_RGB\_ISR\_IRAM\_SAFE

RGB LCD ISR IRAM-Safe

*Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)*

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

**Default value:**

- No (disabled)

**ESP NETIF Adapter** Contains:

- [CONFIG\\_ESP\\_NETIF\\_TCPIP\\_ADAPTER\\_COMPATIBLE\\_LAYER](#)
- [CONFIG\\_ESP\\_NETIF\\_IP\\_LOST\\_TIMER\\_INTERVAL](#)
- [CONFIG\\_ESP\\_NETIF\\_USE\\_TCPIP\\_STACK\\_LIB](#)

### CONFIG\_ESP\_NETIF\_IP\_LOST\_TIMER\_INTERVAL

IP Address lost timer interval (seconds)

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM\_EVENT\_STA\_LOST\_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**

- from 0 to 65535

**Default value:**

- 120

### CONFIG\_ESP\_NETIF\_USE\_TCPIP\_STACK\_LIB

TCP/IP Stack Library

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

**Available options:**

- LwIP (ESP\_NETIF\_TCPIP\_LWIP)  
lwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (ESP\_NETIF\_LOOPBACK)  
Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

### CONFIG\_ESP\_NETIF\_TCPIP\_ADAPTER\_COMPATIBLE\_LAYER

Enable backward compatible tcpip\_adapter interface

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

Backward compatible interface to tcpip\_adapter is enabled by default to support legacy TCP/IP stack initialisation code. Disable this option to use only esp-netif interface.

**Default value:**

- Yes (enabled)

**PHY** Contains:

- [CONFIG\\_ESP\\_PHY\\_CALIBRATION\\_MODE](#)
- [CONFIG\\_ESP\\_PHY\\_ENABLE\\_USB](#)
- [CONFIG\\_ESP\\_PHY\\_MAX\\_WIFI\\_TX\\_POWER](#)
- [CONFIG\\_ESP\\_PHY\\_MAC\\_BB\\_PD](#)
- [CONFIG\\_ESP\\_PHY\\_REDUCE\\_TX\\_POWER](#)
- [CONFIG\\_ESP\\_PHY\\_CALIBRATION\\_AND\\_DATA\\_STORAGE](#)
- [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### **CONFIG\_ESP\_PHY\_CALIBRATION\_AND\_DATA\_STORAGE**

Store phy calibration data in NVS

*Found in:* [Component config](#) > [PHY](#)

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it's easy that your board calibrate bad data, choose 'n'. Two cases for example, you should choose 'n': 1.If your board is easy to be booted up with antenna disconnected. 2.Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose 'y'.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION**

Use a partition to store PHY init data

*Found in:* [Component config](#) > [PHY](#)

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: 'data', subtype: 'phy'). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose 'n'.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_ESP\\_PHY\\_DEFAULT\\_INIT\\_IF\\_INVALID](#)
- [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)

### **CONFIG\_ESP\_PHY\_DEFAULT\_INIT\_IF\_INVALID**

Reset default PHY init data if invalid

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose 'n'.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN

Support multiple PHY init data bin

*Found in: [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)*

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China's PHY init data bin is used by default. Can be modified by country information in API `esp_wifi_set_country()`. The priority of switching the PHY init data type is: 1. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_MANUAL`. 2. Country notified by the connected AP. 3. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_AUTO`.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#) && [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN\_EMBED

Support embedded multiple phy init data bin to app bin

*Found in: [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#) > [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)*

If enabled, multiple phy init data bin will embedded into app bin. If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#) && [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### CONFIG\_ESP\_PHY\_INIT\_DATA\_ERROR

Terminate operation when PHY init data error

*Found in: [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#) > [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)*

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#) && [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### CONFIG\_ESP\_PHY\_MAX\_WIFI\_TX\_POWER

Max WiFi TX power (dBm)

*Found in: [Component config](#) > [PHY](#)*

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**

- from 10 to 20

**Default value:**

- 20

### CONFIG\_ESP\_PHY\_MAC\_BB\_PD

Power down MAC and baseband of Wi-Fi and Bluetooth when PHY is disabled

*Found in: [Component config](#) > [PHY](#)*

If enabled, the MAC and baseband of Wi-Fi and Bluetooth will be powered down when PHY is disabled. Enabling this setting reduces power consumption by a small amount but increases RAM use by approximately 4 KB(Wi-Fi only), 2 KB(Bluetooth only) or 5.3 KB(Wi-Fi + Bluetooth).

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

### **CONFIG\_ESP\_PHY\_REDUCE\_TX\_POWER**

Reduce PHY TX power when brownout reset

*Found in: [Component config](#) > [PHY](#)*

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_PHY\_ENABLE\_USB**

Enable USB when phy init

*Found in: [Component config](#) > [PHY](#)*

When using USB Serial/JTAG/OTG/CDC, PHY should enable USB, otherwise USB module can not work properly. Notice: Enabling this configuration option will slightly impact wifi performance.

**Default value:**

- Yes (enabled)
- No (disabled)

### **CONFIG\_ESP\_PHY\_CALIBRATION\_MODE**

Calibration mode

*Found in: [Component config](#) > [PHY](#)*

Select PHY calibration mode. During RF initialization, the partial calibration method is used by default for RF calibration. Full calibration takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. No calibration method is only used when the device wakes up from deep sleep.

**Available options:**

- Calibration partial ([ESP\\_PHY\\_RF\\_CAL\\_PARTIAL](#))
- Calibration none ([ESP\\_PHY\\_RF\\_CAL\\_NONE](#))
- Calibration full ([ESP\\_PHY\\_RF\\_CAL\\_FULL](#))

### **Power Management** Contains:

- [CONFIG\\_PM\\_SLP\\_DISABLE\\_GPIO](#)
- [CONFIG\\_PM\\_POWER\\_DOWN\\_CPU\\_IN\\_LIGHT\\_SLEEP](#)
- [CONFIG\\_PM\\_SLP\\_IRAM\\_OPT](#)
- [CONFIG\\_PM\\_RTOS\\_IDLE\\_OPT](#)
- [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_ENABLE

Support for power management

*Found in: [Component config](#) > [Power Management](#)*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**

- No (disabled)

### CONFIG\_PM\_DFS\_INIT\_AUTO

Enable dynamic frequency scaling (DFS) at startup

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT\_CPU\_FREQ\_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp\_pm\_configure function.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_PROFILING

Enable profiling counters for PM locks

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, esp\_pm\_\* functions will keep track of the amount of time each of the power management locks has been held, and esp\_pm\_dump\_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_TRACE

Enable debug tracing of PM using GPIOs

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm\_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_SLP\_IRAM\_OPT

Put lightsleep related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 1.8KB of lightsleep related source code would be in IRAM and chip would sleep longer for 760us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

### CONFIG\_PM\_RTOS\_IDLE\_OPT

Put RTOS IDLE related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 260B of RTOS\_IDLE related source code would be in IRAM and chip would sleep longer for 40us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

### CONFIG\_PM\_SLP\_DISABLE\_GPIO

Disable all GPIO when chip at sleep

*Found in: [Component config](#) > [Power Management](#)*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call 'gpio\_sleep\_sel\_dis' to disable this feature on those pins. You can also keep this feature on and call 'gpio\_sleep\_set\_direction' and 'gpio\_sleep\_set\_pull\_mode' to have a different GPIO configuration at sleep. **Warning:** If you want to enable this option on ESP32, you should enable `GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL` at first, otherwise you will not be able to switch pullup/pulldown mode.

### CONFIG\_PM\_POWER\_DOWN\_CPU\_IN\_LIGHT\_SLEEP

Power down CPU in light sleep

*Found in: [Component config](#) > [Power Management](#)*

If enabled, the CPU will be powered down in light sleep, ESP chips supports saving and restoring CPU's running context before and after light sleep, the feature provides applications with seamless CPU powerdowned lightsleep without user awareness. But this will take up some internal memory. On esp32c3 soc, enabling this option will consume 1.68 KB of internal RAM and will reduce sleep current consumption by about 100 uA. On esp32s3 soc, enabling this option will consume 8.58 KB of internal RAM and will reduce sleep current consumption by about 650 uA.

**Default value:**

- Yes (enabled)

### CONFIG\_PM\_POWER\_DOWN\_TAGMEM\_IN\_LIGHT\_SLEEP

Restore I/D-cache tag memory after power down CPU light sleep

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_POWER\\_DOWN\\_CPU\\_IN\\_LIGHT\\_SLEEP](#)*

Cache tag memory and CPU both belong to the CPU power domain. ESP chips supports saving and restoring Cache tag memory before and after sleep, this feature supports accesses to the external memory that was cached before sleep still be cached when the CPU wakes up from a powerdowned CPU lightsleep. This option controls the restore method for Cache tag memory in lightsleep. If this option is enabled, the I/D-cache tag memory will be backed up to the internal RAM before sleep and restored upon wakeup. Depending on the cache configuration, if this option is enabled, it will consume up to 9 KB of internal RAM. If this option is disabled, all cached data won't be kept after sleep, the DCache will be writeback before sleep and invalid all cached data after sleep, all accesses to external memory(Flash/PSRAM) will be cache missed after waking up, resulting in performance degradation due to increased memory accesses latency.

**Default value:**

- Yes (enabled)

**ESP Ringbuf** Contains:

- [\*CONFIG\\_RINGBUF\\_PLACE\\_ISR\\_FUNCTIONS\\_INTO\\_FLASH\*](#)
- [\*CONFIG\\_RINGBUF\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH\*](#)

**CONFIG\_RINGBUF\_PLACE\_FUNCTIONS\_INTO\_FLASH**

Place non-ISR ringbuf functions into flash

*Found in: Component config > ESP Ringbuf*

Place non-ISR ringbuf functions (like `xRingbufferCreate/xRingbufferSend`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

**Default value:**

- No (disabled)

**CONFIG\_RINGBUF\_PLACE\_ISR\_FUNCTIONS\_INTO\_FLASH**

Place ISR ringbuf functions into flash

*Found in: Component config > ESP Ringbuf*

Place non-ISR ringbuf functions (like `xRingbufferSendFromISR/xRingbufferReceiveFromISR`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which is configured to run the ISR from an IRAM context, e.g. `CONFIG_UART_ISR_IN_IRAM`.

**Default value:**

- No (disabled)

**ESP System Settings** Contains:

- [\*CONFIG\\_ESP\\_SYSTEM\\_RTC\\_EXT\\_XTAL\\_BOOTSTRAP\\_CYCLES\*](#)
- [\*CONFIG\\_ESP\\_CONSOLE\\_UART\*](#)
- [\*CONFIG\\_ESP\\_CONSOLE\\_SECONDARY\*](#)
- [\*CONFIG\\_ESP\\_CONSOLE\\_USB\\_CDC\\_SUPPORT\\_ETS\\_PRINTF\*](#)
- [\*CONFIG\\_ESP\\_SYSTEM\\_ALLOW\\_RTC\\_FAST\\_MEM\\_AS\\_HEAP\*](#)
- [\*CONFIG\\_ESP\\_SYSTEM\\_EVENT\\_TASK\\_STACK\\_SIZE\*](#)
- [\*CONFIG\\_ESP\\_TASK\\_WDT\*](#)
- [\*CONFIG\\_ESP\\_XT\\_WDT\*](#)
- [\*CONFIG\\_ESP\\_SYSTEM\\_CHECK\\_INT\\_LEVEL\*](#)
- [\*CONFIG\\_ESP\\_INT\\_WDT\*](#)
- [\*CONFIG\\_ESP\\_MAIN\\_TASK\\_AFFINITY\*](#)
- [\*CONFIG\\_ESP\\_MAIN\\_TASK\\_STACK\\_SIZE\*](#)
- *Memory protection*
- [\*CONFIG\\_ESP\\_MINIMAL\\_SHARED\\_STACK\\_SIZE\*](#)
- [\*CONFIG\\_ESP\\_DEBUG\\_STUBS\\_ENABLE\*](#)
- [\*CONFIG\\_ESP\\_SYSTEM\\_PANIC\*](#)
- [\*CONFIG\\_ESP\\_PANIC\\_HANDLER\\_IRAM\*](#)
- [\*CONFIG\\_ESP\\_SYSTEM\\_BBPLL\\_RECALIB\*](#)
- [\*CONFIG\\_ESP\\_CONSOLE\\_USB\\_CDC\\_RX\\_BUF\\_SIZE\*](#)
- [\*CONFIG\\_ESP\\_SYSTEM\\_EVENT\\_QUEUE\\_SIZE\*](#)
- [\*CONFIG\\_ESP\\_CONSOLE\\_UART\\_BAUDRATE\*](#)
- [\*CONFIG\\_ESP\\_CONSOLE\\_UART\\_NUM\*](#)
- [\*CONFIG\\_ESP\\_CONSOLE\\_UART\\_RX\\_GPIO\*](#)
- [\*CONFIG\\_ESP\\_CONSOLE\\_UART\\_TX\\_GPIO\*](#)

## CONFIG\_ESP\_SYSTEM\_PANIC

Panic handler behaviour

*Found in: [Component config](#) > [ESP System Settings](#)*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler's action here.

### Available options:

- Print registers and halt (ESP\_SYSTEM\_PANIC\_PRINT\_HALT)  
Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (ESP\_SYSTEM\_PANIC\_PRINT\_REBOOT)  
Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (ESP\_SYSTEM\_PANIC\_SILENT\_REBOOT)  
Just resets the processor without outputting anything
- GDBStub on panic (ESP\_SYSTEM\_PANIC\_GDBSTUB)  
Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.
- GDBStub at runtime (ESP\_SYSTEM\_GDBSTUB\_RUNTIME)  
Invoke gdbstub on the serial port, allowing for gdb to attach to it and to do a debug on runtime. This feature will switch system to single core mode.

## CONFIG\_ESP\_SYSTEM\_RTC\_EXT\_XTAL\_BOOTSTRAP\_CYCLES

Bootstrap cycles for external 32kHz crystal

*Found in: [Component config](#) > [ESP System Settings](#)*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for RTC\_SLOW\_CLK calibration” (about 3000).

## CONFIG\_ESP\_SYSTEM\_ALLOW\_RTC\_FAST\_MEM\_AS\_HEAP

Enable RTC fast memory for dynamic allocations

*Found in: [Component config](#) > [ESP System Settings](#)*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

### Default value:

- Yes (enabled)

**Memory protection** Contains:

- [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)

## CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE

Enable memory protection

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#)*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

### **CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE\_LOCK**

Lock memory protection settings

*Found in:* [Component config](#) > [ESP System Settings](#) > [Memory protection](#) > [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)

### **CONFIG\_ESP\_SYSTEM\_EVENT\_QUEUE\_SIZE**

System event queue size

*Found in:* [Component config](#) > [ESP System Settings](#)

Config system event queue size in different application.

**Default value:**

- 32

### **CONFIG\_ESP\_SYSTEM\_EVENT\_TASK\_STACK\_SIZE**

Event loop task stack size

*Found in:* [Component config](#) > [ESP System Settings](#)

Config system event task stack size in different application.

**Default value:**

- 2304

### **CONFIG\_ESP\_MAIN\_TASK\_STACK\_SIZE**

Main task stack size

*Found in:* [Component config](#) > [ESP System Settings](#)

Configure the “main task” stack size. This is the stack of the task which calls `app_main()`. If `app_main()` returns then this task is deleted and its stack memory is freed.

**Default value:**

- 3584

### **CONFIG\_ESP\_MAIN\_TASK\_AFFINITY**

Main task core affinity

*Found in:* [Component config](#) > [ESP System Settings](#)

Configure the “main task” core affinity. This is the used core of the task which calls `app_main()`. If `app_main()` returns then this task is deleted.

**Available options:**

- CPU0 (`ESP_MAIN_TASK_AFFINITY_CPU0`)
- CPU1 (`ESP_MAIN_TASK_AFFINITY_CPU1`)

- No affinity (ESP\_MAIN\_TASK\_AFFINITY\_NO\_AFFINITY)

### CONFIG\_ESP\_MINIMAL\_SHARED\_STACK\_SIZE

Minimal allowed size for shared stack

*Found in: [Component config](#) > [ESP System Settings](#)*

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

**Default value:**

- 2048

### CONFIG\_ESP\_CONSOLE\_UART

Channel for console output

*Found in: [Component config](#) > [ESP System Settings](#)*

Select where to send console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

**Available options:**

- Default: UART0 (ESP\_CONSOLE\_UART\_DEFAULT)
- USB CDC (ESP\_CONSOLE\_USB\_CDC)
- USB Serial/JTAG Controller (ESP\_CONSOLE\_USB\_SERIAL\_JTAG)
- Custom UART (ESP\_CONSOLE\_UART\_CUSTOM)
- None (ESP\_CONSOLE\_NONE)

### CONFIG\_ESP\_CONSOLE\_SECONDARY

Channel for console secondary output

*Found in: [Component config](#) > [ESP System Settings](#)*

This secondary option supports output through other specific port like USB\_SERIAL\_JTAG when UART0 port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or input through this secondary port, please change the primary config to this port in *Channel for console output* menu.

**Available options:**

- No secondary console (ESP\_CONSOLE\_SECONDARY\_NONE)
- USB\_SERIAL\_JTAG PORT (ESP\_CONSOLE\_SECONDARY\_USB\_SERIAL\_JTAG)  
This option supports output through USB\_SERIAL\_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB\_SERIAL\_JTAG port, please change the primary config to ESP\_CONSOLE\_USB\_SERIAL\_JTAG above.

### CONFIG\_ESP\_CONSOLE\_UART\_NUM

UART peripheral to use for console output (0-1)

*Found in: [Component config](#) > [ESP System Settings](#)*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via `esp_rom_printf`.

**Available options:**

- UART0 (ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_0)
- UART1 (ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_1)

## CONFIG\_ESP\_CONSOLE\_UART\_TX\_GPIO

UART TX on GPIO#

*Found in: [Component config](#) > [ESP System Settings](#)*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 46 if ESP\_CONSOLE\_UART\_CUSTOM

**Default value:**

- 43 if ESP\_CONSOLE\_UART\_CUSTOM

## CONFIG\_ESP\_CONSOLE\_UART\_RX\_GPIO

UART RX on GPIO#

*Found in: [Component config](#) > [ESP System Settings](#)*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn't read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 46 if ESP\_CONSOLE\_UART\_CUSTOM

**Default value:**

- 44 if ESP\_CONSOLE\_UART\_CUSTOM

## CONFIG\_ESP\_CONSOLE\_UART\_BAUDRATE

UART console baud rate

*Found in: [Component config](#) > [ESP System Settings](#)*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 1200 to 4000000 if `CONFIG_PM_ENABLE`
- from 1200 to 1000000 if `CONFIG_PM_ENABLE`

**Default value:**

- 115200

### **CONFIG\_ESP\_CONSOLE\_USB\_CDC\_RX\_BUF\_SIZE**

Size of USB CDC RX buffer

*Found in: [Component config](#) > [ESP System Settings](#)*

Set the size of USB CDC RX buffer. Increase the buffer size if your application is often receiving data over USB CDC.

**Range:**

- from 4 to 16384 if `ESP_CONSOLE_USB_CDC`

**Default value:**

- 64 if `ESP_CONSOLE_USB_CDC`

### **CONFIG\_ESP\_CONSOLE\_USB\_CDC\_SUPPORT\_ETC\_PRINTF**

Enable `esp_rom_printf` / `ESP_EARLY_LOG` via USB CDC

*Found in: [Component config](#) > [ESP System Settings](#)*

If enabled, `esp_rom_printf` and `ESP_EARLY_LOG` output will also be sent over USB CDC. Disabling this option saves about 1kB of RAM.

**Default value:**

- No (disabled) if `ESP_CONSOLE_USB_CDC`

### **CONFIG\_ESP\_INT\_WDT**

Interrupt watchdog

*Found in: [Component config](#) > [ESP System Settings](#)*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_INT\_WDT\_TIMEOUT\_MS**

Interrupt watchdog timeout (ms)

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**

- from 10 to 10000

**Default value:**

- 300 if `ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP_INT_WDT`
- 800 if `ESP32_SPIRAM_SUPPORT` && `CONFIG_ESP_INT_WDT`

### CONFIG\_ESP\_INT\_WDT\_CHECK\_CPU1

Also watch CPU1 tick interrupt

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

Also detect if interrupts on CPU 1 are disabled for too long.

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_INT\\_WDT](#) && [CONFIG\\_FREERTOS\\_UNICORE](#)

### CONFIG\_ESP\_TASK\_WDT

Initialize Task Watchdog Timer on startup

*Found in: [Component config](#) > [ESP System Settings](#)*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup. The Task Watchdog timer can be initialized after startup as well (see Task Watchdog Timer API Reference)

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_PANIC

Invoke panic handler on Task Watchdog timeout

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT](#)*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**

- No (disabled)

### CONFIG\_ESP\_TASK\_WDT\_TIMEOUT\_S

Task Watchdog timeout period (seconds)

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT](#)*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**

- from 1 to 60

**Default value:**

- 5

### CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU0

Watch CPU0 Idle Task

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT](#)*

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU1

Watch CPU1 Idle Task

*Found in: Component config > ESP System Settings > CONFIG\_ESP\_TASK\_WDT*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**Default value:**

- Yes (enabled) if *CONFIG\_ESP\_TASK\_WDT* && *CONFIG\_FREERTOS\_UNICORE*

### CONFIG\_ESP\_XT\_WDT

Initialize XTAL32K watchdog timer on startup

*Found in: Component config > ESP System Settings*

This watchdog timer can detect oscillation failure of the XTAL32K\_CLK. When such a failure is detected the hardware can be set up to automatically switch to BACKUP32K\_CLK and generate an interrupt.

### CONFIG\_ESP\_XT\_WDT\_TIMEOUT

XTAL32K watchdog timeout period

*Found in: Component config > ESP System Settings > CONFIG\_ESP\_XT\_WDT*

Timeout period configuration for the XTAL32K watchdog timer based on RTC\_CLK.

**Range:**

- from 1 to 255 if *CONFIG\_ESP\_XT\_WDT*

**Default value:**

- 200 if *CONFIG\_ESP\_XT\_WDT*

### CONFIG\_ESP\_XT\_WDT\_BACKUP\_CLK\_ENABLE

Automatically switch to BACKUP32K\_CLK when timer expires

*Found in: Component config > ESP System Settings > CONFIG\_ESP\_XT\_WDT*

Enable this to automatically switch to BACKUP32K\_CLK as the source of RTC\_SLOW\_CLK when the watchdog timer expires.

**Default value:**

- Yes (enabled) if *CONFIG\_ESP\_XT\_WDT*

### CONFIG\_ESP\_PANIC\_HANDLER\_IRAM

Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**

- No (disabled)

## CONFIG\_ESP\_DEBUG\_STUBS\_ENABLE

OpenOCD debug stubs

*Found in: Component config > ESP System Settings*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

**Default value:**

- “COMPILER\_OPTIMIZATION\_LEVEL\_DEBUG” if ESP32\_TRAX && ESP32S2\_TRAX && [CONFIG\\_ESP32S3\\_TRAX](#)

## CONFIG\_ESP\_SYSTEM\_CHECK\_INT\_LEVEL

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: Component config > ESP System Settings*

Interrupt level to use for Interrupt Watchdog and other system checks.

**Available options:**

- Level 5 interrupt (ESP\_SYSTEM\_CHECK\_INT\_LEVEL\_5)  
Using level 5 interrupt for Interrupt Watchdog and other system checks.
- Level 4 interrupt (ESP\_SYSTEM\_CHECK\_INT\_LEVEL\_4)  
Using level 4 interrupt for Interrupt Watchdog and other system checks.

## CONFIG\_ESP\_SYSTEM\_BBPLL\_RECALIB

Re-calibration BBPLL at startup

*Found in: Component config > ESP System Settings*

This configuration helps to address an BBPLL inaccurate issue when boot from certain bootloader version, which may increase about the boot-up time by about 200 us. Disable this when your bootloader is built with ESP-IDF version v5.2 and above.

**Default value:**

- Yes (enabled)

## High resolution timer (esp\_timer) Contains:

- [CONFIG\\_ESP\\_TIMER\\_PROFILING](#)
- [CONFIG\\_ESP\\_TIMER\\_IMPL](#)
- [CONFIG\\_ESP\\_TIMER\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_ESP\\_TIMER\\_INTERRUPT\\_LEVEL](#)
- [CONFIG\\_ESP\\_TIMER\\_SUPPORTS\\_ISR\\_DISPATCH\\_METHOD](#)

## CONFIG\_ESP\_TIMER\_PROFILING

Enable esp\_timer profiling features

*Found in: Component config > High resolution timer (esp\_timer)*

If enabled, esp\_timer\_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_TIMER\_TASK\_STACK\_SIZE

High-resolution timer task stack size

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

Configure the stack size of “timer\_task” task. This task is used to dispatch callbacks of timers created using ets\_timer and esp\_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS” menu.

**Range:**

- from 2048 to 65536

**Default value:**

- 3584

### CONFIG\_ESP\_TIMER\_INTERRUPT\_LEVEL

Interrupt level

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

It sets the interrupt level for esp\_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp\_timer latency.

**Range:**

- from 1 to 1

**Default value:**

- 1

### CONFIG\_ESP\_TIMER\_SUPPORTS\_ISR\_DISPATCH\_METHOD

Support ISR dispatch method

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

Allows using ESP\_TIMER\_ISR dispatch method (ESP\_TIMER\_TASK dispatch method is also available). - ESP\_TIMER\_TASK - Timer callbacks are dispatched from a high-priority esp\_timer task. - ESP\_TIMER\_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_TIMER\_IMPL

Hardware timer to use for esp\_timer

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

esp\_timer APIs can be implemented using different hardware timers.

- “FRC2 (legacy)” implementation has been used in ESP-IDF v2.x - v4.1.
- “LAC timer of Timer Group 0” implementation is simpler, and has smaller run time overhead because software handling of timer overflow is not needed.
- “SYSTIMER” implementation is similar to “LAC timer of Timer Group 0” but for non ESP32 chips.

**Available options:**

- FRC2 (legacy) timer (ESP\_TIMER\_IMPL\_FRC2)
- LAC timer of Timer Group 0 (ESP\_TIMER\_IMPL\_TG0\_LAC)
- SYSTIMER (ESP\_TIMER\_IMPL\_SYSTIMER)

**Wi-Fi** Contains:

- `CONFIG_ESP_WIFI_SOFTAP_SUPPORT`
- `CONFIG_ESP32_WIFI_TASK_CORE_ID`

**CONFIG\_ESP32\_WIFI\_SW\_COEXIST\_ENABLE**

Software controls WiFi/Bluetooth coexistence

*Found in:* [Component config](#) > [Wi-Fi](#)

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**

- Yes (enabled) if `CONFIG_BT_ENABLED`

**CONFIG\_ESP32\_WIFI\_STATIC\_RX\_BUFFER\_NUM**

Max number of WiFi static RX buffers

*Found in:* [Component config](#) > [Wi-Fi](#)

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when `esp_wifi_init` is called, they are not freed until `esp_wifi_deinit` is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If `ESP32_WIFI_AMPDU_RX_ENABLED` is enabled, this value is recommended to set equal or bigger than `ESP32_WIFI_RX_BA_WIN` in order to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 25

**Default value:**

- 10 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

### **CONFIG\_ESP32\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM**

Max number of WiFi dynamic RX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**

- from 0 to 128 if `CONFIG_LWIP_WND_SCALE`
- from 0 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**

- 32

### **CONFIG\_ESP32\_WIFI\_TX\_BUFFER**

Type of WiFi TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

**Available options:**

- Static (`ESP32_WIFI_STATIC_TX_BUFFER`)
- Dynamic (`ESP32_WIFI_DYNAMIC_TX_BUFFER`)

### **CONFIG\_ESP32\_WIFI\_STATIC\_TX\_BUFFER\_NUM**

Max number of WiFi static TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when `esp_wifi_init()` is called, they are not released until `esp_wifi_deinit()` is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 64 if ESP32\_WIFI\_STATIC\_TX\_BUFFER

**Default value:**

- 16 if ESP32\_WIFI\_STATIC\_TX\_BUFFER

**CONFIG\_ESP32\_WIFI\_CACHE\_TX\_BUFFER\_NUM**

Max number of WiFi cache TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

**Range:**

- from 16 to 128 if ESP32\_SPIRAM\_SUPPORT || ESP32S2\_SPIRAM\_SUPPORT || [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#)

**Default value:**

- 32 if ESP32\_SPIRAM\_SUPPORT || ESP32S2\_SPIRAM\_SUPPORT || [CONFIG\\_ESP32S3\\_SPIRAM\\_SUPPORT](#)

**CONFIG\_ESP32\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM**

Max number of WiFi dynamic TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 128

**Default value:**

- 32

**CONFIG\_ESP\_WIFI\_MGMT\_RX\_BUFFER**

Type of WiFi RX MGMT buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Select type of WiFi RX MGMT buffers:

If “Static” is selected, WiFi RX MGMT buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static RX MGMT buffer is fixed to about 500 Bytes.

If “Dynamic” is selected, each WiFi RX MGMT buffer is allocated as needed when a MGMT data frame is received. The MGMT buffer is freed after the MGMT data frame has been processed by the WiFi driver.

**Available options:**

- Static (ESP\_WIFI\_STATIC\_RX\_MGMT\_BUFFER)
- Dynamic (ESP\_WIFI\_DYNAMIC\_RX\_MGMT\_BUFFER)

**CONFIG\_ESP\_WIFI\_RX\_MGMT\_BUF\_NUM\_DEF**

Max number of WiFi RX MGMT buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi RX\_MGMT buffers.

For Management buffers, the number of dynamic and static management buffers is the same. In order to prevent memory fragmentation, the management buffer type should be set to static first.

**Range:**

- from 1 to 10

**Default value:**

- 5

**CONFIG\_ESP32\_WIFI\_CSI\_ENABLED**

WiFi CSI(Channel State Information)

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable CSI(Channel State Information) feature. CSI takes about CONFIG\_ESP32\_WIFI\_STATIC\_RX\_BUFFER\_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**

- No (disabled)

**CONFIG\_ESP32\_WIFI\_AMPDU\_TX\_ENABLED**

WiFi AMPDU TX

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable AMPDU TX feature

**Default value:**

- Yes (enabled)

**CONFIG\_ESP32\_WIFI\_TX\_BA\_WIN**

WiFi AMPDU TX BA window size

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP32\\_WIFI\\_AMPDU\\_TX\\_ENABLED](#)*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

**Range:**

- from 2 to 32

**Default value:**

- 6

**CONFIG\_ESP32\_WIFI\_AMPDU\_RX\_ENABLED**

WiFi AMPDU RX

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable AMPDU RX feature

**Default value:**

- Yes (enabled)

**CONFIG\_ESP32\_WIFI\_RX\_BA\_WIN**

WiFi AMPDU RX BA window size

Found in: *Component config* > *Wi-Fi* > *CONFIG\_ESP32\_WIFI\_AMPDU\_RX\_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is preferred to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 32

**Default value:**

- 6 if *CONFIG\_SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP* && *CONFIG\_ESP32\_WIFI\_AMPDU\_RX\_ENABLED*
- 16 if *CONFIG\_SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP* && *CONFIG\_ESP32\_WIFI\_AMPDU\_RX\_ENABLED*

**CONFIG\_ESP32\_WIFI\_AMSDU\_TX\_ENABLED**

WiFi AMSDU TX

Found in: *Component config* > *Wi-Fi*

Select this option to enable AMSDU TX feature

**Default value:**

- No (disabled) if *ESP32\_SPIRAM\_SUPPORT* || *ESP32S2\_SPIRAM\_SUPPORT* || *CONFIG\_ESP32S3\_SPIRAM\_SUPPORT*

**CONFIG\_ESP32\_WIFI\_NVS\_ENABLED**

WiFi NVS flash

Found in: *Component config* > *Wi-Fi*

Select this option to enable WiFi NVS flash

**Default value:**

- Yes (enabled)

**CONFIG\_ESP32\_WIFI\_TASK\_CORE\_ID**

WiFi Task Core ID

Found in: *Component config* > *Wi-Fi*

Pinned WiFi task to core 0 or core 1.

**Available options:**

- Core 0 (*ESP32\_WIFI\_TASK\_PINNED\_TO\_CORE\_0*)
- Core 1 (*ESP32\_WIFI\_TASK\_PINNED\_TO\_CORE\_1*)

**CONFIG\_ESP32\_WIFI\_SOFTAP\_BEACON\_MAX\_LEN**

Max length of WiFi SoftAP Beacon

Found in: *Component config* > *Wi-Fi*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of

more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36\*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**

- from 752 to 1256

**Default value:**

- 752

### CONFIG\_ESP32\_WIFI\_MGMT\_SBUF\_NUM

WiFi mgmt short buffer number

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi management short buffer.

**Range:**

- from 6 to 32

**Default value:**

- 32

### CONFIG\_ESP32\_WIFI\_IRAM\_OPT

WiFi IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**

- No (disabled) if `CONFIG_BT_ENABLED` && `ESP32_SPIRAM_SUPPORT`
- Yes (enabled)

### CONFIG\_ESP32\_WIFI\_RX\_IRAM\_OPT

WiFi RX IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**Default value:**

- No (disabled) if `CONFIG_BT_ENABLED` && `ESP32_SPIRAM_SUPPORT`
- Yes (enabled)

### CONFIG\_ESP32\_WIFI\_ENABLE\_WPA3\_SAE

Enable WPA3-Personal

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP' s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be

explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT**

WiFi SLP IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP32\_WIFI\_IRAM\_OPT and ESP32\_WIFI\_RX\_IRAM\_OPT, or this one. If already enabled ESP32\_WIFI\_IRAM\_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP32\_WIFI\_RX\_IRAM\_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

**CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MIN\_ACTIVE\_TIME**

Minimum active time

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)*

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**

- from 8 to 60 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**Default value:**

- 50 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MAX\_ACTIVE\_TIME**

Maximum keep alive time

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)*

The maximum time that wifi keep alive, unit: seconds.

**Range:**

- from 10 to 60 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**Default value:**

- 10 if [CONFIG\\_ESP\\_WIFI\\_SLP\\_IRAM\\_OPT](#)

**CONFIG\_ESP\_WIFI\_FTM\_ENABLE**

WiFi FTM

*Found in: [Component config](#) > [Wi-Fi](#)*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

**Default value:**

- No (disabled)

**CONFIG\_ESP\_WIFI\_FTM\_INITIATOR\_SUPPORT**

FTM Initiator support

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)*

**Default value:**

- Yes (enabled) if *CONFIG\_ESP\_WIFI\_FTM\_ENABLE*

### **CONFIG\_ESP\_WIFI\_FTM\_RESPONDER\_SUPPORT**

FTM Responder support

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_FTM\_ENABLE*

**Default value:**

- Yes (enabled) if *CONFIG\_ESP\_WIFI\_FTM\_ENABLE*

### **CONFIG\_ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE**

Power Management for station at disconnected

*Found in: Component config > Wi-Fi*

Select this option to enable power\_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

### **CONFIG\_ESP\_WIFI\_GCMP\_SUPPORT**

WiFi GCMP Support(GCMP128 and GCMP256)

*Found in: Component config > Wi-Fi*

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_WIFI\_GMAC\_SUPPORT**

WiFi GMAC Support(GMAC128 and GMAC256)

*Found in: Component config > Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**

- No (disabled)

### **CONFIG\_ESP\_WIFI\_SOFTAP\_SUPPORT**

WiFi SoftAP Support

*Found in: Component config > Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT**

Wifi sleep optimize when beacon lost

*Found in: Component config > Wi-Fi*

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_TIMEOUT

Beacon loss timeout

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

**Range:**

- from 5 to 100 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 10 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_THRESHOLD

Maximum number of consecutive lost beacons allowed

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

**Range:**

- from 0 to 8 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 3 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_PHY\_ON\_DELTA\_EARLY\_TIME

Delta early time for RF PHY on

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

**Range:**

- from 0 to 100 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 2 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_PHY\_OFF\_DELTA\_TIMEOUT\_TIME

Delta timeout time for RF PHY off

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

**Range:**

- from 0 to 8 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 2 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_ESPNOW\_MAX\_ENCRYPT\_NUM

Maximum espnow encrypt peers number

*Found in: Component config > Wi-Fi*

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum number of connections of SoftAP = Max hardware keys number.

When using ESP mesh, this value should be set to a maximum of 6.

**Range:**

- from 0 to 17

**Default value:**

- 7

**Core dump** Contains:

- [CONFIG\\_ESP\\_COREDUMP\\_CHECK\\_BOOT](#)
- [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT](#)
- [CONFIG\\_ESP\\_COREDUMP\\_CHECKSUM](#)
- [CONFIG\\_ESP\\_COREDUMP\\_TO\\_FLASH\\_OR\\_UART](#)
- [CONFIG\\_ESP\\_COREDUMP\\_UART\\_DELAY](#)
- [CONFIG\\_ESP\\_COREDUMP\\_LOGS](#)
- [CONFIG\\_ESP\\_COREDUMP\\_DECODE](#)
- [CONFIG\\_ESP\\_COREDUMP\\_MAX\\_TASKS\\_NUM](#)
- [CONFIG\\_ESP\\_COREDUMP\\_STACK\\_SIZE](#)

## CONFIG\_ESP\_COREDUMP\_TO\_FLASH\_OR\_UART

Data destination

*Found in:* [Component config](#) > [Core dump](#)

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition\_table directory.

**Available options:**

- Flash (ESP\_COREDUMP\_ENABLE\_TO\_FLASH)
- UART (ESP\_COREDUMP\_ENABLE\_TO\_UART)
- None (ESP\_COREDUMP\_ENABLE\_TO\_NONE)

## CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT

Core dump data format

*Found in:* [Component config](#) > [Core dump](#)

Select the data format for core dump.

**Available options:**

- Binary format (ESP\_COREDUMP\_DATA\_FORMAT\_BIN)
- ELF format (ESP\_COREDUMP\_DATA\_FORMAT\_ELF)

## CONFIG\_ESP\_COREDUMP\_CHECKSUM

Core dump data integrity check

*Found in:* [Component config](#) > [Core dump](#)

Select the integrity check for the core dump.

**Available options:**

- Use CRC32 for integrity verification (ESP\_COREDUMP\_CHECKSUM\_CRC32)
- Use SHA256 for integrity verification (ESP\_COREDUMP\_CHECKSUM\_SHA256)

### CONFIG\_ESP\_COREDUMP\_CHECK\_BOOT

Check core dump data integrity on boot

*Found in: [Component config](#) > [Core dump](#)*

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**

- Yes (enabled) if ESP\_COREDUMP\_ENABLE\_TO\_FLASH

### CONFIG\_ESP\_COREDUMP\_LOGS

Enable coredump logs for debugging

*Found in: [Component config](#) > [Core dump](#)*

Enable/disable coredump logs. Logs strings from espcoredump component are placed in DRAM. Disabling these helps to save ~5KB of internal memory.

### CONFIG\_ESP\_COREDUMP\_MAX\_TASKS\_NUM

Maximum number of tasks

*Found in: [Component config](#) > [Core dump](#)*

Maximum number of tasks snapshots in core dump.

### CONFIG\_ESP\_COREDUMP\_UART\_DELAY

Delay before print to UART

*Found in: [Component config](#) > [Core dump](#)*

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

**Default value:**

- 0 if ESP\_COREDUMP\_ENABLE\_TO\_UART

### CONFIG\_ESP\_COREDUMP\_STACK\_SIZE

Reserved stack size

*Found in: [Component config](#) > [Core dump](#)*

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

### CONFIG\_ESP\_COREDUMP\_DECODE

Handling of UART core dumps in IDF Monitor

*Found in: [Component config](#) > [Core dump](#)*

**Available options:**

- Decode and show summary (info\_corefile) (ESP\_COREDUMP\_DECODE\_INFO)
- Don't decode (ESP\_COREDUMP\_DECODE\_DISABLE)

**FAT Filesystem support** Contains:

- [CONFIG\\_FATFS\\_API\\_ENCODING](#)
- [CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)
- [CONFIG\\_FATFS\\_LONG\\_FILENAMES](#)
- [CONFIG\\_FATFS\\_MAX\\_LFN](#)
- [CONFIG\\_FATFS\\_FS\\_LOCK](#)
- [CONFIG\\_FATFS\\_CHOOSE\\_CODEPAGE](#)
- [CONFIG\\_FATFS\\_ALLOC\\_PREFER\\_EXTRAM](#)
- [CONFIG\\_FATFS\\_TIMEOUT\\_MS](#)
- [CONFIG\\_FATFS\\_PER\\_FILE\\_CACHE](#)

**CONFIG\_FATFS\_CHOOSE\_CODEPAGE**

OEM Code Page

*Found in: [Component config](#) > [FAT Filesystem support](#)*

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using `f_setcp` function. Note that choosing this option will increase application size by ~480kB.

**Available options:**

- Dynamic (all code pages supported) (`FATFS_CODEPAGE_DYNAMIC`)
- US (CP437) (`FATFS_CODEPAGE_437`)
- Arabic (CP720) (`FATFS_CODEPAGE_720`)
- Greek (CP737) (`FATFS_CODEPAGE_737`)
- KBL (CP771) (`FATFS_CODEPAGE_771`)

**CONFIG\_FATFS\_LONG\_FILENAMES**

Long filename support

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

**Available options:**

- No long filenames (`FATFS_LFN_NONE`)
- Long filename buffer in heap (`FATFS_LFN_HEAP`)
- Long filename buffer on stack (`FATFS_LFN_STACK`)

### CONFIG\_FATFS\_MAX\_LFN

Max long filename length

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Maximum long filename length. Can be reduced to save RAM.

**Range:**

- from 12 to 255

**Default value:**

- 255

### CONFIG\_FATFS\_API\_ENCODING

API character encoding

*Found in: [Component config](#) > [FAT Filesystem support](#)*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

**Available options:**

- API uses ANSI/OEM encoding (FATFS\_API\_ENCODING\_ANSI\_OEM)
- API uses UTF-16 encoding (FATFS\_API\_ENCODING\_UTF\_16)
- API uses UTF-8 encoding (FATFS\_API\_ENCODING\_UTF\_8)

### CONFIG\_FATFS\_FS\_LOCK

Number of simultaneously open files protected by lock function

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets the FATFS configuration value `_FS_LOCK`. The option `_FS_LOCK` switches file lock function to control duplicated file open and illegal operation to open objects.

\* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

\* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

**Range:**

- from 0 to 65535

**Default value:**

- 0

### CONFIG\_FATFS\_TIMEOUT\_MS

Timeout for acquiring a file lock, ms

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets FATFS configuration value `_FS_TIMEOUT`, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

**Default value:**

- 10000

### CONFIG\_FATFS\_PER\_FILE\_CACHE

Use separate cache for each file

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option affects FATFS configuration value `_FS_TINY`.

If this option is set, `_FS_TINY` is 0, and each open file has its own cache, size of the cache is equal to the `_MAX_SS` variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, `_FS_TINY` is 1, and single cache is used for all open files, size is also equal to `_MAX_SS` variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**

- Yes (enabled)

### CONFIG\_FATFS\_ALLOC\_PREFER\_EXTRAM

Prefer external RAM when allocating FATFS buffers

*Found in: [Component config](#) > [FAT Filesystem support](#)*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**

- Yes (enabled) if `SPIRAM_USE_CAPS_ALLOC` || `SPIRAM_USE_MALLOC`

### CONFIG\_FATFS\_USE\_FASTSEEK

Enable fast seek algorithm when using `lseek` function through VFS FAT

*Found in: [Component config](#) > [FAT Filesystem support](#)*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**

- No (disabled)

### CONFIG\_FATFS\_FAST\_SEEK\_BUFFER\_SIZE

Fast seek CLMT buffer size

*Found in: [Component config](#) > [FAT Filesystem support](#) > [CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**

- 64 if [CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)

**Modbus configuration** Contains:

- [CONFIG\\_FMB\\_COMM\\_MODE\\_ASCII\\_EN](#)
- [CONFIG\\_FMB\\_COMM\\_MODE\\_RTU\\_EN](#)
- [CONFIG\\_FMB\\_COMM\\_MODE\\_TCP\\_EN](#)
- [CONFIG\\_FMB\\_CONTROLLER\\_NOTIFY\\_QUEUE\\_SIZE](#)

- `CONFIG_FMB_CONTROLLER_NOTIFY_TIMEOUT`
- `CONFIG_FMB_CONTROLLER_SLAVE_ID_SUPPORT`
- `CONFIG_FMB_CONTROLLER_STACK_SIZE`
- `CONFIG_FMB_PORT_TASK_Prio`
- `CONFIG_FMB_PORT_TASK_STACK_SIZE`
- `CONFIG_FMB_QUEUE_LENGTH`
- `CONFIG_FMB_SERIAL_BUF_SIZE`
- `CONFIG_FMB_EVENT_QUEUE_TIMEOUT`
- `CONFIG_FMB_TIMER_PORT_ENABLED`
- `CONFIG_FMB_PORT_TASK_AFFINITY`
- `CONFIG_FMB_TIMER_USE_ISR_DISPATCH_METHOD`
- `CONFIG_FMB_SERIAL_ASCII_BITS_PER_SYMB`
- `CONFIG_FMB_SERIAL_ASCII_TIMEOUT_RESPOND_MS`
- `CONFIG_FMB_MASTER_DELAY_MS_CONVERT`
- `CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND`

### **CONFIG\_FMB\_COMM\_MODE\_TCP\_EN**

Enable Modbus stack support for TCP communication mode

*Found in: Component config > Modbus configuration*

Enable Modbus TCP option for stack.

**Default value:**

- Yes (enabled)

### **CONFIG\_FMB\_TCP\_PORT\_DEFAULT**

Modbus TCP port number

*Found in: Component config > Modbus configuration > CONFIG\_FMB\_COMM\_MODE\_TCP\_EN*

Modbus default port number used by Modbus TCP stack

**Range:**

- from 0 to 65535

**Default value:**

- 502

### **CONFIG\_FMB\_TCP\_PORT\_MAX\_CONN**

Maximum allowed connections for TCP stack

*Found in: Component config > Modbus configuration > CONFIG\_FMB\_COMM\_MODE\_TCP\_EN*

Maximum allowed connections number for Modbus TCP stack. This is used by Modbus master and slave port layer to establish connections. This parameter may decrease performance of Modbus stack and can cause increasing of processing time (increase only if absolutely necessary).

**Range:**

- from 1 to 6

**Default value:**

- 5

### **CONFIG\_FMB\_TCP\_CONNECTION\_TOUT\_SEC**

Modbus TCP connection timeout

*Found in: Component config > Modbus configuration > CONFIG\_FMB\_COMM\_MODE\_TCP\_EN*

Modbus TCP connection timeout in seconds. Once expired the current connection with the client will be closed and Modbus slave will be waiting for new connection to accept.

**Range:**

- from 1 to 3600

**Default value:**

- 20

### **CONFIG\_FMB\_COMM\_MODE\_RTU\_EN**

Enable Modbus stack support for RTU mode

*Found in: [Component config](#) > [Modbus configuration](#)*

Enable RTU Modbus communication mode option for Modbus serial stack.

**Default value:**

- Yes (enabled)

### **CONFIG\_FMB\_COMM\_MODE\_ASCII\_EN**

Enable Modbus stack support for ASCII mode

*Found in: [Component config](#) > [Modbus configuration](#)*

Enable ASCII Modbus communication mode option for Modbus serial stack.

**Default value:**

- Yes (enabled)

### **CONFIG\_FMB\_MASTER\_TIMEOUT\_MS\_RESPOND**

Slave respond timeout (Milliseconds)

*Found in: [Component config](#) > [Modbus configuration](#)*

If master sends a frame which is not broadcast, it has to wait sometime for slave response. if slave is not respond in this time, the master will process timeout error.

**Range:**

- from 50 to 3000

**Default value:**

- 150

### **CONFIG\_FMB\_MASTER\_DELAY\_MS\_CONVERT**

Slave conversion delay (Milliseconds)

*Found in: [Component config](#) > [Modbus configuration](#)*

If master sends a broadcast frame, it has to wait conversion time to delay, then master can send next frame.

**Range:**

- from 50 to 400

**Default value:**

- 200

### **CONFIG\_FMB\_QUEUE\_LENGTH**

Modbus serial task queue length

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus serial driver queue length. It is used by event queue task. See the serial driver API for more information.

**Range:**

- from 0 to 200

**Default value:**

- 20

### CONFIG\_FMB\_PORT\_TASK\_STACK\_SIZE

Modbus port task stack size

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus port task stack size for rx/tx event processing. It may be adjusted when debugging is enabled (for example).

**Range:**

- from 2048 to 8192

**Default value:**

- 4096

### CONFIG\_FMB\_SERIAL\_BUF\_SIZE

Modbus serial task RX/TX buffer size

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus serial task RX and TX buffer size for UART driver initialization. This buffer is used for modbus frame transfer. The Modbus protocol maximum frame size is 256 bytes. Bigger size can be used for non standard implementations.

**Range:**

- from 0 to 2048

**Default value:**

- 256

### CONFIG\_FMB\_SERIAL\_ASCII\_BITS\_PER\_SYMB

Number of data bits per ASCII character

*Found in: [Component config](#) > [Modbus configuration](#)*

This option defines the number of data bits per ASCII character.

**Range:**

- from 7 to 8

**Default value:**

- 8

### CONFIG\_FMB\_SERIAL\_ASCII\_TIMEOUT\_RESPOND\_MS

Response timeout for ASCII communication mode (ms)

*Found in: [Component config](#) > [Modbus configuration](#)*

This option defines response timeout of slave in milliseconds for ASCII communication mode. Thus the timeout will expire and allow the master program to handle the error.

**Range:**

- from 300 to 2000

**Default value:**

- 1000

### CONFIG\_FMB\_PORT\_TASK\_PRIO

Modbus port task priority

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus port data processing task priority. The priority of Modbus controller task is equal to (CONFIG\_FMB\_PORT\_TASK\_PRIO - 1).

**Range:**

- from 3 to 23

**Default value:**

- 10

### CONFIG\_FMB\_PORT\_TASK\_AFFINITY

Modbus task affinity

*Found in: [Component config](#) > [Modbus configuration](#)*

Allows setting the core affinity of the Modbus controller task, i.e. whether the task is pinned to particular CPU, or allowed to run on any CPU.

**Available options:**

- No affinity (FMB\_PORT\_TASK\_AFFINITY\_NO\_AFFINITY)
- CPU0 (FMB\_PORT\_TASK\_AFFINITY\_CPU0)
- CPU1 (FMB\_PORT\_TASK\_AFFINITY\_CPU1)

### CONFIG\_FMB\_CONTROLLER\_SLAVE\_ID\_SUPPORT

Modbus controller slave ID support

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus slave ID support enable. When enabled the Modbus <Report Slave ID> command is supported by stack.

**Default value:**

- Yes (enabled)

### CONFIG\_FMB\_CONTROLLER\_SLAVE\_ID

Modbus controller slave ID

*Found in: [Component config](#) > [Modbus configuration](#) > [CONFIG\\_FMB\\_CONTROLLER\\_SLAVE\\_ID\\_SUPPORT](#)*

Modbus slave ID value to identify modbus device in the network using <Report Slave ID> command. Most significant byte of ID is used as short device ID and other three bytes used as long ID.

**Range:**

- from 0 to 4294967295

**Default value:**

- "0x00112233"

### CONFIG\_FMB\_CONTROLLER\_NOTIFY\_TIMEOUT

Modbus controller notification timeout (ms)

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus controller notification timeout in milliseconds. This timeout is used to send notification about accessed parameters.

**Range:**

- from 0 to 200

**Default value:**

- 20

**CONFIG\_FMB\_CONTROLLER\_NOTIFY\_QUEUE\_SIZE**

Modbus controller notification queue size

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus controller notification queue size. The notification queue is used to get information about accessed parameters.

**Range:**

- from 0 to 200

**Default value:**

- 20

**CONFIG\_FMB\_CONTROLLER\_STACK\_SIZE**

Modbus controller stack size

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus controller task stack size. The Stack size may be adjusted when debug mode is used which requires more stack size (for example).

**Range:**

- from 0 to 8192

**Default value:**

- 4096

**CONFIG\_FMB\_EVENT\_QUEUE\_TIMEOUT**

Modbus stack event queue timeout (ms)

*Found in: [Component config](#) > [Modbus configuration](#)*

Modbus stack event queue timeout in milliseconds. This may help to optimize Modbus stack event processing time.

**Range:**

- from 0 to 500

**Default value:**

- 20

**CONFIG\_FMB\_TIMER\_PORT\_ENABLED**

Modbus stack use timer for 3.5T symbol time measurement

*Found in: [Component config](#) > [Modbus configuration](#)*

If this option is set the Modbus stack uses timer for T3.5 time measurement. Else the internal UART TOUT timeout is used for 3.5T symbol time measurement.

**Default value:**

- No (disabled)

## CONFIG\_FMB\_TIMER\_USE\_ISR\_DISPATCH\_METHOD

Modbus timer uses ISR dispatch method

*Found in: [Component config](#) > [Modbus configuration](#)*

If this option is set the Modbus stack uses ISR dispatch method to send timeout events from the callback function called from ISR. This option has dependency with the UART\_ISR\_IN\_IRAM option which places UART interrupt handler into IRAM to prevent delays related to processing of UART events.

### Default value:

- No (disabled)

## FreeRTOS Contains:

- [CONFIG\\_FREERTOS\\_CHECK\\_STACKOVERFLOW](#)
- [CONFIG\\_FREERTOS\\_CHECK\\_MUTEX\\_GIVEN\\_BY\\_OWNER](#)
- [CONFIG\\_FREERTOS\\_INTERRUPT\\_BACKTRACE](#)
- [CONFIG\\_FREERTOS\\_OPTIMIZED\\_SCHEDULER](#)
- [CONFIG\\_FREERTOS\\_GENERATE\\_RUN\\_TIME\\_STATS](#)
- [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)
- [CONFIG\\_FREERTOS\\_ENABLE\\_STATIC\\_TASK\\_CLEAN\\_UP](#)
- [CONFIG\\_FREERTOS\\_ENABLE\\_TASK\\_SNAPSHOT](#)
- [CONFIG\\_FREERTOS\\_TASK\\_FUNCTION\\_WRAPPER](#)
- [CONFIG\\_FREERTOS\\_ASSERT](#)
- [CONFIG\\_FREERTOS\\_QUEUE\\_REGISTRY\\_SIZE](#)
- [CONFIG\\_FREERTOS\\_TIMER\\_QUEUE\\_LENGTH](#)
- [CONFIG\\_FREERTOS\\_TIMER\\_TASK\\_PRIORITY](#)
- [CONFIG\\_FREERTOS\\_TIMER\\_TASK\\_STACK\\_DEPTH](#)
- [CONFIG\\_FREERTOS\\_ASSERT\\_ON\\_UNTESTED\\_FUNCTION](#)
- [CONFIG\\_FREERTOS\\_IDLE\\_TASK\\_STACKSIZE](#)
- [CONFIG\\_FREERTOS\\_ISR\\_STACKSIZE](#)
- [CONFIG\\_FREERTOS\\_MAX\\_TASK\\_NAME\\_LEN](#)
- [CONFIG\\_FREERTOS\\_THREAD\\_LOCAL\\_STORAGE\\_POINTERS](#)
- [CONFIG\\_FREERTOS\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH](#)
- [CONFIG\\_FREERTOS\\_UNICORE](#)
- [CONFIG\\_FREERTOS\\_WATCHPOINT\\_END\\_OF\\_STACK](#)
- [CONFIG\\_FREERTOS\\_CHECK\\_PORT\\_CRITICAL\\_COMPLIANCE](#)
- [CONFIG\\_FREERTOS\\_HZ](#)
- [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)
- [CONFIG\\_FREERTOS\\_LEGACY\\_HOOKS](#)
- [CONFIG\\_FREERTOS\\_CORETIMER](#)

## CONFIG\_FREERTOS\_UNICORE

Run FreeRTOS only on first core

*Found in: [Component config](#) > [FreeRTOS](#)*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

# This invisible config value sets the value of `tskNO_AFFINITY` in `task.h`. # Intended to be used as a constant from other Kconfig files. # Value is (32-bit) `INT_MAX`.

## CONFIG\_FREERTOS\_CORETIMER

Xtensa timer to use as the FreeRTOS tick source

*Found in: [Component config](#) > [FreeRTOS](#)*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities. Check

**Available options:**

- Timer 0 (int 6, level 1) (FREERTOS\_CORETIMER\_0)  
Select this to use timer 0
- Timer 1 (int 15, level 3) (FREERTOS\_CORETIMER\_1)  
Select this to use timer 1
- SYSTIMER 0 (level 1) (FREERTOS\_CORETIMER\_SYSTIMER\_LVL1)  
Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (FREERTOS\_CORETIMER\_SYSTIMER\_LVL3)  
Select this to use systimer with the 3 interrupt priority.

**CONFIG\_FREERTOS\_OPTIMIZED\_SCHEDULER**

Enable FreeRTOS platform optimized scheduler

*Found in:* [Component config](#) > [FreeRTOS](#)

On most platforms there are instructions can speedup the ready task searching. Enabling this option the FreeRTOS with this instructions support will be built.

**Default value:**

- Yes (enabled) if [CONFIG\\_FREERTOS\\_UNICORE](#)

**CONFIG\_FREERTOS\_HZ**

Tick rate (Hz)

*Found in:* [Component config](#) > [FreeRTOS](#)

Select the tick rate at which FreeRTOS does pre-emptive context switching.

**Range:**

- from 1 to 1000

**Default value:**

- 100

**CONFIG\_FREERTOS\_ASSERT\_ON\_UNTESTED\_FUNCTION**

Halt when an SMP-untested function is called

*Found in:* [Component config](#) > [FreeRTOS](#)

Some functions in FreeRTOS have not been thoroughly tested yet when moving to the SMP implementation of FreeRTOS. When this option is enabled, these fuctions will throw an assert().

**Default value:**

- Yes (enabled)

**CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW**

Check for stack overflow

*Found in:* [Component config](#) > [FreeRTOS](#)

FreeRTOS can check for stack overflows in threads and trigger an user function called vApplication-StackOverflowHook when this happens.

**Available options:**

- No checking (FREERTOS\_CHECK\_STACKOVERFLOW\_NONE)  
Do not check for stack overflows (configCHECK\_FOR\_STACK\_OVERFLOW=0)

- Check by stack pointer value (FREERTOS\_CHECK\_STACKOVERFLOW\_PTRVAL)  
Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK\_FOR\_STACK\_OVERFLOW=1)
- Check using canary bytes (FREERTOS\_CHECK\_STACKOVERFLOW\_CANARY)  
Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK\_FOR\_STACK\_OVERFLOW=2)

### CONFIG\_FREERTOS\_WATCHPOINT\_END\_OF\_STACK

Set a debug watchpoint as a stack overflow check

*Found in: [Component config > FreeRTOS](#)*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See FREERTOS\_CHECK\_STACKOVERFLOW for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic'ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_INTERRUPT\_BACKTRACE

Enable backtrace from interrupt to task context

*Found in: [Component config > FreeRTOS](#)*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**Default value:**

- Yes (enabled)

### CONFIG\_FREERTOS\_THREAD\_LOCAL\_STORAGE\_POINTERS

Number of thread local storage pointers

*Found in: [Component config > FreeRTOS](#)*

FreeRTOS has the ability to store per-thread pointers in the task control block. This controls the number of pointers available.

This value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

**Range:**

- from 1 to 256

**Default value:**

- 1

## CONFIG\_FREERTOS\_ASSERT

FreeRTOS assertions

*Found in: [Component config](#) > [FreeRTOS](#)*

Failed FreeRTOS configASSERT() assertions can be configured to behave in different ways.

By default these behave the same as the global project assert settings.

**Available options:**

- abort() on failed assertions (FREERTOS\_ASSERT\_FAIL\_ABORT)  
If a FreeRTOS configASSERT() fails, FreeRTOS will abort() and halt execution. The panic handler can be configured to handle the outcome of an abort() in different ways.  
If assertions are disabled for the entire project, they are also disabled in FreeRTOS and this option is unavailable.
- Print and continue failed assertions (FREERTOS\_ASSERT\_FAIL\_PRINT\_CONTINUE)  
If a FreeRTOS assertion fails, print it out and continue.
- Disable FreeRTOS assertions (FREERTOS\_ASSERT\_DISABLE)  
FreeRTOS configASSERT() will not be compiled into the binary.

## CONFIG\_FREERTOS\_IDLE\_TASK\_STACKSIZE

Idle Task stack size

*Found in: [Component config](#) > [FreeRTOS](#)*

The idle task has its own stack, sized in bytes. The default size is enough for most uses. Size can be reduced to 768 bytes if no (or simple) FreeRTOS idle hooks are used and pthread local storage or FreeRTOS local storage cleanup callbacks are not used.

The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.

**Range:**

- from 768 to 32768

**Default value:**

- 1536

## CONFIG\_FREERTOS\_ISR\_STACKSIZE

ISR stack size

*Found in: [Component config](#) > [FreeRTOS](#)*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**Range:**

- from 2096 to 32768 if ESP\_COREDUMP\_DATA\_FORMAT\_ELF
- from 1536 to 32768

**Default value:**

- 2096 if ESP\_COREDUMP\_DATA\_FORMAT\_ELF
- 1536

## CONFIG\_FREERTOS\_LEGACY\_HOOKS

Use FreeRTOS legacy hooks

*Found in: [Component config > FreeRTOS](#)*

FreeRTOS offers a number of hooks/callback functions that are called when a timer tick happens, the idle thread runs etc. esp-idf replaces these by runtime registerable hooks using the esp\_register\_freertos\_XXX\_hook system, but for legacy reasons the old hooks can also still be enabled. Please enable this only if you have code that for some reason can't be migrated to the esp\_register\_freertos\_XXX\_hook system.

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_MAX\_TASK\_NAME\_LEN

Maximum task name length

*Found in: [Component config > FreeRTOS](#)*

Changes the maximum task name length. Each task allocated will include this many bytes for a task name. Using a shorter value saves a small amount of RAM, a longer value allows more complex names.

For most uses, the default of 16 is OK.

**Range:**

- from 1 to 256

**Default value:**

- 16

## CONFIG\_FREERTOS\_ENABLE\_STATIC\_TASK\_CLEAN\_UP

Enable static task clean up hook

*Found in: [Component config > FreeRTOS](#)*

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Bear in mind that if this option is enabled you will need to implement the following function:

```
void vPortCleanUpTCB ( void *pxTCB ) {  
    // place clean up code here  
}
```

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_TIMER\_TASK\_PRIORITY

FreeRTOS timer task priority

*Found in: [Component config > FreeRTOS](#)*

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application's executable binary.

Use this constant to define the priority that the timer task will run at.

**Range:**

- from 1 to 25

**Default value:**

- 1

### CONFIG\_FREERTOS\_TIMER\_TASK\_STACK\_DEPTH

FreeRTOS timer task stack size

*Found in: [Component config](#) > [FreeRTOS](#)*

The timer service task (primarily) makes use of existing FreeRTOS features, allowing timer functionality to be added to an application with minimal impact on the size of the application's executable binary.

Use this constant to define the size (in bytes) of the stack allocated for the timer task.

**Range:**

- from 1536 to 32768

**Default value:**

- 2048

### CONFIG\_FREERTOS\_TIMER\_QUEUE\_LENGTH

FreeRTOS timer queue length

*Found in: [Component config](#) > [FreeRTOS](#)*

FreeRTOS provides a set of timer related API functions. Many of these functions use a standard FreeRTOS queue to send commands to the timer service task. The queue used for this purpose is called the 'timer command queue'. The 'timer command queue' is private to the FreeRTOS timer implementation, and cannot be accessed directly.

For most uses the default value of 10 is OK.

**Range:**

- from 5 to 20

**Default value:**

- 10

### CONFIG\_FREERTOS\_QUEUE\_REGISTRY\_SIZE

FreeRTOS queue registry size

*Found in: [Component config](#) > [FreeRTOS](#)*

FreeRTOS uses the queue registry as a means for kernel aware debuggers to locate queues, semaphores, and mutexes. The registry allows for a textual name to be associated with a queue for easy identification within a debugging GUI. A value of 0 will disable queue registry functionality, and a value larger than 0 will specify the number of queues/semaphores/mutexes that the registry can hold.

**Range:**

- from 0 to 20

**Default value:**

- 0

### CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY

Enable FreeRTOS trace facility

*Found in: [Component config](#) > [FreeRTOS](#)*

If enabled, configUSE\_TRACE\_FACILITY will be defined as 1 in FreeRTOS. This will allow the usage of trace facility functions such as uxTaskGetSystemState().

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_USE\_STATS\_FORMATTING\_FUNCTIONS

Enable FreeRTOS stats formatting functions

*Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)*

If enabled, configUSE\_STATS\_FORMATTING\_FUNCTIONS will be defined as 1 in FreeRTOS. This will allow the usage of stats formatting functions such as vTaskList().

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)

## CONFIG\_FREERTOS\_VTASKLIST\_INCLUDE\_COREID

Enable display of xCoreID in vTaskList

*Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#) > [CONFIG\\_FREERTOS\\_USE\\_STATS\\_FORMATTING\\_FUNCTIONS](#)*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_STATS\\_FORMATTING\\_FUNCTIONS](#)

## CONFIG\_FREERTOS\_GENERATE\_RUN\_TIME\_STATS

Enable FreeRTOS to collect run time stats

*Found in: [Component config](#) > [FreeRTOS](#)*

If enabled, configGENERATE\_RUN\_TIME\_STATS will be defined as 1 in FreeRTOS. This will allow FreeRTOS to collect information regarding the usage of processor time amongst FreeRTOS tasks. Run time stats are generated using either the ESP Timer or the CPU Clock as the clock source (Note that run time stats are only valid until the clock source overflows). The function vTaskGetRunTimeStats() will also be available if FREERTOS\_USE\_STATS\_FORMATTING\_FUNCTIONS and FREERTOS\_USE\_TRACE\_FACILITY are enabled. vTaskGetRunTimeStats() will display the run time of each task as a % of the total run time of all CPUs (task run time / no of CPUs) / (total run time / 100)

**Default value:**

- No (disabled)

## CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_CLK

Choose the clock source for run time stats

*Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG\\_FREERTOS\\_GENERATE\\_RUN\\_TIME\\_STATS](#)*

Choose the clock source for FreeRTOS run time stats. Options are CPU0's CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

**Available options:**

- Use ESP TIMER for run time stats (FREERTOS\_RUN\_TIME\_STATS\_USING\_ESP\_TIMER) ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (FREERTOS\_RUN\_TIME\_STATS\_USING\_CPU\_CLK) CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP32\_DEFAULT\_CPU\_FREQ\_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for

(as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

### **CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE**

Tickless idle support

*Found in: [Component config](#) > [FreeRTOS](#)*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP option. This feature is also known as “automatic light sleep”.

Note that timers created using esp\_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the “skip\_unhandled\_events” option as true.

If disabled, automatic light sleep support will be disabled.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### **CONFIG\_FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP**

Minimum number of ticks to enter sleep mode for

*Found in: [Component config](#) > [FreeRTOS](#) > [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks.

**Range:**

- from 2 to 4294967295 if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

**Default value:**

- 3 if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

### **CONFIG\_FREERTOS\_TASK\_FUNCTION\_WRAPPER**

Enclose all task functions in a wrapper function

*Found in: [Component config](#) > [FreeRTOS](#)*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

**Default value:**

- Yes (enabled)

### **CONFIG\_FREERTOS\_CHECK\_MUTEX\_GIVEN\_BY\_OWNER**

Check that mutex semaphore is given by owner task

*Found in: [Component config](#) > [FreeRTOS](#)*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

**Default value:**

- Yes (enabled)

### CONFIG\_FREERTOS\_CHECK\_PORT\_CRITICAL\_COMPLIANCE

Tests compliance with Vanilla FreeRTOS port\*\_CRITICAL calls

Found in: *Component config > FreeRTOS*

If enabled, context of port\*\_CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port\*\_CRITICAL from ISR context would cause assert failure

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_PLACE\_FUNCTIONS\_INTO\_FLASH

Place FreeRTOS functions into Flash

Found in: *Component config > FreeRTOS*

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_ENABLE\_TASK\_SNAPSHOT

Enable task snapshot functions

Found in: *Component config > FreeRTOS*

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, are compiled and linked.

**Default value:**

- Yes (enabled)

### CONFIG\_FREERTOS\_PLACE\_SNAPSHOT\_FUNS\_INTO\_FLASH

Place task snapshot functions into flash

Found in: *Component config > FreeRTOS > CONFIG\_FREERTOS\_ENABLE\_TASK\_SNAPSHOT*

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, will be placed in flash. Note that if enabled, these functions cannot be called when cache is disabled.

**Default value:**

- No (disabled) if *CONFIG\_FREERTOS\_ENABLE\_TASK\_SNAPSHOT* && *CONFIG\_ESP\_PANIC\_HANDLER\_IRAM*

**Hardware Abstraction Layer (HAL) and Low Level (LL)** Contains:

- *CONFIG\_HAL\_DEFAULT\_ASSERTION\_LEVEL*

### CONFIG\_HAL\_DEFAULT\_ASSERTION\_LEVEL

Default HAL assertion level

Found in: *Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can't exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can't be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

**Available options:**

- Same as system assertion level (HAL\_ASSERTION\_EQUALS\_SYSTEM)
- Disabled (HAL\_ASSERTION\_DISABLE)
- Silent (HAL\_ASSERTION\_SILENT)
- Enabled (HAL\_ASSERTION\_ENABLE)

**Heap memory debugging** Contains:

- [CONFIG\\_HEAP\\_ABORT\\_WHEN\\_ALLOCATION\\_FAILS](#)
- [CONFIG\\_HEAP\\_TASK\\_TRACKING](#)
- [CONFIG\\_HEAP\\_CORRUPTION\\_DETECTION](#)
- [CONFIG\\_HEAP\\_TRACING\\_DEST](#)
- [CONFIG\\_HEAP\\_TRACING\\_STACK\\_DEPTH](#)

### **CONFIG\_HEAP\_CORRUPTION\_DETECTION**

Heap corruption detection

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

**Available options:**

- Basic (no poisoning) (HEAP\_POISONING\_DISABLED)
- Light impact (HEAP\_POISONING\_LIGHT)
- Comprehensive (HEAP\_POISONING\_COMPREHENSIVE)

### **CONFIG\_HEAP\_TRACING\_DEST**

Heap tracing

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enables the heap tracing API defined in esp\_heap\_trace.h.

This function causes a moderate increase in IRAM code size and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it's best to keep it disabled unless tracing is being used.

**Available options:**

- Disabled (HEAP\_TRACING\_OFF)
- Standalone (HEAP\_TRACING\_STANDALONE)
- Host-based (HEAP\_TRACING\_TOHOST)

### **CONFIG\_HEAP\_TRACING\_STACK\_DEPTH**

Heap tracing stack depth

*Found in: [Component config](#) > [Heap memory debugging](#)*

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

### CONFIG\_HEAP\_TASK\_TRACKING

Enable heap task tracking

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

### CONFIG\_HEAP\_ABORT\_WHEN\_ALLOCATION\_FAILS

Abort if memory allocation fails

*Found in: [Component config](#) > [Heap memory debugging](#)*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**

- No (disabled)

**jsmn** Contains:

- [CONFIG\\_JSMN\\_PARENT\\_LINKS](#)
- [CONFIG\\_JSMN\\_STRICT](#)

### CONFIG\_JSMN\_PARENT\_LINKS

Enable parent links

*Found in: [Component config](#) > [jsmn](#)*

You can access to parent node of parsed json

**Default value:**

- No (disabled)

### CONFIG\_JSMN\_STRICT

Enable strict mode

*Found in: [Component config](#) > [jsmn](#)*

In strict mode primitives are: numbers and booleans

**Default value:**

- No (disabled)

**libsodium** Contains:

- [CONFIG\\_LIBSODIUM\\_USE\\_MBEDTLS\\_SHA](#)

### CONFIG\_LIBSODIUM\_USE\_MBEDTLS\_SHA

Use mbedTLS SHA256 & SHA512 implementations

*Found in: [Component config](#) > [libsodium](#)*

If this option is enabled, libsodium will use thin wrappers around mbedTLS for SHA256 & SHA512 operations.

This saves some code size if mbedTLS is also used. However it is incompatible with hardware SHA acceleration (due to the way libsodium's API manages SHA state).

**Default value:**

- Yes (enabled)

**Log output** Contains:

- [CONFIG\\_LOG\\_DEFAULT\\_LEVEL](#)
- [CONFIG\\_LOG\\_TIMESTAMP\\_SOURCE](#)
- [CONFIG\\_LOG\\_MAXIMUM\\_LEVEL](#)
- [CONFIG\\_LOG\\_COLORS](#)

**CONFIG\_LOG\_DEFAULT\_LEVEL**

Default log verbosity

*Found in:* [Component config](#) > [Log output](#)

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set` function.

By default, this setting limits which log statements are compiled into the program. For example, selecting “Warning” would mean that changing log level to “Debug” at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

**Available options:**

- No output (LOG\_DEFAULT\_LEVEL\_NONE)
- Error (LOG\_DEFAULT\_LEVEL\_ERROR)
- Warning (LOG\_DEFAULT\_LEVEL\_WARN)
- Info (LOG\_DEFAULT\_LEVEL\_INFO)
- Debug (LOG\_DEFAULT\_LEVEL\_DEBUG)
- Verbose (LOG\_DEFAULT\_LEVEL\_VERBOSE)

**CONFIG\_LOG\_MAXIMUM\_LEVEL**

Maximum log verbosity

*Found in:* [Component config](#) > [Log output](#)

This config option sets the highest log verbosity that it’s possible to select at runtime by calling `esp_log_level_set()`. This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate “Bootloader log verbosity” setting.

**Available options:**

- Same as default (LOG\_MAXIMUM\_EQUALS\_DEFAULT)
- Error (LOG\_MAXIMUM\_LEVEL\_ERROR)
- Warning (LOG\_MAXIMUM\_LEVEL\_WARN)
- Info (LOG\_MAXIMUM\_LEVEL\_INFO)
- Debug (LOG\_MAXIMUM\_LEVEL\_DEBUG)
- Verbose (LOG\_MAXIMUM\_LEVEL\_VERBOSE)

**CONFIG\_LOG\_COLORS**

Use ANSI terminal colors in log output

*Found in:* [Component config](#) > [Log output](#)

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**

- Yes (enabled)

## CONFIG\_LOG\_TIMESTAMP\_SOURCE

Log Timestamps

Found in: *Component config > Log output*

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the ESP32's RTC and FRC1 timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

**Available options:**

- Milliseconds Since Boot (LOG\_TIMESTAMP\_SOURCE\_RTOS)
- System Time (LOG\_TIMESTAMP\_SOURCE\_SYSTEM)

**LWIP** Contains:

- *CONFIG\_LWIP\_CHECK\_THREAD\_SAFETY*
- *Checksums*
- *CONFIG\_LWIP\_DHCP\_COARSE\_TIMER\_SECS*
- *DHCP server*
- *CONFIG\_LWIP\_DHCP\_OPTIONS\_LEN*
- *CONFIG\_LWIP\_DHCP\_DISABLE\_CLIENT\_ID*
- *CONFIG\_LWIP\_DHCP\_DISABLE\_VENDOR\_CLASS\_ID*
- *CONFIG\_LWIP\_DHCP\_DOES\_ARP\_CHECK*
- *CONFIG\_LWIP\_DHCP\_RESTORE\_LAST\_IP*
- *DNS*
- *CONFIG\_LWIP\_PPP\_CHAP\_SUPPORT*
- *CONFIG\_LWIP\_L2\_TO\_L3\_COPY*
- *CONFIG\_LWIP\_IPV6\_DHCP6*
- *CONFIG\_LWIP\_IP4\_FRAG*
- *CONFIG\_LWIP\_IP6\_FRAG*
- *CONFIG\_LWIP\_IP\_FORWARD*
- *CONFIG\_LWIP\_NETBUF\_RECVINFO*
- *CONFIG\_LWIP\_AUTOIP*
- *CONFIG\_LWIP\_IPV6*
- *CONFIG\_LWIP\_ENABLE\_LCP\_ECHO*
- *CONFIG\_LWIP\_ETHARP\_TRUST\_IP\_MAC*
- *CONFIG\_LWIP\_ESP\_LWIP\_ASSERT*
- *CONFIG\_LWIP\_DEBUG*
- *CONFIG\_LWIP\_IRAM\_OPTIMIZATION*
- *CONFIG\_LWIP\_STATS*
- *CONFIG\_LWIP\_TIMERS\_ONDEMAND*
- *CONFIG\_LWIP\_DNS\_SUPPORT\_MDNS\_QUERIES*
- *CONFIG\_LWIP\_PPP\_MPPE\_SUPPORT*
- *CONFIG\_LWIP\_PPP\_MSCHAP\_SUPPORT*
- *CONFIG\_LWIP\_PPP\_NOTIFY\_PHASE\_SUPPORT*
- *CONFIG\_LWIP\_PPP\_PAP\_SUPPORT*

- `CONFIG_LWIP_PPP_DEBUG_ON`
- `CONFIG_LWIP_PPP_SUPPORT`
- `CONFIG_LWIP_IP4_REASSEMBLY`
- `CONFIG_LWIP_IP6_REASSEMBLY`
- `CONFIG_LWIP_SLIP_SUPPORT`
- `CONFIG_LWIP_SO_LINGER`
- `CONFIG_LWIP_SO_RCVBUF`
- `CONFIG_LWIP_SO_REUSE`
- `CONFIG_LWIP_NETIF_STATUS_CALLBACK`
- `CONFIG_LWIP_TCPIP_CORE_LOCKING`
- `CONFIG_LWIP_NETIF_API`
- *Hooks*
- *ICMP*
- `CONFIG_LWIP_LOCAL_HOSTNAME`
- *LWIP RAW API*
- `CONFIG_LWIP_TCPIP_TASK_PRIO`
- `CONFIG_LWIP_IPV6_ND6_NUM_NEIGHBORS`
- `CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE`
- `CONFIG_LWIP_MAX_SOCKETS`
- `CONFIG_LWIP_ESP_GRATUITOUS_ARP`
- `CONFIG_LWIP_ESP_MLDV6_REPORT`
- *SNTP*
- `CONFIG_LWIP_USE_ONLY_LWIP_SELECT`
- `CONFIG_LWIP_NETIF_LOOPBACK`
- *TCP*
- `CONFIG_LWIP_TCPIP_TASK_AFFINITY`
- `CONFIG_LWIP_TCPIP_TASK_STACK_SIZE`
- `CONFIG_LWIP_TCPIP_RECVMBOX_SIZE`
- `CONFIG_LWIP_IP_DEFAULT_TTL`
- *UDP*
- `CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS`

### **CONFIG\_LWIP\_LOCAL\_HOSTNAME**

Local netif hostname

*Found in: Component config > LWIP*

The default name this device will report to other devices on the network. Could be updated at runtime with `esp_netif_set_hostname()`

**Default value:**

- “espressif”

### **CONFIG\_LWIP\_NETIF\_API**

Enable usage of standard POSIX APIs in LWIP

*Found in: Component config > LWIP*

If this feature is enabled, standard POSIX APIs: `if_indextoname()`, `if_nametoindex()` could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as `esp_netif_get_netif_impl_name()`)

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_TCPIP\_TASK\_PRIO**

LWIP TCP/IP Task Priority

*Found in: [Component config](#) > [LWIP](#)*

LWIP tcpip task priority. In case of high throughput, this parameter could be changed up to (config-MAX\_PRIORITIES-1).

**Range:**

- from 1 to 24

**Default value:**

- 18

## CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING

Enable tcpip core locking

*Found in: [Component config](#) > [LWIP](#)*

If Enable tcpip core locking, Creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See LOCK\_TCPIP\_CORE() and UNLOCK\_TCPIP\_CORE().

If disable tcpip core locking, TCP IP will perform tasks through context switching

**Default value:**

- No (disabled)

## CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING\_INPUT

Enable tcpip core locking input

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_TCPIP\\_CORE\\_LOCKING](#)*

when LWIP\_TCPIP\_CORE\_LOCKING is enabled, this lets tcpip\_input() grab the mutex for input packets as well, instead of allocating a message and passing it to tcpip\_thread.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_TCPIP\\_CORE\\_LOCKING](#)

## CONFIG\_LWIP\_CHECK\_THREAD\_SAFETY

Checks that lwip API runs in expected context

*Found in: [Component config](#) > [LWIP](#)*

Enable to check that the project does not violate lwip thread safety. If enabled, all lwip functions that require thread awareness run an assertion to verify that the TCP/IP core functionality is either locked or accessed from the correct thread.

**Default value:**

- No (disabled)

## CONFIG\_LWIP\_DNS\_SUPPORT\_MDNS\_QUERIES

Enable mDNS queries in resolving host name

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_L2\_TO\_L3\_COPY

Enable copy between Layer2 and Layer3 packets

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IRAM\_OPTIMIZATION

Enable LWIP IRAM optimization

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn't help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TIMERS\_ONDEMAND

Enable LWIP Timers on demand

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_MAX\_SOCKETS

Max number of open sockets

*Found in: [Component config](#) > [LWIP](#)*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**Range:**

- from 1 to 16

**Default value:**

- 10

### CONFIG\_LWIP\_USE\_ONLY\_LWIP\_SELECT

Support LWIP socket select() only (DEPRECATED)

*Found in: [Component config](#) > [LWIP](#)*

This option is deprecated. Use VFS\_SUPPORT\_SELECT instead, which is the inverse of this option.

The virtual filesystem layer of select() redirects sockets to lwip\_select() and non-socket file descriptors to their respective driver implementations. If this option is enabled then all calls of select() will be redirected to lwip\_select(), therefore, select can be used for sockets only.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_LINGER

Enable SO\_LINGER processing

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows SO\_LINGER processing. l\_onoff = 1,l\_linger can set the timeout.

If l\_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If l\_linger!=0,Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_REUSE

Enable SO\_REUSEADDR option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows binding to a port which remains in TIME\_WAIT.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_SO\_REUSE\_RXTOALL

SO\_REUSEADDR copies broadcast/multicast to all matches

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_SO\\_REUSE](#)*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO\_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don't plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_SO\_RCVBUF

Enable SO\_RCVBUF option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for available data on a netconn.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_NETBUF\_RECVINFO

Enable IP\_PKTINFO option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP\_DEFAULT\_TTL

The value for Time-To-Live used by transport layers

*Found in: [Component config](#) > [LWIP](#)*

Set value for Time-To-Live used by transport layers.

**Range:**

- from 1 to 255

**Default value:**

- 64

### CONFIG\_LWIP\_IP4\_FRAG

Enable fragment outgoing IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IP6\_FRAG

Enable fragment outgoing IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IP4\_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows reassembling incoming fragmented IP4 packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP6\_REASSEMBLY

Enable reassembly incoming fragmented IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows reassembling incoming fragmented IP6 packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP\_FORWARD

Enable IP forwarding

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV4\_NAPT

Enable NAT (new/experimental)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IP\\_FORWARD](#)*

Enabling this option allows Network Address and Port Translation.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_IP\\_FORWARD](#)

### CONFIG\_LWIP\_STATS

Enable LWIP statistics

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows LWIP statistics

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_ETHARP\_TRUST\_IP\_MAC

Enable LWIP ARP trust

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows ARP table to be updated.

If this option is enabled, the incoming IP packets cause the ARP table to be updated with the source MAC and IP addresses supplied in the packet. You may want to disable this if you do not trust LAN peers to have the correct addresses, or as a limited approach to attempt to handle spoofing. If disabled, lwIP will need to make a new ARP request if the peer is not already in the ARP table, adding a little latency. The peer *\*is\** in the ARP table if it requested our address before. Also notice that this slows down input processing of every IP packet!

There are two known issues in real application if this feature is enabled: - The LAN peer may have bug to update the ARP table after the ARP entry is aged out. If the ARP entry on the LAN peer is aged out but failed to be updated, all IP packets sent from LWIP to the LAN peer will be dropped by LAN peer. - The LAN peer may not be trustful, the LAN peer may send IP packets to LWIP with two different MACs, but the same IP address. If this happens, the LWIP has problem to receive IP packets from LAN peer.

So the recommendation is to disable this option. Here the LAN peer means the other side to which the ESP station or soft-AP is connected.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_ESP\_GRATUITOUS\_ARP**

Send gratuitous ARP periodically

*Found in: [Component config](#) > [LWIP](#)*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues.If the ARP table of the AP is old, and the AP doesn't send ARP request to update it's ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it's ARP table.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_GARP\_TMR\_INTERVAL**

GARP timer interval(seconds)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ESP\\_GRATUITOUS\\_ARP](#)*

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**

- 60

**CONFIG\_LWIP\_ESP\_MLDV6\_REPORT**

Send mldv6 report periodically

*Found in: [Component config](#) > [LWIP](#)*

Enable this option allows to send mldv6 report periodically.

This option solve the issue that failed to receive multicast data. Some routers fail to forward multicast packets. To solve this problem, send multicast mldv6 report to routers regularly.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_MLDV6\_TMR\_INTERVAL**

mldv6 report timer interval(seconds)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ESP\\_MLDV6\\_REPORT](#)*

Set the timer interval for mldv6 report. The default value is 40s

**Default value:**

- 40

**CONFIG\_LWIP\_TCPIP\_RECVMBOX\_SIZE**

TCPIP task receive mail box size

*Found in: [Component config](#) > [LWIP](#)*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**

- from 6 to 64 if `CONFIG_LWIP_WND_SCALE`
- from 6 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**

- 32

**CONFIG\_LWIP\_DHCP\_DOES\_ARP\_CHECK**

DHCP: Perform ARP check on any offered address

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_DHCP\_DISABLE\_CLIENT\_ID**

DHCP: Disable Use of HW address as client identification

*Found in: [Component config](#) > [LWIP](#)*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_DHCP\_DISABLE\_VENDOR\_CLASS\_ID**

DHCP: Disable Use of vendor class identification

*Found in: [Component config](#) > [LWIP](#)*

This option could be used to disable DHCP client vendor class identification. Set this option to “y” in order to exclude option 60 from DHCP packets.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_DHCP\_RESTORE\_LAST\_IP**

DHCP: Restore last IP obtained from DHCP server

*Found in: [Component config](#) > [LWIP](#)*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_DHCP\_OPTIONS\_LEN**

DHCP total option length

*Found in: [Component config](#) > [LWIP](#)*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP\_ASSERT due to option value is too long. Please increase the LWIP\_DHCP\_OPTIONS\_LEN value.

**Range:**

- from 68 to 255

**Default value:**

- 68
- 108

### CONFIG\_LWIP\_DHCP\_COARSE\_TIMER\_SECS

DHCP coarse timer interval(s)

*Found in: [Component config](#) > [LWIP](#)*

Set DHCP coarse interval in seconds. A higher value will be less precise but cost less power consumption.

**Range:**

- from 1 to 10

**Default value:**

- 1

**DHCP server** Contains:

- [CONFIG\\_LWIP\\_DHCPS](#)

### CONFIG\_LWIP\_DHCPS

DHCPS: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPS)

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#)*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_DHCPS\_LEASE\_UNIT

Multiplier for lease time, in seconds

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#) > [CONFIG\\_LWIP\\_DHCPS](#)*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**Range:**

- from 1 to 3600

**Default value:**

- 60

### CONFIG\_LWIP\_DHCPS\_MAX\_STATION\_NUM

Maximum number of stations

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#) > [CONFIG\\_LWIP\\_DHCPS](#)*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it' s address pool, without notification.

**Range:**

- from 1 to 64

**Default value:**

- 8

**CONFIG\_LWIP\_AUTOIP**

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_AUTOIP\\_TRIES](#)
- [CONFIG\\_LWIP\\_AUTOIP\\_MAX\\_CONFLICTS](#)
- [CONFIG\\_LWIP\\_AUTOIP\\_RATE\\_LIMIT\\_INTERVAL](#)

**CONFIG\_LWIP\_AUTOIP\_TRIES**

DHCP Probes before self-assigning IPv4 LL address

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_AUTOIP](#)*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: “This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP.” (In the case of ESP-IDF, this means multiple SYSTEM\_EVENT\_STA\_GOT\_IP events.)

**Range:**

- from 1 to 100 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 2 if [CONFIG\\_LWIP\\_AUTOIP](#)

**CONFIG\_LWIP\_AUTOIP\_MAX\_CONFLICTS**

Max IP conflicts before rate limiting

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_AUTOIP](#)*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**

- from 1 to 100 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 9 if [CONFIG\\_LWIP\\_AUTOIP](#)

**CONFIG\_LWIP\_AUTOIP\_RATE\_LIMIT\_INTERVAL**

Rate limited interval (seconds)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_AUTOIP](#)*

If rate limiting self-assignment requests, wait this long between each request.

**Range:**

- from 5 to 120 if [CONFIG\\_LWIP\\_AUTOIP](#)

**Default value:**

- 20 if *CONFIG\_LWIP\_AUTOIP*

### CONFIG\_LWIP\_IPV6

Enable IPv6

*Found in: Component config > LWIP*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP\_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IPV6\_AUTOCONFIG

Enable IPV6 stateless address autoconfiguration (SLAAC)

*Found in: Component config > LWIP > CONFIG\_LWIP\_IPV6*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV6\_NUM\_ADDRESSES

Number of IPv6 addresses on each network interface

*Found in: Component config > LWIP > CONFIG\_LWIP\_IPV6*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**

- 3

### CONFIG\_LWIP\_IPV6\_FORWARD

Enable IPv6 forwarding between interfaces

*Found in: Component config > LWIP > CONFIG\_LWIP\_IPV6*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV6\_RDNSS\_MAX\_DNS\_SERVERS

Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in: Component config > LWIP*

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

**Default value:**

- 0 if *CONFIG\_LWIP\_IPV6\_AUTOCONFIG*

### CONFIG\_LWIP\_IPV6\_DHCP6

Enable DHCPv6 stateless address autoconfiguration

Found in: *Component config > LWIP*

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using `dhcp6_enable_stateless(netif)`; Note that the stateful address autoconfiguration is not supported.

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_IPV6\_AUTOCONFIG*

### CONFIG\_LWIP\_NETIF\_STATUS\_CALLBACK

Enable status callback for network interfaces

Found in: *Component config > LWIP*

Enable callbacks when the network interface is up/down and addresses are changed.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_NETIF\_LOOPBACK

Support per-interface loopback

Found in: *Component config > LWIP*

Enabling this option means that if a packet is sent with a destination address equal to the interface's own IP address, it will “loop back” and be received by this interface.

**Default value:**

- Yes (enabled)

Contains:

- *CONFIG\_LWIP\_LOOPBACK\_MAX\_PBUFS*

### CONFIG\_LWIP\_LOOPBACK\_MAX\_PBUFS

Max queued loopback packets per interface

Found in: *Component config > LWIP > CONFIG\_LWIP\_NETIF\_LOOPBACK*

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**Range:**

- from 0 to 16

**Default value:**

- 8

**TCP** Contains:

- *CONFIG\_LWIP\_TCP\_WND\_DEFAULT*
- *CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT*
- *CONFIG\_LWIP\_TCP\_RECVMBOX\_SIZE*
- *CONFIG\_LWIP\_TCP\_RTO\_TIME*
- *CONFIG\_LWIP\_TCP\_KEEP\_CONNECTION\_WHEN\_IP\_CHANGES*
- *CONFIG\_LWIP\_MAX\_ACTIVE\_TCP*
- *CONFIG\_LWIP\_TCP\_FIN\_WAIT\_TIMEOUT*
- *CONFIG\_LWIP\_MAX\_LISTENING\_TCP*

- [CONFIG\\_LWIP\\_TCP\\_MAXRTX](#)
- [CONFIG\\_LWIP\\_TCP\\_SYNMAXRTX](#)
- [CONFIG\\_LWIP\\_TCP\\_MSL](#)
- [CONFIG\\_LWIP\\_TCP\\_MSS](#)
- [CONFIG\\_LWIP\\_TCP\\_OVERSIZE](#)
- [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)
- [CONFIG\\_LWIP\\_TCP\\_SACK\\_OUT](#)
- [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- [CONFIG\\_LWIP\\_TCP\\_HIGH\\_SPEED\\_RETRANSMISSION](#)
- [CONFIG\\_LWIP\\_TCP\\_TMR\\_INTERVAL](#)

### **CONFIG\_LWIP\_MAX\_ACTIVE\_TCP**

Maximum active TCP Connections

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### **CONFIG\_LWIP\_MAX\_LISTENING\_TCP**

Maximum listening TCP Connections

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### **CONFIG\_LWIP\_TCP\_HIGH\_SPEED\_RETRANSMISSION**

TCP high speed retransmissions

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

**Default value:**

- Yes (enabled)

### **CONFIG\_LWIP\_TCP\_MAXRTX**

Maximum number of retransmissions of data segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of data segments.

**Range:**

- from 3 to 12

**Default value:**

- 12

### CONFIG\_LWIP\_TCP\_SYNMAXRTX

Maximum number of retransmissions of SYN segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of SYN segments.

**Range:**

- from 3 to 12

**Default value:**

- 6
- 12

### CONFIG\_LWIP\_TCP\_MSS

Maximum Segment Size (MSS)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP\_MSS Range: 576 <= TCP\_MSS <= 1460 IPv6 TCP\_MSS Range: 1220<= TCP\_MSS <= 1440

**Range:**

- from 536 to 1460

**Default value:**

- 1440

### CONFIG\_LWIP\_TCP\_TMR\_INTERVAL

TCP timer interval(ms)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**

- 250

### CONFIG\_LWIP\_TCP\_MSL

Maximum segment lifetime (MSL)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 60000

### CONFIG\_LWIP\_TCP\_FIN\_WAIT\_TIMEOUT

Maximum FIN segment lifetime

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#)

Set maximum segment lifetime in milliseconds.

**Default value:**

- 20000

### CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT

Default send buffer size

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#)

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with `lwip_setsockopt(s, TCP_SNDBUF, ...)`.

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**

- from 2440 to 65535 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5760

### CONFIG\_LWIP\_TCP\_WND\_DEFAULT

Default receive window size

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#)

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with `lwip_setsockopt(s, TCP_WINDOW, ...)`.

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**

- from 2440 to 65535 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)
- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5760

### CONFIG\_LWIP\_TCP\_RECVMBOX\_SIZE

Default TCP receive mail box size

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#)

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is:  $LWIP\_TCP\_WND\_DEFAULT/TCP\_MSS + 2$ , e.g. if  $LWIP\_TCP\_WND\_DEFAULT=14360$ ,  $TCP\_MSS=1436$ , then the recommended receive mail box size is  $(14360/1436 + 2) = 12$ .

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can cache maximum `LWIP_TCP_RECVMBOX_SIZE` packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is

LWIP\_TCP\_RECVMBOX\_SIZE multiplies the maximum TCP socket number. In other words, the bigger LWIP\_TCP\_RECVMBOX\_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 64 if *CONFIG\_LWIP\_WND\_SCALE*
- from 6 to 1024 if *CONFIG\_LWIP\_WND\_SCALE*

**Default value:**

- 6

### CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ

Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCP\_OOSEQ\_TIMEOUT

Timeout for each pbuf queued in TCP OOSEQ, in RTOs.

*Found in: Component config > LWIP > TCP > CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ*

The timeout value is TCP\_OOSEQ\_TIMEOUT \* RTO.

**Range:**

- from 1 to 30

**Default value:**

- 6

### CONFIG\_LWIP\_TCP\_OOSEQ\_MAX\_PBUFS

The maximum number of pbufs queued on OOSEQ per pcb

*Found in: Component config > LWIP > TCP > CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ*

If LWIP\_TCP\_OOSEQ\_MAX\_PBUFS = 0, TCP will not control the number of OOSEQ pbufs.

In a poor network environment, many out-of-order tcp pbufs will be received. These out-of-order pbufs will be cached in the TCP out-of-order queue which will cause Wi-Fi/Ethernet fail to release RX buffer in time. It is possible that all RX buffers for MAC layer are used by OOSEQ.

Control the number of out-of-order pbufs to ensure that the MAC layer has enough RX buffer to receive packets.

In the Wi-Fi scenario, recommended OOSEQ PBUFS Range:  $0 \leq \text{TCP\_OOSEQ\_MAX\_PBUFS} \leq \text{CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM}/(\text{MAX\_TCP\_NUMBER} + 1)$

In the Ethernet scenario, recommended Ethernet OOSEQ PBUFS Range:  $0 \leq \text{TCP\_OOSEQ\_MAX\_PBUFS} \leq \text{CONFIG\_ETH\_DMA\_RX\_BUFFER\_NUM}/(\text{MAX\_TCP\_NUMBER} + 1)$

Within the recommended value range, the larger the value, the better the performance.

MAX\_TCP\_NUMBER represent Maximum number of TCP connections in Wi-Fi(STA+SoftAP) and Ethernet scenario.

**Range:**

- from 0 to 12

**Default value:**

- 4 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_LWIP_TCP_QUEUE_OOSEQ`
- 0 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_LWIP_TCP_QUEUE_OOSEQ`

**CONFIG\_LWIP\_TCP\_SACK\_OUT**

Support sending selective acknowledgements

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_TCP\_KEEP\_CONNECTION\_WHEN\_IP\_CHANGES**

Keep TCP connections when IP changed

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

This option is enabled when the following scenario happen: network dropped and reconnected, IP changes is like: 192.168.0.2->0.0.0.0->192.168.0.2

Disable this option to keep consistent with the original LWIP code behavior.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_TCP\_OVERSIZE**

Pre-allocate transmit PBUF size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

**Available options:**

- MSS (`LWIP_TCP_OVERSIZE_MSS`)
- 25% MSS (`LWIP_TCP_OVERSIZE_QUARTER_MSS`)
- Disabled (`LWIP_TCP_OVERSIZE_DISABLE`)

**CONFIG\_LWIP\_WND\_SCALE**

Support TCP window scale

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Enable this feature to support TCP window scaling.

**Default value:**

- No (disabled) if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

### CONFIG\_LWIP\_TCP\_RCV\_SCALE

Set TCP receiving window scaling factor

*Found in: [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_WND\\_SCALE](#)*

Enable this feature to support TCP window scaling.

**Range:**

- from 0 to 14 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 0 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

### CONFIG\_LWIP\_TCP\_RTO\_TIME

Default TCP rto time

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**

- 3000
- 1500

**UDP** Contains:

- [CONFIG\\_LWIP\\_UDP\\_RECVMBOX\\_SIZE](#)
- [CONFIG\\_LWIP\\_MAX\\_UDP\\_PCBS](#)

### CONFIG\_LWIP\_MAX\_UDP\_PCBS

Maximum active UDP control blocks

*Found in: [Component config](#) > [LWIP](#) > [UDP](#)*

The maximum number of active UDP “connections” (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### CONFIG\_LWIP\_UDP\_RECVMBOX\_SIZE

Default UDP receive mail box size

*Found in: [Component config](#) > [LWIP](#) > [UDP](#)*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum `UDP_RECCVMBOX_SIZE` packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is `UDP_RECCVMBOX_SIZE` multiplies the maximum UDP socket number. In other words, the bigger `UDP_RECVMBOX_SIZE` means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 64

**Default value:**

- 6

**Checksums** Contains:

- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_ICMP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_IP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_UDP](#)

### **CONFIG\_LWIP\_CHECKSUM\_CHECK\_IP**

Enable LWIP IP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received IP messages

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_CHECKSUM\_CHECK\_UDP**

Enable LWIP UDP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received UDP messages

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_CHECKSUM\_CHECK\_ICMP**

Enable LWIP ICMP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received ICMP messages

**Default value:**

- Yes (enabled)

### **CONFIG\_LWIP\_TCPIP\_TASK\_STACK\_SIZE**

TCP/IP Task Stack Size

*Found in: [Component config](#) > [LWIP](#)*

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**

- from 2048 to 65536

**Default value:**

- 3072

### CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY

TCP/IP task affinity

Found in: *Component config* > *LWIP*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

**Available options:**

- No affinity (LWIP\_TCPIP\_TASK\_AFFINITY\_NO\_AFFINITY)
- CPU0 (LWIP\_TCPIP\_TASK\_AFFINITY\_CPU0)
- CPU1 (LWIP\_TCPIP\_TASK\_AFFINITY\_CPU1)

### CONFIG\_LWIP\_PPP\_SUPPORT

Enable PPP support (new/experimental)

Found in: *Component config* > *LWIP*

Enable PPP stack. Now only PPP over serial is possible.

PPP over serial support is experimental and unsupported.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_PPP\\_ENABLE\\_IPV6](#)

### CONFIG\_LWIP\_PPP\_ENABLE\_IPV6

Enable IPV6 support for PPP connections (IPV6CP)

Found in: *Component config* > *LWIP* > *CONFIG\_LWIP\_PPP\_SUPPORT*

Enable IPV6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPV6 addressing in the local link. If they are requested for IPV6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPV6 support.

**Default value:**

- Yes (enabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#) && [CONFIG\\_LWIP\\_IPV6](#)

### CONFIG\_LWIP\_IPV6\_MEMP\_NUM\_ND6\_QUEUE

Max number of IPv6 packets to queue during MAC resolution

Found in: *Component config* > *LWIP*

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**

- from 3 to 20

**Default value:**

- 3

### CONFIG\_LWIP\_IPV6\_ND6\_NUM\_NEIGHBORS

Max number of entries in IPv6 neighbor cache

Found in: *Component config* > *LWIP*

Config max number of entries in IPv6 neighbor cache

**Range:**

- from 3 to 10

**Default value:**

- 5

### **CONFIG\_LWIP\_PPP\_NOTIFY\_PHASE\_SUPPORT**

Enable Notify Phase Callback

*Found in: [Component config](#) > [LWIP](#)*

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_PAP\_SUPPORT**

Enable PAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Password Authentication Protocol (PAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_CHAP\_SUPPORT**

Enable CHAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Challenge Handshake Authentication Protocol (CHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_MSCHAP\_SUPPORT**

Enable MSCHAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### **CONFIG\_LWIP\_PPP\_MPPE\_SUPPORT**

Enable MPPE support

*Found in: [Component config](#) > [LWIP](#)*

Enable Microsoft Point-to-Point Encryption (MPPE) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_ENABLE\_LCP\_ECHO

Enable LCP ECHO

*Found in: [Component config](#) > [LWIP](#)*

Enable LCP echo keepalive requests

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_LCP\_ECHOINTERVAL

Echo interval (s)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)*

Interval in seconds between keepalive LCP echo requests, 0 to disable.

**Range:**

- from 0 to 1000000 if [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)

**Default value:**

- 3 if [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)

### CONFIG\_LWIP\_LCP\_MAXECHOFAILS

Maximum echo failures

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)*

Number of consecutive unanswered echo requests before failure is indicated.

**Range:**

- from 0 to 100000 if [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)

**Default value:**

- 3 if [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)

### CONFIG\_LWIP\_PPP\_DEBUG\_ON

Enable PPP debug log output

*Found in: [Component config](#) > [LWIP](#)*

Enable PPP debug log output

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_SLIP\_SUPPORT

Enable SLIP support (new/experimental)

*Found in: [Component config](#) > [LWIP](#)*

Enable SLIP stack. Now only SLIP over serial is possible.

SLIP over serial support is experimental and unsupported.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_SLIP\\_DEBUG\\_ON](#)

### CONFIG\_LWIP\_SLIP\_DEBUG\_ON

Enable SLIP debug log output

*Found in: Component config > LWIP > CONFIG\_LWIP\_SLIP\_SUPPORT*

Enable SLIP debug log output

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_SLIP\_SUPPORT*

### ICMP Contains:

- *CONFIG\_LWIP\_ICMP*
- *CONFIG\_LWIP\_BROADCAST\_PING*
- *CONFIG\_LWIP\_MULTICAST\_PING*

### CONFIG\_LWIP\_ICMP

ICMP: Enable ICMP

*Found in: Component config > LWIP > ICMP*

Enable ICMP module for check network stability

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_MULTICAST\_PING

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_BROADCAST\_PING

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**

- No (disabled)

### LWIP RAW API Contains:

- *CONFIG\_LWIP\_MAX\_RAW\_PCBS*

### CONFIG\_LWIP\_MAX\_RAW\_PCBS

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**SNTP** Contains:

- [CONFIG\\_LWIP\\_SNTP\\_MAX\\_SERVERS](#)
- [CONFIG\\_LWIP\\_SNTP\\_UPDATE\\_DELAY](#)
- [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

### **CONFIG\_LWIP\_SNTP\_MAX\_SERVERS**

Maximum number of NTP servers

*Found in:* [Component config](#) > [LWIP](#) > [SNTP](#)

Set maximum number of NTP servers used by LwIP SNTP module. First argument of `sntp_setserver/sntp_setservername` functions is limited to this value.

**Range:**

- from 1 to 16

**Default value:**

- 1

### **CONFIG\_LWIP\_DHCP\_GET\_NTP\_SRV**

Request NTP servers from DHCP

*Found in:* [Component config](#) > [LWIP](#) > [SNTP](#)

If enabled, LWIP will add ‘NTP’ to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see `sntp_servermode_dhcp()` func.)

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_DHCP\_MAX\_NTP\_SERVERS**

Maximum number of NTP servers aquired via DHCP

*Found in:* [Component config](#) > [LWIP](#) > [SNTP](#) > [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

Set maximum number of NTP servers aquired via DHCP-offer. Should be less or equal to “Maximum number of NTP servers” , any extra servers would be just ignored.

**Range:**

- from 1 to 16 if [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

**Default value:**

- 1 if [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

### **CONFIG\_LWIP\_SNTP\_UPDATE\_DELAY**

Request interval to update time (ms)

*Found in:* [Component config](#) > [LWIP](#) > [SNTP](#)

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**Range:**

- from 15000 to 4294967295

**Default value:**

- 3600000

**DNS** Contains:

- [CONFIG\\_LWIP\\_FALLBACK\\_DNS\\_SERVER\\_SUPPORT](#)
- [CONFIG\\_LWIP\\_DNS\\_MAX\\_SERVERS](#)

### **CONFIG\_LWIP\_DNS\_MAX\_SERVERS**

Maximum number of DNS servers

*Found in:* [Component config](#) > [LWIP](#) > [DNS](#)

Set maximum number of DNS servers. If fallback DNS servers are supported, the number of DNS servers needs to be greater than or equal to 3.

**Range:**

- from 1 to 4

**Default value:**

- 3

### **CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_SUPPORT**

Enable DNS fallback server support

*Found in:* [Component config](#) > [LWIP](#) > [DNS](#)

Enable this feature to support DNS fallback server.

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_ADDRESS**

DNS fallback server address

*Found in:* [Component config](#) > [LWIP](#) > [DNS](#) > [CONFIG\\_LWIP\\_FALLBACK\\_DNS\\_SERVER\\_SUPPORT](#)

This option allows you to config dns fallback server address.

**Default value:**

- “114.114.114.114” if [CONFIG\\_LWIP\\_FALLBACK\\_DNS\\_SERVER\\_SUPPORT](#)

### **CONFIG\_LWIP\_ESP\_LWIP\_ASSERT**

Enable LWIP ASSERT checks

*Found in:* [Component config](#) > [LWIP](#)

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled.

If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

**Default value:**

- Yes (enabled) if [COMPILER\\_OPTIMIZATION\\_ASSERTIONS\\_DISABLE](#)

**Hooks** Contains:

- [CONFIG\\_LWIP\\_HOOK\\_ND6\\_GET\\_GW](#)
- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_ROUTE](#)
- [CONFIG\\_LWIP\\_HOOK\\_NETCONN\\_EXTERNAL\\_RESOLVE](#)
- [CONFIG\\_LWIP\\_HOOK\\_TCP\\_ISN](#)

## CONFIG\_LWIP\_HOOK\_TCP\_ISN

TCP ISN Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (*tcp\_next\_iss*) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to `LWIP_HOOK_TCP_ISN_CUSTOM` to provide custom implementation. Set to `LWIP_HOOK_TCP_ISN_NONE` to use lwIP implementation.

**Available options:**

- No hook declared (`LWIP_HOOK_TCP_ISN_NONE`)
- Default implementation (`LWIP_HOOK_TCP_ISN_DEFAULT`)
- Custom implementation (`LWIP_HOOK_TCP_ISN_CUSTOM`)

## CONFIG\_LWIP\_HOOK\_IP6\_ROUTE

IPv6 route Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (`LWIP_HOOK_IP6_ROUTE_NONE`)
- Default (weak) implementation (`LWIP_HOOK_IP6_ROUTE_DEFAULT`)
- Custom implementation (`LWIP_HOOK_IP6_ROUTE_CUSTOM`)

## CONFIG\_LWIP\_HOOK\_ND6\_GET\_GW

IPv6 get gateway Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (`LWIP_HOOK_ND6_GET_GW_NONE`)
- Default (weak) implementation (`LWIP_HOOK_ND6_GET_GW_DEFAULT`)
- Custom implementation (`LWIP_HOOK_ND6_GET_GW_CUSTOM`)

## CONFIG\_LWIP\_HOOK\_NETCONN\_EXTERNAL\_RESOLVE

Netconn external resolve Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (`LWIP_HOOK_NETCONN_EXT_RESOLVE_NONE`)
- Default (weak) implementation (`LWIP_HOOK_NETCONN_EXT_RESOLVE_DEFAULT`)
- Custom implementation (`LWIP_HOOK_NETCONN_EXT_RESOLVE_CUSTOM`)

## CONFIG\_LWIP\_DEBUG

Enable LWIP Debug

*Found in:* [Component config](#) > [LWIP](#)

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_API\\_LIB\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DHCP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DHCP\\_STATE\\_DEBUG](#)
- [CONFIG\\_LWIP\\_ETHARP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_ICMP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_ICMP6\\_DEBUG](#)
- [CONFIG\\_LWIP\\_IP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_IP6\\_DEBUG](#)
- [CONFIG\\_LWIP\\_NETIF\\_DEBUG](#)
- [CONFIG\\_LWIP\\_PBUF\\_DEBUG](#)
- [CONFIG\\_LWIP\\_SNTP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_SOCKETS\\_DEBUG](#)
- [CONFIG\\_LWIP\\_TCP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DEBUG\\_ESP\\_LOG](#)

## CONFIG\_LWIP\_DEBUG\_ESP\_LOG

Route LWIP debugs through ESP\_LOG interface

*Found in:* [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_DEBUG](#)

Enabling this option routes all enabled LWIP debugs through ESP\_LOGD.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

## CONFIG\_LWIP\_NETIF\_DEBUG

Enable netif debug messages

*Found in:* [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_DEBUG](#)

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

## CONFIG\_LWIP\_PBUF\_DEBUG

Enable pbuf debug messages

*Found in:* [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_DEBUG](#)

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

## CONFIG\_LWIP\_ETHARP\_DEBUG

Enable etharp debug messages

*Found in:* [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_DEBUG](#)

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG\_LWIP\_API\_LIB\_DEBUG**

Enable api lib debug messages

*Found in: `Component config > LWIP > CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG\_LWIP\_SOCKETS\_DEBUG**

Enable socket debug messages

*Found in: `Component config > LWIP > CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG\_LWIP\_IP\_DEBUG**

Enable IP debug messages

*Found in: `Component config > LWIP > CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG\_LWIP\_ICMP\_DEBUG**

Enable ICMP debug messages

*Found in: `Component config > LWIP > CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG` && `CONFIG_LWIP_ICMP`

**CONFIG\_LWIP\_DHCP\_STATE\_DEBUG**

Enable DHCP state tracking

*Found in: `Component config > LWIP > CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG\_LWIP\_DHCP\_DEBUG**

Enable DHCP debug messages

*Found in: `Component config > LWIP > CONFIG_LWIP_DEBUG`*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG\_LWIP\_IP6\_DEBUG**

Enable IP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_ICMP6\_DEBUG**

Enable ICMP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_TCP\_DEBUG**

Enable TCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**CONFIG\_LWIP\_SNTP\_DEBUG**

Enable SNTP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**mbedTLS** Contains:

- *CONFIG\_MBEDTLS\_ASYMMETRIC\_CONTENT\_LEN*
- *Certificate Bundle*
- *Certificates*
- *CONFIG\_MBEDTLS\_CHACHA20\_C*
- *CONFIG\_MBEDTLS\_ECP\_C*
- *CONFIG\_MBEDTLS\_CMAC\_C*
- *CONFIG\_MBEDTLS\_ECDSA\_DETERMINISTIC*
- *CONFIG\_MBEDTLS\_HARDWARE\_AES*
- *CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN*
- *CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY*
- *CONFIG\_MBEDTLS\_HARDWARE\_MPI*
- *CONFIG\_MBEDTLS\_HARDWARE\_SHA*
- *CONFIG\_MBEDTLS\_DEBUG*
- *CONFIG\_MBEDTLS\_ECP\_RESTARTABLE*
- *CONFIG\_MBEDTLS\_HAVE\_TIME*
- *CONFIG\_MBEDTLS\_RIPEMD160\_C*

- [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)

### CONFIG\_MBEDTLS\_MEM\_ALLOC\_MODE

Memory allocation strategy

Found in: [Component config > mbedTLS](#)

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls\_platform\_set\_malloc\_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

#### Available options:

- Internal memory (MBEDTLS\_INTERNAL\_MEM\_ALLOC)
- External SPIRAM (MBEDTLS\_EXTERNAL\_MEM\_ALLOC)
- Default alloc mode (MBEDTLS\_DEFAULT\_MEM\_ALLOC)
- Custom alloc mode (MBEDTLS\_CUSTOM\_MEM\_ALLOC)
- Internal IRAM (MBEDTLS\_IRAM\_8BIT\_MEM\_ALLOC)

Allows to use IRAM memory region as 8bit accessible region.

TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### CONFIG\_MBEDTLS\_SSL\_MAX\_CONTENT\_LEN

TLS maximum message content length

Found in: [Component config > mbedTLS](#)

Maximum TLS message length (in bytes) supported by mbedTLS.

16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (`max_fragment_length`, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of `MBEDTLS_ERR_SSL_INVALID_RECORD` (-0x7200).

**Range:**

- from 512 to 16384

**Default value:**

- 16384

### **CONFIG\_MBEDTLS\_ASYMMETRIC\_CONTENT\_LEN**

Asymmetric in/out fragment length

*Found in:* [Component config](#) > [mbedtls](#)

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_SSL\_IN\_CONTENT\_LEN**

TLS maximum incoming fragment length

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)

This defines maximum incoming fragment length, overriding default maximum content length (`MBEDTLS_SSL_MAX_CONTENT_LEN`).

**Range:**

- from 512 to 16384

**Default value:**

- 16384

### **CONFIG\_MBEDTLS\_SSL\_OUT\_CONTENT\_LEN**

TLS maximum outgoing fragment length

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)

This defines maximum outgoing fragment length, overriding default maximum content length (`MBEDTLS_SSL_MAX_CONTENT_LEN`).

**Range:**

- from 512 to 16384

**Default value:**

- 4096

### **CONFIG\_MBEDTLS\_DYNAMIC\_BUFFER**

Using dynamic TX/RX buffer

*Found in:* [Component config](#) > [mbedtls](#)

Using dynamic TX/RX buffer. After enabling this option, mbedtls will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS\_SSL\_OUT\_CONTENT\_LEN” or “MBEDTLS\_SSL\_IN\_CONTENT\_LEN” , so to save more heap, users can set the options to be an appropriate value.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS` && `CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH`

**CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_PEER\_CERT**

Free SSL peer certificate after its usage

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER`

Free peer certificate after its usage in handshake process.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

**CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CONFIG\_DATA**

Free private key and DHM data after its usage

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER`

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

**CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CA\_CERT**

Free SSL CA certificate after its usage

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER > CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA`

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA`

**CONFIG\_MBEDTLS\_DEBUG**

Enable mbedTLS debugging

*Found in:* `Component config > mbedTLS`

Enable mbedTLS debugging functions at compile time.

If this option is enabled, you can include “mbedtls/esp\_debug.h” and call `mbedtls_esp_enable_debug_log()` at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

**Default value:**

- No (disabled)

## CONFIG\_MBEDTLS\_DEBUG\_LEVEL

Set mbedTLS debugging level

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_DEBUG](#)*

Set mbedTLS debugging level

### Available options:

- Warning (MBEDTLS\_DEBUG\_LEVEL\_WARN)
- Info (MBEDTLS\_DEBUG\_LEVEL\_INFO)
- Debug (MBEDTLS\_DEBUG\_LEVEL\_DEBUG)
- Verbose (MBEDTLS\_DEBUG\_LEVEL\_VERBOSE)

### mbedtls v2.28.x related Contains:

- [DTLS-based configurations](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_CONTEXT\\_SERIALIZATION](#)
- [CONFIG\\_MBEDTLS\\_X509\\_TRUSTED\\_CERT\\_CALLBACK](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_KEEP\\_PEER\\_CERTIFICATE](#)
- [CONFIG\\_MBEDTLS\\_ECDH\\_LEGACY\\_CONTEXT](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_VARIABLE\\_BUFFER\\_LENGTH](#)

## CONFIG\_MBEDTLS\_SSL\_VARIABLE\_BUFFER\_LENGTH

Variable SSL buffer length

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#)*

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

### Default value:

- No (disabled)

## CONFIG\_MBEDTLS\_ECDH\_LEGACY\_CONTEXT

Use a backward compatible ECDH context (Experimental)

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#)*

Use the legacy ECDH context format. Define this option only if you enable MBEDTLS\_ECP\_RESTARTABLE or if you want to access ECDH context fields directly.

### Default value:

- Yes (enabled) if `CONFIG_MBEDTLS_ECDH_C` && `CONFIG_MBEDTLS_ECP_RESTARTABLE`

## CONFIG\_MBEDTLS\_X509\_TRUSTED\_CERT\_CALLBACK

Enable trusted certificate callbacks

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#)*

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedtls documentation for required API and more details.

### Default value:

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_CONTEXT\_SERIALIZATION

Enable serialization of the TLS context structures

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#)*

Enable serialization of the TLS context structures This is a local optimization in handling a single, potentially long-lived connection.

See mbedtls documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_KEEP\_PEER\_CERTIFICATE

Keep peer certificate after handshake completion

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#)*

Keep the peer's certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedtls documentation for required API and more details.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_FREE\\_PEER\\_CERT](#)

**DTLS-based configurations** Contains:

- [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_SRTP](#)
- [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

### CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID

Support for the DTLS Connection ID extension

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#)*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport. The Connection ID extension is still in draft state. Refer: version draft-ietf-tls-dtls-connection-id-05

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_DTLS](#)

### CONFIG\_MBEDTLS\_SSL\_CID\_IN\_LEN\_MAX

Maximum length of CIDs used for incoming DTLS messages

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#) > [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)*

Maximum length of CIDs used for incoming DTLS messages

**Range:**

- from 0 to 32 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

**Default value:**

- 32 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

### CONFIG\_MBEDTLS\_SSL\_CID\_OUT\_LEN\_MAX

Maximum length of CIDs used for outgoing DTLS messages

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#) > [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)*

Maximum length of CIDs used for outgoing DTLS messages

**Range:**

- from 0 to 32 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

**Default value:**

- 32 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

### CONFIG\_MBEDTLS\_SSL\_CID\_PADDING\_GRANULARITY

Record plaintext padding (for DTLS 1.2)

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#) > [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)*

Controls the use of record plaintext padding when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**

- from 0 to 32 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

**Default value:**

- 16 if [CONFIG\\_MBEDTLS\\_SSL\\_DTLS\\_CONNECTION\\_ID](#)

### CONFIG\_MBEDTLS\_SSL\_DTLS\_SRTP

Enable support for negotiation of DTLS-SRTP (RFC 5764)

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v2.28.x related](#) > [DTLS-based configurations](#)*

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use\_srtp extension.

See mbedtls documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_DTLS](#)

**Certificate Bundle** Contains:

- [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

### CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE

Enable trusted root certificate bundle

*Found in: [Component config](#) > [mbedtls](#) > [Certificate Bundle](#)*

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**

- Yes (enabled)

## CONFIG\_MBEDTLS\_DEFAULT\_CERTIFICATE\_BUNDLE

Default certificate bundle options

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

### Available options:

- Use the full default certificate bundle (MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_FULL)
- Use only the most common certificates from the default bundles (MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_CMN)  
Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (MBEDTLS\_CERTIFICATE\_BUNDLE\_DEFAULT\_NONE)

## CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE

Add custom certificates to the default bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

### Default value:

- No (disabled)

## CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE\_PATH

Custom certificate bundle path

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#) > [CONFIG\\_MBEDTLS\\_CUSTOM\\_CERTIFICATE\\_BUNDLE](#)

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

## CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE\_MAX\_CERTS

Maximum no of certificates allowed in certificate bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

### Default value:

- 200

## CONFIG\_MBEDTLS\_ECP\_RESTARTABLE

Enable mbedtls ecp restartable

*Found in:* [Component config](#) > [mbedtls](#)

Enable “non-blocking” ECC operations that can return early and be resumed.

### Default value:

- No (disabled)

## CONFIG\_MBEDTLS\_CMAC\_C

Enable CMAC mode for block ciphers

*Found in:* [Component config](#) > [mbedtls](#)

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

### Default value:

- No (disabled)

### CONFIG\_MBEDTLS\_HARDWARE\_AES

Enable hardware AES acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

**Default value:**

- Yes (enabled) if SPIRAM\_CACHE\_WORKAROUND\_STRATEGY\_DUPLDST

### CONFIG\_MBEDTLS\_AES\_USE\_INTERRUPT

Use interrupt for long AES operations

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)*

Use an interrupt to coordinate long AES operations.

This allows other code to run on the CPU while an AES operation is pending. Otherwise the CPU busy-waits.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_HARDWARE\_MPI

Enable hardware MPI (bignum) acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC\_RSA\_MAX\_BIT\_LEN bit results.

These operations are used by RSA.

**Default value:**

- Yes (enabled) if SPIRAM\_CACHE\_WORKAROUND\_STRATEGY\_DUPLDST

### CONFIG\_MBEDTLS\_HARDWARE\_SHA

Enable hardware SHA acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedtls.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**Default value:**

- Yes (enabled) if SPIRAM\_CACHE\_WORKAROUND\_STRATEGY\_DUPLDST

### CONFIG\_MBEDTLS\_ROM\_MD5

Use MD5 implementation in ROM

*Found in: [Component config](#) > [mbedtls](#)*

Use ROM MD5 in mbedtls.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY

Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HAVE\_TIME

Enable mbedtls time support

*Found in: [Component config](#) > [mbedtls](#)*

Enable use of time.h functions (time() and gmtime()) by mbedtls.

This option doesn't require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn't call any standard timekeeping functions.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_HAVE\_TIME\_DATE

Enable mbedtls certificate expiry check

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)*

Enables X.509 certificate expiry checks in mbedtls.

If this option is disabled (default) then X.509 certificate "valid from" and "valid to" timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS\_X509\_BADCERT\_FUTURE or MBEDTLS\_X509\_BADCERT\_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF's SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_ECDSA\_DETERMINISTIC**

Enable deterministic ECDSA

*Found in: [Component config](#) > [mbedtls](#)*

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_SHA512\_C**

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: [Component config](#) > [mbedtls](#)*

Enable MBEDTLS\_SHA512\_C adds support for SHA-384 and SHA-512.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_TLS\_MODE**

TLS Protocol Role

*Found in: [Component config](#) > [mbedtls](#)*

mbedtls can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

**Available options:**

- Server & Client (MBEDTLS\_TLS\_SERVER\_AND\_CLIENT)
- Server (MBEDTLS\_TLS\_SERVER\_ONLY)
- Client (MBEDTLS\_TLS\_CLIENT\_ONLY)
- None (MBEDTLS\_TLS\_DISABLED)

### **TLS Key Exchange Methods** Contains:

- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_DHE\\_RSA](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ECJPAKE](#)
- [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_RSA](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

### CONFIG\_MBEDTLS\_PSK\_MODES

Enable pre-shared-key ciphersuites

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_PSK

Enable PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_PSK

Enable DHE-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_PSK

Enable ECDHE-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#) && [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA\_PSK

Enable RSA-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA

Enable RSA-only based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to support ciphersuites with prefix TLS-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_RSA

Enable DHE-RSA based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE

Support Elliptic Curve based ciphersuites

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)*

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_RSA

Enable ECDHE-RSA based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_ECDSA

Enable ECDHE-ECDSA based ciphersuite modes

*Found in: [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_ECDSA

Enable ECDH-ECDSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_RSA

Enable ECDH-RSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECJPAKE

Enable ECJPAKE based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_ECJPAKE\\_C](#) && [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_SECP256R1\\_ENABLED](#)

### CONFIG\_MBEDTLS\_SSL\_RENEGOTIATION

Support TLS renegotiation

*Found in:* [Component config](#) > [mbedtls](#)

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don't need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_SSL3

Legacy SSL 3.0 support

*Found in:* [Component config](#) > [mbedtls](#)

Support the legacy SSL 3.0 protocol. Most servers will speak a newer TLS protocol these days.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1**

Support TLS 1.0 protocol

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_1**

Support TLS 1.1 protocol

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_2**

Support TLS 1.2 protocol

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_SSL\_PROTO\_GMTSSL1\_1**

Support GM/T SSL 1.1 protocol

*Found in: [Component config](#) > [mbedtls](#)*

Provisions for GM/T SSL 1.1 support

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_SSL\_PROTO\_DTLS**

Support DTLS protocol (all versions)

*Found in: [Component config](#) > [mbedtls](#)*

Requires TLS 1.1 to be enabled for DTLS 1.0 Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_SSL\_ALPN**

Support ALPN (Application Layer Protocol Negotiation)

*Found in: [Component config](#) > [mbedtls](#)*

Disabling this option will save some code size if it is not needed.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_CLIENT\_SSL\_SESSION\_TICKETS

TLS: Client Support for RFC 5077 SSL session tickets

*Found in: [Component config > mbedTLS](#)*

Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_X509\_CHECK\_KEY\_USAGE

Enable verification of the keyUsage extension

*Found in: [Component config > mbedTLS](#)*

Disabling this avoids problems with mis-issued and/or misused (intermediate) CA and leaf certificates. Depending on your PKI use, disabling this can be a security risk.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_X509\_CHECK\_EXTENDED\_KEY\_USAGE

Enable verification of the extendedKeyUsage extension

*Found in: [Component config > mbedTLS](#)*

Disabling this avoids problems with mis-issued and/or misused certificates. Depending on your PKI use, disabling this can be a security risk.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SERVER\_SSL\_SESSION\_TICKETS

TLS: Server Support for RFC 5077 SSL session tickets

*Found in: [Component config > mbedTLS](#)*

Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### Symmetric Ciphers Contains:

- [CONFIG\\_MBEDTLS\\_AES\\_C](#)
- [CONFIG\\_MBEDTLS\\_BLOWFISH\\_C](#)
- [CONFIG\\_MBEDTLS\\_CAMELLIA\\_C](#)
- [CONFIG\\_MBEDTLS\\_CCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_DES\\_C](#)
- [CONFIG\\_MBEDTLS\\_GCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_NIST\\_KW\\_C](#)
- [CONFIG\\_MBEDTLS\\_RC4\\_MODE](#)
- [CONFIG\\_MBEDTLS\\_XTEA\\_C](#)

### CONFIG\_MBEDTLS\_AES\_C

AES block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_CAMELLIA\_C

Camellia block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_DES\_C

DES block cipher (legacy, insecure)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_RC4\_MODE

RC4 Stream Cipher (legacy, insecure)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

ARCFOUR (RC4) stream cipher can be disabled entirely, enabled but not added to default ciphersuites, or enabled completely.

Please consider the security implications before enabling RC4.

**Available options:**

- Disabled (MBEDTLS\_RC4\_DISABLED)
- Enabled, not in default ciphersuites (MBEDTLS\_RC4\_ENABLED\_NO\_DEFAULT)
- Enabled (MBEDTLS\_RC4\_ENABLED)

### CONFIG\_MBEDTLS\_BLOWFISH\_C

Blowfish block cipher (read help)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedtls TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_XTEA\_C**

XTEA block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the XTEA block cipher.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CCM\_C**

CCM (Counter with CBC-MAC) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_GCM\_C**

GCM (Galois/Counter) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_NIST\_KW\_C**

NIST key wrapping (KW) and KW padding (KWP)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable NIST key wrapping and key wrapping padding.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_RIPEMD160\_C**

Enable RIPEMD-160 hash algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable the RIPEMD-160 hash algorithm.

**Default value:**

- No (disabled)

**Certificates** Contains:

- [CONFIG\\_MBEDTLS\\_PEM\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_PEM\\_WRITE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CRL\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CSR\\_PARSE\\_C](#)

**CONFIG\_MBEDTLS\_PEM\_PARSE\_C**

Read & Parse PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_PEM\_WRITE\_C**

Write PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_X509\_CRL\_PARSE\_C**

X.509 CRL parsing

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Support for parsing X.509 Certificate Revocation Lists.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_X509\_CSR\_PARSE\_C**

X.509 CSR parsing

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Support for parsing X.509 Certificate Signing Requests

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECP\_C**

Elliptic Curve Ciphers

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

Contains:

- [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)
- [CONFIG\\_MBEDTLS\\_ECJPAKE\\_C](#)
- [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_BP256R1\\_ENABLED](#)
- [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_BP384R1\\_ENABLED](#)
- [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_BP512R1\\_ENABLED](#)
- [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_CURVE25519\\_ENABLED](#)
- [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_SECP192K1\\_ENABLED](#)
- [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_SECP192R1\\_ENABLED](#)

- `CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_NIST_OPTIM`

### **CONFIG\_MBEDTLS\_ECDH\_C**

Elliptic Curve Diffie-Hellman (ECDH)

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_ECDSA\_C**

Elliptic Curve DSA

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C > CONFIG_MBEDTLS_ECDH_C`

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_ECJPAKE\_C**

Elliptic curve J-PAKE

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP192R1\_ENABLED**

Enable SECP192R1 curve

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

Enable support for SECP192R1 Elliptic Curve.

**Default value:**

- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP224R1\_ENABLED**

Enable SECP224R1 curve

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

Enable support for SECP224R1 Elliptic Curve.

**Default value:**

- Yes (enabled) if `(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C`

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP256R1\_ENABLED**

Enable SECP256R1 curve

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_ECP\_C*

Enable support for SECP256R1 Elliptic Curve.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP384R1\_ENABLED**

Enable SECP384R1 curve

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_ECP\_C*

Enable support for SECP384R1 Elliptic Curve.

**Default value:**

- Yes (enabled) if  $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \parallel \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \&\& \text{CONFIG\_MBEDTLS\_ECP\_C}$

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP521R1\_ENABLED**

Enable SECP521R1 curve

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_ECP\_C*

Enable support for SECP521R1 Elliptic Curve.

**Default value:**

- Yes (enabled) if  $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \parallel \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \&\& \text{CONFIG\_MBEDTLS\_ECP\_C}$

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP192K1\_ENABLED**

Enable SECP192K1 curve

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_ECP\_C*

Enable support for SECP192K1 Elliptic Curve.

**Default value:**

- Yes (enabled) if  $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \parallel \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \&\& \text{CONFIG\_MBEDTLS\_ECP\_C}$

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP224K1\_ENABLED**

Enable SECP224K1 curve

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_ECP\_C*

Enable support for SECP224K1 Elliptic Curve.

**Default value:**

- Yes (enabled) if  $(\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \parallel \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \&\& \text{CONFIG\_MBEDTLS\_ECP\_C}$

**CONFIG\_MBEDTLS\_ECP\_DP\_SECP256K1\_ENABLED**

Enable SECP256K1 curve

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_ECP\_C*

Enable support for SECP256K1 Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

**CONFIG\_MBEDTLS\_ECP\_DP\_BP256R1\_ENABLED**

Enable BP256R1 curve

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

support for DP Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

**CONFIG\_MBEDTLS\_ECP\_DP\_BP384R1\_ENABLED**

Enable BP384R1 curve

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

support for DP Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

**CONFIG\_MBEDTLS\_ECP\_DP\_BP512R1\_ENABLED**

Enable BP512R1 curve

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

support for DP Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

**CONFIG\_MBEDTLS\_ECP\_DP\_CURVE25519\_ENABLED**

Enable CURVE25519 curve

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

Enable support for CURVE25519 Elliptic Curve.

**Default value:**

- Yes (enabled) if (`CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN` || `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`) && `CONFIG_MBEDTLS_ECP_C`

**CONFIG\_MBEDTLS\_ECP\_NIST\_OPTIM**

NIST ‘modulo p’ optimisations

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_ECP_C`

NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.

Disabling this option saves some code size.

# end of Elliptic Curve options

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_POLY1305\_C**

Poly1305 MAC algorithm

*Found in:* [Component config > mbedTLS](#)

Enable support for Poly1305 MAC algorithm.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CHACHA20\_C**

Chacha20 stream cipher

*Found in:* [Component config > mbedTLS](#)

Enable support for Chacha20 stream cipher.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CHACHAPOLY\_C**

ChaCha20-Poly1305 AEAD algorithm

*Found in:* [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_CHACHA20\\_C](#)

Enable support for ChaCha20-Poly1305 AEAD algorithm.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_CHACHA20_C` && `CONFIG_MBEDTLS_POLY1305_C`

**CONFIG\_MBEDTLS\_HKDF\_C**

HKDF algorithm (RFC 5869)

*Found in:* [Component config > mbedTLS](#)

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_THREADING\_C**

Enable the threading abstraction layer

*Found in:* [Component config > mbedTLS](#)

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_THREADING\_ALT**

Enable threading alternate implementation

*Found in:* [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_THREADING\\_C](#)

Enable threading alt to allow your own alternate threading implementation.

**Default value:**

- Yes (enabled) if *CONFIG\_MBEDTLS\_THREADING\_C*

### **CONFIG\_MBEDTLS\_THREADING\_PTHREAD**

Enable threading pthread implementation

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_THREADING\_C*

Enable the pthread wrapper layer for the threading layer.

**Default value:**

- No (disabled) if *CONFIG\_MBEDTLS\_THREADING\_C*

### **CONFIG\_MBEDTLS\_LARGE\_KEY\_SOFTWARE\_MPI**

Fallback to software implementation for larger MPI values

*Found in: Component config > mbedTLS*

Fallback to software implementation for RSA key lengths larger than *SOC\_RSA\_MAX\_BIT\_LEN*. If this is not active then the ESP will be unable to process keys greater than *SOC\_RSA\_MAX\_BIT\_LEN*.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_SECURITY\_RISKS**

Show configurations with potential security risks

*Found in: Component config > mbedTLS*

**Default value:**

- No (disabled)

Contains:

- *CONFIG\_MBEDTLS\_ALLOW\_UNSUPPORTED\_CRITICAL\_EXT*

### **CONFIG\_MBEDTLS\_ALLOW\_UNSUPPORTED\_CRITICAL\_EXT**

X.509 CRT parsing with unsupported critical extensions

*Found in: Component config > mbedTLS > CONFIG\_MBEDTLS\_SECURITY\_RISKS*

Allow the X.509 certificate parser to load certificates with unsupported critical extensions

**Default value:**

- No (disabled) if *CONFIG\_MBEDTLS\_SECURITY\_RISKS*

**mDNS** Contains:

- *CONFIG\_MDNS\_MAX\_SERVICES*
- *CONFIG\_MDNS\_SERVICE\_ADD\_TIMEOUT\_MS*
- *CONFIG\_MDNS\_STRICT\_MODE*
- *CONFIG\_MDNS\_TASK\_AFFINITY*
- *CONFIG\_MDNS\_TASK\_PRIORITY*
- *CONFIG\_MDNS\_TASK\_STACK\_SIZE*
- *CONFIG\_MDNS\_TIMER\_PERIOD\_MS*
- *CONFIG\_MDNS\_MULTIPLE\_INSTANCE*
- *CONFIG\_MDNS\_NETWORKING\_SOCKET*

### CONFIG\_MDNS\_MAX\_SERVICES

Max number of services

*Found in: [Component config](#) > [mDNS](#)*

Services take up a certain amount of memory, and allowing fewer services to be open at the same time conserves memory. Specify the maximum amount of services here. The valid value is from 1 to 64.

**Range:**

- from 1 to 64

**Default value:**

- 10

### CONFIG\_MDNS\_TASK\_PRIORITY

mDNS task priority

*Found in: [Component config](#) > [mDNS](#)*

Allows setting mDNS task priority. Please do not set the task priority higher than priorities of system tasks. Compile time warning/error would be emitted if the chosen task priority were too high.

**Range:**

- from 1 to 255

**Default value:**

- 1

### CONFIG\_MDNS\_TASK\_STACK\_SIZE

mDNS task stack size

*Found in: [Component config](#) > [mDNS](#)*

Allows setting mDNS task stacksize.

**Default value:**

- 4096

### CONFIG\_MDNS\_TASK\_AFFINITY

mDNS task affinity

*Found in: [Component config](#) > [mDNS](#)*

Allows setting mDNS tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU.

**Available options:**

- No affinity (MDNS\_TASK\_AFFINITY\_NO\_AFFINITY)
- CPU0 (MDNS\_TASK\_AFFINITY\_CPU0)
- CPU1 (MDNS\_TASK\_AFFINITY\_CPU1)

### CONFIG\_MDNS\_SERVICE\_ADD\_TIMEOUT\_MS

mDNS adding service timeout (ms)

*Found in: [Component config](#) > [mDNS](#)*

Configures timeout for adding a new mDNS service. Adding a service fails if could not be completed within this time.

**Range:**

- from 10 to 30000

**Default value:**

- 2000

### CONFIG\_MDNS\_STRICT\_MODE

mDNS strict mode

*Found in: [Component config](#) > [mDNS](#)*

Configures strict mode. Set this to 1 for the mDNS library to strictly follow the RFC6762: Currently the only strict feature: Do not repeat original questions in response packets (defined in RFC6762 sec. 6). Default configuration is 0, i.e. non-strict mode, since some implementations, such as lwIP mdns resolver (used by standard POSIX API like getaddrinfo, gethostbyname) could not correctly resolve advertised names.

**Default value:**

- No (disabled)

### CONFIG\_MDNS\_TIMER\_PERIOD\_MS

mDNS timer period (ms)

*Found in: [Component config](#) > [mDNS](#)*

Configures period of mDNS timer, which periodically transmits packets and schedules mDNS searches.

**Range:**

- from 10 to 10000

**Default value:**

- 100

### CONFIG\_MDNS\_NETWORKING\_SOCKET

Use BSD sockets for mdns networking

*Found in: [Component config](#) > [mDNS](#)*

Enables optional mdns networking implementation using BSD sockets in UDP multicast mode. This option creates a new thread to serve receiving packets (TODO). This option uses additional N sockets, where N is number of interfaces.

**Default value:**

- No (disabled)

### CONFIG\_MDNS\_MULTIPLE\_INSTANCE

Multiple instances under the same service type

*Found in: [Component config](#) > [mDNS](#)*

Enables adding multiple service instances under the same service type.

**Default value:**

- Yes (enabled)

### ESP-MQTT Configurations

 Contains:

- [CONFIG\\_MQTT\\_CUSTOM\\_OUTBOX](#)
- [CONFIG\\_MQTT\\_TRANSPORT\\_SSL](#)
- [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)
- [CONFIG\\_MQTT\\_PROTOCOL\\_311](#)
- [CONFIG\\_MQTT\\_TASK\\_CORE\\_SELECTION\\_ENABLED](#)
- [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)
- [CONFIG\\_MQTT\\_OUTBOX\\_EXPIRED\\_TIMEOUT\\_MS](#)

- [\*CONFIG\\_MQTT\\_REPORT\\_DELETED\\_MESSAGES\*](#)
- [\*CONFIG\\_MQTT\\_SKIP\\_PUBLISH\\_IF\\_DISCONNECTED\*](#)
- [\*CONFIG\\_MQTT\\_MSG\\_ID\\_INCREMENTAL\*](#)

### **CONFIG\_MQTT\_PROTOCOL\_311**

Enable MQTT protocol 3.1.1

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

If not, this library will use MQTT protocol 3.1

**Default value:**

- Yes (enabled)

### **CONFIG\_MQTT\_TRANSPORT\_SSL**

Enable MQTT over SSL

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Enable MQTT transport over SSL with mbedtls

**Default value:**

- Yes (enabled)

### **CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET**

Enable MQTT over Websocket

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Enable MQTT transport over Websocket.

**Default value:**

- Yes (enabled)

### **CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET\_SECURE**

Enable MQTT over Websocket Secure

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)*

Enable MQTT transport over Websocket Secure.

**Default value:**

- Yes (enabled)

### **CONFIG\_MQTT\_MSG\_ID\_INCREMENTAL**

Use Incremental Message Id

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED

Skip publish if disconnected

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_REPORT\_DELETED\_MESSAGES

Report deleted messages

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG

MQTT Using custom configurations

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Custom MQTT configurations.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_TCP\_DEFAULT\_PORT

Default MQTT over TCP port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over TCP port

**Default value:**

- 1883 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_SSL\_DEFAULT\_PORT

Default MQTT over SSL port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over SSL port

**Default value:**

- 8883 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_SSL](#)

### CONFIG\_MQTT\_WS\_DEFAULT\_PORT

Default MQTT over Websocket port

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default MQTT over Websocket port

**Default value:**

- 80 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET`

### CONFIG\_MQTT\_WSS\_DEFAULT\_PORT

Default MQTT over Websocket Secure port

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default MQTT over Websocket Secure port

**Default value:**

- 443 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET` && `CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE`

### CONFIG\_MQTT\_BUFFER\_SIZE

Default MQTT Buffer Size

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

This buffer size using for both transmit and receive

**Default value:**

- 1024 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

### CONFIG\_MQTT\_TASK\_STACK\_SIZE

MQTT task stack size

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

MQTT task stack size

**Default value:**

- 6144 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

### CONFIG\_MQTT\_DISABLE\_API\_LOCKS

Disable API locks

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn't access MQTT API from multiple concurrent tasks

**Default value:**

- No (disabled) if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

### CONFIG\_MQTT\_TASK\_PRIORITY

MQTT task priority

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

MQTT task priority. Higher number denotes higher priority.

**Default value:**

- 5 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

### **CONFIG\_MQTT\_TASK\_CORE\_SELECTION\_ENABLED**

Enable MQTT task core selection

*Found in: Component config > ESP-MQTT Configurations*

This will enable core selection

**Default value:**

- “false”

### **CONFIG\_MQTT\_TASK\_CORE\_SELECTION**

Core to use ?

*Found in: Component config > ESP-MQTT Configurations > CONFIG\_MQTT\_TASK\_CORE\_SELECTION\_ENABLED*

**Available options:**

- Core 0 (MQTT\_USE\_CORE\_0)
- Core 1 (MQTT\_USE\_CORE\_1)

### **CONFIG\_MQTT\_CUSTOM\_OUTBOX**

Enable custom outbox implementation

*Found in: Component config > ESP-MQTT Configurations*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar).

**Default value:**

- No (disabled)

### **CONFIG\_MQTT\_OUTBOX\_EXPIRED\_TIMEOUT\_MS**

Outbox message expired timeout[ms]

*Found in: Component config > ESP-MQTT Configurations*

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**

- 30000 if *CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG*

**Newlib** Contains:

- *CONFIG\_NEWLIB\_NANO\_FORMAT*
- *CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING*
- *CONFIG\_NEWLIB\_STDOUT\_LINE\_ENDING*

### **CONFIG\_NEWLIB\_STDOUT\_LINE\_ENDING**

Line ending for UART output

*Found in: Component config > Newlib*

This option allows configuring the desired line endings sent to UART when a newline ( ‘n’ , LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR

LF: no modification is applied, stdout is sent as is

CR: each occurrence of LF is replaced with CR

This option doesn't affect behavior of the UART driver (drivers/uart.h).

**Available options:**

- CRLF (NEWLIB\_STDOUT\_LINE\_ENDING\_CRLF)
- LF (NEWLIB\_STDOUT\_LINE\_ENDING\_LF)
- CR (NEWLIB\_STDOUT\_LINE\_ENDING\_CR)

## CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING

Line ending for UART input

*Found in: [Component config](#) > [Newlib](#)*

This option allows configuring which input sequence on UART produces a newline ( 'n' , LF) on stdin. Three options are possible:

CRLF: CRLF is converted to LF

LF: no modification is applied, input is sent to stdin as is

CR: each occurrence of CR is replaced with LF

This option doesn't affect behavior of the UART driver (drivers/uart.h).

**Available options:**

- CRLF (NEWLIB\_STDIN\_LINE\_ENDING\_CRLF)
- LF (NEWLIB\_STDIN\_LINE\_ENDING\_LF)
- CR (NEWLIB\_STDIN\_LINE\_ENDING\_CR)

## CONFIG\_NEWLIB\_NANO\_FORMAT

Enable 'nano' formatting options for printf/scanf family

*Found in: [Component config](#) > [Newlib](#)*

ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called "nano" formatting option. This option doesn't support 64-bit integer formats and C99 features, such as positional arguments.

For more details about "nano" formatting option, please see newlib readme file, search for 'enable-newlib-nano-formatted-io' : <https://sourceware.org/newlib/README>

If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

**Default value:**

- No (disabled)

**NVS** Contains:

- [CONFIG\\_NVS\\_ENCRYPTION](#)
- [CONFIG\\_NVS\\_COMPATIBLE\\_PRE\\_V4\\_3\\_ENCRYPTION\\_FLAG](#)
- [CONFIG\\_NVS\\_ASSERT\\_ERROR\\_CHECK](#)

### CONFIG\_NVS\_ENCRYPTION

Enable NVS encryption

Found in: *Component config > NVS*

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

**Default value:**

- Yes (enabled) if *CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

### CONFIG\_NVS\_COMPATIBLE\_PRE\_V4\_3\_ENCRYPTION\_FLAG

NVS partition encrypted flag compatible with ESP-IDF before v4.3

Found in: *Component config > NVS*

Enabling this will ignore “encrypted” flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have “encrypted” flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

### CONFIG\_NVS\_ASSERT\_ERROR\_CHECK

Use assertions for error checking

Found in: *Component config > NVS*

This option switches error checking type between assertions (y) or return codes (n).

**Default value:**

- No (disabled)

### OpenSSL Contains:

- *CONFIG\_OPENSSL\_DEBUG*
- *CONFIG\_OPENSSL\_ERROR\_STACK*
- *CONFIG\_OPENSSL\_LOWLEVEL\_DEBUG*
- *CONFIG\_OPENSSL\_DEBUG\_LEVEL*
- *CONFIG\_OPENSSL\_ASSERT*

### CONFIG\_OPENSSL\_DEBUG

Enable OpenSSL debugging

Found in: *Component config > OpenSSL*

Enable OpenSSL debugging function.

If the option is enabled, “SSL\_DEBUG” works.

**Default value:**

- No (disabled)

### CONFIG\_OPENSSL\_ERROR\_STACK

Enable OpenSSL error structure

Found in: *Component config > OpenSSL*

Enable OpenSSL Error reporting

**Default value:**

- Yes (enabled)

**CONFIG\_OPENSSL\_DEBUG\_LEVEL**

OpenSSL debugging level

*Found in:* [Component config](#) > [OpenSSL](#)

OpenSSL debugging level.

Only function whose debugging level is higher than “OPENSSL\_DEBUG\_LEVEL” works.

For example: If OPENSSL\_DEBUG\_LEVEL = 2, you use function “SSL\_DEBUG(1, “malloc failed”)” . Because 1 < 2, it will not print.

**Range:**

- from 0 to 255 if [CONFIG\\_OPENSSL\\_DEBUG](#)

**Default value:**

- 0 if [CONFIG\\_OPENSSL\\_DEBUG](#)

**CONFIG\_OPENSSL\_LOWLEVEL\_DEBUG**

Enable OpenSSL low-level module debugging

*Found in:* [Component config](#) > [OpenSSL](#)

If the option is enabled, low-level module debugging function of OpenSSL is enabled, e.g. mbedtls internal debugging function.

**Default value:**

- No (disabled) if [CONFIG\\_OPENSSL\\_DEBUG](#)

**CONFIG\_OPENSSL\_ASSERT**

Select OpenSSL assert function

*Found in:* [Component config](#) > [OpenSSL](#)

OpenSSL function needs “assert” function to check if input parameters are valid.

If you want to use assert debugging function, “OPENSSL\_DEBUG” should be enabled.

**Available options:**

- Do nothing (OPENSSL\_ASSERT\_DO\_NOTHING)  
Do nothing and “SSL\_ASSERT” does not work.
- Check and exit (OPENSSL\_ASSERT\_EXIT)  
Enable assert exiting, it will check and return error code.
- Show debugging message (OPENSSL\_ASSERT\_DEBUG)  
Enable assert debugging, it will check and show debugging message.
- Show debugging message and exit (OPENSSL\_ASSERT\_DEBUG\_EXIT)  
Enable assert debugging and exiting, it will check, show debugging message and return error code.
- Show debugging message and block (OPENSSL\_ASSERT\_DEBUG\_BLOCK)  
Enable assert debugging and blocking, it will check, show debugging message and block by “while (1);” .

**OpenThread** Contains:

- [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_ENABLED

OpenThread

*Found in: [Component config](#) > [OpenThread](#)*

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**

- No (disabled)

### CONFIG\_OPENTHREAD\_RADIO\_TYPE

Config the Thread radio type

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)*

Configure how OpenThread connects to the 15.4 radio

**Available options:**

- Native 15.4 radio (OPENTHREAD\_RADIO\_NATIVE)  
Select this to use the native 15.4 radio.
- Connect via UART (OPENTHREAD\_RADIO\_SPINEL\_UART)  
Select this to connect to a Radio Co-Processor via UART.

### CONFIG\_OPENTHREAD\_DEVICE\_TYPE

Config the Thread device type

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)*

OpenThread can be configured to different device types (FTD, MTD, Radio)

**Available options:**

- Full Thread Device (OPENTHREAD\_FTD)  
Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (OPENTHREAD\_MTD)  
Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (OPENTHREAD\_RADIO)  
Select this to enable Radio Only Device which cannot can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

### CONFIG\_OPENTHREAD\_DIAG

Enable diag

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)*

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

**Default value:**

- Yes (enabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_COMMISSIONER

Enable Commissioner

*Found in: [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)*

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_JOINER**

Enable Joiner

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED*

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_SRP\_CLIENT**

Enable SRP Client

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED*

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_BORDER\_ROUTER**

Enable Border Router

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED*

Select this option to enable border router features in OpenThread.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_ESP\_LIB\_FROM\_INTERNAL\_SRC**

Build esp\_openthread libraries from source

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED*

Override the shipped libopenthread\_br.a and libopenthread\_port.a, for internal builds.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_NUM\_MESSAGE\_BUFFERS**

The number of openthread message buffers

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_ENABLED*

**Range:**

- from 50 to 100 if *CONFIG\_OPENTHREAD\_ENABLED*

**Default value:**

- 65 if *CONFIG\_OPENTHREAD\_ENABLED*

**PThreads** Contains:

- [CONFIG\\_PTHREAD\\_TASK\\_NAME\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_CORE\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_PRIO\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_STACK\\_SIZE\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_STACK\\_MIN](#)

### **CONFIG\_PTHREAD\_TASK\_PRIO\_DEFAULT**

Default task priority

*Found in: [Component config](#) > [PThreads](#)*

Priority used to create new tasks with default pthread parameters.

**Range:**

- from 0 to 255

**Default value:**

- 5

### **CONFIG\_PTHREAD\_TASK\_STACK\_SIZE\_DEFAULT**

Default task stack size

*Found in: [Component config](#) > [PThreads](#)*

Stack size used to create new tasks with default pthread parameters.

**Default value:**

- 3072

### **CONFIG\_PTHREAD\_STACK\_MIN**

Minimum allowed pthread stack size

*Found in: [Component config](#) > [PThreads](#)*

Minimum allowed pthread stack size set in attributes passed to pthread\_create

**Default value:**

- 768

### **CONFIG\_PTHREAD\_TASK\_CORE\_DEFAULT**

Default pthread core affinity

*Found in: [Component config](#) > [PThreads](#)*

The default core to which pthreads are pinned.

**Available options:**

- No affinity (PTHREAD\_DEFAULT\_CORE\_NO\_AFFINITY)
- Core 0 (PTHREAD\_DEFAULT\_CORE\_0)
- Core 1 (PTHREAD\_DEFAULT\_CORE\_1)

### **CONFIG\_PTHREAD\_TASK\_NAME\_DEFAULT**

Default name of pthreads

*Found in: [Component config](#) > [PThreads](#)*

The default name of pthreads.

**Default value:**

- “pthread”

**Main Flash configuration** Contains:

- *Optional and Experimental Features (READ DOCS FIRST)*

**Optional and Experimental Features (READ DOCS FIRST)** Contains:

- *CONFIG\_SPI\_FLASH\_HPM*
- *CONFIG\_SPI\_FLASH\_HPM\_DC*

### **CONFIG\_SPI\_FLASH\_HPM**

High Performance Mode (READ DOCS FIRST, > 80MHz)

*Found in: Component config > Main Flash configuration > Optional and Experimental Features (READ DOCS FIRST)*

Whether the High Performance Mode of Flash is enabled. As an optional feature, user needs to manually enable this option as a confirmation. To be back-compatible with earlier IDF versionn, this option is automatically enabled with warning when Flash running > 80Mhz.

**Available options:**

- Enable (SPI\_FLASH\_HPM\_ENA)
- Auto (Not recommended) (SPI\_FLASH\_HPM\_AUTO)
- Disabled (SPI\_FLASH\_HPM\_DIS)

### **CONFIG\_SPI\_FLASH\_HPM\_DC**

Support HPM using DC (READ DOCS FIRST)

*Found in: Component config > Main Flash configuration > Optional and Experimental Features (READ DOCS FIRST)*

This feature needs your bootloader to be compiled DC-aware (BOOTLOADER\_FLASH\_DC\_AWARE=y). Otherwise the chip will not be able to boot after a reset.

**Available options:**

- Auto (Enable when bootloader support enabled (BOOTLOADER\_FLASH\_DC\_AWARE)) (SPI\_FLASH\_HPM\_DC\_AUTO)
- Disable (READ DOCS FIRST) (SPI\_FLASH\_HPM\_DC\_DISABLE)

**SPI Flash driver** Contains:

- *Auto-detect flash chips*
- *CONFIG\_SPI\_FLASH\_BYPASS\_BLOCK\_ERASE*
- *CONFIG\_SPI\_FLASH\_ENABLE\_ENCRYPTED\_READ\_WRITE*
- *CONFIG\_SPI\_FLASH\_ENABLE\_COUNTERS*
- *CONFIG\_SPI\_FLASH\_ROM\_DRIVER\_PATCH*
- *CONFIG\_SPI\_FLASH\_YIELD\_DURING\_ERASE*
- *CONFIG\_SPI\_FLASH\_CHECK\_ERASE\_TIMEOUT\_DISABLED*
- *CONFIG\_SPI\_FLASH\_WRITE\_CHUNK\_SIZE*
- *CONFIG\_SPI\_FLASH\_OVERRIDE\_CHIP\_DRIVER\_LIST*
- *CONFIG\_SPI\_FLASH\_SIZE\_OVERRIDE*
- *CONFIG\_SPI\_FLASH\_SHARE\_SPI\_BUS*
- *CONFIG\_SPI\_FLASH\_ROM\_IMPL*
- *CONFIG\_SPI\_FLASH\_USE\_LEGACY\_IMPL*
- *CONFIG\_SPI\_FLASH\_VERIFY\_WRITE*
- *CONFIG\_SPI\_FLASH\_DANGEROUS\_WRITE*

### CONFIG\_SPI\_FLASH\_VERIFY\_WRITE

Verify SPI flash writes

*Found in: [Component config](#) > [SPI Flash driver](#)*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

**Default value:**

- No (disabled)

### CONFIG\_SPI\_FLASH\_LOG\_FAILED\_WRITE

Log errors if verification fails

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_VERIFY\\_WRITE](#)*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

**Default value:**

- No (disabled) if [CONFIG\\_SPI\\_FLASH\\_VERIFY\\_WRITE](#)

### CONFIG\_SPI\_FLASH\_WARN\_SETTING\_ZERO\_TO\_ONE

Log warning if writing zero bits to ones

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_VERIFY\\_WRITE](#)*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

**Default value:**

- No (disabled) if [CONFIG\\_SPI\\_FLASH\\_VERIFY\\_WRITE](#)

### CONFIG\_SPI\_FLASH\_ENABLE\_COUNTERS

Enable operation counters

*Found in: [Component config](#) > [SPI Flash driver](#)*

This option enables the following APIs:

- `spi_flash_reset_counters`
- `spi_flash_dump_counters`
- `spi_flash_get_counters`

These APIs may be used to collect performance data for `spi_flash` APIs and to help understand behaviour of libraries which use SPI flash.

**Default value:**

- 0

### CONFIG\_SPI\_FLASH\_ROM\_DRIVER\_PATCH

Enable SPI flash ROM driver patched functions

*Found in: [Component config](#) > [SPI Flash driver](#)*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_ROM\_IMPL

Use esp\_flash implementation in ROM

*Found in: [Component config](#) > [SPI Flash driver](#)*

Enable this flag to use new SPI flash driver functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. But you can use all of our flash features.

If making this as “y” in your project, you will increase free IRAM. But you may miss out on some flash features and support for new flash chips.

Currently the ROM cannot support the following features:

- SPI\_FLASH\_AUTO\_SUSPEND (C3, S3)

**Default value:**

- No (disabled)

### CONFIG\_SPI\_FLASH\_DANGEROUS\_WRITE

Writing to dangerous flash regions

*Found in: [Component config](#) > [SPI Flash driver](#)*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature \*does not\* check calls to the esp\_rom\_XXX SPI flash ROM functions. These functions should not be called directly from IDF applications.

**Available options:**

- Aborts (SPI\_FLASH\_DANGEROUS\_WRITE\_ABORTS)
- Fails (SPI\_FLASH\_DANGEROUS\_WRITE\_FAILS)
- Allowed (SPI\_FLASH\_DANGEROUS\_WRITE\_ALLOWED)

### CONFIG\_SPI\_FLASH\_USE\_LEGACY\_IMPL

Use the legacy implementation before IDF v4.0

*Found in: [Component config](#) > [SPI Flash driver](#)*

The implementation of SPI flash has been greatly changed in IDF v4.0. Enable this option to use the legacy implementation.

**Default value:**

- No (disabled)

### CONFIG\_SPI\_FLASH\_SHARE\_SPI1\_BUS

Support other devices attached to SPI1 bus

*Found in: [Component config](#) > [SPI Flash driver](#)*

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of esp\_flash driver access to the main flash chip.

If you only need to use esp\_flash driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.

**Default value:**

- No (disabled) if [CONFIG\\_SPI\\_FLASH\\_USE\\_LEGACY\\_IMPL](#)

### CONFIG\_SPI\_FLASH\_BYPASS\_BLOCK\_ERASE

Bypass a block erase and always do sector erase

*Found in: [Component config](#) > [SPI Flash driver](#)*

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

**Default value:**

- No (disabled)

### CONFIG\_SPI\_FLASH\_YIELD\_DURING\_ERASE

Enables yield operation during flash erase

*Found in: [Component config](#) > [SPI Flash driver](#)*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS

Duration of erasing to yield CPUs (ms)

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_YIELD\\_DURING\\_ERASE](#)*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

**Default value:**

- 20

### CONFIG\_SPI\_FLASH\_ERASE\_YIELD\_TICKS

CPU release time (tick) for an erase operation

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_YIELD\\_DURING\\_ERASE](#)*

Defines how many ticks will be before returning to continue a erasing.

**Default value:**

- 1

### CONFIG\_SPI\_FLASH\_WRITE\_CHUNK\_SIZE

Flash write chunk size

*Found in: [Component config](#) > [SPI Flash driver](#)*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

**Range:**

- from 256 to 8192

**Default value:**

- 8192

### CONFIG\_SPI\_FLASH\_SIZE\_OVERRIDE

Override flash size in bootloader header by ESPTOOLPY\_FLASHSIZE

*Found in: [Component config](#) > [SPI Flash driver](#)*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY\_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

**Default value:**

- No (disabled)

### CONFIG\_SPI\_FLASH\_CHECK\_ERASE\_TIMEOUT\_DISABLED

Flash timeout checkout disabled

*Found in: [Component config](#) > [SPI Flash driver](#)*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

**Default value:**

- No (disabled) if [CONFIG\\_SPI\\_FLASH\\_USE\\_LEGACY\\_IMPL](#)

### CONFIG\_SPI\_FLASH\_OVERRIDE\_CHIP\_DRIVER\_LIST

Override default chip driver list

*Found in: [Component config](#) > [SPI Flash driver](#)*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the *default\_registered\_chips* structure must be provided by the user.

See example: `custom_chip_driver` under `examples/storage` for more details.

**Default value:**

- No (disabled) if [CONFIG\\_SPI\\_FLASH\\_USE\\_LEGACY\\_IMPL](#)

**Auto-detect flash chips** Contains:

- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_BOYA\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_GD\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_ISSI\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_MXIC\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_MXIC\\_OPI\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_TH\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_WINBOND\\_CHIP](#)

### CONFIG\_SPI\_FLASH\_SUPPORT\_ISSI\_CHIP

ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_SUPPORT\_MXIC\_CHIP

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_SUPPORT\_GD\_CHIP

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip\_drv` member of the chip struct. If you are using Wrover modules, please don't disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_SUPPORT\_WINBOND\_CHIP

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_SUPPORT\_BOYA\_CHIP

BOYA

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_SUPPORT\_TH\_CHIP

TH

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of TH chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_SUPPORT\_MXIC\_OPI\_CHIP

mxic (opi)

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Octal MXIC chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPI\_FLASH\_ENABLE\_ENCRYPTED\_READ\_WRITE

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

**Default value:**

- Yes (enabled)

### SPIFFS Configuration Contains:

- *Debug Configuration*
- *CONFIG\_SPIFFS\_USE\_MAGIC*
- *CONFIG\_SPIFFS\_GC\_STATS*
- *CONFIG\_SPIFFS\_PAGE\_CHECK*
- *CONFIG\_SPIFFS\_FOLLOW\_SYMLINKS*
- *CONFIG\_SPIFFS\_MAX\_PARTITIONS*
- *CONFIG\_SPIFFS\_USE\_MTIME*
- *CONFIG\_SPIFFS\_GC\_MAX\_RUNS*
- *CONFIG\_SPIFFS\_OBJ\_NAME\_LEN*
- *CONFIG\_SPIFFS\_META\_LENGTH*
- *SPIFFS Cache Configuration*
- *CONFIG\_SPIFFS\_PAGE\_SIZE*
- *CONFIG\_SPIFFS\_MTIME\_WIDE\_64\_BITS*

### CONFIG\_SPIFFS\_MAX\_PARTITIONS

Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.

**Range:**

- from 1 to 10

**Default value:**

- 3

**SPIFFS Cache Configuration** Contains:

- [CONFIG\\_SPIFFS\\_CACHE](#)

### **CONFIG\_SPIFFS\_CACHE**

Enable SPIFFS Cache

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#)*

Enables/disable memory read caching of nucleus file system operations.

**Default value:**

- Yes (enabled)

### **CONFIG\_SPIFFS\_CACHE\_WR**

Enable SPIFFS Write Caching

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#) > [CONFIG\\_SPIFFS\\_CACHE](#)*

Enables memory write caching for file descriptors in hydrogen.

**Default value:**

- Yes (enabled)

### **CONFIG\_SPIFFS\_CACHE\_STATS**

Enable SPIFFS Cache Statistics

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#) > [CONFIG\\_SPIFFS\\_CACHE](#)*

Enable/disable statistics on caching. Debug/test purpose only.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_PAGE\_CHECK**

Enable SPIFFS Page Check

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**Default value:**

- Yes (enabled)

### **CONFIG\_SPIFFS\_GC\_MAX\_RUNS**

Set Maximum GC Runs

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Define maximum number of GC runs to perform to reach desired free pages.

**Range:**

- from 1 to 255

**Default value:**

- 10

**CONFIG\_SPIFFS\_GC\_STATS**

Enable SPIFFS GC Statistics

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Enable/disable statistics on gc. Debug/test purpose only.

**Default value:**

- No (disabled)

**CONFIG\_SPIFFS\_PAGE\_SIZE**

SPIFFS logical page size

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**Range:**

- from 256 to 1024

**Default value:**

- 256

**CONFIG\_SPIFFS\_OBJ\_NAME\_LEN**

Set SPIFFS Maximum Name Length

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS\_OBJ\_NAME\_LEN - 1.

SPIFFS\_OBJ\_NAME\_LEN + SPIFFS\_META\_LENGTH should not exceed SPIFFS\_PAGE\_SIZE - 64.

**Range:**

- from 1 to 256

**Default value:**

- 32

**CONFIG\_SPIFFS\_FOLLOW\_SYMLINKS**

Enable symbolic links for image creation

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_USE\_MAGIC

Enable SPIFFS Filesystem Magic

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_USE\_MAGIC\_LENGTH

Enable SPIFFS Filesystem Length Magic

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [CONFIG\\_SPIFFS\\_USE\\_MAGIC](#)*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_META\_LENGTH

Size of per-file metadata field

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

`SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH` should not exceed `SPIFFS_PAGE_SIZE - 64`.

**Default value:**

- 4

### CONFIG\_SPIFFS\_USE\_MTIME

Save file modification time

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through `stat/fstat` functions. Modification time is updated when the file is opened.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_MTIME\_WIDE\_64\_BITS

The time field occupies 64 bits in the image instead of 32 bits

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches `SPIFFS_META_LENGTH`. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with support `time_t` 64 bits (see `SDK_TOOLCHAIN_SUPPORTS_TIME_WIDE_64_BITS`).

**Default value:**

- No (disabled) if `CONFIG_SPIFFS_META_LENGTH`  $\geq$  8

**Debug Configuration** Contains:

- `CONFIG_SPIFFS_DBG`
- `CONFIG_SPIFFS_API_DBG`
- `CONFIG_SPIFFS_CACHE_DBG`
- `CONFIG_SPIFFS_CHECK_DBG`
- `CONFIG_SPIFFS_TEST_VISUALISATION`
- `CONFIG_SPIFFS_GC_DBG`

### **CONFIG\_SPIFFS\_DBG**

Enable general SPIFFS debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print general debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_API\_DBG**

Enable SPIFFS API debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print API debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_GC\_DBG**

Enable SPIFFS Garbage Cleaner debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print GC debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_CACHE\_DBG**

Enable SPIFFS Cache debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print cache debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_CHECK\_DBG**

Enable SPIFFS Filesystem Check debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print Filesystem Check debug messages to the console.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_TEST\_VISUALISATION

Enable SPIFFS Filesystem Visualization

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enable this option to enable SPIFFS\_vis function in the API.

**Default value:**

- No (disabled)

**TCP Transport** Contains:

- [Websocket](#)

**Websocket** Contains:

- [CONFIG\\_WS\\_TRANSPORT](#)

### CONFIG\_WS\_TRANSPORT

Enable Websocket Transport

*Found in: [Component config](#) > [TCP Transport](#) > [Websocket](#)*

Enable support for creating websocket transport.

**Default value:**

- Yes (enabled)

### CONFIG\_WS\_BUFFER\_SIZE

Websocket transport buffer size

*Found in: [Component config](#) > [TCP Transport](#) > [Websocket](#) > [CONFIG\\_WS\\_TRANSPORT](#)*

Size of the buffer used for constructing the HTTP Upgrade request during connect

**Default value:**

- 1024

**TinyUSB Stack** Contains:

- [CONFIG\\_TINYUSB](#)

### CONFIG\_TINYUSB

Use TinyUSB Stack

*Found in: [Component config](#) > [TinyUSB Stack](#)*

Enable TinyUSB stack support. Note that, esp-idf only uses the device stack provided by TinyUSB.

**Default value:**

- No (disabled)

### CONFIG\_TINYUSB\_DEBUG\_LEVEL

TinyUSB log level (0-3)

*Found in: Component config > TinyUSB Stack > CONFIG\_TINYUSB*

Specify verbosity of TinyUSB log output.

**Range:**

- from 0 to 3 if *CONFIG\_TINYUSB*

**Default value:**

- 0 if *CONFIG\_TINYUSB*

**TinyUSB task configuration** Contains:

- *CONFIG\_TINYUSB\_NO\_DEFAULT\_TASK*
- *CONFIG\_TINYUSB\_TASK\_PRIORITY*
- *CONFIG\_TINYUSB\_TASK\_STACK\_SIZE*

### CONFIG\_TINYUSB\_NO\_DEFAULT\_TASK

Do not create a TinyUSB task

*Found in: Component config > TinyUSB Stack > CONFIG\_TINYUSB > TinyUSB task configuration*

This option allows to not create the FreeRTOS task during the driver initialization. User will have to handle TinyUSB events manually.

**Default value:**

- No (disabled) if *CONFIG\_TINYUSB*

### CONFIG\_TINYUSB\_TASK\_PRIORITY

TinyUSB task priority

*Found in: Component config > TinyUSB Stack > CONFIG\_TINYUSB > TinyUSB task configuration*

Set the priority of the default TinyUSB main task.

**Default value:**

- 5 if *CONFIG\_TINYUSB\_NO\_DEFAULT\_TASK* && *CONFIG\_TINYUSB*

### CONFIG\_TINYUSB\_TASK\_STACK\_SIZE

TinyUSB task stack size (bytes)

*Found in: Component config > TinyUSB Stack > CONFIG\_TINYUSB > TinyUSB task configuration*

Set the stack size of the default TinyUSB main task.

**Default value:**

- 4096 if *CONFIG\_TINYUSB\_NO\_DEFAULT\_TASK* && *CONFIG\_TINYUSB*

**Descriptor configuration** Contains:

- *CONFIG\_TINYUSB\_DESC\_BCD\_DEVICE*
- *CONFIG\_TINYUSB\_DESC\_CDC\_STRING*
- *CONFIG\_TINYUSB\_DESC\_HID\_STRING*
- *CONFIG\_TINYUSB\_DESC\_MANUFACTURER\_STRING*
- *CONFIG\_TINYUSB\_DESC\_MSC\_STRING*
- *CONFIG\_TINYUSB\_DESC\_CUSTOM\_PID*
- *CONFIG\_TINYUSB\_DESC\_USE\_DEFAULT\_PID*
- *CONFIG\_TINYUSB\_DESC\_PRODUCT\_STRING*
- *CONFIG\_TINYUSB\_DESC\_SERIAL\_STRING*

- [CONFIG\\_TINYUSB\\_DESC\\_CUSTOM\\_VID](#)
- [CONFIG\\_TINYUSB\\_DESC\\_USE\\_ESPRESSIF\\_VID](#)

### **CONFIG\_TINYUSB\_DESC\_USE\_ESPRESSIF\_VID**

VID: Use Espressif's vendor ID

*Found in: [Component config](#) > [TinyUSB Stack](#) > [CONFIG\\_TINYUSB](#) > [Descriptor configuration](#)*

Enable this option, USB device will use Espressif's vendor ID as its VID. This is helpful at product develop stage.

**Default value:**

- Yes (enabled) if [CONFIG\\_TINYUSB](#)

### **CONFIG\_TINYUSB\_DESC\_CUSTOM\_VID**

VID: Custom vendor ID

*Found in: [Component config](#) > [TinyUSB Stack](#) > [CONFIG\\_TINYUSB](#) > [Descriptor configuration](#)*

Custom Vendor ID.

**Default value:**

- "0x1234" if [CONFIG\\_TINYUSB\\_DESC\\_USE\\_ESPRESSIF\\_VID](#) && [CONFIG\\_TINYUSB](#)

### **CONFIG\_TINYUSB\_DESC\_USE\_DEFAULT\_PID**

PID: Use a default PID assigned to TinyUSB

*Found in: [Component config](#) > [TinyUSB Stack](#) > [CONFIG\\_TINYUSB](#) > [Descriptor configuration](#)*

Default TinyUSB PID assigning uses values 0x4000...0x4007.

**Default value:**

- Yes (enabled) if [CONFIG\\_TINYUSB](#)

### **CONFIG\_TINYUSB\_DESC\_CUSTOM\_PID**

PID: Custom product ID

*Found in: [Component config](#) > [TinyUSB Stack](#) > [CONFIG\\_TINYUSB](#) > [Descriptor configuration](#)*

Custom Product ID.

**Default value:**

- "0x5678" if [CONFIG\\_TINYUSB\\_DESC\\_USE\\_DEFAULT\\_PID](#) && [CONFIG\\_TINYUSB](#)

### **CONFIG\_TINYUSB\_DESC\_BCD\_DEVICE**

bcdDevice

*Found in: [Component config](#) > [TinyUSB Stack](#) > [CONFIG\\_TINYUSB](#) > [Descriptor configuration](#)*

Version of the firmware of the USB device.

**Default value:**

- "0x0100" if [CONFIG\\_TINYUSB](#)

### CONFIG\_TINYUSB\_DESC\_MANUFACTURER\_STRING

Manufacturer name

*Found in: Component config > TinyUSB Stack > CONFIG\_TINYUSB > Descriptor configuration*

Name of the manufacturer of the USB device.

**Default value:**

- “Espressif Systems” if *CONFIG\_TINYUSB*

### CONFIG\_TINYUSB\_DESC\_PRODUCT\_STRING

Product name

*Found in: Component config > TinyUSB Stack > CONFIG\_TINYUSB > Descriptor configuration*

Name of the USB device.

**Default value:**

- “Espressif Device” if *CONFIG\_TINYUSB*

### CONFIG\_TINYUSB\_DESC\_SERIAL\_STRING

Serial string

*Found in: Component config > TinyUSB Stack > CONFIG\_TINYUSB > Descriptor configuration*

Serial number of the USB device.

**Default value:**

- 123456 if *CONFIG\_TINYUSB*

### CONFIG\_TINYUSB\_DESC\_CDC\_STRING

CDC Device String

*Found in: Component config > TinyUSB Stack > CONFIG\_TINYUSB > Descriptor configuration*

Name of the CDC device.

**Default value:**

- “Espressif CDC Device” if *CONFIG\_TINYUSB\_CDC\_ENABLED* && *CONFIG\_TINYUSB*

### CONFIG\_TINYUSB\_DESC\_MSC\_STRING

MSC Device String

*Found in: Component config > TinyUSB Stack > CONFIG\_TINYUSB > Descriptor configuration*

Name of the MSC device.

**Default value:**

- “Espressif MSC Device” if *CONFIG\_TINYUSB\_MSC\_ENABLED* && *CONFIG\_TINYUSB*

### CONFIG\_TINYUSB\_DESC\_HID\_STRING

HID Device String

*Found in: Component config > TinyUSB Stack > CONFIG\_TINYUSB > Descriptor configuration*

Name of the HID device

**Default value:**

- “Espressif HID Device” if *TINYUSB\_HID\_ENABLED* && *CONFIG\_TINYUSB*

**Massive Storage Class (MSC)** Contains:

- [CONFIG\\_TINYUSB\\_MSC\\_ENABLED](#)

#### **CONFIG\_TINYUSB\_MSC\_ENABLED**

Enable TinyUSB MSC feature

*Found in:* [Component config](#) > [TinyUSB Stack](#) > [CONFIG\\_TINYUSB](#) > [Massive Storage Class \(MSC\)](#)

Enable TinyUSB MSC feature.

**Default value:**

- No (disabled) if [CONFIG\\_TINYUSB](#)

#### **CONFIG\_TINYUSB\_MSC\_BUFSIZE**

MSC FIFO size

*Found in:* [Component config](#) > [TinyUSB Stack](#) > [CONFIG\\_TINYUSB](#) > [Massive Storage Class \(MSC\)](#) > [CONFIG\\_TINYUSB\\_MSC\\_ENABLED](#)

MSC FIFO size, in bytes.

**Range:**

- from 64 to 10000 if [CONFIG\\_TINYUSB\\_MSC\\_ENABLED](#) && [CONFIG\\_TINYUSB](#)

**Default value:**

- 512 if [CONFIG\\_TINYUSB\\_MSC\\_ENABLED](#) && [CONFIG\\_TINYUSB](#)

**Communication Device Class (CDC)** Contains:

- [CONFIG\\_TINYUSB\\_CDC\\_ENABLED](#)

#### **CONFIG\_TINYUSB\_CDC\_ENABLED**

Enable TinyUSB CDC feature

*Found in:* [Component config](#) > [TinyUSB Stack](#) > [CONFIG\\_TINYUSB](#) > [Communication Device Class \(CDC\)](#)

Enable TinyUSB CDC feature.

**Default value:**

- No (disabled) if [CONFIG\\_TINYUSB](#)

#### **CONFIG\_TINYUSB\_CDC\_RX\_BUFSIZE**

CDC FIFO size of RX channel

*Found in:* [Component config](#) > [TinyUSB Stack](#) > [CONFIG\\_TINYUSB](#) > [Communication Device Class \(CDC\)](#) > [CONFIG\\_TINYUSB\\_CDC\\_ENABLED](#)

CDC FIFO size of RX channel.

**Range:**

- from 64 to 10000 if [CONFIG\\_TINYUSB\\_CDC\\_ENABLED](#) && [CONFIG\\_TINYUSB](#)

**Default value:**

- 64 if [CONFIG\\_TINYUSB\\_CDC\\_ENABLED](#) && [CONFIG\\_TINYUSB](#)

### CONFIG\_TINYUSB\_CDC\_TX\_BUFSIZE

CDC FIFO size of TX channel

*Found in: Component config > TinyUSB Stack > CONFIG\_TINYUSB > Communication Device Class (CDC) > CONFIG\_TINYUSB\_CDC\_ENABLED*

CDC FIFO size of TX channel.

**Default value:**

- 64 if *CONFIG\_TINYUSB\_CDC\_ENABLED* && *CONFIG\_TINYUSB*

**Unity unit testing library** Contains:

- *CONFIG\_UNITY\_ENABLE\_COLOR*
- *CONFIG\_UNITY\_ENABLE\_IDF\_TEST\_RUNNER*
- *CONFIG\_UNITY\_ENABLE\_FIXTURE*
- *CONFIG\_UNITY\_ENABLE\_BACKTRACE\_ON\_FAIL*
- *CONFIG\_UNITY\_ENABLE\_64BIT*
- *CONFIG\_UNITY\_ENABLE\_DOUBLE*
- *CONFIG\_UNITY\_ENABLE\_FLOAT*

### CONFIG\_UNITY\_ENABLE\_FLOAT

Support for float type

*Found in: Component config > Unity unit testing library*

If not set, assertions on float arguments will not be available.

**Default value:**

- Yes (enabled)

### CONFIG\_UNITY\_ENABLE\_DOUBLE

Support for double type

*Found in: Component config > Unity unit testing library*

If not set, assertions on double arguments will not be available.

**Default value:**

- Yes (enabled)

### CONFIG\_UNITY\_ENABLE\_64BIT

Support for 64-bit integer types

*Found in: Component config > Unity unit testing library*

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to `UNITY_ASSERT_EQUAL`, as that will cause pointer-to-int-cast warnings.

**Default value:**

- No (disabled)

### CONFIG\_UNITY\_ENABLE\_COLOR

Colorize test output

*Found in: Component config > Unity unit testing library*

If set, Unity will colorize test results using console escape sequences.

**Default value:**

- No (disabled)

**CONFIG\_UTILITY\_ENABLE\_IDF\_TEST\_RUNNER**

Include ESP-IDF test registration/running helpers

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, then the following features will be available:

- TEST\_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: `unity_run_all_tests`, `unity_run_tests_with_filter`, `unity_run_single_test_by_name`.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via `unity_run_menu` function.

Disable if a different test registration mechanism is used.

**Default value:**

- Yes (enabled)

**CONFIG\_UTILITY\_ENABLE\_FIXTURE**

Include Unity test fixture

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, `unity_fixture.h` header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**

- No (disabled)

**CONFIG\_UTILITY\_ENABLE\_BACKTRACE\_ON\_FAIL**

Print a backtrace when a unit test fails

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as `TEST_ASSERT`, `TEST_FAIL` etc.

**Default value:**

- No (disabled)

**USB-OTG** Contains:

- [CONFIG\\_USB\\_HOST\\_HW\\_BUFFER\\_BIAS](#)
- [CONFIG\\_USB\\_HOST\\_CONTROL\\_TRANSFER\\_MAX\\_SIZE](#)
- [Root Hub configuration](#)

**CONFIG\_USB\_HOST\_CONTROL\_TRANSFER\_MAX\_SIZE**

Largest size (in bytes) of transfers to/from default endpoints

*Found in: [Component config](#) > [USB-OTG](#)*

Each USB device attached is allocated a dedicated buffer for its OUT/IN transfers to/from the device's control endpoint. The maximum size of that buffer is determined by this option. The limited size of the transfer buffer have the following implications: - The maximum length of control transfers is limited - Device's with configuration descriptors larger than this limit cannot be supported

**Default value:**

- 256

### CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS

Hardware FIFO size biasing

*Found in: [Component config](#) > [USB-OTG](#)*

The underlying hardware has size adjustable FIFOs to cache USB packets on reception (IN) or for transmission (OUT). The size of these FIFOs will affect the largest MPS (maximum packet size) and the maximum number of packets that can be cached at any one time. The hardware contains the following FIFOs: RX (for all IN packets), Non-periodic TX (for Bulk and Control OUT packets), and Periodic TX (for Interrupt and Isochronous OUT packets). This configuration option allows biasing the FIFO sizes towards a particular use case, which may be necessary for devices that have endpoints with large MPS. The MPS limits for each biasing are listed below:

Balanced: - IN (all transfer types), 408 bytes - OUT non-periodic (Bulk/Control), 192 bytes (i.e., 3 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 192 bytes

Bias IN: - IN (all transfer types), 600 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 128 bytes

Bias Periodic OUT: - IN (all transfer types), 128 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 600 bytes

**Available options:**

- Balanced (USB\_HOST\_HW\_BUFFER\_BIAS\_BALANCED)
- Bias IN (USB\_HOST\_HW\_BUFFER\_BIAS\_IN)
- Periodic OUT (USB\_HOST\_HW\_BUFFER\_BIAS\_PERIODIC\_OUT)

**Root Hub configuration** Contains:

- [CONFIG\\_USB\\_HOST\\_DEBOUNCE\\_DELAY\\_MS](#)
- [CONFIG\\_USB\\_HOST\\_RESET\\_HOLD\\_MS](#)
- [CONFIG\\_USB\\_HOST\\_RESET\\_RECOVERY\\_MS](#)
- [CONFIG\\_USB\\_HOST\\_SET\\_ADDR\\_RECOVERY\\_MS](#)

### CONFIG\_USB\_HOST\_DEBOUNCE\_DELAY\_MS

Debounce delay in ms

*Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)*

On connection of a USB device, the USB 2.0 specification requires a “debounce interval with a minimum duration of 100ms” to allow the connection to stabilize (see USB 2.0 chapter 7.1.7.3 for more details). During the debounce interval, no new connection/disconnection events are registered.

The default value is set to 250 ms to be safe.

**Default value:**

- 250

### CONFIG\_USB\_HOST\_RESET\_HOLD\_MS

Reset hold in ms

*Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)*

The reset signaling can be generated on any Hub or Host Controller port by request from the USB System Software. The USB 2.0 specification requires that “the reset signaling must be driven for a minimum of 10ms” (see USB 2.0 chapter 7.1.7.5 for more details). After the reset, the hub port will transition to the Enabled state (refer to Section 11.5).

The default value is set to 30 ms to be safe.

**Default value:**

- 30

**CONFIG\_USB\_HOST\_RESET\_RECOVERY\_MS**

Reset recovery delay in ms

*Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)*

After a port stops driving the reset signal, the USB 2.0 specification requires that the “USB System Software guarantees a minimum of 10 ms for reset recovery” before the attached device is expected to respond to data transfers (see USB 2.0 chapter 7.1.7.3 for more details). The device may ignore any data transfers during the recovery interval.

The default value is set to 30 ms to be safe.

**Default value:**

- 30

**CONFIG\_USB\_HOST\_SET\_ADDR\_RECOVERY\_MS**

SetAddress() recovery time in ms

*Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)*

“After successful completion of the Status stage, the device is allowed a SetAddress() recovery interval of 2 ms. At the end of this interval, the device must be able to accept Setup packets addressed to the new address. Also, at the end of the recovery interval, the device must not respond to tokens sent to the old address (unless, of course, the old and new address is the same).” See USB 2.0 chapter 9.2.6.3 for more details.

The default value is set to 10 ms to be safe.

**Default value:**

- 10

**Virtual file system** Contains:

- [CONFIG\\_VFS\\_SUPPORT\\_IO](#)

**CONFIG\_VFS\_SUPPORT\_IO**

Provide basic I/O functions

*Found in: [Component config](#) > [Virtual file system](#)*

If enabled, the following functions are provided by the VFS component.

open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:

close, read, write, ioctl, fcntl.

**Default value:**

- Yes (enabled)

## CONFIG\_VFS\_SUPPORT\_DIR

Provide directory related functions

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)*

If enabled, the following functions are provided by the VFS component.

stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir\_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

### Default value:

- Yes (enabled)

## CONFIG\_VFS\_SUPPORT\_SELECT

Provide select function

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)*

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for “select” on UART file descriptors is not required.

### Default value:

- Yes (enabled) if [CONFIG\\_VFS\\_SUPPORT\\_IO](#) && [CONFIG\\_LWIP\\_USE\\_ONLY\\_LWIP\\_SELECT](#)

## CONFIG\_VFS\_SUPPRESS\_SELECT\_DEBUG\_OUTPUT

Suppress select() related debug outputs

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#) > [CONFIG\\_VFS\\_SUPPORT\\_SELECT](#)*

Select() related functions might produce an inconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

### Default value:

- Yes (enabled)

## CONFIG\_VFS\_SUPPORT\_TERMIOS

Provide termios.h functions

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)*

Disabling this option can save memory when the support for termios.h is not required.

### Default value:

- Yes (enabled)

**Host File System I/O (Semihosting)** Contains:

- [CONFIG\\_VFS\\_SEMIHOSTFS\\_MAX\\_MOUNT\\_POINTS](#)

## CONFIG\_VFS\_SEMIHOSTFS\_MAX\_MOUNT\_POINTS

Host FS: Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.

**Default value:**

- 1

**Wear Levelling** Contains:

- [CONFIG\\_WL\\_SECTOR\\_MODE](#)
- [CONFIG\\_WL\\_SECTOR\\_SIZE](#)

## CONFIG\_WL\_SECTOR\_SIZE

Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

**Available options:**

- 512 (WL\_SECTOR\_SIZE\_512)
- 4096 (WL\_SECTOR\_SIZE\_4096)

## CONFIG\_WL\_SECTOR\_MODE

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

**Available options:**

- Performance (WL\_SECTOR\_MODE\_PERF)
- Safety (WL\_SECTOR\_MODE\_SAFE)

**Wi-Fi Provisioning Manager** Contains:

- [CONFIG\\_WIFI\\_PROV\\_BLE\\_BONDING](#)
- [CONFIG\\_WIFI\\_PROV\\_BLE\\_SEC\\_CONN](#)
- [CONFIG\\_WIFI\\_PROV\\_BLE\\_FORCE\\_ENCRYPTION](#)
- [CONFIG\\_WIFI\\_PROV\\_KEEP\\_BLE\\_ON\\_AFTER\\_PROV](#)
- [CONFIG\\_WIFI\\_PROV\\_SCAN\\_MAX\\_ENTRIES](#)

- `CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT`

### **CONFIG\_WIFI\_PROV\_SCAN\_MAX\_ENTRIES**

Max Wi-Fi Scan Result Entries

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

**Range:**

- from 1 to 255

**Default value:**

- 16

### **CONFIG\_WIFI\_PROV\_AUTOSTOP\_TIMEOUT**

Provisioning auto-stop timeout

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

**Range:**

- from 5 to 600

**Default value:**

- 30

### **CONFIG\_WIFI\_PROV\_BLE\_BONDING**

Enable BLE bonding

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

This option is applicable only when provisioning transport is BLE.

### **CONFIG\_WIFI\_PROV\_BLE\_SEC\_CONN**

Enable BLE Secure connection flag

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

Used to enable Secure connection support when provisioning transport is BLE.

**Default value:**

- Yes (enabled) if `BT_NIMBLE_ENABLED`

### **CONFIG\_WIFI\_PROV\_BLE\_FORCE\_ENCRYPTION**

Force Link Encryption during characteristic Read / Write

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

Used to enforce link encryption when attempting to read / write characteristic

### **CONFIG\_WIFI\_PROV\_KEEP\_BLE\_ON\_AFTER\_PROV**

Keep BT on after provisioning is done

*Found in: [Component config](#) > [Wi-Fi Provisioning Manager](#)*

### CONFIG\_WIFI\_PROV\_DISCONNECT\_AFTER\_PROV

Terminate connection after provisioning is done

*Found in:* [Component config](#) > [Wi-Fi Provisioning Manager](#) > [CONFIG\\_WIFI\\_PROV\\_KEEP\\_BLE\\_ON\\_AFTER\\_PROV](#)

**Default value:**

- Yes (enabled) if [CONFIG\\_WIFI\\_PROV\\_KEEP\\_BLE\\_ON\\_AFTER\\_PROV](#)

**Supplicant** Contains:

- [CONFIG\\_WPA\\_TESTING\\_OPTIONS](#)
- [CONFIG\\_WPA\\_11KV\\_SUPPORT](#)
- [CONFIG\\_WPA\\_DPP\\_SUPPORT](#)
- [CONFIG\\_WPA\\_MBO\\_SUPPORT](#)
- [CONFIG\\_WPA\\_SUITE\\_B\\_192](#)
- [CONFIG\\_WPA\\_WAPI\\_PSK](#)
- [CONFIG\\_WPA\\_DEBUG\\_PRINT](#)
- [CONFIG\\_WPA\\_WPS\\_STRICT](#)
- [CONFIG\\_WPA\\_MBEDTLS\\_CRYPTO](#)

### CONFIG\_WPA\_MBEDTLS\_CRYPTO

Use MbedTLS crypto APIs

*Found in:* [Component config](#) > [Supplicant](#)

Select this option to use MbedTLS crypto APIs which utilize hardware acceleration.

**Default value:**

- Yes (enabled)

### CONFIG\_WPA\_WAPI\_PSK

Enable WAPI PSK support

*Found in:* [Component config](#) > [Supplicant](#)

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**

- No (disabled)

### CONFIG\_WPA\_SUITE\_B\_192

Enable NSA suite B support with 192 bit key

*Found in:* [Component config](#) > [Supplicant](#)

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

**Default value:**

- No (disabled)

### CONFIG\_WPA\_DEBUG\_PRINT

Print debug messages from WPA Supplicant

*Found in:* [Component config](#) > [Supplicant](#)

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Default value:**

- No (disabled)

**CONFIG\_WPA\_TESTING\_OPTIONS**

Add DPP testing code

*Found in: [Component config](#) > [Supplicant](#)*

Select this to enable unity test for DPP.

**Default value:**

- No (disabled)

**CONFIG\_WPA\_WPS\_STRICT**

Strictly validate all WPS attributes

*Found in: [Component config](#) > [Supplicant](#)*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

**Default value:**

- No (disabled)

**CONFIG\_WPA\_11KV\_SUPPORT**

Enable 802.11k, 802.11v APIs handling

*Found in: [Component config](#) > [Supplicant](#)*

Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

**Default value:**

- No (disabled)

**CONFIG\_WPA\_SCAN\_CACHE**

Keep scan results in cache

*Found in: [Component config](#) > [Supplicant](#) > [CONFIG\\_WPA\\_11KV\\_SUPPORT](#)*

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**

- No (disabled) if [CONFIG\\_WPA\\_11KV\\_SUPPORT](#)

**CONFIG\_WPA\_MBO\_SUPPORT**

Enable MBO support

*Found in: [Component config](#) > [Supplicant](#)*

Select this option to enable WiFi Multiband operation certification support.

**Default value:**

- No (disabled)

### CONFIG\_WPA\_DPP\_SUPPORT

Enable DPP support

Found in: *Component config > Supplicant*

Select this option to enable WiFi Easy Connect Support.

**Default value:**

- No (disabled)

### Compatibility options

Contains:

- [CONFIG\\_LEGACY\\_INCLUDE\\_COMMON\\_HEADERS](#)

### CONFIG\_LEGACY\_INCLUDE\_COMMON\_HEADERS

Include headers across components as before IDF v4.0

Found in: *Compatibility options*

Soc, esp32, and driver components, the most common components. Some header of these components are included implicitly by headers of other components before IDF v4.0. It's not required for high-level components, but still included through long header chain everywhere.

This is harmful to the modularity. So it's changed in IDF v4.0.

You can still include these headers in a legacy way until it is totally deprecated by enable this option.

**Default value:**

- No (disabled)

### Deprecated options and their replacements

- **CONFIG\_A2D\_INITIAL\_TRACE\_LEVEL** ([CONFIG\\_BT\\_LOG\\_A2D\\_TRACE\\_LEVEL](#))

## 2.9.7 Customisations

Because IDF builds by default with *Warning On Undefined Variables*, when the Kconfig tool generates Makefiles (the `auto.conf` file) its behaviour has been customised. In normal Kconfig, a variable which is set to “no” is undefined. In IDF’s version of Kconfig, this variable is defined in the Makefile but has an empty value.

(Note that `ifdef` and `ifndef` can still be used in Makefiles, because they test if a variable is defined *and has a non-empty value.*)

When generating header files for C & C++, the behaviour is not customised - so `ifdef` can be used to test if a boolean config item is set or not.

## 2.10 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see *Error Handling*.

*ESP\_FAIL* (-1): Generic esp\_err\_t code indicating failure

*ESP\_OK* (0): esp\_err\_t value indicating success (no error)

*ESP\_ERR\_NO\_MEM* (0x101): Out of memory

*ESP\_ERR\_INVALID\_ARG* (0x102): Invalid argument

*ESP\_ERR\_INVALID\_STATE* (0x103): Invalid state

*ESP\_ERR\_INVALID\_SIZE* (0x104): Invalid size

*ESP\_ERR\_NOT\_FOUND* (0x105): Requested resource not found

*ESP\_ERR\_NOT\_SUPPORTED* (0x106): Operation or feature not supported

*ESP\_ERR\_TIMEOUT* (0x107): Operation timed out

*ESP\_ERR\_INVALID\_RESPONSE* (0x108): Received response was invalid

*ESP\_ERR\_INVALID\_CRC* (0x109): CRC or checksum was invalid

*ESP\_ERR\_INVALID\_VERSION* (0x10a): Version was invalid

*ESP\_ERR\_INVALID\_MAC* (0x10b): MAC address was invalid

*ESP\_ERR\_NOT\_FINISHED* (0x10c): There are items remained to retrieve

*ESP\_ERR\_NVS\_BASE* (0x1100): Starting number of error codes

*ESP\_ERR\_NVS\_NOT\_INITIALIZED* (0x1101): The storage driver is not initialized

*ESP\_ERR\_NVS\_NOT\_FOUND* (0x1102): Id namespace doesn't exist yet and mode is NVS\_READONLY

*ESP\_ERR\_NVS\_TYPE\_MISMATCH* (0x1103): The type of set or get operation doesn't match the type of value stored in NVS

*ESP\_ERR\_NVS\_READ\_ONLY* (0x1104): Storage handle was opened as read only

*ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE* (0x1105): There is not enough space in the underlying storage to save the value

*ESP\_ERR\_NVS\_INVALID\_NAME* (0x1106): Namespace name doesn't satisfy constraints

*ESP\_ERR\_NVS\_INVALID\_HANDLE* (0x1107): Handle has been closed or is NULL

*ESP\_ERR\_NVS\_REMOVE\_FAILED* (0x1108): The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

*ESP\_ERR\_NVS\_KEY\_TOO\_LONG* (0x1109): Key name is too long

*ESP\_ERR\_NVS\_PAGE\_FULL* (0x110a): Internal error; never returned by nvs API functions

*ESP\_ERR\_NVS\_INVALID\_STATE* (0x110b): NVS is in an inconsistent state due to a previous error. Call nvs\_flash\_init and nvs\_open again, then retry.

*ESP\_ERR\_NVS\_INVALID\_LENGTH* (0x110c): String or blob length is not sufficient to store data

*ESP\_ERR\_NVS\_NO\_FREE\_PAGES* (0x110d): NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs\_flash\_init again.

*ESP\_ERR\_NVS\_VALUE\_TOO\_LONG* (0x110e): Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

*ESP\_ERR\_NVS\_PART\_NOT\_FOUND* (0x110f): Partition with specified name is not found in the partition table

*ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND* (0x1110): NVS partition contains data in new format and cannot be recognized by this version of code

*ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED* (0x1111): XTS encryption failed while writing NVS entry

*ESP\_ERR\_NVS\_XTS\_DECR\_FAILED* (0x1112): XTS decryption failed while reading NVS entry

*ESP\_ERR\_NVS\_XTS\_CFG\_FAILED* (0x1113): XTS configuration setting failed

*ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND* (**0x1114**): XTS configuration not found

*ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED* (**0x1115**): NVS encryption is not supported in this version

*ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED* (**0x1116**): NVS key partition is uninitialized

*ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART* (**0x1117**): NVS key partition is corrupt

*ESP\_ERR\_NVS\_CONTENT\_DIFFERS* (**0x1118**): Internal error; never returned by nvs API functions. NVS key is different in comparison

*ESP\_ERR\_NVS\_WRONG\_ENCRYPTION* (**0x1119**): NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

*ESP\_ERR\_ULP\_BASE* (**0x1200**): Offset for ULP-related error codes

*ESP\_ERR\_ULP\_SIZE\_TOO\_BIG* (**0x1201**): Program doesn't fit into RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_INVALID\_LOAD\_ADDR* (**0x1202**): Load address is outside of RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_DUPLICATE\_LABEL* (**0x1203**): More than one label with the same number was defined

*ESP\_ERR\_ULP\_UNDEFINED\_LABEL* (**0x1204**): Branch instructions references an undefined label

*ESP\_ERR\_ULP\_BRANCH\_OUT\_OF\_RANGE* (**0x1205**): Branch target is out of range of B instruction (try replacing with BX)

*ESP\_ERR\_OTA\_BASE* (**0x1500**): Base error code for ota\_ops api

*ESP\_ERR\_OTA\_PARTITION\_CONFLICT* (**0x1501**): Error if request was to write or erase the current running partition

*ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID* (**0x1502**): Error if OTA data partition contains invalid content

*ESP\_ERR\_OTA\_VALIDATE\_FAILED* (**0x1503**): Error if OTA app image is invalid

*ESP\_ERR\_OTA\_SMALL\_SEC\_VER* (**0x1504**): Error if the firmware has a secure version less than the running firmware.

*ESP\_ERR\_OTA\_ROLLBACK\_FAILED* (**0x1505**): Error if flash does not have valid firmware in passive partition and hence rollback is not possible

*ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE* (**0x1506**): Error if current active firmware is still marked in pending validation state (*ESP\_OTA\_IMG\_PENDING\_VERIFY*), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

*ESP\_ERR\_EFUSE* (**0x1600**): Base error code for efuse api.

*ESP\_OK\_EFUSE\_CNT* (**0x1601**): OK the required number of bits is set.

*ESP\_ERR\_EFUSE\_CNT\_IS\_FULL* (**0x1602**): Error field is full.

*ESP\_ERR\_EFUSE\_REPEATED\_PROG* (**0x1603**): Error repeated programming of programmed bits is strictly forbidden.

*ESP\_ERR\_CODING* (**0x1604**): Error while a encoding operation.

*ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS* (**0x1605**): Error not enough unused key blocks available

*ESP\_ERR\_DAMAGED\_READING* (**0x1606**): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

*ESP\_ERR\_IMAGE\_BASE* (**0x2000**)

*ESP\_ERR\_IMAGE\_FLASH\_FAIL* (**0x2001**)

*ESP\_ERR\_IMAGE\_INVALID* (**0x2002**)

*ESP\_ERR\_WIFI\_BASE* (**0x3000**): Starting number of WiFi error codes

*ESP\_ERR\_WIFI\_NOT\_INIT* (**0x3001**): WiFi driver was not installed by *esp\_wifi\_init*

*ESP\_ERR\_WIFI\_NOT\_STARTED* (**0x3002**): WiFi driver was not started by *esp\_wifi\_start*

*ESP\_ERR\_WIFI\_NOT\_STOPPED* (**0x3003**): WiFi driver was not stopped by esp\_wifi\_stop

*ESP\_ERR\_WIFI\_IF* (**0x3004**): WiFi interface error

*ESP\_ERR\_WIFI\_MODE* (**0x3005**): WiFi mode error

*ESP\_ERR\_WIFI\_STATE* (**0x3006**): WiFi internal state error

*ESP\_ERR\_WIFI\_CONN* (**0x3007**): WiFi internal control block of station or soft-AP error

*ESP\_ERR\_WIFI\_NVS* (**0x3008**): WiFi internal NVS module error

*ESP\_ERR\_WIFI\_MAC* (**0x3009**): MAC address is invalid

*ESP\_ERR\_WIFI\_SSID* (**0x300a**): SSID is invalid

*ESP\_ERR\_WIFI\_PASSWORD* (**0x300b**): Password is invalid

*ESP\_ERR\_WIFI\_TIMEOUT* (**0x300c**): Timeout error

*ESP\_ERR\_WIFI\_WAKE\_FAIL* (**0x300d**): WiFi is in sleep state(RF closed) and wakeup fail

*ESP\_ERR\_WIFI\_WOULD\_BLOCK* (**0x300e**): The caller would block

*ESP\_ERR\_WIFI\_NOT\_CONNECT* (**0x300f**): Station still in disconnect status

*ESP\_ERR\_WIFI\_POST* (**0x3012**): Failed to post the event to WiFi task

*ESP\_ERR\_WIFI\_INIT\_STATE* (**0x3013**): Invalid WiFi state when init/deinit is called

*ESP\_ERR\_WIFI\_STOP\_STATE* (**0x3014**): Returned when WiFi is stopping

*ESP\_ERR\_WIFI\_NOT\_ASSOC* (**0x3015**): The WiFi connection is not associated

*ESP\_ERR\_WIFI\_TX\_DISALLOW* (**0x3016**): The WiFi TX is disallowed

*ESP\_ERR\_WIFI\_DISCARD* (**0x3017**): Discard frame

*ESP\_ERR\_WIFI\_ROC\_IN\_PROGRESS* (**0x301c**): ROC op is in progress

*ESP\_ERR\_WIFI\_REGISTRAR* (**0x3033**): WPS registrar is not supported

*ESP\_ERR\_WIFI\_WPS\_TYPE* (**0x3034**): WPS type error

*ESP\_ERR\_WIFI\_WPS\_SM* (**0x3035**): WPS state machine is not initialized

*ESP\_ERR\_ESPNOW\_BASE* (**0x3064**): ESPNOW error number base.

*ESP\_ERR\_ESPNOW\_NOT\_INIT* (**0x3065**): ESPNOW is not initialized.

*ESP\_ERR\_ESPNOW\_ARG* (**0x3066**): Invalid argument

*ESP\_ERR\_ESPNOW\_NO\_MEM* (**0x3067**): Out of memory

*ESP\_ERR\_ESPNOW\_FULL* (**0x3068**): ESPNOW peer list is full

*ESP\_ERR\_ESPNOW\_NOT\_FOUND* (**0x3069**): ESPNOW peer is not found

*ESP\_ERR\_ESPNOW\_INTERNAL* (**0x306a**): Internal error

*ESP\_ERR\_ESPNOW\_EXIST* (**0x306b**): ESPNOW peer has existed

*ESP\_ERR\_ESPNOW\_IF* (**0x306c**): Interface error

*ESP\_ERR\_DPP\_FAILURE* (**0x3097**): Generic failure during DPP Operation

*ESP\_ERR\_DPP\_TX\_FAILURE* (**0x3098**): DPP Frame Tx failed OR not Acked

*ESP\_ERR\_DPP\_INVALID\_ATTR* (**0x3099**): Encountered invalid DPP Attribute

*ESP\_ERR\_MESH\_BASE* (**0x4000**): Starting number of MESH error codes

*ESP\_ERR\_MESH\_WIFI\_NOT\_START* (**0x4001**)

*ESP\_ERR\_MESH\_NOT\_INIT* (**0x4002**)

*ESP\_ERR\_MESH\_NOT\_CONFIG* (**0x4003**)

*ESP\_ERR\_MESH\_NOT\_START* (**0x4004**)  
*ESP\_ERR\_MESH\_NOT\_SUPPORT* (**0x4005**)  
*ESP\_ERR\_MESH\_NOT\_ALLOWED* (**0x4006**)  
*ESP\_ERR\_MESH\_NO\_MEMORY* (**0x4007**)  
*ESP\_ERR\_MESH\_ARGUMENT* (**0x4008**)  
*ESP\_ERR\_MESH\_EXCEED\_MTU* (**0x4009**)  
*ESP\_ERR\_MESH\_TIMEOUT* (**0x400a**)  
*ESP\_ERR\_MESH\_DISCONNECTED* (**0x400b**)  
*ESP\_ERR\_MESH\_QUEUE\_FAIL* (**0x400c**)  
*ESP\_ERR\_MESH\_QUEUE\_FULL* (**0x400d**)  
*ESP\_ERR\_MESH\_NO\_PARENT\_FOUND* (**0x400e**)  
*ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND* (**0x400f**)  
*ESP\_ERR\_MESH\_OPTION\_NULL* (**0x4010**)  
*ESP\_ERR\_MESH\_OPTION\_UNKNOWN* (**0x4011**)  
*ESP\_ERR\_MESH\_XON\_NO\_WINDOW* (**0x4012**)  
*ESP\_ERR\_MESH\_INTERFACE* (**0x4013**)  
*ESP\_ERR\_MESH\_DISCARD\_DUPLICATE* (**0x4014**)  
*ESP\_ERR\_MESH\_DISCARD* (**0x4015**)  
*ESP\_ERR\_MESH\_VOTING* (**0x4016**)  
*ESP\_ERR\_MESH\_XMIT* (**0x4017**)  
*ESP\_ERR\_MESH\_QUEUE\_READ* (**0x4018**)  
*ESP\_ERR\_MESH\_PS* (**0x4019**)  
*ESP\_ERR\_MESH\_RECV\_RELEASE* (**0x401a**)  
*ESP\_ERR\_ESP\_NETIF\_BASE* (**0x5000**)  
*ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS* (**0x5001**)  
*ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY* (**0x5002**)  
*ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED* (**0x5003**)  
*ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED* (**0x5004**)  
*ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED* (**0x5005**)  
*ESP\_ERR\_ESP\_NETIF\_NO\_MEM* (**0x5006**)  
*ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED* (**0x5007**)  
*ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED* (**0x5008**)  
*ESP\_ERR\_ESP\_NETIF\_INIT\_FAILED* (**0x5009**)  
*ESP\_ERR\_ESP\_NETIF\_DNS\_NOT\_CONFIGURED* (**0x500a**)  
*ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED* (**0x500b**)  
*ESP\_ERR\_ESP\_NETIF\_IP6\_ADDR\_FAILED* (**0x500c**)  
*ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED* (**0x500d**)  
*ESP\_ERR\_FLASH\_BASE* (**0x6000**): Starting number of flash error codes  
*ESP\_ERR\_FLASH\_OP\_FAIL* (**0x6001**)

ESP\_ERR\_FLASH\_OP\_TIMEOUT (**0x6002**)

ESP\_ERR\_FLASH\_NOT\_INITIALISED (**0x6003**)

ESP\_ERR\_FLASH\_UNSUPPORTED\_HOST (**0x6004**)

ESP\_ERR\_FLASH\_UNSUPPORTED\_CHIP (**0x6005**)

ESP\_ERR\_FLASH\_PROTECTED (**0x6006**)

*ESP\_ERR\_HTTP\_BASE* (**0x7000**): Starting number of HTTP error codes

*ESP\_ERR\_HTTP\_MAX\_REDIRECT* (**0x7001**): The error exceeds the number of HTTP redirects

*ESP\_ERR\_HTTP\_CONNECT* (**0x7002**): Error open the HTTP connection

*ESP\_ERR\_HTTP\_WRITE\_DATA* (**0x7003**): Error write HTTP data

*ESP\_ERR\_HTTP\_FETCH\_HEADER* (**0x7004**): Error read HTTP header from server

*ESP\_ERR\_HTTP\_INVALID\_TRANSPORT* (**0x7005**): There are no transport support for the input scheme

*ESP\_ERR\_HTTP\_CONNECTING* (**0x7006**): HTTP connection hasn't been established yet

*ESP\_ERR\_HTTP\_EAGAIN* (**0x7007**): Mapping of errno EAGAIN to esp\_err\_t

*ESP\_ERR\_HTTP\_CONNECTION\_CLOSED* (**0x7008**): Read FIN from peer and the connection closed

ESP\_ERR\_ESP\_TLS\_BASE (**0x8000**): Starting number of ESP-TLS error codes

ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME (**0x8001**): Error if hostname couldn't be resolved upon tls connection

ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET (**0x8002**): Failed to create socket

ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY (**0x8003**): Unsupported protocol family

ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST (**0x8004**): Failed to connect to host

ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED (**0x8005**): failed to set/get socket option

ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT (**0x8006**): new connection in esp\_tls\_low\_level\_conn connection timed out

ESP\_ERR\_ESP\_TLS\_SE\_FAILED (**0x8007**)

ESP\_ERR\_ESP\_TLS\_TCP\_CLOSED\_FIN (**0x8008**)

ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK (**0x8010**): mbedtls parse certificates was partly successful

ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED (**0x8011**): mbedtls api returned error

ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED (**0x8012**): mbedtls api returned error

ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED (**0x8013**): mbedtls api returned error

ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED (**0x8014**): mbedtls api returned error

ESP\_ERR\_MBEDTLS\_X509\_CRT\_PARSE\_FAILED (**0x8015**): mbedtls api returned error

ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED (**0x8016**): mbedtls api returned error

ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED (**0x8017**): mbedtls api returned error

ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED (**0x8018**): mbedtls api returned error

ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED (**0x8019**): mbedtls api returned failed

ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED (**0x801a**): mbedtls api returned failed

ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED (**0x801b**): mbedtls api returned failed

ESP\_ERR\_MBEDTLS\_SSL\_TICKET\_SETUP\_FAILED (**0x801c**): mbedtls api returned failed

ESP\_ERR\_WOLFSSL\_SSL\_SET\_HOSTNAME\_FAILED (**0x8031**): wolfSSL api returned error

ESP\_ERR\_WOLFSSL\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED (**0x8032**): wolfSSL api returned error

`ESP_ERR_WOLFSSL_CERT_VERIFY_SETUP_FAILED (0x8033)`: wolfSSL api returned error

`ESP_ERR_WOLFSSL_KEY_VERIFY_SETUP_FAILED (0x8034)`: wolfSSL api returned error

`ESP_ERR_WOLFSSL_SSL_HANDSHAKE_FAILED (0x8035)`: wolfSSL api returned failed

`ESP_ERR_WOLFSSL_CTX_SETUP_FAILED (0x8036)`: wolfSSL api returned failed

`ESP_ERR_WOLFSSL_SSL_SETUP_FAILED (0x8037)`: wolfSSL api returned failed

`ESP_ERR_WOLFSSL_SSL_WRITE_FAILED (0x8038)`: wolfSSL api returned failed

`ESP_ERR_MEMPROT_MEMORY_TYPE_INVALID (0xd001)`

`ESP_ERR_MEMPROT_SPLIT_ADDR_INVALID (0xd002)`

`ESP_ERR_MEMPROT_SPLIT_ADDR_OUT_OF_RANGE (0xd003)`

`ESP_ERR_MEMPROT_SPLIT_ADDR_UNALIGNED (0xd004)`

`ESP_ERR_MEMPROT_UNIMGMT_BLOCK_INVALID (0xd005)`

`ESP_ERR_MEMPROT_WORLD_INVALID (0xd006)`

`ESP_ERR_MEMPROT_AREA_INVALID (0xd007)`

## Chapter 3

# ESP32-S3 Hardware Reference

### 3.1 Chip Series Comparison

The comparison below covers key features of chips supported by ESP-IDF. For the full list of features please refer to respective datasheets in Section *Related Documents*.

Table 1: Chip Series Comparison

Feature	ESP32 Series	ESP32-S2 Series	ESP32-C3 Series
Launch year	2016	2020	2020
Variants	See <a href="#">ESP32 Datasheet (PDF)</a>	See <a href="#">ESP32-S2 Datasheet (PDF)</a>	See <a href="#">ESP32-C3 Datasheet (PDF)</a>
Core	Xtensa® dual-core 32-bit LX6 with 600 MIPS (in total); 200 MIPS for ESP32-U4WDH/ESP32-S0WD (single-core variants); 400 MIPS for ESP32-D2WD	Xtensa® single-core 32-bit LX7 with 300 MIPS	32-bit single-core RISC-V
Wi-Fi protocols	802.11 b/g/n, 2.4 GHz	802.11 b/g/n, 2.4 GHz	802.11 b/g/n, 2.4 GHz
Bluetooth®	Bluetooth v4.2 BR/EDR and Bluetooth Low Energy	×	Bluetooth 5.0
Typical frequency	240 MHz (160 MHz for ESP32-S0WD, ESP32-D2WD, and ESP32-U4WDH)	240 MHz	160 MHz
SRAM	520 KB	320 KB	400 KB
ROM	448 KB for booting and core functions	128 KB for booting and core functions	384 KB for booting and core functions
Embedded flash	2 MB, 4 MB, or none, depending on variants	2 MB, 4 MB, or none, depending on variants	4 MB or none, depending on variants
External flash	Up to 16 MB device, address 11 MB + 248 KB each time	Up to 1 GB device, address 11.5 MB each time	Up to 16 MB device, address 8 MB each time
External RAM	Up to 8 MB device, address 4 MB each time	Up to 1 GB device, address 11.5 MB each time	×

Table 1 – continued from previous page

Feature	ESP32 Series	ESP32-S2 Series	ESP32-C3 Series
Cache	✓ Two-way set associative	✓ Four-way set associative, independent instruction cache and data cache	✓ Eight-way set associative, 32-bit data/instruction bus width
<b>Peripherals</b>			
ADC	Two 12-bit, 18 channels	Two 13-bit, 20 channels	Two 12-bit SAR ADCs, at most 6 channels
DAC	Two 8-bit channels	Two 8-bit channels	×
Timers	Four 64-bit general-purpose timers, and three watchdog timers	Four 64-bit general-purpose timers, and three watchdog timers	Two 54-bit general-purpose timers, and three watchdog timers
Temperature sensor	×	1	1
Touch sensor	10	14	×
Hall sensor	1	×	×
GPIO	34	43	22
SPI	4	4 with more modes, compared with ESP32	3
LCD interface	1	1	×
UART	3	2 <sup>1</sup>	2 <sup>1</sup>
I2C	2	2	1
I2S	2, can be configured to operate with 8/16/32/40/48-bit resolution as an input or output channel.	1, can be configured to operate with 8/16/24/32/48/64-bit resolution as an input or output channel.	1, can be configured to operate with 8/16/24/32-bit resolution as an input or output channel.
Camera interface	1	1	×
DMA	Dedicated DMA to UART, SPI, I2S, SDIO slave, SD/MMC host, EMAC, BT, and Wi-Fi	Dedicated DMA to UART, SPI, AES, SHA, I2S, and ADC Controller	General-purpose, 3 TX channels, 3 RX channels
RMT	8 channels	4 channels <sup>1</sup> , can be configured to TX/RX channels	4 channels <sup>2</sup> , 2 TX channels, 2 RX channels
Pulse counter	8 channels	4 channels <sup>1</sup>	×
LED PWM	16 channels	8 channels <sup>1</sup>	6 channels <sup>2</sup>
MCPWM	2, six PWM outputs	×	×
USB OTG	×	1	×
TWAI® controller (compatible with ISO 11898-1)	1	1	1
SD/SDIO/MMCI host controller		×	×
SDIO slave controller	1	×	×
Ethernet MAC	1	×	×
ULP	ULP FSM	PicoRV32 core with 8 KB SRAM, ULP FSM with more instructions	×
Debug Assist	×	×	1

# Chapter 4

## API Guides

### 4.1 Application Level Tracing library

#### 4.1.1 Overview

IDF provides useful feature for program behavior analysis: application level tracing. It is implemented in the corresponding library and can be enabled in menuconfig. This feature allows to transfer arbitrary data between host and ESP32-S3 via JTAG interface with small overhead on program execution.

Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see [Application Specific Tracing](#)
2. Lightweight logging to the host, see [Logging to Host](#)
3. System behavior analysis, see [System Behavior Analysis with SEGGER SystemView](#)
4. Source code coverage, see [Gcov \(Source Code Coverage\)](#)

Tracing components when working over JTAG interface are shown in the figure below.

#### 4.1.2 Modes of Operation

The library supports two modes of operation:

**Post-mortem mode.** This is the default mode. The mode does not need interaction with the host side. In this mode tracing module does not check whether host has read all the data from *HW UP BUFFER* buffer and overwrites old data with the new ones. This mode is useful when only the latest trace data are interesting to the user, e.g. for analyzing program's behavior just before the crash. Host can read the data later on upon user request, e.g. via special OpenOCD command in case of working via JTAG interface.

**Streaming mode.** Tracing module enters this mode when host connects to ESP32-S3. In this mode before writing new data to *HW UP BUFFER* tracing module checks that there is enough space in it and if necessary waits for the host to read data and free enough memory. Maximum waiting time is controlled via timeout values passed by users to corresponding API routines. So when application tries to write data to trace buffer using finite value of the maximum waiting time it is possible situation that this data will be dropped. Especially this is true for tracing from time critical code (ISRs, OS scheduler code etc.) when infinite timeouts can lead to system malfunction. In order to avoid loss of such critical data developers can enable additional data buffering via menuconfig option [CONFIG\\_APPTRACE\\_PENDING\\_DATA\\_SIZE\\_MAX](#). This macro specifies the size of data which can be buffered in above conditions. The option can also help to overcome situation when data transfer to the host is temporarily slowed

Fig. 1: Tracing Components when Working Over JTAG

down, e.g due to USB bus congestions etc. But it will not help when average bitrate of trace data stream exceeds HW interface capabilities.

### 4.1.3 Configuration Options and Dependencies

Using of this feature depends on two components:

1. **Host side:** Application tracing is done over JTAG, so it needs OpenOCD to be set up and running on host machine. For instructions on how to set it up, please see [JTAG Debugging](#) for details.
2. **Target side:** Application tracing functionality can be enabled in menuconfig. *Component config > Application Level Tracing* menu allows selecting destination for the trace data (HW interface for transport). Choosing any of the destinations automatically enables `CONFIG_APPTRACE_ENABLE` option.

---

**Note:** In order to achieve higher data rates and minimize number of dropped packets it is recommended to optimize setting of JTAG clock frequency, so it is at maximum and still provides stable operation of JTAG, see [Optimize JTAG speed](#).

---

There are two additional menuconfig options not mentioned above:

1. *Threshold for flushing last trace data to host on panic* (`CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`). This option is necessary due to the nature of working over JTAG. In that mode trace data are exposed to the host in 16 KB blocks. In post-mortem mode when one block is filled it is exposed to the host and the previous one becomes unavailable. In other words trace data are overwritten in 16 KB granularity. On panic the latest data from the current input block are exposed to host and host can read them for post-analysis. System panic may occur when very small amount of data are not exposed to the host yet. In this case the previous 16 KB of collected data will be lost and host will see the latest, but very small piece of the trace. It can be insufficient to diagnose the problem. This menuconfig option allows avoiding such situations. It controls the threshold for flushing data in case of panic. For example user can decide that it needs not less than 512 bytes of the recent trace data, so if there is less than 512 bytes of pending data at the moment of panic they will not be

flushed and will not overwrite previous 16 KB. The option is only meaningful in post-mortem mode and when working over JTAG.

2. *Timeout for flushing last trace data to host on panic* (`CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`). The option is only meaningful in streaming mode and controls the maximum time tracing module will wait for the host to read the last data in case of panic.

#### 4.1.4 How to use this library

This library provides API for transferring arbitrary data between host and ESP32-S3. When enabled in menuconfig target application tracing module is initialized automatically at the system startup, so all what the user needs to do is to call corresponding API to send, receive or flush the data.

#### Application Specific Tracing

In general user should decide what type of data should be transferred in every direction and how these data must be interpreted (processed). The following steps must be performed to transfer data between target and host:

1. On target side user should implement algorithms for writing trace data to the host. Piece of code below shows an example how to do this.

```
#include "esp_app_trace.h"
...
char buf[] = "Hello World!";
esp_err_t res = esp_apptrace_write(ESP_APPTRACE_DEST_TRAX, buf, strlen(buf),
↳ESP_APPTRACE_TMO_INFINITE);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to write data to host!");
    return res;
}
```

`esp_apptrace_write()` function uses `memcpy` to copy user data to the internal buffer. In some cases it can be more optimal to use `esp_apptrace_buffer_get()` and `esp_apptrace_buffer_put()` functions. They allow developers to allocate buffer and fill it themselves. The following piece of code shows how to do this.

```
#include "esp_app_trace.h"
...
int number = 10;
char *ptr = (char *)esp_apptrace_buffer_get(ESP_APPTRACE_DEST_TRAX, 32, 100/
↳*tmo in us*);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
sprintf(ptr, "Here is the number %d", number);
esp_err_t res = esp_apptrace_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/*tmo_
↳in us*);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report_
↳incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}
```

Also according to his needs user may want to receive data from the host. Piece of code below shows an example how to do this.

```
#include "esp_app_trace.h"
...
char buf[32];
```

(continues on next page)

(continued from previous page)

```

char down_buf[32];
size_t sz = sizeof(buf);

/* config down buffer */
esp_apprace_down_buffer_config(down_buf, sizeof(down_buf));
/* check for incoming data and read them if any */
esp_err_t res = esp_apprace_read(ESP_APPTRACE_DEST_TRAX, buf, &sz, 0/*do not
↳wait*/);
if (res != ESP_OK) {
    ESP_LOGE(TAG, "Failed to read data from host!");
    return res;
}
if (sz > 0) {
    /* we have data, process them */
    ...
}

```

esp\_apprace\_read() function uses memcpy to copy host data to user buffer. In some cases it can be more optimal to use esp\_apprace\_down\_buffer\_get() and esp\_apprace\_down\_buffer\_put() functions. They allow developers to occupy chunk of read buffer and process it in-place. The following piece of code shows how to do this.

```

#include "esp_app_trace.h"
...
char down_buf[32];
uint32_t *number;
size_t sz = 32;

/* config down buffer */
esp_apprace_down_buffer_config(down_buf, sizeof(down_buf));
char *ptr = (char *)esp_apprace_down_buffer_get(ESP_APPTRACE_DEST_TRAX, &sz, 100/*tmo in us*/);
if (ptr == NULL) {
    ESP_LOGE(TAG, "Failed to get buffer!");
    return ESP_FAIL;
}
if (sz > 4) {
    number = (uint32_t *)ptr;
    printf("Here is the number %d", *number);
} else {
    printf("No data");
}
esp_err_t res = esp_apprace_down_buffer_put(ESP_APPTRACE_DEST_TRAX, ptr, 100/*tmo in us*/);
if (res != ESP_OK) {
    /* in case of error host tracing tool (e.g. OpenOCD) will report
↳incomplete user buffer */
    ESP_LOGE(TAG, "Failed to put buffer!");
    return res;
}

```

2. The next step is to build the program image and download it to the target as described in the [Getting Started Guide](#).
3. Run OpenOCD (see [JTAG Debugging](#)).
4. Connect to OpenOCD telnet server. It can be done using the following command in terminal telnet <oocd\_host> 4444. If telnet session is opened on the same machine which runs OpenOCD you can use localhost as <oocd\_host> in the command above.
5. Start trace data collection using special OpenOCD command. This command will transfer tracing data and redirect them to specified file or socket (currently only files are supported as trace data destination). For description of the corresponding commands see [OpenOCD Application Level Tracing Commands](#).
6. The final step is to process received data. Since format of data is defined by user the processing stage is out of the scope of this document. Good starting points for data processor are python scripts in \$IDF\_PATH/

tools/esp\_app\_trace: appttrace\_proc.py (used for feature tests) and logtrace\_proc.py (see more details in section [Logging to Host](#)).

**OpenOCD Application Level Tracing Commands** *HW UP BUFFER* is shared between user data blocks and filling of the allocated memory is performed on behalf of the API caller (in task or ISR context). In multithreading environment it can happen that task/ISR which fills the buffer is preempted by another high priority task/ISR. So it is possible situation that user data preparation process is not completed at the moment when that chunk is read by the host. To handle such conditions tracing module prepends all user data chunks with header which contains allocated user buffer size (2 bytes) and length of actually written data (2 bytes). So total length of the header is 4 bytes. OpenOCD command which reads trace data reports error when it reads incomplete user data chunk, but in any case it puts contents of the whole user chunk (including unfilled area) to output file.

Below is the description of available OpenOCD application tracing commands.

---

**Note:** Currently OpenOCD does not provide commands to send arbitrary user data to the target.

---

Command usage:

```
esp appttrace [start <options>] | [stop] | [status] | [dump <cores_num> <outfile>]
```

Sub-commands:

**start** Start tracing (continuous streaming).  
**stop** Stop tracing.  
**status** Get tracing status.  
**dump** Dump all data from (post-mortem dump).

Start command syntax:

```
start <outfile> [poll_period [trace_size [stop_tmo [wait4halt  
[skip_size]]]]]
```

**outfile** Path to file to save data from both CPUs. This argument should have the following format: file://path/to/file.

**poll\_period** Data polling period (in ms) for available trace data. If greater than 0 then command runs in non-blocking mode. By default 1 ms.

**trace\_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default -1 (trace size stop trigger is disabled).

**stop\_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default -1 (disable this stop trigger). Optionally set it to value longer than longest pause between tracing commands from target.

**wait4halt** If 0 start tracing immediately, otherwise command waits for the target to be halted (after reset, by breakpoint etc.) and then automatically resumes it and starts tracing. By default 0.

**skip\_size** Number of bytes to skip at the start. By default 0.

---

**Note:** If `poll_period` is 0, OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set `trace_size` and wait until this size of data is collected. At this point tracing stops automatically.

---

Command usage examples:

1. Collect 2048 bytes of tracing data to a file "trace.log". The file will be saved in "openocd-esp32" directory.

```
esp appttrace start file://trace.log 1 2048 5 0 0
```

The tracing data will be retrieved and saved in non-blocking mode. This process will stop automatically after 2048 bytes are collected, or if no data are available for more than 5 seconds.

**Note:** Tracing data is buffered before it is made available to OpenOCD. If you see “Data timeout!” message, then the target is likely sending not enough data to empty the buffer to OpenOCD before expiration of timeout. Either increase the timeout or use a function `esp_appttrace_flush()` to flush the data on specific intervals.

2. Retrieve tracing data indefinitely in non-blocking mode.

```
esp appttrace start file://trace.log 1 -1 -1 0 0
```

There is no limitation on the size of collected data and there is no any data timeout set. This process may be stopped by issuing `esp appttrace stop` command on OpenOCD telnet prompt, or by pressing Ctrl+C in OpenOCD window.

3. Retrieve tracing data and save them indefinitely.

```
esp appttrace start file://trace.log 0 -1 -1 0 0
```

OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing press Ctrl+C in OpenOCD window.

4. Wait for target to be halted. Then resume target's operation and start data retrieval. Stop after collecting 2048 bytes of data:

```
esp appttrace start file://trace.log 0 2048 -1 1 0
```

To configure tracing immediately after reset use the `openocd reset halt` command.

### Logging to Host

IDF implements useful feature: logging to host via application level tracing library. This is a kind of semihosting when all `ESP_LOGx` calls send strings to be printed to the host instead of UART. This can be useful because “printing to host” eliminates some steps performed when logging to UART. The most part of work is done on the host.

By default IDF's logging library uses `vprintf`-like function to write formatted output to dedicated UART. In general it involves the following steps:

1. Format string is parsed to obtain type of each argument.
2. According to its type every argument is converted to string representation.
3. Format string combined with converted arguments is sent to UART.

Though implementation of `vprintf`-like function can be optimized to a certain level, all steps above have to be performed in any case and every step takes some time (especially item 3). So it frequently occurs that with additional log added to the program to identify the problem, the program behavior is changed and the problem cannot be reproduced or in the worst cases the program cannot work normally at all and ends up with an error or even hangs.

Possible ways to overcome this problem are to use higher UART bitrates (or another faster interface) and/or move string formatting procedure to the host.

Application level tracing feature can be used to transfer log information to host using `esp_appttrace_vprintf` function. This function does not perform full parsing of the format string and arguments, instead it just calculates number of arguments passed and sends them along with the format string address to the host. On the host log data are processed and printed out by a special Python script.

**Limitations** Current implementation of logging over JTAG has some limitations:

1. Tracing from `ESP_EARLY_LOGx` macros is not supported.
2. No support for `printf` arguments which size exceeds 4 bytes (e.g. `double` and `uint64_t`).
3. Only strings from `.rodata` section are supported as format strings and arguments.
4. Maximum number of `printf` arguments is 256.

**How To Use It** In order to use logging via trace module user needs to perform the following steps:

1. On target side special `vprintf`-like function needs to be installed. As it was mentioned earlier this function is `esp_apptrace_vprintf`. It sends log data to the host. Example code is provided in [system/app\\_trace\\_to\\_host](#).
2. Follow instructions in items 2-5 in [Application Specific Tracing](#).
3. To print out collected log records, run the following command in terminal: `$IDF_PATH/tools/esp_app_trace/logtrace_proc.py /path/to/trace/file /path/to/program/elf/file`.

### Log Trace Processor Command Options

 Command usage:

```
logtrace_proc.py [-h] [--no-errors] <trace_file> <elf_file>
```

Positional arguments:

**trace\_file** Path to log trace file

**elf\_file** Path to program ELF file

Optional arguments:

**-h, --help** show this help message and exit

**--no-errors, -n** Do not print errors

### System Behavior Analysis with SEGGER SystemView

Another useful IDF feature built on top of application tracing library is the system level tracing which produces traces compatible with SEGGER SystemView tool (see [SystemView](#)). SEGGER SystemView is a real-time recording and visualization tool that allows to analyze runtime behavior of an application.

---

**Note:** Currently IDF-based application is able to generate SystemView compatible traces in form of files to be opened in SystemView application. The tracing process cannot yet be controlled using that tool.

---

**How To Use It** Support for this feature is enabled by *Component config > Application Level Tracing > FreeRTOS SystemView Tracing (CONFIG\_APPTRACE\_SV\_ENABLE)* menuconfig option. There are several other options enabled under the same menu:

1. ESP32-S3 timer to use as SystemView timestamp source: (*CONFIG\_APPTRACE\_SV\_TS\_SOURCE*) selects the source of timestamps for SystemView events. In single core mode timestamps are generated using ESP32-S3 internal cycle counter running at maximum 240 Mhz (~4 ns granularity). In dual-core mode external timer working at 40 Mhz is used, so timestamp granularity is 25 ns.
2. Individually enabled or disabled collection of SystemView events (*CONFIG\_APPTRACE\_SV\_EVT\_XXX*):
  - Trace Buffer Overflow Event
  - ISR Enter Event
  - ISR Exit Event
  - ISR Exit to Scheduler Event
  - Task Start Execution Event
  - Task Stop Execution Event
  - Task Start Ready State Event
  - Task Stop Ready State Event
  - Task Create Event
  - Task Terminate Event
  - System Idle Event
  - Timer Enter Event
  - Timer Exit Event

IDF has all the code required to produce SystemView compatible traces, so user can just configure necessary project options (see above), build, download the image to target and use OpenOCD to collect data as described in the previous sections.

**OpenOCD SystemView Tracing Command Options** Command usage:

```
esp sysview [start <options>] | [stop] | [status]
```

Sub-commands:

**start** Start tracing (continuous streaming).**stop** Stop tracing.**status** Get tracing status.

Start command syntax:

```
start <outfile1> [outfile2] [poll_period [trace_size [stop_tmo]]]
```

**outfile1** Path to file to save data from PRO CPU. This argument should have the following format: `file://path/to/file`.**outfile2** Path to file to save data from APP CPU. This argument should have the following format: `file://path/to/file`.**poll\_period** Data polling period (in ms) for available trace data. If greater than 0 then command runs in non-blocking mode. By default 1 ms.**trace\_size** Maximum size of data to collect (in bytes). Tracing is stopped after specified amount of data is received. By default -1 (trace size stop trigger is disabled).**stop\_tmo** Idle timeout (in sec). Tracing is stopped if there is no data for specified period of time. By default -1 (disable this stop trigger).

---

**Note:** If `poll_period` is 0 OpenOCD telnet command line will not be available until tracing is stopped. You must stop it manually by resetting the board or pressing Ctrl+C in OpenOCD window (not one with the telnet session). Another option is to set `trace_size` and wait until this size of data is collected. At this point tracing stops automatically.

---

Command usage examples:

1. Collect SystemView tracing data to files “pro-cpu.SVdat” and “app-cpu.SVdat” . The files will be saved in “openocd-esp32” directory.

```
esp sysview start file://pro-cpu.SVdat file://app-cpu.SVdat
```

The tracing data will be retrieved and saved in non-blocking mode. To stop data this process enter `esp sysview stop` command on OpenOCD telnet prompt, optionally pressing Ctrl+C in OpenOCD window.

2. Retrieve tracing data and save them indefinitely.

```
esp sysview start file://pro-cpu.SVdat file://app-cpu.SVdat 0 -1 -1
```

OpenOCD telnet command line prompt will not be available until tracing is stopped. To stop tracing, press Ctrl+C in OpenOCD window.

**Data Visualization** After trace data are collected user can use special tool to visualize the results and inspect behavior of the program.

Unfortunately SystemView does not support tracing from multiple cores. So when tracing from ESP32-S3 working in dual-core mode two files are generated: one for PRO CPU and another one for APP CPU. User can load every file into separate instance of the tool.

It is uneasy and awkward to analyze data for every core in separate instance of the tool. Fortunately there is Eclipse plugin called *Impulse* which can load several trace files and makes it possible to inspect events from both cores in one view. Also this plugin has no limitation of 1,000,000 events as compared to free version of SystemView.Good instruction on how to install, configure and visualize data in Impulse from one core can be found [here](#).

---

**Note:** IDF uses its own mapping for SystemView FreeRTOS events IDs, so user needs to replace original file with mapping `$SYSVIEW_INSTALL_DIR/Description/SYSVIEW_FreeRTOS.txt` with

`$IDF_PATH/docs/api-guides/SYSVIEW_FreeRTOS.txt`. Also contents of that IDF specific file should be used when configuring SystemView serializer using above link.

---

**Configure Impulse for Dual Core Traces** After installing Impulse and ensuring that it can successfully load trace files for each core in separate tabs, users can add special Multi Adapter port and load both files into one view. To do this, users need to do the following in Eclipse:

1. Open 'Signal Ports' view. Go to Windows->Show View->Other menu. Find 'Signal Ports' view in Impulse folder and double-click on it.
2. In 'Signal Ports' view right-click on 'Ports' and select 'Add ...' ->New Multi Adapter Port
3. In open dialog Press 'Add' button and select 'New Pipe/File' .
4. In open dialog select 'SystemView Serializer' as Serializer and set path to PRO CPU trace file. Press OK.
5. Repeat steps 3-4 for APP CPU trace file.
6. Double-click on created port. View for this port should open.
7. Click Start/Stop Streaming button. Data should be loaded.
8. Use 'Zoom Out' , 'Zoom In' and 'Zoom Fit' button to inspect data.
9. For settings measurement cursors and other features please see [Impulse documentation](#)).

---

**Note:** If you have problems with visualization (no data are shown or strange behavior of zoom action is observed) you can try to delete current signal hierarchy and double click on the necessary file or port. Eclipse will ask you to create new signal hierarchy.

---

## Gcov (Source Code Coverage)

**Basics of Gcov and Gcovr** Source code coverage is data indicating the count and frequency of every program execution path that has been taken within a program' s runtime. **Gcov** is a GCC tool that, when used in concert with the compiler, can generate log files indicating the execution count of each line of a source file. The **Gcovr** tool is utility for managing Gcov and generating summarized code coverage results.

Generally, using Gcov to compile and run programs on the Host will undergo these steps:

1. Compile the source code using GCC with the `--coverage` option enabled. This will cause the compiler to generate a `.gcno` notes files during compilation. The notes files contain information to reconstruct execution path block graphs and map each block to source code line numbers. Each source file compiled with the `--coverage` option should have their own `.gcno` file of the same name (e.g., a `main.c` will generate a `main.gcno` when compiled).
2. Execute the program. During execution, the program should generate `.gda` data files. These data files contain the counts of the number of times an execution path was taken. The program will generate a `.gda` file for each source file compiled with the `--coverage` option (e.g., `main.c` will generate a `main.gda`).
3. Gcov or Gcovr can be used generate a code coverage based on the `.gcno`, `.gda`, and source files. Gcov will generate a text based coverage report for each source file in the form of a `.gcov` file, whilst Gcovr will generate a coverage report in HTML format.

**Gcov and Gcovr in ESP-IDF** Using Gcov in ESP-IDF is complicated by the fact that the program is running remotely from the Host (i.e., on the target). The code coverage data (i.e., the `.gda` files) is initially stored on the target itself. OpenOCD is then used to dump the code coverage data from the target to the host via JTAG during runtime. Using Gcov in ESP-IDF can be split into the following steps.

1. [Setting Up a Project for Gcov](#)
2. [Dumping Code Coverage Data](#)
3. [Generating Coverage Report](#)

## Setting Up a Project for Gcov

**Compiler Option** In order to obtain code coverage data in a project, one or more source files within the project must be compiled with the `--coverage` option. In ESP-IDF, this can be achieved at the component level or the individual source file level:

**To cause all source files in a component to be compiled with the `--coverage` option.**

- Add `target_compile_options(${COMPONENT_LIB} PRIVATE --coverage)` to the `CMakeLists.txt` file of the component if using CMake.
- Add `CFLAGS += --coverage` to the component `.mk` file of the component if using Make.

**To cause a select number of source files (e.g. `source1.c` and `source2.c`) in the same component to be compiled with the**

- Add `set_source_files_properties(source1.c source2.c PROPERTIES COMPILE_FLAGS --coverage)` to the `CMakeLists.txt` file of the component if using CMake.
- Add `source1.o: CFLAGS += --coverage` and `source2.o: CFLAGS += --coverage` to the component `.mk` file of the component if using Make.

When a source file is compiled with the `--coverage` option (e.g. `gcov_example.c`), the compiler will generate the `gcov_example.gcno` file in the project's build directory.

**Project Configuration** Before building a project with source code coverage, ensure that the following project configuration options are enabled by running `idf.py menuconfig` (or `make menuconfig` if using the legacy Make build system).

- Enable the application tracing module by choosing *Trace Memory* for the [CONFIG\\_APPTRACE\\_DESTINATION](#) option.
- Enable Gcov to host via the [CONFIG\\_APPTRACE\\_GCOV\\_ENABLE](#)

**Dumping Code Coverage Data** Once a project has been compiled with the `--coverage` option and flashed onto the target, code coverage data will be stored internally on the target (i.e., in trace memory) whilst the application runs. The process of transferring code coverage data from the target to the Host is known as dumping.

The dumping of coverage data is done via OpenOCD (see [JTAG Debugging](#) on how to setup and run OpenOCD). A dump is triggered by issuing commands to OpenOCD, therefore a telnet session to OpenOCD must be opened to issue such commands (run `telnet localhost 4444`). Note that GDB could be used instead of telnet to issue commands to OpenOCD, however all commands issued from GDB will need to be prefixed as `mon <occd_command>`.

When the target dumps code coverage data, the `.gcda` files are stored in the project's build directory. For example, if `gcov_example_main.c` of the main component was compiled with the `--coverage` option, then dumping the code coverage data would generate a `gcov_example_main.gcda` in `build/esp-idf/main/CMakeFiles/__idf_main.dir/gcov_example_main.c.gcda` (or `build/main/gcov_example_main.gcda` if using the legacy Make build system). Note that the `.gcno` files produced during compilation are also placed in the same directory.

The dumping of code coverage data can be done multiple times throughout an application's life time. Each dump will simply update the `.gcda` file with the newest code coverage information. Code coverage data is accumulative, thus the newest data will contain the total execution count of each code path over the application's entire lifetime.

ESP-IDF supports two methods of dumping code coverage data from the target to the host:

- Instant Run-Time Dumpgit
- Hard-coded Dump

**Instant Run-Time Dump** An Instant Run-Time Dump is triggered by calling the ESP32-S3 `gcov` OpenOCD command (via a telnet session). Once called, OpenOCD will immediately preempt the ESP32-S3's current state and execute a builtin IDF Gcov debug stub function. The debug stub function will handle the dumping of data to the Host. Upon completion, the ESP32-S3 will resume its current state.

**Hard-coded Dump** A Hard-coded Dump is triggered by the application itself by calling `esp_gcov_dump()` from somewhere within the application. When called, the application will halt and wait for OpenOCD to connect and retrieve the code coverage data. Once `esp_gcov_dump()` is called, the Host must execute the `esp_gcov_dump`

OpenOCD command (via a telnet session). The `esp_gcov_dump` command will cause OpenOCD to connect to the ESP32-S3, retrieve the code coverage data, then disconnect from the ESP32-S3 thus allowing the application to resume. Hard-coded Dumps can also be triggered multiple times throughout an application's lifetime.

Hard-coded dumps are useful if code coverage data is required at certain points of an application's lifetime by placing `esp_gcov_dump()` where necessary (e.g., after application initialization, during each iteration of an application's main loop).

GDB can be used to set a breakpoint on `esp_gcov_dump()`, then call `mon esp_gcov_dump` automatically via the use a `gdbinit` script (see Using GDB from [Command Line](#)).

The following GDB script is will add a breakpoint at `esp_gcov_dump()`, then call the `mon esp_gcov_dump` OpenOCD command.

```
b esp_gcov_dump
commands
mon esp_gcov_dump
end
```

---

**Note:** Note that all OpenOCD commands should be invoked in GDB as: `mon <occd_command>`.

---

**Generating Coverage Report** Once the code coverage data has been dumped, the `.gcno`, `.gcda` and the source files can be used to generate a code coverage report. A code coverage report is simply a report indicating the number of times each line in a source file has been executed.

Both `Gcov` and `Gcovr` can be used to generate code coverage reports. `Gcov` is provided along with the Xtensa toolchain, whilst `Gcovr` may need to be installed separately. For details on how to use `Gcov` or `Gcovr`, refer to [Gcov documentation](#) and [Gcovr documentation](#).

**Adding Gcovr Build Target to Project** To make report generation more convenient, users can define additional build targets in their projects such report generation can be done with a single build command.

**CMake Build System** For the CMake build systems, add the following lines to the `CMakeLists.txt` file of your project.

```
include($ENV{IDF_PATH}/tools/cmake/gcov.cmake)
idf_create_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
idf_clean_coverage_report(${CMAKE_CURRENT_BINARY_DIR}/coverage_report)
```

The following commands can now be used:

- `cmake --build build/ --target gcovr-report` will generate an HTML coverage report in `$(BUILD_DIR_BASE)/coverage_report/html` directory.
- `cmake --build build/ --target cov-data-clean` will remove all coverage data files.

**Make Build System** For the Make build systems, add the following lines to the `Makefile` of your project.

```
GCOV := $(call dequote,$(CONFIG_SDK_TOOLPREFIX))gcov
REPORT_DIR := $(BUILD_DIR_BASE)/coverage_report

gcovr-report:
    echo "Generating coverage report in: $(REPORT_DIR)"
    echo "Using gcov: $(GCOV)"
    mkdir -p $(REPORT_DIR)/html
    cd $(BUILD_DIR_BASE)
    gcovr -r $(PROJECT_PATH) --gcov-executable $(GCOV) -s --html-details $(REPORT_
↵DIR)/html/index.html
```

(continues on next page)

```
cov-data-clean:
    echo "Remove coverage data files..."
    find $(BUILD_DIR_BASE) -name "*.gcda" -exec rm {} +
    rm -rf $(REPORT_DIR)

.PHONY: gcovr-report cov-data-clean
```

The following commands can now be used:

- make `gcovr-report` will generate an HTML coverage report in `$(BUILD_DIR_BASE)/coverage_report/html` directory.
- make `cov-data-clean` will remove all coverage data files.

## 4.2 Application Startup Flow

This note explains various steps which happen before `app_main` function of an ESP-IDF application is called.

The high level view of startup process is as follows:

1. *First stage bootloader* in ROM loads second-stage bootloader image to RAM (IRAM & DRAM) from flash offset 0x0.
2. *Second stage bootloader* loads partition table and main app image from flash. Main app incorporates both RAM segments and read-only segments mapped via flash cache.
3. *Application startup* executes. At this point the second CPU and RTOS scheduler are started.

This process is explained in detail in the following sections.

### 4.2.1 First stage bootloader

After SoC reset, PRO CPU will start running immediately, executing reset vector code, while APP CPU will be held in reset. During startup process, PRO CPU does all the initialization. APP CPU reset is de-asserted in the `call_start_cpu0` function of application startup code. Reset vector code is located in the mask ROM of the ESP32-S3 chip and cannot be modified.

Startup code called from the reset vector determines the boot mode by checking `GPIO_STRAP_REG` register for bootstrap pin states. Depending on the reset reason, the following takes place:

1. Reset from deep sleep: if the value in `RTC_CNTL_STORE6_REG` is non-zero, and CRC value of RTC memory in `RTC_CNTL_STORE7_REG` is valid, use `RTC_CNTL_STORE6_REG` as an entry point address and jump immediately to it. If `RTC_CNTL_STORE6_REG` is zero, or `RTC_CNTL_STORE7_REG` contains invalid CRC, or once the code called via `RTC_CNTL_STORE6_REG` returns, proceed with boot as if it was a power-on reset. **Note:** to run customized code at this point, a deep sleep stub mechanism is provided. Please see *deep sleep* documentation for this.
2. For power-on reset, software SOC reset, and watchdog SOC reset: check the `GPIO_STRAP_REG` register if a custom boot mode (such as UART Download Mode) is requested. If this is the case, this custom loader mode is executed from ROM. Otherwise, proceed with boot as if it was due to software CPU reset. Consult ESP32-S3 datasheet for a description of SoC boot modes and how to execute them.
3. For software CPU reset and watchdog CPU reset: configure SPI flash based on EFUSE values, and attempt to load the code from flash. This step is described in more detail in the next paragraphs.

---

**Note:** During normal boot modes the RTC watchdog is enabled when this happens, so if the process is interrupted or stalled then the watchdog will reset the SOC automatically and repeat the boot process. This may cause the SoC to strap into a new boot mode, if the strapping GPIOs have changed.

---

Second stage bootloader binary image is loaded from the start of flash at offset 0x0.

## 4.2.2 Second stage bootloader

In ESP-IDF, the binary image which resides at offset 0x0 in flash is the second stage bootloader. Second stage bootloader source code is available in [components/bootloader](#) directory of ESP-IDF. Second stage bootloader is used in ESP-IDF to add flexibility to flash layout (using partition tables), and allow for various flows associated with flash encryption, secure boot, and over-the-air updates (OTA) to take place.

When the first stage bootloader is finished checking and loading the second stage bootloader, it jumps to the second stage bootloader entry point found in the binary image header.

Second stage bootloader reads the partition table found by default at offset 0x8000 (*configurable value*). See [partition tables](#) documentation for more information. The bootloader finds factory and OTA app partitions. If OTA app partitions are found in the partition table, the bootloader consults the `otadata` partition to determine which one should be booted. See [Over The Air Updates \(OTA\)](#) for more information.

For a full description of the configuration options available for the ESP-IDF bootloader, see [Bootloader](#).

For the selected partition, second stage bootloader reads the binary image from flash one segment at a time:

- For segments with load addresses in internal *IRAM (Instruction RAM)* or *DRAM (Data RAM)*, the contents are copied from flash to the load address.
- For segments which have load addresses in *DROM (data stored in Flash)* or *IROM (code executed from Flash)* regions, the flash MMU is configured to provide the correct mapping from the flash to the load address.

Note that the second stage bootloader configures flash MMU for both PRO and APP CPUs, but it only enables flash MMU for PRO CPU. Reason for this is that second stage bootloader code is loaded into the memory region used by APP CPU cache. The duty of enabling cache for APP CPU is passed on to the application.

Once all segments are processed - meaning code is loaded and flash MMU is set up, second stage bootloader verifies the integrity of the application and then jumps to the application entry point found in the binary image header.

## 4.2.3 Application startup

Application startup covers everything that happens after the app starts executing and before the `app_main` function starts running inside the main task. This is split into three stages:

- Port initialization of hardware and basic C runtime environment.
- System initialization of software services and FreeRTOS.
- Running the main task and calling `app_main`.

---

**Note:** Understanding all stages of ESP-IDF app initialization is often not necessary. To understand initialization from the application developer's perspective only, skip forward to [Running the main task](#).

---

### Port Initialization

ESP-IDF application entry point is `call_start_cpu0` function found in [components/esp\\_system/port/cpu\\_start.c](#). This function is executed by the second stage bootloader, and never returns.

This port-layer initialization function initializes the basic C Runtime Environment ( "CRT" ) and performs initial configuration of the SoC's internal hardware:

- Reconfigure CPU exceptions for the app (allowing app interrupt handlers to run, and causing *Fatal Errors* to be handled using the options configured for the app rather than the simpler error handler provided by ROM).
- If the option `CONFIG_BOOTLOADER_WDT_ENABLE` is not set then the RTC watchdog timer is disabled.
- Initialize internal memory (data & bss).

- Finish configuring the MMU cache.
- Enable PSRAM if configured.
- Set the CPU clocks to the frequencies configured for the project.
- If the app is configured to run on multiple cores, start the other core and wait for it to initialize as well (inside the similar “port layer” initialization function `call_start_cpu1`).

Once `call_start_cpu0` completes running, it calls the “system layer” initialization function `start_cpu0` found in `components/esp_system/startup.c`. Other cores will also complete port-layer initialization and call `start_other_cores` found in the same file.

### System Initialization

The main system initialization function is `start_cpu0`. By default, this function is weak-linked to the function `start_cpu0_default`. This means that it’s possible to override this function to add some additional initialization steps.

The primary system initialization stage includes:

- Log information about this application (project name, *App version*, etc.) if default log level enables this.
- Initialize the heap allocator (before this point all allocations must be static or on the stack).
- Initialize newlib component syscalls and time functions.
- Configure the brownout detector.
- Setup libc stdin, stdout, and stderr according to the *serial console configuration*.
- Perform any security-related checks, including burning efuses that should be burned for this configuration (including *permanently limiting ROM download modes*).
- Initialize SPI flash API support.
- Call global C++ constructors and any C functions marked with `__attribute__((constructor))`.

Secondary system initialization allows individual components to be initialized. If a component has an initialization function annotated with the `ESP_SYSTEM_INIT_FN` macro, it will be called as part of secondary initialization.

### Running the main task

After all other components are initialized, the main task is created and the FreeRTOS scheduler starts running.

After doing some more initialization tasks (that require the scheduler to have started), the main task runs the application-provided function `app_main` in the firmware.

The main task that runs `app_main` has a fixed RTOS priority (one higher than the minimum) and a *configurable stack size*.

The main task core affinity is also configurable: `CONFIG_ESP_MAIN_TASK_AFFINITY`.

Unlike normal FreeRTOS tasks (or embedded C main functions), the `app_main` task is allowed to return. If this happens, the task is cleaned up and the system will continue running with other RTOS tasks scheduled normally. Therefore, it is possible to implement `app_main` as either a function that creates other application tasks and then returns, or as a main application task itself.

### Second core startup

A similar but simpler startup process happens on the APP CPU:

When running system initialization, the code on PRO CPU sets the entry point for APP CPU, de-asserts APP CPU reset, and waits for a global flag to be set by the code running on APP CPU, indicating that it has started. Once this is done, APP CPU jumps to `call_start_cpu1` function in `components/esp_system/port/cpu_start.c`.

While PRO CPU does initialization in `start_cpu0` function, APP CPU runs `start_cpu_other_cores` function. Similar to `start_cpu0`, this function is weak-linked and defaults to the

`start_cpu_other_cores_default` function but can be replaced with a different function by the application.

The `start_cpu_other_cores_default` function does some core-specific system initialization and then waits for the PRO CPU to start the FreeRTOS scheduler, at which point it executes `esp_startup_start_app_other_cores` which is another weak-linked function defaulting to `esp_startup_start_app_other_cores_default`.

By default `esp_startup_start_app_other_cores_default` does nothing but spin in a busy-waiting loop until the scheduler of the PRO CPU triggers an interrupt to start the RTOS scheduler on the APP CPU.

## 4.3 BluFi

### 4.3.1 Overview

The BluFi for ESP32-S3 is a Wi-Fi network configuration function via Bluetooth channel. It provides a secure protocol to pass Wi-Fi configuration and credentials to the ESP32-S3. Using this information ESP32-S3 can then e.g. connect to an AP or establish a SoftAP.

Fragmenting, data encryption, checksum verification in the BluFi layer are the key elements of this process.

You can customize symmetric encryption, asymmetric encryption and checksum support customization. Here we use the DH algorithm for key negotiation, 128-AES algorithm for data encryption, and CRC16 algorithm for checksum verification.

### 4.3.2 The BluFi Flow

The BluFi networking flow includes the configuration of the SoftAP and Station.

The following uses Station as an example to illustrate the core parts of the procedure, including broadcast, connection, service discovery, negotiation of the shared key, data transmission, connection status backhaul.

1. Set the ESP32-S3 into GATT Server mode and then it will send broadcasts with specific *advertising data*. You can customize this broadcast as needed, which is not a part of the BluFi Profile.
2. Use the App installed on the mobile phone to search for this particular broadcast. The mobile phone will connect to ESP32-S3 as the GATT Client once the broadcast is confirmed. The App used during this part is up to you.
3. After the GATT connection is successfully established, the mobile phone will send a data frame for key negotiation to ESP32-S3 (see the section *The Frame Formats Defined in BluFi* for details).
4. After ESP32-S3 receives the data frame of key negotiation, it will parse the content according to the user-defined negotiation method.
5. The mobile phone works with ESP32-S3 for key negotiation using the encryption algorithms such as DH, RSA or ECC.
6. After the negotiation process is completed, the mobile phone will send a control frame for security-mode setup to ESP32-S3.
7. When receiving this control frame, ESP32-S3 will be able to encrypt and decrypt the communication data using the shared key and the security configuration.
8. The mobile phone sends the data frame defined in the section of *The Frame Formats Defined in BluFi*, with the Wi-Fi configuration information to ESP32-S3, including SSID, password, etc.
9. The mobile phone sends a control frame of Wi-Fi connection request to ESP32-S3. When receiving this control frame, ESP32-S3 will regard the communication of essential information as done and get ready to connect to the Wi-Fi.
10. After connecting to the Wi-Fi, ESP32-S3 will send a control frame of Wi-Fi connection status report to the mobile phone, to report the connection status. At this point the networking procedure is completed.

**Note:**

1. After ESP32-S3 receives the control frame of security-mode configuration, it will execute the operations in accordance with the defined security mode.
2. The data lengths before and after symmetric encryption/decryption must stay the same. It also supports in-place encryption and decryption.

### 4.3.3 The Flow Chart of BluFi

Fig. 2: BluFi Flow Chart

### 4.3.4 The Frame Formats Defined in BluFi

The frame formats for the communication between the mobile phone App and ESP32-S3 are defined as follows:

The frame format with no fragment (8 bit):

Description	Value
Type (Least Significant Bit)	1
Frame Control	1
Sequence Number	1
Data Length	1
Data	\${Data Length}
Checksum (Most Significant Bit)	2

If the **Frame Ctrl** bit is enabled, the **Total length** bit indicates the length of remaining part of the frame. It can tell the remote how much memory needs to be allocated.

The frame format with fragments (8 bit) :

Description	Value
Type (Least Significant Bit)	1
Frame Control (Frag)	1
Sequence Number	1
Data Length	1
Data	<ul style="list-style-type: none"> <li>• Total Content Length: 2</li> <li>• Content: \${Data Length} - 2</li> </ul>
Checksum (Most Significant Bit)	2

Normally, the control frame does not contain data bits, except for ACK Frame.

The format of ACK Frame (8 bit) :

Description	Value
Type - ACK (Least Significant Bit)	1
Frame Control	1
Sequence Number	1
Data Length	1
Data	Acked Sequence Number: 2
Checksum (Most Significant Bit)	2

#### 1. Type

The **Type** field, taking 1 byte, is divided into **Type** and **Subtype**, that Type uses the lower 2 bits and **Subtype** uses the upper 6 bits.

- The control frame is not encrypted for the time being and supports to be verified;
- The data frame supports to be encrypted and verified.

##### 1.1 Control Frame (Binary: 0x0 b' 00)

Control Frame	Implication	Explanation	Note
0x0 (b' 000000)	ACK	The data field of the ACK frame uses the same sequence value of the frame to reply to.	The data field consumes a byte and its value is the same as the sequence field of the frame to reply to.
0x1 (b' 000001)	Set ESP device to the security mode.	To inform ESP device of the security mode to use when sending data, which is allowed to be reset multiple times during the process. Each setting affects the subsequent security mode used. If it is not set, ESP device will send the control frame and data frame with no checksum and encryption by default. The data transmission from the mobile phone to ESP device is controlled by this control frame.	The data field consumes a byte. The higher 4 bits are for the security mode setting of the control frame, and the lower 4 bits are for the security mode setting of the data frame. <ul style="list-style-type: none"> <li>b' 0000: no checksum and no encryption;</li> <li>b' 0001: with checksum but no encryption;</li> <li>b' 0010: no checksum but with encryption;</li> <li>b' 0011: with both checksum and encryption.</li> </ul>
0x2 (b' 000010)	Set the opmode of Wi-Fi.	The frame contains opmode settings for configuring the Wi-Fi mode of ESP device.	data[0] is for opmode settings, including: <ul style="list-style-type: none"> <li>0x00: NULL</li> <li>0x01: STA</li> <li>0x02: SoftAP</li> <li>0x03: SoftAP &amp; STA</li> </ul> Please set the SSID/Password/Max Connection Number of the AP mode in the first place if an AP gets involved.
0x3 (b' 000011)	Connect ESP device to the AP.	To notify ESP device that the essential information has been sent and it is allowed to connect to the AP.	No data field is contained.
0x4 (b' 000100)	Disconnect ESP device from the AP.		No data field is contained.
0x5 (b' 000101)	To get the information of ESP device's Wi-Fi mode and it's status.		<ul style="list-style-type: none"> <li>No data field is contained. When receiving this control frame, ESP device will send back a follow-up frame of Wi-Fi connection state report to the mobile phone with the information of the current opmode, connection status, SSID and so on.</li> <li>The types of information sent to the mobile phone is defined by the application installed on the phone.</li> </ul>
0x6 (b' 000110)	Disconnect the STA device from the SoftAP (in SoftAP mode).		Date[0~5] is taken as the MAC address for the STA device. If there is a second STA device, then it uses data[6-11] and the rest can be done in the same manner.
0x7 (b' 000111)	Get the version information.		
0x8 (b' 001000)	Disconnect the BLE GATT link.		ESP device will disconnect the BLE GATT link after receives this command.
0x9 (b' 001001)	Get the Wi-Fi list.	To get ESP device to scan the Wi-Fi access points around.	No data field is contained. When receiving this control frame, ESP device will send back a follow-up frame of Wi-Fi list report to the mobile phone.

## 1.2 Data Frame (Binary: 0x1 b' 01)

Data Frame	Implication	Explanation	Note
0x0 (b' 000000)	Send the negotiation data.	The negotiation data will be sent to the callback function registered in the application layer.	The length of the data depends on the length field.
0x1 (b' 000001)	Send the BSSID for STA mode.	To send the BSSID of the AP for the STA device to connect under the condition that the SSID is hidden.	Please refer to Note 1 below.
0x2 (b' 000010)	Send the SSID for STA mode.	To send the SSID of the AP for the STA device to connect.	Please refer to Note 1 below.
0x3 (b' 000011)	Send the password for STA mode.	To send the password of the AP for the STA device to connect.	Please refer to Note 1 below.
0x4 (b' 000100)	Send the SSID for SoftAP mode.		Please refer to Note 1 below.
0x5 (b' 000101)	Send the password for SoftAP mode.		Please refer to Note 1 below.
0x6 (b' 000110)	Set the maximum connection number for SoftAP mode.		data[0] represents the value of the connection number, ranging from 1 to 4. When the transmission direction is ESP device to the mobile phone, it means to provide the mobile phone with the needed information.
0x7 (b' 000111)	Set the authentication mode for the SoftAP.		data[0]: <ul style="list-style-type: none"> <li>• 0x00: OPEN</li> <li>• 0x01: WEP</li> <li>• 0x02: WPA_PSK</li> <li>• 0x03: WPA2_PSK</li> <li>• 0x04: WPA_WPA2_PSK</li> </ul> When the transmission direction is ESP device to the mobile phone, it means to provide the mobile phone with the needed information.
0x8 (b' 001000)	Set the number of channels for SoftAP mode.		data[0] represents the quantity of the supported channels, ranging from 1 to 14. When the transmission direction is ESP device to the mobile phone, it means to provide the mobile phone with the needed information.
0x9 (b' 001001)	Username	It provides the username of the GATT client when using encryption of enterprise level.	The length of the data depends on the length field.
0xa (b' 001010)	CA Certification	It provides the CA Certification when using encryption of enterprise level.	Please refer to Note 2 below.
0xb (b' 001011)	Client Certification	It provides the client certification when using encryption of enterprise level. Whether the private key is contained or not depends on the content of the certification.	Please refer to Note 2 below.
0xc (b' 001100)	Server Certification	It provides the sever certification when using encryption of enterprise level. Whether the private key is contained or not depends on the content of the certification.	Please refer to Note 2 below.
0xd (b' 001101)	Client Private Key	It provides the private key of the client when using encryption of enterprise level.	Please refer to Note 2 below.
0xe	Server Private Key	It provides the private key of	Please refer to Note 2 below.

**Note:**

- Note 1: The length of the data depends on the length field. When the transmission direction is ESP device to the mobile phone, it means to provide the mobile phone with the needed information.
- Note 2: The length of the data depends on the length field. The frame supports to be fragmented if the data length is not enough.

## 2. Frame Control

Control field, takes 1 byte and each bit has a different meaning.

Bit	Meaning
0x01	Indicates whether the frame is encrypted. <ul style="list-style-type: none"> <li>• 1 means encryption</li> <li>• 0 means unencrypted</li> </ul> The encrypted part of the frame includes the full clear data before the DATA field is encrypted (no checksum). Control frame is not encrypted, so this bit is 0.
0x02	The data field that indicates whether a frame contains a checksum (such as SHA1,MD5,CRC, etc.) for the end of the frame. Data field includes sequence + data length + clear text. Both the control frame and the data frame can contain a check bit or not.
0x04	Represents the data direction. <ul style="list-style-type: none"> <li>• 0 means the mobile phone to ESP device;</li> <li>• 1 means ESP device to the mobile phone.</li> </ul>
0x08	Indicates whether the other person is required to reply to an ACK. <ul style="list-style-type: none"> <li>• 0 indicates no requirement;</li> <li>• 1 indicates to reply ACK.</li> </ul>
0x10	Indicates whether there are subsequent data fragments. <ul style="list-style-type: none"> <li>• 0 indicates that there are no subsequent data fragments for this frame;</li> <li>• 1 indicates that there are subsequent data fragments and used to transmit longer data.</li> </ul> In the case of a frag frame, the total length of the current content section + subsequent content section is given, in the first 2 bytes of the data field (that is, the content data of the maximum support 64 K).
0x10~0x80	reserved

## 3. Sequence Control

Sequence control field. When a frame is sent, the value of sequence field is automatically incremented by 1 regardless of the type of frame, which prevents Replay Attack. The sequence is cleared after each reconnection.

## 4. Length

The length of the data field that does not include CheckSum.

## 5. Data

The instruction of the data field is different according to various values of Type or Subtype. Please refer to the table above.

## 6. CheckSum

This field takes 2 bytes that is used to check “sequence + data length + clear text data” .

### 4.3.5 The Security Implementation of ESP32-S3

## 1. Securing data

To ensure that the transmission of the Wi-Fi SSID and password is secure, the message needs to be encrypted using symmetric encryption algorithms, such as AES, DES and so on. Before using symmetric encryption algorithms, the devices are required to negotiate (or generate) a shared key using an asymmetric encryption algorithm (DH, RSA, ECC, etc).

## 2. Ensuring data integrity

To ensure data integrity, you need to add a checksum algorithm, such as SHA1, MD5, CRC, etc.

### 3. Securing identity (signature)

Algorithm like RSA can be used to secure identity. But for DH, it needs other algorithms as an companion for signature.

### 4. Replay attack prevention

It is added to the Sequence field and used during the checksum verification.

For the coding of ESP32-S3, you can determine and develop the security processing, such as key negotiation. The mobile application sends the negotiation data to ESP32-S3 and then the data will be sent to the application layer for processing. If the application layer does not process it, you can use the DH encryption algorithm provided by BluFi to negotiate the key.

The application layer needs to register several security-related functions to BluFi:

```
typedef void (*esp_blufi_negotiate_data_handler_t) (uint8_t *data, int len, uint8_t *
↳*output_data, int *output_len, bool *need_free)
```

This function is for ESP32-S3 to receive normal data during negotiation, and after processing is completed, the data will be transmitted using Output\_data and Output\_len.

BluFi will send output\_data from Negotiate\_data\_handler after Negotiate\_data\_handler is called.

Here are two “\*” , because the length of the data to be emitted is unknown that requires the function to allocate itself (malloc) or point to the global variable, and to inform whether the memory needs to be freed by NEED\_FREE.

```
typedef int (* esp_blufi_encrypt_func_t) (uint8_t iv8, uint8_t *crypt_data, int_
↳crypt_len)
```

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

```
typedef int (* esp_blufi_decrypt_func_t) (uint8_t iv8, uint8_t *crypt_data, int_
↳crypt_len)
```

The data to be encrypted and decrypted must use the same length. The IV8 is a 8 bit sequence value of frames, which can be used as a 8 bit of IV.

```
typedef uint16_t (*esp_blufi_checksum_func_t) (uint8_t iv8, uint8_t *data, int len)
```

This function is used to compute CheckSum and return a value of CheckSum. BluFi uses the returned value to compare the CheckSum of the frame.

## 4.3.6 GATT Related Instructions

### UUID

BluFi Service UUID: 0xFFFF, 16 bit

BluFi (the mobile -> ESP32-S3): 0xFF01, writable

Blufi (ESP32-S3 -> the mobile phone): 0xFF02, readable and callable

## 4.4 Bootloader

The ESP-IDF Software Bootloader performs the following functions:

1. Minimal initial configuration of internal modules;
2. Initialize *Flash Encryption* and/or *Secure* features, if configured;
3. Select the application partition to boot, based on the partition table and ota\_data (if any);
4. Load this image to RAM (IRAM & DRAM) and transfer management to the image that was just loaded.

Bootloader is located at the address 0x0 in the flash.

For a full description of the startup process including the the ESP-IDF bootloader, see [Application Startup Flow](#).

### 4.4.1 Bootloader compatibility

It is recommended to update to newer *versions of ESP-IDF*: when they are released. The OTA (over the air) update process can flash new apps in the field but cannot flash a new bootloader. For this reason, the bootloader supports booting apps built from newer versions of ESP-IDF.

The bootloader does not support booting apps from older versions of ESP-IDF. When updating ESP-IDF manually on an existing product that might need to downgrade the app to an older version, keep using the older ESP-IDF bootloader binary as well.

---

**Note:** If testing an OTA update for an existing product in production, always test it using the same ESP-IDF bootloader binary that is deployed in production.

---

### SPI Flash Configuration

Each ESP-IDF application or bootloader .bin file contains a header with [CONFIG\\_ESPTOOLPY\\_FLASHMODE](#), [CONFIG\\_ESPTOOLPY\\_FLASHFREQ](#), [CONFIG\\_ESPTOOLPY\\_FLASHSIZE](#) embedded in it. These are used to configure the SPI flash during boot.

The *First stage bootloader* in ROM reads the *Second stage bootloader* header information from flash and uses this information to load the rest of the *Second stage bootloader* from flash. However, at this time the system clock speed is lower than configured and not all flash modes are supported. When the *Second stage bootloader* then runs, it will reconfigure the flash using values read from the currently selected app binary's header (and NOT from the *Second stage bootloader* header). This allows an OTA update to change the SPI flash settings in use.

### 4.4.2 Log Level

The default bootloader log level is “Info” . By setting the [CONFIG\\_BOOTLOADER\\_LOG\\_LEVEL](#) option, it's possible to increase or decrease this level. This log level is separate from the log level used in the app (see [Logging library](#)).

Reducing bootloader log verbosity can improve the overall project boot time by a small amount.

### 4.4.3 Factory reset

Sometimes it is desirable to have a way for the device to fall back to a known-good state, in case of some problem with an update.

To roll back to the original “factory” device configuration and clear any user settings, configure the config item [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#) in the bootloader.

The factory reset mechanism allows the device to be factory reset in two ways:

- Clear one or more data partitions. The [CONFIG\\_BOOTLOADER\\_DATA\\_FACTORY\\_RESET](#) option allows users to specify which data partitions will be erased when the factory reset is executed. Users can specify the names of partitions as a comma-delimited list with optional spaces for readability. (Like this: `nvs, phy_init, nvs_custom`). Make sure that the names of partitions specified in the option are the same as those found in the partition table. Partitions of type “app” cannot be specified here.
- Boot from “factory” app partition. Enabling the [CONFIG\\_BOOTLOADER\\_OTA\\_DATA\\_ERASE](#) option will cause the device to boot from the default “factory” app partition after a factory reset (or if there is no factory app partition in the partition table then the default ota app partition is selected instead). This reset process

involves erasing the OTA data partition which holds the currently selected OTA partition slot. The “factory” app partition slot (if it exists) is never updated via OTA, so resetting to this allows reverting to a “known good” firmware application.

Either or both of these configuration options can be enabled independently.

In addition, the following configuration options control the reset condition:

- [\*CONFIG\\_BOOTLOADER\\_NUM\\_PIN\\_FACTORY\\_RESET\*](#) - The input GPIO number used to trigger a factory reset. This GPIO must be pulled low or high (configurable) on reset to trigger this.
- [\*CONFIG\\_BOOTLOADER\\_HOLD\\_TIME\\_GPIO\*](#) - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.
- [\*CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET\\_PIN\\_LEVEL\*](#) - configure whether a factory reset should trigger on a high or low level of the GPIO. If the GPIO has an internal pullup then this is enabled before the pin is sampled, consult the ESP32-S3 datasheet for details on pin internal pullups.

#### 4.4.4 Boot from Test Firmware

It’s possible to write a special firmware app for testing in production, and boot this firmware when needed. The project partition table will need a dedicated app partition entry for this testing app, type `app` and subtype `test` (see [Partition Tables](#)).

Implementing a dedicated test app firmware requires creating a totally separate ESP-IDF project for the test app (each project in ESP-IDF only builds one app). The test app can be developed and tested independently of the main project, and then integrated at production testing time as a pre-compiled `.bin` file which is flashed to the address of the main project’s test app partition.

To support this functionality in the main project’s bootloader, set the configuration item [\*CONFIG\\_BOOTLOADER\\_APP\\_TEST\*](#) and configure the following two items:

- [\*CONFIG\\_BOOTLOADER\\_NUM\\_PIN\\_APP\\_TEST\*](#) - GPIO number to boot TEST partition. The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset.  
Once the GPIO input is released (allowing it to be pulled up) and the device has been reboot, the normally configured application will boot (factory or any OTA app partition slot).
- [\*CONFIG\\_BOOTLOADER\\_HOLD\\_TIME\\_GPIO\*](#) - this is hold time of GPIO for reset/test mode (by default 5 seconds). The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

#### 4.4.5 Rollback

Rollback and anti-rollback features must be configured in the bootloader as well.

Consult the [App rollback](#) and [Anti-rollback](#) sections in the [OTA API reference document](#).

#### 4.4.6 Watchdog

By default, the hardware RTC Watchdog timer remains running while the bootloader is running and will automatically reset the chip if no app has successfully started after 9 seconds.

- The timeout period can be adjusted by setting [\*CONFIG\\_BOOTLOADER\\_WDT\\_TIME\\_MS\*](#) and recompiling the bootloader.
- The app’s behaviour can be adjusted so the RTC Watchdog remains enabled after app startup. The Watchdog would need to be explicitly reset (i.e., fed) by the app to avoid a reset. To do this, set the [\*CONFIG\\_BOOTLOADER\\_WDT\\_DISABLE\\_IN\\_USER\\_CODE\*](#) option, modify the app as needed, and then recompile the app.
- The RTC Watchdog can be disabled in the bootloader by disabling the [\*CONFIG\\_BOOTLOADER\\_WDT\\_ENABLE\*](#) setting and recompiling the bootloader. This is not recommended.

### 4.4.7 Bootloader Size

When enabling additional bootloader functions, including *Flash Encryption* or Secure Boot, and especially if setting a high `CONFIG_BOOTLOADER_LOG_LEVEL` level, then it is important to monitor the bootloader .bin file's size.

When using the default `CONFIG_PARTITION_TABLE_OFFSET` value 0x8000, the size limit is 0x8000 (32768) bytes.

If the bootloader binary is too large, then the bootloader build will fail with an error “Bootloader binary size [...] is too large for partition table offset” . If the bootloader binary is flashed anyhow then the ESP32-S3 will fail to boot - errors will be logged about either invalid partition table or invalid bootloader checksum.

---

**Note:** The bootloader size check only happens in the CMake Build System, when using the legacy GNU Make Build System the size is not checked but the ESP32-S3 will fail to boot if bootloader is too large.

---

Options to work around this are:

- Set *bootloader compiler optimization* back to “Size” if it has been changed from this default value.
- Reduce *bootloader log level*. Setting log level to Warning, Error or None all significantly reduce the final binary size (but may make it harder to debug).
- Set `CONFIG_PARTITION_TABLE_OFFSET` to a higher value than 0x8000, to place the partition table later in the flash. This increases the space available for the bootloader. If the *partition table* CSV file contains explicit partition offsets, they will need changing so no partition has an offset lower than `CONFIG_PARTITION_TABLE_OFFSET + 0x1000`. (This includes the default partition CSV files supplied with ESP-IDF.)

When Secure Boot V2 is enabled, there is also an absolute binary size limit of 64KB (0x10000 bytes) (excluding the 4 KB signature), because the bootloader is first loaded into a fixed size buffer for verification.

### 4.4.8 Fast boot from Deep Sleep

The bootloader has the `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` option which allows the wake-up time from deep sleep to be reduced (useful for reducing power consumption). This option is available when `CONFIG_SECURE_BOOT` option is disabled. Reduction of time is achieved due to the lack of image verification. During the first boot, the bootloader stores the address of the application being launched in the RTC FAST memory. And during the awakening, this address is used for booting without any checks, thus fast loading is achieved.

### 4.4.9 Custom bootloader

The current bootloader implementation allows a project to extend it or modify it. There are two ways of doing it: by implementing hooks or by overriding it. Both ways are presented in `custom_bootloader` folder in ESP-IDF examples:

- *bootloader\_hooks* which presents how to connect some hooks to the bootloader initialization
- *bootloader\_override* which presents how to override the bootloader implementation

In the bootloader space, you cannot use the drivers and functions from other components. If necessary, then the required functionality should be placed in the project's *bootloader\_components* directory (note that this will increase its size).

If the bootloader grows too large then it can collide with the partition table, which is flashed at offset 0x8000 by default. Increase the *partition table offset* value to place the partition table later in the flash. This increases the space available for the bootloader.

---

**Note:** Customize the bootloader by using either method is only supported with CMake build system (i.e. not supported with legacy Make build system).

---

## 4.5 Build System

This document explains the implementation of the ESP-IDF build system and the concept of “components” . Read this document if you want to know how to organize and build a new ESP-IDF project or component.

### 4.5.1 Overview

An ESP-IDF project can be seen as an amalgamation of a number of components. For example, for a webserver that shows the current humidity, there could be:

- The ESP-IDF base libraries (libc, ROM bindings, etc)
- The Wi-Fi drivers
- A TCP/IP stack
- The FreeRTOS operating system
- A webserver
- A driver for the humidity sensor
- Main code tying it all together

ESP-IDF makes these components explicit and configurable. To do that, when a project is compiled, the build system will look up all the components in the ESP-IDF directories, the project directories and (optionally) in additional custom component directories. It then allows the user to configure the ESP-IDF project using a text-based menu system to customize each component. After the components in the project are configured, the build system will compile the project.

#### Concepts

- A “project” is a directory that contains all the files and configuration to build a single “app” (executable), as well as additional supporting elements such as a partition table, data/filesystem partitions, and a bootloader.
- “Project configuration” is held in a single file called `sdkconfig` in the root directory of the project. This configuration file is modified via `idf.py menuconfig` to customise the configuration of the project. A single project contains exactly one project configuration.
- An “app” is an executable which is built by ESP-IDF. A single project will usually build two apps - a “project app” (the main executable, ie your custom firmware) and a “bootloader app” (the initial bootloader program which launches the project app).
- “components” are modular pieces of standalone code which are compiled into static libraries (.a files) and linked into an app. Some are provided by ESP-IDF itself, others may be sourced from other places.
- “Target” is the hardware for which an application is built. A full list of supported targets in your version if ESP-IDF can be seen by running `idf.py -list-targets`.

Some things are not part of the project:

- “ESP-IDF” is not part of the project. Instead it is standalone, and linked to the project via the `IDF_PATH` environment variable which holds the path of the `esp-idf` directory. This allows the IDF framework to be decoupled from your project.
- The toolchain for compilation is not part of the project. The toolchain should be installed in the system command line `PATH`.

### 4.5.2 Using the Build System

#### `idf.py`

The `idf.py` command-line tool provides a front-end for easily managing your project builds. It manages the following tools:

- [CMake](#), which configures the project to be built
- A command-line build tool (either [Ninja](#) build or *GNU Make*)

- `esptool.py` for flashing the target.

The *getting started guide* contains a brief introduction to how to set up `idf.py` to configure, build, and flash projects.

`idf.py` should be run in an ESP-IDF “project” directory, i.e. one containing a `CMakeLists.txt` file. Older style projects with a Makefile will not work with `idf.py`.

Type `idf.py --help` for a list of commands. Here are a summary of the most useful ones:

- `idf.py set-target <target>` sets the target (chip) for which the project is built. See *Selecting the Target*.
- `idf.py menuconfig` runs the “menuconfig” tool to configure the project.
- `idf.py build` will build the project found in the current directory. This can involve multiple steps:
  - Create the build directory if needed. The sub-directory `build` is used to hold build output, although this can be changed with the `-B` option.
  - Run `CMake` as necessary to configure the project and generate build files for the main build tool.
  - Run the main build tool (`Ninja` or `GNU Make`). By default, the build tool is automatically detected but it can be explicitly set by passing the `-G` option to `idf.py`.

Building is incremental so if no source files or configuration has changed since the last build, nothing will be done.

- `idf.py clean` will “clean” the project by deleting build output files from the build directory, forcing a “full rebuild” the next time the project is built. Cleaning doesn’t delete `CMake` configuration output and some other files.
- `idf.py fullclean` will delete the entire “build” directory contents. This includes all `CMake` configuration output. The next time the project is built, `CMake` will configure it from scratch. Note that this option recursively deletes *all* files in the build directory, so use with care. Project configuration is not deleted.
- `idf.py flash` will automatically build the project if necessary, and then flash it to the target. The `-p` and `-b` options can be used to set serial port name and flasher baud rate, respectively.
- `idf.py monitor` will display serial output from the target. The `-p` option can be used to set the serial port name. Type `Ctrl-]` to exit the monitor. See *IDF Monitor* for more details about using the monitor.

Multiple `idf.py` commands can be combined into one. For example, `idf.py -p COM4 clean flash monitor` will clean the source tree, then build the project and flash it to the target before running the serial monitor.

For commands that are not known to `idf.py` an attempt to execute them as a build system target will be made.

The command `idf.py` supports [shell autocompletion](#) for bash, zsh and fish shells.

In order to make [shell autocompletion](#) supported, please make sure you have at least Python 3.5 and [click 7.1](#) or newer (*see also*).

To enable autocompletion for `idf.py` use the `export` command (*see this*). Autocompletion is initiated by pressing the TAB key. Type “`idf.py -`” and press the TAB key to autocomplete options.

The autocomplete support for PowerShell is planned in the future.

---

**Note:** The environment variables `ESPPORT` and `ESPBAUD` can be used to set default values for the `-p` and `-b` options, respectively. Providing these options on the command line overrides the default.

---

### Advanced Commands

- `idf.py app`, `idf.py bootloader`, `idf.py partition-table` can be used to build only the app, bootloader, or partition table from the project as applicable.
- There are matching commands `idf.py app-flash`, etc. to flash only that single part of the project to the target.
- `idf.py -p PORT erase-flash` will use `esptool.py` to erase the target’s entire flash chip.
- `idf.py size` prints some size information about the app. `size-components` and `size-files` are similar commands which print more detailed per-component or per-source-file information, respectively. If you define variable `-DOUTPUT_JSON=1` when running `CMake` (or `idf.py`), the output will be formatted as JSON not as human readable text. See `idf.py-size` for more information.

- `idf.py reconfigure` re-runs [CMake](#) even if it doesn't seem to need re-running. This isn't necessary during normal usage, but can be useful after adding/removing files from the source tree, or when modifying CMake cache variables. For example, `idf.py -DNAME='VALUE' reconfigure` can be used to set variable `NAME` in CMake cache to value `VALUE`.
- `idf.py python-clean` deletes generated Python byte code from the IDF directory which may cause issues when switching between IDF and Python versions. It is advised to run this target after switching versions of Python.
- `idf.py docs` will open direct link to documentation for project's chip target and version in browser. To see all options use `idf.py docs --help`

The order of multiple `idf.py` commands on the same invocation is not important, they will automatically be executed in the correct order for everything to take effect (ie building before flashing, erasing before flashing, etc.).

**idf.py options** To list all available root level options, run `idf.py --help`. To list options that are specific for a subcommand, run `idf.py <command> --help`, for example `idf.py monitor --help`. Here is a list of some useful options:

- `-C <dir>` allows overriding the project directory from the default current working directory.
- `-B <dir>` allows overriding the build directory from the default `build` subdirectory of the project directory.
- `--ccache` flag can be used to enable [CCache](#) when compiling source files, if the [CCache](#) tool is installed. This can dramatically reduce some build times.

Note that some older versions of CCache may exhibit bugs on some platforms, so if files are not rebuilt as expected then try disabling CCache and build again. CCache can be enabled by default by setting the `IDF_CCACHE_ENABLE` environment variable to a non-zero value.

- `-v` flag causes both `idf.py` and the build system to produce verbose build output. This can be useful for debugging build problems.
- `--cmake-warn-uninitialized` (or `-w`) will cause CMake to print uninitialized variable warnings inside the project directory (not for directories not found inside the project directory). This only controls CMake variable warnings inside CMake itself, not other types of build warnings. This option can also be set permanently by setting the `IDF_CMAKE_WARN_UNINITIALIZED` environment variable to a non-zero value.

### Start a new project

Use the command `idf.py create-project` for starting a new project. Execute `idf.py create-project --help` for more information.

Example:

```
idf.py create-project --path my_projects my_new_project
```

This example will create a new project called `my_new_project` directly into the directory `my_projects`.

### Using CMake Directly

`idf.py` is a wrapper around [CMake](#) for convenience. However, you can also invoke CMake directly if you prefer.

When `idf.py` does something, it prints each command that it runs for easy reference. For example, the `idf.py build` command is the same as running these commands in a bash shell (or similar commands for Windows Command Prompt):

```
mkdir -p build
cd build
cmake .. -G Ninja # or 'Unix Makefiles'
ninja
```

In the above list, the `cmake` command configures the project and generates build files for use with the final build tool. In this case the final build tool is [Ninja](#): running `ninja` actually builds the project.

It's not necessary to run `cmake` more than once. After the first build, you only need to run `ninja` each time. `ninja` will automatically re-invoke `cmake` if the project needs reconfiguration.

If using CMake with `ninja` or `make`, there are also targets for more of the `idf.py` sub-commands - for example running `make menuconfig` or `ninja menuconfig` in the build directory will work the same as `idf.py menuconfig`.

---

**Note:** If you're already familiar with CMake, you may find the ESP-IDF CMake-based build system unusual because it wraps a lot of CMake's functionality to reduce boilerplate. See [writing pure CMake components](#) for some information about writing more "CMake style" components.

---

**Flashing with ninja or make** It's possible to build and flash directly from `ninja` or `make` by running a target like:

```
ninja flash
```

Or:

```
make app-flash
```

Available targets are: `flash`, `app-flash` (app only), `bootloader-flash` (bootloader only).

When flashing this way, optionally set the `ESPPORT` and `ESPBAUD` environment variables to specify the serial port and baud rate. You can set environment variables in your operating system or IDE project. Alternatively, set them directly on the command line:

```
ESPPORT=/dev/ttyUSB0 ninja flash
```

---

**Note:** Providing environment variables at the start of the command like this is Bash shell Syntax. It will work on Linux and macOS. It won't work when using Windows Command Prompt, but it will work when using Bash-like shells on Windows.

---

Or:

```
make -j3 app-flash ESPPORT=COM4 ESPBAUD=2000000
```

---

**Note:** Providing variables at the end of the command line is `make` syntax, and works for `make` on all platforms.

---

### Using CMake in an IDE

You can also use an IDE with CMake integration. The IDE will want to know the path to the project's `CMakeLists.txt` file. IDEs with CMake integration often provide their own build tools (CMake calls these "generators") to build the source files as part of the IDE.

When adding custom non-build steps like "flash" to the IDE, it is recommended to execute `idf.py` for these "special" commands.

For more detailed information about integrating ESP-IDF with CMake into an IDE, see [Build System Metadata](#).

### Setting up the Python Interpreter

ESP-IDF works well with all supported Python versions. It should work out-of-box even if you have a legacy system where the default `python` interpreter is still Python 2.7, however, it is advised to switch to Python 3 if possible.

`idf.py` and other Python scripts will run with the default Python interpreter, i.e. `python`. You can switch to a different one like `python3 $IDF_PATH/tools/idf.py . . .`, or you can set up a shell alias or another script to simplify the command.

If using CMake directly, running `cmake -D PYTHON=python3 . . .` will cause CMake to override the default Python interpreter.

If using an IDE with CMake, setting the `PYTHON` value as a CMake cache override in the IDE UI will override the default Python interpreter.

To manage the Python version more generally via the command line, check out the tools [pyenv](#) or [virtualenv](#). These let you change the default Python version.

**Possible issues** The user of `idf.py` may sometimes experience `ImportError` described below.

```
Traceback (most recent call last):
  File "/Users/user_name/e/esp-idf/tools/kconfig_new/configgen.py", line 27, in
↪<module>
    import kconfiglib
ImportError: bad magic number in 'kconfiglib': b'\x03\xf3\r\n'
```

The exception is often caused by `.pyc` files generated by different Python versions. To solve the issue run the following command:

```
idf.py python-clean
```

### 4.5.3 Example Project

An example project directory tree might look like this:

```
- myProject/
  - CMakeLists.txt
  - sdkconfig
  - components/
    - component1/
      - CMakeLists.txt
      - Kconfig
      - src1.c
    - component2/
      - CMakeLists.txt
      - Kconfig
      - src1.c
      - include/
        - component2.h
  - main/
    - CMakeLists.txt
    - src1.c
    - src2.c
  - build/
```

This example “myProject” contains the following elements:

- A top-level project `CMakeLists.txt` file. This is the primary file which CMake uses to learn how to build the project; and may set project-wide CMake variables. It includes the file [/tools/cmake/project.cmake](#) which implements the rest of the build system. Finally, it sets the project name and defines the project.
- “`sdkconfig`” project configuration file. This file is created/updated when `idf.py menuconfig` runs, and holds configuration for all of the components in the project (including ESP-IDF itself). The “`sdkconfig`” file may or may not be added to the source control system of the project.
- Optional “`components`” directory contains components that are part of the project. A project does not have to contain custom components of this kind, but it can be useful for structuring reusable code or including third party components that aren’t part of ESP-IDF. Alternatively, `EXTRA_COMPONENT_DIRS` can be set in the top-level `CMakeLists.txt` to look for components in other places. See the [renaming main](#) section for more info. If you have a lot of source files in your project, we recommend grouping most into components instead of putting them all in “`main`” .

- “main” directory is a special component that contains source code for the project itself. “main” is a default name, the CMake variable `COMPONENT_DIRS` includes this component but you can modify this variable.
- “build” directory is where build output is created. This directory is created by `idf.py` if it doesn’t already exist. CMake configures the project and generates interim build files in this directory. Then, after the main build process is run, this directory will also contain interim object files and libraries as well as final binary output files. This directory is usually not added to source control or distributed with the project source code.

Component directories each contain a component `CMakeLists.txt` file. This file contains variable definitions to control the build process of the component, and its integration into the overall project. See [Component CMakeLists Files](#) for more details.

Each component may also include a `Kconfig` file defining the *component configuration* options that can be set via `menuconfig`. Some components may also include `Kconfig.projbuild` and `project_include.cmake` files, which are special files for *overriding parts of the project*.

## 4.5.4 Project CMakeLists File

Each project has a single top-level `CMakeLists.txt` file that contains build settings for the entire project. By default, the project `CMakeLists` can be quite minimal.

### Minimal Example CMakeLists

Minimal project:

```
cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)
```

### Mandatory Parts

The inclusion of these three lines, in the order shown above, is necessary for every project:

- `cmake_minimum_required(VERSION 3.5)` tells CMake the minimum version that is required to build the project. ESP-IDF is designed to work with CMake 3.5 or newer. This line must be the first line in the `CMakeLists.txt` file.
- `include($ENV{IDF_PATH}/tools/cmake/project.cmake)` pulls in the rest of the CMake functionality to configure the project, discover all the components, etc.
- `project(myProject)` creates the project itself, and specifies the project name. The project name is used for the final binary output files of the app - ie `myProject.elf`, `myProject.bin`. Only one project can be defined per `CMakeLists` file.

### Optional Project Variables

These variables all have default values that can be overridden for custom behaviour. Look in [/tools/cmake/project.cmake](#) for all of the implementation details.

- `COMPONENT_DIRS`: Directories to search for components. Defaults to `IDF_PATH/components`, `PROJECT_DIR/components`, and `EXTRA_COMPONENT_DIRS`. Override this variable if you don’t want to search for components in these places.
- `EXTRA_COMPONENT_DIRS`: Optional list of additional directories to search for components. Paths can be relative to the project directory, or absolute.
- `COMPONENTS`: A list of component names to build into the project. Defaults to all components found in the `COMPONENT_DIRS` directories. Use this variable to “trim down” the project for faster build times. Note that any component which “requires” another component via the `REQUIRES` or `PRIV_REQUIRES` arguments on component registration will automatically have it added to this list, so the `COMPONENTS` list can be very short.

Any paths in these variables can be absolute paths, or set relative to the project directory.

To set these variables, use the `cmake set command` ie `set (VARIABLE "VALUE")`. The `set ()` commands should be placed after the `cmake_minimum (...)` line but before the `include (...)` line.

### Renaming `main` component

The build system provides special treatment to the `main` component. It is a component that gets automatically added to the build provided that it is in the expected location, `PROJECT_DIR/main`. All other components in the build are also added as its dependencies, saving the user from hunting down dependencies and providing a build that works right out of the box. Renaming the `main` component causes the loss of these behind-the-scenes heavy lifting, requiring the user to specify the location of the newly renamed component and manually specifying its dependencies. Specifically, the steps to renaming `main` are as follows:

1. Rename `main` directory.
2. Set `EXTRA_COMPONENT_DIRS` in the project `CMakeLists.txt` to include the renamed `main` directory.
3. Specify the dependencies in the renamed component's `CMakeLists.txt` file via `REQUIRES` or `PRIV_REQUIRES` arguments *on component registration*.

### Overriding default build specifications

The build sets some global build specifications (compile flags, definitions, etc.) that gets used in compiling all sources from all components.

For example, one of the default build specifications set is the compile option `-Wextra`. Suppose a user wants to use override this with `-Wno-extra`, it should be done after `project ()`:

```
cmake_minimum_required(VERSION 3.5)
include($ENV{IDF_PATH}/tools/cmake/project.cmake)
project(myProject)

idf_build_set_property(COMPILE_OPTIONS "-Wno-error" APPEND)
```

This ensures that the compile options set by the user won't be overridden by the default build specifications, since the latter are set inside `project ()`.

## 4.5.5 Component `CMakeLists` Files

Each project contains one or more components. Components can be part of ESP-IDF, part of the project's own components directory, or added from custom component directories (*see above*).

A component is any directory in the `COMPONENT_DIRS` list which contains a `CMakeLists.txt` file.

### Searching for Components

The list of directories in `COMPONENT_DIRS` is searched for the project's components. Directories in this list can either be components themselves (ie they contain a `CMakeLists.txt` file), or they can be top-level directories whose sub-directories are components.

When CMake runs to configure the project, it logs the components included in the build. This list can be useful for debugging the inclusion/exclusion of certain components.

### Multiple components with the same name

When ESP-IDF is collecting all the components to compile, it will do this in the order specified by `COMPONENT_DIRS`; by default, this means ESP-IDF's internal components first (`IDF_PATH/components`), then any components in directories specified in `EXTRA_COMPONENT_DIRS`, and finally the project's components

(PROJECT\_DIR/components). If two or more of these directories contain component sub-directories with the same name, the component in the last place searched is used. This allows, for example, overriding ESP-IDF components with a modified version by copying that component from the ESP-IDF components directory to the project components directory and then modifying it there. If used in this way, the ESP-IDF directory itself can remain untouched.

---

**Note:** If a component is overridden in an existing project by moving it to a new location, the project will not automatically see the new component path. Run `idf.py reconfigure` (or delete the project build folder) and then build again.

---

### Minimal Component CMakeLists

The minimal component `CMakeLists.txt` file simply registers the component to the build system using `idf_component_register`:

```
idf_component_register(SRCS "foo.c" "bar.c"
                      INCLUDE_DIRS "include"
                      REQUIRES mbedtls)
```

- `SRCS` is a list of source files (`*.c`, `*.cpp`, `*.cc`, `*.S`). These source files will be compiled into the component library.
- `INCLUDE_DIRS` is a list of directories to add to the global include search path for any component which requires this component, and also the main source files.
- `REQUIRES` is not actually required, but it is very often required to declare what other components this component will use. See [Component Requirements](#).

A library with the name of the component will be built and linked into the final app.

Directories are usually specified relative to the `CMakeLists.txt` file itself, although they can be absolute.

There are other arguments that can be passed to `idf_component_register`. These arguments are discussed [here](#).

See [example component requirements](#) and [example component CMakeLists](#) for more complete component `CMakeLists.txt` examples.

### Create a new component

Use the command `idf.py create-component` for creating a new component. The new component will contain set of files necessary for building a component. You may include the component's header file into your project and use its functionality. For more information execute `idf.py create-component --help`.

Example:

```
idf.py -C components create-component my_component
```

The example will create a new component in the subdirectory `components` under the current working directory. For more information about components follow the documentation page [see above](#).

### Preset Component Variables

The following component-specific variables are available for use inside component `CMakeLists`, but should not be modified:

- `COMPONENT_DIR`: The component directory. Evaluates to the absolute path of the directory containing `CMakeLists.txt`. The component path cannot contain spaces. This is the same as the `CMAKE_CURRENT_SOURCE_DIR` variable.
- `COMPONENT_NAME`: Name of the component. Same as the name of the component directory.

- `COMPONENT_ALIAS`: Alias of the library created internally by the build system for the component.
- `COMPONENT_LIB`: Name of the library created internally by the build system for the component.

The following variables are set at the project level, but available for use in component CMakeLists:

- `CONFIG_*`: Each value in the project configuration has a corresponding variable available in cmake. All names begin with `CONFIG_`. [More information here](#).
- `ESP_PLATFORM`: Set to 1 when the CMake file is processed within ESP-IDF build system.

### Build/Project Variables

The following are some project/build variables that are available as build properties and whose values can be queried using `idf_build_get_property` from the component CMakeLists.txt:

- `PROJECT_NAME`: Name of the project, as set in project CMakeLists.txt file.
- `PROJECT_DIR`: Absolute path of the project directory containing the project CMakeLists. Same as the `CMAKE_SOURCE_DIR` variable.
- `COMPONENTS`: Names of all components that are included in this build, formatted as a semicolon-delimited CMake list.
- `IDF_VER`: Git version of ESP-IDF (produced by `git describe`)
- `IDF_VERSION_MAJOR`, `IDF_VERSION_MINOR`, `IDF_VERSION_PATCH`: Components of ESP-IDF version, to be used in conditional expressions. Note that this information is less precise than that provided by `IDF_VER` variable. `v4.0-dev-*`, `v4.0-beta1`, `v4.0-rc1` and `v4.0` will all have the same values of `IDF_VERSION_*` variables, but different `IDF_VER` values.
- `IDF_TARGET`: Name of the target for which the project is being built.
- `PROJECT_VER`: Project version.
  - If `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used.
  - Else, if `PROJECT_VER` variable is set in project CMakeLists.txt file, its value will be used.
  - Else, if the `PROJECT_DIR/version.txt` exists, its contents will be used as `PROJECT_VER`.
  - Else, if the project is located inside a Git repository, the output of `git describe` will be used.
  - Otherwise, `PROJECT_VER` will be “1” .

Other build properties are listed [here](#).

### Controlling Component Compilation

To pass compiler options when compiling source files belonging to a particular component, use the `target_compile_options` function:

```
target_compile_options(${COMPONENT_LIB} PRIVATE -Wno-unused-variable)
```

To apply the compilation flags to a single source file, use the CMake `set_source_files_properties` command:

```
set_source_files_properties(mysrc.c
  PROPERTIES COMPILE_FLAGS
  -Wno-unused-variable
)
```

This can be useful if there is upstream code that emits warnings.

When using these commands, place them after the call to `idf_component_register` in the component CMakeLists file.

## 4.5.6 Component Configuration

Each component can also have a `Kconfig` file, alongside `CMakeLists.txt`. This contains configuration settings to add to the configuration menu for this component.

These settings are found under the “Component Settings” menu when menuconfig is run.

To create a component Kconfig file, it is easiest to start with one of the Kconfig files distributed with ESP-IDF.

For an example, see [Adding conditional configuration](#).

### 4.5.7 Preprocessor Definitions

The ESP-IDF build system adds the following C preprocessor definitions on the command line:

- `ESP_PLATFORM`: Can be used to detect that build happens within ESP-IDF.
- `IDF_VER`: Defined to a git version string. E.g. `v2.0` for a tagged release or `v1.0-275-g0efaa4f` for an arbitrary commit.

### 4.5.8 Component Requirements

When compiling each component, the ESP-IDF build system recursively evaluates its dependencies. This means each component needs to declare the components that it depends on ( “requires” ).

#### When writing a component

```
idf_component_register(...
    REQUIRES mbedtls
    PRIV_REQUIRES console spiffs)
```

- `REQUIRES` should be set to all components whose header files are `#included` from the *public* header files of this component.
- `PRIV_REQUIRES` should be set to all components whose header files are `#included` from *any source files* in this component, unless already listed in `REQUIRES`. Also any component which is required to be linked in order for this component to function correctly.
- The values of `REQUIRES` and `PRIV_REQUIRES` should not depend on any configuration choices (`CONFIG_XXX` macros). This is because requirements are expanded before configuration is loaded. Other component variables (like include paths or source files) can depend on configuration choices.
- Not setting either or both `REQUIRES` variables is fine. If the component has no requirements except for the *Common component requirements* needed for RTOS, libc, etc.

If a components only supports some target chips (values of `IDF_TARGET`) then it can specify `REQUIRED_IDF_TARGETS` in the `idf_component_register` call to express these requirements. In this case the build system will generate an error if the component is included into the build, but does not support the selected target.

---

**Note:** In CMake terms, `REQUIRES` & `PRIV_REQUIRES` are approximate wrappers around the CMake functions `target_link_libraries(... PUBLIC ...)` and `target_link_libraries(... PRIVATE ...)`.

---

#### Example of component requirements

Imagine there is a `car` component, which uses the `engine` component, which uses the `spark_plug` component:

```
- autoProject/
  - CMakeLists.txt
  - components/ - car/ - CMakeLists.txt
                    - car.c
                    - car.h
  - engine/ - CMakeLists.txt
```

(continues on next page)

(continued from previous page)

```

- engine.c
- include/ - engine.h
- spark_plug/ - CMakeLists.txt
- plug.c
- plug.h

```

**Car component** The `car.h` header file is the public interface for the `car` component. This header includes `engine.h` directly because it uses some declarations from this header:

```

/* car.h */
#include "engine.h"

#ifdef ENGINE_IS_HYBRID
#define CAR_MODEL "Hybrid"
#endif

```

And `car.c` includes `car.h` as well:

```

/* car.c */
#include "car.h"

```

This means the `car/CMakeLists.txt` file needs to declare that `car` requires `engine`:

```

idf_component_register(SRCS "car.c"
                      INCLUDE_DIRS "."
                      REQUIRES engine)

```

- `SRCS` gives the list of source files in the `car` component.
- `INCLUDE_DIRS` gives the list of public include directories for this component. Because the public interface is `car.h`, the directory containing `car.h` is listed here.
- `REQUIRES` gives the list of components required by the public interface of this component. Because `car.h` is a public header and includes a header from `engine`, we include `engine` here. This makes sure that any other component which includes `car.h` will be able to recursively include the required `engine.h` also.

**Engine component** The `engine` component also has a public header file `include/engine.h`, but this header is simpler:

```

/* engine.h */
#define ENGINE_IS_HYBRID

void engine_start(void);

```

The implementation is in `engine.c`:

```

/* engine.c */
#include "engine.h"
#include "spark_plug.h"

...

```

In this component, `engine` depends on `spark_plug` but this is a private dependency. `spark_plug.h` is needed to compile `engine.c`, but not needed to include `engine.h`.

This means that the `engine/CMakeLists.txt` file can use `PRIV_REQUIRES`:

```

idf_component_register(SRCS "engine.c"
                      INCLUDE_DIRS "include"
                      PRIV_REQUIRES spark_plug)

```

As a result, source files in the `car` component don't need the `spark_plug` include directories added to their compiler search path. This can speed up compilation, and stops compiler command lines from becoming longer than necessary.

**Spark Plug Component** The `spark_plug` component doesn't depend on anything else. It has a public header file `spark_plug.h`, but this doesn't include headers from any other components.

This means that the `spark_plug/CMakeLists.txt` file doesn't need any `REQUIRES` or `PRIV_REQUIRES` clauses:

```
idf_component_register(SRCS "spark_plug.c"
                      INCLUDE_DIRS ".")
```

### Source File Include Directories

Each component's source file is compiled with these include path directories, as specified in the passed arguments to `idf_component_register`:

```
idf_component_register(..
                      INCLUDE_DIRS "include"
                      PRIV_INCLUDE_DIRS "other")
```

- The current component's `INCLUDE_DIRS` and `PRIV_INCLUDE_DIRS`.
- The `INCLUDE_DIRS` belonging to all other components listed in the `REQUIRES` and `PRIV_REQUIRES` parameters (ie all the current component's public and private dependencies).
- Recursively, all of the `INCLUDE_DIRS` of those components `REQUIRES` lists (ie all public dependencies of this component's dependencies, recursively expanded).

### Main component requirements

The component named `main` is special because it automatically requires all other components in the build. So it's not necessary to pass `REQUIRES` or `PRIV_REQUIRES` to this component. See [renaming main](#) for a description of what needs to be changed if no longer using the `main` component.

### Common component requirements

To avoid duplication, every component automatically requires some "common" IDF components even if they are not mentioned explicitly. Headers from these components can always be included.

The list of common components is: `cxx`, `newlib`, `freertos`, `esp_hw_support`, `heap`, `log`, `lwip`, `soc`, `hal`, `esp_rom`, `esp_common`, `esp_system`.

### Including components in the build

- By default, every component is included in the build.
- If you set the `COMPONENTS` variable to a minimal list of components used directly by your project, then the build will expand to also include required components. The full list of components will be:
  - Components mentioned explicitly in `COMPONENTS`.
  - Those components' requirements (evaluated recursively).
  - The "common" components that every component depends on.
- Setting `COMPONENTS` to the minimal list of required components can significantly reduce compile times.

## Circular Dependencies

It's possible for a project to contain Component A that requires (REQUIRES or PRIV\_REQUIRES) Component B, and Component B that requires Component A. This is known as a dependency cycle or a circular dependency.

CMake will usually handle circular dependencies automatically by repeating the component library names twice on the linker command line. However this strategy doesn't always work, and it's possible the build will fail with a linker error about "Undefined reference to ...", referencing a symbol defined by one of the components inside the circular dependency. This is particularly likely if there is a large circular dependency, i.e. A->B->C->D->A.

The best solution is to restructure the components to remove the circular dependency. In most cases, a software architecture without circular dependencies has desirable properties of modularity and clean layering and will be more maintainable in the long term. However, removing circular dependencies is not always possible.

To bypass a linker error caused by a circular dependency, the simplest workaround is to increase the CMake `LINK_INTERFACE_MULTIPLICITY` property of one of the component libraries. This causes CMake to repeat this library and its dependencies more than two times on the linker command line.

For example:

```
set_property(TARGET ${COMPONENT_LIB} APPEND PROPERTY LINK_INTERFACE_MULTIPLICITY 3)
```

- This line should be placed after `idf_component_register` in the component CMakeLists.txt file.
- If possible, place this line in the component that creates the circular dependency by depending on a lot of other components. However, the line can be placed inside any component that is part of the cycle. Choosing the component that owns the source file shown in the linker error message, or the component that defines the symbol(s) mentioned in the linker error message, is a good place to start.
- Usually increasing the value to 3 (default is 2) is enough, but if this doesn't work then try increasing the number further.
- Adding this option will make the linker command line longer, and the linking stage slower.

**Advanced Workaround: Undefined Symbols** If only one or two symbols is causing a circular dependency, and all other dependencies are linear, then there is an alternative method to avoid linker errors: Specify the specific symbols required for the "reverse" dependency as undefined symbols at link time.

For example, if component A depends on component B but component B also needs to reference `reverse_ops` from component A (but nothing else), then you can add a line like the following to the component B CMakeLists.txt to resolve the cycle at link time:

```
# This symbol is provided by 'Component A' at link time
target_link_libraries(${COMPONENT_LIB} INTERFACE "-u reverse_ops")
```

- The `-u` argument means that the linker will always include this symbol in the link, regardless of dependency ordering.
- This line should be placed after `idf_component_register` in the component CMakeLists.txt file.
- If 'Component B' doesn't need to access any headers of 'Component A', only link to a few symbol(s), then this line can be used instead of any REQUIRES from B to A. This further simplifies the component structure in the build system.

See the [target\\_link\\_libraries](#) documentation for more information about this CMake function.

## Requirements in the build system implementation

- Very early in the CMake configuration process, the script `expand_requirements.cmake` is run. This script does a partial evaluation of all component CMakeLists.txt files and builds a graph of component requirements (this *graph may have cycles*). The graph is used to generate a file `component_depends.cmake` in the build directory.
- The main CMake process then includes this file and uses it to determine the list of components to include in the build (internal `BUILD_COMPONENTS` variable). The `BUILD_COMPONENTS` variable is sorted so dependencies are listed first, however as the component dependency graph has cycles this cannot be guaranteed

for all components. The order should be deterministic given the same set of components and component dependencies.

- The value of `BUILD_COMPONENTS` is logged by CMake as “Component names: “
- Configuration is then evaluated for the components included in the build.
- Each component is included in the build normally and the `CMakeLists.txt` file is evaluated again to add the component libraries to the build.

**Component Dependency Order** The order of components in the `BUILD_COMPONENTS` variable determines other orderings during the build:

- Order that `project_include.cmake` files are included into the project.
- Order that the list of header paths is generated for compilation (via `-I` argument). (Note that for a given component’s source files, only that component’s dependency’s header paths are passed to the compiler.)

## 4.5.9 Overriding Parts of the Project

### `project_include.cmake`

For components that have build requirements which must be evaluated before any component `CMakeLists` files are evaluated, you can create a file called `project_include.cmake` in the component directory. This CMake file is included when `project.cmake` is evaluating the entire project.

`project_include.cmake` files are used inside ESP-IDF, for defining project-wide build features such as `esptool.py` command line arguments and the bootloader “special app” .

Unlike component `CMakeLists.txt` files, when including a `project_include.cmake` file the current source directory (`CMAKE_CURRENT_SOURCE_DIR` and working directory) is the project directory. Use the variable `COMPONENT_DIR` for the absolute directory of the component.

Note that `project_include.cmake` isn’t necessary for the most common component uses - such as adding include directories to the project, or `LDFLAGS` to the final linking step. These values can be customised via the `CMakeLists.txt` file itself. See [Optional Project Variables](#) for details.

`project_include.cmake` files are included in the order given in `BUILD_COMPONENTS` variable (as logged by CMake). This means that a component’s `project_include.cmake` file will be included after it’s all dependencies’ `project_include.cmake` files, unless both components are part of a dependency cycle. This is important if a `project_include.cmake` file relies on variables set by another component. See also [above](#).

Take great care when setting variables or targets in a `project_include.cmake` file. As the values are included into the top-level project CMake pass, they can influence or break functionality across all components!

### `KConfig.projbuild`

This is an equivalent to `project_include.cmake` for [Component Configuration](#) `KConfig` files. If you want to include configuration options at the top-level of `menuconfig`, rather than inside the “Component Configuration” sub-menu, then these can be defined in the `KConfig.projbuild` file alongside the `CMakeLists.txt` file.

Take care when adding configuration values in this file, as they will be included across the entire project configuration. Where possible, it’s generally better to create a `KConfig` file for [Component Configuration](#).

`project_include.cmake` files are used inside ESP-IDF, for defining project-wide build features such as `esptool.py` command line arguments and the bootloader “special app” .

## 4.5.10 Configuration-Only Components

Special components which contain no source files, only `Kconfig.projbuild` and `KConfig`, can have a one-line `CMakeLists.txt` file which calls the function `idf_component_register()` with no arguments specified. This function will include the component in the project build, but no library will be built *and* no header files will be added to any include paths.

### 4.5.11 Debugging CMake

For full details about [CMake](#) and CMake commands, see the [CMake v3.5 documentation](#).

Some tips for debugging the ESP-IDF CMake-based build system:

- When CMake runs, it prints quite a lot of diagnostic information including lists of components and component paths.
- Running `cmake -DDEBUG=1` will produce more verbose diagnostic output from the IDF build system.
- Running `cmake` with the `--trace` or `--trace-expand` options will give a lot of information about control flow. See the [cmake command line documentation](#).

When included from a project CMakeLists file, the `project.cmake` file defines some utility modules and global variables and then sets `IDF_PATH` if it was not set in the system environment.

It also defines an overridden custom version of the built-in [CMake](#) `project` function. This function is overridden to add all of the ESP-IDF specific project functionality.

#### Warning On Undefined Variables

By default, `idf.py` passes the `--warn-uninitialized` flag to [CMake](#) so it will print a warning if an undefined variable is referenced in the build. This can be very useful to find buggy CMake files.

If you don't want this behaviour, it can be disabled by passing `--no-warnings` to `idf.py`.

Browse the [/tools/cmake/project.cmake](#) file and supporting functions in [/tools/cmake/](#) for more details.

### 4.5.12 Example Component CMakeLists

Because the build environment tries to set reasonable defaults that will work most of the time, component `CMakeLists.txt` can be very small or even empty (see [Minimal Component CMakeLists](#)). However, overriding [component variables](#) is usually required for some functionality.

Here are some more advanced examples of component CMakeLists files.

#### Adding conditional configuration

The configuration system can be used to conditionally compile some files depending on the options selected in the project configuration.

Kconfig:

```
config FOO_ENABLE_BAR
    bool "Enable the BAR feature."
    help
        This enables the BAR feature of the FOO component.
```

CMakeLists.txt:

```
set(srcs "foo.c" "more_foo.c")

if(CONFIG_FOO_ENABLE_BAR)
    list(APPEND srcs "bar.c")
endif()

idf_component_register(SRCS "${srcs}"
    ...)
```

This example makes use of the CMake `if` function and `list APPEND` function.

This can also be used to select or stub out an implementation, as such:

Kconfig:

```
config ENABLE_LCD_OUTPUT
    bool "Enable LCD output."
    help
        Select this if your board has a LCD.

config ENABLE_LCD_CONSOLE
    bool "Output console text to LCD"
    depends on ENABLE_LCD_OUTPUT
    help
        Select this to output debugging output to the lcd

config ENABLE_LCD_PLOT
    bool "Output temperature plots to LCD"
    depends on ENABLE_LCD_OUTPUT
    help
        Select this to output temperature plots
```

CMakeLists.txt:

```
if(CONFIG_ENABLE_LCD_OUTPUT)
    set(srcs lcd-real.c lcd-spi.c)
else()
    set(srcs lcd-dummy.c)
endif()

# We need font if either console or plot is enabled
if(CONFIG_ENABLE_LCD_CONSOLE OR CONFIG_ENABLE_LCD_PLOT)
    list(APPEND srcs "font.c")
endif()

idf_component_register(SRCS "${srcs}"
    ...)
```

### Conditions which depend on the target

The current target is available to CMake files via `IDF_TARGET` variable.

In addition to that, if target `xyz` is used (`IDF_TARGET=xyz`), then Kconfig variable `CONFIG_IDF_TARGET_XYZ` will be set.

Note that component dependencies may depend on `IDF_TARGET` variable, but not on Kconfig variables. Also one can not use Kconfig variables in `include` statements in CMake files, but `IDF_TARGET` can be used in such context.

### Source Code Generation

Some components will have a situation where a source file isn't supplied with the component itself but has to be generated from another file. Say our component has a header file that consists of the converted binary data of a BMP file, converted using a hypothetical tool called `bmp2h`. The header file is then included in as C source file called `graphics_lib.c`:

```
add_custom_command(OUTPUT logo.h
    COMMAND bmp2h -i ${COMPONENT_DIR}/logo.bmp -o log.h
    DEPENDS ${COMPONENT_DIR}/logo.bmp
    VERBATIM)

add_custom_target(logo DEPENDS logo.h)
add_dependencies(${COMPONENT_LIB} logo)
```

(continues on next page)

(continued from previous page)

```
set_property(DIRECTORY "${COMPONENT_DIR}" APPEND PROPERTY
  ADDITIONAL_MAKE_CLEAN_FILES logo.h)
```

This answer is adapted from the [CMake FAQ entry](#), which contains some other examples that will also work with ESP-IDF builds.

In this example, `logo.h` will be generated in the current directory (the build directory) while `logo.bmp` comes with the component and resides under the component path. Because `logo.h` is a generated file, it should be cleaned when the project is cleaned. For this reason it is added to the `ADDITIONAL_MAKE_CLEAN_FILES` property.

---

**Note:** If generating files as part of the project `CMakeLists.txt` file, not a component `CMakeLists.txt`, then use build property `PROJECT_DIR` instead of `COMPONENT_DIR` and `PROJECT_NAME` instead of `COMPONENT_LIB`.

---

If a source file from another component included `logo.h`, then `add_dependencies` would need to be called to add a dependency between the two components, to ensure that the component source files were always compiled in the correct order.

### Embedding Binary Data

Sometimes you have a file with some binary or text data that you'd like to make available to your component - but you don't want to reformat the file as C source.

You can specify argument `EMBED_FILES` in the component registration, giving space-delimited names of the files to embed:

```
idf_component_register(...
  EMBED_FILES server_root_cert.der)
```

Or if the file is a string, you can use the variable `EMBED_TXTFILES`. This will embed the contents of the text file as a null-terminated string:

```
idf_component_register(...
  EMBED_TXTFILES server_root_cert.pem)
```

The file's contents will be added to the `.rodata` section in flash, and are available via symbol names as follows:

```
extern const uint8_t server_root_cert_pem_start[] asm("_binary_server_root_cert_
↪pem_start");
extern const uint8_t server_root_cert_pem_end[]   asm("_binary_server_root_cert_
↪pem_end");
```

The names are generated from the full name of the file, as given in `EMBED_FILES`. Characters `/`, `.`, etc. are replaced with underscores. The `_binary` prefix in the symbol name is added by objcopy and is the same for both text and binary files.

To embed a file into a project, rather than a component, you can call the function `target_add_binary_data` like this:

```
target_add_binary_data(myproject.elf "main/data.bin" TEXT)
```

Place this line after the `project()` line in your project `CMakeLists.txt` file. Replace `myproject.elf` with your project name. The final argument can be `TEXT` to embed a null-terminated string, or `BINARY` to embed the content as-is.

For an example of using this technique, see the "main" component of the [file\\_serving example protocols/http\\_server/file\\_serving/main/CMakeLists.txt](#) - two files are loaded at build time and linked into the firmware.

It is also possible embed a generated file:

```
add_custom_command(OUTPUT my_processed_file.bin
                   COMMAND my_process_file_cmd my_unprocessed_file.bin)
target_add_binary_data(my_target "my_processed_file.bin" BINARY)
```

In the example above, `my_processed_file.bin` is generated from `my_unprocessed_file.bin` through some command `my_process_file_cmd`, then embedded into the target.

To specify a dependence on a target, use the `DEPENDS` argument:

```
add_custom_target(my_process COMMAND ...)
target_add_binary_data(my_target "my_embed_file.bin" BINARY DEPENDS my_process)
```

The `DEPENDS` argument to `target_add_binary_data` ensures that the target executes first.

## Code and Data Placements

ESP-IDF has a feature called linker script generation that enables components to define where its code and data will be placed in memory through linker fragment files. These files are processed by the build system, and is used to augment the linker script used for linking app binary. See [Linker Script Generation](#) for a quick start guide as well as a detailed discussion of the mechanism.

## Fully Overriding The Component Build Process

Obviously, there are cases where all these recipes are insufficient for a certain component, for example when the component is basically a wrapper around another third-party component not originally intended to be compiled under this build system. In that case, it's possible to forego the ESP-IDF build system entirely by using a CMake feature called [ExternalProject](#). Example component CMakeLists:

```
# External build process for quirc, runs in source dir and
# produces libquirc.a
externalproject_add(quirc_build
  PREFIX ${COMPONENT_DIR}
  SOURCE_DIR ${COMPONENT_DIR}/quirc
  CONFIGURE_COMMAND ""
  BUILD_IN_SOURCE 1
  BUILD_COMMAND make CC=${CMAKE_C_COMPILER} libquirc.a
  INSTALL_COMMAND ""
)

# Add libquirc.a to the build process
add_library(quirc STATIC IMPORTED GLOBAL)
add_dependencies(quirc quirc_build)

set_target_properties(quirc PROPERTIES IMPORTED_LOCATION
  ${COMPONENT_DIR}/quirc/libquirc.a)
set_target_properties(quirc PROPERTIES INTERFACE_INCLUDE_DIRECTORIES
  ${COMPONENT_DIR}/quirc/lib)

set_directory_properties( PROPERTIES ADDITIONAL_MAKE_CLEAN_FILES
  "${COMPONENT_DIR}/quirc/libquirc.a")
```

(The above CMakeLists.txt can be used to create a component named `quirc` that builds the `quirc` project using its own Makefile.)

- `externalproject_add` defines an external build system.
  - `SOURCE_DIR`, `CONFIGURE_COMMAND`, `BUILD_COMMAND` and `INSTALL_COMMAND` should always be set. `CONFIGURE_COMMAND` can be set to an empty string if the build system has no “configure” step. `INSTALL_COMMAND` will generally be empty for ESP-IDF builds.
  - Setting `BUILD_IN_SOURCE` means the build directory is the same as the source directory. Otherwise you can set `BUILD_DIR`.

- Consult the [ExternalProject](#) documentation for more details about `externalproject_add()`
- The second set of commands adds a library target, which points to the “imported” library file built by the external system. Some properties need to be set in order to add include directories and tell CMake where this file is.
- Finally, the generated library is added to `ADDITIONAL_MAKE_CLEAN_FILES`. This means `make clean` will delete this library. (Note that the other object files from the build won't be deleted.)

**ExternalProject dependencies, clean builds** CMake has some unusual behaviour around external project builds:

- `ADDITIONAL_MAKE_CLEAN_FILES` only works when “make” is used as the build system. If Ninja or an IDE build system is used, it won't delete these files when cleaning.
- However, the [ExternalProject](#) configure & build commands will *always* be re-run after a clean is run.
- Therefore, there are two alternative recommended ways to configure the external build command:
  1. Have the external `BUILD_COMMAND` run a full clean compile of all sources. The build command will be run if any of the dependencies passed to `externalproject_add` with `DEPENDS` have changed, or if this is a clean build (ie any of `idf.py clean`, `ninja clean`, or `make clean` was run.)
  2. Have the external `BUILD_COMMAND` be an incremental build command. Pass the parameter `BUILD_ALWAYS 1` to `externalproject_add`. This means the external project will be built each time a build is run, regardless of dependencies. This is only recommended if the external project has correct incremental build behaviour, and doesn't take too long to run.

The best of these approaches for building an external project will depend on the project itself, its build system, and whether you anticipate needing to frequently recompile the project.

### 4.5.13 Custom sdkconfig defaults

For example projects or other projects where you don't want to specify a full `sdkconfig` configuration, but you do want to override some key values from the ESP-IDF defaults, it is possible to create a file `sdkconfig.defaults` in the project directory. This file will be used when creating a new config from scratch, or when any new config value hasn't yet been set in the `sdkconfig` file.

To override the name of this file or to specify multiple files, set the `SDKCONFIG_DEFAULTS` environment variable or set `SDKCONFIG_DEFAULTS` in top-level `CMakeLists.txt`. File names that are not specified as full paths are resolved relative to current project's directory.

When specifying multiple files, use a semicolon as the list separator. Files listed first will be applied first. If a particular key is defined in multiple files, the definition in the latter file will override definitions from former files.

Some of the IDF examples include a `sdkconfig.ci` file. This is part of the continuous integration (CI) test framework and is ignored by the normal build process.

#### Target-dependent sdkconfig defaults

In addition to `sdkconfig.defaults` file, build system will also load defaults from `sdkconfig.defaults.TARGET_NAME` file, where `TARGET_NAME` is the value of `IDF_TARGET`. For example, for `esp32` target, default settings will be taken from `sdkconfig.defaults` first, and then from `sdkconfig.defaults.esp32`.

If `SDKCONFIG_DEFAULTS` is used to override the name of defaults file/files, the name of target-specific defaults file will be derived from `SDKCONFIG_DEFAULTS` value/values using the rule above.

### 4.5.14 Flash arguments

There are some scenarios that we want to flash the target board without IDF. For this case we want to save the built binaries, `esptool.py` and `esptool write_flash` arguments. It's simple to write a script to save binaries and `esptool.py`.

After running a project build, the build directory contains binary output files (`.bin` files) for the project and also the following flashing data files:

- `flash_project_args` contains arguments to flash the entire project (app, bootloader, partition table, PHY data if this is configured).
- `flash_app_args` contains arguments to flash only the app.
- `flash_bootloader_args` contains arguments to flash only the bootloader.

You can pass any of these flasher argument files to `esptool.py` as follows:

```
python esptool.py --chip esp32 write_flash @build/flash_project_args
```

Alternatively, it is possible to manually copy the parameters from the argument file and pass them on the command line.

The build directory also contains a generated file `flasher_args.json` which contains project flash information, in JSON format. This file is used by `idf.py` and can also be used by other tools which need information about the project build.

### 4.5.15 Building the Bootloader

The bootloader is built by default as part of `idf.py build`, or can be built standalone via `idf.py bootloader`.

The bootloader is a special “subproject” inside `/components/bootloader/subproject`. It has its own project CMakeLists.txt file and builds separate .ELF and .BIN files to the main project. However it shares its configuration and build directory with the main project.

The subproject is inserted as an external project from the top-level project, by the file `/components/bootloader/project_include.cmake`. The main build process runs CMake for the subproject, which includes discovering components (a subset of the main components) and generating a bootloader-specific config (derived from the main `sdkconfig`).

### 4.5.16 Selecting the Target

ESP-IDF supports multiple targets (chips). A full list of supported targets in your version of ESP-IDF can be seen by running `idf.py -list-targets`.

To select the target before building the project, use `idf.py set-target <target>` command, for example:

```
idf.py set-target esp32s2
```

---

**Important:** `idf.py set-target` will clear the build directory and re-generate the `sdkconfig` file from scratch. The old `sdkconfig` file will be saved as `sdkconfig.old`.

---

**Note:** The behavior of `idf.py set-target` command is equivalent to:

1. clearing the build directory (`idf.py fullclean`)
  2. removing the `sdkconfig` file (`mv sdkconfig sdkconfig.old`)
  3. configuring the project with the new target (`idf.py -DIDF_TARGET=esp32 reconfigure`)
- 

It is also possible to pass the desired `IDF_TARGET` as an environment variable (e.g. `export IDF_TARGET=esp32s2`) or as a CMake variable (e.g. `-DIDF_TARGET=esp32s2` argument to CMake or `idf.py`). Setting the environment variable is a convenient method if you mostly work with one type of the chip.

To specify the `_default_` value of `IDF_TARGET` for a given project, add `CONFIG_IDF_TARGET` value to `sdkconfig.defaults`. For example, `CONFIG_IDF_TARGET="esp32s2"`. This value will be used if `IDF_TARGET` is not specified by other method: using an environment variable, CMake variable, or `idf.py set-target` command.

If the target has not been set by any of these methods, the build system will default to `esp32` target.

### 4.5.17 Writing Pure CMake Components

The ESP-IDF build system “wraps” CMake with the concept of “components”, and helper functions to automatically integrate these components into a project build.

However, underneath the concept of “components” is a full CMake build system. It is also possible to make a component which is pure CMake.

Here is an example minimal “pure CMake” component CMakeLists file for a component named `json`:

```
add_library(json STATIC
  cJSON/cJSON.c
  cJSON/cJSON_Utils.c)

target_include_directories(json PUBLIC cJSON)
```

- This is actually an equivalent declaration to the IDF `json` component [/components/json/CMakeLists.txt](#).
- This file is quite simple as there are not a lot of source files. For components with a large number of files, the globbing behaviour of ESP-IDF’s component logic can make the component CMakeLists style simpler.)
- Any time a component adds a library target with the component name, the ESP-IDF build system will automatically add this to the build, expose public include directories, etc. If a component wants to add a library target with a different name, dependencies will need to be added manually via CMake commands.

### 4.5.18 Using Third-Party CMake Projects with Components

CMake is used for a lot of open-source C and C++ projects —code that users can tap into for their applications. One of the benefits of having a CMake build system is the ability to import these third-party projects, sometimes even without modification! This allows for users to be able to get functionality that may not yet be provided by a component, or use another library for the same functionality.

Importing a library might look like this for a hypothetical library `foo` to be used in the `main` component:

```
# Register the component
idf_component_register(...)

# Set values of hypothetical variables that control the build of `foo`
set(FOO_BUILD_STATIC OFF)
set(FOO_BUILD_TESTS OFF)

# Create and import the library targets
add_subdirectory(foo)

# Publicly link `foo` to `main` component
target_link_libraries(main PUBLIC foo)
```

For an actual example, take a look at [build\\_system/cmake/import\\_lib](#). Take note that what needs to be done in order to import the library may vary. It is recommended to read up on the library’s documentation for instructions on how to import it from other projects. Studying the library’s CMakeLists.txt and build structure can also be helpful.

It is also possible to wrap a third-party library to be used as a component in this manner. For example, the `mbedtls` component is a wrapper for Espressif’s fork of `mbedtls`. See its [component CMakeLists.txt](#).

The CMake variable `ESP_PLATFORM` is set to 1 whenever the ESP-IDF build system is being used. Tests such as `if (ESP_PLATFORM)` can be used in generic CMake code if special IDF-specific logic is required.

#### Using ESP-IDF components from external libraries

The above example assumes that the external library `foo` (or `tinymce` in the case of the `import_lib` example) doesn’t need to use any ESP-IDF APIs apart from common APIs such as `libc`, `libstdc++`, etc. If the external library needs to use APIs provided by other ESP-IDF components, this needs to be specified in the external CMakeLists.txt file by adding a dependency on the library target `idf::<componentname>`.

For example, in the `foo/CMakeLists.txt` file:

```
add_library(foo bar.c fizz.cpp buzz.cpp)

if(ESP_PLATFORM)
  # On ESP-IDF, bar.c needs to include esp_spi_flash.h from the spi_flash component
  target_link_libraries(foo PRIVATE idf::spi_flash)
endif()
```

### 4.5.19 Using Prebuilt Libraries with Components

Another possibility is that you have a prebuilt static library (`.a` file), built by some other build process.

The ESP-IDF build system provides a utility function `add_prebuilt_library` for users to be able to easily import and use prebuilt libraries:

```
add_prebuilt_library(target_name lib_path [REQUIRES req1 req2 ...] [PRIV_REQUIRES_
↳req1 req2 ...])
```

where:

- `target_name`- name that can be used to reference the imported library, such as when linking to other targets
- `lib_path`- path to prebuilt library; may be an absolute or relative path to the component directory

Optional arguments `REQUIRES` and `PRIV_REQUIRES` specify dependency on other components. These have the same meaning as the arguments for `idf_component_register`.

Take note that the prebuilt library must have been compiled for the same target as the consuming project. Configuration relevant to the prebuilt library must also match. If not paid attention to, these two factors may contribute to subtle bugs in the app.

For an example, take a look at [build\\_system/cmake/import\\_prebuilt](#).

### 4.5.20 Using ESP-IDF in Custom CMake Projects

ESP-IDF provides a template CMake project for easily creating an application. However, in some instances the user might already have an existing CMake project or may want to create a custom one. In these cases it is desirable to be able to consume IDF components as libraries to be linked to the user's targets (libraries/ executables).

It is possible to do so by using the *build system APIs provided* by `tools/cmake/idf.cmake`. For example:

```
cmake_minimum_required(VERSION 3.5)
project(my_custom_app C)

# Include CMake file that provides ESP-IDF CMake build system APIs.
include(${ENV{IDF_PATH}}/tools/cmake/idf.cmake)

# Include ESP-IDF components in the build, may be thought as an equivalent of
# add_subdirectory() but with some additional processing and magic for ESP-IDF.
↳build
# specific build processes.
idf_build_process(esp32)

# Create the project executable and plainly link the newlib component to it using
# its alias, idf::newlib.
add_executable(${CMAKE_PROJECT_NAME}.elf main.c)
target_link_libraries(${CMAKE_PROJECT_NAME}.elf idf::newlib)

# Let the build system know what the project executable is to attach more targets,
↳dependencies, etc.
idf_build_executable(${CMAKE_PROJECT_NAME}.elf)
```

The example in [build\\_system/cmake/idf\\_as\\_lib](#) demonstrates the creation of an application equivalent to [hello world application](#) using a custom CMake project.

## 4.5.21 ESP-IDF CMake Build System API

### idf-build-commands

```
idf_build_get_property(var property [GENERATOR_EXPRESSION])
```

Retrieve a *build property* *property* and store it in *var* accessible from the current scope. Specifying *GENERATOR\_EXPRESSION* will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

```
idf_build_set_property(property val [APPEND])
```

Set a *build property* *property* with value *val*. Specifying *APPEND* will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

```
idf_build_component(component_dir)
```

Present a directory *component\_dir* that contains a component to the build system. Relative paths are converted to absolute paths with respect to current directory. All calls to this command must be performed before *idf\_build\_process*.

This command does not guarantee that the component will be processed during build (see the *COMPONENTS* argument description for *idf\_build\_process*)

```
idf_build_process(target
    [PROJECT_DIR project_dir]
    [PROJECT_VER project_ver]
    [PROJECT_NAME project_name]
    [SDKCONFIG sdkconfig]
    [SDKCONFIG_DEFAULTS sdkconfig_defaults]
    [BUILD_DIR build_dir]
    [COMPONENTS component1 component2 ...])
```

Performs the bulk of the behind-the-scenes magic for including ESP-IDF components such as component configuration, libraries creation, dependency expansion and resolution. Among these functions, perhaps the most important from a user's perspective is the libraries creation by calling each component's *idf\_component\_register*. This command creates the libraries for each component, which are accessible using aliases in the form *idf::component\_name*. These aliases can be used to link the components to the user's own targets, either libraries or executables.

The call requires the target chip to be specified with *target* argument. Optional arguments for the call include:

- **PROJECT\_DIR** - directory of the project; defaults to **CMAKE\_SOURCE\_DIR**
- **PROJECT\_NAME** - name of the project; defaults to **CMAKE\_PROJECT\_NAME**
- **PROJECT\_VER** - version/revision of the project; defaults to "1"
- **SDKCONFIG** - output path of generated *sdkconfig* file; defaults to **PROJECT\_DIR/sdkconfig** or **CMAKE\_SOURCE\_DIR/sdkconfig** depending if **PROJECT\_DIR** is set
- **SDKCONFIG\_DEFAULTS** - list of files containing default config to use in the build (list must contain full paths); defaults to empty. For each value *filename* in the list, the config from file *filename.target*, if it exists, is also loaded.
- **BUILD\_DIR** - directory to place ESP-IDF build-related artifacts, such as generated binaries, text files, components; defaults to **CMAKE\_BINARY\_DIR**
- **COMPONENTS** - select components to process among the components known by the build system (added via *idf\_build\_component*). This argument is used to trim the build. Other components are automatically added if they are required in the dependency chain, i.e. the public and private requirements of the components in this list are automatically added, and in turn the public and private requirements of those requirements, so on and so forth. If not specified, all components known to the build system are processed.

```
idf_build_executable(executable)
```

Specify the executable *executable* for ESP-IDF build. This attaches additional targets such as dependencies related to flashing, generating additional binary files, etc. Should be called after `idf_build_process`.

```
idf_build_get_config(var config [GENERATOR_EXPRESSION])
```

Get the value of the specified config. Much like build properties, specifying *GENERATOR\_EXPRESSION* will retrieve the generator expression string for that config, instead of the actual value, which can be used with CMake commands that support generator expressions. Actual config values are only known after call to `idf_build_process`, however.

### idf-build-properties

These are properties that describe the build. Values of build properties can be retrieved by using the build command `idf_build_get_property`. For example, to get the Python interpreter used for the build:

```
idf_build_get_property(python PYTHON)
message(STATUS "The Python interpreter is: ${python}")
```

- `BUILD_DIR` - build directory; set from `idf_build_process BUILD_DIR` argument
- `BUILD_COMPONENTS` - list of components included in the build; set by `idf_build_process`
- `BUILD_COMPONENT_ALIASES` - list of library alias of components included in the build; set by `idf_build_process`
- `C_COMPILE_OPTIONS` - compile options applied to all components' C source files
- `COMPILE_OPTIONS` - compile options applied to all components' source files, regardless of it being C or C++
- `COMPILE_DEFINITIONS` - compile definitions applied to all component source files
- `CXX_COMPILE_OPTIONS` - compile options applied to all components' C++ source files
- `EXECUTABLE` - project executable; set by call to `idf_build_executable`
- `EXECUTABLE_NAME` - name of project executable without extension; set by call to `idf_build_executable`
- `EXECUTABLE_DIR` - path containing the output executable
- `IDF_COMPONENT_MANAGER` - the component manager is enabled by default, but if this property is set to 0 it was disabled by the `IDF_COMPONENT_MANAGER` environment variable
- `IDF_PATH` - ESP-IDF path; set from `IDF_PATH` environment variable, if not, inferred from the location of `idf.cmake`
- `IDF_TARGET` - target chip for the build; set from the required target argument for `idf_build_process`
- `IDF_VER` - ESP-IDF version; set from either a version file or the Git revision of the `IDF_PATH` repository
- `INCLUDE_DIRECTORIES` - include directories for all component source files
- `KCONFIGS` - list of Kconfig files found in components in build; set by `idf_build_process`
- `KCONFIG_PROJBUILDS` - list of Kconfig.projbuild files found in components in build; set by `idf_build_process`
- `PROJECT_NAME` - name of the project; set from `idf_build_process PROJECT_NAME` argument
- `PROJECT_DIR` - directory of the project; set from `idf_build_process PROJECT_DIR` argument
- `PROJECT_VER` - version of the project; set from `idf_build_process PROJECT_VER` argument
- `PYTHON` - Python interpreter used for the build; set from `PYTHON` environment variable if available, if not "python" is used
- `SDKCONFIG` - full path to output config file; set from `idf_build_process SDKCONFIG` argument
- `SDKCONFIG_DEFAULTS` - list of files containing default config to use in the build; set from `idf_build_process SDKCONFIG_DEFAULTS` argument
- `SDKCONFIG_HEADER` - full path to C/C++ header file containing component configuration; set by `idf_build_process`
- `SDKCONFIG_CMAKE` - full path to CMake file containing component configuration; set by `idf_build_process`
- `SDKCONFIG_JSON` - full path to JSON file containing component configuration; set by `idf_build_process`

- `SDKCONFIG_JSON_MENUS` - full path to JSON file containing config menus; set by `idf_build_process`

### idf-component-commands

```
idf_component_get_property(var component property [GENERATOR_EXPRESSION])
```

Retrieve a specified *component*'s *component property*, *property* and store it in *var* accessible from the current scope. Specifying *GENERATOR\_EXPRESSION* will retrieve the generator expression string for that property, instead of the actual value, which can be used with CMake commands that support generator expressions.

```
idf_component_set_property(component property val [APPEND])
```

Set a specified *component*'s *component property*, *property* with value *val*. Specifying *APPEND* will append the specified value to the current value of the property. If the property does not previously exist or it is currently empty, the specified value becomes the first element/member instead.

```
idf_component_register([[SRCS src1 src2 ...] | [[SRC_DIRS dir1 dir2 ...] [EXCLUDE_
→SRCS src1 src2 ...]]
                        [INCLUDE_DIRS dir1 dir2 ...]
                        [PRIV_INCLUDE_DIRS dir1 dir2 ...]
                        [REQUIRES component1 component2 ...]
                        [PRIV_REQUIRES component1 component2 ...]
                        [LDFRAGMENTS ldfragment1 ldfragment2 ...]
                        [REQUIRED_IDF_TARGETS target1 target2 ...]
                        [EMBED_FILES file1 file2 ...]
                        [EMBED_TXTFILES file1 file2 ...]
                        [KCONFIG kconfig]
                        [KCONFIG_PROJBUILD kconfig_projbuild])
```

Register a component to the build system. Much like the `project()` CMake command, this should be called from the component's `CMakeLists.txt` directly (not through a function or macro) and is recommended to be called before any other command. Here are some guidelines on what commands can **not** be called before `idf_component_register`:

- commands that are not valid in CMake script mode
- custom commands defined in `project_include.cmake`
- build system API commands except `idf_build_get_property`; although consider whether the property may not have been set yet

Commands that set and operate on variables are generally okay to call before `idf_component_register`.

The arguments for `idf_component_register` include:

- `SRCS` - component source files used for creating a static library for the component; if not specified, component is treated as a config-only component and an interface library is created instead.
- `SRC_DIRS`, `EXCLUDE_SRCS` - used to glob source files (`.c`, `.cpp`, `.S`) by specifying directories, instead of specifying source files manually via `SRCS`. Note that this is subject to the *limitations of globbing in CMake*. Source files specified in `EXCLUDE_SRCS` are removed from the globbed files.
- `INCLUDE_DIRS` - paths, relative to the component directory, which will be added to the include search path for all other components which require the current component
- `PRIV_INCLUDE_DIRS` - directory paths, must be relative to the component directory, which will be added to the include search path for this component's source files only
- `REQUIRES` - public component requirements for the component
- `PRIV_REQUIRES` - private component requirements for the component; ignored on config-only components
- `LDFRAGMENTS` - component linker fragment files
- `REQUIRED_IDF_TARGETS` - specify the only target the component supports
- `KCONFIG` - override the default Kconfig file
- `KCONFIG_PROJBUILD` - override the default Kconfig.projbuild file

The following are used for *embedding data into the component*, and is considered as source files when determining if a component is config-only. This means that even if the component does not specify source files, a static library is still created internally for the component if it specifies either:

- `EMBED_FILES` - binary files to be embedded in the component
- `EMBED_TXTFILES` - text files to be embedded in the component

### idf-component-properties

These are properties that describe a component. Values of component properties can be retrieved by using the build command `idf_component_get_property`. For example, to get the directory of the `freertos` component:

```
idf_component_get_property(dir freertos COMPONENT_DIR)
message(STATUS "The 'freertos' component directory is: ${dir}")
```

- `COMPONENT_ALIAS` - alias for `COMPONENT_LIB` used for linking the component to external targets; set by `idf_build_component` and alias library itself is created by `idf_component_register`
- `COMPONENT_DIR` - component directory; set by `idf_build_component`
- `COMPONENT_OVERRIDEN_DIR` - contains the directory of the original component if *this component overrides another component*
- `COMPONENT_LIB` - name for created component static/interface library; set by `idf_build_component` and library itself is created by `idf_component_register`
- `COMPONENT_NAME` - name of the component; set by `idf_build_component` based on the component directory name
- `COMPONENT_TYPE` - type of the component, whether `LIBRARY` or `CONFIG_ONLY`. A component is of type `LIBRARY` if it specifies source files or embeds a file
- `EMBED_FILES` - list of files to embed in component; set from `idf_component_register` `EMBED_FILES` argument
- `EMBED_TXTFILES` - list of text files to embed in component; set from `idf_component_register` `EMBED_TXTFILES` argument
- `INCLUDE_DIRS` - list of component include directories; set from `idf_component_register` `INCLUDE_DIRS` argument
- `KCONFIG` - component Kconfig file; set by `idf_build_component`
- `KCONFIG_PROJBUILD` - component Kconfig.projbuild; set by `idf_build_component`
- `LDFRAGMENTS` - list of component linker fragment files; set from `idf_component_register` `LDFRAGMENTS` argument
- `MANAGED_PRIV_REQUIRES` - list of private component dependencies added by the IDF component manager from dependencies in `idf_component.yml` manifest file
- `MANAGED_REQUIRES` - list of public component dependencies added by the IDF component manager from dependencies in `idf_component.yml` manifest file
- `PRIV_INCLUDE_DIRS` - list of component private include directories; set from `idf_component_register` `PRIV_INCLUDE_DIRS` on components of type `LIBRARY`
- `PRIV_REQUIRES` - list of private component dependencies; set from value of `idf_component_register` `PRIV_REQUIRES` argument and dependencies in `idf_component.yml` manifest file
- `REQUIRED_IDF_TARGETS` - list of targets the component supports; set from `idf_component_register` `EMBED_TXTFILES` argument
- `REQUIRES` - list of public component dependencies; set from value of `idf_component_register` `REQUIRES` argument and dependencies in `idf_component.yml` manifest file
- `SRCS` - list of component source files; set from `SRCS` or `SRC_DIRS/EXCLUDE_SRCS` argument of `idf_component_register`

### 4.5.22 File Globbing & Incremental Builds

The preferred way to include source files in an ESP-IDF component is to list them manually via `SRCS` argument to `idf_component_register`:

```
idf_component_register(SRCS library/a.c library/b.c platform/platform.c
                      ...)
```

This preference reflects the [CMake best practice](#) of manually listing source files. This could, however, be inconvenient when there are lots of source files to add to the build. The ESP-IDF build system provides an alternative way for specifying source files using `SRC_DIRS`:

```
idf_component_register(SRC_DIRS library platform
                      ...)
```

This uses globbing behind the scenes to find source files in the specified directories. Be aware, however, that if a new source file is added and this method is used, then CMake won't know to automatically re-run and this file won't be added to the build.

The trade-off is acceptable when you're adding the file yourself, because you can trigger a clean build or run `idf.py reconfigure` to manually re-run CMake. However, the problem gets harder when you share your project with others who may check out a new version using a source control tool like Git...

For components which are part of ESP-IDF, we use a third party Git CMake integration module ([/tools/cmake/third\\_party/GetGitRevisionDescription.cmake](#)) which automatically re-runs CMake any time the repository commit changes. This means if you check out a new ESP-IDF version, CMake will automatically re-run.

For project components (not part of ESP-IDF), there are a few different options:

- If keeping your project file in Git, ESP-IDF will automatically track the Git revision and re-run CMake if the revision changes.
- If some components are kept in a third git repository (not the project repository or ESP-IDF repository), you can add a call to the `git_describe` function in a component CMakeLists file in order to automatically trigger re-runs of CMake when the Git revision changes.
- If not using Git, remember to manually run `idf.py reconfigure` whenever a source file may change.
- To avoid this problem entirely, use `SRCS` argument to `idf_component_register` to list all source files in project components.

The best option will depend on your particular project and its users.

### 4.5.23 Build System Metadata

For integration into IDEs and other build systems, when CMake runs the build process generates a number of metadata files in the `build/` directory. To regenerate these files, run `cmake` or `idf.py reconfigure` (or any other `idf.py` build command).

- `compile_commands.json` is a standard format JSON file which describes every source file which is compiled in the project. A CMake feature generates this file, and many IDEs know how to parse it.
- `project_description.json` contains some general information about the ESP-IDF project, configured paths, etc.
- `flasher_args.json` contains `esptool.py` arguments to flash the project's binary files. There are also `flash_*_args` files which can be used directly with `esptool.py`. See [Flash arguments](#).
- `CMakeCache.txt` is the CMake cache file which contains other information about the CMake process, toolchain, etc.
- `config/sdkconfig.json` is a JSON-formatted version of the project configuration values.
- `config/kconfig_menus.json` is a JSON-formatted version of the menus shown in `menuconfig`, for use in external IDE UIs.

### JSON Configuration Server

A tool called `confserver.py` is provided to allow IDEs to easily integrate with the configuration system logic. `confserver.py` is designed to run in the background and interact with a calling process by reading and writing JSON over process `stdin` & `stdout`.

You can run `confserver.py` from a project via `idf.py confserver` or `ninja confserver`, or a similar target triggered from a different build generator.

For more information about `confserver.py`, see [tools/kconfig\\_new/README.md](https://github.com/espressif/esp-idf/blob/master/tools/kconfig_new/README.md).

## 4.5.24 Build System Internals

### Build Scripts

The listfiles for the ESP-IDF build system reside in `/tools/cmake`. The modules which implement core build system functionality are as follows:

- `build.cmake` - Build related commands i.e. build initialization, retrieving/setting build properties, build processing.
- `component.cmake` - Component related commands i.e. adding components, retrieving/setting component properties, registering components.
- `kconfig.cmake` - Generation of configuration files (`sdkconfig`, `sdkconfig.h`, `sdkconfig.cmake`, etc.) from Kconfig files.
- `ldgen.cmake` - Generation of final linker script from linker fragment files.
- `target.cmake` - Setting build target and toolchain file.
- `utilities.cmake` - Miscellaneous helper commands.

Aside from these files, there are two other important CMake scripts in `/tools/cmake`:

- `idf.cmake` - Sets up the build and includes the core modules listed above. Included in CMake projects in order to access ESP-IDF build system functionality.
- `project.cmake` - Includes `idf.cmake` and provides a custom `project()` command that takes care of all the heavy lifting of building an executable. Included in the top-level `CMakeLists.txt` of standard ESP-IDF projects.

The rest of the files in `/tools/cmake` are support or third-party scripts used in the build process.

### Build Process

This section describes the standard ESP-IDF application build process. The build process can be broken down roughly into four phases:

Fig. 3: ESP-IDF Build System Process

**Initialization** This phase sets up necessary parameters for the build.

- **Upon inclusion of `idf.cmake` in `project.cmake`, the following steps are performed:**
  - Set `IDF_PATH` from environment variable or inferred from path to `project.cmake` included in the top-level `CMakeLists.txt`.
  - Add `/tools/cmake` to `CMAKE_MODULE_PATH` and include core modules plus the various helper/third-party scripts.
  - Set build tools/executables such as default Python interpreter.
  - Get ESP-IDF git revision and store as `IDF_VER`.
  - Set global build specifications i.e. compile options, compile definitions, include directories for all components in the build.
  - Add components in `components` to the build.
- **The initial part of the custom `project()` command performs the following steps:**

- Set `IDF_TARGET` from environment variable or CMake cache and the corresponding `CMAKE_TOOLCHAIN_FILE` to be used.
- Add components in `EXTRA_COMPONENT_DIRS` to the build.
- Prepare arguments for calling command `idf_build_process()` from variables such as `COMPONENTS/EXCLUDE_COMPONENTS`, `SDKCONFIG`, `SDKCONFIG_DEFAULTS`.

The call to `idf_build_process()` command marks the end of this phase.

### Enumeration

This phase builds a final list of components to be processed in the build, and is performed in the first half of `idf_build_process()`.

- Retrieve each component's public and private requirements. A child process is created which executes each component's `CMakeLists.txt` in script mode. The values of `idf_component_register` `REQUIRES` and `PRIV_REQUIRES` argument is returned to the parent build process. This is called early expansion. The variable `CMAKE_BUILD_EARLY_EXPANSION` is defined during this step.
- Recursively include components based on public and private requirements.

### Processing

This phase processes the components in the build, and is the second half of `idf_build_process()`.

- Load project configuration from `sdkconfig` file and generate an `sdkconfig.cmake` and `sdkconfig.h` header. These define configuration variables/macros that are accessible from the build scripts and C/C++ source/header files, respectively.
- Include each component's `project_include.cmake`.
- Add each component as a subdirectory, processing its `CMakeLists.txt`. The component `CMakeLists.txt` calls the registration command, `idf_component_register` which adds source files, include directories, creates component library, links dependencies, etc.

### Finalization

This phase is everything after `idf_build_process()`.

- Create executable and link the component libraries to it.
- Generate project metadata files such as `project_description.json` and display relevant information about the project build.

Browse </tools/cmake/project.cmake> for more details.

## 4.5.25 Migrating from ESP-IDF GNU Make System

Some aspects of the CMake-based ESP-IDF build system are very similar to the older GNU Make-based system. The developer needs to provide values the include directories, source files etc. There is a syntactical difference, however, as the developer needs to pass these as arguments to the registration command, `idf_component_register`.

### Automatic Conversion Tool

An automatic project conversion tool is available in [/tools/cmake/convert\\_to\\_cmake.py](/tools/cmake/convert_to_cmake.py). Run this command line tool with the path to a project like this:

```
$IDF_PATH/tools/cmake/convert_to_cmake.py /path/to/project_dir
```

The project directory must contain a Makefile, and GNU Make (`make`) must be installed and available on the `PATH`.

The tool will convert the project Makefile and any component `component.mk` files to their equivalent `CMakeLists.txt` files.

It does so by running `make` to expand the ESP-IDF build system variables which are set by the build, and then producing equivalent CMakefiles to set the same variables.

---

**Important:** When the conversion tool converts a `component.mk` file, it doesn't determine what other components that component depends on. This information needs to be added manually by editing the new `component CMakeLists.txt` file and adding `REQUIRES` and/or `PRIV_REQUIRES` clauses. Otherwise, source files in the component will fail to compile as headers from other components are not found. See [Component Requirements](#).

---

The conversion tool is not capable of dealing with complex Makefile logic or unusual targets. These will need to be converted by hand.

### No Longer Available in CMake

Some features are significantly different or removed in the CMake-based system. The following variables no longer exist in the CMake-based build system:

- `COMPONENT_BUILD_DIR`: Use `CMAKE_CURRENT_BINARY_DIR` instead.
- `COMPONENT_LIBRARY`: Defaulted to `$(COMPONENT_NAME).a`, but the library name could be overridden by the component. The name of the component library can no longer be overridden by the component.
- `CC`, `LD`, `AR`, `OBJCOPY`: Full paths to each tool from the `gcc xtensa` cross-toolchain. Use `CMAKE_C_COMPILER`, `CMAKE_C_LINK_EXECUTABLE`, `CMAKE_OBJCOPY`, etc instead. [Full list here](#).
- `HOSTCC`, `HOSTLD`, `HOSTAR`: Full names of each tool from the host native toolchain. These are no longer provided, external projects should detect any required host toolchain manually.
- `COMPONENT_ADD_LDFLAGS`: Used to override linker flags. Use the CMake [target\\_link\\_libraries](#) command instead.
- `COMPONENT_ADD_LINKER_DEPS`: List of files that linking should depend on. [target\\_link\\_libraries](#) will usually infer these dependencies automatically. For linker scripts, use the provided custom CMake function `target_linker_scripts`.
- `COMPONENT_SUBMODULES`: No longer used, the build system will automatically enumerate all submodules in the ESP-IDF repository.
- `COMPONENT_EXTRA_INCLUDES`: Used to be an alternative to `COMPONENT_PRIV_INCLUDEDIRS` for absolute paths. Use `PRIV_INCLUDE_DIRS` argument to `idf_component_register` for all cases now (can be relative or absolute).
- `COMPONENT_OBJS`: Previously, component sources could be specified as a list of object files. Now they can be specified as a list of source files via `SRCs` argument to `idf_component_register`.
- `COMPONENT_OBJEXCLUDE`: Has been replaced with `EXCLUDE_SRCS` argument to `idf_component_register`. Specify source files (as absolute paths or relative to component directory), instead.
- `COMPONENT_EXTRA_CLEAN`: Set property `ADDITIONAL_MAKE_CLEAN_FILES` instead but note [CMake has some restrictions around this functionality](#).
- `COMPONENT_OWNBUILDTARGET` & `COMPONENT_OWNCLEANTARGET`: Use CMake [ExternalProject](#) instead. See [Fully Overriding The Component Build Process](#) for full details.
- `COMPONENT_CONFIG_ONLY`: Call `idf_component_register` without any arguments instead. See [Configuration-Only Components](#).
- `CFLAGS`, `CPPFLAGS`, `CXXFLAGS`: Use equivalent CMake commands instead. See [Controlling Component Compilation](#).

### No Default Values

Unlike in the legacy Make-based build system, the following have no default values:

- Source directories (`COMPONENT_SRCDIRS` variable in Make, `SRC_DIRS` argument to `idf_component_register` in CMake)

- Include directories (`COMPONENT_ADD_INCLUDEDIRS` variable in Make, `INCLUDE_DIRS` argument to `idf_component_register` in CMake)

### No Longer Necessary

- In the legacy Make-based build system, it is required to also set `COMPONENT_SRCDIRS` if `COMPONENT_SRCS` is set. In CMake, the equivalent is not necessary i.e. specifying `SRC_DIRS` to `idf_component_register` if `SRCS` is also specified (in fact, `SRCS` is ignored if `SRC_DIRS` is specified).

### Flashing from make

`make flash` and similar targets still work to build and flash. However, project `sdkconfig` no longer specifies serial port and baud rate. Environment variables can be used to override these. See *Flashing with ninja or make* for more details.

## 4.6 Deep Sleep Wake Stubs

ESP32-S3 supports running a “deep sleep wake stub” when coming out of deep sleep. This function runs immediately as soon as the chip wakes up - before any normal initialisation, bootloader, or ESP-IDF code has run. After the wake stub runs, the SoC can go back to sleep or continue to start ESP-IDF normally.

Deep sleep wake stub code is loaded into “RTC Fast Memory” and any data which it uses must also be loaded into RTC memory. RTC memory regions hold their contents during deep sleep.

### 4.6.1 Rules for Wake Stubs

Wake stub code must be carefully written:

- As the SoC has freshly woken from sleep, most of the peripherals are in reset states. The SPI flash is unmapped.
- The wake stub code can only call functions implemented in ROM or loaded into RTC Fast Memory (see below.)
- The wake stub code can only access data loaded in RTC memory. All other RAM will be uninitialised and have random contents. The wake stub can use other RAM for temporary storage, but the contents will be overwritten when the SoC goes back to sleep or starts ESP-IDF.
- RTC memory must include any read-only data (`.rodata`) used by the stub.
- Data in RTC memory is initialised whenever the SoC restarts, except when waking from deep sleep. When waking from deep sleep, the values which were present before going to sleep are kept.
- Wake stub code is a part of the main `esp-idf` app. During normal running of `esp-idf`, functions can call the wake stub functions or access RTC memory. It is as if these were regular parts of the app.

### 4.6.2 Implementing A Stub

The wake stub in `esp-idf` is called `esp_wake_deep_sleep()`. This function runs whenever the SoC wakes from deep sleep. There is a default version of this function provided in `esp-idf`, but the default function is weak-linked so if your app contains a function named `esp_wake_deep_sleep()` then this will override the default.

If supplying a custom wake stub, the first thing it does should be to call `esp_default_wake_deep_sleep()`.

It is not necessary to implement `esp_wake_deep_sleep()` in your app in order to use deep sleep. It is only necessary if you want to have special behaviour immediately on wake.

If you want to swap between different deep sleep stubs at runtime, it is also possible to do this by calling the `esp_set_deep_sleep_wake_stub()` function. This is not necessary if you only use the default `esp_wake_deep_sleep()` function.

All of these functions are declared in the `esp_sleep.h` header under `components/esp32s3`.

### 4.6.3 Loading Code Into RTC Memory

Wake stub code must be resident in RTC Fast Memory. This can be done in one of two ways.

The first way is to use the `RTC_IRAM_ATTR` attribute to place a function into RTC memory:

```
void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    // Add additional functionality here
}
```

The second way is to place the function into any source file whose name starts with `rtc_wake_stub`. Files names `rtc_wake_stub*` have their contents automatically put into RTC memory by the linker.

The first way is simpler for very short and simple code, or for source files where you want to mix “normal” and “RTC” code. The second way is simpler when you want to write longer pieces of code for RTC memory.

### 4.6.4 Loading Data Into RTC Memory

Data used by stub code must be resident in RTC memory.

The data can be placed in RTC Fast memory or in RTC Slow memory which is also used by the ULP.

Specifying this data can be done in one of two ways:

The first way is to use the `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` to specify any data (writeable or read-only, respectively) which should be loaded into RTC memory:

```
RTC_DATA_ATTR int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    static RTC_RODATA_ATTR const char fmt_str[] = "Wake count %d\n";
    esp_rom_printf(fmt_str, wake_count++);
}
```

The RTC memory area where this data will be placed can be configured via menuconfig option named `CONFIG_ESP32S3_RTCDATA_IN_FAST_MEM`. This option allows to keep slow memory area for ULP programs and once it is enabled the data marked with `RTC_DATA_ATTR` and `RTC_RODATA_ATTR` are placed in the RTC fast memory segment otherwise it goes to RTC slow memory (default option). This option depends on the `CONFIG_FREERTOS_UNICORE` because RTC fast memory can be accessed only by `PRO_CPU`.

The attributes `RTC_FAST_ATTR` and `RTC_SLOW_ATTR` can be used to specify data that will be force placed into `RTC_FAST` and `RTC_SLOW` memory respectively. Any access to data marked with `RTC_FAST_ATTR` is allowed by `PRO_CPU` only and it is responsibility of user to make sure about it.

Unfortunately, any string constants used in this way must be declared as arrays and marked with `RTC_RODATA_ATTR`, as shown in the example above.

The second way is to place the data into any source file whose name starts with `rtc_wake_stub`.

For example, the equivalent example in `rtc_wake_stub_counter.c`:

```
int wake_count;

void RTC_IRAM_ATTR esp_wake_deep_sleep(void) {
    esp_default_wake_deep_sleep();
    esp_rom_printf("Wake count %d\n", wake_count++);
}
```

The second way is a better option if you need to use strings, or write other more complex code.

To reduce wake-up time use the `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP` Kconfig option, see more information in [Fast boot from Deep Sleep](#).

### 4.6.5 CRC Check For Wake Stubs

During deep sleep, only the wake stubs area of RTC Fast memory is validated with CRC. When ESP32-S3 wakes up from deep sleep, the wake stubs area is validated again. If the validation passes, the wake stubs code will be executed. Otherwise, the normal initialization, bootloader, and esp-idf codes will be executed.

---

**Note:** When the `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP` option is enabled, all the RTC fast memory except the wake stubs area is added to the heap.

---

### 4.6.6 Example

ESP-IDF provides an example to show how to implement the Deep-sleep wake stub.

- [system/deep\\_sleep\\_wake\\_stub](#)

## 4.7 Device Firmware Upgrade through USB

Device Firmware Upgrade (DFU) is a mechanism for upgrading the firmware of devices through Universal Serial Bus (USB). DFU is supported by ESP32-S3 chips. The necessary connections for the USB peripheral are shown in the following table.

GPIO	USB
20	D+ (green)
19	D- (white)
GND	GND (black)
+5V	+5V (red)

By default, `USB_SERIAL_JTAG` module is connected to the internal PHY of the ESP32-S3, while USB\_OTG peripheral can be used only if the external USB PHY is connected. Since DFU mode is provided via USB\_OTG peripheral, it cannot be used through the internal PHY in this configuration.

You can permanently switch the internal USB PHY to work with USB\_OTG peripheral instead of `USB_SERIAL_JTAG` by burning `USB_PHY_SEL` eFuse. See ESP32-S3 Technical Reference Manual for more details about `USB_SERIAL_JTAG` and `USB_OTG`.

---

**Note:** The ESP32-S3 chip needs to be in bootloader mode for the detection as a DFU device and flashing. This can be achieved by pulling GPIO0 down (e.g. pressing the BOOT button), pulsing RESET down for a moment and releasing GPIO0.

---

**Warning:** Some cables are wired up with non-standard colors and some drivers are able to work with swapped D+ and D- connections. Please try to swap the cables connecting to D+ and D- if your device is not detected.

The software requirements of DFU are included in [Step 1. Install prerequisites](#) of the Getting Started Guide.

Section [Building the DFU Image](#) describes how to build firmware for DFU with ESP-IDF and Section [Flashing the Chip with the DFU Image](#) deals with flashing the firmware.

### 4.7.1 Building the DFU Image

The DFU image can be created by running:

```
idf.py dfu
```

which creates `dfu.bin` in the build directory.

---

**Note:** Don't forget to set the target chip by `idf.py set-target` before running `idf.py dfu`. Otherwise, you might create an image for a different chip or receive an error message something like `unknown target 'dfu'`.

---

## 4.7.2 Flashing the Chip with the DFU Image

The DFU image is downloaded into the chip by running:

```
idf.py dfu-flash
```

which relies on `dfu-util`. Please see [Step 1. Install prerequisites](#) for installing `dfu-util`. `dfu-util` needs additional setup for [USB drivers \(Windows only\)](#) or setting up an [udev rule \(Linux only\)](#). Mac OS users should be able to use `dfu-util` without further setup.

If there are more boards with the same chip connected then `idf.py dfu-list` can be used to list the available devices, for example:

```
Found Runtime: [303a:0002] ver=0723, devnum=4, cfg=1, intf=2, path="1-10", alt=0, ↵  
↳name="UNKNOWN", serial="0"  
Found Runtime: [303a:0002] ver=0723, devnum=6, cfg=1, intf=2, path="1-2", alt=0, ↵  
↳name="UNKNOWN", serial="0"
```

Consequently, the desired device can be selected for flashing by the `--path` argument. For example, the devices listed above can be flashed individually by the following commands:

```
idf.py dfu-flash --path 1-10  
idf.py dfu-flash --path 1-2
```

---

**Note:** The vendor and product identifiers are set based on the selected chip target by the `idf.py set-target` command and it is not selectable during the `idf.py dfu-flash` call.

---

See [Common errors and known issues](#) and their solutions.

### udev rule (Linux only)

`udev` is a device manager for the Linux kernel. It allows us to run `dfu-util` (and `idf.py dfu-flash`) without `sudo` for gaining access to the chip.

Create file `/etc/udev/rules.d/40-dfuse.rules` with the following content:

```
SUBSYSTEMS=="usb", ATTRS{idVendor}=="303a", ATTRS{idProduct}=="00??", GROUP=  
↳"plugdev", MODE="0666"
```

---

**Note:** Please check the output of command `groups`. The user has to be a member of the `GROUP` specified above. You may use some other existing group for this purpose (e.g. `uucp` on some systems instead of `plugdev`) or create a new group for this purpose.

---

Restart your computer so the previous setting could take into affect or run `sudo udevadm trigger` to force manually `udev` to trigger your new rule.

## USB drivers (Windows only)

`dfu-util` uses *libusb* to access the device. You have to register on Windows the device with the *WinUSB* driver. Please see the [libusb wiki](#) for more details.

The drivers can be installed by the [Zadig tool](#). Please make sure that the device is in download mode before running the tool and that it detects the ESP32-S3 device before installing the drivers. The Zadig tool might detect several USB interfaces of ESP32-S3. Please install the WinUSB driver for only that interface for which there is no driver installed (probably it is Interface 2) and don't re-install the driver for the other interface.

**Warning:** The manual installation of the driver in Device Manager of Windows is not recommended because the flashing might not work properly.

## Common errors and known issues

- `dfu-util: command not found` might indicate that the tool hasn't been installed or is not available from the terminal. An easy way of checking the tool is running `dfu-util --version`. Please see [Step 1. Install prerequisites](#) for installing `dfu-util`.
- The reason for No DFU capable USB device available could be that the USB driver wasn't properly installed on Windows (see [USB drivers \(Windows only\)](#)), `udev` rule was not setup on Linux (see [udev rule \(Linux only\)](#)) or the device isn't in bootloader mode.
- Flashing with `dfu-util` on Windows fails on the first attempt with error `Lost device after RESET?`. Please retry the flashing and it should succeed the next time.

## 4.8 Error Handling

### 4.8.1 Overview

Identifying and handling run-time errors is important for developing robust applications. There can be multiple kinds of run-time errors:

- Recoverable errors:
  - Errors indicated by functions through return values (error codes)
  - C++ exceptions, thrown using `throw` keyword
- Unrecoverable (fatal) errors:
  - Failed assertions (using `assert` macro and equivalent methods, see [Assertions](#)) and `abort()` calls.
  - CPU exceptions: access to protected regions of memory, illegal instruction, etc.
  - System level checks: watchdog timeout, cache access error, stack overflow, stack smashing, heap corruption, etc.

This guide explains ESP-IDF error handling mechanisms related to recoverable errors, and provides some common error handling patterns.

For instructions on diagnosing unrecoverable errors, see [Fatal Errors](#).

### 4.8.2 Error codes

The majority of ESP-IDF-specific functions use `esp_err_t` type to return error codes. `esp_err_t` is a signed integer type. Success (no error) is indicated with `ESP_OK` code, which is defined as zero.

Various ESP-IDF header files define possible error codes using preprocessor defines. Usually these defines start with `ESP_ERR_` prefix. Common error codes for generic failures (out of memory, timeout, invalid argument, etc.)

are defined in `esp_err.h` file. Various components in ESP-IDF may define additional error codes for specific situations.

For the complete list of error codes, see [Error Code Reference](#).

### 4.8.3 Converting error codes to error messages

For each error code defined in ESP-IDF components, `esp_err_t` value can be converted to an error code name using `esp_err_to_name()` or `esp_err_to_name_r()` functions. For example, passing `0x101` to `esp_err_to_name()` will return “ESP\_ERR\_NO\_MEM” string. Such strings can be used in log output to make it easier to understand which error has happened.

Additionally, `esp_err_to_name_r()` function will attempt to interpret the error code as a [standard POSIX error code](#), if no matching `ESP_ERR_` value is found. This is done using `strerror_r` function. POSIX error codes (such as `ENOENT`, `ENOMEM`) are defined in `errno.h` and are typically obtained from `errno` variable. In ESP-IDF this variable is thread-local: multiple FreeRTOS tasks have their own copies of `errno`. Functions which set `errno` only modify its value for the task they run in.

This feature is enabled by default, but can be disabled to reduce application binary size. See [CONFIG\\_ESP\\_ERR\\_TO\\_NAME\\_LOOKUP](#). When this feature is disabled, `esp_err_to_name()` and `esp_err_to_name_r()` are still defined and can be called. In this case, `esp_err_to_name()` will return `UNKNOWN_ERROR`, and `esp_err_to_name_r()` will return `Unknown error 0xXXXX(YYYY)`, where `0xXXXX` and `YYYY` are the hexadecimal and decimal representations of the error code, respectively.

### 4.8.4 ESP\_ERROR\_CHECK macro

`ESP_ERROR_CHECK()` macro serves similar purpose as `assert`, except that it checks `esp_err_t` value rather than a `bool` condition. If the argument of `ESP_ERROR_CHECK()` is not equal `ESP_OK`, then an error message is printed on the console, and `abort()` is called.

Error message will typically look like this:

```
ESP_ERROR_CHECK failed: esp_err_t 0x107 (ESP_ERR_TIMEOUT) at 0x400d1fdf

file: "/Users/user/esp/example/main/main.c" line 20
func: app_main
expression: sdmmc_card_init(host, &card)

Backtrace: 0x40086e7c:0x3ffb4ff0 0x40087328:0x3ffb5010 0x400d1fdf:0x3ffb5030_
↳0x400d0816:0x3ffb5050
```

**Note:** If *IDF monitor* is used, addresses in the backtrace will be converted to file names and line numbers.

- The first line mentions the error code as a hexadecimal value, and the identifier used for this error in source code. The latter depends on [CONFIG\\_ESP\\_ERR\\_TO\\_NAME\\_LOOKUP](#) option being set. Address in the program where error has occurred is printed as well.
- Subsequent lines show the location in the program where `ESP_ERROR_CHECK()` macro was called, and the expression which was passed to the macro as an argument.
- Finally, backtrace is printed. This is part of panic handler output common to all fatal errors. See [Fatal Errors](#) for more information about the backtrace.

### 4.8.5 ESP\_ERROR\_CHECK\_WITHOUT\_ABORT macro

`ESP_ERROR_CHECK_WITHOUT_ABORT()` macro serves similar purpose as `ESP_ERROR_CHECK`, except that it won't call `abort()`.

### 4.8.6 ESP\_RETURN\_ON\_ERROR macro

`ESP_RETURN_ON_ERROR()` macro checks the error code, if the error code is not equal `ESP_OK`, it prints the message and returns.

### 4.8.7 ESP\_GOTO\_ON\_ERROR macro

`ESP_GOTO_ON_ERROR()` macro checks the error code, if the error code is not equal `ESP_OK`, it prints the message, sets the local variable `ret` to the code, and then exits by jumping to `goto_tag`.

### 4.8.8 ESP\_RETURN\_ON\_FALSE macro

`ESP_RETURN_ON_FALSE()` macro checks the condition, if the condition is not equal `true`, it prints the message and returns with the supplied `err_code`.

### 4.8.9 ESP\_GOTO\_ON\_FALSE macro

`ESP_GOTO_ON_FALSE()` macro checks the condition, if the condition is not equal `true`, it prints the message, sets the local variable `ret` to the supplied `err_code`, and then exits by jumping to `goto_tag`.

### 4.8.10 CHECK MACROS Examples

Some examples:

```
static const char* TAG = "Test";

esp_err_t test_func(void)
{
    esp_err_t ret = ESP_OK;

    ESP_ERROR_CHECK(x); // err message_
    ↪printed if `x` is not `ESP_OK`, and then `abort()``.
    ESP_ERROR_CHECK_WITHOUT_ABORT(x); // err message_
    ↪printed if `x` is not `ESP_OK`, without `abort()``.
    ESP_RETURN_ON_ERROR(x, TAG, "fail reason 1"); // err message_
    ↪printed if `x` is not `ESP_OK`, and then function returns with code `x`.
    ESP_GOTO_ON_ERROR(x, err, TAG, "fail reason 2"); // err message_
    ↪printed if `x` is not `ESP_OK`, `ret` is set to `x`, and then jumps to `err`.
    ESP_RETURN_ON_FALSE(a, err_code, TAG, "fail reason 3"); // err message_
    ↪printed if `a` is not `true`, and then function returns with code `err_code`.
    ESP_GOTO_ON_FALSE(a, err_code, err, TAG, "fail reason 4"); // err message_
    ↪printed if `a` is not `true`, `ret` is set to `err_code`, and then jumps to_
    ↪`err`.

err:
    // clean up
    return ret;
}
```

**Note:** If the option `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT` in Kconfig is enabled, the err message will be discarded, while the other action works as is.

The `ESP_RETURN_XX` and `ESP_GOTO_XX` macros can't be called from ISR. While there are `xx_ISR` versions for each of them, e.g., `ESP_RETURN_ON_ERROR_ISR`, these macros could be used in ISR.

### 4.8.11 Error handling patterns

1. Attempt to recover. Depending on the situation, this might mean to retry the call after some time, or attempt to de-initialize the driver and re-initialize it again, or fix the error condition using an out-of-band mechanism (e.g reset an external peripheral which is not responding).

Example:

```
esp_err_t err;
do {
    err = sdio_slave_send_queue(addr, len, arg, timeout);
    // keep retrying while the sending queue is full
} while (err == ESP_ERR_TIMEOUT);
if (err != ESP_OK) {
    // handle other errors
}
```

2. Propagate the error to the caller. In some middleware components this means that a function must exit with the same error code, making sure any resource allocations are rolled back.

Example:

```
sdmmc_card_t* card = calloc(1, sizeof(sdmmc_card_t));
if (card == NULL) {
    return ESP_ERR_NO_MEM;
}
esp_err_t err = sdmmc_card_init(host, &card);
if (err != ESP_OK) {
    // Clean up
    free(card);
    // Propagate the error to the upper layer (e.g. to notify the user).
    // Alternatively, application can define and return custom error code.
    return err;
}
```

3. Convert into unrecoverable error, for example using `ESP_ERROR_CHECK`. See [ESP\\_ERROR\\_CHECK macro](#) section for details.

Terminating the application in case of an error is usually undesirable behaviour for middleware components, but is sometimes acceptable at application level.

Many ESP-IDF examples use `ESP_ERROR_CHECK` to handle errors from various APIs. This is not the best practice for applications, and is done to make example code more concise.

Example:

```
ESP_ERROR_CHECK(spi_bus_initialize(host, bus_config, dma_chan));
```

### 4.8.12 C++ Exceptions

Support for C++ Exceptions in ESP-IDF is disabled by default, but can be enabled using `CONFIG_COMPILER_CXX_EXCEPTIONS` option.

Enabling exception handling normally increases application binary size by a few kB. Additionally it may be necessary to reserve some amount of RAM for exception emergency pool. Memory from this pool will be used if it is not possible to allocate exception object from the heap. Amount of memory in the emergency pool can be set using `CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE` variable.

If an exception is thrown, but there is no `catch` block, the program will be terminated by `abort` function, and backtrace will be printed. See [Fatal Errors](#) for more information about backtraces.

See [cxx/exceptions](#) for an example of C++ exception handling.

## 4.9 ESP-BLE-MESH

Bluetooth® mesh networking enables many-to-many (m:m) device communications and is optimized for creating large-scale device networks.

Devices may relay data to other devices not in direct radio range of the originating device. In this way, mesh networks can span very large physical areas and contain large numbers of devices. It is ideally suited for building automation, sensor networks, and other IoT solutions where tens, hundreds, or thousands of devices need to reliably and securely communicate with one another.

Bluetooth mesh is not a wireless communications technology, but a networking technology. This technology is dependent upon Bluetooth Low Energy (BLE) - a wireless communications protocol stack.

Built on top of Zephyr Bluetooth Mesh stack, the ESP-BLE-MESH implementation supports device provisioning and node control. It also supports such node features as Proxy, Relay, Low power and Friend.

Please see the [ESP-BLE-MESH Architecture](#) for information about the implementation of ESP-BLE-MESH architecture and [ESP-BLE-MESH API Reference](#) for information about respective API.

ESP-BLE-MESH is implemented and certified based on the latest Mesh Profile v1.0.1, users can refer [here](#) for the certification details of ESP-BLE-MESH.

---

**Note:** If you are looking for Wi-Fi based implementation of mesh for ESP32-S3, please check another product by Espressif called ESP-WIFI-MESH. For more information and documentation see [ESP-WIFI-MESH](#).

---

### 4.9.1 Getting Started with ESP-BLE-MESH

This section is intended to help you get started with ESP-BLE-MESH for the hardware based on the ESP32-S3 chip by Espressif.

We are going to demonstrate process of setting and operation of a small ESP-BLE-MESH network of three nodes. This process will cover device provisioning and node configuration, and then sending on/off commands to Generic OnOff Server Models on specific nodes.

If you are new to ESP-IDF, please first set up development environment, compile, flash and run example application following top level ESP-IDF [Get Started](#) documentation.

#### What You Need

Hardware:

- Three ESP32-S3 boards, see [options](#).
- USB cables to connect the boards.
- Computer configured with ESP-IDF.
- Mobile phone or tablet running Android or iOS.

Software:

- Example application [bluetooth/esp\\_ble\\_mesh/ble\\_mesh\\_node/onoff\\_server](#) code to load to the ESP32-S3 boards.
- Mobile App: **nRF Mesh** for Android or iOS. Optionally you can use some other Apps:
  - [EspBleMesh](#) Android App
  - Silicon Labs Android or iOS App

#### Installation Step by Step

This is a detailed roadmap to walk you through the installation process.

**Step 1. Check Hardware** Both [ESP32-DevKitC](#) and [ESP-WROVER-KIT](#) development boards are supported for ESP-BLE-MESH implementation. You can choose particular board through menuconfig: `idf.py menuconfig` >Example Configuration>Board selection for ESP-BLE-MESH

**Note:** If you plan to use [ESP32-DevKitC](#), connect a RGB LED to GPIO pins 25, 26 and 27.

**Step 2. Configure Software** Enter the `bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server` example directory, run `idf.py menuconfig` to select your board and then run `idf.py build` to compile the example.

**Step 3. Upload Application to Nodes** After the `bluetooth/esp_ble_mesh/ble_mesh_node/onoff_server` example is compiled successfully, users can run `idf.py flash` to upload the same generated binary files into each of the three development boards.

Once boards are powered on, the RGB LED on each board should turn **GREEN**.

Fig. 4: ESP-BLE-MESH Devices Power On

**Step 4. Provision Nodes** In this section, we will use the **nRF Mesh Android App** to demonstrate how to provision an unprovisioned device. Users can also get its iOS version from the App Store.

**4.1 Scanner** The Scanner is App' s functionality to search for unprovisioned devices in range. Open the App, press **Scanner** at the bottom and the search will start. After a short while we should see three unprovisioned devices displayed.

**4.2 Identify** Users can select any unprovisioned device, then the App will try to set up a connection with the selected device. After the BLE connection is established successfully (sometimes users need to try multiple times to

Fig. 5: nRF Mesh - Scanner

get connected), and proper ESP-BLE-MESH GATT Service is discovered, users can see the **IDENTIFY** interface button on the screen. The IDENTIFY operation can be used to tell users which device is going to be provisioned.

---

**Note:** The IDENTIFY operation also needs some cooperation on the device side, then users can see which device is in the provisioning process. Currently when pressing the **IDENTIFY** interface button, no signs can be seen from the device except from the log on the serial monitor.

---

After the **IDENTIFY** interface button is pressed, users can see the **PROVISION** interface button.

**4.3 Provision** Then, the App will try to provision the unprovisioned device. When the device is provisioned successfully, the RGB LED on the board will turn off, and the App will implement the following procedures:

1. Disconnect with the node
2. Try to reconnect with the node
3. Connect successfully and discover ESP-BLE-MESH GATT Service
4. Get Composition Data of the node and add AppKey to it

When all the procedures are finished, the node is configured properly. And after pressing **OK**, users can see that unicast address is assigned, and Composition Data of the node is decoded successfully.

Sometimes in procedure 2, the App may fail to reconnect with the node. In this case, after pressing **OK**, users can see that only unicast address of the node has been assigned, but no Composition Data has been got. Then users need to press **CONNECT** on the top right, and the previously provisioned node will be displayed on the screen, and users need to choose it and try to connect with the node.

After connecting successfully, the App will show the interface buttons which can be used to get Composition Data and add AppKey.

If the device is the second or the third one which has been provisioned by the App, and after pressing **CONNECT**, users can see two or three nodes on the screen. In this situation, users can choose any device to connect with, once succeed then go back to the main screen to choose the node which needs to be configured.

Here an example of three devices listed.

Fig. 6: nRF Mesh - IDENTIFY - PROVISION

Fig. 7: nRF Mesh - Configuration Complete

Fig. 8: nRF Mesh - Initial Configuration Failed

Fig. 9: nRF Mesh - Reconnect - Initial Configuration

- The left picture shows that the third device is provisioned successfully, but the App failed to connect with it. When it tries to reconnect with the third node, three nodes are displayed on the App.
- The right picture shows that after connecting with any node successfully, the App displays the information of the three nodes. Users can see that the App has got the Composition Data of the first and the second nodes, but for the third one, only the unicast address has been assigned to it while the Composition Data is unknown.

Fig. 10: nRF Mesh - Reconnect - Three Nodes

**4.4 Configuration** When provisioning and initial configuration are finished, users can start to configure the node, such as binding AppKey with each model with the elements, setting publication information to it, etc.

Example below shows how to bind AppKey with Generic OnOff Server Model within the Primary Element.

---

**Note:** No need to bind AppKey with the Configuration Server Model, since it only uses the DevKey to encrypt messages in the Upper Transport Layer.

---

**Step 5. Operate Network** After all the Generic OnOff Server Models within the three elements are bound with proper AppKey, users can use the App to turn on/off the RGB LED.

In the [bluetooth/esp\\_ble\\_mesh/ble\\_mesh\\_node/onoff\\_server](#) example, the first Generic OnOff Server Model is used to control the **RED** color, the second one is used to control the **GREEN** color and the third one is used to control the **BLUE** color.

The following screenshot shows different board with different color on.

---

**Note:** For **nRF Mesh** iOS App [version 1.0.4], when the node contains more than one element, the App is not behaving correctly. If users try to turn on/off the second or the third Generic OnOff Server Model, the message sent by the App is destined to the first Generic OnOff Server Model within the Primary Element.

---

Fig. 11: nRF Mesh - Model Bind AppKey

Fig. 13: Three ESP-BLE-MESH Nodes On

## 4.9.2 ESP-BLE-MESH Examples

- [ESP-BLE-MESH Node OnOff Server](#) - shows the use of ESP-BLE-MESH as a node having a Configuration Server model and a Generic OnOff Server model. A ESP-BLE-MESH Provisioner can then provision the unprovisioned device and control a RGB LED representing on/off state, see [example code](#) .
- [ESP-BLE-MESH Node OnOff Client](#) - shows how a Generic OnOff Client model works within a node. The node has a Configuration Server model and a Generic OnOff Client model, see [example code](#) .
- [ESP-BLE-MESH Provisioner](#) - shows how a device can act as an ESP-BLE-MESH Provisioner to provision devices. The Provisioner has a Configuration Server model, a Configuration Client model and a Generic OnOff Client model, see [example code](#) .
- [ESP-BLE-MESH Fast Provisioning - Client](#) and [Server](#) - this example is used for showing how fast provisioning can be used in order to create a mesh network. It takes no more than 60 seconds to provision 100 devices, see [example client code](#) and [example server code](#) .
- [ESP-BLE-MESH and Wi-Fi Coexistence](#) - an example that demonstrates the Wi-Fi and Bluetooth (BLE/BR/EDR) coexistence feature of ESP32-S3. Simply put, users can use the Wi-Fi while operating Bluetooth, see [example code](#) .
- [ESP-BLE-MESH Console](#) - an example that implements BLE Mesh basic features. Within this example a node can be scanned and provisioned by Provisioner and reply to get/set message from Provisioner, see [example node code](#) .

### ESP-BLE-MESH Feature List

#### Supported Features

##### Mesh Core

- **Provisioning: Node Role**
  - PB-ADV and PB-GATT
  - OOB Authentication
- **Provisioning: Provisioner Role**
  - PB-ADV and PB-GATT
  - OOB Authentication
- **Networking**
  - Relay
  - Segmentation and Reassembly
  - Key Refresh Procedure
  - IV Update Procedure
  - Friend
  - Low Power
  - Proxy Server
  - Proxy Client
- **Multiple Client Models Run Simultaneously**
  - Support multiple client models send packets to different nodes simultaneously
  - No blocking between client model and server model
- **NVS Storing**
  - Store provisioning and configuration information of ESP-BLE-MESH Node

##### Mesh Models

- **Foundation models**
  - Configuration Server model
  - Configuration Client model
  - Health Server model
  - Health Client model
- **Generic client models**
  - Generic OnOff Client
  - Generic Level Client
  - Generic Default Transition Time Client
  - Generic Power OnOff Client
  - Generic Power Level Client
  - Generic Battery Client
  - Generic Location Client
  - Generic Property Client
- **Sensor client models**
  - Sensor Client

- **Time and Scenes client models**
  - Time Client
  - Scene Client
  - Scheduler Client
- **Lighting client models**
  - Light Lightness Client
  - Light CTL Client
  - Light HSL Client
  - Light xyL Client
  - Light LC Client
- **Generic server models**
  - Generic OnOff Server
  - Generic Level Server
  - Generic Default Transition Time Server
  - Generic Power OnOff Server
  - Generic Power OnOff Setup Server
  - Generic Power Level Server
  - Generic Power Level Setup Server
  - Generic Battery Server
  - Generic Location Server
  - Generic Location Setup Server
  - Generic User Property Server
  - Generic Admin Property Server
  - Generic Manufacturer Property Server
  - Generic Client Property Server
- **Sensor server models**
  - Sensor Server
  - Sensor Setup Server
- **Time and Scenes server models**
  - Time Server
  - Time Setup Server
  - Scene Server
  - Scene Setup Server
  - Scheduler Server
  - Scheduler Setup Server
- **Lighting server models**
  - Light Lightness Server
  - Light Lightness Setup Server
  - Light CTL Server
  - Light CTL Temperature Server
  - Light CTL Setup Server
  - Light HSL Server
  - Light HSL Hue Server
  - Light HSL Saturation Server
  - Light HSL Setup Server
  - Light xyL Server
  - Light xyL Setup Server
  - Light LC Server
  - Light LC Setup Server

## ESP-BLE-MESH Architecture

This document introduces ESP-BLE-MESH architecture overview, ESP-BLE-MESH architecture implementation as well as ESP-BLE-MESH auxiliary routines.

- ESP-BLE-MESH Architecture Overview
  - Describes the five major parts of ESP-BLE-MESH architecture and the functionality of each part.
- ESP-BLE-MESH Architecture Implementation
  - Describes the basic functions of ESP-BLE-MESH files, the correspondence between files and ESP-BLE-MESH architecture, and the interface for calling among files.
- ESP-BLE-MESH Auxiliary Routines
  - Describe the auxiliary routines of ESP-BLE-MESH, such as Mesh network management, Mesh features, etc.

**1. ESP-BLE-MESH Architecture Overview** Currently ESP-BLE-MESH has implemented most functions of Mesh Profile and all the Client Models defined in Mesh Model specification. Those missing functions/models are under development and will be provided soon. ESP-BLE-MESH architecture has been granted the official Bluetooth [certification](#).

ESP-BLE-MESH architecture includes five key parts:

- Mesh Protocol Stack
  - Mesh Networking is responsible for processing of messages of ESP-BLE-MESH nodes.
  - Mesh Provisioning is responsible for provisioning flow of ESP-BLE-MESH devices.
  - Mesh Models is responsible for the implementation of SIG-defined models.
- Network Management
  - Implements several network management procedures, including node removal procedure, IV Index recovery procedure, etc.
- Features
  - Include several ESP-BLE-MESH features, e.g. Low Power feature, Friend feature, Relay feature, etc.
- Mesh Bearer Layer

Fig. 14: Figure 1.1 ESP-BLE-MESH Architecture Diagram

- Includes Advertising Bearer and GATT Bearer. The bearer layer is crucial to ESP-BLE-MESH protocol stack which is built on Bluetooth Low-Energy technology, because the protocol stack must make use of the bearer layer to transmit data via the BLE advertising channel and connection channel.
- Applications
  - Based on ESP-BLE-MESH protocol stack and Mesh Models.
  - By calling API and handling Event, Applications interact with Mesh Networking and Mesh Provisioning in ESP-BLE-MESH protocol stack, as well as a series of Models provided by Mesh Models.

## 1.1 Mesh Protocol Stack

**1.1.1 Mesh Networking** Mesh Networking in the protocol stack architecture implements the following functions:

- The communication between nodes in the Mesh network.
- Encryption and decryption of messages in the Mesh network.
- Management of Mesh network resources (Network Key, IV Index, etc.).
- Segmentation and reassembly of Mesh network messages.
- Model mapping of messages between different models.
- For more features, please see [ESP-BLE-MESH Feature List](#).

The implementation of Mesh Networking functions is based on hierarchy structure. Functions of each layer are shown in Table 1.1:

Table 1: Table 1.1 Mesh Networking Architecture Description

Layer	Function
Access Layer	Access Layer not only defines the format of application data, but also defines and controls the encryption and decryption of the data packets conducted by Upper Transport Layer.
Upper Transport Layer	Upper Transport Layer encrypts, decrypts, and authenticates application data to and from the access layer; it also handles special messages called “transport control messages” , including messages related to “friendship” and heartbeat messages.
Lower Transport Layer	Lower Transport Layer handles segmentation and reassembly of PDU.
Network Layer	Network Layer defines the address type and format of the network messages, and implements the relay function of the device.

**1.1.2 Mesh Provisioning** Mesh Provisioning in the protocol stack architecture implements the following functions:

- Provisioning of unprovisioned devices.
- Allocation of Mesh network resources (unicast address, IV Index, NetKey, etc.).
- Four authentication methods support during provisioning.
- For more features, please see [ESP-BLE-MESH Feature List](#).

The implementation of Mesh Provisioning functions is based on hierarchy structure. Functions of each layer are shown in Table 1.2:

Table 2: Table 1.2 Mesh Provisioning Architecture Description

Layer	Function
Provisioning PDUs	Provisioning PDUs from different layers are handled using provisioning protocol.
Generic Provisioning PDU/Proxy PDU	The Provisioning PDUs are transmitted to an unprovisioned device using a Generic Provisioning layer or Proxy protocol layer.
PB-ADV/PB-GATT	These layers define how the Provisioning PDUs are transmitted as transactions that can be segmented and reassembled.
Advertising/Provisioning Service	The provisioning bearers define how sessions are established such that the transactions from the generic provisioning layer can be delivered to a single device.

**1.1.3 Mesh Models** `Mesh Models` in the protocol stack architecture implements the following functions:

- Configuration Client/Server Models
- Health Client/Server Models
- Generic Client/Server Models
- Sensor Client/Server Models
- Time and Scenes Client/Server Models
- Lighting Client/Server Models

Functions of each layer are shown in Table 1.3:

Table 3: Table 1.3 Mesh Models Architecture Description

Layer	Function
Model Layer	Model Layer implements models used to standardize the operation of typical user scenarios, including Generic Client/Server Models, Sensor Client/Server Models, Time and Scenes Client/Server Models, Lighting Client/Server Models and several vendor models.
Foundation Model Layer	Foundation Model Layer implements models related to ESP-BLE-MESH configuration, management, self diagnosis, etc.

**1.2 Mesh Network Management** `Network Management` implements the following functions:

- Node removal procedure is used to remove a node from the network.
- IV Index recovery procedure is used to recover a node's IV Index.
- IV update procedure is used to update the nodes' IV Index.
- Key refresh procedure is used to update the nodes' NetKey, AppKey, etc.
- Network creation procedure is used to create a mesh network.
- NVS storage is used to store node's networking information.

**1.3 Mesh Features** `Features` includes the following options:

- Low Power feature is used to reduce node's power consumption.
- Friend feature is used to store messages for Low Power nodes.
- Relay feature is used to relay/forward Network PDUs received by a node over the advertising bearer.
- Proxy Server/Client are two node roles in proxy protocol, which enable nodes to send and receive Network PDUs, mesh beacons, proxy configuration messages and Provisioning PDUs over a connection-oriented bearer.

**1.4 Mesh Bearer Layer** `Bearers` in the protocol stack architecture are responsible for passing of data between ESP-BLE-MESH protocol stack and Bluetooth Low Energy Core.

`Bearers` can be taken as a carrier layer based on Bluetooth Low Energy Core, which implements the function of receiving and transmitting data for the ESP-BLE-MESH protocol stack.

Table 4: Table 1.3 Mesh Bearers Description

Layer	Function
GATT Bearer	The GATT Bearer uses the Proxy protocol to transmit and receive Proxy PDUs between two devices over a GATT connection.
Advertising Bearer	When using the Advertising Bearer, a mesh packet shall be sent in the Advertising Data of a Bluetooth Low Energy advertising PDU using the Mesh Message AD Type.

**1.5 Mesh Applications** The Applications in the protocol stack architecture implement the corresponding functions by calling the API provided by the ESP-BLE-MESH protocol stack and processing the Event reported by the protocol stack. There are some common applications, such as gateway, lighting and etc.

Interaction between application layer (Applications) and API / Event

- Application layer calls API
  - Call the provisioning-related API for provisioning.
  - Call the model-related API to send messages.
  - Call the device-attributes-related API to get local information about the device.
- Application layer processes Event
 

The application layer is designed based on events, which take parameters to the application layer. Events are mainly divided into two categories.

  - **The events completed by calling API.**
    - \* Such as nodes sending messages.
  - **The events that the protocol stack actively reports to the application layer.**
    - \* The Event that the protocol stack actively reports.
    - \* The Event that Model actively reports.
- The event is reported by the callback function registered by the application layer, and the callback function also contains the corresponding processing of the event.

Interaction between API / Event and ESP-BLE-MESH protocol stack

- API used by user mainly calls functions provided by Mesh Networking, Mesh Provisioning and Mesh Models.
- The interaction between API / Event and the protocol stack does not operate across the hierarchy of the protocol stack. For example, API does not call functions related to Network Layer.

**2. ESP-BLE-MESH Architecture Implementation** The design and implementation of ESP-BLE-MESH architecture is based on layers and modules. In details, Section 2.1 (Mesh Networking Implementation), Section 2.2 (Mesh Provisioning Implementation) and Section 2.3 (Mesh Bearers Implementation) are based on layers, and Section 2.4 (Mesh Models Implementation) is on modules.

- **Layer-based Approach:** With Layer-based approach, the architecture is designed according to the layers specified in the Mesh Profile Specification. Each layer has its unique files which include APIs of this layer and etc. The specific design is shown in Figure 2.1.
- **Module-based Approach:** Every file implements an independent function that can be called by other programs.

The design of ESP-BLE-MESH architecture uses layer-based approach. The sequence of layers which data packets are processed through is fixed, i.e., the processing of packets will form a message flow. Thus, we could see flows of messages from the Protocol Stack Interface Diagram in Figure 2.1.

## 2.1 Mesh Protocol Stack Implementation

**2.1.1 Mesh Networking Implementation** The list of files and the functions implemented in each file in Mesh Networking are shown in Table 2.1:

Fig. 15: Figure 2.1 ESP-BLE-MESH Architecture Implementation Diagram

Table 5: Table 2.1 Mesh Networking File Description :widths: 40 150  
:header-rows: 1

File	Functionality
<a href="#">ac-access.c</a>	ESP-BLE-MESH Access Layer
<a href="#">transport.c</a>	ESP-BLE-MESH Lower/Upper Transport Layer
<a href="#">net.c</a>	ESP-BLE-MESH Network Layer
<a href="#">adv.c</a>	A task used to send ESP-BLE-MESH advertising packets, a callback used to handle received advertising packets and APIs used to allocate adv buffers

**2.1.2 Mesh Provisioning Implementation** The implementation of Mesh Provisioning is divided into two chunks due to the Node/Provisioner coexistence.

Specific files that provide implementation of provisioning of Node are shown in Table 2.2:

Table 6: Table 2.2 Mesh Provisioning (Node) File Description

File	Functionality
<a href="#">prov.c</a>	ESP-BLE-MESH Node provisioning (PB-ADV & PB-GATT)
<a href="#">proxy_server.c</a>	ESP-BLE-MESH Proxy Server related functionalities
<a href="#">beacon.c</a>	APIs used to handle ESP-BLE-MESH Beacons

Specific files that implement functions of Provisioner are shown in Table 2.3:

Table 7: Table 2.3 Mesh Provisioning (Provisioner) File Description

File	Functionality
<a href="#">provisioner_prov.c</a>	ESP-BLE-MESH Provisioner provisioning (PB-ADV & PB-GATT)
<a href="#">proxy_client.c</a>	ESP-BLE-MESH Proxy Client related functionalities
<a href="#">provisioner_main.c</a>	ESP-BLE-MESH Provisioner networking related functionalities

**2.1.3 Mesh Models Implementation** Mesh Models are used to implement the specific functions of model in nodes. Server model is used to maintain node status. Client model is used to obtain and modify node state.

Table 8: Table 2.4 Mesh Models File Description

File	Functionality
<a href="#">cfg_cli.c</a>	Send Configuration Client messages and receive corresponding response messages
<a href="#">cfg_srv.c</a>	Receive Configuration Client messages and send proper response messages
<a href="#">health_cli.c</a>	Send Health Client messages and receive corresponding response messages
<a href="#">health_srv.c</a>	Receive Health Client messages and send proper response messages
<a href="#">client_common.c</a>	ESP-BLE-MESH model related operations
<a href="#">generic_client.c</a>	Send ESP-BLE-MESH Generic Client messages and receive corresponding response messages
<a href="#">lighting_client.c</a>	Send ESP-BLE-MESH Lighting Client messages and receive corresponding response messages
<a href="#">sensor_client.c</a>	Send ESP-BLE-MESH Sensor Client messages and receive corresponding response messages
<a href="#">time_scene_client.c</a>	Send ESP-BLE-MESH Time Scene Client messages and receive corresponding response messages
<a href="#">generic_server.c</a>	Receive ESP-BLE-MESH Generic Client messages and send corresponding response messages
<a href="#">lighting_server.c</a>	Receive ESP-BLE-MESH Lighting Client messages and send corresponding response messages
<a href="#">sensor_server.c</a>	Receive ESP-BLE-MESH Sensor Client messages and send corresponding response messages
<a href="#">time_scene_server.c</a>	Receive ESP-BLE-MESH Time Scene Client messages and send corresponding response messages

**2.2 Mesh Bearers Implementation** Portability is fully considered in the implementation of Mesh Bearers. When the ESP-BLE-MESH protocol stack is being ported to other platforms, users only need to modify [mesh\\_bearer\\_adapt.c](#) (example of [NimBLE version](#)).

Table 9: Table 2.5 Mesh Bearers File Description

File	Functionality
<a href="#">mesh_bearer_adapt.c</a>	ESP-BLE-MESH Bearer Layer adapter , This file provides the interfaces used to receive and send ESP-BLE-MESH ADV & GATT related packets.

**Note:** [mesh\\_bearer\\_adapt.c](#) is the implementation of Advertising Bearer and GATT Bearer in Mesh Networking framework.

**2.3 Mesh Applications Implementation** We have provided a series of application examples for customer development, and users can develop products based on [ESP-BLE-MESH Examples](#).

**3. Auxiliary Routine** Auxiliary routine refers to optional functions in the ESP-BLE-MESH protocol stack. The design of the auxiliary routine generally implement the truncation of code through [CONFIG\\_BLE\\_MESH](#).

### 3.1 Features

- Low Power
- Friend
- Relay
- Proxy Client/Server

### 3.2 Network Management

- Node Removal procedure
- IV Index Recovery procedure
- IV Update procedure
- Key Refresh procedure
- Network Creation procedure
- NVS Storage

**3.3 Auxiliary Routine Implementation** When adopting the design of independent module, the two main factors should be considered:

- The module can not be implemented hierarchically, and it can be completely independent, which means it does not rely on the implementation of other modules.
- The functions in the module will be used repeatedly, so it is reasonable to design it into a module. Independent module is shown in Table 3.1:

Table 10: Table 3.1 Module File Description

File	Functionality
<a href="#">lpn.c</a>	ESP-BLE-MESH Low Power functionality
<a href="#">friend.c</a>	ESP-BLE-MESH Friend functionality
<a href="#">net.c</a>	ESP-BLE-MESH Relay feature, network creation, IV Update procedure, IV Index recovery procedure, Key Refresh procedure related functionalities
<a href="#">proxy_server.c</a>	ESP-BLE-MESH Proxy Server related functionalities
<a href="#">proxy_client.c</a>	ESP-BLE-MESH Proxy Client related functionalities
<a href="#">settings.c</a>	ESP-BLE-MESH NVS storage functionality
<a href="#">main.c</a>	ESP-BLE-MESH stack initialize, stack enable, node removal related functionalities

### ESP-BLE-MESH FAQ

This document provides a summary of frequently asked questions about developing with ESP-BLE-MESH, and is divided into seven sections:

- [1. Provisioner Development](#)
- [2. Node Development](#)
- [3. ESP-BLE-MESH and Wi-Fi Coexistence](#)
- [4. Fast Provisioning](#)
- [5. Log Help](#)
- [6. Example Help](#)
- [7. Others](#)

Users could refer to the sections for quick answer to their questions. This document will be updated based on the feedback collected via various channels.

**1. Provisioner Development** Generally, a Provisioner is used to provision unprovisioned devices and form a mesh network. And after provisioning, roles of the unprovisioned devices will be changed to those of a node.

#### 1.1 What is the flow for an unprovisioned device to join ESP-BLE-MESH network?

There are two phases for a device to join ESP-BLE-MESH network via a Provisioner, namely, provisioning and configuration.
