- **ESP_ERR_INVALID_ARG**: Recover from fault failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Recover from fault failed because the fault source is still active
- **ESP_FAIL**: Recover from fault failed because of other error

```c
esp_err_t mcpwm_operator_register_event_callbacks (mcpwm_oper_handle_t oper, const mcpwm_operator_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for MCPWM operator.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Parameters

- **oper** - [in] MCPWM operator handle, allocated by `mcpwm_new_operator`
- **cbs** - [in] Group of callback functions
- **user_data** - [in] User data, which will be passed to callback functions directly

Returns

- **ESP_OK**: Set event callbacks successfully
- **ESP_ERR_INVALID_ARG**: Set event callbacks failed because of invalid argument
- **ESP_FAIL**: Set event callbacks failed because of other error

```c
esp_err_t mcpwm_operator_apply_carrier (mcpwm_oper_handle_t oper, const mcpwm_carrier_config_t *config)
```

Apply carrier feature for MCPWM operator.

Parameters

- **oper** - [in] MCPWM operator, allocated by `mcpwm_new_operator`
- **config** - [in] MCPWM carrier specific configuration

Returns

- **ESP_OK**: Set carrier for operator successfully
- **ESP_ERR_INVALID_ARG**: Set carrier for operator failed because of invalid argument
- **ESP_FAIL**: Set carrier for operator failed because of other error

**Structures**

```c
struct mcpwm_operator_config_t

MCPWM operator configuration.
```

**Public Members**

```c
int group_id

Specify from which group to allocate the MCPWM operator
```

```c
int intr_priority

MCPWM operator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)
```
`uint32_t update_gen_action_on_tez`
Whether to update generator action when timer counts to zero

`uint32_t update_gen_action_on_tep`
Whether to update generator action when timer counts to peak

`uint32_t update_gen_action_on_sync`
Whether to update generator action on sync event

`uint32_t update_dead_time_on_tez`
Whether to update dead time when timer counts to zero

`uint32_t update_dead_time_on_tep`
Whether to update dead time when timer counts to peak

`uint32_t update_dead_time_on_sync`
Whether to update dead time on sync event

`struct mcpwm_operator_config_t::[anonymous] flags`
Extra configuration flags for operator

`struct mcpwm_brake_config_t`
MCPWM brake configuration structure.

**Public Members**

`mcpwm_fault_handle_t fault`
Which fault causes the operator to brake

`mcpwm_operator_brake_mode_t brake_mode`
Brake mode

`uint32_t cbc_recover_on_tez`
Recovery CBC brake state on tez event

`uint32_t cbc_recover_on_tep`
Recovery CBC brake state on tep event

`struct mcpwm_brake_config_t::[anonymous] flags`
Extra flags for brake configuration

`struct mcpwm_operator_event_callbacks_t`
Group of supported MCPWM operator event callbacks.

**Note:** The callbacks are all running under ISR environment
Chapter 2. API Reference

Public Members

`mcpwm_brake_event_cb_t on_brake_cbc`
callback function when mcpwm operator brakes in CBC

`mcpwm_brake_event_cb_t on_brake_ost`
callback function when mcpwm operator brakes in OST

`struct mcpwm_carrier_config_t`
MCPWM carrier configuration structure.

Public Members

`mcpwm_carrier_clock_source_t clk_src`
MCPWM carrier clock source

`uint32_t frequency_hz`
Carrier frequency in Hz

`uint32_t first_pulse_duration_us`
The duration of the first PWM pulse, in us

`float duty_cycle`
Carrier duty cycle

`uint32_t invert_before_modulate`
Invert the raw signal

`uint32_t invert_after_modulate`
Invert the modulated signal

`struct mcpwm_carrier_config_t::[anonymous] flags`
Extra flags for carrier configuration

Header File

- components/driver/include/driver/mcpwm_cmpr.h

Functions

`esp_err_t mcpwm_new_comparator (mcpwm_oper_handle_t oper, const mcpwm_comparator_config_t *config, mcpwm_cmpr_handle_t *ret_cmpr)`
Create MCPWM comparator.

Parameters

- `oper` [in] MCPWM operator, allocated by `mcpwm_new_operator()`, the new comparator will be allocated from this operator
- `config` [in] MCPWM comparator configuration
- `ret_cmpr` [out] Returned MCPWM comparator

Returns

- ESP_OK: Create MCPWM comparator successfully
• ESP_ERR_INVALID_ARG: Create MCPWM comparator failed because of invalid argument
• ESP_ERR_NO_MEM: Create MCPWM comparator failed because out of memory
• ESP_ERR_NOT_FOUND: Create MCPWM comparator failed because can’t find free resource
• ESP_FAIL: Create MCPWM comparator failed because of other error

`esp_err_t mcpwm_del_comparator(mcpwm_cmpr_handle_t cmpr)`
Delete MCPWM comparator.

Parameters
  cmpr -[in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`

Returns
  • ESP_OK: Delete MCPWM comparator successfully
  • ESP_ERR_INVALID_ARG: Delete MCPWM comparator failed because of invalid argument
  • ESP_FAIL: Delete MCPWM comparator failed because of other error

`esp_err_t mcpwm_comparator_register_event_callbacks(mcpwm_cmpr_handle_t cmpr, const mcpwm_comparator_event_callbacks_t *cbs, void *user_data)`
Set event callbacks for MCPWM comparator.

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Parameters
  • cmpr -[in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
  • cbs -[in] Group of callback functions
  • user_data -[in] User data, which will be passed to callback functions directly

Returns
  • ESP_OK: Set event callbacks successfully
  • ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
  • ESP_FAIL: Set event callbacks failed because of other error

`esp_err_t mcpwm_comparator_set_compare_value(mcpwm_cmpr_handle_t cmpr, uint32_t cmp_ticks)`
Set MCPWM comparator’s compare value.

Parameters
  • cmpr -[in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
  • cmp_ticks -[in] The new compare value

Returns
  • ESP_OK: Set MCPWM compare value successfully
  • ESP_ERR_INVALID_ARG: Set MCPWM compare value failed because of invalid argument (e.g. the cmp_ticks is out of range)
  • ESP_ERR_INVALID_STATE: Set MCPWM compare value failed because the operator doesn’t have a timer connected
  • ESP_FAIL: Set MCPWM compare value failed because of other error

Structures

struct `mcpwm_comparator_config_t`
MCPWM comparator configuration.

Public Members

Espressif Systems 1185 Release v5.0.4-384-ge42bcf2e88
Submit Document Feedback
int intr_priority
MCPWM comparator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t update_cmp_on_tez
Whether to update compare value when timer count equals to zero (tez)

uint32_t update_cmp_on_tep
Whether to update compare value when timer count equals to peak (tep)

uint32_t update_cmp_on_sync
Whether to update compare value on sync event

struct mcpwm_comparator_config_t::[anonymous] flags
Extra configuration flags for comparator

struct mcpwm_comparator_event_callbacks_t
Group of supported MCPWM compare event callbacks.

Note: The callbacks are all running under ISR environment

Public Members

mcpwm_compare_event_cb_t on_reach
ISR callback function which would be invoked when counter reaches compare value

Header File

- components/driver/include/driver/mcpwm_gen.h

Functions

esp_err_t mcpwm_new_generator (mcpwm_oper_handle_t oper, const mcpwm_generator_config_t *config,
                                 mcpwm_gen_handle_t *ret_gen)
Allocate MCPWM generator from given operator.

Parameters

- oper - [in] MCPWM operator, allocated by mcpwm_new_operator()
- config - [in] MCPWM generator configuration
- ret_gen - [out] Returned MCPWM generator

Returns

- ESP_OK: Create MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM generator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM generator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM generator failed because can’t find free resource
- ESP_FAIL: Create MCPWM generator failed because of other error

esp_err_t mcpwm_del_generator (mcpwm_gen_handle_t gen)
Delete MCPWM generator.

Parameters gen - [in] MCPWM generator handle, allocated by mcpwm_new_generator()
Returns

- ESP_OK: Delete MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM generator failed because of invalid argument
- ESP_FAIL: Delete MCPWM generator failed because of other error

**esp_err_t mcpwm_generator_set_force_level(mcpwm_gen_handle_t gen, int level, bool hold_on)**

Set force level for MCPWM generator.

**Note:** The force level will be applied to the generator immediately, regardless any other events that would change the generator’s behaviour.

**Note:** If the hold_on is true, the force level will retain forever, until user removes the force level by setting the force level to -1.

**Note:** If the hold_on is false, the force level can be overridden by the next event action.

**Note:** The force level set by this function can be inverted by GPIO matrix or dead-time module. So the level set here doesn’t equal to the final output level.

**Parameters**

- gen – [in] MCPWM generator handle, allocated by mcpwm_new_generator()
- level – [in] GPIO level to be applied to MCPWM generator, specially, -1 means to remove the force level
- hold_on – [in] Whether the forced PWM level should retain (i.e. will remain unchanged until manually remove the force level)

**Returns**

- ESP_OK: Set force level for MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Set force level for MCPWM generator failed because of invalid argument
- ESP_FAIL: Set force level for MCPWM generator failed because of other error

**esp_err_t mcpwm_generator_set_action_on_timer_event(mcpwm_gen_handle_t gen, mcpwm_gen_timer_event_action_t ev_act)**

Set generator action on MCPWM timer event.

**Parameters**

- gen – [in] MCPWM generator handle, allocated by mcpwm_new_generator()
- ev_act – [in] MCPWM timer event action, can be constructed by MCPWM_GEN_TIMER_EVENT_ACTION helper macro

**Returns**

- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set generator action failed because of timer is not connected to operator
- ESP_FAIL: Set generator action failed because of other error

**esp_err_t mcpwm_generator_set_actions_on_timer_event(mcpwm_gen_handle_t gen, mcpwm_gen_timer_event_action_t ev_act, ...)**

Set generator actions on multiple MCPWM timer events.
Note: This is an aggregation version of `mcpwm_generator_set_action_on_timer_event`, which allows user to set multiple actions in one call.

**Parameters**
- `gen` [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `ev_act` [in] MCPWM timer event action list, must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END()`

**Returns**
- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set generator actions failed because of timer is not connected to operator
- ESP_FAIL: Set generator actions failed because of other error

```c
esp_err_t mcpwm_generator_set_action_on_timer_event (mcpwm_gen_handle_t generator,
                                                  mcpwm_gen_timer_event_action_t ev_act)
```

Set generator action on MCPWM timer event.

**Parameters**
- `generator` [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `ev_act` [in] MCPWM compare event action, can be constructed by `MCPWM_GEN_COMPARE_EVENT_ACTION` helper macro

**Returns**
- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error

```c
esp_err_t mcpwm_generator_set_actions_on_compare_event (mcpwm_gen_handle_t generator,
                                                        mcpwm_gen_compare_event_action_t ev_act, ...)
```

Set generator actions on multiple MCPWM compare events.

Note: This is an aggregation version of `mcpwm_generator_set_action_on_compare_event`, which allows user to set multiple actions in one call.

**Parameters**
- `generator` [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `ev_act` [in] MCPWM compare event action list, must be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END()`

**Returns**
- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_FAIL: Set generator actions failed because of other error

```c
esp_err_t mcpwm_generator_set_actions_on_compare_event (mcpwm_gen_handle_t generator,
                                                        mcpwm_gen_compare_event_action_t ev_act, ...)
```

Set generator action on MCPWM brake event.

**Parameters**
- `generator` [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
Chapter 2. API Reference

- `ev_act` - [in] MCPWM brake event action, can be constructed by `MCPWM_GEN_BRAKE_EVENT_ACTION` helper macro

**Returns**

- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error

```c
void mcpwm_generator_set_actions_on_brake_event(mcpwm_gen_handle_t generator, mcpwm_gen_brake_event_action_t ev_act,...)
```

Set generator actions on multiple MCPWM brake events.

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_brake_event`, which allows user to set multiple actions in one call.

**Parameters**

- `generator` - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `ev_act` - [in] MCPWM brake event action list, must be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END()`

**Returns**

- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_FAIL: Set generator actions failed because of other error

```c
void mcpwm_generator_set_dead_time(mcpwm_gen_handle_t in_generator, mcpwm_gen_handle_t out_generator, const mcpwm_dead_time_config_t *config)
```

Set dead time for MCPWM generator.

**Note:** Due to a hardware limitation, you cannot set rising edge delay for both MCPWM generator 0 and 1 at the same time, otherwise, there will be a conflict inside the dead time module. The same goes for the falling edge setting. But you can set both the rising edge and falling edge delay for the same MCPWM generator.

**Parameters**

- `in_generator` - [in] MCPWM generator, before adding the dead time
- `out_generator` - [in] MCPWM generator, after adding the dead time
- `config` - [in] MCPWM dead time configuration

**Returns**

- ESP_OK: Set dead time for MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Set dead time for MCPWM generator failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set dead time for MCPWM generator failed because of invalid state (e.g. delay module is already in use by other generator)
- ESP_FAIL: Set dead time for MCPWM generator failed because of other error

**Structures**

```c
struct mcpwm_generator_config_t
```

MCPWM generator configuration.

**Public Members**
int gen_gpio_num
    The GPIO number used to output the PWM signal

uint32_t invert_pwm
    Whether to invert the PWM signal (done by GPIO matrix)

uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t io_od_mode
    Configure the GPIO as open-drain mode

uint32_t pull_up
    Whether to pull up internally

uint32_t pull_down
    Whether to pull down internally

struct mcpwm_generator_config_t::[anonymous] flags
    Extra configuration flags for generator

struct mcpwm_gen_timer_event_action_t
    Generator action on specific timer event.

Public Members

mcpwm_timer_direction_t direction
    Timer direction

mcpwm_timer_event_t event
    Timer event

mcpwm_generator_action_t action
    Generator action should perform

struct mcpwm_gen_compare_event_action_t
    Generator action on specific comparator event.

Public Members

mcpwm_timer_direction_t direction
    Timer direction

mcpwm_cmpr_handle_t comparator
    Comparator handle

mcpwm_generator_action_t action
    Generator action should perform
Chapter 2. API Reference

struct mcpwm_gen_brake_event_action_t
Generator action on specific brake event.

Public Members

mcpwm_timer_direction_t direction
Timer direction

mcpwm_operator_brake_mode_t brake_mode
Brake mode

mcpwm_generator_action_t action
Generator action should perform

struct mcpwm_dead_time_config_t
MCPWM dead time configuration structure.

Public Members

uint32_t posedge_delay_ticks
delay time applied to rising edge, 0 means no rising delay time

uint32_t negedge_delay_ticks
delay time applied to falling edge, 0 means no falling delay time

uint32_t invert_output
Invert the signal after applied the dead time

struct mcpwm_dead_time_config_t::[anonymous] flags
Extra flags for dead time configuration

Macros

MCPWM_GEN_TIMER_EVENT_ACTION (dir, ev, act)
Help macros to construct a mcpwm_gen_timer_event_action_t entry.

MCPWM_GEN_TIMER_EVENT_ACTION_END ()

MCPWM_GEN_COMPARE_EVENT_ACTION (dir, cmp, act)
Help macros to construct a mcpwm_gen_compare_event_action_t entry.

MCPWM_GEN_COMPARE_EVENT_ACTION_END ()

MCPWM_GEN_BRAKE_EVENT_ACTION (dir, mode, act)
Help macros to construct a mcpwm_gen_brake_event_action_t entry.

MCPWM_GEN_BRAKE_EVENT_ACTION_END ()

 FUNCTIONS

\texttt{esp_err_t mcpwm_new_gpio_fraction}\ (const mcpwm_gpio_fraction_config_t *config, mcpwm_fault_handle_t *ret_fault)

Create MCPWM GPIO fault.

\textbf{Parameters}
- \texttt{config} – [in] MCPWM GPIO configuration
- \texttt{ret_fault} – [out] Returned GPIO fault handle

\textbf{Returns}
- \texttt{ESP_OK}: Create MCPWM GPIO fault successfully
- \texttt{ESP_ERR_INVALID_ARG}: Create MCPWM GPIO fault failed because of invalid argument
- \texttt{ESP_ERR_NO_MEM}: Create MCPWM GPIO fault failed because out of memory
- \texttt{ESP_FAIL}: Create MCPWM GPIO fault failed because of other error

\texttt{esp_err_t mcpwm_new_soft_fault}\ (const mcpwm_soft_fault_config_t *config, mcpwm_fault_handle_t *ret_fault)

Create MCPWM software fault.

\textbf{Parameters}
- \texttt{config} – [in] MCPWM software fault configuration
- \texttt{ret_fault} – [out] Returned software fault handle

\textbf{Returns}
- \texttt{ESP_OK}: Create MCPWM software fault successfully
- \texttt{ESP_ERR_INVALID_ARG}: Create MCPWM software fault failed because of invalid argument
- \texttt{ESP_ERR_NO_MEM}: Create MCPWM software fault failed because out of memory
- \texttt{ESP_FAIL}: Create MCPWM software fault failed because of other error

\texttt{esp_err_t mcpwm_del_fault}\ (mcpwm_fault_handle_t fault)

Delete MCPWM fault.

\textbf{Parameters}
- \texttt{fault} – [in] MCPWM fault handle allocated by \texttt{mcpwm_new_gpio_fraction()} or \texttt{mcpwm_new_soft_fault()}

\textbf{Returns}
- \texttt{ESP_OK}: Delete MCPWM fault successfully
- \texttt{ESP_ERR_INVALID_ARG}: Delete MCPWM fault failed because of invalid argument
- \texttt{ESP_FAIL}: Delete MCPWM fault failed because of other error

\texttt{esp_err_t mcpwm_soft_fault_activate}\ (mcpwm_fault_handle_t fault)

Activate the software fault, trigger the fault event for once.

\textbf{Parameters}
- \texttt{fault} – [in] MCPWM soft fault, allocated by \texttt{mcpwm_new_soft_fault()}

\textbf{Returns}
- \texttt{ESP_OK}: Trigger MCPWM software fault event successfully
- \texttt{ESP_ERR_INVALID_ARG}: Trigger MCPWM software fault event failed because of invalid argument
- \texttt{ESP_FAIL}: Trigger MCPWM software fault event failed because of other error

\texttt{esp_err_t mcpwm_fault_register_event_callbacks}\ (mcpwm_fault_handle_t fault, const mcpwm_fault_event_callbacks_t *cbs, void *user_data)

Set event callbacks for MCPWM fault.

\textbf{Note}: User can deregister a previously registered callback by calling this function and setting the callback member in the \texttt{cbs} structure to NULL.

\textbf{Parameters}
Chapter 2. API Reference

- **fault** -[in] MCPWM GPIO fault handle, allocated by `mcpwm_new_gpio_fault()`
- **cbs** -[in] Group of callback functions
- **user_data** -[in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

**Structures**

```c
struct mcpwm_gpio_fault_config_t
```
MCPWM GPIO fault configuration structure.

**Public Members**

```c
int group_id
```
In which MCPWM group that the GPIO fault belongs to

```c
int intr_priority
```
MCPWM GPIO fault interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

```c
int gpio_num
```
GPIO used by the fault signal

```c
uint32_t active_level
```
On which level the fault signal is treated as active

```c
uint32_t io_loop_back
```
For debug/test, the signal output from the GPIO will be fed to the input path as well

```c
uint32_t pull_up
```
Whether to pull up internally

```c
uint32_t pull_down
```
Whether to pull down internally

```c
struct mcpwm_gpio_fault_config_t::[anonymous] flags
```
Extra configuration flags for GPIO fault

```c
struct mcpwm_soft_fault_config_t
```
MCPWM software fault configuration structure.

```c
struct mcpwm_fault_event_callbacks_t
```
Group of supported MCPWM fault event callbacks.

**Note:** The callbacks are all running under ISR environment
Public Members

```c
mcpwm_fault_event_cb_t on_fault_enter
ISR callback function that would be invoked when fault signal becomes active
```

```c
mcpwm_fault_event_cb_t on_fault_exit
ISR callback function that would be invoked when fault signal becomes inactive
```

Header File

- components/driver/include/driver/mcpwm_sync.h

Functions

```c
esp_err_t mcpwm_new_timer_sync_src(mcpwm_timer_handle_t timer, const mcpwm_timer_sync_src_config_t *config, mcpwm_sync_handle_t *ret_sync)
```

Create MCPWM timer sync source.

**Parameters**
- `timer` - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `config` - [in] MCPWM timer sync source configuration
- `ret_sync` - [out] Returned MCPWM sync handle

**Returns**
- ESP_OK: Create MCPWM timer sync source successfully
- ESP_ERR_INVALID_ARG: Create MCPWM timer sync source failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM timer sync source failed because out of memory
- ESP_ERR_INVALID_STATE: Create MCPWM timer sync source failed because the timer has created a sync source before
- ESP_FAIL: Create MCPWM timer sync source failed because of other error

```c
esp_err_t mcpwm_new_gpio_sync_src(const mcpwm_gpio_sync_src_config_t *config, mcpwm_sync_handle_t *ret_sync)
```

Create MCPWM GPIO sync source.

**Parameters**
- `config` - [in] MCPWM GPIO sync source configuration
- `ret_sync` - [out] Returned MCPWM GPIO sync handle

**Returns**
- ESP_OK: Create MCPWM GPIO sync source successfully
- ESP_ERR_INVALID_ARG: Create MCPWM GPIO sync source failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM GPIO sync source failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM GPIO sync source failed because can’t find free resource
- ESP_FAIL: Create MCPWM GPIO sync source failed because of other error

```c
esp_err_t mcpwm_new_soft_sync_src(const mcpwm_soft_sync_config_t *config, mcpwm_sync_handle_t *ret_sync)
```

Create MCPWM software sync source.

**Parameters**
- `config` - [in] MCPWM software sync source configuration
- `ret_sync` - [out] Returned software sync handle

**Returns**
- ESP_OK: Create MCPWM software sync successfully
- ESP_ERR_INVALID_ARG: Create MCPWM software sync failed because of invalid argument
• ESP_ERR_NO_MEM: Create MCPWM software sync failed because out of memory
• ESP_FAIL: Create MCPWM software sync failed because of other error

```c
esp_err_t mcpwm_del_sync_src (mcpwm_sync_handle_t sync)
```
Delete MCPWM sync source.

**Parameters**
`sync` — [in] MCPWM sync handle, allocated by `mcpwm_new_timer_sync_src()` or `mcpwm_new_gpio_sync_src()` or `mcpwm_new_soft_sync_src()`

**Returns**
• ESP_OK: Delete MCPWM sync source successfully
• ESP_ERR_INVALID_ARG: Delete MCPWM sync source failed because of invalid argument
• ESP_FAIL: Delete MCPWM sync source failed because of other error

```c
esp_err_t mcpwm_soft_sync_activate (mcpwm_sync_handle_t sync)
```
Activate the software sync, trigger the sync event for once.

**Parameters**
`sync` — [in] MCPWM soft sync handle, allocated by `mcpwm_new_soft_sync_src()`

**Returns**
• ESP_OK: Trigger MCPWM software sync event successfully
• ESP_ERR_INVALID_ARG: Trigger MCPWM software sync event failed because of invalid argument
• ESP_FAIL: Trigger MCPWM software sync event failed because of other error

**Structures**

```c
struct mcpwm_timer_sync_src_config_t
```
MCPWM timer sync source configuration.

**Public Members**

```c
mcpwm_timer_event_t timer_event
```
Timer event, upon which MCPWM timer will generate the sync signal

```c
uint32_t propagate_input_sync
```
The input sync signal would be routed to its sync output

```c
struct mcpwm_timer_sync_src_config_t::<anonymous> flags
```
Extra configuration flags for timer sync source

```c
struct mcpwm_gpio_sync_src_config_t
```
MCPWM GPIO sync source configuration.

**Public Members**

```c
int group_id
```
MCPWM group ID

```c
int gpio_num
```
GPIO used by sync source
uint32_t active_neg
Whether the sync signal is active on negedge, by default, the sync signal’s posedge is treated as active

uint32_t io_loop_back
For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t pull_up
Whether to pull up internally

uint32_t pull_down
Whether to pull down internally

struct mcpwm_gpio_sync_src_config_t::[anonymous] flags
Extra configuration flags for GPIO sync source

struct mcpwm_soft_sync_config_t
MCPWM software sync configuration structure.

Header File
• components/driver/include/driver/mcpwm_cap.h

Functions

esp_err_t mcpwm_new_capture_timer (const mcpwm_capture_timer_config_t *config,
                                    mcpwm_cap_timer_handle_t *ret_cap_timer)
Create MCPWM capture timer.

Parameters
• config [in] MCPWM capture timer configuration
• ret_cap_timer [out] Returned MCPWM capture timer handle

Returns
• ESP_OK: Create MCPWM capture timer successfully
• ESP_ERR_INVALID_ARG: Create MCPWM capture timer failed because of invalid argument
• ESP_ERR_NO_MEM: Create MCPWM capture timer failed because out of memory
• ESP_ERR_NOT_FOUND: Create MCPWM capture timer failed because can’t find free resource
• ESP_FAIL: Create MCPWM capture timer failed because of other error

esp_err_t mcpwm_del_capture_timer (mcpwm_cap_timer_handle_t cap_timer)
Delete MCPWM capture timer.

Parameters cap_timer [in] MCPWM capture timer, allocated by mcpwm_new_capture_timer()

Returns
• ESP_OK: Delete MCPWM capture timer successfully
• ESP_ERR_INVALID_ARG: Delete MCPWM capture timer failed because of invalid argument
• ESP_FAIL: Delete MCPWM capture timer failed because of other error

esp_err_t mcpwm_capture_timer_enable (mcpwm_cap_timer_handle_t cap_timer)
Enable MCPWM capture timer.

Parameters cap_timer [in] MCPWM capture timer handle, allocated by mcpwm_new_capture_timer()

Returns
Chapter 2. API Reference

- ESP_OK: Enable MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Enable MCPWM capture timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable MCPWM capture timer failed because timer is enabled already
- ESP_FAIL: Enable MCPWM capture timer failed because of other error

```plaintext
esp_err_t mcpwm_capture_timer_disable(mcpwm_cap_timer_handle_t cap_timer)

Disable MCPWM capture timer.
```

**Parameters**
- **cap_timer**: [in] MCPWM capture timer handle, allocated by `mcpwm_new_capture_timer()`

**Returns**
- ESP_OK: Disable MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM capture timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM capture timer failed because timer is disabled already
- ESP_FAIL: Disable MCPWM capture timer failed because of other error

```plaintext
esp_err_t mcpwm_capture_timer_start(mcpwm_cap_timer_handle_t cap_timer)

Start MCPWM capture timer.
```

**Parameters**
- **cap_timer**: [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

**Returns**
- ESP_OK: Start MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Start MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Start MCPWM capture timer failed because of other error

```plaintext
esp_err_t mcpwm_capture_timer_stop(mcpwm_cap_timer_handle_t cap_timer)

Start MCPWM capture timer.
```

**Parameters**
- **cap_timer**: [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

**Returns**
- ESP_OK: Stop MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Stop MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Stop MCPWM capture timer failed because of other error

```plaintext
esp_err_t mcpwm_capture_timer_get_resolution(mcpwm_cap_timer_handle_t cap_timer, uint32_t *out_resolution)

Get MCPWM capture timer resolution, in Hz.
```

**Parameters**
- **cap_timer**: [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`

**Returns**
- ESP_OK: Get capture timer resolution successfully
- ESP_ERR_INVALID_ARG: Get capture timer resolution failed because of invalid argument
- ESP_FAIL: Get capture timer resolution failed because of other error

```plaintext
esp_err_t mcpwm_capture_timer_set_phase_on_sync(mcpwm_cap_timer_handle_t cap_timer, const mcpwm_capture_timer_sync_phase_config_t *config)

Set sync phase for MCPWM capture timer.
```

**Parameters**
Chapter 2. API Reference

- **cap_timer** - [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- **config** - [in] MCPWM capture timer sync phase configuration

**Returns**
- ESP_OK: Set sync phase for MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Set sync phase for MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Set sync phase for MCPWM capture timer failed because of other error

```c
esp_err_t mcpwm_new_capture_channel(mcpwm_cap_timer_handle_t cap_timer, const mcpwm_capture_channel_config_t *config,
    mcpwm_cap_channel_handle_t *ret_cap_channel)
```

Create MCPWM capture channel.

**Note:** The created capture channel won’t be enabled until calling `mcpwm_capture_channel_enable`

### Parameters
- **cap_timer** - [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`, will be connected to the new capture channel
- **config** - [in] MCPWM capture channel configuration
- **ret_cap_channel** - [out] Returned MCPWM capture channel

**Returns**
- ESP_OK: Create MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Create MCPWM capture channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM capture channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM capture channel failed because can’t find free resource
- ESP_FAIL: Create MCPWM capture channel failed because of other error

```c
esp_err_t mcpwm_del_capture_channel(mcpwm_cap_channel_handle_t cap_channel)
```

Delete MCPWM capture channel.

### Parameters
- **cap_channel** - [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**
- ESP_OK: Delete MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM capture channel failed because of invalid argument
- ESP_FAIL: Delete MCPWM capture channel failed because of other error

```c
esp_err_t mcpwm_capture_channel_enable(mcpwm_cap_channel_handle_t cap_channel)
```

Enable MCPWM capture channel.

**Note:** This function will transit the channel state from init to enable.

**Note:** This function will enable the interrupt service, if it’s lazy installed in `mcpwm_capture_channel_register_event_callbacks()`.

### Parameters
- **cap_channel** - [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**
- ESP_OK: Enable MCPWM capture channel successfully
• ESP_ERR_INVALID_ARG: Enable MCPWM capture channel failed because of invalid argument
• ESP_ERR_INVALID_STATE: Enable MCPWM capture channel failed because the channel is already enabled
• ESP_FAIL: Enable MCPWM capture channel failed because of other error

`esp_err_t mcpwm_capture_channel_disable(mcpwm_cap_channel_handle_t cap_channel)`
Disable MCPWM capture channel.

**Parameters**
- `cap_channel` - [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**
- ESP_OK: Disable MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM capture channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM capture channel failed because the channel is not enabled yet
- ESP_FAIL: Disable MCPWM capture channel failed because of other error

`esp_err_t mcpwm_capture_channel_register_event_callbacks(mcpwm_cap_channel_handle_t cap_channel, const mcpwm_capture_event_callbacks_t *cbs, void *user_data)`
Set event callbacks for MCPWM capture channel.

**Note:** The first call to this function needs to be before the call to `mcpwm_capture_channel_enable`

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Parameters**
- `cap_channel` - [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`
- `cbs` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because the channel is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

`esp_err_t mcpwm_capture_channel_trigger_soft_catch(mcpwm_cap_channel_handle_t cap_channel)`
Trigger a catch by software.

**Parameters**
- `cap_channel` - [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**
- ESP_OK: Trigger software catch successfully
- ESP_ERR_INVALID_ARG: Trigger software catch failed because of invalid argument
- ESP_ERR_INVALID_STATE: Trigger software catch failed because the channel is not enabled yet
- ESP_FAIL: Trigger software catch failed because of other error
Chapter 2. API Reference

Structures

struct mcpwm_capture_timer_config_t
MCPWM capture timer configuration structure.

Public Members

int group_id
Specify from which group to allocate the capture timer

mcpwm_capture_clock_source_t clk_src
MCPWM capture timer clock source

struct mcpwm_capture_timer_sync_phase_config_t
MCPWM Capture timer sync phase configuration.

Public Members

mcpwm_sync_handle_t sync_src
The sync event source

uint32_t count_value
The count value that should lock to upon sync event

mcpwm_timer_direction_t direction
The count direction that should lock to upon sync event

struct mcpwm_capture_channel_config_t
MCPWM capture channel configuration structure.

Public Members

int gpio_num
GPIO used capturing input signal

int intr_priority
MCPWM capture interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t prescale
Prescale of input signal, effective frequency = cap_input_clk/prescale

uint32_t pos_edge
Whether to capture on positive edge

uint32_t neg_edge
Whether to capture on negative edge
### uint32_t pull_up
Whether to pull up internally

### uint32_t pull_down
Whether to pull down internally

### uint32_t invert_cap_signal
Invert the input capture signal

### uint32_t io_loop_back
For debug/test, the signal output from the GPIO will be fed to the input path as well

### uint32_t keep_io_conf_at_exit
For debug/test, whether to keep the GPIO configuration when capture channel is deleted. By default, driver will reset the GPIO pin at exit.

### struct mcpwm_capture_channel_config_t::[anonymous] flags
Extra configuration flags for capture channel

### struct mcpwm_capture_event_callbacks_t
Group of supported MCPWM capture event callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

### Public Members

#### mcpwm_capture_event_cb_t on_cap
Callback function that would be invoked when capture event occurred

---

### Header File
- components/driver/include/driver/mcpwm_types.h

---

### Structures

#### struct mcpwm_timer_event_data_t
MCPWM timer event data.

---

### Public Members

#### uint32_t count_value
MCPWM timer count value

#### mcpwm_timer_direction_t direction
MCPWM timer count direction
struct `mcpwm_brake_event_data_t`
    MCPWM brake event data.

struct `mcpwm_fault_event_data_t`
    MCPWM fault event data.

struct `mcpwm_compare_event_data_t`
    MCPWM compare event data.

**Public Members**

- `uint32_t compare_ticks`
  - Compare value

- `mcpwm_timer_direction_t direction`
  - Count direction

struct `mcpwm_capture_event_data_t`
    MCPWM capture event data.

**Public Members**

- `uint32_t cap_value`
  - Captured value

- `mcpwm_capture_edge_t cap_edge`
  - Capture edge

**Type Definitions**

typedef struct `mcpwm_timer_t` *`mcpwm_timer_handle_t`
    Type of MCPWM timer handle.

typedef struct `mcpwm_oper_t` *`mcpwm_oper_handle_t`
    Type of MCPWM operator handle.

typedef struct `mcpwm_cmpr_t` *`mcpwm_cmpr_handle_t`
    Type of MCPWM comparator handle.

typedef struct `mcpwm_gen_t` *`mcpwm_gen_handle_t`
    Type of MCPWM generator handle.

typedef struct `mcpwm_fault_t` *`mcpwm_fault_handle_t`
    Type of MCPWM fault handle.

typedef struct `mcpwm_sync_t` *`mcpwm_sync_handle_t`
    Type of MCPWM sync handle.
typedef struct mcpwm_cap_timer_t *mcpwm_cap_timer_handle_t
   Type of MCPWM capture timer handle.

typedef struct mcpwm_cap_channel_t *mcpwm_cap_channel_handle_t
   Type of MCPWM capture channel handle.

typedef bool (*mcpwm_timer_event_cb_t)(mcpwm_timer_handle_t timer, const mcpwm_timer_event_data_t *edata, void *user_ctx)
   MCPWM timer event callback function.
   
   Param timer [in] MCPWM timer handle
   Param edata [in] MCPWM timer event data, fed by driver
   Param user_ctx [in] User data, set in mcpwm_timer_register_event_callbacks()
   Return Whether a high priority task has been waken up by this function

typedef bool (*mcpwm_brake_event_cb_t)(mcpwm_oper_handle_t oper, const mcpwm_brake_event_data_t *edata, void *user_ctx)
   MCPWM operator brake event callback function.
   
   Param oper [in] MCPWM operator handle
   Param edata [in] MCPWM brake event data, fed by driver
   Param user_ctx [in] User data, set in mcpwm_operator_register_event_callbacks()
   Return Whether a high priority task has been waken up by this function

typedef bool (*mcpwm_fault_event_cb_t)(mcpwm_fault_handle_t fault, const mcpwm_fault_event_data_t *edata, void *user_ctx)
   MCPWM fault event callback function.
   
   Param fault MCPWM fault handle
   Param edata MCPWM fault event data, fed by driver
   Param user_ctx User data, set in mcpwm_fault_register_event_callbacks()
   Return Whether a task switch is needed after the callback returns

typedef bool (*mcpwm_compare_event_cb_t)(mcpwm_cmpr_handle_t comparator, const mcpwm_compare_event_data_t *edata, void *user_ctx)
   MCPWM comparator event callback function.
   
   Param comparator MCPWM comparator handle
   Param edata MCPWM comparator event data, fed by driver
   Param user_ctx User data, set in mcpwm_comparator_register_event_callbacks()
   Return Whether a high priority task has been waken up by this function

typedef bool (*mcpwm_capture_event_cb_t)(mcpwm_cap_channel_handle_t cap_channel, const mcpwm_capture_event_data_t *edata, void *user_ctx)
   MCPWM capture event callback function.
   
   Param cap_channel MCPWM capture channel handle
   Param edata MCPWM capture event data, fed by driver
   Param user_ctx User data, set in mcpwm_capture_channel_register_event_callbacks()
   Return Whether a high priority task has been waken up by this function

- components/hal/include/hal/mcpwm_types.h
Chapter 2. API Reference

Type Definitions

typedef `soc_periph_mcpwm_timer_clk_src_t` `mcpwm_timer_clock_source_t`
MCPWM timer clock source.

typedef `soc_periph_mcpwm_capture_clk_src_t` `mcpwm_capture_clock_source_t`
MCPWM capture clock source.

typedef `soc_periph_mcpwm_carrier_clk_src_t` `mcpwm_carrier_clock_source_t`
MCPWM carrier clock source.

Enumerations

enum `mcpwm_timer_direction_t`
MCPWM timer count direction.

Values:

  enumerator `MCPWM_TIMER_DIRECTION_UP`
  Counting direction: Increase

  enumerator `MCPWM_TIMER_DIRECTION_DOWN`
  Counting direction: Decrease

enum `mcpwm_timer_event_t`
MCPWM timer events.

Values:

  enumerator `MCPWM_TIMER_EVENT_EMPTY`
  MCPWM timer counts to zero (i.e. counter is empty)

  enumerator `MCPWM_TIMER_EVENT_FULL`
  MCPWM timer counts to peak (i.e. counter is full)

  enumerator `MCPWM_TIMER_EVENT_INVALID`
  MCPWM timer invalid event

enum `mcpwm_timer_count_mode_t`
MCPWM timer count modes.

Values:

  enumerator `MCPWM_TIMER_COUNT_MODE_PAUSE`
  MCPWM timer paused

  enumerator `MCPWM_TIMER_COUNT_MODE_UP`
  MCPWM timer counting up

  enumerator `MCPWM_TIMER_COUNT_MODE_DOWN`
  MCPWM timer counting down
enumerator MCPWM_TIMER_COUNT_MODE_UP_DOWN
    MCPWM timer counting up and down

enum mcpwm_timer_start_stop_cmd_t
    MCPWM timer commands, specify the way to start or stop the timer.
    Values:

enumerator MCPWM_TIMER_STOP_EMPTY
    MCPWM timer stops when next count reaches zero

enumerator MCPWM_TIMER_STOP_FULL
    MCPWM timer stops when next count reaches peak

enumerator MCPWM_TIMER_START_NO_STOP
    MCPWM timer starts counting, and don’t stop until received stop command

enumerator MCPWM_TIMER_START_STOP_EMPTY
    MCPWM timer starts counting and stops when next count reaches zero

enumerator MCPWM_TIMER_START_STOP_FULL
    MCPWM timer starts counting and stops when next count reaches peak

enum mcpwm_generator_action_t
    MCPWM generator actions.
    Values:

enumerator MCPWM_GEN_ACTION_KEEP
    Generator action: Keep the same level

enumerator MCPWM_GEN_ACTION_LOW
    Generator action: Force to low level

enumerator MCPWM_GEN_ACTION_HIGH
    Generator action: Force to high level

enumerator MCPWM_GEN_ACTION_TOGGLE
    Generator action: Toggle level

enum mcpwm_operator_brake_mode_t
    MCPWM operator brake mode.
    Values:

enumerator MCPWM_OPER_BRAKE_MODE_CBC
    Brake mode: CBC (cycle by cycle)

enumerator MCPWM_OPER_BRAKE_MODE_OST
    Brake mode, OST (one shot)
enumerator MCPWM_OPER_BRAKE_MODE_INVALID
    MCPWM operator invalid brake mode

enum mcpwm_capture_edge_t
    MCPWM capture edge.
    
    Values:

enumerator MCPWM_CAP_EDGE_POS
    Capture on the positive edge

tenumerator MCPWM_CAP_EDGE_NEG
    Capture on the negative edge

2.6.13 Pulse Counter (PCNT)

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of input signals. The ESP32 contains multiple pulse counter units in the module. Each unit is in effect an independent counter with multiple channels, where each channel can increment/decrement the counter on a rising/falling edge. Furthermore, each channel can be configured separately.

PCNT channels can react to signals of edge type and level type, however for simple applications, detecting the edge signal is usually sufficient. PCNT channels can be configured react to both pulse edges (i.e., rising and falling edge), and can be configured to increase, decrease or do nothing to the unit’s counter on each edge. The level signal is the so-called control signal, which is used to control the counting mode of the edge signals that are attached to the same channel. By combining the usage of both edge and level signals, a PCNT unit can act as a quadrature decoder.

Besides that, PCNT unit is equipped with a separate glitch filter, which is helpful to remove noise from the signal.

Typically, a PCNT module can be used in scenarios like:

• Calculate periodic signal’s frequency by counting the pulse numbers within a time slice
• Decode quadrature signals into speed and direction

Functional Overview

Description of the PCNT functionality is divided into the following sections:

• Resource Allocation - covers how to allocate PCNT units and channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
• Set Up Channel Actions - covers how to configure the PCNT channel to behave on different signal edges and levels.
• Watch Points - describes how to configure PCNT watch points (i.e., tell PCNT unit to trigger an event when the count reaches a certain value).
• Register Event Callbacks - describes how to hook your specific code to the watch point event callback function.
• Set Glitch Filter - describes how to enable and set the timing parameters for the internal glitch filter.
• Enable and Disable Unit - describes how to enable and disable the PCNT unit.
• Unit IO Control - describes IO control functions of PCNT unit, like enable glitch filter, start and stop unit, get and clear count value.
• Power Management - describes what functionality will prevent the chip from going into low power mode.
• IRAM Safe - describes tips on how to make the PCNT interrupt and IO control functions work better along with a disabled cache.

1 Different ESP chip series might have different number of PCNT units and channels. Please refer to the [TRM] for details. The driver won’t forbid you from applying for more PCNT units and channels, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. pcnt_new_unit()).
**Resource Allocation**  The PCNT unit and channel are represented by `pcnt_unit_handle_t` and `pcnt_channel_handle_t` respectively. All available units and channels are maintained by the driver in a resource pool, so you do not need to know the exact underlying instance ID.

**Install PCNT Unit**  To install a PCNT unit, there’s a configuration structure that needs to be given in advance:

```c
pcnt_unit_config_t
```

- `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit` specify the range for the internal hardware counter. The counter will reset to zero automatically when it crosses either the high or low limit.
- `pcnt_unit_config_t::accum_count` sets whether to create an internal accumulator for the counter. This is helpful when you want to extend the counter’s width, which by default is 16 bit at most, defined in the hardware. See also [Compensate Overflow Loss](#) for how to use this feature to compensate the overflow loss.
- `pcnt_unit_config_t::intr_priority` sets the priority of the timer interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.

**Note:**  Since all PCNT units share the same interrupt source, when installing multiple PCNT units make sure that the interrupt priority `pcnt_unit_config_t::intr_priority` is the same for each unit.

Unit allocation and initialization is done by calling a function `pcnt_new_unit()` with `pcnt_unit_config_t` as an input parameter. The function will return a PCNT unit handle only when it runs correctly. Specifically, when there are no more free PCNT units in the pool (i.e. unit resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT units is recorded by `SOC_PCNT_UNITS_PER_GROUP` for reference.

If a previously created PCNT unit is no longer needed, it’s recommended to recycle the resource by calling `pcnt_del_unit()`. Which in return allows the underlying unit hardware to be used for other purposes. Before deleting a PCNT unit, one should ensure the following prerequisites:

- The unit is in the init state, in other words, the unit is either disabled by `pcnt_unit_disable()` or not enabled yet.
- The attached PCNT channels are all removed by `pcnt_del_channel()`.

```c
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100
pcnt_unit_config_t unit_config = {
  .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,
  .low_limit = EXAMPLE_PCNT_LOW_LIMIT,
};
pcnt_unit_handle_t pcnt_unit = NULL;
ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

**Install PCNT Channel**  To install a PCNT channel, you must initialize a `pcnt_chan_config_t` structure in advance, and then call `pcnt_new_channel()`. The configuration fields of the `pcnt_chan_config_t` structure are described below:

- `pcnt_chan_config_t::edge_gpio_num` and `pcnt_chan_config_t::level_gpio_num` specify the GPIO numbers used by `edge` type signal and `level` type signal. Please note, either of them can be assigned to -1 if it’s not actually used, and thus it will become a virtual IO. For some simple pulse counting applications where one of the level/edge signals is fixed (i.e., never changes), you can reclaim a GPIO by setting the signal as a virtual IO on channel allocation. Setting the level/edge signal as a virtual IO will cause that signal to be internally routed to a fixed High/Low logic level, thus allowing you to save a GPIO for other purposes.
• `pcnt_chan_config_t::virt_edge_io_level` and `pcnt_chan_config_t::virt_level_io_level` specify the virtual IO level for edge and level input signal, to ensure a deterministic state for such control signal. Please note, they are only valid when either `pcnt_chan_config_t::edge_gpio_num` or `pcnt_chan_config_t::level_gpio_num` is assigned to -1.

• `pcnt_chan_config_t::invert_edge_input` and `pcnt_chan_config_t::invert_level_input` are used to decide whether to invert the input signals before they going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware.

• `pcnt_chan_config_t::io_loop_back` is for debug only, which enables both the GPIO’s input and output paths. This can help to simulate the pulse signals by function `gpio_set_level()` on the same GPIO.

Channel allocating and initialization is done by calling a function `pcnt_new_channel()` with the above `pcnt_chan_config_t` as an input parameter plus a PCNT unit handle returned from `pcnt_new_unit()`. This function will return a PCNT channel handle if it runs correctly. Specifically, when there are no more free PCNT channel within the unit (i.e. channel resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT channels within the unit is recorded by `SOC_PCNT_CHANNELS_PER_UNIT` for reference. Note that, when install a PCNT channel for a specific unit, one should ensure the unit is in the init state, otherwise this function will return `ESP_ERR_INVALID_STATE` error.

If a previously created PCNT channel is no longer needed, it’s recommended to recycle the resources by calling `pcnt_del_channel()`. Which in return allows the underlying channel hardware to be used for other purposes.

```c
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2

pcnt_chan_config_t chan_config = {
  .edge_gpio_num = EXAMPLE_CHAN_GPIO_A,
  .level_gpio_num = EXAMPLE_CHAN_GPIO_B,
};

pcnt_channel_handle_t pcnt_chan = NULL;
ESP_ERROR_CHECK(pcnt_new_channel(pcnt_unit, &chan_config, &pcnt_chan));
```

Set Up Channel Actions  The PCNT will increase/decrease/hold its internal count value when the input pulse signal toggles. You can set different actions for edge signal and/or level signal.

• `pcnt_channel_set_edge_action()` function is to set specific actions for rising and falling edge of the signal attached to the `pcnt_chan_config_t::edge_gpio_num`. Supported actions are listed in `pcnt_channel_edge_action_t`.

• `pcnt_channel_set_level_action()` function is to set specific actions for high and low level of the signal attached to the `pcnt_chan_config_t::level_gpio_num`. Supported actions are listed in `pcnt_channel_level_action_t`. This function is not mandatory if the `pcnt_chan_config_t::level_gpio_num` is set to -1 when allocating PCNT channel by `pcnt_new_channel()`.

```c
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(pcnt_chan, PCNT_CHANNEL_EDGE_ACTION_,
  DECREASE, PCNT_CHANNEL_EDGE_ACTION_INCREASE));

// keep the counting mode when the control signal is high level, and reverse the counting mode when the control signal is low level
ESP_ERROR_CHECK(pcnt_channel_set_level_action(pcnt_chan, PCNT_CHANNEL_LEVEL_ACTION_,
  KEEP, PCNT_CHANNEL_LEVEL_ACTION_INVERSE));
```

Watch Points  Each PCNT unit can be configured to watch several different values that you’re interested in. The value to be watched is also called Watch Point. The watch point itself can’t exceed the range set in `pcnt_unit_config_t` by `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit`. When the counter reaches either watch point, a watch event will be triggered and notify you by interrupt if any watch event callback has ever registered in...
pcnt_unit_register_event_callbacks(). See Register Event Callbacks for how to register event callbacks.

The watch point can be added and removed by pcnt_unit_add_watch_point() and pcnt_unit_remove_watch_point(). The commonly used watch points are: zero cross, maximum / minimum count and other threshold values. The number of available watch point is limited, pcnt_unit_add_watch_point() will return error ESP_ERR_NOT_FOUND if it can’t find any free hardware resource to save the watch point. You can’t add the same watch point for multiple times, otherwise it will return error ESP_ERR_INVALID_STATE.

It is recommended to remove the unused watch point by pcnt_unit_remove_watch_point() to recycle the watch point resources.

// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));
// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));

Register Event Callbacks When PCNT unit reaches any enabled watch point, specific event will be generated and notify the CPU by interrupt. If you have some function that want to get executed when event happens, you should hook your function to the interrupt service routine by calling pcnt_unit_register_event_callbacks().

All supported event callbacks are listed in the pcnt_event_callbacks_t:

- pcnt_event_callbacks_t::on_reach sets a callback function for watch point event. As this function is called within the ISR context, you must ensure that the function doesn’t attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in pcnt_watch_cb_t.

You can save their own context to pcnt_unit_register_event_callbacks() as well, via the parameter user_ctx. This user data will be directly passed to the callback functions.

In the callback function, the driver will fill in the event data of specific event. For example, the watch point event data is declared as pcnt_watch_event_data_t:

- pcnt_watch_event_data_t::watch_point_value saves the watch point value that triggers the event.
- pcnt_watch_event_data_t::zero_cross_mode saves how the PCNT unit crosses the zero point in the latest time. The possible zero cross modes are listed in the pcnt_unit_zero_cross_mode_t. Usually different zero cross mode means different counting direction and counting step size.

Registering callback function will result in lazy installation of interrupt service, thus this function should only be called before the unit is enabled by pcnt_unit_enable(). Otherwise, it can return ESP_ERR_INVALID_STATE error.

```c
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_data_t *edata, void *user_ctx) {
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
    xQueueSendFromISR(queue, &edata->watch_point_value, &high_task_wakeup);
    // return whether a high priority task has been waken up by this function
    return (high_task_wakeup == pdTRUE);}
```

```c
pcnt_event_callbacks_t cbs = {
    .on_reach = example_pcnt_on_reach,
};
QueueHandle_t queue = xQueueCreate(10, sizeof(int));
ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));
```
Chapter 2. API Reference

Set Glitch Filter  The PCNT unit features filters to ignore possible short glitches in the signals. The parameters that can be configured for the glitch filter are listed in `pcnt_glitch_filter_config_t`:

- `pcnt_glitch_filter_config_t::max_glitch_ns` sets the maximum glitch width, in nanoseconds. If a signal pulse’s width is smaller than this value, then it will be treated as noise and won’t increase/decrease the internal counter.

You can enable the glitch filter for PCNT unit by calling `pcnt_unit_set_glitch_filter()` with the filter configuration provided above. Particularly, you can disable the glitch filter later by calling `pcnt_unit_set_glitch_filter()` with a NULL filter configuration.

This function should be called when the the unit is in the init state. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.

**Note:** The glitch filter is clocked from APB. For the counter not to miss any pulses, the maximum glitch width should be longer than one APB_CLK cycle (usually 12.5 ns if APB equals 80MHz). As the APB frequency would be changed after DFS (Dynamic Frequency Scaling) enabled, which means the filter won’t work as expect in that case. So the driver will install a PM lock for PCNT unit during the first time you enable the glitch filter. For more information related to power management strategy used in PCNT driver, please see *Power Management*.

```c
pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
};
ESP_ERROR_CHECK(pcnt_unit_set_glitch_filter(pcnt_unit, &filter_config));
```

Enable and Disable Unit  Before doing IO control to the PCNT unit, you need to enable it first, by calling `pcnt_unit_enable()`. Internally, this function will:

- switch the PCNT driver state from init to enable.
- enable the interrupt service if it has been lazy installed in `pcnt_unit_register_event_callbacks()`.
- acquire a proper power management lock if it has been lazy installed in `pcnt_unit_set_glitch_filter()`. See also *Power Management* for more information.

On the contrary, calling `pcnt_unit_disable()` will do the opposite, that is, put the PCNT driver back to the init state, disable the interrupts service and release the power management lock.

Unit IO Control

Start/Stop and Clear  Calling `pcnt_unit_start()` will make the PCNT unit start to work, increase or decrease counter according to pulse signals. On the contrary, calling `pcnt_unit_stop()` will stop the PCNT unit but retain current count value. Instead, clearing counter can only be done by calling `pcnt_unit_clear_count()`.

Note, `pcnt_unit_start()` and `pcnt_unit_stop()` should be called when the unit has been enabled by `pcnt_unit_enable()`. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.

Get Count Value  You can read current count value at any time by calling `pcnt_unit_get_count()`. The returned count value is a signed integer, where the sign can be used to reflect the direction.

```c
int pulse_count = 0;
ESP_ERROR_CHECK(pcnt_unit_get_count(pcnt_unit, &pulse_count));
```

Compensate Overflow Loss  The internal hardware counter will be cleared to zero automatically when it reaches high or low limit. If you want to compensate for that count loss and extend the counter’s bit-width, you can:

1. Enable `pcnt_unit_config_t::accum_count` when installing the PCNT unit.
2. Add the high/low limit as the Watch Points.
3. Now, the returned count value from the \texttt{pcnt_unit_get_count()} function not only reflects the hardware’s count value, but also accumulates the high/low overflow loss to it.

\textbf{Note:} \texttt{pcnt_unit_clear_count()} will reset the accumulated count value as well.

\textbf{Power Management} When power management is enabled (i.e. \texttt{CONFIG\_PM\_ENABLE} is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the behavior of PCNT glitch filter and leading to valid signal being treated as noise.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type \texttt{ESP\_PM\_APB\_FREQ\_MAX}. Whenever you enable the glitch filter by \texttt{pcnt_unit_set_glitch_filter()}, the driver will guarantee that the power management lock is acquired after the PCNT unit is enabled by \texttt{pcnt_unit_enable()}. Likewise, the driver releases the lock after \texttt{pcnt_unit_disable()} is called.

\textbf{IRAM Safe} By default, the PCNT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option \texttt{CONFIG\_PCNT\_ISR\_IRAM\_SAFE} that will:
1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM\textsuperscript{2}
3. Place driver object into DRAM (in case it’s mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

There’s another Kconfig option \texttt{CONFIG\_PCNT\_CTRL\_FUNC\_IN\_IRAM} that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

\begin{itemize}
  \item \texttt{pcnt_unit_start()}
  \item \texttt{pcnt_unit_stop()}
  \item \texttt{pcnt_unit_clear_count()}
  \item \texttt{pcnt_unit_get_count()}
\end{itemize}

\textbf{Thread Safety} The factory functions \texttt{pcnt_new_unit()} and \texttt{pcnt_new_channel()} are guaranteed to be thread safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

\begin{itemize}
  \item \texttt{pcnt_unit_start()}
  \item \texttt{pcnt_unit_stop()}
  \item \texttt{pcnt_unit_clear_count()}
  \item \texttt{pcnt_unit_get_count()}
\end{itemize}

Other functions that take the \texttt{pcnt_unit_handle_t} and \texttt{pcnt_channel_handle_t} as the first positional parameter, are not treated as thread safe. This means you should avoid calling them from multiple tasks.

\textbf{Kconfig Options}

\begin{itemize}
  \item \texttt{CONFIG\_PCNT\_CTRL\_FUNC\_IN\_IRAM} controls where to place the PCNT control functions (IRAM or Flash), see \textbf{IRAM Safe} for more information.
\end{itemize}

\textsuperscript{2} \texttt{pcnt_event_callbacks_t::on_reach} callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.
• **CONFIG_PCNT_ISR_IRAM_SAFE** controls whether the default ISR handler can work when cache is disabled, see IRAM Safe for more information.
• **CONFIG_PCNT_ENABLE_DEBUG_LOG** is used to enabled the debug log output. Enable this option will increase the firmware binary size.

### Application Examples

• Decode the quadrature signals from rotary encoder: peripherals/pcnt/rotary_encoder.

### API Reference

#### Header File

• components/driver/include/driver/pulse_cnt.h

#### Functions

```c
esp_err_t pcnt_new_unit (const pcnt_unit_config_t *config, pcnt_unit_handle_t *ret_unit)
```

Create a new PCNT unit, and return the handle.

**Note:** The newly created PCNT unit is put in the init state.

**Parameters**

- `config` — [in] PCNT unit configuration
- `ret_unit` — [out] Returned PCNT unit handle

**Returns**

- ESP_OK: Create PCNT unit successfully
- ESP_ERR_INVALID_ARG: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- ESP_ERR_NO_MEM: Create PCNT unit failed because out of memory
- ESP_ERR_NOT_FOUND: Create PCNT unit failed because all PCNT units are used up and no more free one
- ESP_FAIL: Create PCNT unit failed because of other error

```c
esp_err_t pcnt_del_unit (pcnt_unit_handle_t unit)
```

Delete the PCNT unit handle.

**Note:** A PCNT unit can’t be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

**Parameters**

- `unit` — [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- ESP_OK: Delete the PCNT unit successfully
- ESP_ERR_INVALID_ARG: Delete the PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- ESP_FAIL: Delete the PCNT unit failed because of other error

```c
esp_err_t pcnt_unit_set_glitch_filter (pcnt_unit_handle_t unit, const pcnt_glitch_filter_config_t *config)
```

Set glitch filter for PCNT unit.

**Note:** The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power...
management is enabled. With this lock, the APB frequency won’t be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

**Note:** This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`
- `config` - [in] PCNT filter configuration, set config to NULL means disabling the filter function

**Returns**
- `ESP_OK`: Set glitch filter successfully
- `ESP_ERR_INVALID_ARG`: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- `ESP_ERR_INVALID_STATE`: Set glitch filter failed because the unit is not in the init state
- `ESP_FAIL`: Set glitch filter failed because of other error

`esp_err_t pcnt_unit_enable(pcnt_unit_handle_t unit)`
Enable the PCNT unit.

**Note:** This function will transit the unit state from init to enable.

**Note:** This function will enable the interrupt service, if it’s lazy installed in `pcnt_unit_register_event_callbacks()`.

**Note:** This function will acquire the PM lock if it’s lazy installed in `pcnt_unit_set_glitch_filter()`.

**Note:** Enable a PCNT unit doesn’t mean to start it. See also `pcnt_unit_start()` for how to start the PCNT counter.

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**
- `ESP_OK`: Enable PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Enable PCNT unit failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Enable PCNT unit failed because the unit is already enabled
- `ESP_FAIL`: Enable PCNT unit failed because of other error

`esp_err_t pcnt_unit_disable(pcnt_unit_handle_t unit)`
Disable the PCNT unit.

**Note:** This function will do the opposite work to the `pcnt_unit_enable()`

**Note:** Disable a PCNT unit doesn’t mean to stop it. See also `pcnt_unit_stop()` for how to stop the
Chapter 2. API Reference

PCNT counter.

**Parameters**

- **unit** – [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- ESP_OK: Disable PCNT unit successfully
- ESP_ERR_INVALID_ARG: Disable PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Disable PCNT unit failed because of other error

```c
esp_err_t pcnt_unit_start(pcnt_unit_handle_t unit)
```

Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_PCIE_CTRL_FUNC_IN_IRAM` is on, so that it’s allowed to be executed when Cache is disabled

```c
Parameters**

- **unit** – [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- ESP_OK: Start PCNT unit successfully
- ESP_ERR_INVALID_ARG: Start PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Start PCNT unit failed because of other error

```c
esp_err_t pcnt_unit_stop(pcnt_unit_handle_t unit)
```

Stop PCNT from counting.

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

**Note:** The stop operation won’t clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_PCIE_CTRL_FUNC_IN_IRAM`, so that it is allowed to be executed when Cache is disabled

```c
Parameters**

- **unit** – [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- ESP_OK: Stop PCNT unit successfully
- ESP_ERR_INVALID_ARG: Stop PCNT unit failed because of invalid argument
• ESP_ERR_INVALID_STATE: Stop PCNT unit failed because the unit is not enabled yet
• ESP_FAIL: Stop PCNT unit failed because of other error

\textit{esp_err_t pcnt_unit_clear_count (pcnt_unit_handle_t \textit{unit})}

Clear PCNT pulse count value to zero.

\textbf{Note:} It’s recommended to call this function after adding a watch point by \textit{pcnt_unit_add_watch_point()}, so that the newly added watch point is effective immediately.

\textbf{Note:} This function is allowed to run within ISR context

\textbf{Note:} This function will be placed into IRAM if \texttt{CONFIG_PCNT_CTRL_FUNC_IN_IRAM}, so that it’s allowed to be executed when Cache is disabled

\textbf{Parameters} \textit{unit} –[in] PCNT unit handle created by \textit{pcnt_new_unit()}
\textbf{Returns}
• ESP_OK: Clear PCNT pulse count successfully
• ESP_ERR_INVALID_ARG: Clear PCNT pulse count failed because of invalid argument
• ESP_FAIL: Clear PCNT pulse count failed because of other error

\textit{esp_err_t pcnt_unit_get_count (pcnt_unit_handle_t \textit{unit}, int* \textit{value})}

Get PCNT count value.

\textbf{Note:} This function is allowed to run within ISR context

\textbf{Note:} This function will be placed into IRAM if \texttt{CONFIG_PCNT_CTRL_FUNC_IN_IRAM}, so that it’s allowed to be executed when Cache is disabled

\textbf{Parameters} \textit{unit} –[in] PCNT unit handle created by \textit{pcnt_new_unit()}
\textit{value} –[out] Returned count value
\textbf{Returns}
• ESP_OK: Get PCNT pulse count successfully
• ESP_ERR_INVALID_ARG: Get PCNT pulse count failed because of invalid argument
• ESP_FAIL: Get PCNT pulse count failed because of other error

\textit{esp_err_t pcnt_unit_register_event_callbacks (pcnt_unit_handle_t \textit{unit}, const pcnt_event_callbacks_t* \textit{cbs}, void* \textit{user_data})}

Set event callbacks for PCNT unit.

\textbf{Note:} User registered callbacks are expected to be runnable within ISR context

\textbf{Note:} The first call to this function needs to be before the call to \textit{pcnt_unit_enable}
Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

### Parameters
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **cbs** - [in] Group of callback functions
- **user_data** - [in] User data, which will be passed to callback functions directly

### Returns
- **ESP_OK**: Set event callbacks successfully
- **ESP_ERR_INVALID_ARG**: Set event callbacks failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Set event callbacks failed because the unit is not in init state
- **ESP_FAIL**: Set event callbacks failed because of other error

#### esp_err_t pcnt_unit_add_watch_point (pcnt_unit_handle_t unit, int watch_point)
Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

### Parameters
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **watch_point** - [in] Value to be watched

### Returns
- **ESP_OK**: Add watch point successfully
- **ESP_ERR_INVALID_ARG**: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in `pcnt_unit_config_t`)
- **ESP_ERR_INVALID_STATE**: Add watch point failed because the same watch point has already been added
- **ESP_ERR_NOT_FOUND**: Add watch point failed because no more hardware watch point can be configured
- **ESP_FAIL**: Add watch point failed because of other error

#### esp_err_t pcnt_unit_remove_watch_point (pcnt_unit_handle_t unit, int watch_point)
Remove a watch point for PCNT unit.

### Parameters
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **watch_point** - [in] Watch point value

### Returns
- **ESP_OK**: Remove watch point successfully
- **ESP_ERR_INVALID_ARG**: Remove watch point failed because of invalid argument
- **ESP_ERR_INVALID_STATE**: Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()` yet
- **ESP_FAIL**: Remove watch point failed because of other error

#### esp_err_t pcnt_new_channel (pcnt_unit_handle_t unit, const pcnt_chan_config_t *config, pcnt_channel_handle_t *ret_chan)
Create PCNT channel for specific unit, each PCNT has several channels associated with it.

### Note: This function should be called when the unit is in init state (i.e. before calling `pcnt_unit_enable()`)

### Parameters
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **config** - [in] PCNT channel configuration
- **ret_chan** - [out] Returned channel handle

### Returns
• ESP_OK: Create PCNT channel successfully
• ESP_ERR_INVALID_ARG: Create PCNT channel failed because of invalid argument
• ESP_ERR_NO_MEM: Create PCNT channel failed because of insufficient memory
• ESP_ERR_NOT_FOUND: Create PCNT channel failed because all PCNT channels are
  used up and no more free one
• ESP_ERR_INVALID_STATE: Create PCNT channel failed because the unit is not in the
  init state
• ESP_FAIL: Create PCNT channel failed because of other error

```c
esp_err_t pcnt_del_channel (pcnt_channel_handle_t chan)
```
Delete the PCNT channel.

Parameters
chan –[in] PCNT channel handle created by pcnt_new_channel()

Returns
• ESP_OK: Delete the PCNT channel successfully
• ESP_ERR_INVALID_ARG: Delete the PCNT channel failed because of invalid argu-
  ment
• ESP_FAIL: Delete the PCNT channel failed because of other error

```c
esp_err_t pcnt_channel_set_edge_action (pcnt_channel_handle_t chan, pcnt_channel_edge_action_t pos_act, pcnt_channel_edge_action_t neg_act)
```
Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the edge_gpio_num configured in pcnt_chan_config_t. We use these actions to control when and how to change the counter value.

Parameters
• chan –[in] PCNT channel handle created by pcnt_new_channel()
• pos_act –[in] Action on posedge signal
• neg_act –[in] Action on negedge signal

Returns
• ESP_OK: Set edge action for PCNT channel successfully
• ESP_ERR_INVALID_ARG: Set edge action for PCNT channel failed because of invalid argu-
  ment
• ESP_FAIL: Set edge action for PCNT channel failed because of other error

```c
esp_err_t pcnt_channel_set_level_action (pcnt_channel_handle_t chan, pcnt_channel_level_action_t high_act, pcnt_channel_level_action_t low_act)
```
Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the level_gpio_num configured in pcnt_chan_config_t. We use these actions to control when and how to change the counting mode.

Parameters
• chan –[in] PCNT channel handle created by pcnt_new_channel()
• high_act –[in] Action on high level signal
• low_act –[in] Action on low level signal

Returns
• ESP_OK: Set level action for PCNT channel successfully
• ESP_ERR_INVALID_ARG: Set level action for PCNT channel failed because of invalid argu-
  ment
• ESP_FAIL: Set level action for PCNT channel failed because of other error

Structures

```c
struct pcnt_watch_event_data_t
```
PCNT watch event data.

Public Members
Chapter 2. API Reference

```c
int watch_point_value
    Watch point value that triggered the event

pcnt_unit_zero_cross_mode_t zero_cross_mode
    Zero cross mode

struct pcnt_event_callbacks_t
    Group of supported PCNT callbacks.
```

**Note:** The callbacks are all running under ISR environment

**Note:** When `CONFIG_PCNT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM.

**Public Members**

```c
pcnt_watch_cb_t on_reach
    Called when PCNT unit counter reaches any watch point
```

```c
struct pcnt_unit_config_t
    PCNT unit configuration.
```

**Public Members**

```c
int low_limit
    Low limitation of the count unit, should be lower than 0

int high_limit
    High limitation of the count unit, should be higher than 0

int intr_priority
    PCNT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t accum_count
    Whether to accumulate the count value when overflows at the high/low limit
```

```c
struct pcnt_unit_config_t::[anonymous] flags
    Extra flags
```

```c
struct pcnt_chan_config_t
    PCNT channel configuration.
```

**Public Members**
Chapter 2. API Reference

int edge_gpio_num
    GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

int level_gpio_num
    GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32_t invert_edge_input
    Invert the input edge signal

uint32_t invert_level_input
    Invert the input level signal

uint32_t virt_edge_io_level
    Virtual edge IO level, 0: low, 1: high. Only valid when edge_gpio_num is set to -1

uint32_t virt_level_io_level
    Virtual level IO level, 0: low, 1: high. Only valid when level_gpio_num is set to -1

uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

struct pcnt_chan_config_t::[anonymous] flags
    Channel config flags

struct pcnt_glitch_filter_config_t
    PCNT glitch filter configuration.

Public Members

uint32_t max_glitch_ns
    Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

Type Definitions

typedef struct pcnt_unit_t *pcnt_unit_handle_t
    Type of PCNT unit handle.

typedef struct pcnt_chan_t *pcnt_channel_handle_t
    Type of PCNT channel handle.

typedef bool (*pcnt_watch_cb_t)(pcnt_unit_handle_t unit, const pcnt_watch_event_data_t *edata, void *user_ctx)
    PCNT watch event callback prototype.

Note: The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

Param unit [in] PCNT unit handle
Chapter 2. API Reference

**Param edata** [in] PCNT event data, fed by the driver

**Param user_ctx** [in] User data, passed from `pcnt_unit_register_event_callbacks()`

**Return** Whether a high priority task has been woken up by this function

### Header File

- components/hal/include/hal/pcnt_types.h

### Enumerations

#### enum `pcnt_channel_level_action_t`

PCNT channel action on control level.

*Values:*

- enumerator `PCNT_CHANNEL_LEVEL_ACTION_KEEP`
  
  Keep current count mode

- enumerator `PCNT_CHANNEL_LEVEL_ACTION_INVERSE`
  
  Invert current count mode (increase -> decrease, decrease -> increase)

- enumerator `PCNT_CHANNEL_LEVEL_ACTION_HOLD`
  
  Hold current count value

#### enum `pcnt_channel_edge_action_t`

PCNT channel action on signal edge.

*Values:*

- enumerator `PCNT_CHANNEL_EDGE_ACTION_HOLD`
  
  Hold current count value

- enumerator `PCNT_CHANNEL_EDGE_ACTION_INCREASE`
  
  Increase count value

- enumerator `PCNT_CHANNEL_EDGE_ACTION_DECREASE`
  
  Decrease count value

#### enum `pcnt_unit_zero_cross_mode_t`

PCNT unit zero cross mode.

*Values:*

- enumerator `PCNT_UNIT_ZERO_CROSS_POS_ZERO`
  
  start from positive value, end to zero, i.e. +N->0

- enumerator `PCNT_UNIT_ZERO_CROSS_NEG_ZERO`
  
  start from negative value, end to zero, i.e. -N->0

2.6.14 Remote Control Transceiver (RMT)

Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, RMT can be extended to a versatile and general-purpose transceiver, transmitting or receiving many other types of signals. From the perspective of network layering, the RMT hardware contains both physical and data link layers. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called the **RMT symbol**, which is represented by `rmt_symbol_word_t` in the driver.

ESP32 contains multiple channels in the RMT peripheral\(^1\). Each channel can be independently configured as either transmitter or receiver.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g., NEC
- General-purpose sequence generator
- Transmit signals in a hardware-controlled loop, with a finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

**Layout of RMT Symbols** The RMT hardware defines data in its own pattern—the **RMT symbol**. The diagram below illustrates the bit fields of an RMT symbol. Each symbol consists of two pairs of two values. The first value in the pair is a 15-bit value representing the signal’s duration in units of RMT ticks. The second in the pair is a 1-bit value representing the signal’s logic level, i.e., high or low.

![RMT symbol diagram]

*Fig. 15: Structure of RMT symbols (L - signal level)*

**RMT Transmitter Overview** The data path and control path of an RMT TX channel is illustrated in the figure below:

The driver encodes the user’s data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high-frequency carrier signal before being routed to a GPIO pad.

**RMT Receiver Overview** The data path and control path of an RMT RX channel is illustrated in the figure below:

\(^1\) Different ESP chip series might have different numbers of RMT channels. Please refer to [TRM] for details. The driver does not forbid you from applying for more RMT channels, but it returns an error when there are no hardware resources available. Please always check the return value when doing **Resource Allocation**.
Fig. 16: RMT Transmitter Overview

Fig. 17: RMT Receiver Overview
The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It is also possible to tell the receiver the basic characteristics of the incoming signal, so that the signal’s stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high-frequency carrier from the base signal.

Functional Overview

The description of the RMT functionality is divided into the following sections:

- **Resource Allocation** - covers how to allocate and properly configure RMT channels. It also covers how to recycle channels and other resources when they are no longer used.
- **Carrier Modulation and Demodulation** - describes how to modulate and demodulate the carrier signals for TX and RX channels respectively.
- **Register Event Callbacks** - covers how to register user-provided event callbacks in order to receive RMT channel events.
- **Enable and Disable Channel** - shows how to enable and disable the RMT channel.
- **Initiate TX Transaction** - describes the steps to initiate a transaction for a TX channel.
- **Initiate RX Transaction** - describes the steps to initiate a transaction for an RX channel.
- **Multiple Channels Simultaneous Transmission** - describes how to collect multiple channels into a sync group so that their transmissions can be started simultaneously.
- **RMT Encoder** - focuses on how to write a customized encoder by combining multiple primitive encoders that are provided by the driver.
- **Power Management** - describes how different clock sources affects power consumption.
- **IRAM Safe** - describes how disabling the cache affects the RMT driver, and tips to mitigate it.
- **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.
- **Kconfig Options** - describes the various Kconfig options supported by the RMT driver.

**Resource Allocation**  Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The driver internally manages which channels are available and hands out a free channel on request.

**Install RMT TX Channel**  To install an RMT TX channel, there is a configuration structure that needs to be given in advance `rmt_tx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the **Power Management** section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this tick.
- `rmt_tx_channel_config_t::mem_block_symbols` has a slightly different meaning based on if the DMA backend is enabled or not.
  - If the DMA is enabled via `rmt_tx_channel_config_t::with_dma`, then this field controls the size of the internal DMA buffer. To achieve a better throughput and smaller CPU overhead, we recommend you set a large value, e.g., 1024.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 64.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of the internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel’s workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter an **ESP_ERR_NOT_SUPPORTED** error.
Chapter 2. API Reference

- `rmt_tx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel’s assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_tx_channel_config_t::io_od_mode` configures the channel’s assigned GPIO as open-drain. When combined with `rmt_tx_channel_config_t::io_loop_back`, a bi-directional bus (e.g., 1-wire) can be achieved.
- `rmt_tx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1, 2 or 3), otherwise use the priority indicated by `rmt_tx_channel_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```c
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,  // select source clock
    .gpio_num = 0,                    // GPIO number
    .mem_block_symbols = 64,          // memory block size, 64 * 4 = 256 Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 µs
    .trans_queue_depth = 4,           // set the number of transactions that can→
    .invert_out = false,              // do not invert output signal
    .with_dma = false,                // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));
```

Install RMT RX Channel To install an RMT RX channel, there is a configuration structure that needs to be given in advance `rmt_rx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_rx_channel_config_t::gpio_num` sets the GPIO number used by the receiver.
- `rmt_rx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the Power Management section.
- `rmt_rx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this tick.
- `rmt_rx_channel_config_t::mem_block_symbols` has a slightly different meaning based on whether the DMA backend is enabled.
  - If the DMA is enabled via `rmt_rx_channel_config_t::with_dma`, this field controls the maximum size of the DMA buffer.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 64.
- `rmt_rx_channel_config_t::invert_in` is used to invert the input signals before it is passed to the RMT receiver. The inversion is done by the GPIO matrix instead of by the RMT peripheral.
- `rmt_rx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel’s workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_rx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel’s assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_rx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the
driver will use a interrupt with low or medium priority (priority level may be one of 1, 2 or 3), otherwise use the priority indicated by \texttt{rmt\_rx\_channel\_config\_t::intr\_priority}. Please use the number form (1,2,3) , not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until \texttt{rmt\_del\_channel()} is called.

Once the \texttt{rmt\_rx\_channel\_config\_t} structure is populated with mandatory parameters, users can call \texttt{rmt\_new\_rx\_channel()} to allocate and initialize an RX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns \texttt{ESP\_ERR\_NOT\_FOUND} error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns \texttt{ESP\_ERR\_NOT\_SUPPORTED} error.

```c
rmt\_channel\_handle\_t rx\_chan = NULL;
rmt\_rx\_channel\_config\_t rx\_chan\_config = {
  .clk\_src = RMT\_CLK\_SRC\_DEFAULT, // select source clock
  .resolution\_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 µs
  .mem\_block\_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
  .gpio\_num = 2, // GPIO number
  .flags.invert\_in = false, // do not invert input signal
  .flags.with\_dma = false, // do not need DMA backend
};
ESP\_ERROR\_CHECK(rmt\_new\_rx\_channel(&rx\_chan\_config, &rx\_chan));
```

### Note:
Due to a software limitation in the GPIO driver, when both TX and RX channels are bound to the same GPIO, ensure the RX Channel is initialized before the TX Channel. If the TX Channel was set up first, then during the RX Channel setup, the previous RMT TX Channel signal will be overridden by the GPIO control signal.

### Uninstall RMT Channel
If a previously installed RMT channel is no longer needed, it is recommended to recycle the resources by calling \texttt{rmt\_del\_channel()}, which in return allows the underlying software and hardware resources to be reused for other purposes.

### Carrier Modulation and Demodulation
The RMT transmitter can generate a carrier wave and modulate it onto the message signal. Compared to the message signal, the carrier signal’s frequency is significantly higher. In addition, the user can only set the frequency and duty cycle for the carrier signal. The RMT receiver can demodulate the carrier signal from the incoming signal. Note that, carrier modulation and demodulation are not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a \texttt{ESP\_ERR\_NOT\_SUPPORTED} error.

Carrier-related configurations lie in \texttt{rmt\_carrier\_config\_t}:

- \texttt{rmt\_carrier\_config\_t::frequency\_hz} sets the carrier frequency, in Hz.
- \texttt{rmt\_carrier\_config\_t::duty\_cycle} sets the carrier duty cycle.
- \texttt{rmt\_carrier\_config\_t::polarity\_active\_low} sets the carrier polarity, i.e., on which level the carrier is applied.
- \texttt{rmt\_carrier\_config\_t::always\_on} sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for the TX channel.

### Note:
For the RX channel, we should not set the carrier frequency exactly to the theoretical value. It is recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25 KHz, instead of the 38 KHz configured on the TX side. The reason is that reflection and refraction occur when a signal travels through the air, leading to distortion on the receiver side.

```c
rmt\_carrier\_config\_t tx\_carrier\_cfg = {
  .duty\_cycle = 0.33, // duty cycle 33%
  .frequency\_hz = 38000, // 38 KHz
  .flags.polarity\_active\_low = false, // carrier should be modulated to high...
  .level
};
```

(continues on next page)
Register Event Callbacks  When an event occurs on an RMT channel (e.g., transmission or receiving is completed), the CPU is notified of this event via an interrupt. If you have some function that needs to be called when a particular events occur, you can register a callback for that event to the RMT driver’s ISR (Interrupt Service Routine) by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, the user should ensure the callback function does not block, e.g., by making sure that only FreeRTOS APIs with the `FromISR` suffix are called from within the function. The callback function has a boolean return value used to indicate whether a higher priority task has been unblocked by the callback.

The TX-channel-supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for the “trans-done” event. The function prototype is declared in `rmt_tx_done_callback_t`.  

The RX-channel-supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for “receive-done” event. The function prototype is declared in `rmt_rx_done_callback_t`.

Users can save their own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data is directly passed to each callback function.

In the callback function, users can fetch the event-specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is only valid for the duration of the callback.

The TX-done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` indicates the number of transmitted RMT symbols. This also reflects the size of the encoding artifacts. Please note, this value accounts for the `EOF` symbol as well, which is appended by the driver to mark the end of one transaction.

The RX-complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the `buffer` parameter of the `rmt_receive()` function. Users should not free this receive buffer before the callback returns.
- `rmt_rx_done_event_data_t::num_symbols` indicates the number of received RMT symbols. This value is not larger than the `buffer_size` parameter of `rmt_receive()` function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver only keeps the maximum number of symbols that the buffer can hold, and excess symbols are discarded or ignored.

Enable and Disable Channel  `rmt_enable()` must be called in advance before transmitting or receiving RMT symbols. For TX channels, enabling a channel enables a specific interrupt and prepares the hardware to dispatch transactions. For RX channels, enabling a channel enables an interrupt, but the receiver is not started during this time, as the characteristics of the incoming signal have yet to be specified. The receiver is started in `rmt_receive()`. `rmt_disable()` does the opposite by disabling the interrupt and clearing any pending interrupts. The transmitter and receiver are disabled as well.
Initiate TX Transaction  
RMT is a special communication peripheral, as it is unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware does not help to convert the user data into RMT symbols, this can only be done in software by the so-called RMT Encoder. The encoder is responsible for encoding user data into RMT symbols and then writing to the RMT memory block or the DMA buffer. For how to create an RMT encoder, please refer to RMT Encoder.

Once we got an encoder, we can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, and payload buffer. Besides, we also need to provide a transmission-specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loops. After the transmitter has finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences with minimal CPU intervention.
  - Setting `rmt_transmit_config_t::loop_count` to -1 means an infinite loop transmission. In this case, the channel does not stop until `rmt_disable()` is called. The “trans-done” event is not generated as well.
  - Setting `rmt_transmit_config_t::loop_count` to a positive number means finite number of iterations. In this case, the “trans-done” event is when the specified number of iterations have completed.

**Note:** The loop transmit feature is not supported on all ESP chips, please refer to [TRM] before you configure this option, or you might encounter ESP_ERR_NOT_SUPPORTED error.

- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.

**Note:** There is a limitation in the transmission size if the `rmt_transmit_config_t::loop_count` is set to non-zero, i.e., to enable the loop feature. The encoded RMT symbols should not exceed the capacity of the RMT hardware memory block size, or you might see an error message like encoding artifacts can’t exceed hw memory block for loop transmission. If you have to start a large transaction by loop, you can try either of the following methods.

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach does not work if the DMA backend is also enabled.
- Customize an encoder and construct an infinite loop in the encoding function. See also RMT Encoder.

Internally, `rmt_transmit()` constructs a transaction descriptor and sends it to a job queue, which is dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. To ensure all pending transactions to complete, the user can use `rmt_tx_wait_all_done()`.

Multiple Channels Simultaneous Transmission  
In some real-time control applications (e.g., to make two robotic arms move simultaneously), we do not want any time drift in between when startup multiple TX channels. The RMT driver can help to manage this by creating a so-called Sync Manager. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

Install RMT Sync Manager  
To create a sync manager, the user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.
- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.
**rmt_new_sync_manager()** can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Especially, when the sync manager has been installed before, and there are no hardware resources to create another manager, this function reports **ESP_ERR_NOT_FOUND** error. In addition, if the sync manager is not supported by the hardware, it reports a **ESP_ERR_NOT_SUPPORTED** error. Please refer to [TRM] before using the sync manager feature.

**Start Transmission Simultaneously** For any managed TX channel, it does not start the machine until **rmt_transmit()** has been called on all channels in **rmt_sync_manager_config_t::tx_channel_array**. Before that, the channel is just put in a waiting state. TX channels will usually complete their transactions at different times due to differing transactions, thus resulting in a loss of sync. So before restarting a simultaneous transmission, the user needs to call **rmt_sync_reset()** to synchronize all channels again.

Calling **rmt_del_sync_manager()** can recycle the sync manager and enable the channels to initiate transactions independently afterward.

```c
rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2}; // install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1 MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that...
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
char synchro_config[{}];
for (int i = 0; i < 2; i++) {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));
ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_num * 3, (transmit_config)));
```
// tx_channels[0] does not start transmission until call of `rmt_transmit()` for...

```c
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_num * 3, &transmit_config));
```

Initiate RX Transaction As also discussed in the Enable and Disable Channel, calling `rmt_enable()` does not prepare an RX to receive RMT symbols. The user needs to specify the basic characteristics of the incoming signals in `rmt_receive_config_t`:

- `rmt_receive_config_t::signal_range_min_ns` specifies the minimal valid pulse duration in either high or low logic levels. A pulse width that is smaller than this value is treated as a glitch, and ignored by the hardware.
- `rmt_receive_config_t::signal_range_max_ns` specifies the maximum valid pulse duration in either high or low logic levels. A pulse width that is bigger than this value is treated as Stop Signal, and the receiver generates receive-complete event immediately.

The RMT receiver starts the RX machine after the user calls `rmt_receive()` with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, the user needs to set the `rmt_receive_config_t` again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of `rmt_symbol_word_t`.

Due to the limited size of the memory block, the RMT receiver can only save short frames whose length is not longer than the memory block capacity. Long frames are truncated by the hardware, and the driver reports an error message: hw buffer too small, received symbols truncated.

The copy destination should be provided in the `buffer` parameter of `rmt_receive()` function. If this buffer overflows due to an insufficient buffer size, the receiver can continue to work, but overflowed symbols are dropped and the following error message is reported: user buffer too small, received symbols truncated. Please take care of the lifecycle of the `buffer` parameter, ensuring that the buffer is not recycled before the receiver is finished or stopped.

The receiver is stopped by the driver when it finishes working, i.e., receive a signal whose duration is bigger than `rmt_receive_config_t::signal_range_max_ns`. The user needs to call `rmt_receive()` again to restart the receiver, if necessary. The user can get the received data in the `rmt_rx_event_callbacks_t::on_recv_done` callback. See also Register Event Callbacks for more information.

```c
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt__rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    // send the received RMT symbols to the parser task
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    // return whether any task is woken up
    return high_task_wakeup == pdTRUE;
}
```

```c
QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
rmt_rx_event_callbacks_t cbs = {
    .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, receive_queue));
```

// the following timing requirement is based on NEC protocol
```
```c
rmt_receive_config_t receive_config = {
    .signal_range_min_ns = 1250, // the shortest duration for NEC signal is...
    .signal_range_max_ns = 12000000, // the longest duration for NEC signal is...
};
```

(continues on next page)
rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a
  —standard NEC frame
// ready to receive
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_
  --config));
// wait for the RX-done signal
rmt_rx_done_event_data_t rx_data;
xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
// parse the received symbols
example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);

RMT Encoder An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write
the correct RMT symbols into hardware memory or DMA buffer at a specific time. There are some special restrictions
for an encoding function:

- During a single transaction, the encoding function may be called multiple times. This is necessary because
  the target RMT memory block cannot hold all the artifacts at once. To overcome this limitation, we utilize a
  ping-pong approach, where the encoding session is divided into multiple parts. This means that the encoder
  needs to keep track of its state in order to continue encoding from where it left off in the previous part.
- The encoding function is running in the ISR context. To speed up the encoding session, it is highly recom-
  mended to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with the RMT driver faster, some commonly-used encoders are provided out-of-the-box. They
can either work alone or be chained together into a new encoder. See also Composite Pattern for the principle behind
it. The driver has defined the encoder interface in rmt_encoder_t, it contains the following functions:

- rmt_encoder_t::encode is the fundamental function of an encoder. This is where the encoding session
  happens.
  - The function might be called multiple times within a single transaction. The encode function should
    return the state of the current encoding session.
  - The supported states are listed in the rmt_encode_state_t. If the result contains
    RMT_ENCODING_COMPLETE, it means the current encoder has finished work.
  - If the result contains RMT_ENCODING_MEM_FULL, we need to yield from the current session, as there
    is no space to save more encoding artifacts.
- rmt_encoder_t::reset should reset the encoder state back to the initial state (the RMT encoder is
  stateful).
  - If the RMT transmitter is manually stopped without resetting its corresponding encoder, subsequent en-
    coding session can be erroneous.
  - This function is also called implicitly in rmt_disable().
- rmt_encoder_t::del should free the resources allocated by the encoder.

Copy Encoder A copy encoder is created by calling rmt_new_copy_encoder(). A copy encoder’s main
functionality is to copy the RMT symbols from user space into the driver layer. It is usually used to encode const
data, i.e., data does not change at runtime after initialization such as the leading code in the IR protocol.

A configuration structure rmt_copy_encoder_config_t should be provided in advance before calling
rmt_new_copy_encoder(). Currently, this configuration is reserved for future expansion, and has no spe-

cific use or setting items for now.

Bytes Encoder A bytes encoder is created by calling rmt_new_bytes_encoder(). The bytes encoder’s main
functionality is to convert the user space byte stream into RMT symbols dynamically. It is usually used to
encode dynamic data, e.g., the address and command fields in the IR protocol.

A configuration structure rmt_bytes_encoder_config_t should be provided in advance before calling
rmt_new_bytes_encoder():

• `rmt_bytes_encoder_config_t::bit0` and `rmt_bytes_encoder_config_t::bit1` are necessary to specify the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.

• `rmt_bytes_encoder_config_t::msb_first` sets the bit endianess of each byte. If it is set to true, the encoder encodes the Most Significant Bit first. Otherwise, it encodes the Least Significant Bit first.

Besides the primitive encoders provided by the driver, the user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

![Encoder Chain Diagram]

**Fig. 19: RMT Encoder Chain**

**Customize RMT Encoder for NEC Protocol** In this section, we demonstrates how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is 562.5 µs in length, logical bits are transmitted as follows. It is worth mentioning that the least significant bit of each byte is sent first.

- Logical 0: a 562.5 µs pulse burst followed by a 562.5 µs space, with a total transmit time of 1.125 ms
- Logical 1: a 562.5 µs pulse burst followed by a 1.6875 ms space, with a total transmit time of 2.25 ms

When a key is pressed on the remote controller, the transmitted message includes the following elements in the specified order:

- 9 ms leading pulse burst, also called the “AGC pulse”
- 4.5 ms space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command
- 8-bit logical inverse of the command
- a final 562.5 µs pulse burst to signify the end of message transmission

Then we can construct the NEC `rmt_encoder_t::encode` function in the same order, for example:
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct an encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base;          // the base "class" declares the standard
                                // encoder interface
    rmt_encoder_t *copy_encoder; // use the copy_encoder to encode the leading-
                                // and ending pulse
    rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address-
                                // and command data
    rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT-
                                // representation
    rmt_symbol_word_t nec_ending_symbol; // NEC ending code with RMT-
                                // representation
    int state; // record the current encoding state, i.e., we are in which-
                  // encoding phase
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state) {
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_t, base);
    rmt_encode_state_t session_state = RMT_ENCODING_RESET;
    rmt_encode_state_t state = RMT_ENCODING_RESET;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
        case 0: // send leading code
            encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_encoder->nec_leading_symbol, sizeof(rmt_symbol_word_t), &session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = 1; // we can only switch to the next state when
                                // the current encoder finished
                } else if (session_state & RMT_ENCODING_MEM_FULL) {
                    state = RMT_ENCODING_MEM_FULL;
                    goto out; // yield if there is no free space to put other encoding-
                                // artifacts
                }
        case 1: // send address
            encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_code->address, sizeof(uint16_t), &session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = 2; // we can only switch to the next state when
                                // the current encoder finished
                } else if (session_state & RMT_ENCODING_MEM_FULL) {
                    state = RMT_ENCODING_MEM_FULL;
                    goto out; // yield if there is no free space to put other encoding-
                                // artifacts
                }
        // fall-through
        case 2: // send command
            // ...
A full sample code can be found in `peripherals/rmt/ir_nec_transceiver`. In the above snippet, we use a switch-case and several goto statements to implement a Finite-state machine. With this pattern, users can construct much more complex IR protocols.

### Power Management

When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the system adjusts the APB frequency before going into Light-sleep, thus potentially changing the resolution of the RMT internal counter. However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the user creates an RMT channel that has selected `RMT_CLK_SRC_APB` as the clock source, the driver guarantees that the power management lock is acquired after the channel enabled by `rmt_enable()`. Likewise, the driver releases the lock after `rmt_disable()` is called for the same channel. This also reveals that the `rmt_enable()` and `rmt_disable()` should appear in pairs.

If the channel clock source is selected to others like `RMT_CLK_SRC_XTAL`, then the driver does not install a power management lock for it, which is more suitable for a low-power application as long as the source clock can still provide sufficient resolution.

### IRAM Safe

By default, the RMT interrupt is deferred when the Cache is disabled for reasons like writing or erasing the main Flash. Thus the transaction-done interrupt does not get handled in time, which is not acceptable in a real-time application. What is worse, when the RMT transaction relies on ping-pong interrupt to successively encode or copy RMT symbols, a delayed interrupt can lead to an unpredictable result.

There is a Kconfig option `CONFIG_RMT_ISR_IRAM_SAFE` that has the following features:
1. Enable the interrupt being serviced even when the cache is disabled
2. Place all functions used by the ISR into IRAM\(^2\)
3. Place the driver object into DRAM in case it is mapped to PSRAM by accident

This Kconfig option allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

**Thread Safety** The factory function `rmt_new_tx_channel()`, `rmt_new_rx_channel()` and `rmt_new_sync_manager()` are guaranteed to be thread-safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the `rmt_channel_handle_t` and `rmt_sync_manager_handle_t` as the first positional parameter, are not thread-safe. which means the user should avoid calling them from multiple tasks.

**Kconfig Options**

- `CONFIG_RMT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also IRAM Safe for more information.
- `CONFIG_RMT_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.

**Application Examples**

- RMT-based RGB LED strip customized encoder: `peripherals/rmt/led_strip`
- RMT IR NEC protocol encoding and decoding: `peripherals/rmt/ir_nec_transceiver`
- RMT transactions in queue: `peripherals/rmt/musical_buzzer`
- RMT-based stepper motor with S-curve algorithm: `peripherals/rmt/stepper_motor`
- RMT infinite loop for driving DShot ESC: `peripherals/rmt/dshot_esc`
- RMT simulate 1-wire protocol (take DS18B20 as example): `peripherals/rmt/onewire`

**FAQ**

- Why the RMT encoder results in more data than expected?
  The RMT encoding takes place in the ISR context. If your RMT encoding session takes a long time (e.g., by logging debug information) or the encoding session is deferred somehow because of interrupt latency, then it is possible the transmitting becomes faster than the encoding. As a result, the encoder can not prepare the next data in time, leading to the transmitter sending the previous data again. There is no way to ask the transmitter to stop and wait. You can mitigate the issue by combining the following ways:
  - Increase the `rmt_tx_channel_config_t::mem_block_symbols`, in steps of 64.
  - Place the encoding function in the IRAM.
  - Enables the `rmt_tx_channel_config_t::with_dma` if it is available for your chip.

**API Reference**

**Header File**

- `components/driver/include/driver/rmt_tx.h`

**Functions**

```c
esp_err_t rmt_new_tx_channel(const rmt_tx_channel_config_t *config, rmt_channel_handle_t *ret_chan)
```

Create a RMT TX channel.

**Parameters**

\(^2\) The callback function, e.g., `rmt_tx_event_callbacks_t::on_trans_done`, and the functions invoked by itself should also reside in IRAM, users need to take care of this by themselves.
**config** [in] TX channel configurations

**ret_chan** [out] Returned generic RMT channel handle

**Returns**

- ESP_OK: Create RMT TX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT TX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT TX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT TX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT TX channel failed because of other error

```c
esp_err_t rmt_transmit (rmt_channel_handle_t tx_channel, rmt_encoder_handle_t encoder, const void *payload, size_t payload_bytes, const rmt_transmit_config_t *config)
```

Transmit data by RMT TX channel.

**Note:** This function will construct a transaction descriptor and push to a queue. The transaction will not start immediately until it’s dispatched in the ISR. If there’re too many transactions pending in the queue, this function will block until the queue has free space.

**Parameters**

- **tx_channel** [in] RMT TX channel that created by `rmt_new_tx_channel()`
- **encoder** [in] RMT encoder that created by various factory APIs like `rmt_new_bytes_encoder()`
- **payload** [in] The raw data to be encoded into RMT symbols
- **payload_bytes** [in] Size of the payload in bytes
- **config** [in] Transmission specific configuration

**Returns**

- ESP_OK: Transmit data successfully
- ESP_ERR_INVALID_ARG: Transmit data failed because of invalid argument
- ESP_ERR_INVALID_STATE: Transmit data failed because channel is not enabled
- ESP_ERR_NOT_SUPPORTED: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- ESP_FAIL: Transmit data failed because of other error

```c
esp_err_t rmt_tx_wait_all_done (rmt_channel_handle_t tx_channel, int timeout_ms)
```

Wait for all pending TX transactions done.

**Note:** This function will block forever if the pending transaction can’t be finished within a limited time (e.g. an infinite loop transaction). See also `rmt_disable()` for how to terminate a working channel.

**Parameters**

- **tx_channel** [in] RMT TX channel that created by `rmt_new_tx_channel()`

**Returns**

- ESP_OK: Flush transactions successfully
- ESP_ERR_INVALID_ARG: Flush transactions failed because of invalid argument
- ESP_ERR_TIMEOUT: Flush transactions failed because of timeout
- ESP_FAIL: Flush transactions failed because of other error

```c
esp_err_t rmt_tx_register_event_callbacks (rmt_channel_handle_t tx_channel, const rmt_tx_event_callbacks_t *cbs, void *user_data)
```
Set event callbacks for RMT TX channel.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Note:** When `CONFIG_RMT_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

**Parameters**
- `tx_channel` *[in]* RMT generic channel that created by `rmt_new_tx_channel()`
- `cbs` *[in]* Group of callback functions
- `user_data` *[in]* User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t rmt_new_sync_manager(const rmt_sync_manager_config_t *config, rmt_sync_manager_handle_t *ret_synchro)
```

Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

**Note:** All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

**Parameters**
- `config` *[in]* Synchronization manager configuration
- `ret_synchro` *[out]* Returned synchronization manager handle

**Returns**
- ESP_OK: Create sync manager successfully
- ESP_ERR_INVALID_ARG: Create sync manager failed because of invalid argument
- ESP_ERR_NOT_SUPPORTED: Create sync manager failed because it is not supported by hardware
- ESP_ERR_INVALID_STATE: Create sync manager failed because not all channels are enabled
- ESP_ERR_NO_MEM: Create sync manager failed because out of memory
- ESP_ERR_NOT_FOUND: Create sync manager failed because all sync controllers are used up and no more free one
- ESP_FAIL: Create sync manager failed because of other error

```c
esp_err_t rmt_del_sync_manager(rmt_sync_manager_handle_t synchro)
```

Delete synchronization manager.

**Parameters**
- `synchro` *[in]* Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**
- ESP_OK: Delete the synchronization manager successfully
- ESP_ERR_INVALID_ARG: Delete the synchronization manager failed because of invalid argument
- ESP_FAIL: Delete the synchronization manager failed because of other error
esp_err_t rmt_sync_reset (rmt_sync_manager_handle_t synchro)
Reset synchronization manager.

Parameters synchro [in] Synchronization manager handle returned from rmt_new_sync_manager()

Returns
- ESP_OK: Reset the synchronization manager successfully
- ESP_ERR_INVALID_ARG: Reset the synchronization manager failed because of invalid argument
- ESP_FAIL: Reset the synchronization manager failed because of other error

Structures

struct rmt_tx_event_callbacks_t
Group of RMT TX callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

rmt_tx_done_callback_t on_trans_done
Event callback, invoked when transmission is finished

struct rmt_tx_channel_config_t
RMT TX channel specific configuration.

Public Members

gpio_num_t gpio_num
GPIO number used by RMT TX channel. Set to -1 if unused

rmt_clock_source_t clk_src
Clock source of RMT TX channel, channels in the same group must use the same clock source

uint32_t resolution_hz
Channel clock resolution, in Hz

size_t mem_block_symbols
Size of memory block, in number of rmt_symbol_word_t, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value; In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

size_t trans_queue_depth
Depth of internal transfer queue, increase this value can support more transfers pending in the background
uint32_t invert_out
  Whether to invert the RMT channel signal before output to GPIO pad

uint32_t with_dma
  If set, the driver will allocate an RMT channel with DMA capability

uint32_t io_loop_back
  The signal output from the GPIO will be fed to the input path as well

uint32_t io_od_mode
  Configure the GPIO as open-drain mode

struct rmt_tx_channel_config_t::[anonymous] flags
  TX channel config flags

int intr_priority
  RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

struct rmt_transmit_config_t
  RMT transmit specific configuration.

  Public Members

  int loop_count
    Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

  uint32_t eot_level
    Set the output level for the “End Of Transmission”

struct rmt_transmit_config_t::[anonymous] flags
  Transmit config flags

struct rmt_sync_manager_config_t
  Synchronous manager configuration.

  Public Members

  const rmt_channel_handle_t *tx_channel_array
    Array of TX channels that are about to be managed by a synchronous controller

  size_t array_size
    Size of the tx_channel_array

Header File
  • components/driver/include/driver/rmt_rx.h
Chapter 2. API Reference

**Functions**

```c
esp_err_t rmt_new_rx_channel(const rmt_rx_channel_config_t *config, rmt_channel_handle_t *ret_chan)
```

Create a RMT RX channel.

**Parameters**
- `config` - [in] RX channel configurations
- `ret_chan` - [out] Returned generic RMT channel handle

**Returns**
- ESP_OK: Create RMT RX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT RX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT RX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT RX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT RX channel failed because of other error

```c
esp_err_t rmt_receive(rmt_channel_handle_t rx_channel, void *buffer, size_t buffer_size, const rmt_receive_config_t *config)
```

Initiate a receive job for RMT RX channel.

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the on_recv_done callback that registered by `rmt_rx_register_event_callbacks()`.

**Parameters**
- `rx_channel` - [in] RMT RX channel that created by `rmt_new_rx_channel()`
- `buffer` - [in] The buffer to store the received RMT symbols
- `buffer_size` - [in] size of the `buffer`, in bytes
- `config` - [in] Receive specific configurations

**Returns**
- ESP_OK: Initiate receive job successfully
- ESP_ERR_INVALID_ARG: Initiate receive job failed because of invalid argument
- ESP_ERR_INVALID_STATE: Initiate receive job failed because channel is not enabled
- ESP_FAIL: Initiate receive job failed because of other error

```c
esp_err_t rmt_rx_register_event_callbacks(rmt_channel_handle_t rx_channel, const rmt_rx_event_callbacks_t *cbs, void *user_data)
```

Set callbacks for RMT RX channel.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

**Parameters**
- `rx_channel` - [in] RMT generic channel that created by `rmt_new_rx_channel()`
- `cbs` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
• ESP_FAIL: Set event callbacks failed because of other error

**Structures**

```c
struct rmt_rx_event_callbacks_t
```

Group of RMT RX callbacks.

**Note:** The callbacks are all running under ISR environment

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

**Public Members**

```c
rmt_rx_done_callback_t on_recv_done
```

Event callback, invoked when one RMT channel receiving transaction completes

```c
struct rmt_rx_channel_config_t
```

RMT RX channel specific configuration.

**Public Members**

```c
gpio_num_t gpio_num
```

GPIO number used by RMT RX channel. Set to -1 if unused

```c
rmt_clock_source_t clk_src
```

Clock source of RMT RX channel, channels in the same group must use the same clock source

```c
uint32_t resolution_hz
```

Channel clock resolution, in Hz

```c
size_t mem_block_symbols
```

Size of memory block, in number of rmt_symbol_word_t, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value (e.g. 1024); In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

```c
uint32_t invert_in
```

Whether to invert the incoming RMT channel signal

```c
uint32_t with_dma
```

If set, the driver will allocate an RMT channel with DMA capability

```c
uint32_t io_loop_back
```

For debug/test, the signal output from the GPIO will be fed to the input path as well

```c
struct rmt_rx_channel_config_t::[anonymous] flags
```

RX channel config flags
int `intr_priority`
RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

struct `rmt_receive_config_t`
RMT receive specific configuration.

**Public Members**

`uint32_t signal_range_min_ns`
A pulse whose width is smaller than this threshold will be treated as glitch and ignored

`uint32_t signal_range_max_ns`
RMT will stop receiving if one symbol level has kept more than signal_range_max_ns

**Header File**
- `components/driver/include/driver/rmt_common.h`

**Functions**

```c
esp_err_t rmt_del_channel(rmt_channel_handle_t channel)
```
Delete an RMT channel.

**Parameters**
- `channel` [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

**Returns**
- ESP_OK: Delete RMT channel successfully
- ESP_ERR_INVALID_ARG: Delete RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete RMT channel failed because it is still in working
- ESP_FAIL: Delete RMT channel failed because of other error

```c
esp_err_t rmt_apply_carrier(rmt_channel_handle_t channel, const rmt_carrier_config_t *config)
```
Apply modulation feature for TX channel or demodulation feature for RX channel.

**Parameters**
- `channel` [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
- `config` [in] Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

**Returns**
- ESP_OK: Apply carrier configuration successfully
- ESP_ERR_INVALID_ARG: Apply carrier configuration failed because of invalid argument
- ESP_FAIL: Apply carrier configuration failed because of other error

```c
esp_err_t rmt_enable(rmt_channel_handle_t channel)
```
Enable the RMT channel.

**Note:** This function will acquire a PM lock that might be installed during channel allocation

**Parameters**
- `channel` [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

**Returns**
- ESP_OK: Enable RMT channel successfully
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Enable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable RMT channel failed because it’s enabled already
- ESP_FAIL: Enable RMT channel failed because of other error

```c
esp_err_t rmt_disable(rmt_channel_handle_t channel)
```

Disable the RMT channel.

**Note:** This function will release a PM lock that might be installed during channel allocation

**Parameters**
- `channel` - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

**Returns**
- ESP_OK: Disable RMT channel successfully
- ESP_ERR_INVALID_ARG: Disable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable RMT channel failed because it’s not enabled yet
- ESP_FAIL: Disable RMT channel failed because of other error

**Structures**

```c
struct rmt_carrier_config_t
```

RMT carrier wave configuration (for either modulation or demodulation)

**Public Members**

- `uint32_t frequency_hz`
  Carrier wave frequency, in Hz, 0 means disabling the carrier

- `float duty_cycle`
  Carrier wave duty cycle (0~100%)

- `uint32_t polarity_active_low`
  Specify the polarity of carrier, by default it’s modulated to base signal’s high level

- `uint32_t always_on`
  If set, the carrier can always exist even there’s not transfer undergoing

- `struct rmt_carrier_config_t::[anonymous] flags`
  Carrier config flags

**Header File**

- `components/driver/include/driver/rmt_encoder.h`

**Functions**

```c
esp_err_t rmt_new_bytes_encoder(const rmt_bytes_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)
```

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

**Parameters**
- `config` - [in] Bytes encoder configuration
- `ret_encoder` - [out] Returned encoder handle
Returns

- ESP_OK: Create RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT bytes encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT bytes encoder failed because out of memory
- ESP_FAIL: Create RMT bytes encoder failed because of other error

```c
esp_err_t rmt_new_bytes_encoder (const rmt_copy_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)
```

Create RMT bytes encoder, which copies the given RMT symbols into RMT memory.

Parameters

- `config` - [in] Copy encoder configuration
- `ret_encoder` - [out] Returned encoder handle

Returns

- ESP_OK: Create RMT copy encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT copy encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT copy encoder failed because out of memory
- ESP_FAIL: Create RMT copy encoder failed because of other error

```c
esp_err_t rmt_new_copy_encoder (const rmt_copy_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)
```

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

Parameters

- `config` - [in] Copy encoder configuration
- `ret_encoder` - [out] Returned encoder handle

Returns

- ESP_OK: Create RMT copy encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT copy encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT copy encoder failed because out of memory
- ESP_FAIL: Create RMT copy encoder failed because of other error

```c
esp_err_t rmt_del_encoder (rmt_encoder_handle_t encoder)
```

Delete RMT encoder.

Parameters encoder - [in] RMT encoder handle, created by e.g. `rmt_new_bytes_encoder()`

Returns

- ESP_OK: Delete RMT encoder successfully
- ESP_ERR_INVALID_ARG: Delete RMT encoder failed because of invalid argument
- ESP_FAIL: Delete RMT encoder failed because of other error

```c
esp_err_t rmt_encoder_reset (rmt_encoder_handle_t encoder)
```

Reset RMT encoder.

Parameters encoder - [in] RMT encoder handle, created by e.g. `rmt_new_bytes_encoder()`

Returns

- ESP_OK: Reset RMT encoder successfully
- ESP_ERR_INVALID_ARG: Reset RMT encoder failed because of invalid argument
- ESP_FAIL: Reset RMT encoder failed because of other error

Structures

```c
struct rmt_encoder_t
```

Interface of RMT encoder.

Public Members

```c
size_t (*encode)(rmt_encoder_t *encoder, rmt_channel_handle_t tx_channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state)
```

Encode the user data into RMT symbols and write into RMT memory.

**Note:** The encoding function will also be called from an ISR context, thus the function must not call any blocking API.
Note: It’s recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

**Param** encoder [in] Encoder handle  
**Param** tx_channel [in] RMT TX channel handle, returned from rmt_new_tx_channel()  
**Param** primary_data [in] App data to be encoded into RMT symbols  
**Param** data_size [in] Size of primary_data, in bytes  
**Param** ret_state [out] Returned current encoder’s state  
**Return** Number of RMT symbols that the primary data has been encoded into

```c
esp_err_t (*reset)(rmt_encoder_t *encoder)  
Reset encoding state.  
  **Param** encoder [in] Encoder handle  
  **Return**  
  • ESP_OK: reset encoder successfully  
  • ESP_FAIL: reset encoder failed

esp_err_t (*del)(rmt_encoder_t *encoder)  
Delete encoder object.  
  **Param** encoder [in] Encoder handle  
  **Return**  
  • ESP_OK: delete encoder successfully  
  • ESP_FAIL: delete encoder failed
```

```c
struct rmt_bytes_encoder_config_t  
Bytes encoder configuration.
```

**Public Members**

```c
rmt_symbol_word_t bit0  
How to represent BIT0 in RMT symbol

rmt_symbol_word_t bit1  
How to represent BIT1 in RMT symbol

uint32_t msb_first  
Whether to encode MSB bit first

struct rmt_bytes_encoder_config_t::[anonymous] flags  
Encoder config flag
```

```c
struct rmt_copy_encoder_config_t  
Copy encoder configuration.
```

**Type Definitions**

typedef struct rmt_encoder_t rmt_encoder_t  
Type of RMT encoder.
Chapter 2. API Reference

Enumerations

enum **rmt_encode_state_t**
   
   RMT encoding state.

   **Values:**

   enumerator **RMT_ENCODING_RESET**
   
   The encoding session is in reset state

   enumerator **RMT_ENCODING_COMPLETE**
   
   The encoding session is finished, the caller can continue with subsequent encoding

   enumerator **RMT_ENCODING_MEM_FULL**
   
   The encoding artifact memory is full, the caller should return from current encoding session

Header File

- components/driver/include/driver/rmt_types.h

Structures

struct **rmt_tx_done_event_data_t**

Type of RMT TX done event data.

   Public Members

   size_t **num_symbols**
   
   The number of transmitted RMT symbols (only one round is counted if it’s a loop transmission)

struct **rmt_rx_done_event_data_t**

Type of RMT RX done event data.

   Public Members

   **rmt_symbol_word_t**  startrmt_symbol_word_t *received_symbols
   
   Point to the received RMT symbols

   size_t **num_symbols**
   
   The number of received RMT symbols

Type Definitions

typedef struct rmt_channel_t  startrmt_channel_handle_t
   
   Type of RMT channel handle.

typedef struct rmt_sync_manager_t  startrmt_sync_manager_handle_t
   
   Type of RMT synchronization manager handle.
typedef struct rmt_encoder_t *rmt_encoder_handle_t
Type of RMT encoder handle.

typedef bool (*rmt tx done callback_t)(rmt channel handle_t tx chan, const rmt tx done event data_t *edata, void *user_ctx)
Prototype of RMT event callback.

Param tx_chan [in] RMT channel handle, created from rmt_new_tx_channel()
Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.
Param user_ctx [in] User registered context, passed from rmt_tx_register_event_callbacks()
Return Whether a high priority task has been waken up by this callback function

typedef bool (*rmt rx done callback_t)(rmt channel handle_t rx chan, const rmt rx done event data_t *edata, void *user_ctx)
Prototype of RMT event callback.

Param rx_chan [in] RMT channel handle, created from rmt_new_rx_channel()
Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.
Param user_ctx [in] User registered context, passed from rmt_rx_register_event_callbacks()
Return Whether a high priority task has been waken up by this function

Header File
- components/hal/include/hal/rmt_types.h

Unions

union rmt symbol word_t
#include <rmt_types.h> The layout of RMT symbol stored in memory, which is decided by the hardware design.

Public Members

uint16_t duration0
Duration of level0

uint16_t level0
Level of the first part

uint16_t duration1
Duration of level1

uint16_t level1
Level of the second part

struct rmt symbol word t::[anonymous] [anonymous]

uint32_t val
Equivalent unsigned value for the RMT symbol
Type Definitions

typedef `soc_periph_rmt_clk_src_t` rmt_clock_source_t

RMT group clock source.

Note: User should select the clock source based on the power and resolution requirement

2.6.15 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see **MTDI Strapping Pin** below.

This document has the following structure:

- Overview of compatibility between the default pull states on pins of Espressif’s products and the states required by the SD bus
- Solutions - ideas on how to resolve compatibility issues
- Related information - other relevant information

Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

Systems on a Chip (SoCs)

- ESP32 (except for D2WD versions, see ESP32 datasheet):
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2 for models with 3.3 V flash chip

- ESP32-D2WD:
  - No Pull-ups
  - No Pull-up on GPIO12

Systems in Packages (SIP)

- ESP32-PICO-D4:
  - No Pull-ups
  - Conflicts Between Bootstrap and SDIO on DAT2

Modules

  - No Pull-ups
Conflicts Between Bootstrap and SDIO on DAT2

• ESP32-WROVER Series, including ESP32-WROVER and ESP32-WROVER-I
  – No Pull-ups
• ESP32-WROVER-B Series, including ESP32-WROVER-B and ESP32-WROVER-IB
  – No Pull-ups
  – Conflicts Between Bootstrap and SDIO on DAT2

Development Boards

• ESP32-PICO-KIT, including PICO-KIT v4.1, v4.0, and v3
  – No Pull-ups
  – Conflicts Between Bootstrap and SDIO on DAT2
  – Download Mode Not Working (minor issue)
• ESP32-DevKitC, including ESP32-DevKitCv4 and v2
  – No Pull-ups
  – Conflicts Between Bootstrap and SDIO on DAT2
  – Download Mode Not Working (minor issue)
• ESP-WROVER-KIT
  – Required pull-ups are provided
  – Pull-up Conflicts on GPIO13 (v4.1, v3, v2, and v1)
  – Conflicts Between Bootstrap and SDIO on DAT2 (v4.1, v2, and v1)
  – Download Mode Not Working (minor issue) (v2, v1)
  You can determine the version of your ESP32-WROVER-KIT by checking which module is mounted on it:
  – ESP32-WROVER-B on v4.1
  – ESP32-WROVER on v3
  – ESP32-WROOM-32 on v1 and v2
• ESP32-LyraTD-MSC
  – Required pull-ups are provided
  – Conflicts Between Bootstrap and SDIO on DAT2
• ESP32-LyraT
  – Required pull-ups are provided
  – Pull-up Conflicts on GPIO13

Non-Espressif Hosts  Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.

Solutions

No Pull-ups  If you use a development board without pull-ups, you can do the following:

• If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to Development Boards.
• Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

Pull-up Conflicts on GPIO13  If DAT3 of your device is not properly pulled up, you have the following options:

• Use 1-bit SD mode and tie the device’s DAT3 to VDD
• Use SPI mode
• Perform one of the following actions on the GPIO13 pin:
  – Remove the pull-down resistors
  – Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  – Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

Conflicts Between Bootstrap and SDIO on DAT2  There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see MTDI Strapping Pin.

To resolve the conflict, you have the following options:
1. **Recommended** Burn the flash voltage selection eFuses. This will permanently configure the internal regulator’s output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.

**Warning:** Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on https://www.espressif.com/. If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command will burn the `XPD_SDIO_TIEH`, `XPD_SDIO_FORCE`, and `XPD_SDIO_REG` eFuses. After all the three eFuses are burned to value 1, the internal VDD_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

```
espefuse.py v2.6
Connecting....
Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.
The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH.
This is an irreversible operation.
Type 'BURN' (all capitals) to continue.
BURN
VDD_SDIO setting complete.
```

To check the status of the eFuses, run:

```
''components/esptool_py/esptool/espefuse.py summary''
```

If running from an automated flashing script, `espefuse.py` has an option `--do-not-confirm`.

For more details, see *ESP32 Technical Reference Manual [PDF]*.

2. **If using 1-bit SD mode or SPI mode**, disconnect the DAT2 pin and make sure it is pulled high. For this, do one of the following:
   - Leave the host’s DAT2 floating and directly connect the slave’s DAT2 to VDD.
   - For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and re-flash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host’s side.

**No Pull-up on GPIO12** Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

**Download Mode Not Working (minor issue)** When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:
   - For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
   - For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
     - **LEDs** would not affect operation in most cases.
     - **Pull-down resistors** can interfere with DAT0 signals and must be removed.
If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

**Related Information**

**MTDI Strapping Pin** MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low level at startup, which will lead to selecting the default 3.3 V operation.

All ESP32-WROVER modules, excluding ESP32-WROVER-B, use 1.8 V flash and have internal pull-ups on GPIO12. Other modules that use 3.3 V flash have no pull-ups on the GPIO12 pin, and this pin is slightly pulled down internally.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
- On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif’s boards with the SD card operation, see *Overview of Compatibility*.

**Internal Pull-ups and Strapping Requirements** Using external resistors is always preferable. However, Espressif’s products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups / pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:

- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC

**2.6.16 SDMMC Host Driver**

**Overview**

ESP32’s SDMMC host peripheral has two slots. Each slot can be used independently to connect to an SD card, SDIO device or eMMC chip.

- Slot 0 (*SDMMC_HOST_SLOT_0*) is an 8-bit slot. It uses HS1_* signals in the PIN MUX.
- Slot 1 (*SDMMC_HOST_SLOT_1*) is a 4-bit slot. It uses HS2_* signals in the PIN MUX.

The slots are connected to ESP32 GPIOs using IO MUX. Pin mappings of these slots are given in the table below.
The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the `cd` and `wp` members of the `sdmmc_slot_config_t` structure before calling `sdmmc_host_init_slot()`. Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**Warning:** Pins used by Slot 0 (`HS1_*) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

### Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:

- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards

### Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

### Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (`SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.
In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```c
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

### DDR Mode for eMMC chips

By default, DDR mode will be used if:

- SDMMC host frequency is set to `SDMMC_FREQ_HIGHSPEED` in `sdmmc_host_t` structure, and
- eMMC chip reports DDR mode support in its CSD register

DDR mode places higher requirements for signal integrity. To disable DDR mode while keeping `SDMMC_FREQ_HIGHSPEED` frequency, clear `SDMMC_HOST_FLAG_DDR` bit in `flags` field of `sdmmc_host_t`:

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

### See also

See [SD/SDIO/MMC Driver](#) for the higher level driver which implements the protocol layer.

See [SD SPI Host Driver](#) for a similar driver which uses the SPI controller and is limited to SD protocol’s SPI mode.

See [SD Pull-up Requirements](#) for pullup support and compatibilities of modules and development kits.

### API Reference

#### Header File

- `components/driver/include/driver/sdmmc_host.h`

#### Functions

- `esp_err_t sdmmc_host_init (void)`
  
  Initialize SDMMC host peripheral.

  **Note:** This function is not thread safe

  **Returns**

  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if `sdmmc_host_init` was already called
  - ESP_ERR_NO_MEM if memory cannot be allocated

- `esp_err_t sdmmc_host_init_slot (int slot, const sdmmc_slot_config_t *slot_config)`
  
  Initialize given slot of SDMMC peripheral.

  On the ESP32, SDMMC peripheral has two slots:

  - Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
  - Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX
Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

**Note:** This function is not thread safe

### Parameters
- **slot** - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **slot_config** - additional configuration for the slot

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using sdmmc_host_init

### esp_err_t sdmmc_host_set_bus_width(int slot, size_t width)

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

**Note:** This function is not thread safe

### Parameters
- **slot** - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **width** - bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if slot number or width is not valid

### size_t sdmmc_host_get_slot_width(int slot)

Get bus width configured in sdmmc_host_init_slot to be used for data transfer.

### Parameters
- **slot** - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

### Returns
- configured bus width of the specified slot.

### esp_err_t sdmmc_host_set_card_clk(int slot, uint32_t freq_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note:** This function is not thread safe

### Parameters
- **slot** - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **freq_khz** - card clock frequency, in kHz

### Returns
- ESP_OK on success
- other error codes may be returned in the future

### esp_err_t sdmmc_host_set_bus_ddr_mode(int slot, bool ddr_enabled)

Enable or disable DDR mode of SD interface.

### Parameters
- **slot** - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST SLOT_1)
- **ddr_enabled** - enable or disable DDR mode

### Returns
- ESP_OK on success
**esp_err_t** sdmmc_host_set_cclk_always_on (int slot, bool cclk_always_on)

Enable or disable always-on card clock. When `cclk_always_on` is false, the host controller is allowed to shut down the card clock between the commands. When `cclk_always_on` is true, the clock is generated even if no command is in progress.

**Parameters**
- *slot*  – slot number
- *cclk_always_on*  – enable or disable always-on clock

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the slot number is invalid

**esp_err_t** sdmmc_host_do_transaction (int slot, sdmmc_command_t *cmdinfo)

Send command to the card and get response. This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Attention**  Data buffer passed in `cmdinfo->data` must be in DMA capable memory

**Note:** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdmmc_host_do_transaction` as long as other `sdmmc_host_*` functions are not called.

**Parameters**
- *slot*  – slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- *cmdinfo*  – pointer to structure describing command and data to transfer

**Returns**
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
- ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
- ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

**esp_err_t** sdmmc_host_io_int_enable (int slot)

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**Parameters**
- *slot*  – slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

**Returns**
- ESP_OK on success (interrupt enabled)
- other errors possible in the future

**esp_err_t** sdmmc_host_io_int_wait (int slot, TickType_t timeout_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

**Parameters**
- *slot*  – slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- *timeout_ticks*  – number of RTOS ticks to wait for the interrupt

**Returns**
- ESP_OK on success (interrupt received)
- ESP_ERR_TIMEOUT if the interrupt did not occur within `timeout_ticks`

**esp_err_t** sdmmc_host_deinit (void)

Disable SDMMC host and release allocated resources.

**Note:** This function is not thread safe

Chapter 2. API Reference

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

Chapter 2. API Reference

2.6.17 SD SPI Host Driver

Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an `sdspi_dev_handle_t` `spi_handle` returned when attaching the device to an SPI bus by calling `sdspi_host_init_device`. The bus should be already initialized before (by `spi_bus_initialize`).

This driver’s naming pattern was adopted from the *SDMMC Host* driver due to their similarity. Likewise, the APIs of both drivers are also very similar.

SD SPI driver (access the SD card in SPI mode) offers lower throughput but makes pin selection more flexible. With the help of the GPIO matrix, an SPI peripheral’s signals can be routed to any ESP32 pin. Otherwise, if SDMMC host driver is used (See *SDMMC Host*) to access the card in SD 1-bit/4-bit mode, higher throughput can be reached but it requires routing the signals through their dedicated IO_MUX pins only.

With the help of *SPI Master driver* based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize a structure `sdmmc_slot_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the `slot` parameter of the structure to the SD SPI device `spi_handle` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init`
- `sdspi_host_init_device`
- `sdspi_host_remove_device`
- `sdspi_host_deinit`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see the *SD/SDIO/MMC Driver*.

Note: SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.
Warning: If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see [Sharing the SPI bus among SD card and other SPI devices](#). 

Related Docs

**Sharing the SPI bus among SD card and other SPI devices**  The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

**Pin loading of other devices**  When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

**AC loading**  SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin’s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing requirements of an SD card may be violated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

(Terminology: **launch edge**: at which clock edge the data start to toggle; **latch edge**: at which clock edge the data is supposed to be sampled by the receiver, for SD card, it’s the rising edge.)

1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.
   You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it’s not as obvious as with an oscilloscope.
2. Try to use slower clock frequency.
   If the lower frequency can work while the higher frequency can’t, it’s an indication of the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.

**DC loading**  The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700uA, otherwise the device output may not be read correctly.

**Initialization sequence**

**Note:**  If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (SDMMC_FREQ_PROBING = 400 KHz for SD card) to avoid the influence of pin AC loading (see above section).

When using ab SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also storage/sd_card)

1. Initialize the SPI bus properly by *spi_bus_initialize*.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step.
   You can do this by either:
   1. Attach devices to the SPI bus by calling `spi_bus_add_device`. This function will initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
   3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).
   3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount`.
      This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.
      If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.
   4. Now you can talk to other SPI devices freely!

API Reference

Header File

- components/driver/include/driver/sdspi_host.h

Functions

`esp_err_t sdspi_host_init (void)`

Initialize SD SPI driver.

**Note:** This function is not thread safe

**Returns**

- ESP_OK on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device (const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)`

Attach and initialize an SD SPI device on the specific SPI bus.

**Note:** This function is not thread safe

**Note:** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

**Note:** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Parameters**

- `dev_config` - pointer to device configuration structure
- `out_handle` - Output of the handle to the sdspi device.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_host_init_device has invalid arguments
- ESP_ERR_NO_MEM if memory can not be allocated
other errors from the underlying spi_master and gpio drivers

```
esp_err_t sdspi_host_remove_device (sdspi_dev_handle_t handle)
Remove an SD SPI device.
```

**Parameters**
- **handle** - Handle of the SD SPI device

**Returns**
- Always ESP_OK

```
esp_err_t sdspi_host_do_transaction (sdspi_dev_handle_t handle, sdmmc_command_t *cmdinfo)
Send command to the card and get response.
This function returns when command is sent and response is received, or data is transferred, or timeout occurs.
```

**Note:** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_* functions are not called.

```
Parameters
- **handle** - Handle of the sdspi device
- **cmdinfo** - pointer to structure describing command and data to transfer

Returns
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
```

```
esp_err_t sdspi_host_set_card_clk (sdspi_dev_handle_t host, uint32_t freq_khz)
Set card clock frequency.
Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.
```

**Note:** This function is not thread safe

```
Parameters
- **host** - Handle of the sdspi device
- **freq_khz** - card clock frequency, in kHz

Returns
- ESP_OK on success
- other error codes may be returned in the future
```

```
esp_err_t sdspi_host_deinit (void)
Release resources allocated using sdspi_host_init.
```

**Note:** This function is not thread safe

```
Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called
```

```
esp_err_t sdspi_host_io_int_enable (sdspi_dev_handle_t handle)
Enable SDIO interrupt.
```

**Parameters**
- **handle** - Handle of the sdspi device

**Returns**
Chapter 2. API Reference

- ESP_OK on success

```c
esp_err_t sdspi_host_io_int_wait (sdspi_dev_handle_t handle, TickType_t timeout_ticks)
```
Wait for SDIO interrupt until timeout.

**Parameters**
- `handle` - Handle of the sdspi device
- `timeout_ticks` - Ticks to wait before timeout.

**Returns**
- ESP_OK on success

**Structures**

```c
struct sdspi_device_config_t
```
Extra configuration for SD SPI device.

**Public Members**

```c
spi_host_device_t host_id
```
SPI host to use, SPIx_HOST (see spi_types.h).

```c
gpio_num_t gpio_cs
```
GPIO number of CS signal.

```c
gpio_num_t gpio_cd
```
GPIO number of card detect signal.

```c
gpio_num_t gpio_wp
```
GPIO number of write protect signal.

```c
gpio_num_t gpio_int
```
GPIO number of interrupt line (input) for SDIO card.

**Macros**

```c
SDSPI_DEFAULT_HOST
```
Default `sdmmc_host_t` structure initializer for SD over SPI driver.
Uses SPI mode and max frequency set to 20MHz
‘slot’ should be set to an sdspi device initialized by `sdspi_host_init_device()`.

```c
SDSPI_SLOT_NO_CS
```
indicates that card select line is not used

```c
SDSPI_SLOT_NO_CD
```
indicates that card detect line is not used
SDSPI_SLOT_NO_WP
indicates that write protect line is not used

SDSPI_SLOT_NO_INT
indicates that interrupt line is not used

SDSPI_DEVICE_CONFIG_DEFAULT ()
Macro defining default configuration of SD SPI device.

Type Definitions
typedef int sdspi_dev_handle_t
Handle representing an SD SPI device.

2.6.18 SDIO Card Slave Driver

Overview

The ESP32 SDIO Card peripherals (Host, Slave) shares two sets of pins as below table. The first set is usually occupied by SPI0 bus which is responsible for the SPI flash holding the code to run. This means SDIO slave driver can only runs on the second set of pins while SDIO host is not using it.

The SDIO slave can run under 3 modes: SPI, 1-bit SD and 4-bit SD modes, which is detected automatically by the hardware. According to the SDIO specification, CMD and DAT0-3 lines should be pulled up no matter in 1-bit, 4-bit or SPI mode.

<table>
<thead>
<tr>
<th>Connections</th>
<th>Pin Name</th>

<td>DAT3</td>
<td>#CS</td>
<td>10</td>
<td>13</td>
</tr>
</tbody>
</table>

- 1-bit SD mode: Connect CLK, CMD, DAT0, DAT1 pins and the ground.
- 4-bit SD mode: Connect all pins and the ground.
- SPI mode: Connect SCLK, MOSI, MISO, Interrupt, #CS pins and the ground.

Note: Please check if CMD and DATA lines D0-D3 of the card are properly pulled up by 10 KOhm resistors. This should be ensured even in 1-bit mode or SPI mode. Most official modules don’t offer these pullups internally. If you are using official development boards, check Overview of Compatibility to see whether your development boards have such pullups.

Note: Most official modules have conflicts on strapping pins with the SDIO slave function. If you are using a ESP32 module with 3.3 V flash inside, you have to burn the EFUSE when you are developing on the module for the first time. See Overview of Compatibility to see how to make your modules compatible with the SDIO.

Here is a list for modules/kits with 3.3 V flash:

Chapter 2. API Reference

- Kits: ESP32-PICO-KIT, ESP32-DevKitC (till v4), ESP32-WROVER-KIT (v4.1 (also known as ESP32-WROVER-KIT-VB), v2, v1 (also known as DevKitJ v1))

You can tell the version of your ESP32-WROVER-KIT version from the module on it: v4.1 are with ESP32-WROVER-B modules, v3 are with ESP32-WROVER modules, while v2 and v1 are with ESP32-WROOM-32 modules.

Refer to SD Pull-up Requirements for more technical details of the pullups.

The host initialize the slave into SD mode by first sending CMD0 with DAT3 pin high, or in SPI mode by sending CMD0 with CS pin (the same pin as DAT3) low.

After the initialization, the host can enable the 4-bit SD mode by writing CCCR register 0x07 by CMD52. All the bus detection process are handled by the slave peripheral.

The host has to communicate with the slave by an ESP-slave-specific protocol. The slave driver offers 3 services over Function 1 access by CMD52 and CMD53: (1) a sending FIFO and a receiving FIFO, (2) 52 8-bit R/W registers shared by host and slave, (3) 16 interrupt sources (8 from host to slave, and 8 from slave to host).

Terminology The SDIO slave driver uses the following terms:

- Transfer: a transfer is always started by a command token from the host, and may contain a reply and several data blocks. ESP32 slave software is based on transfers.
- Sending: slave to host transfers.
- Receiving: host to slave transfers.

Note: Register names in ESP32 Technical Reference Manual > SDIO Slave Controller [PDF] are oriented from the point of view of the host, i.e. ‘rx’ registers refer to sending, while ‘tx’ registers refer to receiving. We’re not using tx or rx in the driver to avoid ambiguities.

- FIFO: specific address in Function 1 that can be access by CMD53 to read/write large amount of data. The address is related to the length requested to read from/write to the slave in a single transfer: requested length = 0x1F800-address.
- Ownership: When the driver takes ownership of a buffer, it means the driver can randomly read/write the buffer (usually via DMA). The application should not read/write the buffer until the ownership is returned to the application. If the application reads from a buffer owned by a receiving driver, the data read can be random; if the application writes to a buffer owned by a sending driver, the data sent may be corrupted.
- Requested length: The length requested in one transfer determined by the FIFO address.
- Transfer length: The length requested in one transfer determined by the CMD53 byte/block count field.

Note: Requested length is different from the transfer length. ESP32 slave DMA base on the requested length rather than the transfer length. The transfer length should be no shorter than the requested length, and the rest part will be filled with 0 (sending) or discard (receiving).

- Receiving buffer size: The buffer size is pre-defined between the host and the slave before communication starts. Slave application has to set the buffer size during initialization by the recv_buffer_size member of sdio_slave_config_t.
- Interrupts: the esp32 slave support interrupts in two directions: from host to slave (called slave interrupts below) and from slave to host (called host interrupts below). See more in Interrupts.
- Registers: specific address in Function 1 access by CMD52 or CMD53.

Communication with ESP SDIO Slave The host should initialize the ESP32 SDIO slave according to the standard SDIO initialization process (Sector 3.1.2 of SDIO Simplified Specification), which is described briefly in ESP SDIO Slave Initialization.
Furthermore, there’s an ESP32-specific upper-level communication protocol upon the CMD52/CMD53 to Func1. Please refer to ESP SDIO Slave Protocol. There is also a component ESP Serial Slave Link for ESP32 master to communicate with ESP32 SDIO slave, see example peripherals/sdio when programming your host.

**Interrupts** There are interrupts from host to slave, and from slave to host to help communicating conveniently.

**Slave Interrupts** The host can interrupt the slave by writing any one bit in the register 0x08D. Once any bit of the register is set, an interrupt is raised and the SDIO slave driver calls the callback function defined in the slave_intr_cb member in the sdio_slave_config_t structure.

---

**Note:** The callback function is called in the ISR, do not use any delay, loop or spinlock in the callback.

There’s another set of functions can be used. You can call sdio_slave_wait_int to wait for an interrupt within a certain time, or call sdio_slave_clear_int to clear interrupts from host. The callback function can work with the wait functions perfectly.

**Host Interrupts** The slave can interrupt the host by an interrupt line (at certain time) which is level sensitive. When the host see the interrupt line pulled down, it may read the slave interrupt status register, to see the interrupt source. Host can clear interrupt bits, or choose to disable a interrupt source. The interrupt line will hold active until all the sources are cleared or disabled.

There are several dedicated interrupt sources as well as general purpose sources. see sdio_slave_hostint_t for more information.

**Shared Registers** There are 52 8-bit R/W shared registers to share information between host and slave. The slave can write or read the registers at any time by sdio_slave_read_reg and sdio_slave_write_reg. The host can access (R/W) the register by CMD52 or CMD53.

**Receiving FIFO** When the host is going to send the slave some packets, it has to check whether the slave is ready to receive by reading the buffer number of slave.

To allow the host sending data to the slave, the application has to load buffers to the slave driver by the following steps:

1. Register the buffer by calling sdio_slave_recv_register_buf, and get the handle of the registered buffer. The driver will allocate memory for the linked-list descriptor needed to link the buffer onto the hardware. The size of these buffers should equal to the Receiving buffer size.
2. Load buffers onto the driver by passing the buffer handle to sdio_slave_recv_load_buf.
3. Get the received data by calling sdio_slave_recv or sdio_slave_recv_packet. If non-blocking call is needed, set wait=0.
   
   The difference between two APIs is that, sdio_slave_recv_packet gives more information about packet, which can consist of several buffers. When ESP_ERR_NOT_FINISHED is returned by this API, you should call this API iteratively until the return value is ESP_OK. All the continuous buffers returned with ESP_ERR_NOT_FINISHED, together with the last buffer returned with ESP_OK, belong to one packet from the host. Call sdio_slave_recv_get_buf to get the address of the received data, and the actual length received in each buffer. The packet length is the sum of received length of all the buffers in the packet.
   
   If the host never send data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream), you can call the simpler version sdio_slave_recv instead.
4. Pass the handle of processed buffer back to the driver by sdio_recv_load_buf again.

---

**Note:** To avoid overhead from copying data, the driver itself doesn’t have any buffer inside, the application is responsible to offer new buffers in time. The DMA will automatically store received data to the buffer.
**Sending FIFO** Each time the slave has data to send, it raises an interrupt and the host will request for the packet length. There are two sending modes:

- **Stream Mode**: when a buffer is loaded to the driver, the buffer length will be counted into the packet length requested by host in the incoming communications. Regardless previous packets are sent or not. This means the host can get data of several buffers in one transfer.
- **Packet Mode**: the packet length is updated packet by packet, and only when previous packet is sent. This means that the host can only get data of one buffer in one transfer.

**Note**: To avoid overhead from copying data, the driver itself doesn’t have any buffer inside. Namely, the DMA takes data directly from the buffer provided by the application. The application should not touch the buffer until the sending is finished.

The sending mode can be set in the `sending_mode` member of `sdio_slave_config_t`, and the buffer numbers can be set in the `send_queue_size`. All the buffers are restricted to be no larger than 4092 bytes. Though in the stream mode several buffers can be sent in one transfer, each buffer is still counted as one in the queue.

The application can call `sdio_slave_transmit` to send packets. In this case the function returns when the transfer is successfully done, so the queue is not fully used. When higher efficiency is required, the application can use the following functions instead:

1. Pass buffer information (address, length, as well as an `arg` indicating the buffer) to `sdio_slave_send_queue`. If non-blocking call is needed, set `wait=0`. If the wait is not `portMAX_DELAY` (wait until success), application has to check the result to know whether the data is put in to the queue or discard.

2. Call `sdio_slave_send_get_finished` to get and deal with a finished transfer. A buffer should be keep unmodified until returned from `sdio_slave_send_get_finished`. This means the buffer is actually sent to the host, rather than just staying in the queue.

There are several ways to use the `arg` in the queue parameter:

1. Directly point `arg` to a dynamic-allocated buffer, and use the `arg` to free it when transfer finished.
2. Wrap transfer informations in a transfer structure, and point `arg` to the structure. You can use the structure to do more things like:

   ```c
   typedef struct {
     uint8_t * buffer;
     size_t size;
     int id;
   }sdio_transfer_t;

   //and send as:
   sdio_transfer_t trans = {
     .buffer = ADDRESS_TO_SEND,
     .size = 8,
     .id = 3, //the 3rd transfer so far
   };
   sdio_slave_send_queue(trans.buffer, trans.size, &trans, portMAX_DELAY);
   //... maybe more transfers are sent here

   //and deal with finished transfer as:
   sdio_transfer_t * arg = NULL;
   sdio_slave_send_get_finished((void**) &arg, portMAX_DELAY);
   ESP_LOGI("tag", "(%d) successfully send %d bytes of %p", arg->id, arg->size,...
            arg->buffer);
   some_post_callback(arg); //do more things
   ```

3. Working with the receiving part of this driver, point `arg` to the receive buffer handle of this buffer. So that we can directly use the buffer to receive data when it’s sent:
```c
uint8_t buffer[256] = {1, 2, 3, 4, 5, 6, 7, 8};
sdio_slave_buf_handle_t handle = sdio_slave_recv_register_buf(buffer);
sdio_slave_send_queue(buffer, 8, handle, portMAX_DELAY);

// ... maybe more transfers are sent here

// and load finished buffer to receive
sdio_slave_buf_handle_t handle = NULL;
sdio_slave_send_get_finished((void**)&handle, portMAX_DELAY);
sdio_slave_recv_load_buf(handle);
```

More about this, see peripherals/sdio.

### Application Example

Slave/master communication: peripherals/sdio.

### API Reference

#### Header File

- components/hal/include/hal/sdio_slave_types.h

#### Enumerations

- **enum sdio_slave_hostint_t**
  
  Mask of interrupts sending to the host.

  **Values:**

  - enumerator **SDIO_SLAVE_HOSTINT_BIT0**
    
    General purpose interrupt bit 0.

  - enumerator **SDIO_SLAVE_HOSTINT_BIT1**

  - enumerator **SDIO_SLAVE_HOSTINT_BIT2**

  - enumerator **SDIO_SLAVE_HOSTINT_BIT3**

  - enumerator **SDIO_SLAVE_HOSTINT_BIT4**

  - enumerator **SDIO_SLAVE_HOSTINT_BIT5**

  - enumerator **SDIO_SLAVE_HOSTINT_BIT6**

  - enumerator **SDIO_SLAVE_HOSTINT_BIT7**

  - enumerator **SDIO_SLAVE_HOSTINT_SEND_NEW_PACKET**
    
    New packet available.

- **enum sdio_slave_timing_t**

  Timing of SDIO slave.

  **Values:**
enumerator `SDIO_SLAVE_TIMING_PSEND_PSAMPLE`

Send at posedge, and sample at posedge. Default value for HS mode. If :c:macro:`SDIO_SLAVE_FLAG_HIGH_SPEED` is specified in :cpp:class:`sdio_slave_config_t`, this should be selected. Normally there’s no problem using this to work in DS mode.

enumerator `SDIO_SLAVE_TIMING_NSEND_PSAMPLE`

Send at negedge, and sample at posedge. Default value for DS mode and below. If :c:macro:`SDIO_SLAVE_FLAG_DEFAULT_SPEED` is specified in :cpp:class:`sdio_slave_config_t`, this should be selected.

enumerator `SDIO_SLAVE_TIMING_PSEND_NSAMPLE`

Send at posedge, and sample at negedge.

enumerator `SDIO_SLAVE_TIMING_NSEND_NSAMPLE`

Send at negedge, and sample at negedge.

enum `sdio_slave_sending_mode_t`

Configuration of SDIO slave mode.

Values:

enumerator `SDIO_SLAVE_SEND_STREAM`

Stream mode, all packets to send will be combined as one if possible.

enumerator `SDIO_SLAVE_SEND_PACKET`

Packet mode, one packets will be sent one after another (only increase packet_len if last packet sent).

Header File

- components/driver/include/driver/sdio_slave.h

Functions

```c
esp_err_t sdio_slave_initialize (sdio_slave_config_t *config)
```

Initialize the sdio slave driver

Parameters config – Configuration of the sdio slave driver.

Returns

- ESP_ERR_NOT_FOUND if no free interrupt found.
- ESP_ERR_INVALID_STATE if already initialized.
- ESP_ERR_NO_MEM if fail due to memory allocation failed.
- ESP_OK if success

```c
void sdio_slave_deinit (void)
```

De-initialize the sdio slave driver to release the resources.

```c
esp_err_t sdio_slave_start (void)
```

Start hardware for sending and receiving, as well as set the IOREADY1 to 1.

Note: The driver will continue sending from previous data and PKT_LEN counting, keep data received as well as start receiving from current TOKEN1 counting. See sdio_slave_reset.

Returns

- ESP_ERR_INVALID_STATE if already started.
Chapter 2. API Reference

- ESP_OK otherwise.

```c
void sdio_slave_stop(void)
```

Stop hardware from sending and receiving, also set IOREADY1 to 0.

**Note:** this will not clear the data already in the driver, and also not reset the PKT_LEN and TOKEN1 counting. Call `sdio_slave_reset` to do that.

```c
esp_err_t sdio_slave_reset(void)
```

Clear the data still in the driver, as well as reset the PKT_LEN and TOKEN1 counting.

**Returns** always return ESP_OK.

```c
sdio_slave_buf_handle_t sdio_slave_recv_register_buf(uint8_t* start)
```

Register buffer used for receiving. All buffers should be registered before used, and then can be used (again) in the driver by the handle returned.

**Note:** The driver will use and only use the amount of space specified in the `recv_buffer_size` member set in the `sdio_slave_config_t`. All buffers should be larger than that. The buffer is used by the DMA, so it should be DMA capable and 32-bit aligned.

**Parameters** `start` - The start address of the buffer.

**Returns** The buffer handle if success, otherwise NULL.

```c
esp_err_t sdio_slave_recv_unregister_buf(sdio_slave_buf_handle_t handle)
```

Unregister buffer from driver, and free the space used by the descriptor pointing to the buffer.

**Parameters** `handle` - Handle to the buffer to release.

**Returns** ESP_OK if success, ESP_ERR_INVALID_ARG if the handle is NULL or the buffer is being used.

```c
esp_err_t sdio_slave_recv_load_buf(sdio_slave_buf_handle_t handle)
```

Load buffer to the queue waiting to receive data. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

**Parameters** `handle` - Handle to the buffer ready to receive data.

**Returns**
- ESP_ERR_INVALID_ARG if invalid handle or the buffer is already in the queue. Only after the buffer is returned by `sdio_slave_recv` can you load it again.
- ESP_OK if success

```c
esp_err_t sdio_slave_recv_packet(sdio_slave_buf_handle_t *handle_ret, TickType_t wait)
```

Get buffer of received data if exist with packet information. The driver returns the ownership of the buffer to the app.

When you see return value is ESP_ERR_NOT_FINISHED, you should call this API iteratively until the return value is ESP_OK. All the continuous buffers returned with ESP_ERR_NOT_FINISHED, together with the last buffer returned with ESP_OK, belong to one packet from the host.

You can call simpler `sdio_slave_recv` instead, if the host never send data longer than the Receiving buffer size, or you don’t care about the packet boundary (e.g. the data is only a byte stream).

**Note:** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

**Parameters**
Chapter 2. API Reference

- **handle_ret** – Handle of the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf()` to receive in the same buffer again.
- **wait** – Time to wait before data received.

**Returns**
- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_ERR_NOT_FINISHED if returned buffer is not the end of a packet from the host, should call this API again until the end of a packet
- ESP_OK if success

```c
esp_err_t sdio_slave_recv (sdio_slave_buf_handle_t *handle_ret, uint8_t **out_addr, size_t *out_len,
                          TickType_t wait)
```

Get received data if exist. The driver returns the ownership of the buffer to the app.

**Note:** Call `sdio_slave_load_buf` with the handle to re-load the buffer onto the link list, and receive with the same buffer again. The address and length of the buffer got here is the same as got from `sdio_slave_get_buffer`.

**Parameters**
- **handle_ret** – Handle to the buffer holding received data. Use this handle in `sdio_slave_recv_load_buf` to receive in the same buffer again.
- **out_addr** – [out] Output of the start address, set to NULL if not needed.
- **out_len** – [out] Actual length of the data in the buffer, set to NULL if not needed.
- **wait** – Time to wait before data received.

**Returns**
- ESP_ERR_INVALID_ARG if handle_ret is NULL
- ESP_ERR_TIMEOUT if timeout before receiving new data
- ESP_OK if success

```c
uint8_t *sdio_slave_recv_get_buf (sdio_slave_buf_handle_t handle, size_t *len_o)
```

Retrieve the buffer corresponding to a handle.

**Parameters**
- **handle** – Handle to get the buffer.
- **len_o** – Output of buffer length

**Returns** buffer address if success, otherwise NULL.

```c
esp_err_t sdio_slave_send_queue (uint8_t *addr, size_t len, void *arg, TickType_t wait)
```

Put a new sending transfer into the send queue. The driver takes ownership of the buffer until the buffer is returned by `sdio_slave_send_get_finished` after the transaction is finished.

**Parameters**
- **addr** – Address for data to be sent. The buffer should be DMA capable and 32-bit aligned.
- **len** – Length of the data, should not be longer than 4092 bytes (may support longer in the future).
- **arg** – Argument to returned in `sdio_slave_send_get_finished`. The argument can be used to indicate which transaction is done, or as a parameter for a callback. Set to NULL if not needed.
- **wait** – Time to wait if the buffer is full.

**Returns**
- ESP_ERR_INVALID_ARG if the length is not greater than 0.
- ESP_ERR_TIMEOUT if the queue is still full until timeout.
- ESP_OK if success.

```c
esp_err_t sdio_slave_send_get_finished (void **out_arg, TickType_t wait)
```

Return the ownership of a finished transaction.

**Parameters**
• **out_arg** – Argument of the finished transaction. Set to NULL if unused.
• **wait** – Time to wait if there’s no finished sending transaction.

Returns ESP_ERR_TIMEOUT if no transaction finished, or ESP_OK if succeed.

```c
esp_err_t sdio_slave_transmit (uint8_t *addr, size_t len)
```

Start a new sending transfer, and wait for it (blocked) to be finished.

**Parameters**

• **addr** – Start address of the buffer to send
• **len** – Length of buffer to send.

**Returns**

• ESP_ERR_INVALID_ARG if the length of descriptor is not greater than 0.
• ESP_ERR_TIMEOUT if the queue is full or host do not start a transfer before timeout.
• ESP_OK if success.

```c
uint8_t sdio_slave_read_reg (int pos)
```

Read the spi slave register shared with host.

**Note:** register 28 to 31 are reserved for interrupt vector.

**Parameters** **pos** – register address, 0-27 or 32-63.

**Returns** value of the register.

```c
esp_err_t sdio_slave_write_reg (int pos, uint8_t reg)
```

Write the spi slave register shared with host.

**Note:** register 29 and 31 are used for interrupt vector.

**Parameters**

• **pos** – register address, 0-11, 14-15, 18-19, 24-27 and 32-63, other address are reserved.
• **reg** – the value to write.

**Returns** ESP_ERR_INVALID_ARG if address wrong, otherwise ESP_OK.

```c
sdio_slave_hostint_t sdio_slave_get_host_intena (void)
```

Get the interrupt enable for host.

**Returns** the interrupt mask.

```c
void sdio_slave_set_host_intena (sdio_slave_hostint_t mask)
```

Set the interrupt enable for host.

**Parameters** **mask** – Enable mask for host interrupt.

```c
esp_err_t sdio_slave_send_host_int (uint8_t pos)
```

Interrupt the host by general purpose interrupt.

**Parameters** **pos** – Interrupt num, 0-7.

**Returns**

• ESP_ERR_INVALID_ARG if interrupt num error
• ESP_OK otherwise

```c
void sdio_slave_clear_host_int (sdio_slave_hostint_t mask)
```

Clear general purpose interrupt to host.

**Parameters** **mask** – Interrupt bits to clear, by bit mask.
```c
esp_err_t sdio_slave_wait_int(int pos, TickType_t wait)

Wait for general purpose interrupt from host.

Note: this clears the interrupt at the same time.
```

Parameters
- `pos` - Interrupt source number to wait for. is set.
- `wait` - Time to wait before interrupt triggered.

Returns
- ESP_OK if success, ESP_ERR_TIMEOUT if timeout.

Structures

```c
struct sdio_slave_config_t

Configuration of SDIO slave.
```

Public Members

```c
sdio_slave_timing_t timing

 timing of sdio_slave. see sdio_slave_timing_t.
```

```c
sdio_slave_sending_mode_t sending_mode

 mode of sdio_slave. SDIO_SLAVE_MODE_STREAM if the data needs to be sent as much as possible;
 SDIO_SLAVE_MODE_PACKET if the data should be sent in packets.
```

```c
int send_queue_size

 max buffers that can be queued before sending.
```

```c
size_t recv_buffer_size

If buffer_size is too small, it costs more CPU time to handle larger number of buffers. If buffer_size is too large, the space larger than the transaction length is left blank but still counts a buffer, and the buffers are easily run out. Should be set according to length of data really transferred. All data that do not fully fill a buffer is still counted as one buffer. E.g. 10 bytes data costs 2 buffers if the size is 8 bytes per buffer. Buffer size of the slave pre-defined between host and slave before communication. All receive buffer given to the driver should be larger than this.
```

```c
sdio_event_cb_t event_cb

when the host interrupts slave, this callback will be called with interrupt number (0-7).
```

```c
uint32_t flags

Features to be enabled for the slave, combinations of SDIO_SLAVE_FLAG_.*.
```

Macros

```c
SDIO_SLAVE_RECV_MAX_BUFFER

```

```c
SDIO_SLAVE_FLAG_DAT2_DISABLED

It is required by the SD specification that all 4 data lines should be used and pulled up even in 1-bit mode or SPI mode. However, as a feature, the user can specify this flag to make use of DAT2 pin in 1-bit mode. Note that the host cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.
```
SDIO_SLAVE_FLAG_HOST_INTR_DISABLED

The DAT1 line is used as the interrupt line in SDIO protocol. However, as a feature, the user can specify this flag to make use of DAT1 pin of the slave in 1-bit mode. Note that the host has to do polling to the interrupt registers to know whether there are interrupts from the slave. And it cannot read CCCR registers to know we don’t support 4-bit mode anymore, please do this at your own risk.

SDIO_SLAVE_FLAG_INTERNAL_PULLUP

Enable internal pullups for enabled pins. It is required by the SD specification that all the 4 data lines should be pulled up even in 1-bit mode or SPI mode. Note that the internal pull-ups are not sufficient for stable communication, please do connect external pull-ups on the bus. This is only for example and debug use.

SDIO_SLAVE_FLAG_DEFAULT_SPEED

Disable the highspeed support of the hardware.

SDIO_SLAVE_FLAG_HIGH_SPEED

Enable the highspeed support of the hardware. This is the default option. The host will see highspeed capability, but the mode actually used is determined by the host.

Type Definitions

typedef void (*sdio_event_cb_t)(uint8_t event)

typedef void *sdio_slave_buf_handle_t

Handle of a receive buffer, register a handle by calling sdio_slave_recv_register_buf. Use the handle to load the buffer to the driver, or call sdio_slave_recv_unregister_buf if it is no longer used.

2.6.19 Sigma-Delta Modulation (SDM)

Introduction

ESP32 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available.\(^1\)

Typically, a Sigma-Delta modulated channel can be used in scenarios like:

- LED dimming
- Simple DAC (8-bit), with the help of an active RC low-pass filter
- Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

Functional Overview

The following sections of this document cover the typical steps to install and operate a SDM channel:

- Resource Allocation - covers which parameters should be set up to get a channel handle and how to recycle the resources when it finishes working.
- Enable and Disable Channel - covers how to enable and disable the channel.
- Set Equivalent Duty Cycle - describes how to set the equivalent duty cycle of the PDM pulses.
- Power Management - describes how different source clock selections can affect power consumption.
- IRAM Safe - lists which functions are supposed to work even when the cache is disabled.
- Thread Safety - lists which APIs are guaranteed to be thread safe by the driver.

\(^1\) Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter GPIO and IOMUX in ESP32 Technical Reference Manual for more details. The driver won’t forbid you from applying for more channels, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. sdm_new_channel()).
Kconfig Options - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

Resource Allocation A SDM channel is represented by `sdm_channel_handle_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation. The driver manages all available channels in a pool, so that users don’t need to manually assign a fixed channel to a GPIO.

To install a SDM channel, you should call `sdm_new_channel()` to get a channel handle. Channel specific configurations are passed in the `sdm_config_t` structure:

- `sdm_config_t::gpio_num` sets the GPIO that the PDM pulses will output from
- `sdm_config_t::clk_src` selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- `sdm_config_t::sample_rate_hz` sets the sample rate of the SDM module.
- `sdm_config_t::invert_out` sets whether to invert the output signal.
- `sdm_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The function `sdm_new_channel()` can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e. all hardware SDM channels have been used up), then ESP_ERR_NOT_FOUND will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling `sdm_del_channel()`. It allows the underlying HW channel to be used for other purposes. Before deleting a SDM channel handle, you should disable it by `sdm_channel_disable()` in advance or make sure it has not enabled yet by `sdm_channel_enable()`.

Creating a SDM Channel with Sample Rate of 1MHz

```c
sdm_channel_handle_t chan = NULL;
int config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

Enable and Disable Channel Before doing further IO control to the SDM channel, you should enable it first, by calling `sdm_channel_enable()`. Internally, this function will:

- switch the channel state from `init` to `enable`
- acquire a proper power management lock is a specific clock source (e.g. APB clock) is selected. See also Power management for more information.

On the contrary, calling `sdm_channel_disable()` will do the opposite, that is, put the channel back to the `init` state and release the power management lock.

Set Equivalent Duty Cycle For the output PDM signals, the duty cycle refers to the percentage of high level cycles to the whole statistical period. The average output voltage from the channel is calculated by $V_{out} = VDD_{IO} / 256 * duty + VDD_{IO} / 2$. Thus the range of the duty input parameter of `sdm_channel_set_duty()` is from -128 to 127 (eight bit signed integer). For example, if zero value is set, then the output signal’s duty will be about 50%.

Power Management When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the sample rate of the sigma-delta modulator.
However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates a SDM channel instance that has selected `SDM_CLK_SRC_APB` as its clock source, the driver will guarantee that the power management lock is acquired when enable the channel by `sdm_channel_enable()`. Likewise, the driver releases the lock when `sdm_channel_disable()` is called for that channel.

**IRAM Safe** There’s a Kconfig option `CONFIG_SDM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `sdm_channel_set_duty()`

**Thread Safety** The factory function `sdm_new_channel()` is guaranteed to be thread safe by the driver, which means, user can call it from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `sdm_channel_set_duty()`

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread safe. Which means the user should avoid calling them from multiple tasks.

**Kconfig Options**

- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` controls where to place the SDM channel control functions (IRAM or Flash), see **IRAM Safe** for more information.
- `CONFIG_SDM_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

**Convert to analog signal (Optional)**

Typically, if the sigma-delta signal is connected to an LED, you don’t have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

**Application Example**

- LED driven by a GPIO that is modulated with Sigma-Delta: peripherals/sigma_delta.

**API Reference**

**Header File**

- components/driver/include/driver/sdm.h

**Functions**

```c
esp_err_t sdm_new_channel(const sdm_config_t *config, sdm_channel_handle_t *ret_chan)
```

Create a new Sigma Delta channel.

**Parameters**

- `config` [in] SDM configuration
- `ret_chan` [out] Returned SDM channel handle

**Returns**
Chapter 2. API Reference

Fig. 21: Sallen-Key Low Pass Filter

- ESP_OK: Create SDM channel successfully
- ESP_ERR_INVALID_ARG: Create SDM channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create SDM channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create SDM channel failed because all channels are used up and no more free one
- ESP_FAIL: Create SDM channel failed because of other error

`esp_err_t sdm_del_channel(sdm_channel_handle_t chan)`
Delete the Sigma Delta channel.

**Parameters**
- `chan` – [in] SDM channel created by `sdm_new_channel`

**Returns**
- ESP_OK: Delete the SDM channel successfully
- ESP_ERR_INVALID_ARG: Delete the SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the SDM channel failed because the channel is not in init state
- ESP_FAIL: Delete the SDM channel failed because of other error

`esp_err_t sdm_channel_enable(sdm_channel_handle_t chan)`
Enable the Sigma Delta channel.

**Note:** This function will transit the channel state from init to enable.

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `sdm_config_t`, while CONFIG_PM_ENABLE is enabled.

**Parameters**
- `chan` – [in] SDM channel created by `sdm_new_channel`

**Returns**
- ESP_OK: Enable SDM channel successfully
- ESP_ERR_INVALID_ARG: Enable SDM channel failed because of invalid argument
• ESP_ERR_INVALID_STATE: Enable SDM channel failed because the channel is already enabled
• ESP_FAIL: Enable SDM channel failed because of other error

```c
esp_err_t sdm_channel_disable(sdm_channel_handle_t chan)
```
Disable the Sigma Delta channel.

**Note:** This function will do the opposite work to the `sdm_channel_enable()`

**Parameters**
- `chan` [in] SDM channel created by `sdm_new_channel`

**Returns**
- ESP_OK: Disable SDM channel successfully
- ESP_ERR_INVALID_ARG: Disable SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable SDM channel failed because the channel is not enabled yet
- ESP_FAIL: Disable SDM channel failed because of other error

```c
esp_err_t sdm_channel_set_duty(sdm_channel_handle_t chan, int8_t duty)
```
Set the duty cycle of the PDM output signal.

**Note:** For PDM signals, duty cycle refers to the percentage of high level cycles to the whole statistical period. The average output voltage could be \( V_{out} = \frac{V_{DD\_IO}}{256} \times \text{duty} + \frac{V_{DD\_IO}}{2} \)

**Note:** If the duty is set to zero, the output signal is like a 50% duty cycle square wave, with a frequency around \( \frac{\text{sample\_rate\_hz}}{4} \).

**Note:** The duty is proportional to the equivalent output voltage after a low-pass-filter.

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_SDM_CTRL_FUNC_IN_IRAM` is on, so that it’s allowed to be executed when Cache is disabled

**Parameters**
- `chan` [in] SDM channel created by `sdm_new_channel`
- `duty` [in] Equivalent duty cycle of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

**Returns**
- ESP_OK: Set duty cycle successfully
- ESP_ERR_INVALID_ARG: Set duty cycle failed because of invalid argument
- ESP_FAIL: Set duty cycle failed because of other error

**Structures**

```c
struct sdm_config_t
```
Sigma Delta channel configuration.
Chapter 2. API Reference

Public Members

```c
int gpio_num
    GPIO number

sdm_clock_source_t clk_src
    Clock source

uint32_t sample_rate_hz
    Sample rate in Hz, it determines how frequent the modulator outputs a pulse

uint32_t invert_out
    Whether to invert the output signal

uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

struct sdm_config_t::[anonymous] flags
    Extra flags
```

Type Definitions

typedef struct sdm_channel_t *sdm_channel_handle_t
    Type of Sigma Delta channel handle.

Header File

- components/hal/include/hal/sdm_types.h

Type Definitions

typedef soc_periph_sdm_clk_src_t sdm_clock_source_t

2.6.20 SPI Master Driver

SPI Master driver is a program that controls ESP32’s SPI peripherals while they function as masters.

Overview of ESP32’s SPI peripherals

ESP32 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32’s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. There are quite a few limitations when using SPI Master driver on the SPI1 bus, see Notes on Using the SPI Master driver on SPI1 Bus.

- SPI2 and SPI3 are general purpose SPI controllers, sometimes referred to as HSPI and VSPI, respectively. They are open to users. SPI2 and SPI3 have independent bus signals with the same respective names. Each bus has three CS lines to drive up to same number of SPI slaves.
## Terminology

The terms used in relation to the SPI master driver are given in the table below.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host</strong></td>
<td>The SPI controller peripheral inside ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td><strong>Device</strong></td>
<td>SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td><strong>Bus</strong></td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MOSI, MISO, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td><strong>MOSI</strong></td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>MISO</strong></td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>SCLK</strong></td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td><strong>CS</strong></td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td><strong>QUADWP</strong></td>
<td>Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>QUADHD</strong></td>
<td>signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA4</strong></td>
<td>Data4 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA5</strong></td>
<td>Data5 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA6</strong></td>
<td>Data6 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA7</strong></td>
<td>Data7 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>Assertion</strong></td>
<td>The action of activating a line.</td>
</tr>
<tr>
<td><strong>De-assertion</strong></td>
<td>The action of returning the line back to inactive (back to idle) status.</td>
</tr>
<tr>
<td><strong>Transaction</strong></td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td><strong>Launch edge</strong></td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td><strong>Latch edge</strong></td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

## Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see SPI Bus Lock.

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is not thread-safe. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using xSemaphoreCreateMutex.
SPI Features

SPI Master

SPI Bus Lock  To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For SPI1 bus, the BG is the cache. The bus lock will disable the cache before device operations start, and enable it again after device releases the lock. No devices on SPI1 is allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled.
  There are quite a few limitations when using SPI Master driver on the SPI1 bus. See Notes on Using the SPI Master driver on SPI1 Bus.
- For other buses, the driver may register its ISR as the BG. When a device task requests for exclusive use of the bus, the bus lock will block the task and try to disable ISR. After ISR is successfully disabled, the bus lock will then unblock the device task and allow it to exclusively use the bus. When the task releases the lock, the lock will also try to resume ISR if there are pending transactions in ISR.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-64 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>

<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no command or address phase will occur.
Chapter 2. API Reference

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `spi_transaction_t::tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see *Notes on Sending Mixed Transactions to the Same Device*.

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see *Bus Acquiring*.

**Transaction Line Mode** Supported line modes for ESP32 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the Bus IO setting Flag column.

<table>

</tr>
</tbody>
</table>

**Command and Address Phases** During the command and address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or
SPI_TRANS_VARIABLE_ADDR in the member spi_transaction_ext_t::base and configure the rest of base as usual. Then the length of each phase will be equal to spi_transaction_ext_t::command_bits and spi_transaction_ext_t::address_bits set in the struct spi_transaction_ext_t.

If the command and address phase need to be as the same number of lines as data phase, you need to set SPI_TRANS_MULTILINE_CMD and/or SPI_TRANS_MULTILINE_ADDR to the flags member in the struct spi_transaction_t. Also see Transaction Line Mode.

Write and Read Phases Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members spi_transaction_t::rx_buffer and spi_transaction_t::tx_buffer. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If external PSRAM is enabled, this means using pvPortMallocCaps(size, MALLOC_CAP_DMA).
2. 32-bit aligned (staring from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set SPI_DEVICE_HALFDUPLEX flag for the member flags in the struct spi_device_interface_config_t. And the member flags in the struct spi_transaction_t should be set as described in Transaction Line Mode.

Note: Half-duplex transactions with both read and write phases are not supported when using DMA. For details and workarounds, see Known Issues.

Bus Acquiring Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions spi_device_acquire_bus() and spi_device_release_bus().

Driver Usage

- Initialize an SPI bus by calling the function spi_bus_initialize(). Make sure to set the correct I/O pins in the struct spi_bus_config_t. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function spi_bus_add_device(). Make sure to configure any timing requirements the device might need with the parameter dev_config. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more spi_transaction_t structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - Interrupt Either queue all transactions by calling the function spi_device_queue_trans() and, at a later time, query the result using the function spi_device_get_trans_result(), or handle all requests synchronously by feeding them into spi_device_transmit().
  - Polling Call the function spi_device_polling_transmit() to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using spi_device_polling_start() and spi_device_polling_end().
- (Optional) To perform back-to-back transactions with a Device, call the function spi_device_acquire_bus() before sending transactions and spi_device_release_bus() after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call spi_bus_remove_device() with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call spi_bus_free().

The example code for the SPI master driver can be found in the peripherals/spi_master directory of ESP-IDF examples.
Transactions with Data Not Exceeding 32 Bits When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `spi_transaction_t::tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `spi_transaction_t::rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `spi_transaction_t::tx_buffer` or `spi_transaction_t::rx_buffer` members, because they use the same memory locations as `spi_transaction_t::tx_data` and `spi_transaction_t::rx_data`.

Transactions with Integers Other Than `uint8_t` An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner. For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

Notes on Sending Mixed Transactions to the Same Device To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Notes on Using the SPI Master driver on SPI1 Bus

Note: Though the `SPI Bus Lock` feature makes it possible to use SPI Master driver on the SPI1 bus, it’s still tricky and needs a lot of special treatment. It’s a feature for advanced developers.

To use SPI Master driver on SPI1 bus, you have to take care of two problems:

1. The code and data, required at the meanwhile the driver is operating SPI1 bus, should be in the internal memory. SPI1 bus is shared among devices and the cache for data (code) in the Flash as well as the PSRAM. The cache should be disabled during the other drivers are operating the SPI1 bus. Hence the data (code) in the flash as well as the PSRAM cannot be fetched at the meanwhile the driver acquires the SPI1 bus by:
   - Explicit bus acquiring between `spi_device_acquire_bus()` and `spi_device_release_bus()`.
• Implicit bus acquiring between `spi_device_polling_start()` and `spi_device_polling_end()` (or inside `spi_device_polling_transmit()`). During the time above, all other tasks and most ISRs will be disabled (see IRAM-Safe Interrupt Handlers). Application code and data used by current task should be placed in internal memory (DRAM or IRAM), or already in the ROM. Access to external memory (flash code, const data in the flash, and static/heap data in the PSRAM) will cause a Cache disabled but cached memory region accessed exception. For differences between IRAM, DRAM, and flash cache, please refer to the application memory layout documentation.

To place functions into the IRAM, you can either:
1. Add `IRAM_ATTR` (include `esp_attr.h`) to the function like:
   ```c
   IRAM_ATTR void foo(void) {} 
   ```
   Please note that when a function is inlined, it will follow its caller’s segment, and the attribute will not take effect. You may need to use `NOLINE_ATTR` to avoid this.
2. Use the `noflash` placement in the linker.elf. See more in Linker Script Generation. Please note that, some code may be transformed into lookup table in the const data by the compiler, so `noflash_text` is not safe. Please do take care that the optimization level may affect the compiler behavior of inline, or transforming some code into lookup table in the const data, etc.

To place data into the DRAM, you can either:
1. Add `DRAM_ATTR` (include `esp_attr.h`) to the data definition like:
   ```c
   DRAM_ATTR int g_foo = 3; 
   ```
2. Use the `noflash` placement in the linker.elf. See more in Linker Script Generation.

Please also see the example peripherals/spi_master/hd_eeprom.

**GPIO Matrix and IO_MUX** Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

The GPIO matrix introduces flexibility of routing but also brings the following disadvantages:
- Increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.
- Allows signals with clock frequencies only up to 40 MHz, as opposed to 80 MHz if IO_MUX pins are used.

**Note:** For more details about the influence of the MISO input delay on the maximum clock frequency, see Timing Considerations.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>SPI2</th>
<th>SPI3</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>
<td>15</td>
<td>5</td>
</tr>
<tr>
<td>SCLK</td>

<td>18</td>
</tr>
<tr>
<td>MISO</td>
<td>12</td>
<td>19</td>
</tr>
<tr>
<td>MOSI</td>
<td>13</td>
<td>23</td>
</tr>
<tr>
<td>QUADWP</td>
<td>2</td>
<td>22</td>
</tr>
<tr>
<td>QUADHD</td>
<td>4</td>
<td>21</td>
</tr>
</tbody>
</table>

* Only the first Device attached to the bus can use the CS0 pin.

**Transfer Speed Considerations**

There are three factors limiting the transfer speed:
- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks
Chapter 2. API Reference

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

**Transaction Duration**  Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See *Interrupt Transactions*. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 28 µs.
- Interrupt Transaction via CPU: 25 µs.
- Polling Transaction via DMA: 10 µs.
- Polling Transaction via CPU: 8 µs.

**SPI Clock Frequency**  Transfering each byte takes eight times the clock period 8/fspi.

If the clock frequency is too high, the use of some functions might be limited. See *Timing Considerations*.

**Cache Miss**  The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is 20+8n/Fspi[MHz] [us] for n bytes transferred in one transaction. Hence, the transferring speed is: n/(20+8n/Fspi). An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see *IRAM-Safe Interrupt Handlers*.

**Timing Considerations**

As shown in the figure below, there is a delay on the MISO line after the SCLK launch edge and before the signal is latched by the internal register. As a result, the MISO pin setup time is the limiting factor for the SPI clock speed.
When the delay is too long, the setup slack is < 0, which means the setup timing requirement is violated and the reading might be incorrect.

The maximum allowed frequency is dependent on:

- `spi_device_interface_config_t::input_delay_ns` - maximum data valid time on the MISO bus after a clock cycle on SCLK starts
- If the IO_MUX pin or the GPIO Matrix is used

When the GPIO matrix is used, the maximum allowed frequency is reduced to about 33~77% in comparison to the existing `input delay`. To retain a higher frequency, you have to use the IO_MUX pins or the dummy bit workaround. You can obtain the maximum reading frequency of the master by using the function `spi_get_freq_limit()`.

**Dummy bit workaround**: Dummy clocks, during which the Host does not read data, can be inserted before the read phase begins. The Device still sees the dummy clocks and sends out data, but the Host does not read until the read phase comes. This compensates for the lack of the MISO setup time required by the Host and allows the Host to do reading at a higher frequency.

In the ideal case, if the Device is so fast that the input delay is shorter than an APB clock cycle - 12.5 ns - the maximum frequency at which the Host can read (or read and write) in different conditions is as follows:

<table>
<thead>
<tr>
<th>Frequency Limit (MHz)</th>
<th>Dummy Bits Used By Driver</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPIO matrix</td>
<td>IO_MUX pins</td>
<td></td>
</tr>
<tr>
<td>26.6</td>
<td>80</td>
<td>No</td>
</tr>
<tr>
<td>40</td>
<td></td>
<td>Half-duplex, no DMA allowed</td>
</tr>
</tbody>
</table>

If the Host only writes data, the dummy bit workaround and the frequency check can be disabled by setting the bit `SPI_DEVICE_NO_DUMMY` in the member `spi_device_interface_config_t::flags`. When disabled, the output frequency can be 80MHz, even if the GPIO matrix is used.

**spi_device_interface_config_t::flags**

The SPI master driver still works even if the `spi_device_interface_config_t::input_delay_ns` in the structure `spi_device_interface_config_t` is set to 0. However, setting an accurate value helps to:

- Calculate the frequency limit for full-duplex transactions
- Compensate the timing correctly with dummy bits for half-duplex transactions

You can approximate the maximum data valid time after the launch edge of SPI clocks by checking the statistics in the AC characteristics chapter of your Device’s specification or measure the time using an oscilloscope or logic analyzer.
Please note that the actual PCB layout design and excessive loads may increase the input delay. It means that non-optimal wiring and/or a load capacitor on the bus will most likely lead to input delay values exceeding the values given in the Device specification or measured while the bus is floating.

Some typical delay values are shown in the following table. (These data are retrieved when the slave device is on a different physical chip)

<table>
<thead>
<tr>
<th>Device</th>
<th>Input delay (ns)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ideal Device</td>
<td>0</td>
</tr>
<tr>
<td>ESP32 slave using IO_MUX*</td>
<td>50</td>
</tr>
<tr>
<td>ESP32 slave using GPIO_MUX*</td>
<td>75</td>
</tr>
</tbody>
</table>

The MISO path delay (valid time) consists of a slave’s input delay plus master’s GPIO matrix delay. This delay determines the frequency limit above which full-duplex transfers will not work as well as the dummy bits used in the half-duplex transactions. The frequency limit is:

\[
\text{Freq limit [MHz]} = \frac{80}{\left(\text{floor}(\text{MISO delay}[ns]/12.5) + 1\right)}
\]

The figure below shows the relationship between frequency limit and input delay. Two extra APB clock cycle periods should be added to the MISO delay if the master uses the GPIO matrix.

![Graph showing the relationship between frequency limit and input delay](image)

Corresponding frequency limits for different Devices with different input delay times are shown in the table below.

</tbody>
</table>
Known Issues

1. Half-duplex transactions are not compatible with DMA when both writing and reading phases are used. If such transactions are required, you have to use one of the alternative solutions:
   1. Use full-duplex transactions instead.
   2. **Disable DMA by setting the bus initialization function’s last parameter to 0 as follows:**
      ```c
      ret=spi_bus_initialize(VSPI_HOST, &buscfg, 0);
      ```
      This can prohibit you from transmitting and receiving data longer than 64 bytes.
   3. Try using the command and address fields to replace the write phase.
2. Full-duplex transactions are not compatible with the dummy bit workaround, hence the frequency is limited. See [dummy bit speed-up workaround](#).
3. `dummy_bits` in `spi_device_interface_config_t` and `spi_transaction_ext_t` are not available when SPI read and write phases are both enabled (regardless of full duplex or half duplex mode).
4. `cs_ena_pretrans` is not compatible with the command and address phases of full-duplex transactions.

Application Example

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

API Reference - SPI Common

Header File

Structures

```c
struct spi_line_mode_t
{
    Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.
}
```

Public Members

```c
uint8_t cmd_lines
    The line width of command phase, e.g. 2-line-cmd-phase.
```

```c
uint8_t addr_lines
    The line width of address phase, e.g. 1-line-addr-phase.
```

```c
uint8_t data_lines
    The line width of data phase, e.g. 4-line-data-phase.
```

Enumerations

```c
enum spi_host_device_t
{
    Enum with the three SPI peripherals that are software-accessible in it.
    Values:

    enumerator SPI1_HOST
        SPI1.
```
enumerator SPI2_HOST
   SPI2.

enumerator SPI3_HOST
   SPI3.

enumerator SPI_HOST_MAX
   invalid host value

enum spi_clock_source_t
   Values:

enumerator SPI_CLK_APB
   Select APB as the source clock.

enumerator SPI_CLK_XTAL
   Select XTAL as the source clock.

enum spi_event_t
   SPI Events.
   Values:

enumerator SPI_EV_BUF_TX
   The buffer has sent data to master.

enumerator SPI_EV_BUF_RX
   The buffer has received data from master.

enumerator SPI_EV_SEND_DMA_READY
   Slave has loaded its TX data buffer to the hardware (DMA).

enumerator SPI_EV_SEND
   Master has received certain number of the data, the number is determined by Master.

enumerator SPI_EV_RECV_DMA_READY
   Slave has loaded its RX data buffer to the hardware (DMA).

enumerator SPI_EV_RECV
   Slave has received certain number of data from master, the number is determined by Master.

enumerator SPI_EV_CMD9
   Received CMD9 from master.

enumerator SPI_EV_CMDA
   Received CMDA from master.

enumerator SPI_EV_TRANS
   A transaction has done.
enum spi_command_t
  SPI command.

Values:

enumerator SPI_CMD_HD_WRBUF
enumerator SPI_CMD_HD_RDBUF
enumerator SPI_CMD_HD_WRDMA
enumerator SPI_CMD_HD_RDDMA
enumerator SPI_CMD_HD_SEG_END
enumerator SPI_CMD_HD_EN_QPI
enumerator SPI_CMD_HD_WR_END

Functions

esp_err_t spi_bus_initialize (spi_host_device_t host_id, const spi_bus_config_t *bus_config,
  spi_dma_chan_t dma_chan)

Initialize a SPI bus.

Warning: SPI0/1 is not supported

Warning: If a DMA channel is selected, any transmit and receive buffer used should be allocated inDMA-capable memory.

Warning: The ISR of SPI is always executed on the core which calls this function. Never starve the ISRon this core or the SPI transactions will not be handled.

Parameters

- host_id  - SPI peripheral that controls this bus
- bus_config  - Pointer to a spi_bus_config_t struct specifying how the host should be initialized
• **dma_chan** -- Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting **SPI_DMA_DISABLED** limits the size of transactions.
  - Set to **SPI_DMA_DISABLED** if only the SPI flash uses this bus.
  - Set to **SPI_DMA_CH_AUTO** to let the driver to allocate the DMA channel.

**Returns**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

`esp_err_t spi_bus_free(spi_host_device_t host_id)`

Free a SPI bus.

**Warning:** In order for this to succeed, all devices have to be removed first.

**Parameters**

- **host_id** - SPI peripheral to free

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if bus hasn’t been initialized before, or not all devices on the bus are freed
- ESP_OK on success

**Structures**

`struct spi_bus_config_t`

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**Note:** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in **spi_bus_config_t** referring to these lines will be ignored and can thus safely be left uninitialized.

**Public Members**

- `int mosi_io_num`
  
  GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

- `int data0_io_num`
  
  GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

- `int miso_io_num`
  
  GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

- `int data1_io_num`
  
  GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.
int `sclk_io_num`
    GPIO pin for SPI Clock signal, or -1 if not used.

int `quadwp_io_num`
    GPIO pin for WP (Write Protect) signal, or -1 if not used.

int `data2_io_num`
    GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int `quadhd_io_num`
    GPIO pin for HD (Hold) signal, or -1 if not used.

int `data3_io_num`
    GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int `data4_io_num`
    GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int `data5_io_num`
    GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int `data6_io_num`
    GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int `data7_io_num`
    GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int `max_transfer_sz`
    Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

`uint32_t` `flags`
    Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

int `intr_flags`
    Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

**Macros**

`SPI_MAX_DMA_LEN`

`SPI_SWAP_DATA_TX` (DATA, LEN)
    Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```c
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to &data.

**Parameters**
Chapter 2. API Reference

• **DATA** – Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
• **LEN** – Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPI_SWAP_DATA_RX** (DATA, LEN)
Transform received data of length <= 32 bits to the format of an unsigned integer.
E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```c
uint16_t data = SPI_SWAP_DATA_RX((uint32_t*)t->rx_data, 15);
```

**Parameters**
• **DATA** – Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
• **LEN** – Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON_BUSFLAG_SLAVE**
Initialize I/O in slave mode.

**SPICOMMON_BUSFLAG_MASTER**
Initialize I/O in master mode.

**SPICOMMON_BUSFLAG_IOMUX_PINS**
Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON_BUSFLAG_GPIO_PINS**
Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON_BUSFLAG_SCLK**
Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON_BUSFLAG_MISO**
Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON_BUSFLAG_MOSI**
Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON_BUSFLAG_DUAL**
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON_BUSFLAG_WP HD**
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON_BUSFLAG_QUAD**
Check existing of MOSI/MISO/ WP/ HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON_BUSFLAG_IO4_IO7**
Check existing of IO4-IO7 pins. Or indicates IO4-IO7 pins initialized.

**SPICOMMON_BUSFLAG_OCTAL**
Check existing of MOSI/MISO/ WP/ HD/ SPII04/ SPII05/ SPII06/ SPII07 pins as output. Or indicates bus able to work under octal mode.
SPICOMMON_BUSFLAG_NATIVE_PINS

Type Definitions
typedef spi_common_dma_t spi_dma_chan_t

Enumerations
enum spi_common_dma_t
    SPI_DMA_DISABLEDo not enable DMA for SPI.

enumerator SPI_DMA_CH1
    Enable DMA, select DMA Channel 1.

enumerator SPI_DMA_CH2
    Enable DMA, select DMA Channel 2.

enumerator SPI_DMA_CH_AUTO
    Enable DMA, channel is automatically selected by driver.

API Reference - SPI Master

Header File
- components/driver/include/driver/spi_master.h

Functions
esp_err_t spi_bus_add_device(spi_host_device_t host_id, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

Note: While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

Parameters
- host_id - SPI peripheral to allocate device on
- dev_config - SPI interface protocol config for the device
- handle - Pointer to variable to hold the device handle

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success
**esp_err_t** `spi_bus_remove_device` *(spi_device_handle_t handle)*

Remove a device from the SPI bus.

**Parameters**
- `handle` - Device handle to free

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

**esp_err_t** `spi_device_queue_trans` *(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)*

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Parameters**
- `handle` - Device handle obtained using `spi_host_add_dev`
- `trans_desc` - Description of transaction to execute
- `ticks_to_wait` - Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- ESP_ERR_TIMEOUT if there was no room in the queue before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

**esp_err_t** `spi_device_get_trans_result` *(spi_device_handle_t handle, spi_transaction_t **trans_desc, TickType_t ticks_to_wait)*

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Parameters**
- `handle` - Device handle obtained using `spi_host_add_dev`
- `trans_desc` - Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- `ticks_to_wait` - Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if there was no completed transaction before `ticks_to_wait` expired
- ESP_OK on success

**esp_err_t** `spi_device_transmit` *(spi_device_handle_t handle, spi_transaction_t *trans_desc)*

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or polling_start/transmit that hasn’t been finalized.
Note: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Parameters
- **handle**: Device handle obtained using spi_host_add_dev
- **trans_desc**: Description of transaction to execute

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t spi_device_polling_start (spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Immediately start a polling transaction.

Note: Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

Parameters
- **handle**: Device handle obtained using spi_host_add_dev
- **trans_desc**: Description of transaction to execute
- **ticks_to_wait**: Ticks to wait until there’s room in the queue; currently only port-MAX_DELAY is supported.

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (spi_device_acquire_bus() should be called first)
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

```c
esp_err_t spi_device_polling_end (spi_device_handle_t handle, TickType_t ticks_to_wait)
```

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

Parameters
- **handle**: Device handle obtained using spi_host_add_dev
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
- ESP_OK on success

```c
esp_err_t spi_device_polling_transmit (spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_polling_start() followed by spi_device_polling_end(). Do not use this when there is still a transaction that hasn’t been finalized.

Note: This function is not thread safe when multiple tasks access the same SPI device. Normally a device
cannot start (queue) polling and interrupt transactions simultaneously.

**Parameters**
- `handle` - Device handle obtained using `spi_host_add_dev`
- `trans_desc` - Description of transaction to execute

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the device cannot get control of the bus
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions of same device are not finished
- ESP_OK on success

```c
esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)
```

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

**Note:** The function will wait until all the existing transactions have been sent.

**Parameters**
- `device` - The device to occupy the bus.
- `wait` - Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`

**Returns**
- ESP_ERR_INVALID_ARG : `wait` is not set to `portMAX_DELAY`.
- ESP_OK : Success.

```c
void spi_device_release_bus(spi_device_handle_t dev)
```

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters**
- `dev` - The device to release the bus.

```c
int spi_get_actual_clock(int fapb, int hz, int duty_cycle)
```

Calculate the working frequency that is most close to desired frequency.

**Parameters**
- `fapb` - The frequency of apb clock, should be `APB_CLK_FREQ`.
- `hz` - Desired working frequency
- `duty_cycle` - Duty cycle of the spi clock

**Returns**
- Actual working frequency that most fit.

```c
void spi_get_timing(bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```

Calculate the timing settings of specified frequency and settings.

**Note:** If `*dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

**Parameters**
- `gpio_is_used` - True if using GPIO matrix, or False if iomux pins are used.
- `input_delay_ns` - Input delay from SCLK launch edge to MISO data valid.
- `eff_clk` - Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
- `dummy_o` - Address of dummy bits used output. Set to NULL if not needed.
- `cycles_remain_o` - Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
– positive value: cycles suggest to compensate.

```c
int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Parameters**

- `gpio_is_used` – True if using GPIO matrix, or False if native pins are used.
- `input_delay_ns` – Input delay from SCLK launch edge to MISO data valid.

**Returns** Frequency limit of current configurations.

```c
esp_err_t spi_bus_get_max_transaction_len (spi_host_device_t host_id, size_t *max_bytes)
```

Get max length (in bytes) of one transaction.

**Parameters**

- `host_id` – SPI peripheral
- `max_bytes` – [out] Max length of one transaction, in bytes

**Returns**

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument

**Structures**

```c
struct spi_device_interface_config_t
```

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

```c
uint8_t command_bits
```

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

```c
uint8_t address_bits
```

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

```c
dummy_bits
```

Amount of dummy bits to insert between address and data phase.

```c
uint8_t mode
```

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

```c
duty_cycle_pos
```

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

```c
uint16_t cs_ena_pretrans
```

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.
uint8_t cs_ena_posttrans
    Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int clock_speed_hz
    Clock speed, divisors of 80MHz, in Hz. See SPI_MASTER_FREQ_*. 

int input_delay_ns
    Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.

int spics_io_num
    CS GPIO pin for this device, or -1 if not used.

uint32_t flags
    Bitwise OR of SPI_DEVICE_* flags.

int queue_size
    Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

transaction_cb_t pre_cb
    Callback to be called before a transmission is started.
    This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

transaction_cb_t post_cb
    Callback to be called after a transmission has completed.
    This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_transaction_t
    This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members

uint32_t flags
    Bitwise OR of SPI_TRANS_* flags.

uint16_t cmd
    Command data, of which the length is set in the command_bits of spi_device_interface_config_t.
    NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.
    Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you may have to write 0x3_12).
uint64_t addr
Address data, of which the length is set in the address_bits of spi_device_interface_config_t.

NOTE: this field, used to be "address" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF3.0.
Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t length
Total data length, in bits.

size_t rxlength
Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

void *user
User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]
If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer
Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]
If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t
This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct spi_transaction_t base
Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits
The command length in this transaction, in bits.

uint8_t address_bits
The address length in this transaction, in bits.

uint8_t dummy_bits
The dummy length in this transaction, in bits.
Chapter 2. API Reference

Macros

**SPI_MASTER_FREQ_8M**
SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).

8MHz

**SPI_MASTER_FREQ_9M**
8.89MHz

**SPI_MASTER_FREQ_10M**
10MHz

**SPI_MASTER_FREQ_11M**
11.43MHz

**SPI_MASTER_FREQ_13M**
13.33MHz

**SPI_MASTER_FREQ_16M**
16MHz

**SPI_MASTER_FREQ_20M**
20MHz

**SPI_MASTER_FREQ_26M**
26.67MHz

**SPI_MASTER_FREQ_40M**
40MHz

**SPI_MASTER_FREQ_80M**
80MHz

**SPI_DEVICE_TXBIT_LSBFIRST**
Transmit command/address/data LSB first instead of the default MSB first.

**SPI_DEVICE_RXBIT_LSBFIRST**
Receive data LSB first instead of the default MSB first.

**SPI_DEVICE_BIT_LSBFIRST**
Transmit and receive LSB first.

**SPI_DEVICE_3WIRE**
Use MOSI (=spid) for both sending and receiving data.

**SPI_DEVICE_POSITIVE_CS**
Make CS positive during a transaction instead of negative.

**SPI_DEVICE_HALFDUPLEX**
Transmit data before receiving it, instead of simultaneously.
**SPI_DEVICE_CLK_AS_CS**
Output clock on CS line if CS is active.

**SPI_DEVICE_NO_DUMMY**
There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPIDEVICE_DDRCLK**

**SPI_TRANS_MODE_DIO**
Transmit/receive data in 2-bit mode.

**SPI_TRANS_MODE_QIO**
Transmit/receive data in 4-bit mode.

**SPI_TRANS_USE_RXDATA**
Receive into rx_data member of `spi_transaction_t` instead into memory at rx_buffer.

**SPI_TRANS_USE_TXDATA**
Transmit tx_data member of `spi_transaction_t` instead of data at tx_buffer. Do not set tx_buffer when using this.

**SPI_TRANS_MODE_DIOQIO_ADDR**
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

**SPI_TRANS_VARIABLE_CMD**
Use the command_bits in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_VARIABLE_ADDR**
Use the address_bits in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_VARIABLE_DUMMY**
Use the dummy_bits in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_CS_KEEP_ACTIVE**
Keep CS active after data transfer.

**SPI_TRANS_MULTILINE_CMD**
The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)
Chapter 2  API Reference

SPI_TRANS_MODE_OCT
Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR
The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

Type Definitions

typedef struct spi_transaction_t spi_transaction_t
typedef void (*transaction_cb_t)(spi_transaction_t *trans)

typedef struct spi_device_t *spi_device_handle_t
Handle for a device on a SPI bus.

2.6.21 SPI Slave Driver

SPI Slave driver is a program that controls ESP32’s SPI peripherals while they function as slaves.

Overview of ESP32’s SPI peripherals

ESP32 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master.

- SPI2, sometimes referred to as HSPI
- SPI3, sometimes referred to as VSPI

SPI2 and SPI3 have independent signal buses with the same respective names.

Terminology

The terms used in relation to the SPI slave driver are given in the table below.
### Term | Definition
--- | ---
**Host** | The SPI controller peripheral external to ESP32 that initiates SPI transmissions over the bus, and acts as an SPI Master.
**Device** | SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.
**Bus** | A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
**MISO** | Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
**MOSI** | Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.
**SCLK** | Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
**CS** | Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
**QUADWP** | Write Protect signal. Only used for 4-bit (qio/qout) transactions.
**QUADHD** | Hold signal. Only used for 4-bit (qio/qout) transactions.
**Assertion** | The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion.
**Transaction** | One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
**Launch Edge** | Edge of the clock at which the source register launches the signal onto the line.
**Latch Edge** | Edge of the clock at which the destination register latches in the signal.

### Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.

### SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see Transaction Interval.
Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to -1.

If transactions will be longer than 32 bytes, allow a DMA channel 1 or 2 by setting the parameter `dma_chan` to 1 or 2 respectively. Otherwise, set `dma_chan` to 0.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.

- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::length` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

GPIO Matrix and IO_MUX

Most of ESP32’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix.

If at least one signal is routed through the GPIO matrix, then all signals will be routed through it. The GPIO matrix samples all signals at 80 MHz and transmits them between the GPIO and the peripheral.

If the driver is configured so that all SPI signals are either routed to their dedicated IO_MUX pins or are not connected at all, the GPIO matrix will be bypassed.

The GPIO matrix introduces flexibility of routing but also increases the input delay of the MISO signal, which makes MISO setup time violations more likely. If SPI needs to operate at high speeds, use dedicated IO_MUX pins.

Note: For more details about the influence of the MISO input delay on the maximum clock frequency, see Timing Considerations.

The IO_MUX pins for SPI buses are given below.
### Pin Name

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>GPIO Number (SPI2)</th>
<th>GPIO Number (SPI3)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0*</td>

</tr>
</tbody>
</table>

- Only the first Device attached to the bus can use the CS0 pin.

### Speed and Timing Considerations

#### Transaction Interval

The ESP32 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`.

#### SCLK Frequency Requirements

The SPI slaves are designed to operate at up to 10 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

On top of that, there are additional requirements for the data to meet the timing constraints:

- **Read (MOSI):** The Device can read data correctly only if the data is already set at the launch edge. Although it is usually the case for most masters.
- **Write (MISO):** The output delay of the MISO signal needs to be shorter than half of a clock cycle period so that the MISO line is stable before the next latch edge. Given that the clock is balanced, the output delay and frequency limitations in different cases are given below.

<table>
<thead>
<tr>
<th>/</th>
<th>Output delay of MISO (ns)</th>
<th>Freq. limit (MHz)</th>
</tr>
</thead>
<tbody>
<tr>
<td>IO_MUX</td>
<td>43.75</td>
<td>&lt;11.4</td>
</tr>
<tr>
<td>GPIO matrix</td>
<td>68.75</td>
<td>&lt;7.2</td>
</tr>
</tbody>
</table>

Note: 1. If the frequency reaches the maximum limitation, random errors may occur. 2. The clock uncertainty between the Host and the Device (12.5 ns) is included. 3. The output delay is measured under ideal circumstances (no load). If the MISO pin is heavily loaded, the output delay will be longer, and the maximum allowed frequency will be lower.

Exception: The frequency is allowed to be higher if the master has more tolerance for the MISO setup time, e.g., latch data at the next edge, or configurable latching time.

### Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied. Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

2. Furthermore, DMA requires SPI modes 1 and 3. For SPI modes 0 and 2, the MISO signal has to be launched half a clock cycle earlier to meet the timing. The new timing is as follows:
If DMA is enabled, a Device’s launch edge is half of an SPI clock cycle ahead of the normal time, shifting to the Master’s actual latch edge. In this case, if the GPIO matrix is bypassed, the hold time for data sampling is 68.75 ns and no longer a half of an SPI clock cycle. If the GPIO matrix is used, the hold time will increase to 93.75 ns. The Host should sample the data immediately at the latch edge or communicate in SPI modes 1 or 3. If your Host cannot meet these timing requirements, initialize your Device without DMA.

**Application Example**

The code example for Device/Host communication can be found in the peripherals/spi_slave directory of ESP-IDF examples.

**API Reference**

**Header File**

- components/driver/include/driver/spi_slave.h

**Functions**

```c
esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config, const spi_slave_interface_config_t *slave_config, spi_dma_chan_t dma Chan)
```

Initialize a SPI bus as a slave interface.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Parameters**

- **host** - SPI peripheral to use as a SPI slave interface
- **bus_config** - Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- **slave_config** - Pointer to a `spi_slave_interface_config_t` struct specifying the details for the slave interface
- **dma Chan** -- Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
  - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
  - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

**Returns**

- **ESP_ERR_INVALID_ARG** if configuration is invalid
- **ESP_ERR_INVALID_STATE** if host already is in use
### Chapter 2. API Reference

- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**esp_err_t spi_slave_free (spi_host_device_t host)**

Free a SPI bus claimed as a SPI slave interface.

**Parameters**
- host – SPI peripheral to free

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**esp_err_t spi_slave_queue_trans (spi_host_device_t host, const spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)**

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function; the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

**Parameters**
- host – SPI peripheral that is acting as a slave
- trans_desc – Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- ticks_to_wait – Ticks to wait until there’s room in the queue; use `portMAX_DELAY` to never time out.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**esp_err_t spi_slave_get_trans_result (spi_host_device_t host, spi_slave_transaction_t **trans_desc, TickType_t ticks_to_wait)**

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

**Parameters**
- host – SPI peripheral to that is acting as a slave
- trans_desc – [out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- ticks_to_wait – Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**esp_err_t spi_slave_transmit (spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)**

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn’t been finalized using `spi_slave_get_trans_result`.

---

Espressif Systems 1306  Release v5.0.4-384-ge42bcf2e88

Submit Document Feedback
Parameters

- **host**: SPI peripheral to that is acting as a slave
- **trans_desc**: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Structures

```c
struct spi_slave_interface_config_t
```

This is a configuration for a SPI host acting as a slave device.

Public Members

```c
int spics_io_num
```

CS GPIO pin for this device.

```c
uint32_t flags
```

Bitwise OR of SPI_SLAVE_* flags.

```c
int queue_size
```

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

```c
uint8_t mode
```

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

```c
slave_transaction_cb_t post_setup_cb
```

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

```c
slave_transaction_cb_t post_trans_cb
```

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

```c
struct spi_slave_transaction_t
```

This structure describes one SPI transaction
Chapter 2. API Reference

Public Members

size_t length
Total data length, in bits.

size_t trans_len
Transaction data length, in bits.

const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer
Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (rx_buffer%4==0), and has length of a multiple of 4 bytes.

void *user
User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST
Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST
Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST
Transmit and receive LSB first.

Type Definitions

typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

2.6.22 ESP32-WROOM-32SE (Secure Element)

Overview

The ESP32-WROOM-32SE has integrated Microchip’s ATECC608A cryptoauth chip in the module. ATECC608A is secure element which would generate and store ECC private key in the hardware. The ECC private key can be used to enhance security to connect to IoT cloud services with use of X.509 based mutual authentication. The application example demonstrates ECDSA sign and verify functions using ECC private key stored in ATECC608A

Application Example

Secure Element ECDSA Sign/Verify example: peripherals/secure_element/atecc608_ecdsa.

How to configure and provision ESP32-WROOM-32SE for TLS

To configure and provision ATECC608A chip on ESP32-WROOM-32SE please visit esp_cryptoauth_utility
How to use ATECC608A of ESP32-WROOM-32SE for TLS

ATECC608A can be used for TLS connections using ESP-TLS. To configure ESP-TLS for using secure element please refer ATECC608A with ESP-TLS in ESP-TLS documentation.

2.6.23 Touch Sensor

Introduction

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When a user touches the surface, the capacitance variation is used to evaluate if the touch was valid.

Touch sensor on ESP32 can support up to 10 capacitive touch pads / GPIOs.

The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

For design, operation, and control registers of a touch sensor, see ESP32 Technical Reference Manual > On-Chip Sensors and Analog Signal Processing [PDF].

In-depth design details of touch sensors and firmware development guidelines for ESP32 are available in Touch Sensor Application Note.

For more information about testing touch sensors in various configurations, please check the Guide for ESP32-Sense-Kit.

Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section API Reference. Practical implementation of this API is covered in Section Application Examples.

Initialization  Before using a touch pad, you need to initialize the touch pad driver by calling the function touch_pad_init(). This function sets several ...DEFAULT driver parameters listed in API Reference under Macros. It also removes the information about which pads have been touched before, if any, and disables interrupts. If the driver is not required anymore, deinitialize it by calling touch_pad_deinit().

Configuration  Enabling the touch sensor functionality for a particular GPIO is done with touch_pad_config().

Use the function touch_pad_set_fsm_mode() to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use touch_pad_sw_start() to start the FSM.
**Touch State Measurements**  The following two functions come in handy to read raw or filtered measurements from the sensor:

- `touch_pad_read_raw_data()`
- `touch_pad_read_filtered()`

They can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

**Note:** Before using `touch_pad_read_filtered()`, you need to initialize and configure the filter by calling specific filter functions described in Section *Filtering of Measurements*.

For the demonstration of how to read the touch pad data, check the application example `peripherals/touch_sensor/touch_sensor_v1/touch_pad_read`.

**Method of Measurements**  The touch sensor will count the number of charge/discharge cycles over a fixed period of time (specified by `touch_pad_set_measurement_clock_cycles()`). The count result is the raw data that read from `touch_pad_read_raw_data()`. After finishing one measurement, the touch sensor will sleep until the next measurement start, this interval between two measurements can be set by `touch_pad_set_measurement_interval()`.

**Note:** If the specified clock cycles for measurement is too small, the result may be inaccurate, but increasing clock cycles will increase the power consumption as well. Additionally, the response of the touch sensor will slow down if the total time of the interval and measurement is too long.

**Optimization of Measurements**  A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged / discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_measurement_clock_cycles()`.

The following list summarizes available measurement parameters and corresponding ‘set’ functions:

- Touch pad charge / discharge parameters:
  - voltage range: `touch_pad_set_voltage()`
  - speed (slope): `touch_pad_set_cnt_mode()`
- Clock cycles of one measurement: `touch_pad_set_measurement_clock_cycles()`

Relationship between the voltage range (high / low reference voltages), speed (slope), and measurement time is shown in the figure below.

The last chart *Output* represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

All functions are provided in pairs to set a specific parameter and to get the current parameter’s value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

**Filtering of Measurements**  If measurements are noisy, you can filter them with provided API functions. Before using the filter, please start it by calling `touch_pad_filter_start()`.

The filter type is IIR (infinite impulse response), and it has a configurable period that can be set with the function `touch_pad_set_filter_period()`.
You can stop the filter with `touch_pad_filter_stop()`. If not required anymore, the filter can be deleted by invoking `touch_pad_filter_delete()`.

**Touch Detection** Touch detection is implemented in ESP32's hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection / provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt.

**Touch Triggered Interrupts** Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in **Touch State Measurements** to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thres()`.  

In the next step, configure how interrupts are triggered. They can be triggered below or above the threshold, which is set with the function `touch_pad_set_trigger_mode()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`  
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

**Note:** Interrupts on touch detection operate on raw / unfiltered measurements checked against user established threshold and are implemented in hardware. Enabling the software filtering API (see **Filtering of Measurements**) does.
Wakeup from Sleep Mode  If touch pad interrupts are used to wake up the chip from a sleep mode, you can select a certain configuration of pads (SET1 or both SET1 and SET2) that should be touched to trigger the interrupt and cause the subsequent wakeup. To do so, use the function `touch_pad_set_trigger_source()`. Configuration of required bit patterns of pads may be managed for each SET with:

- `touch_pad_set_group_mask()` / `touch_pad_get_group_mask()`
- `touch_pad_clear_group_mask()`

Application Examples

- Touch sensor read example: `peripherals/touch_sensor/touch_sensor_v1/touch_pad_read`.  
- Touch sensor interrupt example: `peripherals/touch_sensor/touch_sensor_v1/touch_pad_interrupt`.  

API Reference

Header File

- components/driver/esp32/include/driver/touch_sensor.h

Functions

`esp_err_t touch_pad_config(touch_pad_t touch_num, uint16_t threshold)`  
Configure touch pad interrupt threshold.  

**Note:** If FSM mode is set to TOUCH_FSM_MODE_TIMER, this function will be blocked for one measurement cycle and wait for data to be valid.

**Parameters**

- `touch_num` – touch pad index  
- `threshold` – interrupt threshold,

**Returns**

- ESP_OK Success  
- ESP_ERR_INVALID_ARG if argument wrong  
- ESP_FAIL if touch pad not initialized

`esp_err_t touch_pad_read(touch_pad_t touch_num, uint16_t *touch_value)`  
get touch sensor counter value. Each touch sensor has a counter to count the number of charge/discharge cycles. When the pad is not `touched`, we can get a number of the counter. When the pad is `touched`, the value in counter will get smaller because of the larger equivalent capacitance.  

**Note:** This API requests hardware measurement once. If IIR filter mode is enabled, please use ‘`touch_pad_read_raw_data`’ interface instead.

**Parameters**

- `touch_num` – touch pad index  
- `touch_value` – pointer to accept touch sensor value

**Returns**

- ESP_OK Success  
- ESP_ERR_INVALID_ARG Touch pad parameter error  
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “`touch_value`” is 0.
Chapter 2. API Reference

- ESP_FAIL Touch pad not initialized

\textbf{\texttt{esp_err_t}} \texttt{touch_pad_read_filtered}\texttt{(touch_pad_t \_touch_num, uint16_t* \_touch_value)}

get filtered touch sensor counter value by IIR filter.

\textbf{Note:} touch_pad_filter_start has to be called before calling touch_pad_read_filtered. This function can be called from ISR.

**Parameters**
- \texttt{touch_num} – touch pad index
- \texttt{touch_value} – pointer to accept touch sensor value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

\textbf{\texttt{esp_err_t}} \texttt{touch_pad_read_raw_data}\texttt{(touch_pad_t \_touch_num, uint16_t* \_touch_value)}

get raw data (touch sensor counter value) from IIR filter process. Need not request hardware measurements.

\textbf{Note:} touch_pad_filter_start has to be called before calling touch_pad_read_raw_data. This function can be called from ISR.

**Parameters**
- \texttt{touch_num} – touch pad index
- \texttt{touch_value} – pointer to accept touch sensor value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch pad parameter error
- ESP_ERR_INVALID_STATE This touch pad hardware connection is error, the value of “touch_value” is 0.
- ESP_FAIL Touch pad not initialized

\textbf{\texttt{esp_err_t}} \texttt{touch_pad_set_filter_read_cb}\texttt{(filter_cb_t \_read_cb)}

Register the callback function that is called after each IIR filter calculation.

\textbf{Note:} The ‘read_cb’ callback is called in timer task in each filtering cycle.

**Parameters** \texttt{read_cb} – Pointer to filtered callback function. If the argument passed in is NULL, the callback will stop.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG set error

\textbf{\texttt{esp_err_t}} \texttt{touch_pad_isr_register}\texttt{(intr_handler_t \_fn, void* \_arg)}

Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**
- \texttt{fn} – Pointer to ISR handler
- \texttt{arg} – Parameter for ISR

**Returns**
- ESP_OK Success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NO_MEM No memory

`esp_err_t touch_pad_set_measurement_clock_cycles(uint16_t clock_cycle)`
Set the clock cycles of each measurement.

**Note:** This function will specify the clock cycles of each measurement and the clock is sourced from SOC_MOD_CLK_RTC_FAST, its default frequency is SOC_CLK_RC_FAST_FREQ_APPROX. The touch sensor will record the charge and discharge times during these clock cycles as the final result (raw value).

**Note:** If clock cycles are too small, it may lead to inaccurate results.

**Parameters clock_cycle** - The clock cycles of each measurement measure_time = clock_cycle / SOC_CLK_RC_FAST_FREQ_APPROX, the maximum measure time is 0xffff / SOC_CLK_RC_FAST_FREQ_APPROX

**Returns**
- ESP_OK Set the clock cycle success

`esp_err_t touch_pad_get_measurement_clock_cycles(uint16_t *clock_cycle)`
Get the clock cycles of each measurement.

**Parameters clock_cycle** - The clock cycles of each measurement

**Returns**
- ESP_OK Get the clock cycle success
- ESP_ERR_INVALID_ARG The input parameter is NULL

`esp_err_t touch_pad_set_measurement_interval(uint16_t interval_cycle)`
Set the interval between two measurements.

**Note:** The touch sensor will sleep between two measurements. This function is to set the interval cycle. The interval is clocked from SOC_MOD_CLK_RTC_SLOW, its default frequency is SOC_CLK_RC_SLOW_FREQ_APPROX.

**Parameters interval_cycle** - The interval between two measurements sleep_time = interval_cycle / SOC_CLK_RC_SLOW_FREQ_APPROX. The approximate frequency value of RTC_SLOW_CLK can be obtained using rtc_clk_slow_freq_get_hz function.

**Returns**
- ESP_OK Set interval cycle success

`esp_err_t touch_pad_get_measurement_interval(uint16_t *interval_cycle)`
Get the interval between two measurements.

**Parameters interval_cycle** - The interval between two measurements

**Returns**
- ESP_OK Get interval cycle success
- ESP_ERR_INVALID_ARG The input parameter is NULL

`esp_err_t touch_pad_set_meas_time(uint16_t sleep_cycle, uint16_t meas_cycle)`
Set touch sensor measurement and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

**Note:** The touch sensor will count the number of charge/discharge cycles over a fixed period of time (specified as the second parameter). That means the number of cycles (raw value) will decrease as the capacity of the touch pad is increasing.
Chapter 2. API Reference

**Note:** The greater the duty cycle of the measurement time, the more system power is consumed.

**Parameters**

- **sleep_cycle** – The touch sensor will sleep after each measurement. sleep_cycle decide the interval between each measurement. t_sleep = sleep_cycle / SOC_CLK_RC_SLOW_FREQ_APPROX. The approximate frequency value of RTC_SLOW_CLK can be obtained using rtc_clk_slow_freq_get_hz function.
- **meas_cycle** – The duration of the touch sensor measurement. t_meas = meas_cycle / SOC_CLK_RC_FAST_FREQ_APPROX. The maximum measure time is 0xffff / SOC_CLK_RC_FAST_FREQ_APPROX

**Returns**

- ESP_OK on success

```c
esp_err_t touch_pad_get_meas_time(uint16_t *sleep_cycle, uint16_t *meas_cycle)
```

Get touch sensor measurement and sleep time.

**Parameters**

- **sleep_cycle** – Pointer to accept sleep cycle number
- **meas_cycle** – Pointer to accept measurement cycle count.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG The input parameter is NULL

```c
esp_err_t touch_pad_sw_start(void)
```

Trigger a touch sensor measurement, only support in SW mode of FSM.

**Returns**

- ESP_OK on success

```c
esp_err_t touch_pad_set_thresh(touch_pad_t touch_num, uint16_t threshold)
```

Set touch sensor interrupt threshold.

**Parameters**

- **touch_num** – touch pad index
- **threshold** – threshold of touchpad count, refer to touch_pad_set_trigger_mode to see how to set trigger mode.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_get_thresh(touch_pad_t touch_num, uint16_t *threshold)
```

Get touch sensor interrupt threshold.

**Parameters**

- **touch_num** – touch pad index
- **threshold** – pointer to accept threshold

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_set_trigger_mode(touch_trigger_mode_t mode)
```

Set touch sensor interrupt trigger mode. Interrupt can be triggered either when counter result is less than threshold or when counter result is more than threshold.

**Parameters**

- **mode** – touch sensor interrupt trigger mode

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong
esp_err_t touch_pad_get_trigger_mode (touch_trigger_mode_t *mode)
Get touch sensor interrupt trigger mode.

Parameters mode – pointer to accept touch sensor interrupt trigger mode

Returns
• ESP_OK on success

esp_err_t touch_pad_set_trigger_source (touch_trigger_src_t src)
Set touch sensor interrupt trigger source. There are two sets of touch signals. Set1 and set2 can be mapped to several touch signals. Either set will be triggered if at least one of its touch signal is ‘touched’. The interrupt can be configured to be generated if set1 is triggered, or only if both sets are triggered.

Parameters src – touch sensor interrupt trigger source

Returns
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t touch_pad_set_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)
Set touch sensor group mask. Touch pad module has two sets of signals, ‘Touched’ signal is triggered only if at least one of touch pad in this group is “touched”. This function will set the register bits according to the given bitmask.

Parameters
• set1_mask – bitmask of touch sensor signal group1, it’s a 10-bit value
• set2_mask – bitmask of touch sensor signal group2, it’s a 10-bit value
• en_mask – bitmask of touch sensor work enable, it’s a 10-bit value

Returns
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t touch_pad_get_group_mask (uint16_t *set1_mask, uint16_t *set2_mask, uint16_t *en_mask)
Get touch sensor group mask.

Parameters
• set1_mask – pointer to accept bitmask of touch sensor signal group1, it’s a 10-bit value
• set2_mask – pointer to accept bitmask of touch sensor signal group2, it’s a 10-bit value
• en_mask – pointer to accept bitmask of touch sensor work enable, it’s a 10-bit value

Returns
• ESP_OK on success

esp_err_t touch_pad_clear_group_mask (uint16_t set1_mask, uint16_t set2_mask, uint16_t en_mask)
Clear touch sensor group mask. Touch pad module has two sets of signals, Interrupt is triggered only if at least one of touch pad in this group is “touched”. This function will clear the register bits according to the given bitmask.

Parameters
• set1_mask – bitmask touch sensor signal group1, it’s a 10-bit value
• set2_mask – bitmask touch sensor signal group2, it’s a 10-bit value
• en_mask – bitmask of touch sensor work enable, it’s a 10-bit value

Returns
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

esp_err_t touch_pad_intr_enable (void)
To enable touch pad interrupt.
Returns
- ESP_OK on success

```c
esp_err_t touch_pad_intr_disable (void)
```
To disable touch pad interrupt.

Returns
- ESP_OK on success

```c
esp_err_t touch_pad_intr_clear (void)
```
To clear touch pad interrupt.

Returns
- ESP_OK on success

```c
esp_err_t touch_pad_set_filter_period (uint32_t new_period_ms)
```
set touch pad filter calibration period, in ms. Need to call touch_pad_filter_start before all touch filter APIs

Parameters
- `new_period_ms` - filter period, in ms

Returns
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

```c
esp_err_t touch_pad_get_filter_period (uint32_t *p_period_ms)
```
get touch pad filter calibration period, in ms Need to call touch_pad_filter_start before all touch filter APIs

Parameters
- `p_period_ms` - pointer to accept period

Returns
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error
- ESP_ERR_INVALID_ARG parameter error

```c
esp_err_t touch_pad_filter_start (uint32_t filter_period_ms)
```
start touch pad filter function This API will start a filter to process the noise in order to prevent false triggering when detecting slight change of capacitance. Need to call touch_pad_filter_start before all touch filter APIs

Note: This filter uses FreeRTOS timer, which is dispatched from a task with priority 1 by default on CPU 0. So if some application task with higher priority takes a lot of CPU0 time, then the quality of data obtained from this filter will be affected. You can adjust FreeRTOS timer task priority in menuconfig.

```c
Parameters
- `filter_period_ms` - filter calibration period, in ms

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter error
- ESP_ERR_NO_MEM Nomemory fordriver
- ESP_ERR_INVALID_STATE driver state error
```

```c
esp_err_t touch_pad_filter_stop (void)
```
stop touch pad filter function Need to call touch_pad_filter_start before all touch filter APIs

Returns
- ESP_OK Success
- ESP_ERR_INVALID_STATE driver state error

```c
esp_err_t touch_pad_filter_delete (void)
```
delete touch pad filter driver and release the memory Need to call touch_pad_filter_start before all touch filter APIs

Returns
- ESP_OK Success
• ESP_ERR_INVALID_STATE driver state error

Type Definitions
typedef void (*filter_cb_t)(uint16_t *raw_value, uint16_t *filtered_value)
    Callback function that is called after each IIR filter calculation.

Note: This callback is called in timer task in each filtering cycle.

Note: This callback should not be blocked.

Param raw_value The latest raw data (touch sensor counter value) that points to all channels(raw_value[0..TOUCH_PAD_MAX-1]).
Param filtered_value The latest IIR filtered data (calculated from raw data) that points to all channels(filtered_value[0..TOUCH_PAD_MAX-1]).

Header File
• components/driver/include/driver/touch_sensor_common.h

Functions

esp_err_t touch_pad_init (void)
    Initialize touch module.

Note: If default parameter don’t match the usage scenario, it can be changed after this function.

Returns
• ESP_OK Success
• ESP_ERR_NO_MEM Touch pad init error
• ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL

esp_err_t touch_pad_deinit (void)
    Un-install touch pad driver.

Note: After this function is called, other touch functions are prohibited from being called.

Returns
• ESP_OK Success
• ESP_FAIL Touch pad driver not initialized

esp_err_t touch_pad_io_init (touch_pad_t touch_num)
    Initialize touch pad GPIO.

Parameters touch_num – touch pad index

Returns
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong
**esp_err_t touch_pad_set_voltage** (touch_high_volt_t refh, touch_low_volt_t refl, touch_volt_atten_t atten)

Set touch sensor high voltage threshold of change. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

**Parameters**
- `refh` - the value of DREFH
- `refl` - the value of DREFL
- `atten` - the attenuation on DREFH

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**esp_err_t touch_pad_get_voltage** (touch_high_volt_t *refh, touch_low_volt_t *refl, touch_volt_atten_t *atten)

Get touch sensor reference voltage.

**Parameters**
- `refh` - pointer to accept DREFH value
- `refl` - pointer to accept DREFL value
- `atten` - pointer to accept the attenuation on DREFH

**Returns**
- ESP_OK on success

**esp_err_t touch_pad_set_cnt_mode** (touch_pad_t touch_num, touch_cnt_slope_t slope, touch_tie_opt_t opt)

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

**Note:** The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

**Parameters**
- `touch_num` - touch pad index
- `slope` - touch pad charge/discharge speed
- `opt` - the initial voltage

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**esp_err_t touch_pad_get_cnt_mode** (touch_pad_t touch_num, touch_cnt_slope_t *slope, touch_tie_opt_t *opt)

Get touch sensor charge/discharge speed for each pad.

**Parameters**
- `touch_num` - touch pad index
- `slope` - pointer to accept touch pad charge/discharge slope
- `opt` - pointer to accept the initial voltage

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**esp_err_t touch_pad_isr_deregister** (void (*fn)(void*), void *arg)

Deregister the handler previously registered using touch_pad_isr_handler_register.

**Parameters**
- `fn` - handler function to call (as passed to touch_pad_isr_handler_register)
- `arg` - argument of the handler (as passed to touch_pad_isr_handler_register)

**Returns**
Chapter 2. API Reference

- ESP_OK on success
- ESP_ERR_INVALID_STATE if a handler matching both fn and arg isn’t registered

```c
esp_err_t touch_pad_get_wakeup_status(touch_pad_t *pad_num)
```
Get the touch pad which caused wakeup from deep sleep.

**Parameters**
- `pad_num` - pointer to touch pad which caused wakeup

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

```c
esp_err_t touch_pad_set_fsm_mode(touch_fsm_mode_t mode)
```
Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**Parameters**
- `mode` - FSM mode

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_get_fsm_mode(touch_fsm_mode_t *mode)
```
Get touch sensor FSM mode.

**Parameters**
- `mode` - pointer to accept FSM mode

**Returns**
- ESP_OK on success

```c
esp_err_t touch_pad_clear_status(void)
```
To clear the touch sensor channel active status.

**Note:** The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

```c
uint32_t touch_pad_get_status(void)
```
Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

**Returns**
- The touch sensor status. e.g. Touch1 trigger status is `status_mask & (BIT1)`.

```c
bool touch_pad_meas_is_done(void)
```
Check touch sensor measurement status.

**Returns**
- True measurement is under way
- False measurement done

**GPIO Lookup Macros** Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.

1. `TOUCH_PAD_NUM5_GPIO_NUM` is the GPIO number of channel 5 (12);
2. `TOUCH_PAD_GPIO4_CHANNEL` is the channel number of GPIO 4 (channel 0).

`TOUCH_PAD_SLOPE_DEFAULT`

`TOUCH_PAD_TIE_OPT_DEFAULT`

`TOUCH_PAD_BIT_MASK_MAX`

`TOUCH_PAD_HIGH_VOLTAGE_THRESHOLD`

`TOUCH_PAD_LOW_VOLTAGE_THRESHOLD`

`TOUCH_PAD_ATTEN_VOLTAGE_THRESHOLD`

`TOUCH_PAD_IDLE_CH_CONNECT_DEFAULT`

`TOUCH_PAD_THRESHOLD_MAX`

If set touch threshold max value, The touch sensor can’t be in touched status

`TOUCH_PAD_SLEEP_CYCLE_DEFAULT`

The timer frequency is RTC_SLOW_CLK (can be 150k or 32k depending on the options), max value is 0xffff

`TOUCH_PAD_MEASURE_CYCLE_DEFAULT`

The timer frequency is 8Mhz, the max value is 0x7fff

`TOUCH_FSM_MODE_DEFAULT`

The touch FSM may be started by the software or timer

`TOUCH_TRIGGER_MODE_DEFAULT`

Interrupts can be triggered if sensor value gets below or above threshold

`TOUCH_TRIGGER_SOURCE_DEFAULT`

The wakeup trigger source can be SET1 or both SET1 and SET2

**Enumerations**

```c
enum touch_pad_t
{
	Touch pad channel

	Values:

	enumerator TOUCH_PAD_NUM0
		Touch pad channel 0 is GPIO4(ESP32)

	enumerator TOUCH_PAD_NUM1
		Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)
```

Touch sensor charge/discharge speed  
*Values:*  

enumerator **TOUCH_PAD_SLOPE_0**  
Touch sensor charge / discharge speed, always zero
enumerator TOUCH_PAD_SLOPE_1
  Touch sensor charge / discharge speed, slowest

enumerator TOUCH_PAD_SLOPE_2
  Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_3
  Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_4
  Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_5
  Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_6
  Touch sensor charge / discharge speed

enumerator TOUCH_PAD_SLOPE_7
  Touch sensor charge / discharge speed, fast

enumerator TOUCH_PAD_SLOPE_MAX

enum touch_tie_opt_t
  Touch sensor initial charge level

Values:

enumerator TOUCH_PAD_TIE_OPT_LOW
  Initial level of charging voltage, low level

enumerator TOUCH_PAD_TIE_OPT_HIGH
  Initial level of charging voltage, high level

enumerator TOUCH_PAD_TIE_OPT_MAX

enum touch_fsm_mode_t
  Touch sensor FSM mode

Values:

enumerator TOUCH_FSM_MODE_TIMER
  To start touch FSM by timer

enumerator TOUCH_FSM_MODE_SW
  To start touch FSM by software trigger

enumerator TOUCH_FSM_MODE_MAX
enum touch_trigger_mode_t
    Values:

    enumerator TOUCH_TRIGGER BELOW
        Touch interrupt will happen if counter value is less than threshold.

    enumerator TOUCH_TRIGGER ABOVE
        Touch interrupt will happen if counter value is larger than threshold.

    enumerator TOUCH_TRIGGER_MAX

enum touch_trigger_src_t
    Values:

    enumerator TOUCH_TRIGGER SOURCE BOTH
        wakeup interrupt is generated if both SET1 and SET2 are “touched”

    enumerator TOUCH_TRIGGER SOURCE SET1
        wakeup interrupt is generated if SET1 is “touched”

    enumerator TOUCH_TRIGGER SOURCE_MAX

2.6.24 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32’s peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

Warning: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

Sections

- Two-Wire Automotive Interface (TWAI)
  - Overview
  - TWAI Protocol Summary
  - Signals Lines and Transceiver
  - Driver Configuration
  - Driver Operation
  - Examples
  - API Reference
TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

Asynchronous: The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

Error Detection and Signalling: Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

Message Priorities: Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

TWAI Messages TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as Extended Frame and Standard Frame which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

Error States and Counters The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself form the bus. This is implemented by requiring every node to maintain two internal error counters known as the Transmit Error Counter (TEC) and the Receive Error Counter (REC). The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely Error Active, Error Passive, and Bus-Off.

Error Active: A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an Active Error Flag over the bus.

Error Passive: A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a Passive Error Flag upon detection of an error.

Bus-Off: A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to the ESP32’s GPIO pads.
**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is optional and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is optional and outputs a prescaled version of the controller’s source clock (APB Clock).

**Note:** An external transceiver must internally loopback the TX to RX such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

---

**Driver Configuration**

This section covers how to configure the TWAI driver.

**Operating Modes**

The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

**Listen Only Mode:** This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts**

The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured...
during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_Lost</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT_ABOVE_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

**Note:** The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

**Note:** When enabling alerts, the `TWAI_ALERT_AND_LOG` flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and `TWAI_ALERT_AND_LOG` if the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled (see Placing ISR into IRAM).

**Note:** The `TWAI_ALERT_ALL` and `TWAI_ALERT_NONE` macros can also be used to enable/disable all alerts during configuration/reconfiguration.

**Bit Timing** The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a prescaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The Synchronization Segment consists of a single time quantum
2. Timing Segment 1 consists of 1 to 16 time quanta before sample point
3. Timing Segment 2 consists of 1 to 8 time quanta after sample point

The Baudrate Prescaler is used to determine the period of each time quantum by dividing the TWAI controller’s source clock (80 MHz APB clock). On the ESP32, the brp can be any even number from 2 to 128.

If the ESP32 is a revision 2 or later chip, the brp will also support any multiple of 4 from 132 to 256, and can be enabled by setting the `CONFIG_ESP32_REV_MIN` to revision 2 or higher.

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling Triple Sampling will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).
Chapter 2. API Reference

Fig. 24: Bit timing configuration for 500kbit/s given BRP = 8

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. sjw can range from 1 to 4.

**Note:** Multiple combinations of brp, tseg_1, tseg_2, and sjw can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver:

- TWAI_TIMING_CONFIG_1MBITS()
- TWAI_TIMING_CONFIG_800KBITS()
- TWAI_TIMING_CONFIG_500KBITS()
- TWAI_TIMING_CONFIG_250KBITS()
- TWAI_TIMING_CONFIG_100KBITS()
- TWAI_TIMING_CONFIG_50KBITS()
- TWAI_TIMING_CONFIG_25KBITS()
- TWAI_TIMING_CONFIG_20KBITS()
- TWAI_TIMING_CONFIG_16KBITS()
- TWAI_TIMING_CONFIG_12_5KBITS()

Revision 2 or later of the ESP32 also supports the following bit rates:

- TWAI_TIMING_CONFIG_12_5KBITS()
- TWAI_TIMING_CONFIG_12_5KBITS()

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message will not receive the message, but will still acknowledge it. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the acceptance code and the acceptance mask.

The acceptance code specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The acceptance mask is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).
Disabling TX Queue  The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

Placing ISR into IRAM  The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:
- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:
- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

Note: When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

ESP32 Errata Workarounds  The ESP32’s TWAI controller contains multiple hardware errata (more details about the errata can be found in the ESP32’s ECO document). Some of these errata are critical, and under specific circumstances, can place the TWAI controller into an unrecoverable state (i.e., the controller gets stuck until it is reset by the CPU).

The TWAI driver contains software workarounds for these critical errata. With these workarounds, the ESP32 TWAI driver can operate normally, albeit with degraded performance. The degraded performance will affect users in the following ways depending on what particular errata conditions are encountered:
- The TWAI driver can occasionally drop some received messages.
- The TWAI driver can be unresponsive for a short period of time (i.e., will not transmit or ACK for 11 bit times or longer).
- If `CONFIG_TWAI_ISR_IN_IRAM` is enabled, the workarounds will increase IRAM usage by approximately 1KB.

The software workarounds are enabled by default and it is recommended that users keep this workarounds enabled.
Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

![State transition diagram of the TWAI driver]

#### Table 27: State transition diagram of the TWAI driver (see table below)

<table>

</tr>
</tbody>
</table>

**Driver States**  

**Uninstalled**: In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped**: In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running**: In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

**Bus-Off**: The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering**: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags**  

The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:
<table>
<thead>
<tr>
<th>Message Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>

<td>Data Frame.</td>
</tr>
</tbody>
</table>

**Examples**

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main() {
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_-
    →NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) { 
        printf("Driver started\n");
    } else { 
        printf("Failed to start driver\n");
        return;
    }
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```c
#include "driver/twai.h"
...
```

(continues on next page)
//Configure message to transmit
    twai_message_t message;
    message.identifier = 0xAAAA;
    message.extd = 1;
    message.data_length_code = 4;
    for (int i = 0; i < 4; i++) {
        message.data[i] = 0;
    }

    //Queue message for transmission
    if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
        printf("Message queued for transmission\n");
    } else {
        printf("Failed to queue message for transmission\n");
    }

Message Reception  The following code snippet demonstrates how to receive a message via the usage of the twai_message_t type and twai_receive() function.

#include "driver/twai.h"

...  

//Wait for message to be received
    twai_message_t message;
    if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
        printf("Message received\n");
    } else {
        printf("Failed to receive message\n");
        return;
    }

    //Process received message
    if (message.extd) {
        printf("Message is in Extended Format\n");
    } else {
        printf("Message is in Standard Format\n");
    }
    printf("ID is %d\n", message.identifier);
    if (!message.rtr) {
        for (int i = 0; i < message.data_length_code; i++) {
            printf("Data byte %d = %d\n", i, message.data[i]);
        }
    }

Reconfiguring and Reading Alerts  The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the twai_reconfigure_alerts() and twai_read_alerts() functions.

#include "driver/twai.h"

...  

//Reconfigure alerts to detect Error Passive and Bus-Off error states
    uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
    if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
        printf("Alerts reconfigured\n");
    } else {
        printf("Failed to reconfigure alerts");
    

// Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

**Stop and Uninstall**

The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```c
#include "driver/twai.h"
...

// Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

// Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

**Multiple ID Filter Configuration**

The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how to calculate the acceptance mask given multiple IDs:

```
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
ID4 = 11'b101 1010 1000
// Acceptance Mask
MASK = 11'b000 0000 1101
```

**Application Examples**

**Network Example:** The TWAIN Network example demonstrates communication between two ESP32s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via `peripherals/twai/twai_network`.

**Alert and Recovery Example:** This example demonstrates how to use the TWAI driver’s alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via `peripherals/twai/twai_alert_and_recovery`.

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via `peripherals/twai/twai_self_test`.
API Reference

Header File

- components/hal/include/hal/twai_types.h

Structures

struct twai_message_t

Structure to store a TWAI message.

Note: The flags member is deprecated

Public Members

uint32_t extd
    Extended Frame Format (29bit ID)

uint32_t rtr
    Message is a Remote Frame

uint32_t ss
    Transmit as a Single Shot Transmission. Unused for received.

uint32_t self
    Transmit as a Self Reception Request. Unused for received.

uint32_t dlc_non_comp
    Message’s Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32_t reserved
    Reserved bits

uint32_t flags
    Deprecated: Alternate way to set bits using message flags

uint32_t identifier
    11 or 29 bit identifier

uint8_t data_length_code
    Data length code

uint8_t data[TWAI_FRAME_MAX_DLC]
    Data bytes (not relevant in RTR frame)

struct twai_timing_config_t

Structure for bit timing configuration of the TWAI driver.

Note: Macro initializers are available for this structure
Public Members

uint32_t **brp**

Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported.

uint8_t **tseg_1**

Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t **tseg_2**

Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t **sjw**

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool **triple_sampling**

Enables triple sampling when the TWAI controller samples a bit

struct **twai_filter_config_t**

Structure for acceptance filter configuration of the TWAI driver (see documentation)

---

Note: Macro initializers are available for this structure

Public Members

uint32_t **acceptance_code**

32-bit acceptance code

uint32_t **acceptance_mask**

32-bit acceptance mask

bool **single_filter**

Use Single Filter Mode (see documentation)

---

Macros

**TWAI_EXTD_ID_MASK**

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID

**TWAI_STD_ID_MASK**

Bit mask for 11 bit Standard Frame Format ID

**TWAI_FRAME_MAX_DLC**

Max data bytes allowed in TWAI

**TWAI_FRAME_EXTD_ID_LEN_BYTES**

EFF ID requires 4 bytes (29bit)
Chapter 2. API Reference

**TWAI_FRAME_STD_ID_LEN_BYTES**
SFF ID requires 2 bytes (11bit)

**TWAI_ERR_PASS_THRESH**
Error counter threshold for error passive

**Enumerations**

```c
enum twai_mode_t
{
    TWAI_MODE_NORMAL,  // Normal operating mode where TWAI controller can send/receive/acknowledge messages
    TWAI_MODE_NO_ACK,  // Transmission does not require acknowledgment. Use this mode for self testing
    TWAI_MODE_LISTEN_ONLY,  // The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages
};
```

**Header File**
- components/driver/include/driver/twai.h

**Functions**

```c
esp_err_t twai_driver_install(const twai_general_config_t *g_config, const twai_timing_config_t *t_config, const twai_filter_config_t *f_config)
```

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

**Note:** Macro initializers are available for the configuration structures (see documentation)

**Note:** To reinstall the TWAI driver, call `twai_driver_uninstall()` first

**Parameters**
- `g_config` [in] General configuration structure
- `t_config` [in] Timing configuration structure
- `f_config` [in] Filter configuration structure

**Returns**
- ESP_OK: Successfully installed TWAI driver
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed

Espressif Systems 1338

Submit Document Feedback

Release v5.0.4-384-ge42bcf2e88
**esp_err_t twai_driver_uninstall (void)**

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning:** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Returns**
- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

**esp_err_t twai_start (void)**

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**Returns**
- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

**esp_err_t twai_stop (void)**

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until twai_start() is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**Warning:** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

**Returns**
- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

**esp_err_t twai_transmit (const twai_message_t *message, TickType_t ticks_to_wait)**

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

**Note:** This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note:** The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.
Parameters

- **message** - [in] Message to transmit
- **ticks_to_wait** - [in] Number of FreeRTOS ticks to block on the TX queue

Returns

- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

```c
esp_err_t twai_receive(twai_message_t *message, TickType_t ticks_to_wait)
```
Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

**Warning:** The flags field of the received message should be checked to determine if the received message contains any data bytes.

Parameters

- **message** - [out] Received message
- **ticks_to_wait** - [in] Number of FreeRTOS ticks to block on RX queue

Returns

- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

```c
esp_err_t twai_read_alerts(uint32_t*alerts, TickType_t ticks_to_wait)
```
Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

**Note:** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

Parameters

- **alerts** - [out] Bit field of raised alerts (see documentation for alert flags)
- **ticks_to_wait** - [in] Number of FreeRTOS ticks to block for alert

Returns

- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

```c
esp_err_t twai_reconfigure_alerts(uint32_t alerts_enabled, uint32_t*current_alerts)
```
Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

Parameters

- **alerts_enabled** - [in] Bit field of alerts to enable (see documentation for alert flags)
- **current_alerts** - [out] Bit field of currently raised alerts. Set to NULL if unused
Returns
- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

`esp_err_t twai_initiate_recovery (void)`
Start the bus recovery process.
This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

Note: The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

Returns
- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

`esp_err_t twai_get_status_info (twai_status_info_t *status_info)`
Get current status information of the TWAI driver.

Parameters
- `status_info` - [out] Status information

Returns
- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

`esp_err_t twai_clear_transmit_queue (void)`
Clear the transmit queue.
This function will clear the transmit queue of all messages.

Note: The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

Returns
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

`esp_err_t twai_clear_receive_queue (void)`
Clear the receive queue.
This function will clear the receive queue of all messages.

Note: The receive queue is automatically cleared when `twai_start()` is called.

Returns
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

Structures

`struct twai_general_config_t`
Structure for general configuration of the TWAI driver.
Note: Macro initializers are available for this structure

**Public Members**

```c
typedef enum {...
```

1. ```twai_mode_t mode```  
   Mode of TWAI controller

2. ```gpio_num_t tx_io```  
   Transmit GPIO number

3. ```gpio_num_t rx_io```  
   Receive GPIO number

4. ```gpio_num_t clkout_io```  
   CLKOUT GPIO number (optional, set to -1 if unused)

5. ```gpio_num_t bus_off_io```  
   Bus off indicator GPIO number (optional, set to -1 if unused)

6. ```uint32_t tx_queue_len```  
   Number of messages TX queue can hold (set to 0 to disable TX Queue)

7. ```uint32_t rx_queue_len```  
   Number of messages RX queue can hold

8. ```uint32_t alerts_enabled```  
   Bit field of alerts to enable (see documentation)

9. ```uint32_t clkout_divider```  
   CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

10. ```int intr_flags```  
    Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

```c
struct twai_status_info_t {
    ...
```

11. ```struct twai_status_info_t```  
    Structure to store status information of TWAI driver.

**Public Members**

```c
typedef enum {...
```

1. ```twai_state_t state```  
   Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

2. ```uint32_t msgs_to_tx```  
   Number of messages queued for transmission or awaiting transmission completion
uint32_t msgs_to_rx
    Number of messages in RX queue waiting to be read

uint32_t tx_error_counter
    Current value of Transmit Error Counter

uint32_t rx_error_counter
    Current value of Receive Error Counter

uint32_t tx_failed_count
    Number of messages that failed transmissions

uint32_t rx_missed_count
    Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t rx_overrun_count
    Number of messages that were lost due to a RX FIFO overrun

uint32_t arb_lost_count
    Number of instances arbitration was lost

uint32_t bus_error_count
    Number of instances a bus error has occurred

**Macros**

**TWAI_IO_UNUSED**
    Marks GPIO as unused in TWAI configuration

**Enumerations**

enum twai_state_t
    TWAI driver states.
    
    *Values:

    enumerator TWAI_STATE_STOPPED
        Stopped state. The TWAI controller will not participate in any TWAI bus activities

    enumerator TWAI_STATE_RUNNING
        Running state. The TWAI controller can transmit and receive messages

    enumerator TWAI_STATE_BUS_OFF
        Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

    enumerator TWAI_STATE_RECOVERING
        Recovering state. The TWAI controller is undergoing bus recovery
2.6.25 Universal Asynchronous Receiver/Transmitter (UART)

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32 chip has three UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

Functional Overview

The following overview describes how to establish communication between an ESP32 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. Setting Communication Parameters - Setting baud rate, data bits, stop bits, etc.
2. Setting Communication Pins - Assigning pins for connection to a device.
3. Driver Installation - Allocating ESP32’s resources for the UART driver.
4. Running UART Communication - Sending / receiving data
5. Using Interrupts - Triggering interrupts on specific communication events
6. Deleting a Driver - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver’s functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

Setting Communication Parameters

UART communication parameters can be configured all in a single step or individually in multiple steps.

Single Step

Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to `peripherals/uart/uart_echo`.

Multiple Steps

Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.
Table 8: Functions for Configuring specific parameters individually

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud rate</td>
<td>uart_set_baudrate()</td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td>uart_set_word_length() selected out of uart_word_length_t</td>
</tr>
<tr>
<td>Parity control</td>
<td>uart_set_parity() selected out of uart_parity_t</td>
</tr>
<tr>
<td>Number of stop bits</td>
<td>uart_set_stop_bits() selected out of uart_stop_bits_t</td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td>uart_set_hw_flow_ctrl() selected out of uart_hw_flowcontrol_t</td>
</tr>
<tr>
<td>Communication mode</td>
<td>uart_set_mode() selected out of uart_mode_t</td>
</tr>
</tbody>
</table>

Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the current baud rate value, call uart_get_baudrate().

**Setting Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function uart_set_pin() and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro UART_PIN_NO_CHANGE.

The same macro should be specified for pins that will not be used.

```c
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

**Driver Installation** Once the communication pins are set, install the driver by calling uart_driver_install() and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication** Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using uart_write_bytes() and uart_read_bytes() respectively, and the FSM will do the rest.
Transmitting  After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```

Receiving  Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```c
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
uint_t length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

Software Flow Control  If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

Communication Mode Selection  The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```c
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

Using Interrupts  There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in ESP32 Technical Reference Manual > UART Controller
UART Interrupts and UHCI Interrupts [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in Driver Installation. An example of using Event detection can be found in `peripherals/uart/uart_events`.

- **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_baud_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros** The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

**Overview of RS485 specific communication options**

**Note:** The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see ESP32 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is
supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the -RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options** This section provides example schematics to demonstrate the basic aspects of ESP32’s RS485 interface connection.

**Note:**
- The schematics below do not necessarily contain all required elements.
- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.

### Circuit A: Collision Detection Circuit

| VCC | +-------------------+ |
| RXD | | ------x------ | R |
| TXD | | D | ------x------ | D | ADM483 |
| RTS | | DE | | A | ------x------ | A | RS485 bus side |
| RTS | | DE | | A | ------x------ | A | RS485 bus side |
| RTS | | DE | | A | ------x------ | A | RS485 bus side |
| RTS | | DE | | A | ------x------ | A | RS485 bus side |

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485_TX_RX_EN` is enabled.

### Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

| VCC | +-------------------+ |
| RXD | | ------x------ | R |
| TXD | | D | ------x------ | D | ADM483 |
| RTS | | DE | | A | ------x------ | A | RS485 bus side |
| RTS | | DE | | A | ------x------ | A | RS485 bus side |
| RTS | | DE | | A | ------x------ | A | RS485 bus side |
| RTS | | DE | | A | ------x------ | A | RS485 bus side |

(continues on next page)
This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

Circuit C: Auto Switching Transmitter/Receiver

| VCC1 | 10K | ______ | 10K | ______ | +----|____|--+ | 10K | ______ | VCC2 |
|------|-----|--------|-----|--------|-------|------|-------|------|
| RX   | A   | +----|____|--| A (+) | +----|____|--| PV   | ADM2483 | 120   |
| RXD  |     |       |     |       |       |     |       |       |
| +----|____|--|------|____|--|      |     |       |       |
| TX   | B   | /RE  | /-C  | TXD  | 10K   |     |       |       |
| ____ | B (-)| -+   | +----|____|--+ | ____ |       |       |
|     |     | /NPN |     |      | 10K   |     |       |       |
|     |     | /-E  |     | ____ |____| |     |       |
| GND1| GND1| GND1 | GND2| GND2 | GND2 |     |       |       |

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN to 1 and UART_RS485_CONF_REG.UART_RS485TX_RX_EN to 0. This setup can work in any RS485 UART mode or even in UART_MODE_UART.

Application Examples

The table below describes the code examples available in the directory peripherals/uart/.

Functions

`esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)`

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note:** Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

**Parameters**

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **rx_buffer_size** - UART RX ring buffer size.
- **tx_buffer_size** - UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue_size** - UART event queue size/depth.
- **uart_queue** - UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr_alloc_flags** - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

**Returns**

- ESP_OK Success
- ESP_FAIL Parameter error

`esp_err_t uart_driver_delete(uart_port_t uart_num)`

Uninstall UART driver.

**Parameters**

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**

- ESP_OK Success
- ESP_FAIL Parameter error

`bool uart_is_driver_installed(uart_port_t uart_num)`

Checks whether the driver is installed or not.

**Parameters**

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**

- true driver is installed
- false driver is not installed

`esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)`

Set UART data bits.

**Parameters**

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **data_bit** - UART data bits

**Returns**

- ESP_OK Success
- ESP_FAIL Parameter error

`esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)`

Get the UART data bit configuration.

**Parameters**

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
**data_bit** – Pointer to accept value of UART data bits.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

`esp_err_t uart_set_stop_bits (uart_port_t uart_num, uart_stop_bits_t stop_bits)`
Set UART stop bits.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `stop_bits` - UART stop bits

**Returns**
- ESP_OK Success
- ESP_FAIL Fail

`esp_err_t uart_get_stop_bits (uart_port_t uart_num, uart_stop_bits_t *stop_bits)`
Get the UART stop bit configuration.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `stop_bits` - Pointer to accept value of UART stop bits.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success

`esp_err_t uart_set_parity (uart_port_t uart_num, uart_parity_t parity_mode)`
Set UART parity mode.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `parity_mode` - the enum of uart parity configuration

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success

`esp_err_t uart_get_parity (uart_port_t uart_num, uart_parity_t *parity_mode)`
Get the UART parity mode configuration.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `parity_mode` - Pointer to accept value of UART parity mode.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success

`esp_err_t uart_get_sclk_freq (uart_sclk_t sclk, uint32_t *out_freq_hz)`
Get the frequency of a clock source for the UART.

**Parameters**
- `sclk` - Clock source
- `out_freq_hz` - [out] Output of frequency, in Hz

**Returns**
- ESP_ERR_INVALID_ARG: if the clock source is not supported
- otherwise ESP_OK

`esp_err_t uart_set_baudrate (uart_port_t uart_num, uint32_t baudrate)`
Set UART baud rate.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `baudrate` - UART baud rate.

**Returns**
- ESP_FAIL Parameter error
• ESP_OK Success

*esp_err_t uart_get_baudrate (uart_port_t uart_num, uint32_t *baudrate)*

Get the UART baud rate configuration.

**Parameters**
- *uart_num* - UART port number, the max port number is (UART_NUM_MAX -1).
- *baudrate* - Pointer to accept value of UART baud rate

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

*esp_err_t uart_set_line_inverse (uart_port_t uart_num, uint32_t inverse_mask)*

Set UART line inverse mode.

**Parameters**
- *uart_num* - UART port number, the max port number is (UART_NUM_MAX -1).
- *inverse_mask* - Choose the wires that need to be inverted. Using the ORed mask of uart_signal_inv_t

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

*esp_err_t uart_set_hw_flow_ctrl (uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)*

Set hardware flow control.

**Parameters**
- *uart_num* - UART port number, the max port number is (UART_NUM_MAX -1).
- *flow_ctrl* - Hardware flow control mode
- *rx_thresh* - Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

*esp_err_t uart_set_sw_flow_ctrl (uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)*

Set software flow control.

**Parameters**
- *uart_num* - UART_NUM_0, UART_NUM_1 or UART_NUM_2
- *enable* - switch on or off
- *rx_thresh_xon* - low water mark
- *rx_thresh_xoff* - high water mark

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

*esp_err_t uart_get_hw_flow_ctrl (uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)*

Get the UART hardware flow control configuration.

**Parameters**
- *uart_num* - UART port number, the max port number is (UART_NUM_MAX -1).
- *flow_ctrl* - Option for different flow control mode.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

*esp_err_t uart_clear_intr_status (uart_port_t uart_num, uint32_t clr_mask)*

Clear UART interrupt status.

**Parameters**
Chapter 2. API Reference

- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **clr_mask** - Bit mask of the interrupt status to be cleared.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_enable_intr_mask (uart_port_t uart_num, uint32_t enable_mask)
```

Set UART interrupt enable.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **enable_mask** - Bit mask of the enable bits.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_disable_intr_mask (uart_port_t uart_num, uint32_t disable_mask)
```

Clear UART interrupt enable bits.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **disable_mask** - Bit mask of the disable bits.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_enable_rx_intr (uart_port_t uart_num)
```

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_disable_rx_intr (uart_port_t uart_num)
```

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_disable_tx_intr (uart_port_t uart_num)
```

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

**Parameters**
- **uart_num** - UART port number

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_enable_tx_intr (uart_port_t uart_num, int enable, int thresh)
```

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **enable** - 1: enable; 0: disable
- **thresh** - Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_pin (uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)
```
Assign signals of a UART peripheral to GPIO pins.

**Note:** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0’s default TX pin and GPIO3 is UART0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

**Note:** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

### Parameters
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `tx_io_num` - UART TX pin GPIO number.
- `rx_io_num` - UART RX pin GPIO number.
- `rts_io_num` - UART RTS pin GPIO number.
- `cts_io_num` - UART CTS pin GPIO number.

### Returns
- `ESP_OK` Success
- `ESP_FAIL` Parameter error

```c
esp_err_t uart_set_rts(uart_port_t uart_num, int level)
```

Manually set the UART RTS pin level.

**Note:** UART must be configured with hardware flow control disabled.

#### Parameters
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `level` -1: RTS output low (active); 0: RTS output high (block)

#### Returns
- `ESP_OK` Success
- `ESP_FAIL` Parameter error

```c
esp_err_t uart_set_dtr(uart_port_t uart_num, int level)
```

Manually set the UART DTR pin level.

#### Parameters
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `level` - DTR output low; 0: DTR output high

#### Returns
- `ESP_OK` Success
- `ESP_FAIL` Parameter error

```c
esp_err_t uart_set_tx_idle_num(uart_port_t uart_num, uint16_t idle_num)
```

Set UART idle interval after tx FIFO is empty.

#### Parameters
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `idle_num` - idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

#### Returns
- `ESP_OK` Success
esp_err_t uart_param_config (uart_port_t uart_num, const uart_config_t *uart_config)

Set UART configuration parameters.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX -1).
• uart_config - UART parameter settings

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_intr_config (uart_port_t uart_num, const uart_intr_config_t *intr_conf)

Configure UART interrupts.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX -1).
• intr_conf - UART interrupt settings

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_wait_tx_done (uart_port_t uart_num, TickType_t ticks_to_wait)

Wait until UART TX FIFO is empty.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX -1).
• ticks_to_wait - Timeout, count in RTOS ticks

Returns
• ESP_OK Success
• ESP_FAIL Parameter error
• ESP_ERR_TIMEOUT Timeout

int uart_tx_chars (uart_port_t uart_num, const char *buffer, uint32_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

Note: This function should only be used when UART TX buffer is not enabled.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX -1).
• buffer - data buffer address
• len - data length to send

Returns
• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

int uart_write_bytes (uart_port_t uart_num, const void *src, size_t size)

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero, this function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX -1).
• src - data buffer address
• **size**  - data length to send

#### Returns

• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

```c
int uart_write_bytes_with_break (uart_port_t uart_num, const void *src, size_t size, int brk_len)
```

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Parameters**

• **uart_num**  - UART port number, the max port number is (UART_NUM_MAX -1).
• **src**  - data buffer address
• **size**  - data length to send
• **brk_len**  - break signal duration(unit: the time it takes to send one bit at current baudrate)

**Returns**

• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

```c
int uart_read_bytes (uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)
```

UART read bytes from UART buffer.

**Parameters**

• **uart_num**  - UART port number, the max port number is (UART_NUM_MAX -1).
• **buf**  - pointer to the buffer.
• **length**  - data length
• **ticks_to_wait**  - Timeout, count in RTOS ticks

**Returns**

• (-1) Error
• OTHERS (>=0) The number of bytes read from UART FIFO

```c
esp_err_t uart_flush (uart_port_t uart_num)
```

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

```c
esp_err_t uart_flush_input (uart_port_t uart_num)
```

Clear input buffer, discard all the data is in the ring-buffer.

**Note:** In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

```c
Params • uart_num  - UART port number, the max port number is (UART_NUM_MAX -1).
```

**Returns**

• ESP_OK Success
• ESP_FAIL Parameter error

**esp_err_t uart_get_buffered_data_len (uart_port_t uart_num, size_t *size)**

UART get RX ring buffer cached data length.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **size** - Pointer of size_t to accept cached data length

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_get_tx_buffer_free_size (uart_port_t uart_num, size_t *size)**

UART get TX ring buffer free space size.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **size** - Pointer of size_t to accept the free space size

**Returns**
- ESP_OK Success
- ESP.ERR_INVALID_ARG Parameter error

**esp_err_t uart_disable_pattern_det_intr (uart_port_t uart_num)**

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_enable_pattern_det_baud_intr (uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)**

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Parameters**
- **uart_num** - UART port number.
- **pattern_chr** - character of the pattern.
- **chr_num** - number of the character, 8bit value.
- **chr_tout** - timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
- **post_idle** - idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char.
- **pre_idle** - idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**int uart_pattern_pop_pos (uart_port_t uart_num)**

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.
Note: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Parameters `uart_num` - UART port number, the max port number is (UART_NUM_MAX - 1).
Returns
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

int `uart_pattern_get_pos(uart_port_t uart_num)`
Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Parameters `uart_num` - UART port number, the max port number is (UART_NUM_MAX - 1).
Returns
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

`esp_err_t uart_pattern_queue_reset(uart_port_t uart_num, int queue_length)`
Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

Parameters
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX - 1).
- `queue_length` - Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

Returns
- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

`esp_err_t uart_set_mode(uart_port_t uart_num, uart_mode_t mode)`
UART set communication mode.

Note: This function must be executed after uart_driver_install(), when the driver object is initialized.

Parameters
- `uart_num` - Uart number to configure, the max port number is (UART_NUM_MAX - 1).
- `mode` - UART UART mode to set

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**esp_err_t uart_set_rx_full_threshold** *(uart_port_t uart_num, int threshold)*

Set uart threshold value for RX fifo full.

**Note:** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced.

**Parameters**
- `uart_num` - UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `threshold` - Threshold value above which RX fifo full interrupt is generated

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**esp_err_t uart_set_tx_empty_threshold** *(uart_port_t uart_num, int threshold)*

Set uart threshold values for TX fifo empty.

**Parameters**
- `uart_num` - UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `threshold` - Threshold value below which TX fifo empty interrupt is generated

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**esp_err_t uart_set_rx_timeout** *(uart_port_t uart_num, const uint8_t tout_thresh)*

UART set threshold timeout for TOUT feature.

**Parameters**
- `uart_num` - Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `tout_thresh` - This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**esp_err_t uart_get_collision_flag** *(uart_port_t uart_num, bool *collision_flag)*

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

**Parameters**
- `uart_num` - Uart number to configure the max port number is (UART_NUM_MAX -1).
- `collision_flag` - Pointer to variable of type bool to return collision flag.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t uart_set_wakeup_threshold** *(uart_port_t uart_num, int wakeup_threshold)*

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.
Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select UART_SCLK_REF_TICK or UART_SCLK_XTAL as UART clock source in `uart_config_t::source_clk`.

**Note:** in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

### Parameters

- **uart_num** - UART number, the max port number is (UART_NUM_MAX - 1).
- **wakeup_threshold** - number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

### Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

```
esp_err_t uart_get_wakeup_threshold(uart_port_t uart_num, int *out_wakeup_threshold)
```

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

### Parameters

- **uart_num** - UART number, the max port number is (UART_NUM_MAX - 1).
- **out_wakeup_threshold** - [out] output, set to the current value of wakeup threshold for the given UART.

### Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

```
esp_err_t uart_wait_tx_idle_polling(uart_port_t uart_num)
```

Wait until UART tx memory empty and the last char send ok (polling mode).

```
esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)
```

Configure TX signal loop back to RX module, just for the test usage.

```
esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)
```

Configure TX signal loop back to RX module, just for the test usage.
Parameters

- `uart_num` - UART number
- `loop_back_en` - Set true to enable the loop back function, else set it false.

```c
void uart_set_always_rx_timeout (uart_port_t uart_num, bool always_rx_timeout_en)
```

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

Parameters

- `uart_num` - UART number
- `always_rx_timeout_en` - Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

Structures

```c
struct uart_intr_config_t
```

UART interrupt configuration parameters for `uart_intr_config` function.

Public Members

- `intr_enable_mask` - UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under UART_INT_ENA_REG(i), connect with bit-or operator
- `rx_timeout_thresh` - UART timeout interrupt threshold (unit: time of sending one byte)
- `txfifo_empty_intr_thresh` - UART TX empty interrupt threshold.
- `rxfifo_full_thresh` - UART RX full interrupt threshold.

```c
struct uart_event_t
```

Event structure used in UART event queue.

Public Members

- `type` - UART event type
- `size` - UART data size for UART_DATA event
- `timeout_flag` - UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.
## Macros

**UART_NUM_0**

UART port 0

**UART_NUM_1**

UART port 1

**UART_NUM_2**

UART port 2

**UART_NUM_MAX**

UART port max

**UART_PIN_NO_CHANGE**

**UART_FIFO_LEN**

Length of the UART HW FIFO.

**UART_BITRATE_MAX**

Maximum configurable bitrate.

## Type Definitions

typedef `intr_handle_t` *uart_isr_handle_t*

## Enumerations

enum **uart_event_type_t**

UART event types used in the ring buffer.

*Values:*

- enumerator **UART_DATA**
  
  UART data event

- enumerator **UART_BREAK**
  
  UART break event

- enumerator **UART_BUFFER_FULL**
  
  UART RX buffer full event

- enumerator **UART_FIFO_OVF**
  
  UART FIFO overflow event

- enumerator **UART_FRAME_ERR**
  
  UART RX frame error event

- enumerator **UART_PARITY_ERR**
  
  UART RX parity event
Chapter 2. API Reference

enumerator UART_DATA_BREAK
UART TX data and break event

enumerator UART_PATTERN_DET
UART pattern detected

enumerator UART_EVENT_MAX
UART event max index

Header File
• components/hal/include/hal/uart_types.h

Structures

struct uart_at_cmd_t
UART AT cmd char configuration parameters. Note that this function may differ on different chips. Please refer to the TRM at configuration.

Public Members

uint8_t cmd_char
UART AT cmd char

uint8_t char_num
AT cmd char repeat number

uint32_t gap_tout
gap time (in baud-rate) between AT cmd char

uint32_t pre_idle
the idle time (in baud-rate) between the non AT char and first AT char

uint32_t post_idle
the idle time (in baud-rate) between the last AT char and the none AT char

struct uart_sw_flowctrl_t
UART software flow control configuration parameters.

Public Members

uint8_t xon_char
Xon flow control char

uint8_t xoff_char
Xoff flow control char
Chapter 2. API Reference

uint8_t xon_thrd
If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t xoff_thrd
If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

struct uart_config_t
UART configuration parameters for uart_param_config function.

Public Members

int baud_rate
UART baud rate

uart_word_length_t data_bits
UART byte size

uart_parity_t parity
UART parity mode

uart_stop_bits_t stop_bits
UART stop bits

uart_hw_flowcontrol_t flow_ctrl
UART HW flow control mode (cts/rts)

uint8_t rx_flow_ctrl_thresh
UART HW RTS threshold

uart_clk_t source_clk
UART source clock selection

Type Definitions

typedef int uart_port_t
UART port number, can be UART_NUM_0~(UART_NUM_MAX -1).

typedef soc_periph_uart_clk_src_legacy_t uart_sclk_t
UART source clock.

Enumerations

enum uart_mode_t
UART mode selection.

Values:
enumerator UART_MODE_UART
    mode: regular UART mode

enumerator UART_MODE_RS485_HALF_DUPLEX
    mode: half duplex RS485 UART mode control by RTS pin

counter UART_MODE_IRDA
    mode: IRDA UART mode

enumerator UART_MODE_RS485_COLLISION_DETECT
    mode: RS485 collision detection UART mode (used for test purposes)

enumerator UART_MODE_RS485_APP_CTRL
    mode: application control RS485 UART mode (used for test purposes)

eenum uart_word_length_t
    UART word length constants.
    Values:

counter UART_DATA_5_BITS
    word length: 5bits

counter UART_DATA_6_BITS
    word length: 6bits

counter UART_DATA_7_BITS
    word length: 7bits

counter UART_DATA_8_BITS
    word length: 8bits

counter UART_DATA_BITS_MAX

eenum uart_stop_bits_t
    UART stop bits number.
    Values:

counter UART_STOP_BITS_1
    stop bit: 1bit

counter UART_STOP_BITS_1_5
    stop bit: 1.5bits

counter UART_STOP_BITS_2
    stop bit: 2bits

counter UART_STOP_BITS_MAX
enum **uart_parity_t**
UART parity constants.

*Values:*

enumerator **UART_PARITY_DISABLE**
Disable UART parity

enumerator **UART_PARITY_EVEN**
Enable UART even parity

enumerator **UART_PARITY_ODD**
Enable UART odd parity

enum **uart_hw_flowcontrol_t**
UART hardware flow control modes.

*Values:*

enumerator **UART_HW_FLOWCTRL_DISABLE**
disable hardware flow control

enumerator **UART_HW_FLOWCTRL_RTS**
enable RX hardware flow control (rts)

enumerator **UART_HW_FLOWCTRL_CTS**
enable TX hardware flow control (cts)

enumerator **UART_HW_FLOWCTRL_CTS_RTS**
enable hardware flow control

enumerator **UART_HW_FLOWCTRL_MAX**

enum **uart_signal_inv_t**
UART signal bit map.

*Values:*

enumerator **UART_SIGNAL_INV_DISABLE**
Disable UART signal inverse

enumerator **UART_SIGNAL_IRDA_TX_INV**
inverse the UART irda_tx signal

enumerator **UART_SIGNAL_IRDA_RX_INV**
inverse the UART irda_rx signal

enumerator **UART_SIGNAL_RXD_INV**
inverse the UART rxd signal
enumerator UART_SIGNAL_CTS_INV
    inverse the UART cts signal
enumerator UART_SIGNAL_DSR_INV
    inverse the UART dsr signal
enumerator UART_SIGNAL_TXD_INV
    inverse the UART txd signal
enumerator UART_SIGNAL_RTS_INV
    inverse the UART rts signal
enumerator UART_SIGNAL_DTR_INV
    inverse the UART dtr signal

GPIO Lookup Macros    The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

Note:    These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. UART_NUM_2_TXD_DIRECT_GPIO_NUM returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. UART_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. UART_CTS_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.

2.7 Project Configuration

2.7.1 Introduction

ESP-IDF uses kconfiglib which is a Python-based extension to the Kconfig system which provides a compile-time project configuration mechanism. Kconfig is based around options of several types: integer, string, boolean. Kconfig files specify dependencies between options, default values of the options, the way the options are grouped together, etc.

For the complete list of available features please see Kconfig and kconfiglib extensions.

2.7.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the idf.py menuconfig build target.

After being updated, this configuration is saved inside sdkconfig file in the project root directory. Based on sdkconfig, application build targets will generate sdkconfig.h file in the build directory, and will make sdkconfig options available to the project build system and source files.

2.7.3 Using sdkconfig.defaults

In some cases, such as when sdkconfig file is under revision control, the fact that sdkconfig file gets changed by the build system may be inconvenient. The build system offers a way to avoid this, in the form of sdkconfig.defaults file. This file is never touched by the build system, and can be created manually or automatically. It can contain all the options which matter for the given application and are different from the default ones. The format is the same as that of the sdkconfig file. sdkconfig.defaults can be created manually when one remembers all the changed configurations. Otherwise, the file can be generated automatically by running the idf.py save-defconfig command.

Once sdkconfig.defaults is created, sdkconfig can be deleted and added to the ignore list of the revision control system (e.g. .gitignore file for git). Project build targets will automatically create sdkconfig file, populated with the settings from sdkconfig.defaults file, and the rest of the settings will be set to their default values. Note that the build process will not override settings that are already in sdkconfig by ones from sdkconfig.defaults. For more information, see Custom sdkconfig defaults.
2.7.4 Kconfig Formatting Rules

The following attributes of Kconfig files are standardized:

- Within any menu, option names should have a consistent prefix. The prefix length is currently set to at least 3 characters.
- The indentation style is 4 characters created by spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, menu is indented by 0 characters, the config inside of the menu by 4 characters, the help of the config by 8 characters and the text of the help by 12 characters.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is set to 40 characters.
- The maximum length of lines is set to 120 characters.

Format checker

tools/ci/check_kconfigs.py is provided for checking the Kconfig formatting rules. The checker checks all Kconfig and Kconfig.projbuild files in the ESP-IDF directory and generates a new file with suffix _new with some recommendations how to fix issues (if there are any). Please note that the checker cannot correct all rules and the responsibility of the developer is to check and make final corrections in order to pass the tests. For example, indentations will be corrected if there isn’t some misleading previous formatting but it cannot come up with a common prefix for options inside a menu.

2.7.5 Backward Compatibility of Kconfig Options

The standard Kconfig tools ignore unknown options in sdkconfig. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. confgen.py is used by the tool chain to pre-process sdkconfig files before anything else, for example menuconfig, would read them. As the consequence, the settings for old options will be kept and not ignored.
2. confgen.py recursively finds all sdkconfig.rename files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the sdkconfig file. Renames that should only appear for a single target can be placed in a target specific rename file: sdkconfig.rename.TARGET, where TARGET is the target name, e.g. sdkconfig.rename.esp32s2.
3. confgen.py post-processes sdkconfig files and generates all build outputs (sdkconfig.h, sdkconfig.cmake, auto.conf) by adding a list of compatibility statements, i.e. value of the old option is set the value of the new option (after modification). This is done in order to not break customer codes where old option might still be used.
4. Deprecated options and their replacements are automatically generated by confgen.py.

2.7.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options, automatically generated from Kconfig files. Note that depending on the options selected, some options listed here may not be visible by default in the interface of menuconfig.

By convention, all option names are upper case with underscores. When Kconfig generates sdkconfig and sdkconfig.h files, option names are prefixed with CONFIG_. So if an option ENABLE_FOO is defined in a Kconfig file and selected in menuconfig, then sdkconfig and sdkconfig.h files will have CONFIG_ENABLE_FOO defined. In this reference, option names are also prefixed with CONFIG_, same as in the source code.

Build type

Contains:

- CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERS
- CONFIG_APP_COMPATIBLE_PRE_V2_1_BOOTLOADERS
Chapter 2. API Reference

- **CONFIG_APP_BUILD_TYPE**
- **CONFIG_APP_REPRODUCIBLE_BUILD**
- **CONFIG_APP_NO_BLOBS**

### CONFIG_APP_BUILD_TYPE

Application build type

*Found in: Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash. Note that at the moment, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote:3333
# Reset and halt the target mon reset halt
# Run to a specific point in ROM code, # where most of initialization is complete. thb
*0x40007d54 c
# Load the application into RAM load
# Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:

```bash
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG_APP_BUILD_TYPE_ELF_RAM is required, other options help reduce application memory footprint.

```makefile
CONFIG_APP_BUILD_TYPE_ELF_RAM=y
CONFIG_VFS_SUPPORT_TERMIOS=y
CONFIG_NEWLIB_NANO_FORMAT=y
CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE=CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

*Available options:*

- Default (binary application + 2nd stage bootloader)
- ELF file, loadable into RAM (EXPERIMENTAL)

### CONFIG_APP_REPRODUCIBLE_BUILD

Enable reproducible build

*Found in: Build type*

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create automatically. (or will be append if you have one already)

*Default value:*

- No (disabled)

### CONFIG_APP_NO_BLOBS
No Binary Blobs

*Found in: Build type*

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

**Default value:**
- No (disabled)

**CONFIG_APP_COMPATIBLE_PRE_V2_1_BOOTLOADERS**

App compatible with bootloaders before ESP-IDF v2.1

*Found in: Build type*

Bootloaders before ESP-IDF v2.1 did less initialisation of the system clock. This setting needs to be enabled to build an app which can be booted by these older bootloaders.

If this setting is enabled, the app can be booted by any bootloader from IDF v1.0 up to the current version.

If this setting is disabled, the app can only be booted by bootloaders from IDF v2.1 or newer.

Enabling this setting adds approximately 1KB to the app’s IRAM usage.

**Default value:**
- No (disabled)

**CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERS**

App compatible with bootloader and partition table before ESP-IDF v3.1

*Found in: Build type*

Partition tables before ESP-IDF V3.1 do not contain an MD5 checksum field, and the bootloader before ESP-IDF v3.1 cannot read a partition table that contains an MD5 checksum field.

Enable this option only if your app needs to boot on a bootloader and/or partition table that was generated from a version *before* ESP-IDF v3.1.

If this option and Flash Encryption are enabled at the same time, and any data partitions in the partition table are marked Encrypted, then the partition encrypted flag should be manually verified in the app before accessing the partition (see CVE-2021-27926).

**Default value:**
- No (disabled)

**Bootloader config**

Contains:

- `CONFIG_BOOTLOADER_LOG_LEVEL`
- `CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`
- `CONFIG_BOOTLOADER_SPI_WP_PIN`
- `CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE`
- `CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE`
- `CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT`
- `CONFIG_BOOTLOADER_APP_TEST`
- `CONFIG_BOOTLOADER_FACTORY_RESET`
- `CONFIG_BOOTLOADER_HOLD_TIME_GPIO`
- `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS`
- `CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON`
• `CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP`
• `CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN`
• `CONFIG_BOOTLOADER_WDT_ENABLE`
• `CONFIG_BOOTLOADER_VDDSDIO_BOOST`

`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION`

Bootloader optimization Level

*Found in:* Bootloader config

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

**Available options:**

- Size (-Os) (`BOOTLOADER_COMPILER_OPTIMIZATION_SIZE`)
- Debug (-Og) (`BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG`)
- Optimize for performance (-O2) (`BOOTLOADER_COMPILER_OPTIMIZATION_PERF`)
- Debug without optimization (-O0) (`BOOTLOADER_COMPILER_OPTIMIZATION_NONE`)

`CONFIG_BOOTLOADER_LOG_LEVEL`

Bootloader log verbosity

*Found in:* Bootloader config

Specify how much output to see in bootloader logs.

**Available options:**

- No output (`BOOTLOADER_LOG_LEVEL_NONE`)
- Error (`BOOTLOADER_LOG_LEVEL_ERROR`)
- Warning (`BOOTLOADER_LOG_LEVEL_WARN`)
- Info (`BOOTLOADER_LOG_LEVEL_INFO`)
- Debug (`BOOTLOADER_LOG_LEVEL_DEBUG`)
- Verbose (`BOOTLOADER_LOG_LEVEL_VERBOSE`)

`CONFIG_BOOTLOADER_SPI_CUSTOM_WP_PIN`

Use custom SPI Flash WP Pin when flash pins set in eFuse (read help)

*Found in:* Bootloader config

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is QIO or QOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The same pin is also used for external SPIRAM if it is enabled.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP.

**Default value:**

- No (disabled) if `ESPTOOLPY_FLASHMODE_QIO` || `ESPTOOLPY_FLASHMODE_QOUT`
**CONFIG_BOOTLOADER_SPI_WP_PIN**

Custom SPI Flash WP Pin

*Found in: Bootloader config*

The option “Use custom SPI Flash WP Pin” must be set or this value is ignored.

If burning a customized set of SPI flash pins in eFuse and using QIO or QOUT mode for flash, set this value to the GPIO number of the SPI flash WP pin.

**Range:**
- from 0 to 33 if `ESP TOOLPY_FLASHMODE_QIO || ESP TOOLPY_FLASHMODE_QOUT`

**Default value:**
- 7 if `ESP TOOLPY_FLASHMODE_QIO || ESP TOOLPY_FLASHMODE_QOUT`

**CONFIG_BOOTLOADER_VDDSDIO_BOOST**

VDDSDIO LDO voltage

*Found in: Bootloader config*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

**Available options:**
- 1.8V (BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (BOOTLOADER_VDDSDIO_BOOST_1_9V)

**CONFIG_BOOTLOADER_FACTORY_RESET**

GPIO triggers factory reset

*Found in: Bootloader config*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET**

Number of the GPIO input for factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Range:**
- from 0 to 39 if `CONFIG_BOOTLOADER_FACTORY_RESET`

**Default value:**
- 4 if `CONFIG_BOOTLOADER_FACTORY_RESET`
Chapter 2. API Reference

CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL

Factory reset GPIO level

Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET

Pin level for factory reset, can be triggered on low or high.

Available options:
- Reset on GPIO low (BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (BOOTLOADER_FACTORY_RESET_PIN_HIGH)

CONFIG_BOOTLOADER_OTA_DATA_ERASE

Clear OTA data on factory reset (select factory partition)

Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

CONFIG_BOOTLOADER_DATA_FACTORY_RESET

Comma-separated names of partitions to clear on factory reset

Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, … ”) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

Default value:
- “nvs” if CONFIG_BOOTLOADER_FACTORY_RESET

CONFIG_BOOTLOADER_APP_TEST

GPIO triggers boot from test app partition

Found in: Bootloader config

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

Default value:
- No (disabled) if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST

Number of the GPIO input to boot TEST partition

Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

Range:
- from 0 to 39 if CONFIG_BOOTLOADER_APP_TEST

Default value:
- 18 if CONFIG_BOOTLOADER_APP_TEST
**CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL**

App test GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

Pin level for app test, can be triggered on low or high.

**Available options:**
- Enter test app on GPIO low (BOOTLOADER_APP_TEST_PIN_LOW)
- Enter test app on GPIO high (BOOTLOADER_APP_TEST_PIN_HIGH)

**CONFIG_BOOTLOADER_HOLD_TIME_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in: Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**
- 5 if CONFIG_BOOTLOADER_FACTORY_RESET || CONFIG_BOOTLOADER_APP_TEST

**CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE**

Enable protection for unmapped memory regions

*Found in: Bootloader config*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**
- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_ENABLE**

Use RTC watchdog in start code

*Found in: Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on RTC_CLK_SRC (INTERNAL_RC or EXTERNAL_CRYSTAL).

**Default value:**
- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE**

Allows RTC watchdog disable in user code

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app’s own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.
**CONFIG_BOOTLOADER_WDT_TIME_MS**

Timeout for RTC watchdog (ms)

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

**Range:**
- from 0 to 120000

**Default value:**
- 9000

**CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**

Enable app rollback support

*Found in: Bootloader config*

After updating the app, the bootloader runs a new app with the “ESP OTA IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK**

Enable app anti-rollback support

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**
- No (disabled) if CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

**CONFIG_BOOTLOADER_APP_SECURE_VERSION**

eFuse secure version of app

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.
Your partition table should have a scheme with ota_0 + ota_1 (without factory).

**Default value:**
- 0 if `CONFIG_BOOTLOADERS_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADERS_APP_SEC_VER_SIZE_EFUSE_FIELD**

Size of the efuse secure version field

*Found in:* `Bootloader config > CONFIG_BOOTLOADERS_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADERS_APP_ANTI_ROLLBACK`

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**
- from 1 to 32 if `CONFIG_BOOTLOADERS_APP_ANTI_ROLLBACK`
- from 1 to 16 if `CONFIG_BOOTLOADERS_APP_ANTI_ROLLBACK`

**Default value:**
- 32 if `CONFIG_BOOTLOADERS_APP_ANTI_ROLLBACK`
- 16 if `CONFIG_BOOTLOADERS_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADERS_EFUSE_SECURE_VERSION_EMULATE**

Emulate operations with efuse secure version (only test)

*Found in:* `Bootloader config > CONFIG_BOOTLOADERS_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADERS_APP_ANTI_ROLLBACK`

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: `EFUSE_VIRTUAL` and `EFUSE_VIRTUAL_KEEP_IN_FLASH`.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADERS_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADERS_SKIP_VALIDATE_IN_DEEP_SLEEP**

Skip image validation when exiting deep sleep

*Found in:* `Bootloader config`

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it is strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**
- No (disabled) if `(CONFIG_SECURE_BOOT && CONFIG_SECURE_BOOT_INSECURE) || CONFIG_SECURE_BOOT`
Skip image validation from power on reset (READ HELP FIRST)

*Found in: Bootloader config*

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**
- No (disabled)

`CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS`

Skip image validation always (READ HELP FIRST)

*Found in: Bootloader config*

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**
- No (disabled)

`CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`

Reserve RTC FAST memory for custom purposes

*Found in: Bootloader config*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.

**Default value:**
- No (disabled)

`CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE`

Size in bytes for custom purposes

*Found in: Bootloader config > CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

**Default value:**
- 0 if `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`
CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT

Enable the support for flash chips of XMC (READ HELP FIRST)

*Found in: Bootloader config*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

**DON’T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.**

**Default value:**
- Yes (enabled)

### Security features

Contains:

### CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

Require signed app images

*Found in: Security features*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

### CONFIG_SECURE_SIGNED_APPS_SCHEME

App Signing Scheme

*Found in: Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
   - Legacy custom secure boot scheme. Supported in ESP32 SoC.

2. **Secure boot V2**
   - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
   - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.
Available options:

- **ECDSA** (SECURE_SIGNED_APPS_ECDSA_SCHEME)
  Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.

- **RSA** (SECURE_SIGNED_APPS_RSA_SCHEME)
  Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.

- **ECDSA (V2)** (SECURE_SIGNED_APPS_ECDSA_V2_SCHEME)
  For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

**CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE**

ECDSA key size

*Found in: Security features*

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

Available options:

- Using ECC curve NISTP192 (SECURE_BOOT_ECDSA_KEY_LEN_192_BITS)
- Using ECC curve NISTP256 (Recommended) (SECURE_BOOT_ECDSA_KEY_LEN_256_BITS)

**CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT**

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

Default value:

- No (disabled) if CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT && SECURE_SIGNED_APPS_ECDSA_SCHEME

**CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT**

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

Default value:

- Yes (enabled) if CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
**CONFIG_SECURE_BOOT**

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for re-flashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**
- No (disabled)

**CONFIG_SECURE_BOOT_VERSION**

Select secure boot version

*Found in: Security features > CONFIG_SECURE_BOOT*

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

**Available options:**
- Enable Secure Boot version 1 (SECURE_BOOT_V1_ENABLED)
  Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.
- Enable Secure Boot version 2 (SECURE_BOOT_V2_ENABLED)
  Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOTLOADER_MODE**

Secure bootloader mode

*Found in: Security features*

**Available options:**
- One-time flash (SECURE_BOOTLOADER_ONE_TIME_FLASH)
  On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot. Enabling this option means that the bootloader cannot be changed after the first time it is booted.
- Reflashable (SECURE_BOOTLOADER_REFLASHABLE)
  Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key. This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key. This option is less secure than one-time flash, because a leak of the digest key from one device allows re-flashing of any device that uses it.
**CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES**

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in “Secure boot private signing key” will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

**CONFIG_SECURE_BOOT_SIGNING_KEY**

Secure boot private signing key

*Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.

**Default value:**

- “secure_boot_signing_key.pem” if CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

**CONFIG_SECURE_BOOT_VERIFICATION_KEY**

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the espsecure.py extract_public_key command.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE**

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader.

This feature provides a strong resistance against physical attacks on the device.

**NOTE:** Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

**Default value:**

- No (disabled) if CONFIG_SECURE_BOOT && SOC_SUPPORT_SECURE_BOOT_REVOKE_KEY
Chapter 2. API Reference

**CONFIG_SECURE_BOOTLOADER_KEY_ENCODING**

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with esefuse.py.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn’t change any firmware code, it only changes the size of key binary which is generated at build time.

**Available options:**

- No encoding (256 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
- 3/4 encoding (192 bit key) (SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

---

**CONFIG_SECURE_BOOT_INSECURE**

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT`

---

**CONFIG_SECURE_FLASH_ENC_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

**Default value:**

- No (disabled)

---

**CONFIG_SECURE_FLASH_ENCRYPTION_KEYSIZE**

Size of generated AES-XTS key

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

Size of generated AES-XTS key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

**Available options:**
Chapter 2. API Reference

- AES-128 key derived from 128 bits (SHA256(128 bits)) (SECURE_FLASH_ENCRYPTION_AES128_DERIVED)
- AES-128 (256-bit key) (SECURE_FLASH_ENCRYPTION_AES128)
- AES-256 (512-bit key) (SECURE_FLASH_ENCRYPTION_AES256)

**CONFIG_SECURE_FLASH_ENCRYPTION_MODE**

Enable usage mode

*Found in: Security features > CONFIG_SECURE_FLASH_ENC_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it’s possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it’s no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

Refer to the Flash Encryption section of the ESP-IDF Programmer’s Guide for details.

**Available options:**
- Development (NOT SECURE) (SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
- Release (SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

**Potentially insecure options** Contains:
- CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS
- CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION
- CONFIG_SECURE_BOOT_ALLOW_JTAG
- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC
- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC
- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE
- CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS
- CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED

**CONFIG_SECURE_BOOT_ALLOW_ROM_BASIC**

Leave ROM BASIC Interpreter available on reset

*Found in: Security features > Potentially insecure options*

By default, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

When either flash encryption or secure boot are enabled, the default is to disable this BASIC fallback mode permanently via eFuse.

If this option is set, this eFuse is not burned and the BASIC ROM Console may remain accessible. Only set this option in testing environments.

**Default value:**
- No (disabled) if CONFIG_SECURE_BOOT_INSECURE || SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

**CONFIG_SECURE_BOOT_ALLOW_JTAG**

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.
Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION**

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

**CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS**

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the WR_DIS_RD_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK_KEY0-BLOCK_KEY5) (for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

**NOTE:** Once a BLOCK is read-protected, the application will read all zeros from that block.

**NOTE:** If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is **NOT** possible to read/write efuses using espefuse.py utility. However, efuse can be read/written from the application.

**CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS**

Leave unused digest slots available (not revoke)

*Found in: Security features > Potentially insecure options*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called esp_efuse_set_digest_revoke(num_digest) for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` && `SOC_EFUSE_REVOKE_BOOT_KEY_DIGESTS`
CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_DEC

Leave UART bootloader decryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader decryption access on first boot. If set, the UART bootloader will still be able to access hardware decryption.

Only set this option in testing environments. Setting this option allows complete bypass of flash encryption.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espfuse.py.

**Default value:**
- No (disabled) if SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP

Check Flash Encryption enabled on app startup

*Found in: Security features*
If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

**Default value:**
- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

**CONFIG_SECURE_UART_ROM_DL_MODE**

UART ROM download mode

*Found in: Security features*

**Available options:**
- UART ROM download mode (Permanently disabled (recommended)) (SECURE_DISABLE_ROM_DL_MODE)
  
  If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espfuse.py and similar tools. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead. It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required. It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.

- UART ROM download mode (Permanently switch to Secure mode (recommended)) (SECURE_ENABLE_SECURE_ROM_DL_MODE)
  
  If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse. Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (`get_security_info`). Secure Download mode is not compatible with the esptool.py flasher stub feature, espfuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands. Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack. It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`.
  
  Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

- UART ROM download mode (Enabled (not recommended)) (SECURE_INSECURE_ALLOW_DL_MODE)
  
  This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

**Application manager**

Contains:

- `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`
- `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`
- `CONFIG_APP_PROJECT_VER_FROM_CONFIG`
- `CONFIG_APP_RETRIEVE_LEN_ELF_SHA`
- `CONFIG_APP_COMPILE_TIME_DATE`
Chapter 2. API Reference

**CONFIG_APP_COMPILE_TIME_DATE**

Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

**Default value:**
- Yes (enabled)

**CONFIG_APP_EXCLUDE_PROJECT_VER_VAR**

Exclude PROJECT_VER from firmware image

*Found in: Application manager*

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

**Default value:**
- No (disabled)

**CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR**

Exclude PROJECT_NAME from firmware image

*Found in: Application manager*

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

**Default value:**
- No (disabled)

**CONFIG_APP_PROJECT_VER_FROM_CONFIG**

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

**Default value:**
- No (disabled)

**CONFIG_APP_PROJECT_VER**

Project version

*Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG*

Project version

**Default value:**
- 1 if CONFIG_APP_PROJECT_VER_FROM_CONFIG
CONFIG_APP_RETRIEVE_LEN_ELF_SHA

The length of APP ELF SHA is stored in RAM (chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

*Range:*
  - from 8 to 64

*Default value:*
  - 16

Serial flasher config

Contains:

- `CONFIG_ESPTOOLPY_AFTER`
- `CONFIG_ESPTOOLPY_BEFORE`
- `CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE`
- `CONFIG_ESPTOOLPY_NO_STUB`
- `CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE`
- `CONFIG_ESPTOOLPY_FLASHSIZE`
- `CONFIG_ESPTOOLPY_FLASHMODE`
- `CONFIG_ESPTOOLPY_FLASHFREQ`

CONFIG_ESPTOOLPY_NO_STUB

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

*Default value:*
  - No (disabled)

CONFIG_ESPTOOLPY_FLASHMODE

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

*Available options:*
  - QIO (ESPTOOLPY_FLASHMODE_QIO)
  - QOUT (ESPTOOLPY_FLASHMODE_QOUT)
  - DIO (ESPTOOLPY_FLASHMODE_DIO)
  - DOUT (ESPTOOLPY_FLASHMODE_DOUT)
  - OPI (ESPTOOLPY_FLASHMODE_OPI)

CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE

Flash Sampling Mode

*Found in: Serial flasher config*

*Available options:*
• STR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
• DTR Mode (ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

CONFIG_ESPTOOLPY_FLASHFREQ

Flash SPI speed

*Found in: Serial flasher config*

*Available options:*
  • 120 MHz (ESPTOOLPY_FLASHFREQ_120M)
  • 80 MHz (ESPTOOLPY_FLASHFREQ_80M)
  • 60 MHz (ESPTOOLPY_FLASHFREQ_60M)
  • 48 MHz (ESPTOOLPY_FLASHFREQ_48M)
  • 40 MHz (ESPTOOLPY_FLASHFREQ_40M)
  • 30 MHz (ESPTOOLPY_FLASHFREQ_30M)
  • 26 MHz (ESPTOOLPY_FLASHFREQ_26M)
  • 24 MHz (ESPTOOLPY_FLASHFREQ_24M)
  • 20 MHz (ESPTOOLPY_FLASHFREQ_20M)
  • 15 MHz (ESPTOOLPY_FLASHFREQ_15M)

CONFIG_ESPTOOLPY_FLASHSIZE

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

*Available options:*
  • 1 MB (ESPTOOLPY_FLASHSIZE_1MB)
  • 2 MB (ESPTOOLPY_FLASHSIZE_2MB)
  • 4 MB (ESPTOOLPY_FLASHSIZE_4MB)
  • 8 MB (ESPTOOLPY_FLASHSIZE_8MB)
  • 16 MB (ESPTOOLPY_FLASHSIZE_16MB)
  • 32 MB (ESPTOOLPY_FLASHSIZE_32MB)
  • 64 MB (ESPTOOLPY_FLASHSIZE_64MB)
  • 128 MB (ESPTOOLPY_FLASHSIZE_128MB)

CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

*Default value:*
  • No (disabled)

CONFIG_ESPTOOLPY_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.
Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**
- Reset to bootloader (ESPTOOLPY_BEFORE_RESET)
- No reset (ESPTOOLPY_BEFORE_NORESET)

**CONFIG_ESPTOOLPY_AFTER**

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

**Available options:**
- Reset after flashing (ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (ESPTOOLPY_AFTER_NORESET)

**Partition Table**

Contains:

- `CONFIG_PARTITION_TABLE_CUSTOM_FILENAME`
- `CONFIG_PARTITION_TABLE_MD5`
- `CONFIG_PARTITION_TABLE_OFFSET`
- `CONFIG_PARTITION_TABLE_TYPE`

**CONFIG_PARTITION_TABLE_TYPE**

Partition Table

*Found in: Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it’s expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

**Available options:**
- Single factory app, no OTA (PARTITION_TABLE_SINGLE_APP)
  This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Single factory app (large), no OTA (PARTITION_TABLE_SINGLE_APP_LARGE)
  This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Factory app, two OTA definitions (PARTITION_TABLE_TWO_OTA)
  This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv
• Custom partition table CSV (PARTITION_TABLE_CUSTOM)
  Specify the path to the partition table CSV to use for your project.
  Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
• Single factory app, no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
  This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_encr_nvs.csv
• Single factory app (large), no OTA, encrypted NVS (PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)
  This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large_encr_nvs.csv
• Factory app, two OTA definitions, encrypted NVS (PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
  This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota_encr_nvs.csv

CONFIG_PARTITION_TABLE_CUSTOM_FILENAME

Custom partition CSV file

*Found in: Partition Table*

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**Default value:**
- “partitions.csv”

CONFIG_PARTITION_TABLE_OFFSET

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**
- “0x8000”

CONFIG_PARTITION_TABLE_MD5

Generate an MD5 checksum for the partition table

*Found in: Partition Table*
Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**
- Yes (enabled) if `CONFIG_APP_COMPATIBLE_PRE_V3_1_BOOTLOADERS`

**Compiler options**

Contains:

- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_FLOAT_LIB_FROM`
- `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`
- `CONFIG_COMPILER_DUMP_RTL_FILES`
- `CONFIG_COMPILER_WARN_WRITE_STRINGS`
- `CONFIG_COMPILER_CXX_EXCEPTIONS`
- `CONFIG_COMPILER_CXX_RTTI`
- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_HIDE_PATHS_MACROS`
- `CONFIG_COMPILER_STACK_CHECK_MODE`

**CONFIG_COMPILER_OPTIMIZATION**

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Default” setting will add the -0g flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -00 flag to CFLAGS.

The “Size” setting causes the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlate code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOTLOADER_COMPILER_OPTIMIZATION setting.

**Available options:**
- Debug (-Og) (COMPILER_OPTIMIZATION_DEFAULT)
- Optimize for size (-Os) (COMPILER_OPTIMIZATION_SIZE)
- Optimize for performance (-O2) (COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (COMPILER_OPTIMIZATION_NONE)

**CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL**

Assertion level

*Found in: Compiler options*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
• Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
• Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:
- Enabled (COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
  If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

CONFIG_COMPILER_FLOAT_LIB_FROM
Compiler float lib source

Found in: Compiler options

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is “fast”, but it has a few exceptions from IEEE 754 compliance.

Available options:
- libgcc (COMPILER_FLOAT_LIB_FROM_GCCLIB)
- librvfp (COMPILER_FLOAT_LIB_FROM_RVFPLIB)

CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT
Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

Found in: Compiler options

If enabled, the error messages will be discarded in following check macros: - ESP_RETURN_ON_ERROR - ESP_EXIT_ON_ERROR - ESP_RETURN_ON_FALSE - ESP_EXIT_ON_FALSE

Default value:
- No (disabled)

CONFIG_COMPILER_HIDE_PATHS_MACROS
Replace ESP-IDF and project paths in binaries

Found in: Compiler options

When expanding the __FILE__ and __BASE_FILE__ macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes -fmacro-prefix-map options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom -fmacro-prefix-map or -ffile-prefix-map arguments.

Default value:
- Yes (enabled)
CONFIG_COMPILER_CXX_EXCEPTIONS

Enable C++ exceptions

*Found in: Compiler options*

Enabling this option compiles all IDF C++ files with exception support enabled. Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**
- No (disabled)

Contains:
- CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE

Emergency Pool Size

*Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**
- 0 if CONFIG_COMPILER_CXX_EXCEPTIONS

CONFIG_COMPILER_CXX_RTTI

Enable C++ run-time type info (RTTI)

*Found in: Compiler options*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using dynamic_cast conversion and typeid operator.

**Default value:**
- No (disabled)

CONFIG_COMPILER_STACK_CHECK_MODE

Stack smashing protection mode

*Found in: Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: -fstack-protector) only functions that call alloca, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: -fstack-protector-strong) is like NORMAL, but includes additional functions to be protected -those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: -fstack-protector-all) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL
The performance impact includes increasing the amount of stack memory required for each task.

**Available options:**
- None (COMPILER_STACK_CHECK_MODE_NONE)
- Normal (COMPILER_STACK_CHECK_MODE_NORM)
- Strong (COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (COMPILER_STACK_CHECK_MODE_ALL)

**CONFIG_COMPILER_WARN_WRITE_STRINGS**

Enable -Wwrite-strings warning flag

*Found in: Compiler options*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

*Default value:*  
- No (disabled)

**CONFIG_COMPILER_DUMP_RTL_FILES**

Dump RTL files during compilation

*Found in: Compiler options*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

**Component config**

Contains:

- ADC and ADC Calibration
- Application Level Tracing
- Bluetooth
- Common ESP-related
- Core dump
- Driver Configurations
- eFuse Bit Manager
- CONFIG_BLE_MESH
- ESP HTTP client
- ESP HTTPS OTA
- ESP HTTPS server
- ESP NETIF Adapter
- ESP PSRAM
- ESP Ringbuf
- ESP System Settings
- ESP-MQTT Configurations
- ESP-TLS
- Ethernet
- Event Loop Library
- FAT Filesystem support
- FreeRTOS
- GDB Stub
- Hardware Abstraction Layer (HAL) and Low Level (LL)
Chapter 2. API Reference

- Hardware Settings
- Heap memory debugging
- High resolution timer (esp_timer)
- HTTP Server
- IPC (Inter-Processor Call)
- LCD and Touch Panel
- Log output
- LWIP
- mbedTLS
- Newlib
- NVS
- OpenThread
- PHY
- Power Management
- Protocomm
- PThreads
- SoC Settings
- SPI Flash driver
- SPIFFS Configuration
- Supplicant
- TCP Transport
- Ultra Low Power (ULP) Co-processor
- Unity unit testing library
- Virtual file system
- Wear Levelling
- Wi-Fi
- Wi-Fi Provisioning Manager

Application Level Tracing  Contains:

- CONFIG_APPTRACE_DESTINATION1
- CONFIG_APPTRACE_DESTINATION2
- FreeRTOS SystemView Tracing
- CONFIG_APPTRACE_GCOV_ENABLE
- CONFIG_APPTRACE_BUF_SIZE
- CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX
- CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH
- CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO
- CONFIG_APPTRACE_UART_BAUDRATE
- CONFIG_APPTRACE_UART_RX_GPIO
- CONFIG_APPTRACE_UART_RX_BUFF_SIZE
- CONFIG_APPTRACE_UART_TX_MSG_SIZE
- CONFIG_APPTRACE_UART_TX_GPIO
- CONFIG_APPTRACE_UART_TX_BUFF_SIZE

CONFIG_APPTRACE_DESTINATION1

Data Destination 1

Found in: Component config > Application Level Tracing

Select destination for application trace: JTAG or none (to disable).

Available options:
- JTAG (APTRACE_DEST_JTAG)
- None (APTRACE_DEST_NONE)
Chapter 2. API Reference

**CONFIG_APPTRACE_DESTINATION2**

Data Destination 2

*Found in: Component config > Application Level Tracing*

Select destination for application trace: UART(XX) or none (to disable).

**Available options:**
- UART0 (APTRACE_DEST_UART0)
- UART1 (APTRACE_DEST_UART1)
- UART2 (APTRACE_DEST_UART2)
- USB_CDC (APTRACE_DEST_USB_CDC)
- None (APTRACE_DEST_UART_NONE)

**CONFIG_APPTRACE_UART_TX_GPIO**

UART TX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART TX pin.

**CONFIG_APPTRACE_UART_RX_GPIO**

UART RX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART RX pin.

**CONFIG_APPTRACE_UART_BAUDRATE**

UART baud rate

*Found in: Component config > Application Level Tracing*

This baud rate is used for UART.

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

**CONFIG_APPTRACE_UART_RX_BUFF_SIZE**

UART RX ring buffer size

*Found in: Component config > Application Level Tracing*

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

**CONFIG_APPTRACE_UART_TX_BUFF_SIZE**

UART TX ring buffer size

*Found in: Component config > Application Level Tracing*

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.
CONFIG_APPTRACE_UART_TX_MSG_SIZE

UART TX message size

Found in: Component config > Application Level Tracing

Maximum size of the single message to transfer.

CONFIG_APPTRACE_UART_TASK_PRIO

UART Task Priority

Found in: Component config > Application Level Tracing

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX_PRIORITIES-1).

Range:
- from 1 to 32

Default value:
- 1

CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO

Timeout for flushing last trace data to host on panic

Found in: Component config > Application Level Tracing

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH

Threshold for flushing last trace data to host on panic

Found in: Component config > Application Level Tracing

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

CONFIG_APPTRACE_BUF_SIZE

Size of the aptrace buffer

Found in: Component config > Application Level Tracing

Size of the memory buffer for trace data in bytes.

CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX

Size of the pending data buffer

Found in: Component config > Application Level Tracing

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

FreeRTOS SystemView Tracing

Contains:
- CONFIG_APPTRACE_SV_CPU
- CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE
- CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE
- CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE
- CONFIG_APPTRACE_SV_MAX_TASKS
Chapter 2. API Reference

- `CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE`
- `CONFIG_APPTRACE_SV_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE`
- `CONFIG_APPTRACE_SV_BUF_WAIT_TMO`
- `CONFIG_APPTRACE_SV_DEST`
- `CONFIG_APPTRACE_SV_CPU`
- `CONFIG_APPTRACE_SV_TS_SOURCE`

### CONFIG_APPTRACE_SV_ENABLE

SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

### CONFIG_APPTRACE_SV_DEST

SystemView destination

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

SystemView will transfer data through defined interface.

**Available options:**
- Data destination JTAG (APTRACE_SV_DEST_JTAG)
  Send SEGGER SystemView events through JTAG interface.
- Data destination UART (APTRACE_SV_DEST_UART)
  Send SEGGER SystemView events through UART interface.

### CONFIG_APPTRACE_SV_CPU

CPU to trace

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Define the CPU to trace by SystemView.

**Available options:**
- CPU0 (APTRACE_SV_DEST_CPU_0)
  Send SEGGER SystemView events for Pro CPU.
- CPU1 (APTRACE_SV_DEST_CPU_1)
  Send SEGGER SystemView events for App CPU.

### CONFIG_APPTRACE_SV_TS_SOURCE

Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

**Available options:**
- CPU cycle counter (CCOUNT) (APTRACE_SV_TS_SOURCE_CCOUNT)
- General Purpose Timer (Timer Group) (APTRACE_SV_TS_SOURCE_GPTIMER)
• esp_timer high resolution timer (APPTRACE_SV_TS_SOURCE_ESP_TIMER)

**CONFIG_APPTRACE_SV_MAX_TASKS**

Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures maximum supported tasks in sysview debug.

**CONFIG_APPTRACE_SV_BUF_WAIT_TMO**

Trace buffer wait timeout

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

**CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE**

Trace Buffer Overflow Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Trace Buffer Overflow” event.

**CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE**

ISR Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “ISR Enter” event.

**CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE**

ISR Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “ISR Exit” event.

**CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE**

ISR Exit to Scheduler Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “ISR to Scheduler” event.

**CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE**

Task Start Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Start Execution” event.
CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE

Task Stop Execution Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Stop Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_START READY_ENABLE

Task Start Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Start Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP READY_ENABLE

Task Stop Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Stop Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE

Task Create Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Create” event.

CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Terminate” event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE

System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “System Idle” event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Timer Enter” event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Timer Exit” event.
CONFIG_APPTRACE_GCOV_ENABLE

GCOV to Host Enable

*Found in:* Component config > Application Level Tracing

Enables support for GCOV data transfer to host.

CONFIG_APPTRACE_GCOV_DUMP_TASK_STACK_SIZE

Gcov dump task stack size

*Found in:* Component config > Application Level Tracing > CONFIG_APPTRACE_GCOV_ENABLE

Configures stack size of Gcov dump task

**Default value:**

- 2048 if `CONFIG_APPTRACE_GCOV_ENABLE`

Bluetooth  Contains:

- Bluedroid Options
- `CONFIG_BT_ENABLED`
- Controller Options
- NimBLE Options
- `CONFIG_BT_RELEASE_IRAM`

CONFIG_BT_ENABLED

Bluetooth

*Found in:* Component config > Bluetooth

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

CONFIG_BT_HOST

Host

*Found in:* Component config > Bluetooth > `CONFIG_BT_ENABLED`

This helps to choose Bluetooth host stack

**Available options:**

- Bluedroid - Dual-mode (`BT_BLUEDROID_ENABLED`)  
  This option is recommended for classic Bluetooth or for dual-mode usecases
- NimBLE - BLE only (`BT_NIMBLE_ENABLED`)  
  This option is recommended for BLE only usecases to save on memory
- Disabled (`BT_CONTROLLER_ONLY`)  
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

CONFIG_BT_CONTROLLER

Controller

*Found in:* Component config > Bluetooth > `CONFIG_BT_ENABLED`

This helps to choose Bluetooth controller stack

**Available options:**

- Enabled (`BT_CONTROLLER_ENABLED`)  
  This option is recommended for Bluetooth controller usecases
• Disabled (BT_CONTROLLER_DISABLED)
  This option is recommended for Bluetooth Host only use cases

**Bluedroid Options**  Contains:

- `CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK`
- `CONFIG_BT_BLUEDROID_MEM_DEBUG`
- `CONFIG_BT_BTU_TASK_STACK_SIZE`
- `CONFIG_BT_BTU_TASK_STACK_SIZE`
- `CONFIG_BT_BLE_ENABLED`
- `BT_DEBUG LOG LEVEL`
- `CONFIG_BT_ACL_CONNECTIONS`
- `CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST`
- `CONFIG_BT_CLASSIC_ENABLED`
- `CONFIG_BT_HID_ENABLED`
- `CONFIG_BT_STACK_NO_LOG`
- `CONFIG_BT_BLE_42_FEATURES_SUPPORTED`
- `CONFIG_BT_BLE_50_FEATURES_SUPPORTED`
- `CONFIG_BT_BLE_HIGH_DUTY_ADV_INTERVAL`
- `CONFIG_BT_MULTI_CONNECTION_ENBALE`
- `CONFIG_BT_BLE_FEAT_PERIODIC_ADV_SYNC_TRANSFER`
- `CONFIG_BT_BLE_FEAT.PERIODIC_ADV_ENH`
- `CONFIG_BT_MAX_Device_NAME_LEN`
- `CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN`
- `CONFIG_BT_BTU_TASK_STACK_SIZE`
- `CONFIG_BT_BLE_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT`
- `CONFIG_BT_BLE_RPA_TIMEOUT`
- `CONFIG_BT_BLE_RPA_SUPPORTED`
- `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY`
- `CONFIG_BT_HFP_WBS_ENABLE`
This select btu task stack size

**Default value:**
- 4096 if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_BLUE_DROID_MEM_DEBUG**

Bluedroid memory debug

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluedroid memory debug

**Default value:**
- No (disabled) if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_CLASSIC_ENABLED**

Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options*

For now this option needs “SMP_ENABLE” to be set to yes

**Default value:**
- No (disabled) if BT_BLUE_DROID_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_CLASSIC_BQB_ENABLED**

Host Qualification support for Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_CLASSIC_ENABLED*

This enables functionalities of Host qualification for Classic Bluetooth.

**Default value:**
- No (disabled) if CONFIG_CLASSIC_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_A2DP_ENABLE**

A2DP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_CLASSIC_ENABLED*

Advanced Audio Distribution Profile

**Default value:**
- No (disabled) if CONFIG_CLASSIC_ENABLED && BT_BLUE_DROID_ENABLED

**CONFIG_SPP_ENABLED**

SPP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_CLASSIC_ENABLED*

This enables the Serial Port Profile

**Default value:**
- No (disabled) if CONFIG_CLASSIC_ENABLED && BT_BLUE_DROID_ENABLED
**CONFIG_BT_L2CAP_ENABLED**

BT L2CAP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Logical Link Control and Adaptation Layer Protocol. Only supported classic bluetooth.

**Default value:**
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` & `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HFP_ENABLE**

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

Hands Free Unit and Audio Gateway can be included simultaneously but they cannot run simultaneously due to internal limitations.

**Default value:**
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` & `BT_BLUEDROID_ENABLED`

**Contains:**
- `CONFIG_BT_HFP_AG_ENABLE`
- `CONFIG_BT_HFP_AUDIO_DATA_PATH`
- `CONFIG_BT_HFP_CLIENT_ENABLE`

**CONFIG_BT_HFP_CLIENT_ENABLE**

Hands Free Unit

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

**Default value:**
- Yes (enabled) if `CONFIG_BT_HFP_ENABLE` & `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HFP_AG_ENABLE**

Audio Gateway

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

**Default value:**
- Yes (enabled) if `CONFIG_BT_HFP_ENABLE` & `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HFP_AUDIO_DATA_PATH**

audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API “esp_bredr_sco_datapath_set” in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

**Available options:**
- PCM (BT_HFP_AUDIO_DATA_PATH_PCM)
- HCI (BT_HFP_AUDIO_DATA_PATH_HCI)
**CONFIG_BT_HFP_WBS_ENABLE**

Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

**Default value:**

- Yes (enabled) if `BT_HFP_AUDIO_DATA_PATH_HCI` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HID_ENABLED**

Classic BT HID

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

Contains:

- `CONFIG_BT_HID_DEVICE_ENABLED`
- `CONFIG_BT_HID_HOST_ENABLED`

**CONFIG_BT_HID_HOST_ENABLED**

Classic BT HID Host

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_HID_ENABLED*

This enables the BT HID Host

**Default value:**

- No (disabled) if `CONFIG_BT_HID_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_HID_DEVICE_ENABLED**

Classic BT HID Device

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_HID_ENABLED*

This enables the BT HID Device

**CONFIG_BT_SSP_ENABLED**

Secure Simple Pairing

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the Secure Simple Pairing. If disable this option, Bluedroid will only support Legacy Pairing

**Default value:**

- Yes (enabled) if `CONFIG_BT_CLASSIC_ENABLED` && `BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_ENABLED**

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy
Default value:

- Yes (enabled) if BT_BLUEDROID_ENABLED & BT_BLUEDROID_ENABLED

**CONFIG_BT_GATTS_ENABLE**

Include GATT server module (GATTS)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be disabled when the app work only on gatt client mode

Default value:

- Yes (enabled) if CONFIG_BT_BLE_ENABLED & & BT_BLUEDROID_ENABLED

**CONFIG_BT_GATTS_PPCP_CHAR_GAP**

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

Default value:

- No (disabled) if CONFIG_BT_GATTS_ENABLE & & BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_BLUFI_ENABLE**

Include blufi function

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This option can be close when the app does not require blufi function.

Default value:

- No (disabled) if CONFIG_BT_GATTS_ENABLE & & BT_BLUEDROID_ENABLED

**CONFIG_BT_GATT_MAX_SR_PROFILES**

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Maximum GATT Server Profiles Count

Range:

- from 1 to 32 if CONFIG_BT_GATTS_ENABLE & & BT_BLUEDROID_ENABLED & & BT_BLUEDROID_ENABLED

Default value:

- 8 if CONFIG_BT_GATTS_ENABLE & & BT_BLUEDROID_ENABLED & & BT_BLUEDROID_ENABLED

**CONFIG_BT_GATT_MAX_SR_ATTRIBUTES**

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Maximum GATT Service Attributes Count
Range:
• from 1 to 500 if \texttt{CONFIG_BT_GATTS\_ENABLE} \&\& \texttt{BT\_BLE\_ENABLED} \&\& \texttt{BT\_BLE\_ENABLED}

Default value:
• 100 if \texttt{CONFIG_BT_GATTS\_ENABLE} \&\& \texttt{BT\_BLE\_ENABLED} \&\& \texttt{BT\_BLE\_ENABLED}

**CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MODE**

GATTs Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Service change indication mode for GATT Server.

**Available options:**
• GATTs manually send service change indication (BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MANUAL)
  Manually send service change indication through API esp\_ble\_gatts\_send\_service\_change\_indication()
• GATTs automatically send service change indication (BT\_GATTS\_SEND\_SERVICE\_CHANGE\_AUTO)
  Let Bluedroid handle the service change indication internally

**CONFIG\_BT\_GATTS\_ROBUST\_CACHING\_ENABLED**

Enable Robust Caching on Server Side

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option enable gatt robust caching feature on server

**Default value:**
• No (disabled) if \texttt{CONFIG_BT_GATTS\_ENABLE} \&\& \texttt{BT\_BLE\_ENABLED}

**CONFIG\_BT\_GATTS\_DEVICE\_NAME\_WRITABLE**

Allow to write device name by GATT clients

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Enabling this option allows remote GATT clients to write device name

**Default value:**
• No (disabled) if \texttt{CONFIG_BT_GATTS\_ENABLE} \&\& \texttt{BT\_BLE\_ENABLED}

**CONFIG\_BT\_GATTS\_APPEARANCE\_WRITABLE**

Allow to write appearance by GATT clients

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Enabling this option allows remote GATT clients to write appearance

**Default value:**
• No (disabled) if \texttt{CONFIG_BT_GATTS\_ENABLE} \&\& \texttt{BT\_BLE\_ENABLED}
CONFIG_BT_GATTC_ENABLE
Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app work only on gatt server mode

**Default value:**
- Yes (enabled) if CONFIG_BT_BLE_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_MAX_CACHE_CHAR
Max gattc cache characteristic for discover

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

Maximum GATTC cache characteristic count

**Range:**
- from 1 to 500 if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

**Default value:**
- 40 if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_NOTIF_REG_MAX
Max gattc notify(indication) register number

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

Maximum GATTC notify(indication) register number

**Range:**
- from 1 to 64 if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

**Default value:**
- 5 if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_CACHE_NVS_FLASH
Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**
- No (disabled) if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_CONNECT_RETRY_COUNT
The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**
- from 0 to 7 if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED

**Default value:**
- 3 if CONFIG_BT_GATTC_ENABLE && BT_BLUEDROID_ENABLED
CONFIG_BT_BLE_SMP_ENABLE
Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**
- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE
Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**
- No (disabled) if `CONFIG_BT_BLE_SMP_ENABLE` && `BT_BLUEDROID_ENABLED`

CONFIG_BT_STACK_NO_LOG
Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

**Default value:**
- No (disabled) if `BT_BLUEDROID_ENABLED` && `BT_BLUEDROID_ENABLED`

BT DEBUG LOG LEVEL  Contains:
- `CONFIG_BT_LOG_A2D_TRACE_LEVEL`
- `CONFIG_BT_LOG_APPL_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVCT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVDT_TRACE_LEVEL`
- `CONFIG_BT_LOG_AVRC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BLUFI_TRACE_LEVEL`
- `CONFIG_BT_LOG_BNEP_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTC_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTIF_TRACE_LEVEL`
- `CONFIG_BT_LOG_BTM_TRACE_LEVEL`
- `CONFIG_BT_LOG_GAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_GATT_TRACE_LEVEL`
- `CONFIG_BT_LOG_HCI_TRACE_LEVEL`
- `CONFIG_BT_LOG_HID_TRACE_LEVEL`
- `CONFIG_BT_LOG_L2CAP_TRACE_LEVEL`
- `CONFIG_BT_LOG_MCA_TRACE_LEVEL`
- `CONFIG_BT_LOG_OSI_TRACE_LEVEL`
- `CONFIG_BT_LOG_PAN_TRACE_LEVEL`
- `CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL`
- `CONFIG_BT_LOG_SDP_TRACE_LEVEL`
- `CONFIG_BT_LOG_SMP_TRACE_LEVEL`

CONFIG_BT_LOG_HCI_TRACE_LEVEL
Chapter 2. API Reference

HCI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HCI layer

**Available options:**

- NONE (BT_LOG_HCI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HCI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HCI_TRACE_LEVEL_WARNING)
- API (BT_LOG_HCI_TRACE_LEVEL_API)
- EVENT (BT_LOG_HCI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HCI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTM_TRACE_LEVEL**

BTM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTM layer

**Available options:**

- NONE (BT_LOG_BTM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_L2CAP_TRACE_LEVEL**

L2CAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for L2CAP layer

**Available options:**

- NONE (BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
- API (BT_LOG_L2CAP_TRACE_LEVEL_API)
- EVENT (BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL**

RFCOMM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for RFCOMM layer

**Available options:**

- NONE (BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SDP_TRACE_LEVEL
SDP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for SDP layer

Available options:
• NONE (BT_LOG_SDP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_SDP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_SDP_TRACE_LEVEL_WARNING)
• API (BT_LOG_SDP_TRACE_LEVEL_API)
• EVENT (BT_LOG_SDP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_SDP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GAP_TRACE_LEVEL
GAP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for GAP layer

Available options:
• NONE (BT_LOG_GAP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_GAP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_GAP_TRACE_LEVEL_WARNING)
• API (BT_LOG_GAP_TRACE_LEVEL_API)
• EVENT (BT_LOG_GAP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_GAP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BNEP_TRACE_LEVEL
BNEP layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BNEP layer

Available options:
• NONE (BT_LOG_BNEP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BNEP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BNEP_TRACE_LEVEL_WARNING)
• API (BT_LOG_BNEP_TRACE_LEVEL_API)
• EVENT (BT_LOG_BNEP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_PAN_TRACE_LEVEL
PAN layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for PAN layer

Available options:
Chapter 2. API Reference

- NONE (BT_LOG_PAN_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_PAN_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_PAN_TRACE_LEVEL_WARNING)
- API (BT_LOG_PAN_TRACE_LEVEL_API)
- EVENT (BT_LOG_PAN_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_PAN_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_PAN_TRACE_LEVEL_VERY_VERBOSE)

CONFIG_BT_LOG_A2D_TRACE_LEVEL

A2D layer

Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL

Define BT trace level for A2D layer

Available options:
- NONE (BT_LOG_A2D_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_A2D_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_A2D_TRACE_LEVEL_WARNING)
- API (BT_LOG_A2D_TRACE_LEVEL_API)
- EVENT (BT_LOG_A2D_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_A2D_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_A2D_TRACE_LEVEL_VERY_VERBOSE)

CONFIG_BT_LOG_AVDT_TRACE_LEVEL

AVDT layer

Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL

Define BT trace level for AVDT layer

Available options:
- NONE (BT_LOG_AVDT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVDT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVDT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVDT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVDT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVDT_TRACE_LEVEL_VERY_VERBOSE)

CONFIG_BT_LOG_AVCT_TRACE_LEVEL

AVCT layer

Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL

Define BT trace level for AVCT layer

Available options:
- NONE (BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVCT_TRACE_LEVEL_VERY_VERBOSE)
CONFIG_BT_LOG_AVRC_TRACE_LEVEL

AVRC layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for AVRC layer

Available options:
- NONE (BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL

MCA layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for MCA layer

Available options:
- NONE (BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HID layer

Available options:
- NONE (BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (BT_LOG_HID_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for APPL layer

Available options:
- NONE (BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (BT_LOG_APPL_TRACE_LEVEL_API)
• EVENT (BT_LOG_APBPL_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_APBPL_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_APBPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GATT layer

**Available options:**

• NONE (BT_LOG_GATT_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_GATT_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_GATT_TRACE_LEVEL_WARNING)
• API (BT_LOG_GATT_TRACE_LEVEL_API)
• EVENT (BT_LOG_GATT_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_GATT_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SMP layer

**Available options:**

• NONE (BT_LOG_SMP_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_SMP_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_SMP_TRACE_LEVEL_WARNING)
• API (BT_LOG_SMP_TRACE_LEVEL_API)
• EVENT (BT_LOG_SMP_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_SMP_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTIF layer

**Available options:**

• NONE (BT_LOG_BTIF_TRACE_LEVEL_NONE)
• ERROR (BT_LOG_BTIF_TRACE_LEVEL_ERROR)
• WARNING (BT_LOG_BTIF_TRACE_LEVEL_WARNING)
• API (BT_LOG_BTIF_TRACE_LEVEL_API)
• EVENT (BT_LOG_BTIF_TRACE_LEVEL_EVENT)
• DEBUG (BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
• VERBOSE (BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTCL_TRACE_LEVEL

BTC layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTC layer
Available options:
- NONE (BT_LOG_BTC_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BTC_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BTC_TRACE_LEVEL_WARNING)
- API (BT_LOG_BTC_TRACE_LEVEL_API)
- EVENT (BT_LOG_BTC_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BTC_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for OSI layer

Available options:
- NONE (BT_LOG_OSI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_OSI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_OSI_TRACE_LEVEL_WARNING)
- API (BT_LOG_OSI_TRACE_LEVEL_API)
- EVENT (BT_LOG_OSI TRACE_LEVEL EVENT)
- DEBUG (BT_LOG_OSI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

BLUFI layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for BLUFI layer

Available options:
- NONE (BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- ERROR (BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- WARNING (BT_LOG_BLUFI TRACE_LEVEL_WARNING)
- API (BT_LOG_BLUFI_TRACE_LEVEL_API)
- EVENT (BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- DEBUG (BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- VERBOSE (BT_LOG_BLUFI TRACE_LEVEL_VERBOSE)

CONFIG_BT_ACL_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~9)

Found in: Component config > Bluetooth > Bluedroid Options

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

Range:
- from 1 to 9 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:
- 4 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED
**CONFIG_BT_MULTI_CONNECTION_ENBALE**
Enable BLE multi-conections

*Found in: Component config > Bluetooth > Bluedroid Options*
Enable this option if there are multiple connections

**Default value:**
- Yes (enabled) if BT_BLUELEDROID_ENABLED && BT_BLUELEDROID_ENABLED

**CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST**
BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*
This select can save the internal RAM if there have the PSRAM

**Default value:**
- No (disabled) if BT_BLUELEDROID_ENABLED && BT_BLUELEDROID_ENABLED

**CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY**
Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*
This select can make the allocation of memory will become more flexible

**Default value:**
- No (disabled) if BT_BLUELEDROID_ENABLED && BT_BLUELEDROID_ENABLED

**CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK**
BLE queue congestion check

*Found in: Component config > Bluetooth > Bluedroid Options*
When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. If enabled, adv packets will be lost when host queue is congested.

**Default value:**
- No (disabled) if BT_BLUELEDROID_ENABLED && BT_BLUELEDROID_ENABLED

**CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN**
Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluedroid Options*
Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

**Default value:**
- No (disabled) if BT_BLUELEDROID_ENABLED && CONFIG_BT_BLE_ENABLED && BT_BLUELEDROID_ENABLED
CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT

Timeout of BLE connection establishment

Found in: Component config > Bluetooth > Bluedroid Options

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.

Range:
- from 1 to 60 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:
- 30 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_MAX_DEVICE_NAME_LEN

Length of Bluetooth device name

Found in: Component config > Bluetooth > Bluedroid Options

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can’t fit in will be truncated.

Range:
- from 32 to 248 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:
- 32 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_RPA_SUPPORTED

Update RPA to Controller

Found in: Component config > Bluetooth > Bluedroid Options

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

Default value:
- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_RPA_TIMEOUT

Timeout of resolvable private address

Found in: Component config > Bluetooth > Bluedroid Options

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

Range:
- from 1 to 3600 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED

Default value:
- 900 if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED
CONFIG_BT_BLE_50_FEATURES_SUPPORTED

Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

**Default value:**

- Yes (enabled) if BT_BLUEDROID_ENABLED && SOC_ESP_NIMBLE_CONTROLLER && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_42_FEATURES_SUPPORTED

Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features.

**Default value:**

- No (disabled) if BT_BLUEDROID_ENABLED && SOC_ESP_NIMBLE_CONTROLLER && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_FEAT_PERIODIC_ADV_SYNC_TRANSFER

Enable BLE periodic advertising sync transfer feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE periodic advertising sync transfer feature

**Default value:**

- No (disabled) if BT_BLUEDROID_ENABLED && CONFIG_BT_BLE_50_FEATURES_SUPPORTED && SOC_ESP_NIMBLE_CONTROLLER && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_FEAT_PERIODIC_ADV_ENH

Enable periodic adv enhancements(adi support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the periodic advertising enhancements

**Default value:**

- No (disabled) if BT_BLUEDROID_ENABLED && CONFIG_BT_BLE_50_FEATURES_SUPPORTED && SOC_ESP_NIMBLE_CONTROLLER && BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_HIGH_DUTY_ADV_INTERVAL

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enable BLE high duty advertising interval feature

**Default value:**

- No (disabled) if BT_BLUEDROID_ENABLED && BT_BLUEDROID_ENABLED
**NimBLE Options**  Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_HOST_QUEUE_CONFIG_CHECK`
- `CONFIG_BT_NIMBLE_WHITELIST_SIZE`
- `CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_ROLE_BROADCASTER`
- `CONFIG_BT_NIMBLE_ROLE_CENTRAL`
- `CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL`
- `CONFIG_BT_NIMBLE_MESH`
- `CONFIG_BT_NIMBLE_ROLE_OBSERVER`
- `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL`

**CONFIG_BT_NIMBLE_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > Bluetooth > NimBLE Options*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

**Available options:**

- Internal memory (`BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL`)
- External SPIRAM (`BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL`)
- Default alloc mode (`BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT`)
- Internal IRAM (`BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT`)
  Allows to use IRAM memory region as 8bit accessible region.
Chapter 2. API Reference

Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BT_NIMBLE_LOG_LEVEL

NimBLE Host log verbosity

*Found in: Component config > Bluetooth > NimBLE Options*

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in “Component config -&gt; Log output -&gt; Default log verbosity”.

**Available options:**

- No logs (BT_NIMBLE_LOG_LEVEL_NONE)
- Error logs (BT_NIMBLE_LOG_LEVEL_ERROR)
- Warning logs (BT_NIMBLE_LOG_LEVEL_WARNING)
- Info logs (BT_NIMBLE_LOG_LEVEL_INFO)
- Debug logs (BT_NIMBLE_LOG_LEVEL_DEBUG)

CONFIG_BT_NIMBLE_MAX_CONNECTIONS

Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*

 Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu. For ESP32C2, ESP32C6 and ESP32H2, each connection will take about 1k DRAM.

**Range:**

- from 1 to 9 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_BONDS

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

**Default value:**

- 3 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CCCDS

Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

**Default value:**

- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in
Range:
• from 0 to 9 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:
• 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE**

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

**Available options:**
• Core 0 (PRO CPU) (BT_NIMBLE_PINNED_TO_CORE_0)
• Core 1 (APP CPU) (BT_NIMBLE_PINNED_TO_CORE_1)

**CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE**

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**
• 5120 if CONFIG_BLE_MESH && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
• 4096 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ROLE_CENTRAL**

Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables central role

**Default value:**
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ROLE_PERIPHERAL**

Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*

Enable peripheral role

**Default value:**
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ROLE_BROADCASTER**

Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables broadcaster role

**Default value:**
• Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_ROLE_OBSERVER

Enable BLE Observer role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables observer role

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_NVS_PERSIST

Persist the BLE Bonding keys in NVS

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this flag to make bonding persistent across device reboots

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable BLE SM feature

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE sm feature

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Contains:
- CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION
- CONFIG_BT_NIMBLE_SM_LEGACY
- CONFIG_BT_NIMBLE_SM_SC

CONFIG_BT_NIMBLE_SM_LEGACY

Security manager legacy pairing

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE*

Enable security manager legacy pairing

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SC

Security manager secure connections (4.2)

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE*

Enable security manager secure connections

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS

Use predefined public-private key pair

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE > CONFIG_BT_NIMBLE_SM_SC

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && CONFIG_BT_NIMBLE_SM_SC && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION

Enable LE encryption

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable encryption connection

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_DEBUG

Enable extra runtime asserts and host debugging

*Found in:* Component config > Bluetooth > NimBLE Options

This enables extra runtime asserts and host debugging

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME

BLE GAP default device name

*Found in:* Component config > Bluetooth > NimBLE Options

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API ble_svc_gap_device_name_set()

**Default value:**
- “nimble” if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN

Maximum length of BLE device name in octets

*Found in:* Component config > Bluetooth > NimBLE Options

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**
- 31 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API ble_att_set_preferred_mtu()

**Default value:**
- 256 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**
- 0 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Memory Settings**

Contains:

- CONFIG_BT_NIMBLE_ACL_BUF_COUNT
- CONFIG_BT_NIMBLE_ACL_BUF_SIZE
- CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE
- CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT
- CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT
- CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT
- CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE
- CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT
- CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT

MSYS_1 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**
- 24 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED
- 12 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE

MSYS_1 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 1

**Default value:**
- 128 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED
- 256 if SOC_ESP_NIMBLE_CONTROLLER && BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT**

MSYS_2 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory count

**Default value:**

- 24 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE**

MSYS_2 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 2

**Default value:**

- 320 if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ACL_BUF_COUNT**

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

The number of ACL data buffers.

**Default value:**

- 24 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ACL_BUF_SIZE**

ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes).

**Default value:**

- 255 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_EVT_BUF_SIZE**

HCI Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**

- 257 if CONFIG_BT_NIMBLE_EXT_ADV && BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- 70 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_HCI_EVT_HI_BUF_COUNT**

High Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the high priority HCI events’ buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead.

**Default value:**
- 30 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HCI_EVT_LO_BUF_COUNT**

Low Priority HCI Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped.

**Default value:**
- 8 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_GATT_MAX_PROCS**

Maximum number of GATT client procedures

*Found in: Component config > Bluetooth > NimBLE Options*

Maximum number of GATT client procedures that can be executed.

**Default value:**
- 4 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL**

Enable Host Flow control

*Found in: Component config > Bluetooth > NimBLE Options*

Enable Host Flow control

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL**

Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control interval in msecs

**Default value:**
- 1000 if CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH

Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**
- 2 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT

Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_RPA_TIMEOUT

RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change. This is applicable in case of Host based RPA

**Range:**
- from 1 to 41400 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

**Default value:**
- 900 if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MESH

Enable BLE mesh functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: `../esp32/api-guides/esp-ble-mesh/ble-mesh-index`

**Default value:**
- No (disabled) if `BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED`

Contains:
- `CONFIG_BT_NIMBLE_MESH_PROVISIONER`
- `CONFIG_BT_NIMBLE_MESH_PROV`
- `CONFIG_BT_NIMBLE_MESH_GATT_PROXY`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
- `CONFIG_BT_NIMBLE_MESH_RELAY`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_MESH_NODE_COUNT`
CONFIG_BT_NIMBLE_MESH_PROXY

Enable mesh proxy functionality

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROV

Enable BLE mesh provisioning

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Enable mesh provisioning

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PB_ADV

Enable mesh provisioning over advertising bearer

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PB_GATT

Enable mesh provisioning over GATT bearer

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_GATT_PROXY

Enable GATT Proxy functionality

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_RELAY

Enable mesh relay functionality

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH

Support for acting as a Mesh Relay Node
Default value:
• No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_LOW_POWER**
Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*
Enable this option to be able to act as a Low Power Node

**Default value:**
• No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_FRIEND**
Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*
Enable this option to be able to act as a Friend Node

**Default value:**
• No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_DEVICE_NAME**
Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*
This value defines Bluetooth Mesh device/node name

**Default value:**
• “nimble-mesh-node” if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_NODE_COUNT**
Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*
Defines mesh node count.

**Default value:**
• 1 if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_PROVISIONER**
Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*
Enable mesh provisioner.

**Default value:**
• 0 if `CONFIG_BT_NIMBLE_MESH` && `BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS
Override TinyCrypt with mbedTLS for crypto computations

- Found in: Component config > Bluetooth > NimBLE Options
- Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.
- Default value: Yes (enabled) if BT_NIMBLE_ENABLED & BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS
BLE host stop timeout in msec

- Found in: Component config > Bluetooth > NimBLE Options
- BLE Host stop procedure timeout in milliseconds.
- Default value: 2000 if BT_NIMBLE_ENABLED & BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HOST_BASED_PRIVACY
Enable host based privacy for random address.

- Found in: Component config > Bluetooth > NimBLE Options
- Use this option to do host based Random Private Address resolution. If this option is disabled then controller based privacy is used.
- Default value: No (disabled) if BT_NIMBLE_ENABLED & BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT
Enable connection reattempts on connection establishment error

- Found in: Component config > Bluetooth > NimBLE Options
- Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.
- Default value: No (disabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT
Maximum number connection reattempts

- Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT
- Defines maximum number of connection reattempts.
- Range: from 1 to 7 if BT_NIMBLE_ENABLED & CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT & BT_NIMBLE_ENABLED
- Default value: 3 if BT_NIMBLE_ENABLED & CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT & BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable BLE 5 feature

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE 5 feature

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED && (SOC_BLE_50_SUPPORTED || BT_CONTROLLER_ENABLED) && BT_NIMBLE_ENABLED

**Contains:**
- CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY
- CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY
- CONFIG_BT_NIMBLE_EXT_ADV
- CONFIG_BT_NIMBLE_BLE_POWER_CONTROL
- CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY

Enable 2M Phy

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT*

Enable 2M-PHY

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY

Enable coded Phy

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT*

Enable coded-PHY

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_EXT_ADV

Enable extended advertising

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT*

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED
Chapter 2. API Reference

**CONFIG_BT_NIMBLE_MAX_EXT_ADV_INSTANCES**

Maximum number of extended advertising instances.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. For ESP32C2, ESP32C6 and ESP32H2, each extended advertising instance will take about 0.5k DRAM.

**Range:**
- from 0 to 4 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**Default value:**
- 1 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_EXT_ADV_MAX_SIZE**

Maximum length of the advertising data.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Defines the length of the extended adv data. The value should not exceed 1650.

**Range:**
- from 0 to 1650 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**Default value:**
- 1650 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV**

Enable periodic advertisement.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Enable this option to start periodic advertisement.

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_PERIODIC_ADV_SYNC_TRANSFER**

Enable transfer sync events

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV > CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV

This enables controller transfer periodic sync events to host.

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS

Maximum number of periodic advertising syncs

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

Range:
• from 0 to 8 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

Default value:
• 1 if CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED
• 0 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLE_POWER_CONTROL

Enable support for BLE Power Control

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to enable the Power Control feature

CONFIG_BT_NIMBLE_WHITELIST_SIZE

BLE white list size

Found in: Component config > Bluetooth > NimBLE Options

BLE list size

Range:
• from 1 to 15 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

Default value:
• 12 if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST

Throughput Test Mode enable

Found in: Component config > Bluetooth > NimBLE Options

Enable the throughput test mode

Default value:
• No (disabled) if BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLUFI_ENABLE

Enable blufi functionality

Found in: Component config > Bluetooth > NimBLE Options

Set this option to enable blufi functionality.

Default value:
• No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_USE_ESP_TIMER**

Enable Esp Timer for Nimble

*Found in: Component config > Bluetooth > NimBLE Options*

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER**

Blob transfer

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used when data to be sent is more than 512 bytes. For peripheral role, BT_NIMBLE_MSYS_1_BLOCK_COUNT needs to be increased according to the need.

**CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL**

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > NimBLE Options*

This enable BLE high duty advertising interval feature

**CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > NimBLE Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. If enabled, adv packets will be lost when host queue is congested.

**Default value:**
- No (disabled) if BT_NIMBLE_ENABLED && BT_NIMBLE_ENABLED

**Controller Options**  
Contains:

- **CONFIG_BTDM_CTRL_AUTO_LATENCY**
- **CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP**
- **CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED**
- **CONFIG_BTDM_CTRL_BLE_MAX_CONN**
- **CONFIG_BTDM_BLE_SCAN_DUPL**
- **CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY**
- **CONFIG_BTDM_CTRL_MODE**
- **CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN**
- **CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH**
- **CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN**
- **CONFIG_BTDM_CTRL_HCI_MODE_CHOICE**
- **HCI UART(H4) Options**
- **CONFIG_BTDM_CTRL_HLI**
- **CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT**
- **MODEM SLEEP Options**
- **CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG**
- **CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE**
CONFIG_BTDM_CTRL_MODE
Bluetooth controller mode (BR/EDR/BLE/DUALMODE)

*Found in: Component config > Bluetooth > Controller Options*

Specify the bluetooth controller mode (BR/EDR, BLE or dual mode).

**Available options:**
- BLE Only (BTDM_CTRL_MODE_BLE_ONLY)
- BR/EDR Only (BTDM_CTRL_MODE_BR_EDR_ONLY)
- Bluetooth Dual Mode (BTDM_CTRL_MODE_BTDM)

CONFIG_BTDM_CTRL_BLE_MAX_CONN
BLE Max Connections

*Found in: Component config > Bluetooth > Controller Options*

BLE maximum connections of bluetooth controller. Each connection uses 1 KB static DRAM whenever the BT controller is enabled.

**Range:**
- from 1 to 9 if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**Default value:**
- 3 if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

CONFIG_BTDM_CTRL_BR_EDR_MAX_ACL_CONN
BR/EDR ACL Max Connections

*Found in: Component config > Bluetooth > Controller Options*

BR/EDR ACL maximum connections of bluetooth controller. Each connection uses 1.2 KB DRAM whenever the BT controller is enabled.

**Range:**
- from 1 to 7 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**Default value:**
- 2 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

CONFIG_BTDM_CTRL_BR_EDR_MAX_SYNC_CONN
BR/EDR Sync(SCO/eSCO) Max Connections

*Found in: Component config > Bluetooth > Controller Options*

BR/EDR Synchronize maximum connections of bluetooth controller. Each connection uses 2 KB DRAM whenever the BT controller is enabled.

**Range:**
- from 0 to 3 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**Default value:**
- 0 if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED
CONFIG_BTDM_CTRL_BR_EDR_SCO_DATA_PATH

BR/EDR Sync(SCO/eSCO) default data path

*Found in: Component config > Bluetooth > Controller Options*

SCO data path, i.e. HCI or PCM. SCO data can be sent/received through HCI synchronous packets, or the data can be routed to on-chip PCM module on ESP32. PCM input/output signals can be “matrixed” to GPIOs. The default data path can also be set using API “esp_bredr_sco_datapath_set”

*Available options:*
  - HCI (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_HCI)
  - PCM (BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM)

CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG

PCM Signal Config (Role and Polar)

*Found in: Component config > Bluetooth > Controller Options*

*Default value:*
  - Yes (enabled) if BTDM_CTRL_BR_EDR_SCO_DATA_PATH_PCM && BT_CONTROLLER_ENABLED

*Contains:*
  - CONFIG_BTDM_CTRL_PCM_POLAR
  - CONFIG_BTDM_CTRL_PCM_ROLE

CONFIG_BTDM_CTRL_PCM_ROLE

PCM Role

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*

PCM role can be configured as PCM master or PCM slave

*Available options:*
  - PCM Master (BTDM_CTRL_PCM_ROLE_MASTER)
  - PCM Slave (BTDM_CTRL_PCM_ROLE_SLAVE)

CONFIG_BTDM_CTRL_PCM_POLAR

PCM Polar

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_CTRL_PCM_ROLE_EDGE_CONFIG*

PCM polarity can be configured as Falling Edge or Rising Edge

*Available options:*
  - Falling Edge (BTDM_CTRL_PCM_POLAR_FALLING_EDGE)
  - Rising Edge (BTDM_CTRL_PCM_POLAR_RISING_EDGE)

CONFIG_BTDM_CTRL_AUTO_LATENCY

Auto latency

*Found in: Component config > Bluetooth > Controller Options*

BLE auto latency, used to enhance classic BT performance while classic BT and BLE are enabled at the same time.

*Default value:*
  - No (disabled) if BTDM_CTRL_MODE_BTDM && BT_CONTROLLER_ENABLED
CONFIG_BTDM_CTRL_LEGACY_AUTH_VENDOR_EVT
 Legacy Authentication Vendor Specific Event Enable

*Found in: Component config > Bluetooth > Controller Options*

To protect from BIAS attack during Legacy authentication, Legacy authentication Vendor specific event should be enabled

**Default value:**
- Yes (enabled) if (BTDM_CTRL_MODE_BR_EDR_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

CONFIG_BTDM_CTRL_PINNED_TO_CORE_CHOICE
 The cpu core which bluetooth controller run

*Found in: Component config > Bluetooth > Controller Options*

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

**Available options:**
- Core 0 (PRO CPU) (BTDM_CTRL_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (BTDM_CTRL_PINNED_TO_CORE_1)

CONFIG_BTDM_CTRL_HCI_MODE_CHOICE
 HCI mode

*Found in: Component config > Bluetooth > Controller Options*

Specify HCI mode as VHCI or UART(H4)

**Available options:**
- VHCI (BTDM_CTRL_HCI_MODE_VHCI)
  Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32, too.
- UART(H4) (BTDM_CTRL_HCI_MODE_UART_H4)
  If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

HCI UART(H4) Options  Contains:

- `CONFIG_BTDM_CTRL_HCI_UART_FLOW_CTRL_EN`
- `CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE`
- `CONFIG_BTDM_CTRL_HCI_UART_NO`

CONFIG_BTDM_CTRL_HCI_UART_NO
 UART Number for HCI

*Found in: Component config > Bluetooth > Controller Options > HCI UART(H4) Options*

Uart number for HCI. The available uart is UART1 and UART2.

**Range:**
- from 1 to 2 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

**Default value:**
- 1 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED
**CONFIG_BTDM_CTRL_HCI_UART_BAUDRATE**

UART Baudrate for HCI

*Found in: Component config > Bluetooth > Controller Options > HCI UART(H4) Options*

UART Baudrate for HCI. Please use standard baudrate.

*Range:*

- from 115200 to 921600 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

*Default value:*

- 921600 if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_HCI_UART_FLOW_CTRL_EN**

Enable UART flow control

*Found in: Component config > Bluetooth > Controller Options > HCI UART(H4) Options*

*Default value:*

- Yes (enabled) if BTDM_CTRL_HCI_MODE_UART_H4 && BT_CONTROLLER_ENABLED

---

**MODEM SLEEP Options**  Contains:

- **CONFIG_BTDM_CTRL_LOW_POWER_CLOCK**
- **CONFIG_BTDM_CTRL_MODEM_SLEEP**

**CONFIG_BTDM_CTRL_MODEM_SLEEP**

Bluetooth modem sleep

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options*

Enable/disable bluetooth controller low power mode.

*Default value:*

- Yes (enabled) if BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_MODEM_SLEEP_MODE**

Bluetooth Modem sleep mode

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options > CONFIG_BTDM_CTRL_MODEM_SLEEP*

To select which strategy to use for modem sleep

*Available options:*

- ORIG Mode(sleep with low power clock) (BTDM_CTRL_MODEM_SLEEP_MODE_ORIG)
  ORIG mode is a bluetooth sleep mode that can be used for dual mode controller. In this mode, bluetooth controller sleeps between BR/EDR frames and BLE events. A low power clock is used to maintain bluetooth reference clock.
- EVED Mode(For internal test only) (BTDM_CTRL_MODEM_SLEEP_MODE_EVED)
  EVED mode is for BLE only and is only for internal test. Do not use it for production. this mode is not compatible with DFS nor light sleep
CONFIG_BTDM_CTRL_LOW_POWER_CLOCK

Bluetooth low power clock

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options*

Select the low power clock source for Bluetooth controller. Bluetooth low power clock is the clock source to maintain time in sleep mode.

- “Main crystal” option provides good accuracy and can support Dynamic Frequency Scaling to be used with Bluetooth modem sleep. Light sleep is not supported.
- “External 32kHz crystal” option allows user to use a 32.768kHz crystal as Bluetooth low power clock. This option is allowed as long as External 32kHz crystal is configured as the system RTC clock source. This option provides good accuracy and supports Bluetooth modem sleep to be used alongside Dynamic Frequency Scaling or light sleep.

**Available options:**

- **Main crystal (BTDM_CTRL_LPCLK_SEL_MAIN_XTAL)**
  Main crystal can be used as low power clock for Bluetooth modem sleep. If this option is selected, Bluetooth modem sleep can work under Dynamic Frequency Scaling (DFS) enabled, but cannot work when light sleep is enabled. Main crystal has a good performance in accuracy as the Bluetooth low power clock source.

- **External 32kHz crystal (BTDM_CTRL_LPCLK_SEL_EXT_32K_XTAL)**
  External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.

CONFIG_BTDM_BLE_SLEEP_CLOCK_ACCURACY

BLE Sleep Clock Accuracy

*Found in: Component config > Bluetooth > Controller Options*

BLE Sleep Clock Accuracy (SCA) for the local device is used to estimate window widening in BLE connection events. With a lower level of clock accuracy (e.g. 500ppm over 250ppm), the slave needs a larger RX window to synchronize with master in each anchor point, thus resulting in an increase of power consumption but a higher level of robustness in keeping connected. According to the requirements of Bluetooth Core specification 4.2, the worst-case accuracy of Classic Bluetooth low power oscillator (LPO) is +/-250ppm in STANDBY and in low power modes such as sniff. For BLE the worst-case SCA is +/-500ppm.

- “151ppm to 250ppm” option is the default value for Bluetooth Dual mode
- “251ppm to 500ppm” option can be used in BLE only mode when using external 32kHz crystal as low power clock. This option is provided in case that BLE sleep clock has a lower level of accuracy, or other error sources contribute to the inaccurate timing during sleep.

**Available options:**

- 251ppm to 500ppm (BTDM_BLE_DEFAULT_SCA_500PPM)
- 151ppm to 250ppm (BTDM_BLE_DEFAULT_SCA_250PPM)

CONFIG_BTDM_BLE_SCAN_DUPL

BLE Scan Duplicate Options

*Found in: Component config > Bluetooth > Controller Options*

This select enables parameters setting of BLE scan duplicate.

**Default value:**

- Yes (enabled) if (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && BT_CONTROLLER_ENABLED
CONFIG_BTDM_SCAN_DUPL_TYPE

Scan Duplicate Type

*Found in:* Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL

Scan duplicate have three ways. One is “Scan Duplicate By Device Address”. This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data”. This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

**Available options:**

- Scan Duplicate By Device Address (BTDM_SCAN_DUPL_TYPE_DEVICE)
  This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once.

- Scan Duplicate By Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA)
  This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

- Scan Duplicate By Device Address And Advertising Data (BTDM_SCAN_DUPL_TYPE_DATA_DEVICE)
  This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported.

CONFIG_BTDM_SCAN_DUPL_CACHE_SIZE

Maximum number of devices in scan duplicate filter

*Found in:* Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**

- from 10 to 1000 if CONFIG_BTDM_BLE_SCAN_DUPL && BT_CONTROLLER_ENABLED

**Default value:**

- 100 if CONFIG_BTDM_BLE_SCAN_DUPL && BT_CONTROLLER_ENABLED

CONFIG_BTDM_SCAN_DUPL_CACHE_REFRESH_PERIOD

Duplicate scan list refresh period (seconds)

*Found in:* Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL

If the period value is non-zero, the controller will periodically clear the device information stored in the scan duplicate filter. If it is 0, the scan duplicate filter will not be cleared until the scanning is disabled. Duplicate advertisements for this period should not be sent to the Host in advertising report events. There are two scenarios where the ADV packet will be repeatedly reported: 1. The duplicate scan cache is full, the controller will delete the oldest device information and add new device information. 2. When the refresh period is up, the controller will clear all device information and start filtering again.

**Range:**

- from 0 to 1000 if CONFIG_BTDM_BLE_SCAN_DUPL && BT_CONTROLLER_ENABLED

**Default value:**

- 0 if CONFIG_BTDM_BLE_SCAN_DUPL && BT_CONTROLLER_ENABLED

CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN
Special duplicate scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL*

This enables the BLE scan duplicate for special BLE Mesh scan.

**Default value:**

- No (disabled) if `CONFIG_BTDM_BLE_SCAN_DUPL` && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_MESH_DUPL_SCAN_CACHE_SIZE**

Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_SCAN_DUPL > CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**

- from 10 to 1000 if `CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN` && BT_CONTROLLER_ENABLED

**Default value:**

- 100 if `CONFIG_BTDM_BLE_MESH_SCAN_DUPL_EN` && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_CTRL_FULL_SCAN_SUPPORTED**

BLE full scan feature supported

*Found in: Component config > Bluetooth > Controller Options*

The full scan function is mainly used to provide BLE scan performance. This is required for scenes with high scan performance requirements, such as BLE Mesh scenes.

**Default value:**

- Yes (enabled) if (BTDM_CTRL_MODE_BLE_ONLY || BTDM_CTRL_MODE_BTDM) && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP**

BLE adv report flow control supported

*Found in: Component config > Bluetooth > Controller Options*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**

- Yes (enabled) if (BTDM_CTRL_MODE_BTDM || BTDM_CTRL_MODE_BLE_ONLY) && BT_CONTROLLER_ENABLED

**CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM**

BLE adv report flow control number

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

The number of unprocessed advertising report that Bluedroid can save. If you set `BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a small value, this may cause adv packets lost. If you set `BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a large value, Bluedroid may cache a lot of adv packets and this may cause system memory run out. For example,
if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set `BTDM_BLE_ADV_REPORT_FLOW_CTRL_NUM` according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**Range:**
- from 50 to 1000 if `CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `BT_CONTROLLER_ENABLED`

**Default value:**
- 100 if `CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD**

BLE adv lost event threshold value

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set `BTDM_BLE_ADV_REPORT_DISCARD_THRESHOLD` to a small value or printf every adv lost event, it may cause adv packets lost more.

**Range:**
- from 1 to 1000 if `CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `BT_CONTROLLER_ENABLED`

**Default value:**
- 20 if `CONFIG_BTDM_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `BT_CONTROLLER_ENABLED`

**CONFIG_BTDM_CTRL_HLI**

High level interrupt

*Found in: Component config > Bluetooth > Controller Options*

Using Level 4 interrupt for Bluetooth.

**Default value:**
- Yes (enabled) if `CONFIG_BT_ENABLED` && `BT_CONTROLLER_ENABLED`

**CONFIG_BT_RELEASE_IRAM**

Release Bluetooth text (READ DOCS FIRST)

*Found in: Component config > Bluetooth*

This option release Bluetooth text section and merge Bluetooth data, bss & text into a large free heap region when esp_bt_mem_release is called, total saving ~21kB or more of IRAM. ESP32-C2 only 3 configurable PMP entries available, rest of them are hard-coded. We cannot split the memory into 3 different regions (IRAM, BLE-IRAM, DRAM). So this option will disable the PMP (ESP_SYSTEM_PMP_IDRAM_SPLIT)

**Default value:**
- No (disabled) if `CONFIG_BT_ENABLED` && `BT_LE_RELEASE_IRAM_SUPPORTED`

**CONFIG_BLE_MESH**

ESP BLE Mesh Support

*Found in: Component config*
This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- **BLE Mesh and BLE coexistence support**
- **CONFIG_BLE_MESH_GATT_PROXY_CLIENT**
- **CONFIG_BLE_MESH_GATT_PROXY_SERVER**
- **BLE Mesh NET BUF DEBUG LOG LEVEL**
- **CONFIG_BLE_MESH_PROV**
- **CONFIG_BLE_MESH_PROXY**
- **BLE Mesh specific test option**
- **BLE Mesh STACK DEBUG LOG LEVEL**
- **CONFIG_BLE_MESH_NO_LOG**
- **CONFIG_BLE_MESH_IVU_DIVIDER**
- **CONFIG_BLE_MESH_FAST_PROV**
- **CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC**
- **CONFIG_BLE_MESH_CRPL**
- **CONFIG_BLE_MESH_RX_SDU_MAX**
- **CONFIG_BLE_MESH_MODEL_KEY_COUNT**
- **CONFIG_BLE_MESH_APP_KEY_COUNT**
- **CONFIG_BLE_MESH_MODEL_GROUP_COUNT**

- **CONFIG_BLE_MESH_RELAY**
- **CONFIG_BLE_MESH_SETTINGS**
- **CONFIG_BLE_MESH_DEINIT**
- **CONFIG_BLE_MESH_USE_DUPLICATE_SCAN**
- **Support for BLE Mesh Client/Server models**
- **Support for BLE Mesh Foundation models**
- **CONFIG_BLE_MESH_NODE**
- **CONFIG_BLE_MESH_PROVISIONER**
- **CONFIG_BLE_MESH_FRIEND**
- **CONFIG_BLE_MESH_LOW_POWER**
- **CONFIG_BLE_MESH_HCI_5_0**
- **CONFIG_BLE_MESH_IV_UPDATE_TEST**
- **CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT**
- **CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT**

**CONFIG_BLE_MESH_HCI_5_0**

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG_BLE_MESH*

It is a temporary solution and needs further modifications.

**Default value:**

- Yes (enabled) if **CONFIG_BLE_MESH**

**CONFIG_BLE_MESH_USE_DUPLICATE_SCAN**
Support Duplicate Scan in BLE Mesh

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > CONFIG_BLE_MESH

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,
• Internal DRAM memory only
• External SPIRAM memory only
• Either internal or external memory based on default malloc() behavior in ESP-IDF
• Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:
• Internal DRAM (BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
• External SPIRAM (BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
• Default alloc mode (BLE_MESH_MEM_ALLOC_MODE_DEFAULT)
  Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
• Internal IRAM (BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)
  Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Enable FreeRTOS static allocation

Found in: Component config > CONFIG_BLE_MESH

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

Default value:
• No (disabled) if (CONFIG_SPIRAM || CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY) && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE

Memory allocation for FreeRTOS objects
Chapter 2. API Reference

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Choose the memory to be used for FreeRTOS objects.

Available options:
- External SPIRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)
  If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.
- Internal IRAM (BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT)
  If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

CONFIG_BLE_MESH_DEINIT

Support de-initialize BLE Mesh stack

Found in: Component config > CONFIG_BLE_MESH

If enabled, users can use the function esp_ble_mesh_deinit() to de-initialize the whole BLE Mesh stack.

Default value:
- Yes (enabled) if CONFIG_BLE_MESH

BLE Mesh and BLE coexistence support  Contains:
- CONFIG_BLE_MESH_SUPPORT_BLE_SCAN
- CONFIG_BLE_MESH_SUPPORT_BLE_ADV

CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Support sending normal BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can send normal BLE advertising packets with specific API.

Default value:
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT

Number of advertising buffers for BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Number of advertising buffers for BLE packets available.

Range:
- from 1 to 255 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

Default value:
- 3 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SUPPORT_BLE_SCAN

Support scanning normal BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.
Default value:
• No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_FAST_PROV
Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

Default value:
• No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_NODE
Support for BLE Mesh Node

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

CONFIG_BLE_MESH_PROVISIONER
Support for BLE Mesh Provisioner

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM
Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**
• from 1 to 100 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**Default value:**
• 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_PROV_NODES
Maximum number of devices that can be provisioned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.
**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_PBA_SAME_TIME**

Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

**Range:**
- from 1 to 10 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**
- 2 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_PBG_SAME_TIME**

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

**Range:**
- from 1 to 5 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT**

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

---

**CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

**Range:**
• from 1 to 4096 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

Default value:
• 3 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROVISIONER_RECV_HB

Support receiving Heartbeat messages

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

Default value:
• No (disabled) if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE

Maximum number of filter entries for receiving Heartbeat messages

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

Range:
• from 1 to 1000 if CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

Default value:
• 3 if CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROV

BLE Mesh Provisioning support

Found in: Component config > CONFIG_BLE_MESH

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_PB_ADV

Provisioning support using the advertising bearer (PB-ADV)

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

Default value:
• Yes (enabled) if CONFIG_BLE_MESH
CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE_MESH_FAST_PROV is selected, the value is better to be 3 seconds, or less.

Range:
- from 1 to 100 if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH

Default value:
- 5 if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH
- 3 if CONFIG_BLE_MESH_FAST_PROV && CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_PB_ADV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PB_GATT

Provisioning support using GATT (PB-GATT)

Found in: Component config > CONFIG_BLE_MESH

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

CONFIG_BLE_MESH_PROXY

BLE Mesh Proxy protocol support

Found in: Component config > CONFIG_BLE_MESH

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

Default value:
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_GATT_PROXY_SERVER

BLE Mesh GATT Proxy Server

Found in: Component config > CONFIG_BLE_MESH

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

Default value:
- Yes (enabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH

CONFIG_BLE_MESH_NODE_ID_TIMEOUT

Node Identity advertising timeout

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully
and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**
- from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH`

**Default value:**
- 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROXY_FILTER_SIZE**

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**Range:**
- from 1 to 32767 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH`

**Default value:**
- 4 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_GATT_PROXY_CLIENT**

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SETTINGS**

Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG_BLE_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_STORE_TIMEOUT**

Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH`
Default value:
- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SEQ_STORE_RATE**

How often the sequence number gets updated in storage

*Found in: Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that’s guaranteed to be larger than the last one used before power off.

*Range:*
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

*Default value:*
- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RPL_STORE_TIMEOUT**

Minimum frequency that the RPL gets updated in storage

*Found in: Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

*Range:*
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

*Default value:*
- 0 if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY**

A specific option for settings backward compatibility

*Found in: Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

*Default value:*
- No (disabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_SPECIFIC_PARTITION

Use a specific NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes’ information in the flash (e.g. more than 20), this option is recommended to be enabled.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PARTITION_NAME

Name of the NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION*

This value defines the name of the specified NVS partition used by the mesh stack.

**Default value:**
- “ble_mesh” if CONFIG_BLE_MESH_SPECIFIC_PARTITION && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE

Support using multiple NVS namespaces by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_NVS_NAMESPACE

Maximum number of NVS namespaces

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE*

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**
- from 1 to 255 if CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**Default value:**
- 2 if CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH
CONFIG_BLE_MESH_SUBNET_COUNT

Maximum number of mesh subnets per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_APP_KEY_COUNT

Maximum number of application keys per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_MODEL_KEY_COUNT

Maximum number of application keys per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_MODEL_GROUP_COUNT

Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

**Range:**
- from 1 to 4096 if `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LABEL_COUNT

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**Range:**
- from 0 to 4096 if `CONFIG_BLE_MESH`
Chapter 2. API Reference

**Default value:**
- 3 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_CRPL**

Maximum capacity of the replay protection list

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

*Range:*
- from 2 to 65535 if `CONFIG_BLE_MESH`

*Default value:*
- 10 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MSG_CACHE_SIZE**

Network message cache size

*Found in: Component config > CONFIG_BLE_MESH*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

*Range:*
- from 2 to 65535 if `CONFIG_BLE_MESH`

*Default value:*
- 10 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_ADV_BUF_COUNT**

Number of advertising buffers

*Found in: Component config > CONFIG_BLE_MESH*

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

*Range:*
- from 6 to 256 if `CONFIG_BLE_MESH`

*Default value:*
- 60 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_IVU_DIVIDER**

Divider for IV Update state refresh timer

*Found in: Component config > CONFIG_BLE_MESH*
When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**
- from 2 to 96 if `CONFIG_BLE_MESH`

**Default value:**
- 4 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_IVU_RECOVERY_IVI**

Recovery the IV index when the latest whole IV update procedure is missed

*Found in: Component config > CONFIG_BLE_MESH*

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TX_SEG_MSG_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**
- from 1 to if `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RX_SEG_MSG_COUNT**

Maximum number of simultaneous incoming segmented messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.
**CONFIG_BLE_MESH_RX_SDU_MAX**

Maximum incoming Upper Transport Access PDU length

*Found in: Component config > CONFIG_BLE_MESH*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

**Range:**
- from 36 to 384 if `CONFIG_BLE_MESH`

**Default value:**
- 384 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TX_SEG_MAX**

Maximum number of segments in outgoing messages

*Found in: Component config > CONFIG_BLE_MESH*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

**Range:**
- from 2 to 32 if `CONFIG_BLE_MESH`

**Default value:**
- 32 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RELAY**

Relay support

*Found in: Component config > CONFIG_BLE_MESH*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_NODE` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_RELAY_ADV_BUF**

Use separate advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY*

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.
Chapter 2. API Reference

Default value:
• No (disabled) if `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

`CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT`
Number of advertising buffers for relay packets

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF`

Number of advertising buffers for relay packets available.

*Range:*
• from 6 to 256 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` && `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

*Default value:*
• 60 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` && `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

`CONFIG_BLE_MESH_LOW_POWER`
Support for Low Power features

*Found in:* `Component config > CONFIG_BLE_MESH`

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

`CONFIG_BLE_MESH_LPN_ESTABLISHMENT`
Perform Friendship establishment using low power

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER`

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

*Default value:*
• No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

`CONFIG_BLE_MESH_LPN_AUTO`
Automatically start looking for Friend nodes once provisioned

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER`

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

*Default value:*
• No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

`CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT`
Time from last received message before going to LPN mode

*Found in:* `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO`

Submit Document Feedback
Chapter 2. API Reference

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

Range:
- from 0 to 3600 if CONFIG_BLE_MESH_LPN_AUTO && CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

Default value:
- 15 if CONFIG_BLE_MESH_LPN_AUTO && CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT

Retry timeout for Friend requests

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

Range:
- from 1 to 3600 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

Default value:
- 6 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_RSSI_FACTOR

RSSIFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

Range:
- from 0 to 3 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

Default value:
- 0 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR

ReceiveWindowFactor, used in Friend Offer Delay calculation

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

Range:
- from 0 to 3 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

Default value:
- 0 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE

Minimum size of the acceptable friend queue (MinQueueSizeLog)

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The MinQueueSizeLog field is defined as log_2(N), where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.
CONFIG_BLE_MESH_LPN_RECV_DELAY

Receive delay requested by the local node

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**
- from 1 to 255 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 100 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_POLL_TIMEOUT

The value of the PollTimeout timer

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**
- from 10 to 244735 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 300 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_INIT POLL_TIMEOUT

The starting value of the PollTimeout timer

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**
- from 10 to 49 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_LPN_SCAN_LATENCY

Latency for enabling scanning

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**
- from 0 to 50 if CONFIG_BLE_MESH_LOW_POWER && CONFIG_BLE_MESH

**Default value:**
- 10 if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_GROUPS**

Number of groups the LPN can subscribe to.

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**
- from 0 to 16384 if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH`

**Default value:**
- 8 if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_SUB_ALL_NODES_ADDR**

Automatically subscribe all nodes address.

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Automatically subscribe all nodes address when friendship established.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND**

Support for Friend feature.

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to be able to act as a Friend Node.

**CONFIG_BLE_MESH_FRIEND_RECV_WIN**

Friend Receive Window.

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_FRIEND` & `CONFIG_BLE_MESH`

**Default value:**
- 255 if `CONFIG_BLE_MESH_FRIEND` & `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE**

Minimum number of buffers supported per Friend Queue.

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**
- from 2 to 65536 if `CONFIG_BLE_MESH_FRIEND` & `CONFIG_BLE_MESH`

**Default value:**
- 16 if `CONFIG_BLE_MESH_FRIEND` & `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE**

Friend Subscription List Size

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**
- from 0 to 1023 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 3 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_LPN_COUNT**

Number of supported LPN nodes

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 2 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FRIEND_SEG_RX**

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*

Number of incomplete segment lists tracked for each Friends’ LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**Range:**
- from 1 to 1000 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**Default value:**
- 1 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_NO_LOG**

Disable BLE Mesh debug logs (minimize bin size)

*Found in: Component config > CONFIG_BLE_MESH*

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH` && `CONFIG_BLE_MESH`

**BLE Mesh STACK DEBUG LOG LEVEL**

Contains:

- `CONFIG_BLE_MESH_STACK_TRACE_LEVEL`
Chapter 2. API Reference

**CONFIG_BLE_MESH_STACK_TRACE_LEVEL**

BLE_MESH_STACK

*Found in:* `Component config > CONFIG_BLE_MESH > BLE Mesh STACK DEBUG LOG LEVEL`

Define BLE Mesh trace level for BLE Mesh stack.

**Available options:**

- NONE (BLE_MESH_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_TRACE_LEVEL_VERBOSE)

**BLE Mesh NET BUF DEBUG LOG LEVEL**

Contains:

- `CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL`

**CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL**

BLE_MESH_NET_BUF

*Found in:* `Component config > CONFIG_BLE_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL`

Define BLE Mesh trace level for BLE Mesh net buffer.

**Available options:**

- NONE (BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
- ERROR (BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
- WARNING (BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
- INFO (BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
- DEBUG (BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)
- VERBOSE (BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE)

**CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT**

Timeout(ms) for client message response

*Found in:* `Component config > CONFIG_BLE_MESH`

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

**Range:**

- from 100 to 1200000 if `CONFIG_BLE_MESH`

**Default value:**

- 4000 if `CONFIG_BLE_MESH`

**Support for BLE Mesh Foundation models**

Contains:

- `CONFIG_BLE_MESH_CFG_CLI`
- `CONFIG_BLE_MESH_HEALTH_CLI`
- `CONFIG_BLE_MESH_HEALTH_SRV`
Chapter 2. API Reference

**CONFIG_BLE_MESH_CFG_CLI**

Configuration Client model

*Found in:* `Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models`

Enable support for Configuration Client model.

**CONFIG_BLE_MESH_HEALTH_CLI**

Health Client model

*Found in:* `Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models`

Enable support for Health Client model.

**CONFIG_BLE_MESH_HEALTH_SRV**

Health Server model

*Found in:* `Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models`

Enable support for Health Server model.

**Support for BLE Mesh Client/Server models**

Contains:

- `CONFIG_BLE_MESH_GENERIC_BATTERY_CLI`
- `CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI`
- `CONFIG_BLE_MESH_GENERIC_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_LOCATION_CLI`
- `CONFIG_BLE_MESH_GENERIC_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI`
- `CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI`
- `CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI`
- `CONFIG_BLE_MESH_GENERIC_SERVER`
- `CONFIG_BLE_MESH_LIGHT_CTL_CLI`
- `CONFIG_BLE_MESH_LIGHT_HSL_CLI`
- `CONFIG_BLE_MESH_LIGHT_LC_CLI`
- `CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI`
- `CONFIG_BLE_MESH_LIGHT_XYL_CLI`
- `CONFIG_BLE_MESH_LIGHTING_SERVER`
- `CONFIG_BLE_MESH_SCENE_CLI`
- `CONFIG_BLE_MESH_SCHEDULER_CLI`
- `CONFIG_BLE_MESH_SENSOR_CLI`
- `CONFIG_BLE_MESH_SENSOR_SERVER`
- `CONFIG_BLE_MESH_TIME_SCENE_SERVER`
- `CONFIG_BLE_MESH_TIME_CLI`

**CONFIG_BLE_MESH_GENERIC_ONOFF_CLI**

Generic OnOff Client model

*Found in:* `Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models`

Enable support for Generic OnOff Client model.

---

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_GENERIC_LEVEL_CLI
Generic Level Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Level Client model.

CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI
Generic Default Transition Time Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Default Transition Time Client model.

CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI
Generic Power OnOff Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Power OnOff Client model.

CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI
Generic Power Level Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Power Level Client model.

CONFIG_BLE_MESH_GENERIC_BATTERY_CLI
Generic Battery Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Battery Client model.

CONFIG_BLE_MESH_GENERIC_LOCATION_CLI
Generic Location Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Location Client model.

CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI
Generic Property Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Property Client model.

CONFIG_BLE_MESH_SENSOR_CLI
Sensor Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Sensor Client model.
CONFIG_BLE_MESH_TIME_CLI

Time Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Time Client model.

CONFIG_BLE_MESH_SCENE_CLI

Scene Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Scene Client model.

CONFIG_BLE_MESH_SCHEDULER_CLI

Scheduler Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Scheduler Client model.

CONFIG_BLE_MESH_LIGHT_LIGHTESS_CLI

Light Lightness Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light Lightness Client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI

Light CTL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light CTL Client model.

CONFIG_BLE_MESH_LIGHT_HSL_CLI

Light HSL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light HSL Client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI

Light XYL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light XYL Client model.

CONFIG_BLE_MESH_LIGHT_LC_CLI

Light LC Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light LC Client model.
CONFIG_BLE_MESH_GENERIC_SERVER

Generic server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_SENSOR_SERVER

Sensor server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_TIME_SCENE_SERVER

Time and Scenes server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time and Scenes server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_LIGHTING_SERVER

Lighting server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_IV_UPDATE_TEST

Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**BLE Mesh specific test option**  Contains:

- `CONFIG_BLE_MESH_DEBUG`
- `CONFIG_BLE_MESH_SHELL`
- `CONFIG_BLE_MESH_BQB_TEST`
- `CONFIG_BLE_MESH_SELF_TEST`
- `CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK`
- `CONFIG_BLE_MESH_TEST_USE_WHITE_LIST`
CONFIG_BLE_MESH_SELF_TEST
Perform BLE Mesh self-tests

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_BQB_TEST
Enable BLE Mesh specific internal test

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

This option is used to enable some internal functions for auto-pts test.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK
Unprovisioned device enters mesh network automatically

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

With this option enabled, an unprovisioned device can automatically enter mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH_SELF_TEST && CONFIG_BLE_MESH

CONFIG_BLE_MESH_TEST_USE_WHITE_LIST
Use white list to filter mesh advertising packets

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH_SELF_TEST && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SHELL
Enable BLE Mesh shell

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_DEBUG
Enable BLE Mesh debug logs

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option

Enable debug logs for the BLE Mesh functionality.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH
**CONFIG_BLE_MESH_DEBUG_NET**

Network layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Network layer debug logs for the BLE Mesh functionality.

**CONFIG_BLE_MESH_DEBUG_TRANS**

Transport layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Transport layer debug logs for the BLE Mesh functionality.

**CONFIG_BLE_MESH_DEBUG_BEACON**

Beacon debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Beacon-related debug logs for the BLE Mesh functionality.

**CONFIG_BLE_MESH_DEBUG_CRYPTO**

Crypto debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable cryptographic debug logs for the BLE Mesh functionality.

**CONFIG_BLE_MESH_DEBUG_PROV**

Provisioning debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Provisioning debug logs for the BLE Mesh functionality.

**CONFIG_BLE_MESH_DEBUG_ACCESS**

Access layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Access layer debug logs for the BLE Mesh functionality.

**CONFIG_BLE_MESH_DEBUG_MODEL**

Foundation model debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Foundation Models debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_ADV
Advertising debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER
Low Power debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Low Power debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_FRIEND
Friend debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Friend debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROXY
Proxy debug

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Proxy protocol debug logs for the BLE Mesh functionality.

Driver Configurations Contains:

• GPIO Configuration
• GPTimer Configuration
• I2S Configuration
• Legacy ADC Configuration
• MCPWM Configuration
• PCNT Configuration
• RMT Configuration
• Sigma Delta Modulator Configuration
• SPI Configuration
• Temperature sensor Configuration
• TWAI Configuration
• UART Configuration

Legacy ADC Configuration Contains:

• CONFIG_ADC_DISABLE_DAC
• Legacy ADC Calibration Configuration
• CONFIG_ADC_SUPPRESS_DEPRECATE_WARN
**CONFIG_ADC_DISABLE_DAC**

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: Component config > Driver Configurations > Legacy ADC Configuration*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**
- Yes (enabled)

**CONFIG_ADC.Suppress_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Legacy ADC Configuration*

Whether to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**Legacy ADC Calibration Configuration**

Contains:

- **CONFIG_ADC_CALI.Suppress_DEPRECATE_WARN**
- **CONFIG_ADC_CAL_EFUSE_VREF_ENABLE**
- **CONFIG_ADC_CAL_LUT_ENABLE**
- **CONFIG_ADC_CAL_EFUSE_TP_ENABLE**

**CONFIG_ADC_CAL_EFUSE_TP_ENABLE**

Use Two Point Values

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**Default value:**
- Yes (enabled)

**CONFIG_ADC_CAL_EFUSE_VREF_ENABLE**

Use eFuse Vref

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

**Default value:**
- Yes (enabled)
CONFIG_ADC_CAL_LUT_ENABLE

Use Lookup Tables

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

**Default value:**
- Yes (enabled)

CONFIG_ADC_CALI_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Whether to suppress the deprecation warnings when using legacy adc calibration driver (esp_adc_cal.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

SPI Configuration Contains:

- CONFIG_SPI_MASTER_ISR_IN_IRAM
- CONFIG_SPI_SLAVE_ISR_IN_IRAM
- CONFIG_SPI_MASTER_IN_IRAM
- CONFIG_SPI_SLAVE_IN_IRAM

CONFIG_SPI_MASTER_IN_IRAM

Place transmitting functions of SPI master into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put queue\_trans, get\_trans\_result and transmit functions into the IRAM to avoid possible cache miss.

During unit test, this is enabled to measure the ideal case of api.

**Default value:**
- No (disabled)

CONFIG_SPI_MASTER_ISR_IN_IRAM

Place SPI master ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add ESP_INTR_FLAG_IRAM when initializing the driver.

**Default value:**
- Yes (enabled)
Chapter 2. API Reference

**CONFIG_SPI_SLAVE_IN_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans`, `get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**Default value:**
- No (disabled)

**CONFIG_SPI_SLAVE_ISR_IN_IRAM**

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**
- Yes (enabled)

**TWAI Configuration**  Contains:

- `CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID`
- `CONFIG_TWAI_ERRATA_FIX_LISTEN_ONLY_DOM`
- `CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC`
- `CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT`
- `CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST`
- `CONFIG_TWAI_ISR_IN_IRAM`

**CONFIG_TWAI_ISR_IN_IRAM**

Place TWAI ISR function into IRAM

*Found in: Component config > Driver Configurations > TWAI Configuration*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled:
- Users should also set the `ESP_INTR_FLAG_IRAM` in the driver configuration structure when installing the driver (see docs for specifics).
- Alert logging (i.e., setting of the `TWAI_ALERT_AND_LOG` flag) will have no effect.

**Default value:**
- No (disabled)

**CONFIG_TWAI_ERRATA_FIX_BUS_OFF_REC**

Add SW workaround for REC change during bus-off

*Found in: Component config > Driver Configurations > TWAI Configuration*

When the bus-off condition is reached, the REC should be reset to 0 and frozen (via LOM) by the driver’s ISR. However on the ESP32, there is an edge case where the REC will increase before the driver’s ISR can respond in time (e.g., due to the rapid occurrence of bus errors), thus causing the REC to be non-zero after bus-off. A non-zero REC can prevent bus-off recovery as the bus-off recovery condition
is that both TEC and REC become 0. Enabling this option will add a workaround in the driver to forcibly reset REC to zero on reaching bus-off.

**Default value:**
- Yes (enabled)

**CONFIG_TWAI_ERRATA_FIX_TX_INTR_LOST**
Add SW workaround for TX interrupt lost errata

*Found in: Component config > Driver Configurations > TWAI Configuration*

On the ESP32, when a transmit interrupt occurs, and interrupt register is read on the same APB clock cycle, the transmit interrupt could be lost. Enabling this option will add a workaround that checks the transmit buffer status bit to recover any lost transmit interrupt.

**Default value:**
- Yes (enabled)

**CONFIG_TWAI_ERRATA_FIX_RX_FRAME_INVALID**
Add SW workaround for invalid RX frame errata

*Found in: Component config > Driver Configurations > TWAI Configuration*

On the ESP32, when receiving a data or remote frame, if a bus error occurs in the data or CRC field, the data of the next received frame could be invalid. Enabling this option will add a workaround that will reset the peripheral on detection of this errata condition. Note that if a frame is transmitted on the bus whilst the reset is ongoing, the message will not be receive by the peripheral sent on the bus during the reset, the message will be lost.

**Default value:**
- Yes (enabled)

**CONFIG_TWAI_ERRATA_FIX_RX_FIFO_CORRUPT**
Add SW workaround for RX FIFO corruption errata

*Found in: Component config > Driver Configurations > TWAI Configuration*

On the ESP32, when the RX FIFO overruns and the RX message counter maxes out at 64 messages, the entire RX FIFO is no longer recoverable. Enabling this option will add a workaround that resets the peripheral on detection of this errata condition. Note that if a frame is being sent on the bus during the reset bus during the reset, the message will be lost.

**Default value:**
- Yes (enabled)

**CONFIG_TWAI_ERRATA_FIX_LISTEN_ONLY_DOM**
Add SW workaround for listen only transmits dominant bit errata

*Found in: Component config > Driver Configurations > TWAI Configuration*

When in the listen only mode, the TWAI controller must not influence the TWAI bus (i.e., must not send any dominant bits). However, while in listen only mode on the ESP32/ESP32-S2/ESP32-S3/ESP32-C3, the TWAI controller will still transmit dominant bits when it detects an error (i.e., as part of an active error frame). Enabling this option will add a workaround that forces the TWAI controller into an error passive state on initialization, thus preventing any dominant bits from being sent.

**Default value:**
- Yes (enabled)
**Temperature sensor Configuration**  
Contains:

- `CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG`
- `CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN`

**CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN**  
Suppress legacy driver deprecated warning  
*Found in: Component config > Driver Configurations > Temperature sensor Configuration*

Whether to suppress the deprecation warnings when using legacy temperature sensor driver (driver/temp_sensor.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled) if SOC_TEMP_SENSOR_SUPPORTED

**CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG**  
Enable debug log  
*Found in: Component config > Driver Configurations > Temperature sensor Configuration*

Whether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_TEMP_SENSOR_SUPPORTED

**UART Configuration**  
Contains:

- `CONFIG_UART_ISR_IN_IRAM`

**CONFIG_UART_ISR_IN_IRAM**  
Place UART ISR function into IRAM  
*Found in: Component config > Driver Configurations > UART Configuration*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**Default value:**
- No (disabled) if CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH

**GPIO Configuration**  
Contains:

- `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`
- `CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL`

**CONFIG_GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL**  
Support light sleep GPIO pullup/pulldown configuration for ESP32  
*Found in: Component config > Driver Configurations > GPIO Configuration*

This option is intended to fix the bug that ESP32 is not able to switch to configured pullup/pulldown mode in sleep. If this option is selected, chip will automatically emulate the behaviour of switching, and about 450B of source codes would be placed into IRAM.
**CONFIG_GPIO_CTRL_FUNC_IN_IRAM**

Place GPIO control functions into IRAM

*Found in: Component config > Driver Configurations > GPIO Configuration*

Place GPIO control functions (like intr_disable/set_level) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**
- No (disabled)

**Sigma Delta Modulator Configuration**

Contains:
- CONFIG_SDM_ENABLE_DEBUG_LOG
- CONFIG_SDM_CTRL_FUNC_IN_IRAM
- CONFIG_SDM_SUPPRESS_DEPRECATE_WARN

**CONFIG_SDM_CTRL_FUNC_IN_IRAM**

Place SDM control functions into IRAM

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Place SDM control functions (like set_duty) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

**CONFIG_SDM_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Whether to suppress the deprecation warnings when using legacy sigma delta driver. If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**CONFIG_SDM_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Whether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**GPTimer Configuration**

Contains:
- CONFIG_GPTIMER_ENABLE_DEBUG_LOG
- CONFIG_GPTIMER_ISR_IRAM_SAFE
- CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM
- CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN
Chapter 2. API Reference

**CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM**
Place GPTimer control functions into IRAM

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

**CONFIG_GPTIMER_ISR_IRAM_SAFE**
GPTimer ISR IRAM-Safe

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

**CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN**
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Wether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**CONFIG_GPTIMER_ENABLE_DEBUG_LOG**
Enable debug log

*Found in: Component config > Driver Configurations > GPTimer Configuration*

Wether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**PCNT Configuration**  Contains:
- **CONFIG_PCNT_ENABLE_DEBUG_LOG**
- **CONFIG_PCNT_ISR_IRAM_SAFE**
- **CONFIG_PCNT_CTRL_FUNC_IN_IRAM**
- **CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN**

**CONFIG_PCNT_CTRL_FUNC_IN_IRAM**
Place PCNT control functions into IRAM

*Found in: Component config > Driver Configurations > PCNT Configuration*
Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

**CONFIG_PCNT_ISR_IRAM_SAFE**

PCNT ISR IRAM-Safe

*Found in: Component config > Driver Configurations > PCNT Configuration*

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

**CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > PCNT Configuration*

Whether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**CONFIG_PCNT_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > PCNT Configuration*

Whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**RMT Configuration**  
Contains:

- **CONFIG_RMT_ENABLE_DEBUG_LOG**
- **CONFIG_RMT_ISR_IRAM_SAFE**
- **CONFIG_RMT_SUPPRESS_DEPRECATE_WARN**

**CONFIG_RMT_ISR_IRAM_SAFE**

RMT ISR IRAM-Safe

*Found in: Component config > Driver Configurations > RMT Configuration*

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)
CONFIG_RMT_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > RMT Configuration*

Wether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

CONFIG_RMT_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > RMT Configuration*

Wether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

MCPWM Configuration Contains:

- CONFIG_MCPWM_ENABLE_DEBUG_LOG
- CONFIG_MCPWM_CTRL_FUNC_IN_IRAM
- CONFIG_MCPWM_ISR_IRAM_SAFE
- CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN

CONFIG_MCPWM_ISR_IRAM_SAFE

Place MCPWM ISR function into IRAM

*Found in: Component config > Driver Configurations > MCPWM Configuration*

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

**Default value:**
- No (disabled)

CONFIG_MCPWM_CTRL_FUNC_IN_IRAM

Place MCPWM control functions into IRAM

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Place MCPWM control functions (like set_compare_value) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > MCPWM Configuration*
Wether to suppress the deprecation warnings when using legacy MCPWM driver (driver/mcpwm.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**CONFIG_MCPWM_ENABLE_DEBUG_LOG**
Enable debug log

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Wether to enable the debug log message for MCPWM driver. Note that, this option only controls the MCPWM driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**I2S Configuration**
Contains:
- **CONFIG_I2S_ENABLE_DEBUG_LOG**
- **CONFIG_I2S_ISR_IRAM_SAFE**
- **CONFIG_I2S_SUPPRESS_DEPRECATED_WARN**

**CONFIG_I2S_ISR_IRAM_SAFE**
I2S ISR IRAM-Safe

*Found in: Component config > Driver Configurations > I2S Configuration*

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

**CONFIG_I2S_SUPPRESS_DEPRECATED_WARN**
Supress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > I2S Configuration*

Enable this option will suppress the deprecation warnings of using APIs in legacy I2S driver.

**Default value:**
- No (disabled)

**CONFIG_I2S_ENABLE_DEBUG_LOG**
Enable I2S debug log

*Found in: Component config > Driver Configurations > I2S Configuration*

Wether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

**Default value:**
- No (disabled)
eFuse Bit Manager  Contains:

- `CONFIG_EFUSE_CODE_SCHEME_SELECTOR`
- `CONFIG_EFUSE_VIRTUAL`
- `CONFIG_EFUSE_CUSTOM_TABLE`

**CONFIG_EFUSE_CUSTOM_TABLE**

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_CUSTOM_TABLE_FILENAME**

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**
- “main/esp_efuse_custom_table.csv” if `CONFIG_EFUSE_CUSTOM_TABLE`

**CONFIG_EFUSE_VIRTUAL**

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If “n” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH**

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL*

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the `efuse` partition.

`partition.csv`: “efuse_em, data, efuse, , 0x2000,”

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure_boot and flash_encryption).

**CONFIG_EFUSE_CODE_SCHEME_SELECTOR**

Coding Scheme Compatibility

*Found in: Component config > eFuse Bit Manager*

Selector eFuse code scheme.
Available options:
- None Only (EFUSE_CODE_SCHEME_COMPAT_NONE)
- 3/4 and None (EFUSE_CODE_SCHEME_COMPAT_3_4)
- Repeat, 3/4 and None (common table does not support it) (EFUSE_CODE_SCHEME_COMPAT_REPEAT)

ESP-TLS Contains:
- CONFIG_ESP_TLS_INSECURE
- CONFIG_ESP_TLS_LIBRARY_CHOOSE
- CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS
- CONFIG_ESP_DEBUG_WOLFSSL
- CONFIG_ESP_TLS_SERVER
- CONFIG_ESP_TLS_PSK_VERIFICATION
- CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY
- CONFIG_ESP_TLS_USE_DS_PERIPHERAL
- CONFIG_ESP_TLS_USE_SECURE_ELEMENT

CONFIG_ESP_TLS_LIBRARY_CHOOSE
Choose SSL/TLS library for ESP-TLS (See help for more Info)

Found in: Component config > ESP-TLS

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

Available options:
- mbedTLS (ESP_TLS_USING_MBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (ESP_TLS_USING_WOLFSSL)

CONFIG_ESP_TLS_USE_SECURE_ELEMENT
Use Secure Element (ATECC608A) with ESP-TLS

Found in: Component config > ESP-TLS

Enable use of Secure Element for ESP-TLS, this enables internal support for ATECC608A peripheral on ESPWROOM32SE, which can be used for TLS connection.

CONFIG_ESP_TLS_USE_DS_PERIPHERAL
Use Digital Signature (DS) Peripheral with ESP-TLS

Found in: Component config > ESP-TLS

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

Default value:
- Yes (enabled) if ESP_TLS_USING_MBEDTLS & SOCDIGSIGN_SUPPORTED

CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS
Enable client session tickets

Found in: Component config > ESP-TLS

Enable session ticket support as specified in RFC5077.
CONFIG_ESP_TLS_SERVER

Enable ESP-TLS Server

*Found in: Component config > ESP-TLS*

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

Enable server session tickets

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER*

Enable session ticket support as specified in RFC5077

CONFIG_ESP_TLS_SERVER_SESSION_TICKET_TIMEOUT

Server session ticket timeout in seconds

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER > CONFIG_ESP_TLS_SERVER_SESSION_TICKETS*

Sets the session ticket timeout used in the tls server.

**Default value:**

- 86400 if `CONFIG_ESP_TLS_SERVER_SESSION_TICKETS`

CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK

Certificate selection hook

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER*

Ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc).

CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER*

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

mbedtls_ssl_get_verify_result() can be called after the handshake is complete to retrieve status of verification.

CONFIG_ESP_TLS_PSK_VERIFICATION

Enable PSK verification

*Found in: Component config > ESP-TLS*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.
**CONFIG_ESP_TLS_INSECURE**
Allow potentially insecure options

*Found in: Component config > ESP-TLS*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

**CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY**
Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_INSECURE*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. crt_bundle_attach, use_global_ca_store etc.). WARNING: Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

**CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY**
Enable SMALL_CERT_VERIFY

*Found in: Component config > ESP-TLS*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

*Default value:*
- Yes (enabled) if ESP_TLS_USING_WOLFSSL

**CONFIG_ESP_DEBUG_WOLFSSL**
Enable debug logs for wolfSSL

*Found in: Component config > ESP-TLS*

Enable detailed debug prints for wolfSSL SSL library.

**ADC and ADC Calibration**
Contains:
- ADC Calibration Configurations
- CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE
- CONFIG_ADC_DISABLE_DAC_OUTPUT
- CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM

**CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM**
Place ISR version ADC oneshot mode read function into IRAM

*Found in: Component config > ADC and ADC Calibration*

Place ISR version ADC oneshot mode read function into IRAM.

*Default value:*
- No (disabled)
CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE

ADC continuous mode driver ISR IRAM-Safe

*Found in: Component config > ADC and ADC Calibration*

Ensure the ADC continuous mode ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

**Default value:**
- No (disabled)

ADC Calibration Configurations

Contains:
- CONFIG_ADC_CALI_EFUSE_VREF_ENABLE
- CONFIG_ADC_CALI_LUT_ENABLE
- CONFIG_ADC_CALI_EFUSE_TP_ENABLE

CONFIG_ADC_CALI_EFUSE_TP_ENABLE

Use Two Point Values

*Found in: Component config > ADC and ADC Calibration > ADC Calibration Configurations*

Some ESP32s have Two Point calibration values burned into eFuse BLOCK3. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using Two Point values if they are available.

**Default value:**
- Yes (enabled)

CONFIG_ADC_CALI_EFUSE_VREF_ENABLE

Use eFuse Vref

*Found in: Component config > ADC and ADC Calibration > ADC Calibration Configurations*

Some ESP32s have Vref burned into eFuse BLOCK0. This option will allow the ADC calibration component to characterize the ADC-Voltage curve using eFuse Vref if it is available.

**Default value:**
- Yes (enabled)

CONFIG_ADC_CALI_LUT_ENABLE

Use Lookup Tables

*Found in: Component config > ADC and ADC Calibration > ADC Calibration Configurations*

This option will allow the ADC calibration component to use Lookup Tables to correct for non-linear behavior in 11db attenuation. Other attenuations do not exhibit non-linear behavior hence will not be affected by this option.

**Default value:**
- Yes (enabled)

CONFIG_ADC_DISABLE_DAC_OUTPUT

Disable DAC when ADC2 is in use

*Found in: Component config > ADC and ADC Calibration*

By default, this is set. The ADC oneshot driver will disable the output of the corresponding DAC channels: ESP32: IO25 and IO26 ESP32S2: IO17 and IO18
Disable this option so as to measure the output of DAC by internal ADC, for test usage.

**Default value:**
- Yes (enabled)

**Common ESP-related**
- Contains:
  - `CONFIG_ESP_ERR_TO_NAME_LOOKUP`

**CONFIG_ESP_ERR_TO_NAME_LOOKUP**

Enable lookup of error code strings

*Found in: Component config > Common ESP-related*

Functions `esp_err_to_name()` and `esp_err_to_name_r()` return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**
- Yes (enabled)

**Ethernet**
- Contains:
  - `CONFIG_ETH_TRANSMIT_MUTEX`
  - `CONFIG_ETH_USE_ESP32_EMAC`
  - `CONFIG_ETH_USE_OPENETH`
  - `CONFIG_ETH_USE_SPI_ETHERNET`

**CONFIG_ETH_USE_ESP32_EMAC**

Support ESP32 internal EMAC controller

*Found in: Component config > Ethernet*

ESP32 integrates a 10/100M Ethernet MAC controller.

**Default value:**
- Yes (enabled)

Contains:
- `CONFIG_ETH_DMA_RX_BUFFER_NUM`
- `CONFIG_ETH_DMA_TX_BUFFER_NUM`
- `CONFIG_ETH_IRAM_OPTIMIZATION`
- `CONFIG_ETH_SOFT_FLOW_CONTROL`
- `CONFIG_ETH_DMA_BUFFER_SIZE`
- `CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0`
- `CONFIG_ETH_PHY_INTERFACE`
- `CONFIG_ETH_RMII_CLK_OUT_GPIO`
- `CONFIG_ETH_RMII_CLK_MODE`

**CONFIG_ETH_PHY_INTERFACE**

PHY interface

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select the communication interface between MAC and PHY chip.

**Available options:**
- Reduced Media Independent Interface (RMII) (ETH_PHY_INTERFACE_RMII)
**CONFIG_ETH_RMII_CLK_MODE**

RMII clock mode

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Select external or internal RMII clock.

**Available options:**
- Input RMII clock from external (ETH_RMII_CLK_INPUT)
  MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.
- Output RMII clock from internal (ETH_RMII_CLK_OUTPUT)
  ESP32 can generate RMII clock by internal APLL. This clock can be routed to the external PHY device. ESP32 supports to route the RMII clock to GPIO0/16/17.

**CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0**

Output RMII clock from GPIO0 (Experimental!)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

**Default value:**
- No (disabled) if ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

**CONFIG_ETH_RMII_CLK_OUT_GPIO**

RMII clock GPIO number

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the GPIO number to output RMII Clock.

**Range:**
- from 16 to 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

**Default value:**
- 17 if CONFIG_ETH_RMII_CLK_OUTPUT_GPIO0 && ETH_RMII_CLK_OUTPUT && CONFIG_ETH_USE_ESP32_EMAC

**CONFIG_ETH_DMA_BUFFER_SIZE**

Ethernet DMA buffer size (Byte)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Set the size of each buffer used by Ethernet MAC DMA.

**Range:**
- from 256 to 1600

**Default value:**
- 512

**CONFIG_ETH_DMA_RX_BUFFER_NUM**
Amount of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA receive buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

**Range:**
- from 3 to 30

**Default value:**
- 10

---

**CONFIG_ETH_DMA_TX_BUFFER_NUM**

Amount of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Number of DMA transmit buffers. Each buffer’s size is ETH_DMA_BUFFER_SIZE. Larger number of buffers could increase throughput somehow.

**Range:**
- from 3 to 30

**Default value:**
- 10

---

**CONFIG_ETH_SOFT_FLOW_CONTROL**

Enable software flow control

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

Ethernet MAC engine on ESP32 doesn’t feature a flow control logic. The MAC driver can perform a software flow control if you enable this option. Note that, if the RX buffer number is small, enabling software flow control will cause obvious performance loss.

**Default value:**
- No (disabled) if CONFIG_ETH_DMA_RX_BUFFER_NUM > 15 && CONFIG_ETH_USE_ESP32_EMAC

---

**CONFIG_ETH_IRAM_OPTIMIZATION**

Enable IRAM optimization

*Found in: Component config > Ethernet > CONFIG_ETH_USE_ESP32_EMAC*

If enabled, functions related to RX/TX are placed into IRAM. It can improve Ethernet throughput. If disabled, all functions are placed into FLASH.

**Default value:**
- No (disabled)

---

**CONFIG_ETH_USE_SPI_Ethernet**

Support SPI to Ethernet Module

*Found in: Component config > Ethernet*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**
- Yes (enabled)

Contains:
- CONFIG_ETH_SPI_Ethernet_DM9051
• `CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL`
• `CONFIG_ETH_SPI_ETHERNET_W5500`

**CONFIG_ETH_SPI_ETHERNET_DM9051**

Use DM9051

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

DM9051 is a fast Ethernet controller with an SPI interface. It’s also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

**CONFIG_ETH_SPI_ETHERNET_W5500**

Use W5500 (MAC RAW)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

**CONFIG_ETH_SPI_ETHERNET_KSZ8851SNL**

Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

**CONFIG_ETH_USE_OPENETH**

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**

• No (disabled)

Contains:

• `CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM`
• `CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM`

**CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM**

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**

• from 1 to 64 if `CONFIG_ETH_USE_OPENETH`

**Default value:**

• 4 if `CONFIG_ETH_USE_OPENETH`
Chapter 2. API Reference

**CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM**

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

*Range:*
  - from 1 to 64 if `CONFIG_ETH_USE_OPENETH`

*Default value:*
  - 1 if `CONFIG_ETH_USE_OPENETH`

**CONFIG_ETH_TRANSMIT_MUTEX**

Enable Transmit Mutex

*Found in: Component config > Ethernet*

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

*Default value:*
  - No (disabled)

**Event Loop Library**

Contains:

- `CONFIG_ESP_EVENT_LOOP_PROFILING`
- `CONFIG_ESP_EVENT_POST_FROM_ISR`

**CONFIG_ESP_EVENT_LOOP_PROFILING**

Enable event loop profiling

*Found in: Component config > Event Loop Library*

Enables collections of statistics in the event loop library such as the number of events posted to/recieved by an event loop, number of callbacks involved, number of events dropped to to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

*Default value:*
  - No (disabled)

**CONFIG_ESP_EVENT_POST_FROM_ISR**

Support posting events from ISRs

*Found in: Component config > Event Loop Library*

Enable posting events from interrupt handlers.

*Default value:*
  - Yes (enabled)

**CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR**

Support posting events from ISRs placed in IRAM

*Found in: Component config > Event Loop Library > CONFIG_ESP_EVENT_POST_FROM_ISR*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

*Default value:*
  - Yes (enabled)
GDB Stub  Contains:
  • CONFIG_ESP_GDBSTUB_SUPPORT_TASKS

CONFIG_ESP_GDBSTUB_SUPPORT_TASKS
Enable listing FreeRTOS tasks through GDB Stub

Found in: Component config > GDB Stub

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using ‘info threads’ command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

CONFIG_ESP_GDBSTUB_MAX_TASKS
Maximum number of tasks supported by GDB Stub

Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS

Set the number of tasks which GDB Stub will support.

Default value:
  • 32 if CONFIG_ESP_GDBSTUB_SUPPORT_TASKS

ESP HTTP client  Contains:
  • CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH
  • CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH
  • CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS

CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS
Enable https

Found in: Component config > ESP HTTP client

This option will enable https protocol by linking esp-tls library and initializing SSL transport

Default value:
  • Yes (enabled)

CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH
Enable HTTP Basic Authentication

Found in: Component config > ESP HTTP client

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

Default value:
  • No (disabled)

CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH
Enable HTTP Digest Authentication

Found in: Component config > ESP HTTP client

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS
Default value:
- No (disabled)

HTTP Server  Contains:
- `CONFIG_HTTPD_QUEUE_WORK_BLOCKING`
- `CONFIG_HTTPD_PURGE_BUF_LEN`
- `CONFIG_HTTPD_LOG_PURGE_DATA`
- `CONFIG_HTTPD_MAX_REQ_HDR_LEN`
- `CONFIG_HTTPD_MAX_URI_LEN`
- `CONFIG_HTTPD_ERR_RESP_NO_DELAY`
- `CONFIG_HTTPD_WS_SUPPORT`

`CONFIG_HTTPD_MAX_REQ_HDR_LEN`
Max HTTP Request Header Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

Default value:
- 512

`CONFIG_HTTPD_MAX_URI_LEN`
Max HTTP URI Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of HTTP request URI to be processed by the server

Default value:
- 512

`CONFIG_HTTPD_ERR_RESP_NO_DELAY`
Use TCP_NODELAY socket option when sending HTTP error responses

*Found in: Component config > HTTP Server*

Using TCP_NODEALY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

Default value:
- Yes (enabled)

`CONFIG_HTTPD_PURGE_BUF_LEN`
Length of temporary buffer for purging data

*Found in: Component config > HTTP Server*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

Default value:
- 32
CONFIG_HTTPD_LOG_PURGE_DATA
Log purged content data at Debug level

Found in: Component config > HTTP Server

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

Default value:
• No (disabled)

CONFIG_HTTPD_WS_SUPPORT
WebSocket server support

Found in: Component config > HTTP Server

This sets the WebSocket server support.

Default value:
• No (disabled)

CONFIG_HTTPD_QUEUE_WORK_BLOCKING
httpd_queue_work as blocking API

Found in: Component config > HTTP Server

This makes httpd_queue_work() API to wait until a message space is available on UDP control socket. It internally uses a counting semaphore with count set to LWIP_UDP_RECMBOX_SIZE to achieve this. This config will slightly change API behavior to block until message gets delivered on control socket.

ESP HTTPS OTA  Contains:
• CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP
• CONFIG_HTTPS_OTA_DECRYPT_CB

CONFIG_ESP_HTTPS_OTA_DECRYPT_CB
Provide decryption callback

Found in: Component config > ESP HTTPS OTA

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

Default value:
• No (disabled)

CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP
Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: Component config > ESP HTTPS OTA

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

Default value:
• No (disabled)
ESP HTTPS server  Contains:

- `CONFIG_ESP_HTTPS_SERVER_ENABLE`

**CONFIG_ESP_HTTPS_SERVER_ENABLE**

Enable ESP_HTTPS_SERVER component

*Found in: Component config > ESP HTTPS server*

Enable ESP HTTPS server component

**Hardware Settings**  Contains:

- Chip revision
- `ESP_SLEEP_WORKAROUND`
- GDMA Configuration
- MAC Config
- Main XTAL Config
- Peripheral Control
- RTC Clock Config
- Sleep Config

**Chip revision**  Contains:

- `CONFIG_ESP32_REV_MIN`

**CONFIG_ESP32_REV_MIN**

Minimum Supported ESP32 Revision

*Found in: Component config > Hardware Settings > Chip revision*

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

**Available options:**

- Rev v0.0 (ECO0) (ESP32_REV_MIN_0)
- Rev v1.0 (ECO1) (ESP32_REV_MIN_1)
- Rev v1.1 (ECO1.1) (ESP32_REV_MIN_1_1)
- Rev v2.0 (ECO2) (ESP32_REV_MIN_2)
- Rev v3.0 (ECO3) (ESP32_REV_MIN_3)
- Rev v3.1 (ECO4) (ESP32_REV_MIN_3_1)

**MAC Config**  Contains:

- `CONFIG_ESP_MAC_IGNORE_MAC_CRC_ERROR`
- `CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES`

**CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES**

Number of universally administered (by IEEE) MAC address

*Found in: Component config > Hardware Settings > MAC Config*

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address. If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially.
by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

**Available options:**
- Two (ESP32_UNIVERSAL_MAC_ADDRESSES_TWO)
- Four (ESP32_UNIVERSAL_MAC_ADDRESSES_FOUR)

**CONFIG_ESP_MAC_IGNORE_MAC_CRC_ERROR**

Ignore MAC CRC error (not recommended)

*Found in: Component config > Hardware Settings > MAC Config*

If you have an invalid MAC CRC (ESP_ERR_INVALID_CRC) problem and you still want to use this chip, you can enable this option to bypass such an error. This applies to both MAC_FACTORY and CUSTOM_MAC fusces.

*Default value:*
- No (disabled)

**Sleep Config**

Contains:

- CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS
- CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND
- CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS
- CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND
- CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS
- CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND
- CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS
- CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND

**CONFIG_ESP_SLEEP_POWER_DOWN_FLASH**

Power down flash in light sleep when there is no SPIRAM

*Found in: Component config > Hardware Settings > Sleep Config*

If enabled, chip will try to power down flash as part of esp_light_sleep_start(), which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using esp_sleep_pd_config() to set ESP_PD_DOMAIN_VDDSDIO to ESP_PD_OPTION_OFF. It should be noted that there is a risk in powering down flash, you can refer ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash for more details.

*Default value:*
- No (disabled) if CONFIG_SPIRAM

**CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND**

Pull-up Flash CS pin in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

All I/Os will be set to isolate(floating) state by default during sleep. Since the power supply of SPI Flash is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state,
there will be a large current leakage, and the data in Flash may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of Flash to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of SPI Flash in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don’t deselect this option if you don’t have external SPI Flash CS pin pullups.)

**Default value:**

- Yes (enabled) if `CONFIG_ESP_SLEEP_POWER_DOWN_FLASH`

**CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND**

Pull-up PSRAM CS pin in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

All IOs will be set to isolate (floating) state by default during sleep. Since the power supply of PSRAM is not lost during lightsleep, if its CS pin is recognized as low level (selected state) in the floating state, there will be a large current leakage, and the data in PSRAM may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of PSRAM to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of PSRAM in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don’t deselect this option if you don’t have external PSRAM CS pin pullups.)

**Default value:**

- Yes (enabled) if `CONFIG_SPIRAM`

**CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU**

Pull-up all SPI pins in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

**CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND**

light sleep GPIO reset workaround

*Found in: Component config > Hardware Settings > Sleep Config*

esp32c2, esp32c3 and esp32s3 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating. The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

**CONFIG_ESP_SLEEP_DEEP_SLEEP_WAKEUP_DELAY**

Extra delay in deep sleep wake stub (in us)

*Found in: Component config > Hardware Settings > Sleep Config*
When the chip exits deep sleep, the CPU and the flash chip are powered on at the same time. CPU will run deep sleep stub first, and then proceed to load code from flash. Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

By default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing “flash read err, 1000” message printed to the console after deep sleep reset, try increasing this value.

**Range:**
- from 0 to 5000

**Default value:**
- 2000

**CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS**

Allow to enable internal pull-up/downs for the Deep-Sleep wakeup IOs

*Found in: Component config > Hardware Settings > Sleep Config*

When using rtc gpio wakeup source during deepsleep without external pull-up/downs, you may want to make use of the internal ones.

**Default value:**
- Yes (enabled)

**ESP_SLEEP_WORKAROUND**

**RTC Clock Config**

Contains:
- **CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD**
- **CONFIG_RTC_XTAL_CAL_RETRY**
- **CONFIG_RTC_CLK_CAL_CYCLES**
- **CONFIG_RTC_CLK_SRC**

**CONFIG_RTC_CLK_SRC**

RTC clock source

*Found in: Component config > Hardware Settings > RTC Clock Config*

Choose which clock is used as RTC clock source.

- **“Internal 150kHz oscillator”** option provides lowest deep sleep current consumption, and does not require extra external components. However frequency stability with respect to temperature is poor, so time may drift in deep/light sleep modes.

- **“External 32kHz crystal”** provides better frequency stability, at the expense of slightly higher (1uA) deep sleep current consumption.

- **“External 32kHz oscillator”** allows using 32kHz clock generated by an external circuit. In this case, external clock signal must be connected to 32K_XN pin. Amplitude should be <1.2V in case of sine wave signal, and <1V in case of square wave signal. Common mode voltage should be 0.1 < Vcm < 0.5Vamp, where Vamp is the signal amplitude. Additionally, 1nF capacitor must be connected between 32K_XP pin and ground. 32K_XP pin cannot be used as a GPIO in this case.

- **“Internal 8.5MHz oscillator divided by 256”** option results in higher deep sleep current (by 5uA) but has better frequency stability than the internal 150kHz oscillator. It does not require external components.

**Available options:**
- Internal 150kHz RC oscillator (**RTC_CLK_SRC_INT_RC**)

• External 32kHz crystal (RTC_CLK_SRC_EXT_CRYS)
• External 32kHz oscillator at 32K_XN pin (RTC_CLK_SRC_EXT_OSC)
• Internal 8.5MHz oscillator, divided by 256 (~33kHz) (RTC_CLK_SRC_INT_8MD256)

CONFIG_RTC_EXT_CRYST_ADDIT_CURRENT_METHOD

Additional current for external 32kHz crystal

Found in: Component config > Hardware Settings > RTC Clock Config

With some 32kHz crystal configurations, the X32N and X32P pins may not have enough drive strength to keep the crystal oscillating. Choose the method to provide additional current from touchpad 9 to the external 32kHz crystal. Note that the deep sleep current is slightly high (4-5uA) and the touchpad and the wakeup sources of both touchpad and ULP are not available in method 1 and method 2.

This problem is fixed in ESP32 ECO 3, so this workaround is not needed. Setting the project configuration to minimum revision ECO3 will disable this option, allow all wakeup sources, and save some code size.

• "None" option will not provide additional current to external crystal
• "Method 1" option cannot ensure 100% to solve the external 32k crystal start failed issue, but the touchpad can work in this method.
• "Method 2" option can solve the external 32k issue, but the touchpad cannot work in this method.

Available options:
• None (RTC_EXT_CRYST_ADDIT_CURRENT_NONE)
• Method 1 (RTC_EXT_CRYST_ADDIT_CURRENT)
• Method 2 (RTC_EXT_CRYST_ADDIT_CURRENT_V2)

CONFIG_RTC_CLK_CAL_CYCLES

Number of cycles for RTC_SLOW_CLK calibration

Found in: Component config > Hardware Settings > RTC Clock Config

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

• 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
• 32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more. In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

Range:
• From 0 to 27000 if RTC_CLK_SRC_EXT_CRYS || RTC_CLK_SRC_EXT_OSC || RTC_CLK_SRC_INT_8MD256
• From 0 to 32766

Default value:
• 3000 if RTC_CLK_SRC_EXT_CRYS || RTC_CLK_SRC_EXT_OSC || RTC_CLK_SRC_INT_8MD256
• 1024

CONFIG_RTC_XTAL_CAL_RETRY
Number of attempts to repeat 32k XTAL calibration

*Found in: Component config > Hardware Settings > RTC Clock Config*

Number of attempts to repeat 32k XTAL calibration before giving up and switching to the internal RC. Increase this option if the 32k crystal oscillator does not start and switches to internal RC.

**Default value:**
- 1 if RTC_CLK_SRC_EXT_CRYS

**Peripheral Control**
Contains:
- `CONFIG_PERIPH_CTRL_FUNC_IN_IRAM`

**CONFIG_PERIPH_CTRL_FUNC_IN_IRAM**
Place peripheral control functions into IRAM

*Found in: Component config > Hardware Settings > Peripheral Control*

Place peripheral control functions (e.g. `periph_module_reset`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**
- No (disabled)

**GDMA Configuration**
Contains:
- `CONFIG_GDMA_ISR_IRAM_SAFE`
- `CONFIG_GDMA_CTRL_FUNC_IN_IRAM`

**CONFIG_GDMA_CTRL_FUNC_IN_IRAM**
Place GDMA control functions into IRAM

*Found in: Component config > Hardware Settings > GDMA Configuration*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled) if SOC_GDMA_SUPPORTED

**CONFIG_GDMA_ISR_IRAM_SAFE**
GDMA ISR IRAM-Safe

*Found in: Component config > Hardware Settings > GDMA Configuration*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

**Default value:**
- No (disabled) if SOC_GDMA_SUPPORTED

**Main XTAL Config**
Contains:
- `CONFIG_XTAL_FREQ_SEL`
**CONFIG_XTAL_FREQ_SEL**

Main XTAL frequency

*Found in: Component config > Hardware Settings > Main XTAL Config*

This option selects the operating frequency of the XTAL (crystal) clock used to drive the ESP target. The selected value MUST reflect the frequency of the given hardware.

Note: The XTAL_FREQ_AUTO option allows the ESP target to automatically estimating XTAL clock’s operating frequency. However, this feature is only supported on the ESP32. The ESP32 uses the internal 8MHZ as a reference when estimating. Due to the internal oscillator’s frequency being temperature dependent, usage of the XTAL_FREQ_AUTO is not recommended in applications that operate in high ambient temperatures or use high-temperature qualified chips and modules.

**Available options:**
- 24 MHz (XTAL_FREQ_24)
- 26 MHz (XTAL_FREQ_26)
- 32 MHz (XTAL_FREQ_32)
- 40 MHz (XTAL_FREQ_40)
- Autodetect (XTAL_FREQ_AUTO)

**LCD and Touch Panel**

*Contains:*

- **LCD Peripheral Configuration**

  **CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE**

  LCD panel io format buffer size

  *Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

  LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

  **Default value:**
  - 32

**CONFIG_LCD_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Whether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**CONFIG_LCD_RGB_ISR_IRAM_SAFE**

RGB LCD ISR IRAM-Safe

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*
Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

**Default value:**
- No (disabled) if SOC_LCD_RGB_SUPPORTED

**CONFIG_LCD_RGB_RESTART_IN_VSYNC**

Restart transmission in VSYNC

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Reset the GDMA channel every VBlank to stop permanent desyncs from happening. Only need to enable it when in your application, the DMA can’t deliver data as fast as the LCD consumes it.

**Default value:**
- No (disabled) if SOC_LCD_RGB_SUPPORTED

**ESP NETIF Adapter**

Contains:

- `CONFIG_ESP_NETIF_BRIDGE_EN`
- `CONFIG_ESP_NETIF_L2_TAP`
- `CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL`
- `CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB`
- `CONFIG_ESP_NETIF_RECEIVE_REPORT_ERRORS`

**CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL**

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM_EVENT_STA_LOST_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**
- from 0 to 65535

**Default value:**
- 120

**CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB**

TCP/IP Stack Library

*Found in: Component config > ESP NETIF Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

**Available options:**
- LwIP (ESP_NETIF_TCPIP_LWIP)
  lwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (ESP_NETIF_LOOPBACK)
  Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only
CONFIG_ESP_NETIF_RECEIVE_REPORT_ERRORS

Use esp_err_t to report errors from esp_netif_receive.

Found in: Component config > ESP NETIF Adapter

Enable if esp_netif_receive() should return error code. This is useful to inform upper layers that packet input to TCP/IP stack failed, so the upper layers could implement flow control. This option is disabled by default due to backward compatibility and will be enabled in v6.0 (IDF-7194).

Default value:
- No (disabled)

CONFIG_ESP_NETIF_L2_TAP

Enable netif L2 TAP support.

Found in: Component config > ESP NETIF Adapter

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

CONFIG_ESP_NETIF_L2_TAP_MAX_FDS

Maximum number of opened L2 TAP File descriptors.

Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP

Maximum number of opened File descriptors (FDs) associated with ESP TAP device. ESP TAP FDs take up a certain amount of memory, and allowing fewer FDs to be opened at the same time conserves memory.

Range:
- from 1 to 10 if CONFIG_ESP_NETIF_L2_TAP

Default value:
- 5 if CONFIG_ESP_NETIF_L2_TAP

CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE

Size of L2 TAP Rx queue.

Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

Range:
- from 1 to 100 if CONFIG_ESP_NETIF_L2_TAP

Default value:
- 20 if CONFIG_ESP_NETIF_L2_TAP

CONFIG_ESP_NETIF_BRIDGE_EN

Enable LwIP IEEE 802.1D bridge.

Found in: Component config > ESP NETIF Adapter

Enable LwIP IEEE 802.1D bridge support in ESP-NETIF. Note that “Number of clients store data in netif” (LWIP_NUM_NETIF_CLIENT_DATA) option needs to be properly configured to be LwIP bridge available.

Default value:
- No (disabled)
PHY Contains:

- CONFIG_ESP_PHY_CALIBRATION_MODE
- CONFIG_ESP_PHY_IMPROVE_RX_11B
- CONFIG_ESP_PHY_MAX_WIFI_TX_POWER
- CONFIG_ESP_PHY_REDUCE_TX_POWER
- CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE
- CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE

Store phy calibration data in NVS

*Found in: Component config > PHY*

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it’s easy that your board calibrate bad data, choose ‘n’. Two cases for example, you should choose ‘n’: 1. If your board is easy to be booted up with antenna disconnected. 2. Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose ‘y’.

*Default value:*

- Yes (enabled)

CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

Use a partition to store PHY init data

*Found in: Component config > PHY*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: ‘data’, subtype: ‘phy’). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose ‘n’.

*Default value:*

- No (disabled)

Contains:

- CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID
- CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN

CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID

Reset default PHY init data if invalid

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose ‘n’.

*Default value:*

- No (disabled) if CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION
CONFIG ESP PHY MULTIPLE INIT DATA BIN

Support multiple PHY init data bin

Found in: Component config > PHY > CONFIG ESP PHY INIT DATA IN_PARTITION

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China’s PHY init data bin is used by default. Can be modified by country information in API esp_wifi_set_country(). The priority of switching the PHY init data type is:

1. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_MANUAL.
2. Country notified by the connected AP.
3. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_AUTO.

Default value:
- No (disabled) if CONFIG ESP PHY INIT DATA IN_PARTITION && CONFIG ESP PHY MULTIPLE INIT DATA BIN

CONFIG ESP PHY MULTIPLE INIT DATA BIN EMBED

Support embedded multiple phy init data bin to app bin

Found in: Component config > PHY > CONFIG ESP PHY INIT DATA IN_PARTITION > CONFIG ESP PHY MULTIPLE INIT DATA BIN

If enabled, multiple phy init data bin will embedded into app bin. If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

Default value:
- No (disabled) if CONFIG ESP PHY MULTIPLE INIT DATA BIN && CONFIG ESP PHY INIT DATA IN_PARTITION

CONFIG ESP PHY INIT DATA ERROR

Terminate operation when PHY init data error

Found in: Component config > PHY > CONFIG ESP PHY INIT DATA IN_PARTITION > CONFIG ESP PHY MULTIPLE INIT DATA BIN

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

Default value:
- No (disabled) if CONFIG ESP PHY MULTIPLE INIT DATA BIN && CONFIG ESP PHY INIT DATA IN_PARTITION

CONFIG ESP PHY MAX WIFI TX POWER

Max WiFi TX power (dBm)

Found in: Component config > PHY

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

Range:
- from 10 to 20

Default value:
- 20

CONFIG ESP PHY REDUCE TX POWER
Reduce PHY TX power when brownout reset  

*Found in: Component config > PHY*

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**
- No (disabled)

**CONFIG_ESP_PHY_CALIBRATION_MODE**

Calibration mode  

*Found in: Component config > PHY*

Select PHY calibration mode. During RF initialization, the partial calibration method is used by default for RF calibration. Full calibration takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. No calibration method is only used when the device wakes up from deep sleep.

**Available options:**
- Calibration partial (ESP_PHY_RF_CAL_PARTIAL)
- Calibration none (ESP_PHY_RF_CAL_NONE)
- Calibration full (ESP_PHY_RF_CAL_FULL)

**CONFIG_ESP_PHY_IMPROVE_RX_11B**

Improve Wi-Fi receive 11b pkts  

*Found in: Component config > PHY*

This is a workaround to improve Wi-Fi receive 11b pkts for some modules using AC-DC power supply with high interference, enable this option will sacrifice Wi-Fi OFDM receive performance. But to guarantee 11b receive performance serves as a bottom line in this case.

**Default value:**
- No (disabled) if SOC_PHY_IMPROVE_RX_11B

**Power Management**

Contains:

- CONFIG_PM_SLP_DISABLE_GPIO
- CONFIG_PM_SLP_IRAM_OPT
- CONFIG_PMRTOS_IDLE_OPT
- CONFIG_PM_ENABLE

**CONFIG_PM_ENABLE**

Support for power management  

*Found in: Component config > Power Management*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**
- No (disabled) if CONFIG_FREERTOS_SMP
CONFIG_PM_DFS_INIT_AUTO

Enable dynamic frequency scaling (DFS) at startup

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_PROFILING

Enable profiling counters for PM locks

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_TRACE

Enable debug tracing of PM using GPIOs

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_SLP_IRAM_OPT

Put lightsleep related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 1.8KB of lightsleep related source code would be in IRAM and chip would sleep longer for 760us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_RTOS_IDLE_OPT

Put RTOS IDLE related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 260B of RTOS_IDLE related source code would be in IRAM and chip would sleep longer for 40us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.
CONFIG_PM_SLP_DISABLE_GPIO

Disable all GPIO when chip at sleep

*Found in: Component config > Power Management*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200–300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call `gpio_sleep_sel_dis` to disable this feature on those pins. You can also keep this feature on and call `gpio_sleep_set_direction` and `gpio_sleep_set_pull_mode` to have a different GPIO configuration at sleep. Warning: If you want to enable this option on ESP32, you should enable `GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL` at first, otherwise you will not be able to switch pullup/pulldown mode.

ESP PSRAM

Contains:

- `CONFIG_SPIRAM`

CONFIG_SPIRAM

Support for external, SPI-connected RAM

*Found in: Component config > ESP PSRAM*

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

**Default value:**
- No (disabled)

SPI RAM config

Contains:

- `CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_ALLOW_NOINIT_SEG_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY`
- `CONFIG_SPIRAM_SPIWP_SD3_PIN`
- `CONFIG_SPIRAM_BANKSWITCH_ENABLE`
- `CONFIG_SPIRAM_2T_MODE`
- `CONFIG_SPIRAM_CACHE_WORKAROUND`
- `CONFIG_SPIRAM_BOOT_INIT`
- `CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL`
- `PSRAM clock and cs IO for ESP32-D2WD`
- `PSRAM clock and cs IO for ESP32-DOWD`
- `PSRAM clock and cs IO for ESP32-PICO-D4`
- `CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL`
- `CONFIG_SPIRAM_MEMTEST`
- `CONFIG_SPIRAM_OCCUPY_SPI_HOST`
- `CONFIG_SPIRAM_TYPE`
- `SPIRAM cache workaround debugging`
- `SPIRAM workaround libraries placement`
- `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- `CONFIG_SPIRAM_CACHE_WORKAROUND`
- `CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN`

CONFIG_SPIRAM_TYPE

Type of SPI RAM chip in use

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*
Available options:

- Auto-detect (SPIRAM_TYPE_AUTO)
- ESP-PSRAM16 or APS1604 (SPIRAM_TYPE_ESPPSRAM16)
- ESP-PSRAM32 (SPIRAM_TYPE_ESPPSRAM32)
- ESP-PSRAM64 or LY68L6400 (SPIRAM_TYPE_ESPPSRAM64)

**CONFIG_SPIRAM_SPEED**

Set RAM clock speed

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Select the speed for the SPI RAM chip. If SPI RAM is enabled, we only support three combinations of SPI speed mode we supported now:

1. Flash SPI running at 40Mhz and RAM SPI running at 40Mhz
2. Flash SPI running at 80Mhz and RAM SPI running at 40Mhz
3. Flash SPI running at 80Mhz and RAM SPI running at 80Mhz

Note: If the third mode(80Mhz+80Mhz) is enabled for SPI RAM of type 32MBit, one of the HSPI/VSPI host will be occupied by the system. Which SPI host to use can be selected by the config item SPIRAM_OCCUPY_SPI_HOST. Application code should never touch HSPI/VSPI hardware in this case. The option to select 80MHz will only be visible if the flash SPI speed is also 80MHz. (ESP-TOOLPY_FLASHFREQ_80M is true)

Available options:

- 40MHz clock speed (SPIRAM_SPEED_40M)
- 80MHz clock speed (SPIRAM_SPEED_80M)

**CONFIG_SPIRAM_BOOT_INIT**

Initialize SPI RAM during startup

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you’ll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

*Default value:*

- Yes (enabled) if CONFIG_SPIRAM

**CONFIG_SPIRAM_IGNORE_NOTFOUND**

Ignore PSRAM when not found

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > CONFIG_SPIRAM_BOOT_INIT*

Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

*Default value:*

- No (disabled) if CONFIG_SPIRAM_BOOT_INIT && CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY && CONFIG_SPIRAM

**CONFIG_SPIRAM_USE**

SPI RAM access method

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU’s memory map, by integrating it in the heap as ‘special’ memory needing
heap_caps_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

**Available options:**
- Integrate RAM into memory map (SPIRAM_USE_MEMMAP)
- Make RAM allocatable using heap_caps_malloc(...) (SPIRAM_USE_CAPS_ALLOC)
- Make RAM allocatable using malloc() as well (SPIRAM_USE_MALLOC)

**CONFIG_SPIRAM_MEMTEST**

Run memory test on SPI RAM initialization

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

**Default value:**
- Yes (enabled) if CONFIG_SPIRAM_BOOT_INIT && CONFIG_SPIRAM

**CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL**

Maximum malloc() size, in bytes, to always put in internal memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.

**Range:**
- from 0 to 131072 if SPIRAM_USE_MALLOC && CONFIG_SPIRAM

**Default value:**
- 16384 if SPIRAM_USE_MALLOC && CONFIG_SPIRAM

**CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP**

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

**Default value:**
- No (disabled) if (SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_SPIRAM

**CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL**

Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that’s also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.
Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

**Range:**
- from 0 to 262144 if SPIRAM_USE_MALLOC && CONFIG_SPIRAM

**Default value:**
- 32768 if SPIRAM_USE_MALLOC && CONFIG_SPIRAM

**CONFIG_SPIRAM_ALLOW_BSS_SEGEXTERNAL_MEMORY**

Allow .bss segment placed in external memory

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

If enabled, variables with EXT_RAM_BSS_ATTR attribute will be placed in SPIRAM instead of internal DRAM. BSS section of lwip, net80211, pp, bt libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme extram_bss.

Note that the variables placed in SPIRAM using EXT_RAM_BSS_ATTR will be zero initialized.

**Default value:**
- No (disabled) if CONFIG_SPIRAM && CONFIG_SPIRAM

**CONFIG_SPIRAM_ALLOW_NOINITSEGEXTERNAL_MEMORY**

Allow .noinit segment placed in external memory

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

If enabled, noinit variables can be placed in PSRAM using EXT_RAM_NOINIT_ATTR.

Note the values placed into this section will not be initialized at startup and should keep its value after software restart.

**Default value:**
- No (disabled) if CONFIG_SPIRAM && CONFIG_SPIRAM

**CONFIG_SPIRAM_CACHE_WORKAROUND**

Enable workaround for bug in SPI RAM cache for Rev1 ESP32s

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Revision 1 of the ESP32 has a bug that can cause a write to PSRAM not to take place in some situations when the cache line needs to be fetched from external RAM and an interrupt occurs. This enables a fix in the compiler (-mfix-esp32-psram-cache-issue) that makes sure the specific code that is vulnerable to this will not be emitted.

This will also not use any bits of newlib that are located in ROM, opting for a version that is compiled with the workaround and located in flash instead.

The workaround is not required for ESP32 revision 3 and above.

**Default value:**
- Yes (enabled) if (SPIRAM_USE_MEMMAP || SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC) && CONFIG_SPIRAM

**SPIRAM cache workaround debugging**

Contains:
- CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY
CONFIG_SPIRAM_CACHE_WORKAROUND_STRATEGY

Workaround strategy

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM cache workaround debugging*

Select the workaround strategy. Note that the strategy for precompiled libraries (libgcc, newlib, bt, wifi) is not affected by this selection.

Unless you know you need a different strategy, it’s suggested you stay with the default MEMW strategy. Note that DUPLDST can interfere with hardware encryption and this will be automatically disabled if this workaround is selected. ‘Insert nops’ is the workaround that was used in older esp-idf versions. This workaround still can cause faulty data transfers from/to SPI RAM in some situation.

**Available options:**
- Insert *memw* after vulnerable instructions (default) (SPI_RAM_CACHE_WORKAROUND_STRATEGY_MEMW)
- Duplicate LD/ST for 32-bit, *memw* for 8/16 bit (SPI_RAM_CACHE_WORKAROUND_STRATEGY_DUPLDST)
- Insert nops between vulnerable loads/stores (old strategy, obsolete) (SPI_RAM_CACHE_WORKAROUND_STRATEGY_NOPS)

SPIRAM workaround libraries placement

Contains:

- `CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM`
- `CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM`

CONFIG_SPIRAM_CACHE_LIBJMP_IN_IRAM

Put libc’s jump related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: longjmp and setjmp. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

CONFIG_SPIRAM_CACHE_LIBMATH_IN_IRAM

Put libc’s math related functions in IRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement*

The functions affected by this option are: abs, div, labs, ldiv, quorem, fpclassify, and nan. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.
Default value:
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM

**CONFIG_SPIRAM_CACHE_LIBNUMPARSER_IN_IRAM**

Put libc’s number parsing related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: utoa, itoa, atoi, atol, strtol, and strtoul. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM

**CONFIG_SPIRAM_CACHE_LIBIO_IN_IRAM**

Put libc’s I/O related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: wcrtomb, fwrite, wbuf, wsetup, fputwc, wctomb_r, ungetc, makebuf, fflush, refill, and sccl. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM

**CONFIG_SPIRAM_CACHE_LIBTIME_IN_IRAM**

Put libc’s time related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: asctime, asctime_r, ctime, ctime_r, localtime, localtime_r, gmtime, gmtime_r, strftime, mktime, tzset, tzset_r, time, tzset, time, gettzinfo, systimes, month_lengths, timelocal, tzvars, tzlock, tzcalc_limits, and strftime. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM

**CONFIG_SPIRAM_CACHE_LIBCHAR_IN_IRAM**

Put libc’s characters related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: ctype, toupper, tolower, toascii, strupr, bzero, isalnum, isalpha, isascii, isblank, iscntrl, isdigit, isgraph, islower, isprint, ispunct, isspace, and isupper. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:
- Yes (enabled) if CONFIG_SPIRAM_CACHE_WORKAROUND && CONFIG_SPIRAM
**CONFIG_SPIRAM_CACHE_LIBMEM_IN_IRAM**

Put libc’s memory related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: memccpy, memchr, memmove, and memrchr. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBSTR_IN_IRAM**

Put libc’s string related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: strcasecmp, strcasestr, strchr, strcoll, strcpy, strcspn, strdup, strdup_r, strlcat, strlcpy, strlen, strlwr, strncasecmp, strncat, strncmp, strncpy, strndup, strndup_r, strlen, strsep, strspn, strtok_r, and strupr. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBRAND_IN_IRAM**

Put libc’s random related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: srand, rand, and rand_r. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBENV_IN_IRAM**

Put libc’s environment related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: environ, envlock, and getenv_r. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM_CACHE_WORKAROUND` && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_CACHE_LIBFILE_IN_IRAM**

Put libc’s file related functions in IRAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement
The functions affected by this option are: lock, isatty, fclose, open, close, creat, read, shift, sbrk, stdio, symlink, symlink, creat, sysread, fwrite, impure, fwrite, and findfp. Putting these functions in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:
• Yes (enabled) if \texttt{CONFIG_SPIRAM_CACHE_WORKAROUND} \&\& \texttt{CONFIG_SPIRAM}

\textbf{CONFIG_SPIRAM_CACHE_LIBMISC_IN_IRAM}

Put libc’s miscellaneous functions in IRAM, see help

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > SPIRAM workaround libraries placement

The functions affected by this option are: raise and system. Putting these function in IRAM will allow them to be called when flash cache is disabled but it will also reduce the available size of free IRAM for the user application.

Default value:
• Yes (enabled) if \texttt{CONFIG_SPIRAM_CACHE_WORKAROUND} \&\& \texttt{CONFIG_SPIRAM}

\textbf{CONFIG_SPIRAM_BANKSWITCH_ENABLE}

Enable bank switching for >4MiB external RAM

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

The ESP32 only supports 4MiB of external RAM in its address space. The hardware does support larger memories, but these have to be bank-switched in and out of this address space. Enabling this allows you to reserve some MMU pages for this, which allows the use of the \texttt{esp_himem} api to manage these banks.

#Note that this is limited to 62 banks, as \texttt{esp_psram_extram_writeback_cache} needs some kind of mapping of #some banks below that mark to work. We cannot at this moment guarantee this to exist when himem is enabled.

If spiram 2T mode is enabled, the size of 64Mbit psram will be changed as 32Mbit, so himem will be unusable.

Default value:
• Yes (enabled) if \texttt{(SPIRAM_USE_MEMMAP || SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC)} \&\& \texttt{CONFIG_SPIRAM}

\textbf{CONFIG_SPIRAM_BANKSWITCH_RESERVE}

Amount of 32K pages to reserve for bank switching

*Found in:* Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > CONFIG_SPIRAM_BANKSWITCH_ENABLE

Select the amount of banks reserved for bank switching. Note that the amount of RAM allocatable with malloc/\texttt{esp_heap_alloc_caps} will decrease by 32K for each page reserved here.

Note that this reservation is only actually done if your program actually uses the himem API. Without any himem calls, the reservation is not done and the original amount of memory will be available to malloc/\texttt{esp_heap_alloc_caps}.

Range:
• from 1 to 62 if \texttt{CONFIG_SPIRAM_BANKSWITCH_ENABLE} \&\& \texttt{CONFIG_SPIRAM}

Default value:
• 8 if \texttt{CONFIG_SPIRAM_BANKSWITCH_ENABLE} \&\& \texttt{CONFIG_SPIRAM}
**CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY**

Allow external memory as an argument to xTaskCreateStatic

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Because some bits of the ESP32 code environment cannot be recompiled with the cache workaround, normally tasks cannot be safely run with their stack residing in external memory; for this reason xTaskCreate (and related task creation functions) always allocate stack in internal memory and xTaskCreateStatic will check if the memory passed to it is in internal memory. If you have a task that needs a large amount of stack and does not call on ROM code in any way (no direct calls, but also no Bluetooth/WiFi), you can try enable this to cause xTaskCreateStatic to allow tasks stack in external memory.

**Default value:**
- No (disabled) if SPIRAM_USE_MALLOC && CONFIG_SPIRAM

**CONFIG_SPIRAM_OCCUPY_SPI_HOST**

SPI host to use for 32MBit PSRAM

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

When both flash and PSRAM is working under 80MHz, and the PSRAM is of type 32MBit, one of the HSPI/VSPI host will be used to output the clock. Select which one to use here.

**Available options:**
- HSPI host (SPI2) (SPIRAM_OCCUPY_HSPI_HOST)
- VSPI host (SPI3) (SPIRAM_OCCUPY_VSPI_HOST)
- Will not try to use any host, will abort if not able to use the PSRAM (SPIRAM_OCCUPY_NO_HOST)

**PSRAM clock and cs IO for ESP32-DOWD**

Contains:
- `CONFIG_D0WD_PSRAM_CLK_IO`
- `CONFIG_D0WD_PSRAM_CS_IO`

**CONFIG_D0WD_PSRAM_CLK_IO**

PSRAM CLK IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-DOWD*

The PSRAM CLOCK IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

If configured to the same pin as Flash, PSRAM shouldn’t be rev0. Contact Espressif for more information.

**Range:**
- from 0 to 33 if `CONFIG_SPIRAM && CONFIG_SPIRAM`

**Default value:**
- 17 if `CONFIG_SPIRAM && CONFIG_SPIRAM`

**CONFIG_D0WD_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-DOWD*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design. If user use 1.8V flash and 1.8V psram, this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.
Range:
- from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

Default value:
- 16 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

PSRAM clock and cs IO for ESP32-D2WD  Contains:

- `CONFIG_D2WD_PSRAM_CLK_IO`
- `CONFIG_D2WD_PSRAM_CS_IO`

**CONFIG_D2WD_PSRAM_CLK_IO**

PSRAM CLK IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psock can only be 1.8V psock, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

If configued to the same pin (GPIO6) as Flash, PSRAM shouldn’t be rev0. Contact Espressif for more information.

Range:
- from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

Default value:
- 9 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**CONFIG_D2WD_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-D2WD*

User can config it based on hardware design. For ESP32-D2WD chip, the psock can only be 1.8V psock, so this value can only be one of 6, 7, 8, 9, 10, 11, 16, 17.

Range:
- from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

Default value:
- 10 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

PSRAM clock and cs IO for ESP32-PICO-D4  Contains:

- `CONFIG_PICO_PSRAM_CS_IO`

**CONFIG_PICO_PSRAM_CS_IO**

PSRAM CS IO number

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > PSRAM clock and cs IO for ESP32-PICO-D4*

The PSRAM CS IO can be any unused GPIO, user can config it based on hardware design.

For ESP32-PICO chip, the psock share clock with flash, so user do not need to configure the clock IO. For the reference hardware design, please refer to https://www.espressif.com/sites/default/files/documentation/esp32-pico-d4_datasheet_en.pdf

Range:
- from 0 to 33 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

Default value:
- 10 if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`  

**CONFIG_SPIRAM_CUSTOM_SPIWP_SD3_PIN**

Use custom SPI PSRAM WP(SD3) Pin when flash pins set in eFuse (read help)

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

This setting is only used if the SPI flash pins have been overridden by setting the eFuses SPI_PAD_CONFIG_xxx, and the SPI flash mode is DIO or DOUT.

When this is the case, the eFuse config only defines 3 of the 4 Quad I/O data pins. The WP pin (aka ESP32 pin “SD_DATA_3” or SPI flash pin “IO2”) is not specified in eFuse. The psram only has QPI mode, so a WP pin setting is necessary.

If this config item is set to N (default), the correct WP pin will be automatically used for any Espressif chip or module with integrated flash. If a custom setting is needed, set this config item to Y and specify the GPIO number connected to the WP pin.

When flash mode is set to QIO or QOUT, the PSRAM WP pin will be set the same as the SPI Flash WP pin configured in the bootloader.

*Default value:*
- No (disabled) if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_SPIWP_SD3_PIN**

Custom SPI PSRAM WP(SD3) Pin

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

The option “Use custom SPI PSRAM WP(SD3) pin” must be set or this value is ignored.

If burning a customized set of SPI flash pins in eFuse and using DIO or DOUT mode for flash, set this value to the GPIO number of the SPIRAM WP pin.

*Range:*
- from 0 to 33 if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && `CONFIG_SPIRAM`

*Default value:*
- 7 if (ESPTOOLPY_FLASHMODE_DIO || ESPTOOLPY_FLASHMODE_DOUT) && `CONFIG_SPIRAM`

**CONFIG_SPIRAM_2T_MODE**

Enable SPI PSRAM 2T mode

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Enable this option to fix single bit errors inside 64Mbit PSRAM.

Some 64Mbit PSRAM chips have a hardware issue in the RAM which causes bit errors at multiple fixed bit positions.

Note: If this option is enabled, the 64Mbit PSRAM chip will appear to be 32Mbit in size. Applications will not be affected unless the use the esp_himem APIs, which are not supported in 2T mode.

*Default value:*
- No (disabled) if `CONFIG_SPIRAM` && `CONFIG_SPIRAM`

**ESP Ringbuf** Contains:

- `CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`
**CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH**

Place non-ISR ringbuf functions into flash

*Found in: Component config > ESP Ringbuf*

Place non-ISR ringbuf functions (like `xRingbufferCreate/xRingbufferSend`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

**Default value:**

- No (disabled)

**CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH**

Place ISR ringbuf functions into flash

*Found in: Component config > ESP Ringbuf > CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH*

Place ISR ringbuf functions (like `xRingbufferSendFromISR/xRingbufferReceiveFromISR`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which are configured to run the ISR from an IRAM context, e.g. `CONFIG_UART_ISR_IN_IRAM`.

**Default value:**

- No (disabled) if `CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`

**ESP System Settings**

Contains:

- `CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES`
- Brownout Detector
- `CONFIG_ESP_CONSOLE_UART`
- `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`
- `CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP`
- `CONFIG_ESP_TASK_WDT_EN`
- `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`
- `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`
- `CONFIG_ESP_INT_WDT`
- `CONFIG_ESP_MAIN_TASK_AFFINITY`
- `CONFIG_ESP_MAIN_TASK_STACK_SIZE`
- `CONFIG_ESP_DEBUG_OCDATAWARE`
- Memory
- Memory protection
- `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
- `CONFIG_ESP_DEBUG_STUBS_ENABLE`
- `CONFIG_ESP_SYSTEM_PANIC`
- `CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE`
- `CONFIG_ESP_PANIC_HANDLER_IRAM`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
- Trace memory
- `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
- `CONFIG_ESP_CONSOLE_UART_NUM`
- `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_TX_GPIO`

**CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ**

CPU frequency

*Found in: Component config > ESP System Settings*

CPU frequency to be set on application startup.
Chapter 2. API Reference

Available options:
- 40 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_40)
- 80 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_80)
- 160 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_160)
- 240 MHz (ESP_DEFAULT_CPU_FREQ_MHZ_240)

Memory  Contains:
- CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY
- CONFIG_ESP32_RTCDATA_IN_FAST_MEM
- CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

CONFIG_ESP32_RTCDATA_IN_FAST_MEM
Place RTC_DATA_ATTR and RTC_RODATA_ATTR variables into RTC fast memory segment

Found in: Component config > ESP System Settings > Memory

This option allows to place .rtc_data and .rtc_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs. This option depends on the CONFIG_FREERTOS_UNICORE option because RTC fast memory can be accessed only by PRO_CPU core.

Default value:
- No (disabled) if CONFIG_FREERTOS_UNICORE

CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE
Use fixed static RAM size

Found in: Component config > ESP System Settings > Memory

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0_0 region, where its length is set with ESP32_FIXED_STATIC_RAM_SIZE

Default value:
- No (disabled)

CONFIG_ESP32_FIXED_STATIC_RAM_SIZE
Fixed Static RAM size

Found in: Component config > ESP System Settings > Memory > CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

RAM size dedicated for static variables (.data & .bss sections). Please note that the actual length will be reduced by BTDM_RESERVE_DRAM if Bluetooth controller is enabled.

Range:
- from 0 to 0x2c200 if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

Default value:
- “0x1E000” if CONFIG_ESP32_USE_FIXED_STATIC_RAM_SIZE

CONFIG_ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY
Enable IRAM as 8 bit accessible memory

Found in: Component config > ESP System Settings > Memory
If enabled, application can use IRAM as byte accessible region for storing data (Note: IRAM region cannot be used as task stack)

This is possible due to handling of exceptions LoadStoreError (3) and LoadStoreAlignmentError (9) Each unaligned read/write access will incur a penalty of maximum of 167 CPU cycles.

**Trace memory**

Contains:

- `CONFIG_ESP32_TRAX`

**CONFIG_ESP32_TRAX**

Use TRAX tracing feature

*Found in: Component config > ESP System Settings > Trace memory*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

**Default value:**

- No (disabled)

**CONFIG_ESP32_TRAX_TWOBANKS**

Reserve memory for tracing both pro as well as app cpu execution

*Found in: Component config > ESP System Settings > Trace memory > CONFIG_ESP32_TRAX*

The ESP32 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

# Memory to reverse for trace, used in linker script

**Default value:**

- No (disabled) if `CONFIG_ESP32_TRAX` & `CONFIG_FREERTOS_UNICORE`

**CONFIG_ESP_SYSTEM_PANIC**

Panic handler behaviour

*Found in: Component config > ESP System Settings*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler’s action here.

**Available options:**

- Print registers and halt (ESP_SYSTEM_PANIC_PRINT_HALT)
  Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (ESP_SYSTEM_PANIC_PRINT_REBOOT)
  Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (ESP_SYSTEM_PANIC_SILENT_REBOOT)
  Just resets the processor without outputting anything
- GDBStub on panic (ESP_SYSTEM_PANIC_GDBSTUB)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.
- GDBStub at runtime (ESP_SYSTEM_GDBSTUB_RUNTIME)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it and to do a debug on runtime.
**CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES**

Bootstrap cycles for external 32kHz crystal

*Found in: Component config > ESP System Settings*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for RTC_SLOW_CLK calibration” (about 3000).

**CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP**

Enable RTC fast memory for dynamic allocations

*Found in: Component config > ESP System Settings*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

**Memory protection**

Contains:

- **CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT**
- **CONFIG_ESP_SYSTEM_MEMPROT_FEATURE**

**CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT**

Enable IRAM/DRAM split protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the CPU watches all the memory access and raises an exception in case of any memory violation. This feature automatically splits the SRAM memory, using PMP, into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled) if SOC_CPU_IDRAM_SPLIT_USING_PMP

**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE**

Enable memory protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled) if SOC_MEMPROT_SUPPORTED
**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE_LOCK**

Lock memory protection settings

*Found in: Component config > ESP System Settings > Memory protection > CONFIG_ESP_SYSTEM_MEMPROT_FEATURE*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**
- Yes (enabled) if `CONFIG_ESP_SYSTEM_MEMPROT_FEATURE`

**CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE**

System event queue size

*Found in: Component config > ESP System Settings*

Config system event queue size in different application.

**Default value:**
- 32

**CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE**

Event loop task stack size

*Found in: Component config > ESP System Settings*

Config system event task stack size in different application.

**Default value:**
- 2304

**CONFIG_ESP_MAIN_TASK_STACK_SIZE**

Main task stack size

*Found in: Component config > ESP System Settings*

Configure the “main task” stack size. This is the stack of the task which calls `app_main()`. If `app_main()` returns then this task is deleted and its stack memory is freed.

**Default value:**
- 3584

**CONFIG_ESP_MAIN_TASK_AFFINITY**

Main task core affinity

*Found in: Component config > ESP System Settings*

Configure the “main task” core affinity. This is the used core of the task which calls `app_main()`. If `app_main()` returns then this task is deleted.

**Available options:**
- CPU0 (ESP_MAIN_TASK_AFFINITY_CPU0)
- CPU1 (ESP_MAIN_TASK_AFFINITY_CPU1)
- No affinity (ESP_MAIN_TASK_AFFINITY_NO_AFFINITY)
CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE

Minimal allowed size for shared stack

*Found in: Component config > ESP System Settings*

Minimal value of size, in bytes, accepted to execute an expression with shared stack.

*Default value:*
  - 2048

CONFIG_ESP_CONSOLE_UART

Channel for console output

*Found in: Component config > ESP System Settings*

Select where to send console output (through stdout and stderr).

- Default is to use UART0 on pre-defined GPIOs.
- If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
- On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

*Available options:*
  - Default: UART0 (ESP_CONSOLE_UART_DEFAULT)
  - USB CDC (ESP_CONSOLE_USB_CDC)
  - USB Serial/JTAG Controller (ESP_CONSOLE_USB_SERIAL_JTAG)
  - Custom UART (ESP_CONSOLE_UART_CUSTOM)
  - None (ESP_CONSOLE_NONE)

CONFIG_ESP_CONSOLE_UART_NUM

UART peripheral to use for console output (0-1)

*Found in: Component config > ESP System Settings*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via esp_rom_printf.

*Available options:*
  - UART0 (ESP_CONSOLE_UART_CUSTOM_NUM_0)
  - UART1 (ESP_CONSOLE_UART_CUSTOM_NUM_1)

CONFIG_ESP_CONSOLE_UART_TX_GPIO

UART TX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

*Range:*

Espressif Systems 1525 Release v5.0.4-384-ge42bcf2e88
Chapter 2. API Reference

- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

**Default value:**
- 1 if ESP_CONSOLE_UART_CUSTOM
- 43 if ESP_CONSOLE_UART_CUSTOM

**CONFIG_ESP_CONSOLE_UART_RX_GPIO**

UART RX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn’t read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 0 to 46 if ESP_CONSOLE_UART_CUSTOM

**Default value:**
- 3 if ESP_CONSOLE_UART_CUSTOM
- 44 if ESP_CONSOLE_UART_CUSTOM

**CONFIG_ESP_CONSOLE_UART_BAUDRATE**

UART console baud rate

*Found in: Component config > ESP System Settings*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 1200 to 4000000 if CONFIG_PM_ENABLE
- from 1200 to 1000000 if CONFIG_PM_ENABLE

**Default value:**
- 115200

**CONFIG_ESP_INT_WDT**

Interrupt watchdog

*Found in: Component config > ESP System Settings*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**
- Yes (enabled)
### CONFIG_ESP_INT_WDT_TIMEOUT_MS

Interrupt watchdog timeout (ms)

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**
- from 10 to 10000

**Default value:**
- 300 if `CONFIG_SPIRAM && CONFIG_ESP_INT_WDT`
- 800 if `CONFIG_SPIRAM && CONFIG_ESP_INT_WDT`

### CONFIG_ESP_INT_WDT_CHECK_CPU1

Also watch CPU1 tick interrupt

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

Also detect if interrupts on CPU 1 are disabled for too long.

**Default value:**
- Yes (enabled) if `CONFIG_ESP_INT_WDT` && `CONFIG_FREERTOS_UNICORE`

### CONFIG_ESP_TASK_WDT_EN

Enable Task Watchdog Timer

*Found in: Component config > ESP System Settings*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will enable the Task Watchdog Timer. It can be either initialized automatically at startup or initialized after startup (see Task Watchdog Timer API Reference)

**Default value:**
- Yes (enabled)

### CONFIG_ESP_TASK_WDT_INIT

Initialize Task Watchdog Timer on startup

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN*

Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup.

**Default value:**
- Yes (enabled)

### CONFIG_ESP_TASK_WDT_PANIC

Invoke panic handler on Task Watchdog timeout

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**
- No (disabled)
**CONFIG_ESP_TASK_WDT_TIMEOUT_S**

Task Watchdog timeout period (seconds)

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**
- from 1 to 60

**Default value:**
- 5

**CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0**

Watch CPU0 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1**

Watch CPU1 Idle Task

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

**Default value:**
- Yes (enabled) if CONFIG_ESP_TASK_WDT_INIT & CONFIG_FREERTOS_UNICORE

**CONFIG_ESP_PANIC_HANDLER_IRAM**

Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**
- No (disabled)
CONFIG_ESP_DEBUG_STUBS_ENABLE

OpenOCD debug stubs

*Found in: Component config > ESP System Settings*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

**Default value:**

- “COMPILER_OPTIMIZATION_LEVEL_DEBUG” if CONFIG_ESP32_TRAX && ESP32S2_TRAX && ESP32S3_TRAX

CONFIG_ESP_DEBUG_OCD_AWARE

Make exception and panic handlers JTAG/OCD aware

*Found in: Component config > ESP System Settings*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**

- Yes (enabled)

CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: Component config > ESP System Settings*

Interrupt level to use for Interrupt Watchdog and other system checks.

**Available options:**

- Level 5 interrupt (ESP_SYSTEM_CHECK_INT_LEVEL_5)
  Using level 5 interrupt for Interrupt Watchdog and other system checks.
- Level 4 interrupt (ESP_SYSTEM_CHECK_INT_LEVEL_4)
  Using level 4 interrupt for Interrupt Watchdog and other system checks.

Brownout Detector

Contains:

- **CONFIG_ESP_BROWNOUT_DET**

CONFIG_ESP_BROWNOUT_DET

Hardware brownout detect & reset

*Found in: Component config > ESP System Settings > Brownout Detector*

The ESP has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**

- Yes (enabled)

CONFIG_ESP_BROWNOUT_DET_LVL_SEL

Brownout voltage level

*Found in: Component config > ESP System Settings > Brownout Detector > CONFIG_ESP_BROWNOUT_DET*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP chip.
# The voltage levels here are estimates, more work needs to be done to figure out the exact voltages of the brownout threshold levels.

**Available options:**
- 2.43V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_0)
- 2.48V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_1)
- 2.58V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_2)
- 2.62V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_3)
- 2.67V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_4)
- 2.70V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_5)
- 2.77V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_6)
- 2.80V +/- 0.05 (ESP_BROWNOUT_DET_LVL_SEL_7)

**CONFIG_ESP32_DISABLE_BASIC_ROM_CONSOLE**
Permanently disable BASIC ROM Console

*Found in: Component config > ESP System Settings*

If set, the first time the app boots it will disable the BASIC ROM Console permanently (by burning an eFuse).

Otherwise, the BASIC ROM Console starts on reset if no valid bootloader is read from the flash.

(Enabling secure boot also disables the BASIC ROM Console by default.)

**Default value:**
- No (disabled)

**IPC (Inter-Processor Call)** Contains:
- **CONFIG_ESP_IPC_TASK_STACK_SIZE**
- **CONFIG_ESP_IPC_USES_CALLERS_PRIORITY**

**CONFIG_ESP_IPC_TASK_STACK_SIZE**
Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC task stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**
- from 512 to 65536

**Default value:**
- 1024

**CONFIG_ESP_IPC_USES_CALLERS_PRIORITY**
IPC runs at caller’s priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX_PRIORITIES - 1) priority.

**Default value:**
- Yes (enabled) if **CONFIG_FREERTOS_UNICORE**
High resolution timer (esp_timer) Contains:

- CONFIG_ESP_TIMER_PROFILING
- CONFIG_ESP_TIMER_TASK_STACK_SIZE
- CONFIG_ESP_TIMER_INTERRUPT_LEVEL
- CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD

CONFIG_ESP_TIMER_PROFILING

Enable esp_timer profiling features

*Found in: Component config > High resolution timer (esp_timer)*

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

*Default value:*
- No (disabled)

CONFIG_ESP_TIMER_TASK_STACK_SIZE

High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp_timer)*

Configure the stack size of timer_task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS” menu.

*Range:*
- from 2048 to 65536

*Default value:*
- 3584

CONFIG_ESP_TIMER_INTERRUPT_LEVEL

Interrupt level

*Found in: Component config > High resolution timer (esp_timer)*

It sets the interrupt level for esp_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp_timer latency.

*Range:*
- from 1 to 3
- from 1 to 1

*Default value:*
- 1

CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD

Support ISR dispatch method

*Found in: Component config > High resolution timer (esp_timer)*

Allows using ESP_TIMER_ISR dispatch method (ESP_TIMER_TASK dispatch method is also available). - ESP_TIMER_TASK - Timer callbacks are dispatched from a high-priority esp_timer task. - ESP_TIMER_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.
Chapter 2. API Reference

**Default value:**
- No (disabled)

**Wi-Fi** Contains:

- `CONFIG_ESP_WIFI_ENTERPRISE_SUPPORT`
- `CONFIG_ESP32_WIFI_ENABLE_WPA3_OWE_STA`
- `CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE`
- `CONFIG_ESP_WIFI_WPS_PASSPHRASE`
- `CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN`
- `CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM`
- `CONFIG_ESP_WIFI_RX_MGMT_BUF_NUM_DEF`
- `CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM`
- `CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM`
- `CONFIG_ESP_WIFI_WPS_PASSPHRASE`
- `CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN`
- `CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE`
- `CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE`
- `CONFIG_ESP_WIFI_FTM_ENABLE`
- `CONFIG_ESP_WIFI_GCMP_SUPPORT`
- `CONFIG_ESP_WIFI_GMAC_SUPPORT`
- `CONFIG_ESP32_WIFI_IRAM_OPT`
- `CONFIG_ESP32_WIFI_MGMT_SBUF_NUM`
- `CONFIG_ESP32_WIFI_NVS_ENABLED`
- `CONFIG_ESP32_WIFI_RX_IRAM_OPT`
- `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`
- `CONFIG_ESP_WIFI_SLP_IRAM_OPT`
- `CONFIG_ESP32_WIFI_SOFTAP_SUPPORT`
- `CONFIG_ESP32_WIFI_TASK_CORE_ID`

**CONFIG_ESP32_WIFI_SW_COEXIST_ENABLE**

Software controls WiFi/Bluetooth coexistence

*Found in: Component config > Wi-Fi*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**
- Yes (enabled) if `CONFIG_BT_ENABLED`

**CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM**

Max number of WiFi static RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when esp_wifi_init is called, they are not freed until esp_wifi_deinit is called.
WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If ESP32_WIFI_AMPDU_RX_ENABLED is enabled, this value is recommended to set equal or bigger than ESP32_WIFI_RX_BA_WIN in order to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 25

**Default value:**
- 10 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

**CONFIG_ESP32_WIFI_DYNAMIC_RX_BUFFER_NUM**

Max number of WiFi dynamic RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**
- from 0 to 128 if `CONFIG_LWIP_WND_SCALE`
- from 0 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 32

**CONFIG_ESP32_WIFI_TX_BUFFER**

Type of WiFi TX buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

**Available options:**
- Static (ESP32_WIFI_STATIC_TX_BUFFER)
- Dynamic (ESP32_WIFI_DYNAMIC_TX_BUFFER)

**CONFIG_ESP32_WIFI_STATIC_TX_BUFFER_NUM**

Max number of WiFi static TX buffers

*Found in: Component config > Wi-Fi*
Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

Range:
- from 1 to 64 if ESP32_WIFI_STATIC_TX_BUFFER
Default value:
- 16 if ESP32_WIFI_STATIC_TX_BUFFER

CONFIG_ESP32_WIFI_CACHE_TX_BUFFER_NUM
Max number of WiFi cache TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

Range:
- from 16 to 128 if CONFIG_SPIRAM
Default value:
- 32 if CONFIG_SPIRAM

CONFIG_ESP32_WIFI_DYNAMIC_TX_BUFFER_NUM
Max number of WiFi dynamic TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

Range:
- from 1 to 128
Default value:
- 32

CONFIG_ESP_WIFI_MGMT_RX_BUFFER
Type of WiFi RX MGMT buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi RX MGMT buffers:

If “Static” is selected, WiFi RX MGMT buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static RX MGMT buffer is fixed to about 500 Bytes.

If “Dynamic” is selected, each WiFi RX MGMT buffer is allocated as needed when a MGMT data frame is received. The MGMT buffer is freed after the MGMT data frame has been processed by the WiFi driver.

Available options:
Chapter 2. API Reference

- Static (ESP_WIFI_STATIC_RX_MGMT_BUFFER)
- Dynamic (ESP_WIFI_DYNAMIC_RX_MGMT_BUFFER)

**CONFIG_ESP_WIFI_RX_MGMT_BUF_NUM_DEF**
Max number of WiFi RX MGMT buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi RX_MGMT buffers.

For Management buffers, the number of dynamic and static management buffers is the same. In order to prevent memory fragmentation, the management buffer type should be set to static first.

**Range:**
- from 1 to 10

**Default value:**
- 5

**CONFIG_ESP32_WIFICSI_ENABLED**
WiFi CSI (Channel State Information)

*Found in: Component config > Wi-Fi*

Select this option to enable CSI (Channel State Information) feature. CSI takes about CONFIG_ESP32_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**
- No (disabled)

**CONFIG_ESP32_WIFIAMPDU_TX_ENABLED**
WiFi AMPDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU TX feature

**Default value:**
- Yes (enabled)

**CONFIG_ESP32_WIFI_TX_BA_WIN**
WiFi AMPDU TX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFIAMPDU_TX_ENABLED*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

**Range:**
- from 2 to 32

**Default value:**
- 6
CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED

WiFi AMPDU RX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

**Default value:**
- Yes (enabled)

CONFIG_ESP32_WIFI_RX_BA_WIN

WiFi AMPDU RX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of the time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is preferred to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**
- from 2 to 32

**Default value:**
- 6 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED`
- 16 if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP` && `CONFIG_ESP32_WIFI_AMPDU_RX_ENABLED`

CONFIG_ESP32_WIFI_AMSDU_TX_ENABLED

WiFi AMSDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMSDU TX feature

**Default value:**
- No (disabled) if `CONFIG_SPIRAM`

CONFIG_ESP32_WIFI_NVS_ENABLED

WiFi NVS flash

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi NVS flash

**Default value:**
- Yes (enabled)

CONFIG_ESP32_WIFI_TASK_CORE_ID

WiFi Task Core ID

*Found in: Component config > Wi-Fi*

Pinned WiFi task to core 0 or core 1.

**Available options:**
- Core 0 (ESP32_WIFI_TASK_PINNED_TO_CORE_0)
- Core 1 (ESP32_WIFI_TASK_PINNED_TO_CORE_1)
CONFIG_ESP32_WIFI_SOFTAP_BEACON_MAX_LEN

Max length of WiFi SoftAP Beacon

Found in: Component config > Wi-Fi

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added ontop of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

Range:
- from 752 to 1256

Default value:
- 752

CONFIG_ESP32_WIFI_MGMT_SBUF_NUM

WiFi mgmt short buffer number

Found in: Component config > Wi-Fi

Set the number of WiFi management short buffer.

Range:
- from 6 to 32

Default value:
- 32

CONFIG_ESP32_WIFI_IRAM_OPT

WiFi IRAM speed optimization

Found in: Component config > Wi-Fi

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

Default value:
- No (disabled) if CONFIG_BT_ENABLED && CONFIG_SPIRAM
- Yes (enabled)

CONFIG_ESP32_WIFI_RX_IRAM_OPT

WiFi RX IRAM speed optimization

Found in: Component config > Wi-Fi

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

Default value:
- No (disabled) if CONFIG_BT_ENABLED && CONFIG_SPIRAM
- Yes (enabled)
**CONFIG_ESP32_WIFI_ENABLE_WPA3_SAE**

Enable WPA3-Personal

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**
- Yes (enabled)

**CONFIG_ESP32_WIFI_ENABLE_WPA3_OWE_STA**

Enable OWE STA

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish OWE connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_SLP_IRAM_OPT**

WiFi SLP IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP32_WIFI_IRAM_OPT and ESP32_WIFI_RX_IRAM_OPT, or this one. If already enabled ESP32_WIFI_IRAM_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP32_WIFI_RX_IRAM_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

**CONFIG_ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME**

Minimum active time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**
- from 8 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

**Default value:**
- 50 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

**CONFIG_ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME**

Maximum keep alive time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The maximum time that wifi keep alive, unit: seconds.

**Range:**
- from 10 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

**Default value:**
Chapter 2. API Reference

- 10 if `CONFIG_ESP_WIFI_SLP_IRAM_OPT`

**CONFIG_ESP_WIFI_FTM_ENABLE**
WiFi FTM

*Found in: Component config > Wi-Fi*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

**CONFIG_ESP_WIFI_FTM_INITIATOR_SUPPORT**
FTM Initiator support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

**Default value:**
- Yes (enabled) if `CONFIG_ESP_WIFI_FTM_ENABLE`

**CONFIG_ESP_WIFI_FTM_RESPONDER_SUPPORT**
FTM Responder support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

**Default value:**
- Yes (enabled) if `CONFIG_ESP_WIFI_FTM_ENABLE`

**CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE**
Power Management for station at disconnected

*Found in: Component config > Wi-Fi*

Select this option to enable power management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_GCMP_SUPPORT**
WiFi GCMP Support(GCMP128 and GCMP256)

*Found in: Component config > Wi-Fi*

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

**CONFIG_ESP_WIFI_GMAC_SUPPORT**
WiFi GMAC Support(GMAC128 and GMAC256)

*Found in: Component config > Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**
- No (disabled)
Chapter 2. API Reference

**CONFIG_ESP_WIFI_SOFTAP_SUPPORT**

WiFi SoftAP Support

*Found in: Component config > Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT**

WiFi sleep optimize when beacon lost

*Found in: Component config > Wi-Fi*

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

**CONFIG_ESP_WIFI_SLP_BEACON_LOST_TIMEOUT**

Beacon loss timeout

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

**Range:**
- from 5 to 100 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

**Default value:**
- 10 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

**CONFIG_ESP_WIFI_SLP_BEACON_LOST_THRESHOLD**

Maximum number of consecutive lost beacons allowed

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

**Range:**
- from 0 to 8 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

**Default value:**
- 3 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

**CONFIG_ESP_WIFI_SLP_PHY_ON_DELTA_EARLY_TIME**

Delta early time for RF PHY on

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

**Range:**
- from 0 to 100 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

**Default value:**
- 2 if CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT
**CONFIG_ESP_WIFI_SLP_PHY_OFF_DELTA_TIMEOUT_TIME**

Delta timeout time for RF PHY off

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Delta timeout time for rf phy off. When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

**Range:**
- from 0 to 8 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**Default value:**
- 2 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM**

Maximum espnow encrypt peers number

*Found in: Component config > Wi-Fi*

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum number of connections of SoftAP = Max hardware keys number.

When using ESP mesh, this value should be set to a maximum of 6.

**Range:**
- from 0 to 17

**Default value:**
- 7

**CONFIG_ESP_WIFI_WPS_PASSPHRASE**

Get WPA2 passphrase in WPS config

*Found in: Component config > Wi-Fi*

Select this option to get passphrase during WPS configuration. This option fakes the virtual display capabilities to get the configuration in passphrase mode. Not recommended to be used since WPS credentials should not be shared to other devices, making it in readable format increases that risk, also passphrase requires pbkdf2 to convert in psk.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_ENTERPRISE_SUPPORT**

Enable enterprise option

*Found in: Component config > Wi-Fi*

Select this to enable/disable enterprise connection support.

Disabling this will reduce binary size. Disabling this will disable the use of any esp_wifi_sta_wpa2_ent_* (as APIs will be meaningless)

**Default value:**
- Yes (enabled)
Core dump  Contains:

- `CONFIG_ESP_COREDUMP_CHECK_BOOT`
- `CONFIG_ESP_COREDUMP_DATA_FORMAT`
- `CONFIG_ESP_COREDUMP_CHECKSUM`
- `CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART`
- `CONFIG_ESP_COREDUMP_UART_DELAY`
- `CONFIG_ESP_COREDUMP_LOGS`
- `CONFIG_ESP_COREDUMP_DECODE`
- `CONFIG_ESP_COREDUMP_MAX_TASKS_NUM`
- `CONFIG_ESP_COREDUMP_STACK_SIZE`

**CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART**

Data destination

*Found in: Component config > Core dump*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition_table directory.

*Available options:*

- Flash (ESP_COREDUMP_ENABLE_TO_FLASH)
- UART (ESP_COREDUMP_ENABLE_TO_UART)
- None (ESP_COREDUMP_ENABLE_TO_NONE)

**CONFIG_ESP_COREDUMP_DATA_FORMAT**

Core dump data format

*Found in: Component config > Core dump*

Select the data format for core dump.

*Available options:*

- Binary format (ESP_COREDUMP_DATA_FORMAT_BIN)
- ELF format (ESP_COREDUMP_DATA_FORMAT_ELF)

**CONFIG_ESP_COREDUMP_CHECKSUM**

Core dump data integrity check

*Found in: Component config > Core dump*

Select the integrity check for the core dump.

*Available options:*

- Use CRC32 for integrity verification (ESP_COREDUMP_CHECKSUM_CRC32)
- Use SHA256 for integrity verification (ESP_COREDUMP_CHECKSUM_SHA256)

**CONFIG_ESP_COREDUMP_CHECK_BOOT**

Check core dump data integrity on boot

*Found in: Component config > Core dump*

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

*Default value:*
Chapter 2. API Reference

- Yes (enabled) if ESP_COREDUMP_ENABLE_TO_FLASH

**CONFIG_ESP_COREDUMP_LOGS**
Enable coredump logs for debugging

*Found in: Component config > Core dump*

Enable/disable coredump logs. Logs strings from espcoredump component are placed in DRAM. Disabling these helps to save ~5KB of internal memory.

**CONFIG_ESP_COREDUMP_MAX_TASKS_NUM**
Maximum number of tasks

*Found in: Component config > Core dump*

Maximum number of tasks snapshots in core dump.

**CONFIG_ESP_COREDUMP_UART_DELAY**
Delay before print to UART

*Found in: Component config > Core dump*

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

*Default value:*
- 0 if ESP_COREDUMP_ENABLE_TO_UART

**CONFIG_ESP_COREDUMP_STACK_SIZE**
Reserved stack size

*Found in: Component config > Core dump*

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

**CONFIG_ESP_COREDUMP_DECODE**
Handling of UART core dumps in IDF Monitor

*Found in: Component config > Core dump*

*Available options:*
- Decode and show summary (info_corefile) (ESP_COREDUMP_DECODE_INFO)
- Don’t decode (ESP_COREDUMP_DECODE_DISABLE)

**FAT Filesystem support**
Contains:
- CONFIG_FATFS_API_ENCODING
- CONFIG_FATFS_USE_FASTSEEK
- CONFIG_FATFS_CHOOSE_TYPE
- CONFIG_FATFS_LONG_FILENAMES
- CONFIG_FATFS_MAX_LFN
- CONFIG_FATFS_FS_LOCK
- CONFIG_FATFS_VOLUME_COUNT
- CONFIG_FATFS_CHOOSE_CODEPAGE
- CONFIG_FATFS_ALLOC_PREFER_EXTRAM
• CONFIG_FATFS_SECTOR_SIZE
• CONFIG_FATFS_SECTORS_PER_CLUSTER
• CONFIG_FATFS_TIMEOUT_MS
• CONFIG_FATFS_PER_FILE_CACHE

CONFIG_FATFS_VOLUME_COUNT

Number of volumes

Found in: Component config > FAT Filesystem support

Number of volumes (logical drives) to use.

Range:
• from 1 to 10

Default value:
• 2

CONFIG_FATFS_SECTOR_SIZE

Sector size

Found in: Component config > FAT Filesystem support

Specify the size of the sector in bytes for FATFS partition generator.

Available options:
• 512 (FATFS_SECTOR_512)
• 1024 (FATFS_SECTOR_1024)
• 2048 (FATFS_SECTOR_2048)
• 4096 (FATFS_SECTOR_4096)

CONFIG_FATFS_SECTORS_PER_CLUSTER

Sectors per cluster

Found in: Component config > FAT Filesystem support

This value specifies how many sectors there are in one cluster.

Available options:
• 1 (FATFS_SECTORS_PER_CLUSTER_1)
• 2 (FATFS_SECTORS_PER_CLUSTER_2)
• 4 (FATFS_SECTORS_PER_CLUSTER_4)
• 8 (FATFS_SECTORS_PER_CLUSTER_8)
• 16 (FATFS_SECTORS_PER_CLUSTER_16)
• 32 (FATFS_SECTORS_PER_CLUSTER_32)
• 64 (FATFS_SECTORS_PER_CLUSTER_64)
• 128 (FATFS_SECTORS_PER_CLUSTER_128)

CONFIG_FATFS_CHOOSE_CODEPAGE

OEM Code Page

Found in: Component config > FAT Filesystem support

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using f_setcp function. Note that choosing this option will increase application size by ~480kB.

Available options:
• Dynamic (all code pages supported) (FATFS_CODEPAGE_DYNAMIC)
• US (CP437) (FATFS_CODEPAGE_437)
Chapter 2. API Reference

- Arabic (CP720) (FATFS_CODEPAGE_720)
- Greek (CP737) (FATFS_CODEPAGE_737)
- KBL (CP771) (FATFS_CODEPAGE_771)
- Baltic (CP775) (FATFS_CODEPAGE_775)
- Latin 1 (CP850) (FATFS_CODEPAGE_850)
- Latin 2 (CP852) (FATFS_CODEPAGE_852)
- Cyrillic (CP855) (FATFS_CODEPAGE_855)
- Turkish (CP857) (FATFS_CODEPAGE_857)
- Portuguese (CP860) (FATFS_CODEPAGE_860)
- Icelandic (CP861) (FATFS_CODEPAGE_861)
- Hebrew (CP862) (FATFS_CODEPAGE_862)
- Canadian French (CP863) (FATFS_CODEPAGE_863)
- Arabic (CP864) (FATFS_CODEPAGE_864)
- Nordic (CP865) (FATFS_CODEPAGE_865)
- Russian (CP866) (FATFS_CODEPAGE_866)
- Greek 2 (CP869) (FATFS_CODEPAGE_869)
- Japanese (DBC) (CP932) (FATFS_CODEPAGE_932)
- Simplified Chinese (DBC) (CP936) (FATFS_CODEPAGE_936)
- Korean (DBC) (CP949) (FATFS_CODEPAGE_949)
- Traditional Chinese (DBC) (CP950) (FATFS_CODEPAGE_950)

CONFIG_FATFS_CHOOSE_TYPE
FAT type

*Found in: Component config > FAT Filesystem support*

If user specifies automatic detection of the FAT type, the FATFS generator will determine the type by the size.

**Available options:**
- Select a suitable FATFS type automatically. (FATFS_AUTO_TYPE)
- FAT12 (FATFS_FAT12)
- FAT16 (FATFS_FAT16)

CONFIG_FATFS_LONG_FILENAMES
Long filename support

*Found in: Component config > FAT Filesystem support*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap (Currently not supported by FATFS partition generator).

**Available options:**
- No long filenames (FATFS_LFN_NONE)
- Long filename buffer in heap (FATFS_LFN_HEAP)
- Long filename buffer on stack (FATFS_LFN_STACK)

CONFIG_FATFS_MAX_LFN
Max long filename length

*Found in: Component config > FAT Filesystem support*

Maximum long filename length. Can be reduced to save RAM.

**Range:**
- from 12 to 255

**Default value:**
- 255
**CONFIG_FATFS_API_ENCODING**

API character encoding

*Found in: Component config > FAT Filesystem support*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

**Available options:**
- API uses ANSI/OEM encoding (FATFS_API_ENCODING_ANSI_OEM)
- API uses UTF-8 encoding (FATFS_API_ENCODING_UTF_8)

**CONFIG_FATFS_FS_LOCK**

Number of simultaneously open files protected by lock function

*Found in: Component config > FAT Filesystem support*

This option sets the FATFS configuration value _FS_LOCK. The option _FS_LOCK switches file lock function to control duplicated file open and illegal operation to open objects.

*0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.*

*>0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.*

Note that the file lock control is independent of re-entrancy.

**Range:**
- from 0 to 65535

**Default value:**
- 0

**CONFIG_FATFS_TIMEOUT_MS**

Timeout for acquiring a file lock, ms

*Found in: Component config > FAT Filesystem support*

This option sets FATFS configuration value _FS_TIMEOUT, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and timeout after amount of time set by this option.

**Default value:**
- 10000

**CONFIG_FATFS_PER_FILE_CACHE**

Use separate cache for each file

*Found in: Component config > FAT Filesystem support*

This option affects FATFS configuration value _FS_TINY.

If this option is set, _FS_TINY is 0, and each open file has its own cache, size of the cache is equal to the _MAX_SS variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, _FS_TINY is 1, and single cache is used for all open files, size is also equal to _MAX_SS variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**

Espressif Systems 1546 Release v5.0.4-384-ge42bcf2e88
Chapter 2. API Reference

• Yes (enabled)

**CONFIG_FATFS_ALLOC_PREFER_EXTRAM**

Perfer external RAM when allocating FATFS buffers

*Found in: Component config > FAT Filesystem support*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

*Default value:*

• Yes (enabled) if SPIRAM_USE_CAPS_ALLOC || SPIRAM_USE_MALLOC

**CONFIG_FATFS_USE_FASTSEEK**

Enable fast seek algorithm when using lseek function through VFS FAT

*Found in: Component config > FAT Filesystem support*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

*Default value:*

• No (disabled)

**CONFIG_FATFS_FAST_SEEK_BUFFER_SIZE**

Fast seek CLMT buffer size

*Found in: Component config > FAT Filesystem support > CONFIG_FATFS_USE_FASTSEEK*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

*Default value:*

• 64 if CONFIG_FATFS_USE_FASTSEEK

**FreeRTOS**

Contains:

• *Kernel*
• *Port*

**Kernel**

Contains:

• CONFIG_FREERTOS_CHECK_STACKOVERFLOW
• CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY
• CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS
• CONFIG_FREERTOS_MAX_TASK_NAME_LEN
• CONFIG_FREERTOS_IDLE_TASK_STACKSIZE
• CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS
• CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE
• CONFIG_FREERTOS_HZ
• CONFIG_FREERTOS_TIMER_QUEUE_LENGTH
• CONFIG_FREERTOS_TIMER_TASK_PRIORITY
• CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH
• CONFIG_FREERTOS_USE_IDLE_HOOK
• CONFIG_FREERTOS_OPTIMIZED_SCHEDULER
• `CONFIG_FREERTOS_USE_TICK_HOOK`
• `CONFIG_FREERTOS_USE_TICKLESS_IDLE`
• `CONFIG_FREERTOS_USE_TRACE_FACILITY`
• `CONFIG_FREERTOS_UNICORE`
• `CONFIG_FREERTOS_SMP`
• `CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK`

**CONFIG_FREERTOS_SMP**

Run the Amazon SMP FreeRTOS kernel instead (FEATURE UNDER DEVELOPMENT)

*Found in: Component config > FreeRTOS > Kernel*

Amazon has released an SMP version of the FreeRTOS Kernel which can be found via the following link: [https://github.com/FreeRTOS/FreeRTOS-Kernel/tree/smp](https://github.com/FreeRTOS/FreeRTOS-Kernel/tree/smp)

IDF has added an experimental port of this SMP kernel located in components/freertos/FreeRTOS-Kernel-SMP. Enabling this option will cause IDF to use the Amazon SMP kernel. Note that THIS FEATURE IS UNDER ACTIVE DEVELOPMENT, users use this at their own risk.

Leaving this option disabled will mean the IDF FreeRTOS kernel is used instead, which is located in: components/freertos/FreeRTOS-Kernel. Both kernel versions are SMP capable, but differ in their implementation and features.

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_UNICORE**

Run FreeRTOS only on first core

*Found in: Component config > FreeRTOS > Kernel*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

**CONFIG_FREERTOS_HZ**

`configTICK_RATE_HZ`

*Found in: Component config > FreeRTOS > Kernel*

Sets the FreeRTOS tick interrupt frequency in Hz (see `configTICK_RATE_HZ` documentation for more details).

**Range:**
- from 1 to 1000

**Default value:**
- 100

**CONFIG_FREERTOS_OPTIMIZED_SCHEDULER**

`configUSE_PORT_OPTIMISED_TASK_SELECTION`

*Found in: Component config > FreeRTOS > Kernel*

Enables port specific task selection method. This option can will speed up the search of ready tasks when scheduling (see `configUSE_PORT_OPTIMISED_TASK_SELECTION` documentation for more details).

**Default value:**
- Yes (enabled) if `CONFIG_FREERTOS_UNICORE`
CONFIG_FREERTOS_CHECK_STACKOVERFLOW

configCHECK_FOR_STACK_OVERFLOW

Found in: Component config > FreeRTOS > Kernel

Enables FreeRTOS to check for stack overflows (see configCHECK_FOR_STACK_OVERFLOW documentation for more details).

Note: If users do not provide their own vApplicationStackOverflowHook() function, a default function will be provided by ESP-IDF.

Available options:

- No checking (FREERTOS_CHECK_STACKOVERFLOW_NONE)
  Do not check for stack overflows (configCHECK_FOR_STACK_OVERFLOW = 0)
- Check by stack pointer value (Method 1) (FREERTOS_CHECK_STACKOVERFLOW_PTRVAL)
  Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK_FOR_STACK_OVERFLOW = 1)
- Check using canary bytes (Method 2) (FREERTOS_CHECK_STACKOVERFLOW_CANARY)
  Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK_FOR_STACK_OVERFLOW = 2)

CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS

configNUM_THREAD_LOCAL_STORAGE_POINTERS

Found in: Component config > FreeRTOS > Kernel

Set the number of thread local storage pointers in each task (see configNUM_THREAD_LOCAL_STORAGE_POINTERS documentation for more details).

Note: In ESP-IDF, this value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

Range:

- from 1 to 256

Default value:

- 1

CONFIG_FREERTOS_IDLE_TASK_STACKSIZE

configMINIMAL_STACK_SIZE (Idle task stack size)

Found in: Component config > FreeRTOS > Kernel

Sets the idle task stack size in bytes (see configMINIMAL_STACK_SIZE documentation for more details).

Note:

- ESP-IDF specifies stack sizes in bytes instead of words.
- The default size is enough for most use cases.
- The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.
- Conversely, the stack size can be reduced to the minimum if none of the idle features are used.

Range:

- from 768 to 32768

Default value:

- 1536
CONFIG_FREERTOS_USE_IDLE_HOOK

configUSE_IDLE_HOOK

Found in: Component config > FreeRTOS > Kernel

Enables the idle task application hook (see configUSE_IDLE_HOOK documentation for more details).

Note:
- The application must provide the hook function void vApplicationIdleHook( void );
- vApplicationIdleHook() is called from FreeRTOS idle task(s)
- The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled simultaneously.

Default value:
- No (disabled)

CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK

UseFreeRTOS minimal idle hook

Found in: Component config > FreeRTOS > Kernel

Enables the minimal idle task application hook (see configUSE_IDLE_HOOK documentation for more details).

Note:
- The application must provide the hook function void vApplicationMinimalIdleHook( void );
- vApplicationMinimalIdleHook() is called from FreeRTOS minimal idle task(s)

Default value:
- No (disabled) if CONFIG_FREERTOS_SMP

CONFIG_FREERTOS_USE_TICK_HOOK

configUSE_TICK_HOOK

Found in: Component config > FreeRTOS > Kernel

Enables the tick hook (see configUSE_TICK_HOOK documentation for more details).

Note:
- The application must provide the hook function void vApplicationTickHook( void );
- vApplicationTickHook() is called from FreeRTOS’s tick handling function xTaskIncrementTick()
- The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

Default value:
- No (disabled)

CONFIG_FREERTOS_MAX_TASK_NAME_LEN

configMAX_TASK_NAME_LEN

Found in: Component config > FreeRTOS > Kernel

Sets the maximum number of characters for task names (see configMAX_TASK_NAME_LEN documentation for more details).

Note: For most uses, the default of 16 characters is sufficient.
Chapter 2. API Reference

**Range:**
- from 1 to 256

**Default value:**
- 16

**CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY**

```
configENABLE_BACKWARD_COMPATIBILITY
```

*Found in: Component config > FreeRTOS > Kernel*

Enable backward compatibility with APIs prior to FreeRTOS v8.0.0. (see configENABLE_BACKWARD_COMPATIBILITY documentation for more details).

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_TIMER_TASK_PRIORITY**

```
configTIMER_TASK_PRIORITY
```

*Found in: Component config > FreeRTOS > Kernel*

Sets the timer task’s priority (see configTIMER_TASK_PRIORITY documentation for more details).

**Range:**
- from 1 to 25

**Default value:**
- 1

**CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH**

```
configTIMER_TASK_STACK_DEPTH
```

*Found in: Component config > FreeRTOS > Kernel*

Set the timer task’s stack size (see configTIMER_TASK_STACK_DEPTH documentation for more details).

**Range:**
- from 1536 to 32768

**Default value:**
- 2048

**CONFIG_FREERTOS_TIMER_QUEUE_LENGTH**

```
configTIMER_QUEUE_LENGTH
```

*Found in: Component config > FreeRTOS > Kernel*

Set the timer task’s command queue length (see configTIMER_QUEUE_LENGTH documentation for more details).

**Range:**
- from 5 to 20

**Default value:**
- 10
**CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE**

`configQUEUE_REGISTRY_SIZE`

*Found in: Component config > FreeRTOS > Kernel*

Set the size of the queue registry (see `configQUEUE_REGISTRY_SIZE` documentation for more details).

**Note:** A value of 0 will disable queue registry functionality

**Range:**
- from 0 to 20

**Default value:**
- 0

**CONFIG_FREERTOS_USE_TRACE_FACILITY**

`configUSE_TRACE_FACILITY`

*Found in: Component config > FreeRTOS > Kernel*

Enables additional structure members and functions to assist with execution visualization and tracing (see `configUSE_TRACE_FACILITY` documentation for more details).

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS**

`configUSE_STATS_FORMATTING_FUNCTIONS`

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TRACE_FACILITY*

Set `configUSE_TRACE_FACILITY` and `configUSE_STATS_FORMATTING_FUNCTIONS` to 1 to include the `vTaskList()` and `vTaskGetRunTimeStats()` functions in the build (see `configUSE_STATS_FORMATTING_FUNCTIONS` documentation for more details).

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_USE_TRACE_FACILITY`

**CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID**

Enable display of xCoreID in vTaskList

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TRACE_FACILITY > CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS`

**CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS**

`configGENERATE_RUN_TIME_STATS`

*Found in: Component config > FreeRTOS > Kernel*

Enables collection of run time statistics for each task (see `configGENERATE_RUN_TIME_STATS` documentation for more details).

**Note:** The clock used for run time statistics can be configured in `FREERTOS_RUN_TIME_STATS_CLK`.
**Default value:**
- No (disabled)

**CONFIG_FREERTOS_USE_TICKLESS_IDLE**

configUSE_TICKLESS_IDLE

*Found in: Component config > FreeRTOS > Kernel*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS_IDLE_TIME_BEFORE_SLEEP option. This feature is also known as “automatic light sleep”.

Note that timers created using esp_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the “skip_unhandled_events” option as true.

If disabled, automatic light sleep support will be disabled.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE

**CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP**

configEXPECTED_IDLE_TIME_BEFORE_SLEEP

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TICKLESS_IDLE*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks.

**Range:**
- from 2 to 4294967295 if CONFIG_FREERTOS_USE_TICKLESS_IDLE

**Default value:**
- 3 if CONFIG_freertos_use_tickless_idle

**Port**

Contains:

- CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER
- CONFIG_FREERTOS_RUN_TIME_STATS_CLK
- CONFIG_FREERTOS_INTERRUPT_BACKTRACE
- CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK
- CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP
- CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT
- CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS
- CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION
- CONFIG_FREERTOS_ISR_STACKSIZE
- CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH
- CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS_INTO_FLASH
- CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE
- CONFIG_FREERTOS_CORETIMER
- CONFIG_FREERTOS_FPU_IN_ISR
- CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER

**CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER**

Wrap task functions

*Found in: Component config > FreeRTOS > Port*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper
function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK**

Enable stack overflow debug watchpoint

*Found in: Component config > FreeRTOS > Port*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See FREERTOS_CHECK_STACKOVERFLOW for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS**

Enable thread local storage pointers deletion callbacks

*Found in: Component config > FreeRTOS > Port*

ESP-IDF provides users with the ability to free TLSP memory by registering TLSP deletion callbacks. These callbacks are automatically called by FreeRTOS when a task is deleted. When this option is turned on, the memory reserved for TLSPs in the TCB is doubled to make space for storing the deletion callbacks. If the user does not wish to use TLSP deletion callbacks then this option could be turned off to save space in the TCB memory.

**Default value:**
- Yes (enabled) if CONFIG_FREERTOS_SMP && CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS > 0

**CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP**

Enable static task cleanup hook

*Found in: Component config > FreeRTOS > Port*

Enable this option to make FreeRTOS call the static task cleanup hook when a task is deleted.

Note: Users will need to provide a `void vPortCleanUpTCB ( void *pxTCB )` callback

**Default value:**
- No (disabled) if CONFIG_FREERTOS_SMP
CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER

Check that mutex semaphore is given by owner task

*Found in: Component config > FreeRTOS > Port*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

**Default value:**
- Yes (enabled)

CONFIG_FREERTOS_ISR_STACKSIZE

ISR stack size

*Found in: Component config > FreeRTOS > Port*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**Range:**
- from 2096 to 32768 if ESP_COREDUMP_DATA_FORMAT_ELF
- from 1536 to 32768

**Default value:**
- 2096 if ESP_COREDUMP_DATA_FORMAT_ELF
- 1536

CONFIG_FREERTOS_INTERRUPT_BACKTRACE

Enable backtrace from interrupt to task context

*Found in: Component config > FreeRTOS > Port*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**Default value:**
- Yes (enabled)

CONFIG_FREERTOS_FPU_IN_ISR

Use float in Level 1 ISR

*Found in: Component config > FreeRTOS > Port*

When enabled, the usage of float type is allowed inside Level 1 ISRs. Note that usage of float types in higher level interrupts is still not permitted.

**Default value:**
- No (disabled)

CONFIG_FREERTOS_CORETIMER

Tick timer source (Xtensa Only)

*Found in: Component config > FreeRTOS > Port*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities.
Available options:

- Timer 0 (int 6, level 1) (FREERTOS_CORETIMER_0)
  Select this to use timer 0
- Timer 1 (int 15, level 3) (FREERTOS_CORETIMER_1)
  Select this to use timer 1
- SYSTIMER 0 (level 1) (FREERTOS_CORETIMER_SYSTIMER_LVL1)
  Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (FREERTOS_CORETIMER_SYSTIMER_LVL3)
  Select this to use systimer with the 3 interrupt priority.

CONFIG_FREERTOS_RUN_TIME_STATS_CLK

Choose the clock source for run time stats

Found in: Component config > FreeRTOS > Port

Choose the clock source for FreeRTOS run time stats. Options are CPU0’s CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

Available options:

- Use ESP TIMER for run time stats (FREERTOS_RUN_TIME_STATS_USING_ESP_TIMER)
  ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (FREERTOS_RUN_TIME_STATS_USING_CPU_CLK)
  CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP_DEFAULT_CPU_FREQ_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH

Place FreeRTOS functions into Flash

Found in: Component config > FreeRTOS > Port

When enabled these selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

Default value:
- No (disabled)

CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS_INTO_FLASH

Place task snapshot functions into flash

Found in: Component config > FreeRTOS > Port

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, will be placed in flash. Note that if enabled, these functions cannot be called when cache is disabled.

Default value:
- No (disabled) if CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT && CONFIG_ESP_PANIC_HANDLER_IRAM
Chapter 2. API Reference

CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE

Tests compliance with Vanilla FreeRTOS port*_CRITICAL calls

*Found in: Component config > FreeRTOS > Port*

If enabled, context of port*_CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port*_CRITICAL from ISR context would cause assert failure

Default value:

- No (disabled)

CONFIG_FREERTOS_ASSERT_ON_UNTESTED_FUNCTION

Halt when an SMP-untested function is called

*Found in: Component config > FreeRTOS > Port*

Some functions in FreeRTOS have not been thoroughly tested yet when moving to the SMP implementation of FreeRTOS. When this option is enabled, these functions will throw an assert().

Default value:

- Yes (enabled)

CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT

Enable task snapshot functions

*Found in: Component config > FreeRTOS > Port*

When enabled, the functions related to snapshots, such as vTaskGetSnapshot or uxTaskGetSnapshotAll, are compiled and linked. Task snapshots are used by Task Watchdog (TWDT), GDB Stub and Core dump.

Default value:

- Yes (enabled)

Hardware Abstraction Layer (HAL) and Low Level (LL) Contains:

- CONFIG_HAL_DEFAULT_ASSERTION_LEVEL
- CONFIG_HAL_LOG_LEVEL
- CONFIG_HAL_SYSTIMER_USE_ROM_IMPL
- CONFIG_HAL_WDT_USE_ROM_IMPL

CONFIG_HAL_DEFAULT_ASSERTION_LEVEL

Default HAL assertion level

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can’t exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can’t be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

Available options:

- Same as system assertion level (HAL_ASSERTION_EQUALS_SYSTEM)
- Disabled (HAL_ASSERTION_DISABLE)
- Silent (HAL_ASSERTION_SILENT)
- Enabled (HAL_ASSERTION_ENABLE)
**CONFIG_HAL_LOG_LEVEL**

HAL layer log verbosity

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Specify how much output to see in HAL logs.

**Available options:**
- No output (HAL_LOG_LEVEL_NONE)
- Error (HAL_LOG_LEVEL_ERROR)
- Warning (HAL_LOG_LEVEL_WARN)
- Info (HAL_LOG_LEVEL_INFO)
- Debug (HAL_LOG_LEVEL_DEBUG)
- Verbose (HAL_LOG_LEVEL_VERBOSE)

**CONFIG_HAL_SYSTIMER_USE_ROM_IMPL**

Use ROM implementation of SysTimer HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled) if ESP_ROM_HAS_HAL_SYSTIMER

**CONFIG_HAL_WDT_USE_ROM_IMPL**

Use ROM implementation of WDT HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled) if ESP_ROM_HAS_HAL_WDT

**Heap memory debugging**

Contains:

- CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS
- CONFIG_HEAP_TASK_TRACKING
- CONFIG_HEAP_CORRUPTION_DETECTION
- CONFIG_HEAP_TRACING_DEST
- CONFIG_HEAP_TRACING_STACK_DEPTH
- CONFIG_HEAP_TLSF_USE_ROM_IMPL

**CONFIG_HEAP_CORRUPTION_DETECTION**

Heap corruption detection

*Found in: Component config > Heap memory debugging*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.
See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

**Available options:**
- Basic (no poisoning) (HEAP_POISONING_DISABLED)
- Light impact (HEAP_POISONING_LIGHT)
- Comprehensive (HEAP_POISONING_COMPREHENSIVE)

**CONFIG_HEAP_TRACING_DEST**

Heap tracing

*Found in: Component config > Heap memory debugging*

Enables the heap tracing API defined in esp_heap_trace.h.

This function causes a moderate increase in IRAM code side and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.

**Available options:**
- Disabled (HEAP_TRACING_OFF)
- Standalone (HEAP_TRACING_STANDALONE)
- Host-based (HEAP_TRACING_TOHOST)

**CONFIG_HEAP_TRACING_STACK_DEPTH**

Heap tracing stack depth

*Found in: Component config > Heap memory debugging*

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

**CONFIG_HEAP_TASK_TRACKING**

Enable heap task tracking

*Found in: Component config > Heap memory debugging*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

**CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS**

Abort if memory allocation fails

*Found in: Component config > Heap memory debugging*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**
- No (disabled)

**CONFIG_HEAP_TLSF_USE_ROM_IMPL**

Use ROM implementation of heap tlsf library

*Found in: Component config > Heap memory debugging*

Enable this flag to use heap functions from ROM instead of ESP-IDF.
If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled) if ESP_ROM_HAS HEAP_TLSF

**Log output**
Contains:
- `CONFIG_LOG_DEFAULT_LEVEL`
- `CONFIG_LOG_TIMESTAMP_SOURCE`
- `CONFIG_LOG_MAXIMUM_LEVEL`
- `CONFIG_LOG_COLORS`

**CONFIG_LOG_DEFAULT_LEVEL**
Default log verbosity

*Found in: Component config > Log output*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using esp_log_level_set function.

By default, this setting limits which log statements are compiled into the program. For example, selecting “Warning” would mean that changing log level to “Debug” at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

**Available options:**
- No output (LOG_DEFAULT_LEVEL_NONE)
- Error (LOG_DEFAULT_LEVEL_ERROR)
- Warning (LOG_DEFAULT_LEVEL_WARN)
- Info (LOG_DEFAULT_LEVEL_INFO)
- Debug (LOG_DEFAULT_LEVEL_DEBUG)
- Verbose (LOG_DEFAULT_LEVEL_VERBOSE)

**CONFIG_LOG_MAXIMUM_LEVEL**
Maximum log verbosity

*Found in: Component config > Log output*

This config option sets the highest log verbosity that it’s possible to select at runtime by calling esp_log_level_set(). This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate “Bootloader log verbosity” setting.

**Available options:**
- Same as default (LOG_MAXIMUM_EQUALS_DEFAULT)
- Error (LOG_MAXIMUM_LEVEL_ERROR)
- Warning (LOG_MAXIMUM_LEVEL_WARN)
- Info (LOG_MAXIMUM_LEVEL_INFO)
- Debug (LOG_MAXIMUM_LEVEL_DEBUG)
- Verbose (LOG_MAXIMUM_LEVEL_VERBOSE)
**CONFIG_LOG_COLORS**

Use ANSI terminal colors in log output

*Found in: Component config > Log output*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**
- Yes (enabled)

**CONFIG_LOG_TIMESTAMP_SOURCE**

Log Timestamps

*Found in: Component config > Log output*

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the chip’s RTC and high resolution timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)

**NOTE:** Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

**Available options:**
- Milliseconds Since Boot (LOG_TIMESTAMP_SOURCE_RTOS)
- System Time (LOG_TIMESTAMP_SOURCE_SYSTEM)

**LWIP** Contains:

- `CONFIG_LWIP_CHECK_THREAD_SAFETY`
- Checksums
- `CONFIG_LWIP_DHCP_COARSE_TIMER_SECS`
- DHCP server
- `CONFIG_LWIP_DHCP_OPTIONS_LEN`
- `CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID`
- `CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID`
- `CONFIG_LWIP_DHCP.Does_ARP_CHECK`
- `CONFIG_LWIP_DHCP.RESTORE_LAST_IP`
- `CONFIG_LWIP.PPP.CHAPE_SUPPORT`
- `CONFIG_LWIP.L2_TO_L3_COPY`
- `CONFIG_LWIP.IPv6_DHCP6`
- `CONFIG_LWIP.IP4_FRAG`
- `CONFIG_LWIP.IP6_FRAG`
- `CONFIG_LWIP.IP_FORWARD`
- `CONFIG_LWIP.NETBUF_RECVINFO`
- `CONFIG_LWIP.AUTOIP`
- `CONFIG_LWIP.IPv6`
- `CONFIG_LWIP_ENABLE_LCP_ECHO`
- `CONFIG_LWIP.ESP_LWIP_ASSERT`
- `CONFIG_LWIP_DEBUG`
- `CONFIG_LWIP_IRAM_OPTIMIZATION`
- `CONFIG_LWIP_STATS`
- `CONFIG_LWIP.TIMERS.ONDEMAND`
- `CONFIG_LWIP.DNS_SUPPORT_MDNS QUERIES`
- `CONFIG_LWIP.PPP_MFFE_SUPPORT`
• CONFIG_LWIP_PPP_MSCHAP_SUPPORT
• CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT
• CONFIG_LWIP_PPP_PAP_SUPPORT
• CONFIG_LWIP_PPP_DEBUG_ON
• CONFIG_LWIP_PPP_SUPPORT
• CONFIG_LWIP_IP4_REASSEMBLY
• CONFIG_LWIP_IP6_REASSEMBLY
• CONFIG_LWIP_SLIP_SUPPORT
• CONFIG_LWIP_SO_LINGER
• CONFIG_LWIP_SO_RECVBUF
• CONFIG_LWIP_SO_REUSE
• CONFIG_LWIP_NETIF_STATUS_CALLBACK
• CONFIG_LWIP_TCPIP_CORE_LOCKING
• CONFIG_LWIP_NETIF_API
• Hooks
• ICMP
• CONFIG_LWIP_LOCAL_HOSTNAME
• LWIP RAW API
• CONFIG_LWIP_TCPIP_TASK_PRIO
• CONFIG_LWIP_IPV6 ND6 NUM_NEIGHBORS
• CONFIG_LWIP_IPV6 MEMP NUM ND6 QUEUE
• CONFIG_LWIP_MAX SOCKETS
• CONFIG_LWIP_BRIDGEIF MAX_PORTS
• CONFIG_LWIP_NUM_NETIF_CLIENT_DATA
• CONFIG_LWIP_ESP Gratuitous ARP
• CONFIG_LWIP_ESP_MLDV6_REPORT
• SNTP
• CONFIG_LWIP_USE ONLY LWIP SELECT
• CONFIG_LWIP_NETIF LOOPBACK
• TCP
• CONFIG_LWIP_TCPIP_TASK_AFFINITY
• CONFIG_LWIP_TCPIP_TASK_STACK_SIZE
• CONFIG_LWIP_TCPIP_RECVMBOX_SIZE
• UDP
• CONFIG_LWIP_IPV6_RDNSS_MAX DNS SERVERS

**CONFIG_LWIP_LOCAL_HOSTNAME**

Local netif hostname

*Found in: Component config > LWIP*

The default name this device will report to other devices on the network. Could be updated at runtime with esp_netif_set_hostname()

**Default value:**

- “espressif”

**CONFIG_LWIP_NETIF_API**

Enable usage of standard POSIX APIs in LWIP

*Found in: Component config > LWIP*

If this feature is enabled, standard POSIX APIs: if_indextoname(), if_nametoindex() could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as esp_netif_get_netif_impl_name())

**Default value:**

- No (disabled)
CONFIG_LWIP_TCPIP_TASK_PRIO

LWIP TCP/IP Task Priority

*Found in: Component config > LWIP*

LWIP tcpip task priority. In case of high throughput, this parameter could be changed up to (config-MAX_PRIORITIES-1).

**Range:**
- from 1 to 24

**Default value:**
- 18

CONFIG_LWIP_TCPIP_CORE_LOCKING

Enable tcpip core locking

*Found in: Component config > LWIP*

If Enable tcpip core locking, creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See LOCK_TCPIP_CORE() and UNLOCK_TCPIP_CORE().

If disable tcpip core locking, TCP IP will perform tasks through context switching

**Default value:**
- No (disabled)

CONFIG_LWIP_TCPIP_CORE_LOCKING_INPUT

Enable tcpip core locking input

*Found in: Component config > LWIP > CONFIG_LWIP_TCPIP_CORE_LOCKING*

When LWIP_TCPIP_CORE_LOCKING is enabled, this lets tcpip_input() grab the mutex for input packets as well, instead of allocating a message and passing it to tcpip_thread.

**Default value:**
- No (disabled) if CONFIG_LWIP_TCPIP_CORE_LOCKING

CONFIG_LWIP_CHECK_THREAD_SAFETY

Checks that lwip API runs in expected context

*Found in: Component config > LWIP*

Enable to check that the project does not violate lwip thread safety. If enabled, all lwip functions that require thread awareness run an assertion to verify that the TCP/IP core functionality is either locked or accessed from the correct thread.

**Default value:**
- No (disabled)

CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES

Enable mDNS queries in resolving host name

*Found in: Component config > LWIP*

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

**Default value:**
- Yes (enabled)
CONFIG_LWIP_L2_TO_L3_COPY

Enable copy between Layer2 and Layer3 packets

*Found in: Component config > LWIP*

If this feature is enabled, all traffic from layer2 (WIFI Driver) will be copied to a new buffer before sending it to layer3 (LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**Default value:**
- No (disabled)

CONFIG_LWIP_IRAM_OPTIMIZATION

Enable LWIP IRAM optimization

*Found in: Component config > LWIP*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn’t help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**
- No (disabled)

CONFIG_LWIP_TIMERS_ONDEMAND

Enable LWIP Timers on demand

*Found in: Component config > LWIP*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_MAX_SOCKETS

Max number of open sockets

*Found in: Component config > LWIP*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**Range:**
- from 1 to 16

**Default value:**
- 10
**CONFIG_LWIP_USE_ONLY_LWIP_SELECT**

Support LWIP socket select() only (DEPRECATED)

*Found in: Component config > LWIP*

This option is deprecated. Do not use this option, use `VFS_SUPPORT_SELECT` instead.

**Default value:**
- No (disabled)

**CONFIG_LWIP_SO_LINGER**

Enable SO_LINGER processing

*Found in: Component config > LWIP*

Enabling this option allows SO_LINGER processing. `l_onoff = 1,l_linger` can set the timeout.

If l_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If l_linger!=0, Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**
- No (disabled)

**CONFIG_LWIP_SO_REUSE**

Enable SO_REUSEADDR option

*Found in: Component config > LWIP*

Enabling this option allows binding to a port which remains in TIME_WAIT.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_SO_REUSE_RXTOALL**

SO_REUSEADDR copies broadcast/multicast to all matches

*Found in: Component config > LWIP > CONFIG_LWIP_SO_REUSE*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don’t plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_SO_RCVBUF**

Enable SO_RCVBUF option

*Found in: Component config > LWIP*

Enabling this option allows checking for available data on a netconn.

**Default value:**
- No (disabled)
CONFIG_LWIP_NETBUF_RECVINFO

Enable IP_PKTINFO option

*Found in: Component config > LWIP*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**Default value:**
- No (disabled)

CONFIG_LWIP_IP4_FRAG

Enable fragment outgoing IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_IP6_FRAG

Enable fragment outgoing IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_IP4_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP4 packets.

**Default value:**
- No (disabled)

CONFIG_LWIP_IP6_REASSEMBLY

Enable reassembly incoming fragmented IP6 packets

*Found in: Component config > LWIP*

Enabling this option allows reassembling incoming fragmented IP6 packets.

**Default value:**
- No (disabled)

CONFIG_LWIP_IP_FORWARD

Enable IP forwarding

*Found in: Component config > LWIP*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**
- No (disabled)
CONFIG_LWIP_IPV4_NAPT

Enable NAT (new/experimental)

Found in: Component config > LWIP > CONFIG_LWIP_IP_FORWARD

Enabling this option allows Network Address and Port Translation.

Default value:
- No (disabled) if CONFIG_LWIP_IP_FORWARD

CONFIG_LWIP_STATS

Enable LWIP statistics

Found in: Component config > LWIP

Enabling this option allows LWIP statistics

Default value:
- No (disabled)

CONFIG_LWIP_ESP GRATUITOUS_ARP

Send gratuitous ARP periodically

Found in: Component config > LWIP

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues. If the ARP table of the AP is old, and the AP doesn’t send ARP request to update it’s ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it’s ARP table.

Default value:
- Yes (enabled)

CONFIG_LWIP_GARP_TMR_INTERVAL

GARP timer interval(seconds)

Found in: Component config > LWIP > CONFIG_LWIP_ESP GRATUITOUS_ARP

Set the timer interval for gratuitous ARP. The default value is 60s

Default value:
- 60

CONFIG_LWIP_ESP_MLDV6_REPORT

Send mldv6 report periodically

Found in: Component config > LWIP

Enable this option allows to send mldv6 report periodically.

This option solve the issue that failed to receive multicast data. Some routers fail to forward multicast packets. To solve this problem, send multicast mldv6 report to routers regularly.

Default value:
- Yes (enabled)
**CONFIG_LWIP_MLDV6_TMR_INTERVAL**

mldv6 report timer interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP_MLDV6_REPORT*

Set the timer interval for mldv6 report. The default value is 30s

**Default value:**
- 40

**CONFIG_LWIP_TCPIP_RECVBOX_SIZE**

TCPIP task receive mailbox size

*Found in: Component config > LWIP*

Set TCPIP task receive mailbox size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**
- from 6 to 64 if `CONFIG_LWIP_WND_SCALE`
- from 6 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 32

**CONFIG_LWIP_DHCP_DOES_ARP_CHECK**

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID**

DHCP: Disable Use of HW address as client identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

**Default value:**
- No (disabled)

**CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID**

DHCP: Disable Use of vendor class identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client vendor class identification. Set this option to “y” in order to exclude option 60 from DHCP packets.

**Default value:**
- Yes (enabled)
CONFIG_LWIP_DHCP_RESTORE_LAST_IP

DHCP: Restore last IP obtained from DHCP server

*Found in: Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**
- No (disabled)

CONFIG_LWIP_DHCP_OPTIONS_LEN

DHCP total option length

*Found in: Component config > LWIP*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP_ASSERT due to option value is too long. Please increase the LWIP_DHCP_OPTIONS_LEN value.

**Range:**
- from 68 to 255

**Default value:**
- 68
- 108

CONFIG_LWIP_NUM_NETIF_CLIENT_DATA

Number of clients store data in netif

*Found in: Component config > LWIP*

Number of clients that may store data in client_data member array of struct netif.

**Range:**
- from 0 to 256

**Default value:**
- 0

CONFIG_LWIP_DHCP_COARSE_TIMER_SECS

DHCP coarse timer interval(s)

*Found in: Component config > LWIP*

Set DHCP coarse interval in seconds. A higher value will be less precise but cost less power consumption.

**Range:**
- from 1 to 10

**Default value:**
- 1

DHCP server

Contains:
- CONFIG_LWIP_DHCPS
**CONFIG_LWIP_DHCPS**

DHCPs: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPs)

*Found in: Component config > LWIP > DHCP server*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_DHCPSLEASE_UNIT**

Multiplier for lease time, in seconds

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**Range:**
- from 1 to 3600

**Default value:**
- 60

**CONFIG_LWIP_DHCPS_MAX_STATION_NUM**

Maximum number of stations

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from its address pool, without notification.

**Range:**
- from 1 to 64

**Default value:**
- 8

**CONFIG_LWIP_AUTOIP**

Enable IPv4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

**Default value:**
- No (disabled)

Contains:
- **CONFIG_LWIP_AUTOIP_TRIES**
- **CONFIG_LWIP_AUTOIP_MAX_CONFLICTS**
- **CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL**
CONFIG_LWIP_AUTOIP_TRIES

DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: “This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP.” (In the case of ESP-IDF, this means multiple SYSTEM_EVENT_STA_GOT_IP events.)

*Range:*
  - from 1 to 100 if CONFIG_LWIP_AUTOIP

*Default value:*
  - 2 if CONFIG_LWIP_AUTOIP

CONFIG_LWIP_AUTOIP_MAX_CONFLICTS

Max IP conflicts before rate limiting

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

*Range:*
  - from 1 to 100 if CONFIG_LWIP_AUTOIP

*Default value:*
  - 9 if CONFIG_LWIP_AUTOIP

CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL

Rate limited interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

*Range:*
  - from 5 to 120 if CONFIG_LWIP_AUTOIP

*Default value:*
  - 20 if CONFIG_LWIP_AUTOIP

CONFIG_LWIP_IPV6

Enable IPv6

*Found in: Component config > LWIP*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP_IPV6 then some other components (coap and asio) will no longer be available.

*Default value:*
  - Yes (enabled)

CONFIG_LWIP_IPV6_AUTOCONFIG

Enable IPv6 stateless address autoconfiguration (SLAAC)

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration (SLAAC).

See RFC 4862.
Default value:
• No (disabled)

**CONFIG_LWIP_IPV6_NUM_ADDRESSES**

Number of IPv6 addresses on each network interface

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**
• 3

**CONFIG_LWIP_IPV6_FORWARD**

Enable IPv6 forwarding between interfaces

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**
• No (disabled)

**CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS**

Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in: Component config > LWIP*

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

**Default value:**
• 0 if **CONFIG_LWIP_IPV6_AUTOCONFIG**

**CONFIG_LWIP_IPV6_DHCP6**

Enable DHCPv6 stateless address autoconfiguration

*Found in: Component config > LWIP*

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using dhcp6_enable_stateless(netif); Note that the stateful address autoconfiguration is not supported.

**Default value:**
• No (disabled) if **CONFIG_LWIP_IPV6_AUTOCONFIG**

**CONFIG_LWIP_NETIF_STATUS_CALLBACK**

Enable status callback for network interfaces

*Found in: Component config > LWIP*

Enable callbacks when the network interface is up/down and addresses are changed.

**Default value:**
• No (disabled)
CONFIG_LWIP_NETIF_LOOPBACK

Support per-interface loopback

*Found in:* Component config > LWIP

Enabling this option means that if a packet is sent with a destination address equal to the interface’s own IP address, it will “loop back” and be received by this interface. Disabling this option disables support of loopback interface in lwIP

**Default value:**

* Yes (enabled)

Contains:

* CONFIG_LWIP_LOOPBACK_MAX_PBUFS

CONFIG_LWIP_LOOPBACK_MAX_PBUFS

Max queued loopback packets per interface

*Found in:* Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**Range:**

* from 0 to 16

**Default value:**

* 8

TCP

Contains:

* CONFIG_LWIP_TCP_WND_DEFAULT
* CONFIG_LWIP_TCP_SND_BUF_DEFAULT
* CONFIG_LWIP_TCP_RECVMBOX_SIZE
* CONFIG_LWIP_TCP_RTO_TIME
* CONFIG_LWIP_MAX_ACTIVE_TCP
* CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT
* CONFIG_LWIP_MAX_LISTENING_TCP
* CONFIG_LWIP_TCP_MAXRTX
* CONFIG_LWIP_TCP_SYNMAXRTX
* CONFIG_LWIP_TCP_MSL
* CONFIG_LWIP_TCP_MSS
* CONFIG_LWIP_TCP_OVERSIZE
* CONFIG_LWIP_TCP_QUEUE_OOSEQ
* CONFIG_LWIP_TCP_MAXRTX
* CONFIG_LWIP_TCP_SYNMAXRTX
* CONFIG_LWIP_TCP_MSL
* CONFIG_LWIP_TCP_MSS
* CONFIG_LWIP_TCP_OVERSIZE

CONFIG_LWIP_MAX_ACTIVE_TCP

Maximum active TCP Connections

*Found in:* Component config > LWIP > TCP

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**Range:**

* from 0 to 16
Chapter 2. API Reference

- from 1 to 1024
**Default value:**
- 16

**CONFIG_LWIP_MAX_LISTENING_TCP**

Maximum listening TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**Range:**
- from 1 to 1024
**Default value:**
- 16

**CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION**

TCP high speed retransmissions

*Found in: Component config > LWIP > TCP*

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_TCP_MAXRTX**

Maximum number of retransmissions of data segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of data segments.

**Range:**
- from 3 to 12
**Default value:**
- 12

**CONFIG_LWIP_TCP_SYNMAXRTX**

Maximum number of retransmissions of SYN segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of SYN segments.

**Range:**
- from 3 to 12
**Default value:**
- 6
- 12
Chapter 2. API Reference

CONFIG_LWIP_TCP_MSS

Maximum Segment Size (MSS)

Found in: Component config > LWIP > TCP

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP_MSS Range: 576 <= TCP_MSS <= 1460 IPv6 TCP_MSS Range: 1220 <= TCP_mSS <= 1440

Range:
  • from 536 to 1460

Default value:
  • 1440

CONFIG_LWIP_TCP_TMR_INTERVAL

TCP timer interval (ms)

Found in: Component config > LWIP > TCP

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

Default value:
  • 250

CONFIG_LWIP_TCP_MSL

Maximum segment lifetime (MSL)

Found in: Component config > LWIP > TCP

Set maximum segment lifetime in milliseconds.

Default value:
  • 60000

CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT

Maximum FIN segment lifetime

Found in: Component config > LWIP > TCP

Set maximum segment lifetime in milliseconds.

Default value:
  • 20000

CONFIG_LWIP_TCP_SND_BUF_DEFAULT

Default send buffer size

Found in: Component config > LWIP > TCP

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with lwip_setsockopt(s, TCP_SNDBUF, ...).

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

Range:
  • from 2440 to 65535 if CONFIG_LWIP_WND_SCALE
  • from 2440 to 1024000 if CONFIG_LWIP_WND_SCALE
**Default value:**
- 5744

**CONFIG_LWIP_TCP_WND_DEFAULT**

Default receive window size

*Found in: Component config > LWIP > TCP*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with lwip_setsockopt(s, TCP_WINDOW, ...).

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

*Range:*
- from 2440 to 65535 if `CONFIG_LWIP_WND_SCALE`
- from 2440 to 1024000 if `CONFIG_LWIP_WND_SCALE`

*Default value:*
- 5744

**CONFIG_LWIP_TCP_RECCVMBOX_SIZE**

Default TCP receive mail box size

*Found in: Component config > LWIP > TCP*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is: LWIP_TCP_WND_DEFAULT/TCP_MSS + 2, e.g. if LWIP_TCP_WND_DEFAULT=14360, TCP_MSS=1436, then the recommended receive mail box size is (14360/1436 + 2) = 12.

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum LWIP_TCP_RECCVMBOX_SIZE packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is LWIP_TCP_RECCVMBOX_SIZE multiples the maximum TCP socket number. In other words, the bigger LWIP_TCP_RECCVMBOX_SIZE means more memory. On the other hand, if the receiv mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

*Range:*
- from 6 to 64 if `CONFIG_LWIP_WND_SCALE`
- from 6 to 1024 if `CONFIG_LWIP_WND_SCALE`

*Default value:*
- 6

**CONFIG_LWIP_TCP_QUEUE_OOSEQ**

Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

*Default value:*
- Yes (enabled)
**CONFIG_LWIP_TCP_SACK_OUT**

Support sending selective acknowledgements

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_TCP_QUEUE_OOSEQ*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**
- No (disabled)

**CONFIG_LWIP_TCP_OVERSIZE**

Pre-allocate transmit PBUF size

*Found in: Component config > LWIP > TCP*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

**Available options:**
- MSS (LWIP_TCP_OVERSIZE_MSS)
- 25% MSS (LWIP_TCP_OVERSIZE_QUARTER_MSS)
- Disabled (LWIP_TCP_OVERSIZE_DISABLE)

**CONFIG_LWIP_WND_SCALE**

Support TCP window scale

*Found in: Component config > LWIP > TCP*

Enable this feature to support TCP window scaling.

**Default value:**
- No (disabled) if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

**CONFIG_LWIP_TCP_RCV_SCALE**

Set TCP receiving window scaling factor

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_WND_SCALE*

Enable this feature to support TCP window scaling.

**Range:**
- from 0 to 14 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
- 0 if `CONFIG_LWIP_WND_SCALE`

**CONFIG_LWIP_TCP_RTO_TIME**

Default TCP rto time

*Found in: Component config > LWIP > TCP*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**
- 3000
UDP Contains:

- `CONFIG_LWIP_UDP_RECVMBOX_SIZE`
- `CONFIG_LWIP_MAX_UDP_PCBS`

`CONFIG_LWIP_MAX_UDP_PCBS`

Maximum active UDP control blocks

*Found in: Component config > LWIP > UDP*

The maximum number of active UDP “connections” (i.e., UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**
- from 1 to 1024

**Default value:**
- 16

`CONFIG_LWIP_UDP_RECVMBOX_SIZE`

Default UDP receive mail box size

*Found in: Component config > LWIP > UDP*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum UDP_RECVMBOX_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP_RECVMBOX_SIZE multiples the maximum UDP socket number. In other words, the larger UDP_RECVMBOX_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**
- from 6 to 64

**Default value:**
- 6

Checksums Contains:

- `CONFIG_LWIP_CHECKSUM_CHECK_ICMP`
- `CONFIG_LWIP_CHECKSUM_CHECK_IP`
- `CONFIG_LWIP_CHECKSUM_CHECK_UDP`

`CONFIG_LWIP_CHECKSUM_CHECK_IP`

Enable LWIP IP checksums

*Found in: Component config > LWIP > Checksums*

Enable checksum checking for received IP messages

**Default value:**
- No (disabled)
CONFIG_LWIP_CHECKSUM_CHECK_UDP
Enable LWIP UDP checksums
*Found in: Component config > LWIP > Checksums*
Enable checksum checking for received UDP messages
**Default value:**
- No (disabled)

CONFIG_LWIP_CHECKSUM_CHECK_ICMP
Enable LWIP ICMP checksums
*Found in: Component config > LWIP > Checksums*
Enable checksum checking for received ICMP messages
**Default value:**
- Yes (enabled)

CONFIG_LWIP_TCPIP_TASK_STACK_SIZE
TCP/IP Task Stack Size
*Found in: Component config > LWIP*
Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.
**Range:**
- from 2048 to 65536
**Default value:**
- 3072

CONFIG_LWIP_TCPIP_TASK_AFFINITY
TCP/IP task affinity
*Found in: Component config > LWIP*
Allows setting LWIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.
**Available options:**
- No affinity (LWIP_TCPIP_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (LWIP_TCPIP_TASK_AFFINITY_CPU0)
- CPU1 (LWIP_TCPIP_TASK_AFFINITY_CPU1)

CONFIG_LWIP_PPP_SUPPORT
Enable PPP support (new/experimental)
*Found in: Component config > LWIP*
Enable PPP stack. Now only PPP over serial is possible.
PPP over serial support is experimental and unsupported.
**Default value:**
- No (disabled)
Contains:
- CONFIG_LWIP_PPP_ENABLE_IPV6
CONFIG_LWIP_PPP_ENABLE_IPV6

Enable IPv6 support for PPP connections (IPV6CP)

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable IPv6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPv6 addressing in the local link. If they are requested for IPV6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPv6 support.

**Default value:**
- Yes (enabled) if `CONFIG_LWIP_PPP_SUPPORT` && `CONFIG_LWIP_IPV6`

CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE

Max number of IPv6 packets to queue during MAC resolution

*Found in: Component config > LWIP*

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**
- from 3 to 20

**Default value:**
- 3

CONFIG_LWIP_IPV6_NUM_ND6_NEIGHBORS

Max number of entries in IPv6 neighbor cache

*Found in: Component config > LWIP*

Config max number of entries in IPv6 neighbor cache

**Range:**
- from 3 to 10

**Default value:**
- 5

CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT

Enable Notify Phase Callback

*Found in: Component config > LWIP*

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_PPP_PAP_SUPPORT

Enable PAP support

*Found in: Component config > LWIP*

Enable Password Authentication Protocol (PAP) support

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`
CONFIG_LWIP_PPP_CHAP_SUPPORT
Enable CHAP support
Found in: Component config > LWIP
Enable Challenge Handshake Authentication Protocol (CHAP) support
Default value:
  • No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_PPP_MSCHAP_SUPPORT
Enable MSCHAP support
Found in: Component config > LWIP
Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support
Default value:
  • No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_PPP_MPPE_SUPPORT
Enable MPPE support
Found in: Component config > LWIP
Enable Microsoft Point-to-Point Encryption (MPPE) support
Default value:
  • No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_ENABLE_LCP_ECHO
Enable LCP ECHO
Found in: Component config > LWIP
Enable LCP echo keepalive requests
Default value:
  • No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_LCP_ECHOINTERVAL
Echo interval (s)
Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO
Interval in seconds between keepalive LCP echo requests, 0 to disable.
Range:
  • from 0 to 100000 if CONFIG_LWIP_ENABLE_LCP_ECHO
Default value:
  • 3 if CONFIG_LWIP_ENABLE_LCP_ECHO

CONFIG_LWIP_LCP_MAXECHOFAILS
Maximum echo failures
Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO
Number of consecutive unanswered echo requests before failure is indicated.
Range:
  • from 0 to 100000 if CONFIG_LWIP_ENABLE_LCP_ECHO
Default value:
- 3 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**CONFIG_LWIP_PPP_DEBUG_ON**
Enable PPP debug log output

*Found in: Component config > LWIP*
Enable PPP debug log output

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

**CONFIG_LWIP_SLIP_SUPPORT**
Enable SLIP support (new/experimental)

*Found in: Component config > LWIP*
Enable SLIP stack. Now only SLIP over serial is possible.
SLIP over serial support is experimental and unsupported.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_LWIP_SLIP_DEBUG_ON`

**CONFIG_LWIP_SLIP_DEBUG_ON**
Enable SLIP debug log output

*Found in: Component config > LWIP > CONFIG_LWIP_SLIP_SUPPORT*
Enable SLIP debug log output

**Default value:**
- No (disabled) if `CONFIG_LWIP_SLIP_SUPPORT`

**ICMP**
Contains:
- `CONFIG_LWIP_ICMP`
- `CONFIG_LWIP_BROADCAST_PING`
- `CONFIG_LWIP_MULTICAST_PING`

**CONFIG_LWIP_ICMP**
ICMP: Enable ICMP

*Found in: Component config > LWIP > ICMP*
Enable ICMP module for check network stability

**Default value:**
- Yes (enabled)
CONFIG_LWIP_MULTICAST_PING
Respond to multicast pings

Found in: Component config > LWIP > ICMP

Default value:
• No (disabled)

CONFIG_LWIP_BROADCAST_PING
Respond to broadcast pings

Found in: Component config > LWIP > ICMP

Default value:
• No (disabled)

LWIP RAW API Contains:
• CONFIG_LWIP_MAX_RAW_PCBS

CONFIG_LWIP_MAX_RAW_PCBS
Maximum LWIP RAW PCBs

Found in: Component config > LWIP > LWIP RAW API

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

Range:
• from 1 to 1024

Default value:
• 16

SNTP Contains:
• CONFIG_LWIP_SNTP_MAX_SERVERS
• CONFIG_LWIP_SNTP_UPDATE_DELAY
• CONFIG_LWIP_DHCP_GET_NTP_SRV

CONFIG_LWIP_SNTP_MAX_SERVERS
Maximum number of NTP servers

Found in: Component config > LWIP > SNTP

Set maximum number of NTP servers used by LwIP SNTP module. First argument of sntp_setserver/sntp_setservername functions is limited to this value.

Range:
• from 1 to 16

Default value:
• 1

CONFIG_LWIP_DHCP_GET_NTP_SRV
Request NTP servers from DHCP

Found in: Component config > LWIP > SNTP
If enabled, LWIP will add ‘NTP’ to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see snp_servermode_dhcp() func.)

Default value:
- No (disabled)

**CONFIG_LWIP_DHCP_MAX_NTP_SERVERS**

Maximum number of NTP servers acquired via DHCP

*Found in: Component config > LWIP > SNTP > CONFIG_LWIP_DHCP_GET_NTP_SRV*

Set maximum number of NTP servers acquired via DHCP-offer. Should be less or equal to “Maximum number of NTP servers”, any extra servers would be just ignored.

**Range:**
- from 1 to 16 if `CONFIG_LWIP_DHCP_GET_NTP_SRV`

**Default value:**
- 1 if `CONFIG_LWIP_DHCP_GET_NTP_SRV`

**CONFIG_LWIP_SNTP_UPDATE_DELAY**

Request interval to update time (ms)

*Found in: Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP, Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**Range:**
- from 15000 to 4294967295

**Default value:**
- 3600000

**CONFIG_LWIP_BRIDGEIF_MAX_PORTS**

Maximum number of bridge ports

*Found in: Component config > LWIP*

Set maximum number of ports a bridge can consist of.

**Range:**
- from 1 to 63

**Default value:**
- 7

**CONFIG_LWIP_ESP_LWIP_ASSERT**

Enable LWIP ASSERT checks

*Found in: Component config > LWIP*

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled. If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

**Default value:**
- Yes (enabled) if COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE
Hooks Contains:

- CONFIG_LWIP_HOOK_ND6_GET_GW
- CONFIG_LWIP_HOOK_IP6_INPUT
- CONFIG_LWIP_HOOK_IP6_ROUTE
- CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE
- CONFIG_LWIP_HOOK_TCP_ISN

**CONFIG_LWIP_HOOK_TCP_ISN**

TCP ISN Hook

*Found in: Component config > LWIP > Hooks*

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (tcp_next_iss) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to LWIP_HOOK_TCP_ISN_CUSTOM to provide custom implementation. Set to LWIP_HOOK_TCP_ISN_NONE to use lwIP implementation.

**Available options:**

- No hook declared (LWIP_HOOK_TCP_ISN_NONE)
- Default implementation (LWIP_HOOK_TCP_ISN_DEFAULT)
- Custom implementation (LWIP_HOOK_TCP_ISN_CUSTOM)

**CONFIG_LWIP_HOOK_IP6_ROUTE**

IPv6 route Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (LWIP_HOOK_IP6_ROUTE_NONE)
- Default (weak) implementation (LWIP_HOOK_IP6_ROUTE_DEFAULT)
- Custom implementation (LWIP_HOOK_IP6_ROUTE_CUSTOM)

**CONFIG_LWIP_HOOK_ND6_GET_GW**

IPv6 get gateway Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**

- No hook declared (LWIP_HOOK_ND6_GET_GW_NONE)
- Default (weak) implementation (LWIP_HOOK_ND6_GET_GW_DEFAULT)
- Custom implementation (LWIP_HOOK_ND6_GET_GW_CUSTOM)

**CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE**

Netconn external resolve Hook

*Found in: Component config > LWIP > Hooks*
Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_NETCONN_EXT_RESOLVE_NONE)
- Default (weak) implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_DEFAULT)
- Custom implementation (LWIP_HOOK_NETCONN_EXT_RESOLVE_CUSTOM)

**CONFIG_LWIP_HOOK_IP6_INPUT**

IPv6 packet input

*Found in: Component config > LWIP > Hooks*

 Enables custom IPv6 packet input. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

**Available options:**
- No hook declared (LWIP_HOOK_IP6_INPUT_NONE)
- Default (weak) implementation (LWIP_HOOK_IP6_INPUT_DEFAULT)
- Custom implementation (LWIP_HOOK_IP6_INPUT_CUSTOM)

**CONFIG_LWIP_DEBUG**

Enable LWIP Debug

*Found in: Component config > LWIP*

Enabling this option allows different kinds of lwIP debug output. All lwIP debug features increase the size of the final binary.

**Default value:**
- No (disabled)

Contains:

- CONFIG_LWIP_API_LIB_DEBUG
- CONFIG_LWIP_BRIDGEIF_FDB_DEBUG
- CONFIG_LWIP_BRIDGEIF_FW_DEBUG
- CONFIG_LWIP_BRIDGEIF_DEBUG
- CONFIG_LWIP_DHCP_DEBUG
- CONFIG_LWIP_DHCP_STATE_DEBUG
- CONFIG_LWIP_DNS_DEBUG
- CONFIG_LWIP_ETHARP_DEBUG
- CONFIG_LWIP_ICMP_DEBUG
- CONFIG_LWIP_ICMP6_DEBUG
- CONFIG_LWIP_IP_DEBUG
- CONFIG_LWIP_IP6_DEBUG
- CONFIG_LWIP_NETIF_DEBUG
- CONFIG_LWIP_PBUF_DEBUG
- CONFIG_LWIP_SNTP_DEBUG
- CONFIG_LWIP_SOCKETS_DEBUG
- CONFIG_LWIP_TCP_DEBUG
- CONFIG_LWIP_DEBUG_ESP_LOG

**CONFIG_LWIP_DEBUG_ESP_LOG**

Route LWIP debugs through ESP_LOG interface

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*
Enabling this option routes all enabled LWIP debugs through ESP_LOGD.

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_NETIF_DEBUG**
Enable netif debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_PBUF_DEBUG**
Enable pbuf debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_ETHARP_DEBUG**
Enable etharp debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_API_LIB_DEBUG**
Enable api lib debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_SOCKETS_DEBUG**
Enable socket debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_IP_DEBUG**
Enable IP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`
CONFIG_LWIP_ICMP_DEBUG
Enable ICMP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG &&& CONFIG_LWIP_ICMP

CONFIG_LWIP_DHCP_STATE_DEBUG
Enable DHCP state tracking

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_DHCP_DEBUG
Enable DHCP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_IP6_DEBUG
Enable IP6 debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_ICMP6_DEBUG
Enable ICMP6 debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_TCP_DEBUG
Enable TCP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIPDEBUG

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_SNTP_DEBUG
Enable SNTP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG
**CONFIG_LWIP_DNS_DEBUG**

Enable DNS debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

**CONFIG_LWIP_BRIDGEIF_DEBUG**

Enable bridge generic debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

**CONFIG_LWIP_BRIDGEIF_FDB_DEBUG**

Enable bridge FDB debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

**CONFIG_LWIP_BRIDGEIF_FW_DEBUG**

Enable bridge forwarding debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

*Default value:*
- No (disabled) if CONFIG_LWIP_DEBUG

**mbedTLS**  Contains:

- CONFIG_MBEDTLSASYMMETRICCONTENTLEN
- CertificateBundle
- Certificates
- CONFIG_MBEDTLSCHACHA20_C
- CONFIG_MBEDTLDHM_C
- CONFIG_MBEDTLECP_C
- CONFIG_MBEDTLECDH_C
- CONFIG_MBEDTLECPJPAKE_C
- CONFIG_MBEDTLECPDPBP256R1_ENABLED
- CONFIG_MBEDTLECPDPBP384R1_ENABLED
- CONFIG_MBEDTLECPDPBP512R1_ENABLED
- CONFIG_MBEDTLSMAC_C
- CONFIG_MBEDTLECPDPCURVE25519_ENABLED
- CONFIG_MBEDTLECPDSECURITY
- CONFIG_MBEDTLECPFIXEDPOINTOPTIM
- CONFIG_MBEDTLSHARDWAREAES
- CONFIG_MBEDTLSHARDWAREECC
- CONFIG_MBEDTLSATCAHWECDSASIGN
- CONFIG_MBEDTLSATCAHWECDSAVERIFY
- CONFIG_MBEDTLSHARDWAREMPI
- CONFIG_MBEDTLSHARDWARESHA
- CONFIG_MBEDTLSDEBUG
- CONFIG_MBEDTLECPRESTARTABLE
- CONFIG_MBEDTLSHAVE_TIME
Configuration: CONFIG_MBEDTLS_MEM_ALLOC_MODE

**Memory allocation strategy**

*Found in: Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPI RAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls_platform_set_calloc_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPI RAM contents provided hardware flash encryption feature is enabled. In that case, using external SPI RAM allocation strategy is also safe choice from security perspective.

**Available options:**

- Internal memory (MBEDTLS_INTERNAL_MEM_ALLOC)
- External SPI RAM (MBEDTLS_EXTERNAL_MEM_ALLOC)
- Default alloc mode (MBEDTLS_DEFAULT_MEM_ALLOC)
- Custom alloc mode (MBEDTLS_CUSTOM_MEM_ALLOC)
• Internal IRAM (MBEDTLS(IRAM_8BIT_MEM_ALLOC))
  Allows to use IRAM memory region as 8bit accessible region.
  TLS input and output buffers will be allocated in IRAM section which is 32bit aligned mem-
  ory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of
certain clock cycles per unaligned read/write.

CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN

TLS maximum message content length

Found in: Component config > mbedTLS

Maximum TLS message length (in bytes) supported by mbedTLS.
16384 is the default and this value is required to comply fully with TLS standards.
However you can set a lower value in order to save RAM. This is safe if the other end of the connection
supports Maximum Fragment Length Negotiation Extension (max_fragment_length, see RFC6066) or
you know for certain that it will never send a message longer than a certain number of bytes.
If the value is set too low, symptoms are a failed TLS handshake or a return value of
MBEDTLS_ERR_SSL_INVALID_RECORD (-0x7200).

Range:
• from 512 to 16384

Default value:
• 16384

CONFIG_MBEDTLSASYMMETRICCONTENT_LEN

Asymmetric in/out fragment length

Found in: Component config > mbedTLS

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note
that enabling this with default values saves 12KB of dynamic memory per TLS connection.

Default value:
• Yes (enabled)

CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN

TLS maximum incoming fragment length

Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRICCONTENT_LEN

This defines maximum incoming fragment length, overriding default maximum content length
(MBEDTLS_SSL_MAX_CONTENT_LEN).

Range:
• from 512 to 16384

Default value:
• 16384

CONFIG_MBEDTLS_SSL_OUTCONTENT_LEN

TLS maximum outgoing fragment length

Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRICCONTENT_LEN

This defines maximum outgoing fragment length, overriding default maximum content length
(MBEDTLS_SSL_MAXCONTENT_LEN).

Range:
• from 512 to 16384
CONFIG_MBEDTLS_DYNAMIC_BUFFER

Using dynamic TX/RX buffer

*Found in: Component config > mbedTLS*

Using dynamic TX/RX buffer. After enabling this option, mbedTLS will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS_SSL_OUT_CONTENT_LEN” or “MBEDTLS_SSL_IN_CONTENT_LEN”, so to save more heap, users can set the options to be an appropriate value.

*Default value:*

- No (disabled) if CONFIG_MBEDTLS_SSL_PROTO_DTLS && CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH

CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

Free private key and DHM data after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER*

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

*Default value:*

- No (disabled) if CONFIG_MBEDTLS_DYNAMIC_BUFFER

CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT

Free SSL CA certificate after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER > CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA*

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

*Default value:*

- Yes (enabled) if CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

CONFIG_MBEDTLS_DEBUG

Enable mbedTLS debugging

*Found in: Component config > mbedTLS*

Enable mbedTLS debugging functions at compile time.

If this option is enabled, you can include “mbedtls/esp_debug.h” and call mbedtls_esp_enable_debug_log() at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

*Default value:*

- No (disabled)
CONFIG_MBEDTLS_DEBUG_LEVEL

Set mbedTLS debugging level

Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DEBUG

Set mbedTLS debugging level

Available options:

• Warning (MBEDTLS_DEBUG_LEVEL_WARN)
• Info (MBEDTLS_DEBUG_LEVEL_INFO)
• Debug (MBEDTLS_DEBUG_LEVEL_DEBUG)
• Verbose (MBEDTLS_DEBUG_LEVEL_VERBOSE)

mbedTLS v3.x related  Contains:

• DTLS-based configurations
• CONFIG_MBEDTLS_PKCS7_C
• CONFIG_MBEDTLS_SSL_CONTEXT.Serialization
• CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK
• CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE
• CONFIG_MBEDTLS_SSL_PROTO_TLS1_3
• CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT
• CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH

CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

Support TLS 1.3 protocol

Found in: Component config > mbedTLS > mbedTLS v3.x related

Default value:

• No (disabled) if CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE && CONFIG_MBEDTLS_DYNAMIC_BUFFER

TLS 1.3 related configurations  Contains:

• CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_EPHEMERAL
• CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE
• CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK_EPHEMERAL
• CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK

CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE

TLS 1.3 middlebox compatibility mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations

Default value:

• Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK

TLS 1.3 PSK key exchange mode

Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations

Default value:

• Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3

Submit Document Feedback
CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_EPHEMERAL

TLS 1.3 ephemeral key exchange mode

Default value:
- Yes (enabled) if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`
See mbedtls documentation for required API and more details. Disabling this option will save some code size.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE**

Keep peer certificate after handshake completion

*Found in: Component config > mbedtls > mbedtls v3.x related*

Keep the peer’s certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedtls documentation for required API and more details.

**Default value:**
- Yes (enabled) if MBEDTLS_DYNAMIC_FREE_PEER_CERT

**CONFIG_MBEDTLS_PKCS7_C**

Enable PKCS #7

*Found in: Component config > mbedtls > mbedtls v3.x related*

Enable PKCS #7 core for using PKCS #7-formatted signatures.

**Default value:**
- Yes (enabled)

**DTLS-based configurations**

Contains:

- **CONFIG_MBEDTLS_SSL_DTLS_SRTP**
- **CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID**

**CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID**

Support for the DTLS Connection ID extension

*Found in: Component config > mbedtls > mbedtls v3.x related > DTLS-based configurations*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_SSL_PROTO_DTLS

**CONFIG_MBEDTLS_SSL_CID_IN_LEN_MAX**

Maximum length of CIDs used for incoming DTLS messages

*Found in: Component config > mbedtls > mbedtls v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

Maximum length of CIDs used for incoming DTLS messages

**Range:**

- from 0 to 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID && CONFIG_MBEDTLS_SSL_PROTO_DTLS

**Default value:**

- 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID && CONFIG_MBEDTLS_SSL_PROTO_DTLS
Chapter 2. API Reference

**CONFIG_MBEDTLS_SSL_CID_OUT_LEN_MAX**

Maximum length of CIDs used for outgoing DTLS messages

*Found in:* Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Maximum length of CIDs used for outgoing DTLS messages

**Range:**

- from 0 to 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID && CONFIG_MBEDTLS_SSL_PROTO_DTLS

**Default value:**

- 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID && CONFIG_MBEDTLS_SSL_PROTO_DTLS

**CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY**

Record plaintext padding (for DTLS 1.2)

*Found in:* Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Controls the use of record plaintext padding when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**

- from 0 to 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID && CONFIG_MBEDTLS_SSL_PROTO_DTLS

**Default value:**

- 16 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID && CONFIG_MBEDTLS_SSL_PROTO_DTLS

**CONFIG_MBEDTLS_SSL_DTLS_SRTP**

Enable support for negotiation of DTLS-SRTP (RFC 5764)

*Found in:* Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use_srtp extension.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled) if CONFIG_MBEDTLS_SSL_PROTO_DTLS

**Certificate Bundle** Contains:

- CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

**CONFIG_MBEDTLS_CERTIFICATE_BUNDLE**

Enable trusted root certificate bundle

*Found in:* Component config > mbedTLS > Certificate Bundle

Enable support for large number of default root certificates
When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE**

Default certificate bundle options

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE*

**Available options:**
- Use the full default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL)
- Use only the most common certificates from the default bundles (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN)
  
- Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE)

**CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE**

Add custom certificates to the default bundle

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE*

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH**

Custom certificate bundle path

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE***

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

**CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_MAX_CERTS**

Maximum no of certificates allowed in certificate bundle

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE***

**Default value:**
- 200

**CONFIG_MBEDTLS_ECP_RESTARTABLE**

Enable mbedTLS ecp restartable

*Found in: Component config > mbedTLS***

Enable “non-blocking” ECC operations that can return early and be resumed.

**Default value:**
- No (disabled)
CONFIG_MBEDTLS_CMAC_C
Enable CMAC mode for block ciphers

*Found in: Component config > mbedTLS*
Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_HARDWARE_AES
Enable hardware AES acceleration

*Found in: Component config > mbedTLS*
Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_HARDWARE_GCM
Enable partially hardware accelerated GCM

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_AES*
Enable partially hardware accelerated GCM. GHASH calculation is still done in software.

If MBEDTLS_HARDWARE_GCM is disabled and MBEDTLS_HARDWARE_AES is enabled then mbedTLS will still use the hardware accelerated AES block operation, but on a single block at a time.

**Default value:**
- Yes (enabled) if SOC_AES_SUPPORT_GCM && CONFIG_MBEDTLS_HARDWARE_AES

CONFIG_MBEDTLS_HARDWARE_MPI
Enable hardware MPI (bignum) acceleration

*Found in: Component config > mbedTLS*
Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC_RSA_MAX_BIT_LEN bit results.

These operations are used by RSA.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

CONFIG_MBEDTLS_HARDWARE_SHA
Enable hardware SHA acceleration

*Found in: Component config > mbedTLS*
Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedTLS.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.
SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**Default value:**
- Yes (enabled) if SPIRAM_CACHE_WORKAROUND_STRATEGY_DUPLDST

**CONFIG_MBEDTLS_HARDWARE_ECC**

Enable hardware ECC acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedTLS

**Default value:**
- Yes (enabled) if SOC_ECC_SUPPORTED

**CONFIG_MBEDTLS_ECC_OTHER_CURVES_SOFT_FALLBACK**

Fallback to software implementation for curves not supported in hardware

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_ECC*

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_HARDWARE_ECC

**CONFIG_MBEDTLS_ROM_MD5**

Use MD5 implementation in ROM

*Found in: Component config > mbedTLS*

Use ROM MD5 in mbedTLS.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN**

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: Component config > mbedTLS*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY**

Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: Component config > mbedTLS*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**
- No (disabled)
**CONFIG_MBEDTLS_HAVE_TIME**

Enable mbedtls time support

*Found in: Component config > mbedtls*

Enable use of time.h functions (time() and gmtime()) by mbedtls.

This option doesn’t require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn’t call any standard timekeeping functions.

**Default value:**

- Yes (enabled)

**CONFIG_MBEDTLS_PLATFORM_TIME_ALT**

Enable mbedtls time support: platform-specific

*Found in: Component config > mbedtls > CONFIG_MBEDTLS_HAVE_TIME*

Enabling this config will provide users with a function “mbedtls_platform_set_time()” that allows to set an alternative time function pointer.

**Default value:**

- No (disabled)

**CONFIG_MBEDTLS_HAVE_TIME_DATE**

Enable mbedtls certificate expiry check

*Found in: Component config > mbedtls > CONFIG_MBEDTLS_HAVE_TIME*

Enables X.509 certificate expiry checks in mbedtls.

If this option is disabled (default) then X.509 certificate “valid from” and “valid to” timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the current system time then verification will fail with code MBEDTLS_X509_BADCERT_FUTURE or MBEDTLS_X509_BADCERT_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF’s SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**

- No (disabled)

**CONFIG_MBEDTLS_ECDSA_DETERMINISTIC**

Enable deterministic ECDSA

*Found in: Component config > mbedtls*

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**
Chapter 2. API Reference

• Yes (enabled)

### CONFIG_MBEDTLS_SHA512_C

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: Component config > mbedTLS*

Enable MBEDTLS_SHA512_C adds support for SHA-384 and SHA-512.

*Default value:*

• Yes (enabled)

### CONFIG_MBEDTLS_TLS_MODE

TLS Protocol Role

*Found in: Component config > mbedTLS*

mbedTLS can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

*Available options:*

• Server & Client (MBEDTLS_TLS_SERVER_AND_CLIENT)
• Server (MBEDTLS_TLS_SERVER_ONLY)
• Client (MBEDTLS_TLS_CLIENT_ONLY)
• None (MBEDTLS_TLS_DISABLED)

### TLS Key Exchange Methods

Contains:

• CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA
• CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE
• CONFIG_MBEDTLS_PSK_MODES
• CONFIG_MBEDTLS_KEY_EXCHANGE_RSA
• CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

### CONFIG_MBEDTLS_PSK_MODES

Enable pre-shared-key ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

*Default value:*

• No (disabled)

### CONFIG_MBEDTLS_KEY_EXCHANGE_PSK

Enable PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

*Default value:*

• No (disabled) if CONFIG_MBEDTLS_PSK_MODES
CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK
Enable DHE-PSK based ciphersuite modes

Default value:
• Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_DH_C

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK
Enable ECDHE-PSK based ciphersuite modes

Default value:
• Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_ECDH_C

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK
Enable RSA-PSK based ciphersuite modes

Default value:
• Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA
Enable RSA-only based ciphersuite modes

Default value:
• Yes (enabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA
Enable DHE-RSA based ciphersuite modes

Default value:
• Yes (enabled) if CONFIG_MBEDTLS_DH_C

CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE
Support Elliptic Curve based ciphersuites

Enable to show Elliptic Curve based ciphersuite mode options.
Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA**
Enable ECDHE-RSA based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA**
Enable ECDHE-ECDSA based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA**
Enable ECDH-ECDSA based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA**
Enable ECDH-RSA based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE**
Enable ECJPAKE based ciphersuite modes

*Found in:* Component config > mbedTLS > TLS Key Exchange Methods

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_ECJPAKE_C && CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED
Chapter 2. API Reference

CONFIG_MBEDTLS_SSL_RENEGOTIATION
Support TLs renegotiation

*Found in: Component config > mbedTLS*

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don’t need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_TLS1_2
Support TLS 1.2 protocol

*Found in: Component config > mbedTLS*

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_SSL_PROTO_GMTSSL1_1
Support GM/T SSL 1.1 protocol

*Found in: Component config > mbedTLS*

Provisions for GM/T SSL 1.1 support

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_PROTO_DTLS
Support DTLS protocol (all versions)

*Found in: Component config > mbedTLS*

Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_SSL_ALPN
Support ALPN (Application Layer Protocol Negotiation)

*Found in: Component config > mbedTLS*

Disabling this option will save some code size if it is not needed.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS
TLS: Client Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*

Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)
**CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS**

TLS: Server Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*

Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

**Default value:**
- Yes (enabled)

**Symmetric Ciphers**

Contains:

- CONFIG_MBEDTLS_AES_C
- CONFIG_MBEDTLS_BLOWFISH_C
- CONFIG_MBEDTLS_CAMELLIA_C
- CONFIG_MBEDTLS_CCM_C
- CONFIG_MBEDTLS_DES_C
- CONFIG_MBEDTLS_GCM_C
- CONFIG_MBEDTLS_NIST_KW_C
- CONFIG_MBEDTLS_XTEA_C

**CONFIG_MBEDTLS_AES_C**

AES block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_CAMELLIA_C**

Camellia block cipher

*Found in: Component config > mbedTLS > Symmetric Ciphers*

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_DES_C**

DES block cipher (legacy, insecure)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_BLOWFISH_C**

Blowfish block cipher (read help)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedTLS TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.
Default value:
• No (disabled)

CONFIG_MBEDTLS_XTEA_C
XTEA block cipher

*Found in: Component config > mbedtls > Symmetric Ciphers*
Enables the XTEA block cipher.

Default value:
• No (disabled)

CONFIG_MBEDTLS_CCM_C
CCM (Counter with CBC-MAC) block cipher modes

*Found in: Component config > mbedtls > Symmetric Ciphers*
Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.
Disabling this option saves some code size.

Default value:
• Yes (enabled)

CONFIG_MBEDTLS_GCM_C
GCM (Galois/Counter) block cipher modes

*Found in: Component config > mbedtls > Symmetric Ciphers*
Enable Galois/Counter Mode for AES and/or Camellia ciphers.
This option is generally faster than CCM.

Default value:
• Yes (enabled)

CONFIG_MBEDTLS_NIST_KW_C
NIST key wrapping (KW) and KW padding (KWP)

*Found in: Component config > mbedtls > Symmetric Ciphers*
Enable NIST key wrapping and key wrapping padding.

Default value:
• No (disabled)

CONFIG_MBEDTLS_RIPEMD160_C
Enable RIPEMD-160 hash algorithm

*Found in: Component config > mbedtls*
Enable the RIPEMD-160 hash algorithm.

Default value:
• No (disabled)
Certificates  Contains:

- \texttt{CONFIG\_MBEDTLS\_PEM\_PARSE\_C}
- \texttt{CONFIG\_MBEDTLS\_PEM\_WRITE\_C}
- \texttt{CONFIG\_MBEDTLS\_X509\_CRL\_PARSE\_C}
- \texttt{CONFIG\_MBEDTLS\_X509\_CSR\_PARSE\_C}

\texttt{CONFIG\_MBEDTLS\_PEM\_PARSE\_C}

Read & Parse PEM formatted certificates

\textit{Found in: \texttt{Component config > mbedTLS > Certificates}}

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

\textbf{Default value:}

- Yes (enabled)

\texttt{CONFIG\_MBEDTLS\_PEM\_WRITE\_C}

Write PEM formatted certificates

\textit{Found in: \texttt{Component config > mbedTLS > Certificates}}

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.

\textbf{Default value:}

- Yes (enabled)

\texttt{CONFIG\_MBEDTLS\_X509\_CRL\_PARSE\_C}

X.509 CRL parsing

\textit{Found in: \texttt{Component config > mbedTLS > Certificates}}

\textbf{Default value:}

- Yes (enabled)

\texttt{CONFIG\_MBEDTLS\_X509\_CSR\_PARSE\_C}

X.509 CSR parsing

\textit{Found in: \texttt{Component config > mbedTLS > Certificates}}

Support for parsing X.509 Certificate Signing Requests

\textbf{Default value:}

- Yes (enabled)

\texttt{CONFIG\_MBEDTLS\_ECP\_C}

Elliptic Curve Ciphers

\textit{Found in: \texttt{Component config > mbedTLS}}

\textbf{Default value:}

- Yes (enabled)
Chapter 2. API Reference

**CONFIG_MBEDTLS_DHM_C**
Diffie-Hellman-Merkle key exchange (DHM)

*Found in: Component config > mbedtls*
Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ECDH_C**
Elliptic Curve Diffie-Hellman (ECDH)

*Found in: Component config > mbedtls*
Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_ECDSA_C**
Elliptic Curve DSA

*Found in: Component config > mbedtls > CONFIG_MBEDTLS_ECDH_C*
Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_ECJPAKE_C**
Elliptic curve J-PAKE

*Found in: Component config > mbedtls*
Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED**
Enable SECP192R1 curve

*Found in: Component config > mbedtls*
Enable support for SECP192R1 Elliptic Curve.

**Default value:**
- Yes (enabled) if (CON FIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CON FIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C

**CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED**
Enable SECP224R1 curve

*Found in: Component config > mbedtls*
Enable support for SECP224R1 Elliptic Curve.
Default value:
- Yes (enabled) if ($(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C

CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED
Enable SECP256R1 curve
*Found in: Component config > mbedTLS*
Enable support for SECP256R1 Elliptic Curve.
Default value:
- Yes (enabled)

CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED
Enable SECP384R1 curve
*Found in: Component config > mbedTLS*
Enable support for SECP384R1 Elliptic Curve.
Default value:
- Yes (enabled) if ($(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C

CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED
Enable SECP521R1 curve
*Found in: Component config > mbedTLS*
Enable support for SECP521R1 Elliptic Curve.
Default value:
- Yes (enabled) if ($(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C

CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED
Enable SECP192K1 curve
*Found in: Component config > mbedTLS*
Enable support for SECP192K1 Elliptic Curve.
Default value:
- Yes (enabled) if ($(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C

CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED
Enable SECP224K1 curve
*Found in: Component config > mbedTLS*
Enable support for SECP224K1 Elliptic Curve.
Default value:
- Yes (enabled) if ($(CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN || CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY) && CONFIG_MBEDTLS_ECP_C
**CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED**

Enable SECP256K1 curve

*Found in: Component config > mbedtls*

Enable support for SECP256K1 Elliptic Curve.

**Default value:**

- Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \ || \ \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \ && \ \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED**

Enable BP256R1 curve

*Found in: Component config > mbedtls*

support for DP Elliptic Curve.

**Default value:**

- Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \ || \ \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \ && \ \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED**

Enable BP384R1 curve

*Found in: Component config > mbedtls*

support for DP Elliptic Curve.

**Default value:**

- Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \ || \ \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \ && \ \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED**

Enable BP512R1 curve

*Found in: Component config > mbedtls*

support for DP Elliptic Curve.

**Default value:**

- Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \ || \ \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \ && \ \text{CONFIG\_MBEDTLS\_ECP\_C})\)

**CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED**

Enable CURVE25519 curve

*Found in: Component config > mbedtls*

Enable support for CURVE25519 Elliptic Curve.

**Default value:**

- Yes (enabled) if \((\text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN} \ || \ \text{CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY}) \ && \ \text{CONFIG\_MBEDTLS\_ECP\_C})\)
CONFIG_MBEDTLS_ECP_NIST_OPTIM
NIST ‘modulo p’ optimisations
*Found in: Component config > mbedTLS*
NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.
Disabling this option saves some code size.
**Default value:**
• Yes (enabled)

CONFIG_MBEDTLS_ECP_FIXED_POINT_OPTIM
Enable fixed-point multiplication optimisations
*Found in: Component config > mbedTLS*
This configuration option enables optimizations to speedup (about 3 ~ 4 times) the ECP fixed point multiplication using pre-computed tables in the flash memory. Disabling this configuration option saves flash footprint (about 29KB if all Elliptic Curves selected) in the application binary.

# end of Elliptic Curve options
**Default value:**
• Yes (enabled)

CONFIG_MBEDTLS_POLY1305_C
Poly1305 MAC algorithm
*Found in: Component config > mbedTLS*
Enable support for Poly1305 MAC algorithm.
**Default value:**
• No (disabled)

CONFIG_MBEDTLS_CHACHA20_C
Chacha20 stream cipher
*Found in: Component config > mbedTLS*
Enable support for Chacha20 stream cipher.
**Default value:**
• No (disabled)

CONFIG_MBEDTLS_CHACHAPOLY_C
Chacha20-Poly1305 AEAD algorithm
*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_CHACHA20_C*
Enable support for ChaCha20-Poly1305 AEAD algorithm.
**Default value:**
• No (disabled) if CONFIG_MBEDTLS_CHACHA20_C && CONFIG_MBEDTLS_POLY1305_C
CONFIG_MBEDTLS_HKDF_C

HKDF algorithm (RFC 5869)

*Found in: Component config > mbedTLS*

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_THREADING_C

Enable the threading abstraction layer

*Found in: Component config > mbedTLS*

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_THREADING_ALT

Enable threading alternate implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable threading alt to allow your own alternate threading implementation.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_THREADING_PTHREAD

Enable threading pthread implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable the pthread wrapper layer for the threading layer.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_LARGE_KEY_SOFTWARE_MPI

Fallback to software implementation for larger MPI values

*Found in: Component config > mbedTLS*

Fallback to software implementation for RSA key lengths larger than SOC_RSA_MAX_BIT_LEN. If this is not active then the ESP will be unable to process keys greater than SOC_RSA_MAX_BIT_LEN.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_USE_CRYPTO_ROM_IMPL

Use ROM implementation of the crypto algorithm

*Found in: Component config > mbedTLS*

Enable this flag to use mbedtls crypto algorithm from ROM instead of ESP-IDF.
This configuration option saves flash footprint in the application binary. Note that the version of mbedtls crypto algorithm library in ROM is v2.16.12. We have done the security analysis of the mbedtls revision in ROM (v2.16.12) and ensured that affected symbols have been patched (removed). If in the future mbedtls revisions there are security issues that also affects the version in ROM (v2.16.12) then we shall patch the relevant symbols. This would increase the flash footprint and hence care must be taken to keep some reserved space for the application binary in flash layout.

**Default value:**
- No (disabled) if ESP_ROM_HAS_MBEDTLS_CRYPTO_LIB

### ESP-MQTT Configurations
Contains:
- `CONFIG_MQTT_CUSTOM_OUTBOX`
- `CONFIG_MQTT_TRANSPORT_TLS`
- `CONFIG_MQTT_TRANSPORT_WEBSOCKET`
- `CONFIG_MQTT_PROTOCOL_311`
- `CONFIG_MQTT_PROTOCOL_5`
- `CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED`
- `CONFIG_MQTT_USE_CUSTOM_CONFIG`
- `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS`
- `CONFIG_MQTT_REPORT_DELETED_MESSAGES`
- `CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED`
- `CONFIG_MQTT_MSG_ID_INCREMENTAL`

**CONFIG_MQTT_PROTOCOL_311**
Enable MQTT protocol 3.1.1

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will use MQTT protocol 3.1

**Default value:**
- Yes (enabled)

**CONFIG_MQTT_PROTOCOL_5**
Enable MQTT protocol 5.0

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will not support MQTT 5.0

**Default value:**
- No (disabled)

**CONFIG_MQTT_TRANSPORT_TLS**
Enable MQTT over SSL

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over SSL with mbedtls

**Default value:**
- Yes (enabled)

**CONFIG_MQTT_TRANSPORT_WEBSOCKET**
Enable MQTT over Websocket

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over Websocket.

**Default value:**
- Yes (enabled)

---

**CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE**

Enable MQTT over Websocket Secure

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TRANSPORT_WEBSOCKET*

Enable MQTT transport over Websocket Secure.

**Default value:**
- Yes (enabled)

---

**CONFIG_MQTT_MSG_ID_INCREMENTAL**

Use Incremental Message Id

*Found in: Component config > ESP-MQTT Configurations*

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

**Default value:**
- No (disabled)

---

**CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED**

Skip publish if disconnected

*Found in: Component config > ESP-MQTT Configurations*

Set this to true to avoid publishing (enqueuing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT_SKIP_PUBLISH_IF_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**
- No (disabled)

---

**CONFIG_MQTT_REPORT_DELETED_MESSAGES**

Report deleted messages

*Found in: Component config > ESP-MQTT Configurations*

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**
- No (disabled)
CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT Using custom configurations

*Found in:* Component config > ESP-MQTT Configurations

Custom MQTT configurations.

**Default value:**
- No (disabled)

CONFIG_MQTT_TCP_DEFAULT_PORT

Default MQTT over TCP port

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over TCP port

**Default value:**
- 1883 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_SSL_DEFAULT_PORT

Default MQTT over SSL port

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over SSL port

**Default value:**
- 8883 if CONFIG_MQTT_USE_CUSTOM_CONFIG && CONFIG_MQTT_TRANSPORT_SSL

CONFIG_MQTT_WS_DEFAULT_PORT

Default MQTT over Websocket port

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over Websocket port

**Default value:**
- 80 if CONFIG_MQTT_USE_CUSTOM_CONFIG && CONFIG_MQTT_TRANSPORT_WEBSOCKET

CONFIG_MQTT_WSS_DEFAULT_PORT

Default MQTT over Websocket Secure port

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default MQTT over Websocket Secure port

**Default value:**
- 443 if CONFIG_MQTT_USE_CUSTOM_CONFIG && CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE

CONFIG_MQTT_BUFFER_SIZE

Default MQTT Buffer Size

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQ TT_USE_CUSTOM_CONFIG

This buffer size using for both transmit and receive

**Default value:**
- 1024 if CONFIG_MQTT_USE_CUSTOM_CONFIG
Chapter 2. API Reference

CONFIG_MQTT_TASK_STACK_SIZE

MQTT task stack size

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT task stack size

Default value:
• 6144 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_DISABLE_API_LOCKS

Disable API locks

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn’t access MQTT API from multiple concurrent tasks

Default value:
• No (disabled) if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_TASK_PRIORITY

MQTT task priority

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT task priority. Higher number denotes higher priority.

Default value:
• 5 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED

Enable MQTT task core selection

Found in: Component config > ESP-MQTT Configurations

This will enable core selection

CONFIG_MQTT_TASK_CORE_SELECTION

Core to use?

Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED

Available options:
• Core 0 (MQTT_USE_CORE_0)
• Core 1 (MQTT_USE_CORE_1)

CONFIG_MQTT_CUSTOM_OUTBOX

Enable custom outbox implementation

Found in: Component config > ESP-MQTT Configurations

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources:

```
idf_component_get_property(mqtt mqtt COMPONENT_LIB) set_property(TARGET ${mqtt} PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)
```

Default value:
• No (disabled)

**CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS**

Outbox message expired timeout[ms]

*Found in: Component config > ESP-MQTT Configurations*

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**

• 30000 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**Newlib** Contains:

• `CONFIG_NEWLIB_NANO_FORMAT`
• `CONFIG_NEWLIB_STDIN_LINE_ENDING`
• `CONFIG_NEWLIB_STDOUT_LINE_ENDING`
• `CONFIG_NEWLIB_TIME_SYSCALL`

**CONFIG_NEWLIB_STDOUT_LINE_ENDING**

Line ending for UART output

*Found in: Component config > Newlib*

This option allows configuring the desired line endings sent to UART when a newline (`\n`, LF) appears on stdout. Three options are possible:

- CRLF: whenever LF is encountered, prepend it with CR
- LF: no modification is applied, stdout is sent as is
- CR: each occurrence of LF is replaced with CR

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**

• CRLF (NEWLIB_STDOUT_LINE_ENDING_CRLF)
• LF (NEWLIB_STDOUT_LINE_ENDING_LF)
• CR (NEWLIB_STDOUT_LINE_ENDING_CR)

**CONFIG_NEWLIB_STDIN_LINE_ENDING**

Line ending for UART input

*Found in: Component config > Newlib*

This option allows configuring which input sequence on UART produces a newline (`\n`, LF) on stdin. Three options are possible:

- CRLF: CRLF is converted to LF
- LF: no modification is applied, input is sent to stdin as is
- CR: each occurrence of CR is replaced with LF

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

**Available options:**

• CRLF (NEWLIB_STDIN_LINE_ENDING_CRLF)
• LF (NEWLIB_STDIN_LINE_ENDING_LF)
• CR (NEWLIB_STDIN_LINE_ENDING_CR)
CONFIG_NEWLIB_NANO_FORMAT

Enable ‘nano’ formatting options for printf/scanf family

**Found in:** Component config > Newlib

ESP32 ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called ‘nano’ formatting option. This option doesn’t support 64-bit integer formats and C99 features, such as positional arguments.

For more details about ‘nano’ formatting option, please see newlib readme file, search for ‘-enable-newlib-nano-formatted-io’ : https://sourceware.org/newlib/README

If this option is enabled, build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

CONFIG_NEWLIB_TIME_SYSCALL

Timers used for gettimeofday function

**Found in:** Component config > Newlib

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.

- **If both high-resolution (systimer for all targets except ESP32) and RTC timers are used,** timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- **If only high-resolution timer (systimer) is used,** gettimeofday will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- **If only RTC timer is used,** timekeeping will continue in deep sleep, but time will be measured at 6.6 microsecond resolution. Also the gettimeofday function itself may take longer to run.
- **If no timers are used,** gettimeofday and time functions return -1 and set errno to ENOSYS.
- **When RTC is used for timekeeping,** two RTC_STORE registers are used to keep time in deep sleep mode.

**Available options:**

- RTC and high-resolution timer (NEWLIB_TIME_SYSCALL_USE_RTC_HRT)
- RTC (NEWLIB_TIME_SYSCALL_USE_RTC)
- High-resolution timer (NEWLIB_TIME_SYSCALL_USE_HRT)
- None (NEWLIB_TIME_SYSCALL_USE_NONE)

NVS Contains:

- **CONFIG_NVS_ENCRYPTION**
- **CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG**
- **CONFIG_NVS_ASSERT_ERROR_CHECK**

CONFIG_NVS_ENCRYPTION

Enable NVS encryption

**Found in:** Component config > NVS

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

**Default value:**

- Yes (enabled) if **CONFIG_SECURE_FLASH_ENC_ENABLED**
**CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG**

NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in: Component config > NVS*

Enabling this will ignore “encrypted” flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have “encrypted” flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

**CONFIG_NVS_ASSERT_ERROR_CHECK**

Use assertions for error checking

*Found in: Component config > NVS*

This option switches error checking type between assertions (y) or return codes (n).

**Default value:**
- No (disabled)

**OpenThread** Contains:

- **CONFIG_OPENTHREAD_ENABLED**

**CONFIG_OPENTHREAD_ENABLED**

OpenThread

*Found in: Component config > OpenThread*

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**
- No (disabled)

**CONFIG_OPENTHREAD_LOG_LEVEL_DYNAMIC**

Enable dynamic log level control

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable dynamic log level control for OpenThread

**Default value:**
- Yes (enabled) if **CONFIG_OPENTHREAD_ENABLED**

**CONFIG_OPENTHREAD_LOG_LEVEL**

OpenThread log verbosity

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select OpenThread log level.

**Available options:**
- No logs (OPENTHREAD_LOG_LEVEL_NONE)
- Error logs (OPENTHREAD_LOG_LEVEL_CRIT)
- Warning logs (OPENTHREAD_LOG_LEVEL_WARN)
- Notice logs (OPENTHREAD_LOG_LEVEL_NOTE)
- Info logs (OPENTHREAD_LOG_LEVEL_INFO)
- Debug logs (OPENTHREAD_LOG_LEVEL_DEBUG)
**CONFIG_OPENTHREAD_RADIO_TYPE**

Config the Thread radio type

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Configure how OpenThread connects to the 15.4 radio

**Available options:**
- Native 15.4 radio (OPENTHREAD_RADIO_NATIVE)
  Select this to use the native 15.4 radio.
- Connect via UART (OPENTHREAD_RADIO_SPINEL_UART)
  Select this to connect to a Radio Co-Processor via UART.

**CONFIG_OPENTHREAD_DEVICE_TYPE**

Config the Thread device type

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

OpenThread can be configured to different device types (FTD, MTD, Radio)

**Available options:**
- Full Thread Device (OPENTHREAD_FTD)
  Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (OPENTHREAD_MTD)
  Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (OPENTHREAD_RADIO)
  Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

**CONFIG_OPENTHREAD_CLI**

Enable Openthread Command-Line Interface

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable Command-Line Interface in OpenThread.

**Default value:**
- Yes (enabled) if CONFIG_OPENTHREAD_ENABLED

**CONFIG_OPENTHREAD_DIAG**

Enable diag

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

**Default value:**
- Yes (enabled) if CONFIG_OPENTHREAD_ENABLED

**CONFIG_OPENTHREAD_COMMISSIONER**

Enable Commissioner

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*
Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_JOINER**

Enable Joiner

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_SRPO_CLIENT**

Enable SRP Client

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_BORDER_ROUTER**

Enable Border Router

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to enable border router features in OpenThread.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS**

The number of openthread message buffers

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

**Range:**
- from 50 to 100 if `CONFIG_OPENTHREAD_ENABLED`

**Default value:**
- 65 if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_DNS64_CLIENT**

Use dns64 client

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED*

Select this option to acquire NAT64 address from dns servers.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`
Protocomm Contains:

- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`

**CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0**

Support protocomm security version 0 (no security)

*Found in: Component config > Protocomm*

Enable support of security version 0. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

*Default value:*
  - Yes (enabled)

**CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1**

Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption)

*Found in: Component config > Protocomm*

Enable support of security version 1. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

*Default value:*
  - Yes (enabled)

**CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2**

Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption)

*Found in: Component config > Protocomm*

Enable support of security version 2. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

*Default value:*
  - Yes (enabled)

PThreads Contains:

- `CONFIG_PTHREAD_TASK_NAME_DEFAULT`
- `CONFIG_PTHREAD_TASK_CORE_DEFAULT`
- `CONFIG_PTHREAD_TASK_PRIO_DEFAULT`
- `CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT`
- `CONFIG_PTHREAD_STACK_MIN`

**CONFIG_PTHREAD_TASK_PRIO_DEFAULT**

Default task priority

*Found in: Component config > PThreads*

Priority used to create new tasks with default pthread parameters.

*Range:*
  - from 0 to 255
Default value:
  • 5

**CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT**
Default task stack size

*Found in: Component config > PThreads*
Stack size used to create new tasks with default pthread parameters.

**Default value:**
  • 3072

**CONFIG_PTHREAD_STACK_MIN**
Minimum allowed pthread stack size

*Found in: Component config > PThreads*
Minimum allowed pthread stack size set in attributes passed to pthread_create

**Default value:**
  • 768

**CONFIG_PTHREAD_TASK_CORE_DEFAULT**
Default pthread core affinity

*Found in: Component config > PThreads*
The default core to which pthreads are pinned.

**Available options:**
  • No affinity (PTHREAD_DEFAULT_CORE_NO_AFFINITY)
  • Core 0 (PTHREAD_DEFAULT_CORE_0)
  • Core 1 (PTHREAD_DEFAULT_CORE_1)

**CONFIG_PTHREAD_TASK_NAME_DEFAULT**
Default name of pthreads

*Found in: Component config > PThreads*
The default name of pthreads.

**Default value:**
  • “pthread”

**SoC Settings**  
Contains:
  • **MMU Config**

**MMU Config**

**SPI Flash driver**  
Contains:
  • *Auto-detect flash chips*
  • **CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE**
  • **CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE**
  • **CONFIG_SPI_FLASH_ENABLE_COUNTERS**
  • **CONFIG_SPI_FLASH_ROM_DRIVER_PATCH**
Chapter 2. API Reference

- CONFIG_SPI_FLASH_YIELD_DURING_ERASE
- CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED
- CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE
- CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST
- CONFIG_SPI_FLASH_SIZE_OVERRIDE
- SPI Flash behavior when brownout
- CONFIG_SPI_FLASH_SHARE_SPI1_BUS
- CONFIG_SPI_FLASH_VERIFY_WRITE
- CONFIG_SPI_FLASH_DANGEROUS_WRITE

CONFIG_SPI_FLASH_VERIFY_WRITE
Verify SPI flash writes

*Found in: Component config > SPI Flash driver*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

**Default value:**
- No (disabled)

CONFIG_SPI_FLASH_LOG_FAILED_WRITE
Log errors if verification fails

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

**Default value:**
- No (disabled) if CONFIG_SPI_FLASH_VERIFY_WRITE

CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE
Log warning if writing zero bits to ones

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

**Default value:**
- No (disabled) if CONFIG_SPI_FLASH_VERIFY_WRITE

CONFIG_SPI_FLASH_ENABLE_COUNTERS
Enable operation counters

*Found in: Component config > SPI Flash driver*

This option enables the following APIs:
- spi_flash_reset_counters
- spi_flash_dump_counters
- spi_flash_get_counters
These APIs may be used to collect performance data for spi_flash APIs and to help understand behaviour of libraries which use SPI flash.

**Default value:**
- 0

**CONFIG_SPI_FLASH_ROM_DRIVER_PATCH**

Enable SPI flash ROM driver patched functions

*Found in: Component config > SPI Flash driver*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

**Default value:**
- Yes (enabled)

**CONFIG_SPI_FLASH_DANGEROUS_WRITE**

Writing to dangerous flash regions

*Found in: Component config > SPI Flash driver*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the esp_rom_xxx SPI flash ROM functions. These functions should not be called directly from IDF applications.

**Available options:**
- Aborts (SPI_FLASH_DANGEROUS_WRITE_ABORTS)
- Fails (SPI_FLASH_DANGEROUS_WRITE_FAILS)
- Allowed (SPI_FLASH_DANGEROUS_WRITE_ALLOWED)

**CONFIG_SPI_FLASH_SHARE_SPI1_BUS**

Support other devices attached to SPI1 bus

*Found in: Component config > SPI Flash driver*

Each SPI bus needs a lock for arbitration among devices. This allows multiple devices on a same bus, but may reduce the speed of esp_flash driver access to the main flash chip.

If you only need to use esp_flash driver to access the main flash chip, disable this option, and the lock will be bypassed on SPI1 bus. Otherwise if extra devices are needed to attach to SPI1 bus, enable this option.

**Default value:**
- No (disabled)

**CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE**

Bypass a block erase and always do sector erase

*Found in: Component config > SPI Flash driver*

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.
Default value:
• No (disabled)

**CONFIG_SPI_FLASH_YIELD_DURING_ERASE**

Enables yield operation during flash erase

*Found in: Component config > SPI Flash driver*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks. Please use this configuration together with SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS and SPI\_FLASH\_ERASE\_YIELD\_TICKS after carefully checking flash datasheet to avoid a watchdog timeout. For more information, please check *SPI Flash API* reference documentation under section *OS Function*.

Default value:
• Yes (enabled)

**CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS**

Duration of erasing to yield CPUs (ms)

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

Default value:
• 20

**CONFIG_SPI_FLASH_ERASE_YIELD_TICKS**

CPU release time (tick) for an erase operation

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

Defines how many ticks will be before returning to continue a erasing.

Default value:
• 1

**CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE**

Flash write chunk size

*Found in: Component config > SPI Flash driver*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

**Range:**
• from 256 to 8192

Default value:
• 8192

**CONFIG_SPI_FLASH_SIZE_OVERRIDE**

Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.
Chapter 2. API Reference

**Default value:**
- No (disabled)

**CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED**

Flash timeout checkout disabled

*Found in: Component config > SPI Flash driver*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

**Default value:**
- No (disabled)

**CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST**

Override default chip driver list

*Found in: Component config > SPI Flash driver*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the `default_registered_chips` structure must be provided by the user.

See example: custom_chip_driver under examples/storage for more details.

**Default value:**
- No (disabled)

**SPI Flash behavior when brownout**

Contains:
- **CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC**

**CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC**

Enable sending reset when brownout for XMC flash chips

*Found in: Component config > SPI Flash driver > SPI Flash behavior when brownout*

When this option is selected, the patch will be enabled for XMC. Follow the recommended flow by XMC for better stability.

**Default value:**
- Yes (enabled)

**Auto-detect flash chips**

Contains:
- **CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP**
- **CONFIG_SPI_FLASH_SUPPORT_GD_CHIP**
- **CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP**
- **CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP**
- **CONFIG_SPI_FLASH_SUPPORT_TH_CHIP**
- **CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP**
CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP

ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_GD_CHIP

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection Flash (GigaDevice) chips if chip vendor not directly given by `chip_drv` member of the chip struct. If you are using Wrover modules, please don’t disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- Yes (enabled)

CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP

BOYA

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- No (disabled)
- Yes (enabled)
CONFIG_SPI_FLASH_SUPPORT_TH_CHIP

TH

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of TH chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**Default value:**
- No (disabled)
- Yes (enabled)

CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

**Default value:**
- Yes (enabled)

SPIFFS Configuration  Contains:

- *Debug Configuration*
- CONFIG_SPIFFS_USE_MAGIC
- CONFIG_SPIFFS_GC_STATS
- CONFIG_SPIFFS_PAGE_CHECK
- CONFIG_SPIFFS_FOLLOW_SYMLINKS
- CONFIG_SPIFFS_MAX_PARTITIONS
- CONFIG_SPIFFS_USE_MTIME
- CONFIG_SPIFFS_GC_MAX_RUNS
- CONFIG_SPIFFS_OBJ_NAME_LEN
- CONFIG_SPIFFS_META_LENGTH
- SPIFFS Cache Configuration
- CONFIG_SPIFFS_PAGE_SIZE
- CONFIG_SPIFFS_MTIME_WIDE_64_BITS

CONFIG_SPIFFS_MAX_PARTITIONS

Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.

**Range:**
- from 1 to 10

**Default value:**
- 3

SPIFFS Cache Configuration  Contains:

- CONFIG_SPIFFS_CACHE
Chapter 2. API Reference

CONFIG_SPIFFS_CACHE
Enable SPIFFS Cache

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration*

Enables/disables memory read caching of nucleus file system operations.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_CACHE_WR
Enable SPIFFS Write Caching

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enables memory write caching for file descriptors in hydrogen.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_CACHE_STATS
Enable SPIFFS Cache Statistics

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enable/disable statistics on caching. Debug/test purpose only.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_PAGE_CHECK
Enable SPIFFS Page Check

*Found in: Component config > SPIFFS Configuration*

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_GC_MAX_RUNS
Set Maximum GC Runs

*Found in: Component config > SPIFFS Configuration*

Define maximum number of GC runs to perform to reach desired free pages.

**Range:**
- from 1 to 10000

**Default value:**
- 10
CONFIG_SPIFFS_GC_STATS

Enable SPIFFS GC Statistics

*Found in: Component config > SPIFFS Configuration*

Enable/disable statistics on gc. Debug/test purpose only.

**Default value:**
- **No (disabled)**

CONFIG_SPIFFS_PAGE_SIZE

SPIFFS logical page size

*Found in: Component config > SPIFFS Configuration*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**Range:**
- **from 256 to 1024**

**Default value:**
- **256**

CONFIG_SPIFFS_OBJ_NAME_LEN

Set SPIFFS Maximum Name Length

*Found in: Component config > SPIFFS Configuration*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Range:**
- **from 1 to 256**

**Default value:**
- **32**

CONFIG_SPIFFS_FOLLOW_SYMLINKS

Enable symbolic links for image creation

*Found in: Component config > SPIFFS Configuration*

If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**
- **No (disabled)**

CONFIG_SPIFFS_USE_MAGIC

Enable SPIFFS Filesystem Magic

*Found in: Component config > SPIFFS Configuration*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**
- **Yes (enabled)**
**CONFIG_SPIFFS_USE_MAGIC_LENGTH**

Enable SPIFFS Filesystem Length Magic

*Found in: Component config > SPIFFS Configuration > CONFIG_SPIFFS_USE_MAGIC*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_META_LENGTH**

Size of per-file metadata field

*Found in: Component config > SPIFFS Configuration*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Default value:**
- 4

**CONFIG_SPIFFS_USE_MTIME**

Save file modification time

*Found in: Component config > SPIFFS Configuration*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_MTIME_WIDE_64_BITS**

The time field occupies 64 bits in the image instead of 32 bits

*Found in: Component config > SPIFFS Configuration*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with 64-bit time_t support.

**Default value:**
- No (disabled) if CONFIG_SPIFFS_META_LENGTH >= 8

**Debug Configuration** Contains:

- CONFIG_SPIFFS_DBG
- CONFIG_SPIFFS_API_DBG
- CONFIG_SPIFFS_CACHE_DBG
- CONFIG_SPIFFS_CHECK_DBG
- CONFIG_SPIFFS_TEST_VISUALISATION
- CONFIG_SPIFFS_GC_DBG
CONFIG_SPIFFS_DBG

Enable general SPIFFS debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print general debug messages to the console.

Default value:
• No (disabled)

CONFIG_SPIFFS_API_DBG

Enable SPIFFS API debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print API debug messages to the console.

Default value:
• No (disabled)

CONFIG_SPIFFS_GC_DBG

Enable SPIFFS Garbage Cleaner debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print GC debug messages to the console.

Default value:
• No (disabled)

CONFIG_SPIFFS_CACHE_DBG

Enable SPIFFS Cache debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print cache debug messages to the console.

Default value:
• No (disabled)

CONFIG_SPIFFS_CHECK_DBG

Enable SPIFFS Filesystem Check debug

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enabling this option will print Filesystem Check debug messages to the console.

Default value:
• No (disabled)

CONFIG_SPIFFS_TEST_VISUALISATION

Enable SPIFFS Filesystem Visualization

Found in: Component config > SPIFFS Configuration > Debug Configuration

Enable this option to enable SPIFFS_vis function in the API.

Default value:
• No (disabled)
TCP Transport  Contains:
  • Websocket

Websocket  Contains:
  • CONFIG_WS_TRANSPORT

CONFIG_WS_TRANSPORT
  Enable Websocket Transport
  
  Found in: Component config > TCP Transport > Websocket
  
  Enable support for creating websocket transport.
  
  Default value:
  • Yes (enabled)

CONFIG_WS_BUFFER_SIZE
  Websocket transport buffer size
  
  Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT
  
  Size of the buffer used for constructing the HTTP Upgrade request during connect
  
  Default value:
  • 1024

CONFIG_WS_DYNAMIC_BUFFER
  Using dynamic websocket transport buffer
  
  Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT
  
  If enable this option, websocket transport buffer will be freed after connection succeed to save more heap.
  
  Default value:
  • No (disabled)

Ultra Low Power (ULP) Co-processor  Contains:
  • CONFIG_ULP_COPROC_ENABLED
  • ULP RISC-V Settings

CONFIG_ULP_COPROC_ENABLED
  Enable Ultra Low Power (ULP) Co-processor
  
  Found in: Component config > Ultra Low Power (ULP) Co-processor
  
  Enable this feature if you plan to use the ULP Co-processor. Once this option is enabled, further ULP co-processor configuration will appear in the menu.
  
  Default value:
  • No (disabled)
CONFIG_ULP_COPROC_TYPE

ULP Co-processor type

Found in: 
Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED

Choose the ULP Coprocessor type: ULP FSM (Finite State Machine) or ULP RISC-V. Please note that ESP32 only supports ULP FSM.

Available options:
- ULP FSM (Finite State Machine) (ULP_COPROC_TYPE_FSM)
- ULP RISC-V (ULP_COPROC_TYPE_RISCV)

CONFIG_ULP_COPROC_RESERVE_MEM

RTC slow memory reserved for coprocessor

Found in: 
Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED

Bytes of memory to reserve for ULP Co-processor firmware & data. Data is reserved at the beginning of RTC slow memory.

Range:
- from 32 to 8176 if CONFIG_ULP_COPROC_ENABLED

Default value:
- 512 if CONFIG_ULP_COPROC_ENABLED

ULP RISC-V Settings

Unity unit testing library

Contains:
- CONFIG.Unity_ENABLE_COLOR
- CONFIG.Unity_ENABLE_IDF_TEST_RUNNER
- CONFIG.Unity_ENABLE_FIXTURE
- CONFIG.Unity_ENABLE_BACKTRACE_ON_FAIL
- CONFIG.Unity_ENABLE_64BIT
- CONFIG.Unity_ENABLE_DOUBLE
- CONFIG.Unity_ENABLE_FLOAT

CONFIG.Unity_ENABLE_FLOAT

Support for float type

Found in: Component config > Unity unit testing library

If not set, assertions on float arguments will not be available.

Default value:
- Yes (enabled)

CONFIG.Unity_ENABLE_DOUBLE

Support for double type

Found in: Component config > Unity unit testing library

If not set, assertions on double arguments will not be available.

Default value:
- Yes (enabled)
CONFIG_UNITY_ENABLE_64BIT

Support for 64-bit integer types

*Found in: Component config > Unity unit testing library*

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to UNITY_ASSERT_EQUAL, as that will cause pointer-to-int-cast warnings.

**Default value:**
- No (disabled)

CONFIG_UNITY_ENABLE_COLOR

Colorize test output

*Found in: Component config > Unity unit testing library*

If set, Unity will colorize test results using console escape sequences.

**Default value:**
- No (disabled)

CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER

Include ESP-IDF test registration/running helpers

*Found in: Component config > Unity unit testing library*

If set, then the following features will be available:

- TEST_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: unity_run_all_tests, unity_run_tests_with_filter, unity_run_single_test_by_name.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via unity_run_menu function.

Disable if a different test registration mechanism is used.

**Default value:**
- Yes (enabled)

CONFIG_UNITY_ENABLE_FIXTURE

Include Unity test fixture

*Found in: Component config > Unity unit testing library*

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**
- No (disabled)

CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL

Print a backtrace when a unit test fails

*Found in: Component config > Unity unit testing library*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

**Default value:**
- No (disabled)
Virtual file system  Contains:

-  `CONFIG_VFS_SUPPORT_IO`

**CONFIG_VFS_SUPPORT_IO**

Provide basic I/O functions

*Found in: Component config > Virtual file system*

If enabled, the following functions are provided by the VFS component.

- open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

*Default value:*

- Yes (enabled)

**CONFIG_VFS_SUPPORT_DIR**

Provide directory related functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, the following functions are provided by the VFS component.

- stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

*Default value:*

- Yes (enabled)

**CONFIG_VFS_SUPPORT_SELECT**

Provide select function

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for “select” on UART file descriptors is not required.

*Default value:*

- Yes (enabled) if `CONFIG_VFS_SUPPORT_IO` && `CONFIG_LWIP_USE_ONLY_LWIP_SELECT`
Chapter 2. API Reference

**CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT**
Suppress select() related debug outputs

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT*

Select() related functions might produce an unconveniendly lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

**Default value:**
- Yes (enabled)

**CONFIG_VFS_SUPPORT_TERMIOS**
Provide termios.h functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

Disabling this option can save memory when the support for termios.h is not required.

**Default value:**
- Yes (enabled)

**Host File System I/O (Semihosting) Contains:**
- **CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS**

**CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS**
Host FS: Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.

**Default value:**
- 1

**Wear Levelling Contains:**
- **CONFIG_WL_SECTOR_MODE**
- **CONFIG_WL_SECTOR_SIZE**

**CONFIG_WL_SECTOR_SIZE**
Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

**Available options:**
- 512 (WL_SECTOR_SIZE_512)
- 4096 (WL_SECTOR_SIZE_4096)
Chapter 2. API Reference

**CONFIG_WL_SECTOR_MODE**

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

**Available options:**
- Performance (WL_SECTOR_MODE_PERF)
- Safety (WL_SECTOR_MODE_SAFE)

**Wi-Fi Provisioning Manager**  Contains:

- `CONFIG_WIFI_PROV_BLE_BONDING`
- `CONFIG_WIFI_PROV_BLE_SEC_CONN`
- `CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION`
- `CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV`
- `CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES`
- `CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT`
- `CONFIG_WIFI_PROV_STA_SCAN_METHOD`

**CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES**

Max Wi-Fi Scan Result Entries

*Found in: Component config > Wi-Fi Provisioning Manager*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

**Range:**
- from 1 to 255

**Default value:**
- 16

**CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT**

Provisioning auto-stop timeout

*Found in: Component config > Wi-Fi Provisioning Manager*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

**Range:**
- from 5 to 600

**Default value:**
- 30

**CONFIG_WIFI_PROV_BLE_BONDING**

Enable BLE bonding

*Found in: Component config > Wi-Fi Provisioning Manager*

This option is applicable only when provisioning transport is BLE.
CONFIG_WIFI_PROV_BLE_SEC_CONN

Enable BLE Secure connection flag

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enable Secure connection support when provisioning transport is BLE.

**Default value:**
- Yes (enabled) if BT_NIMBLE_ENABLED

CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION

Force Link Encryption during characteristic Read / Write

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enforce link encryption when attempting to read / write characteristic

CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

Keep BT on after provisioning is done

*Found in: Component config > Wi-Fi Provisioning Manager*

CONFIG_WIFI_PROV_DISCONNECT_AFTER_PROV

Terminate connection after provisioning is done

*Found in: Component config > Wi-Fi Provisioning Manager > CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV*

**Default value:**
- Yes (enabled) if CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

CONFIG_WIFI_PROV_STA_SCAN_METHOD

Wifi Provisioning Scan Method

*Found in: Component config > Wi-Fi Provisioning Manager*

**Available options:**
- All Channel Scan (WIFI_PROV_STA_ALL_CHANNEL_SCAN)
  Scan will end after scanning the entire channel. This option is useful in Mesh WiFi Systems.
- Fast Scan (WIFI_PROV_STA_FAST_SCAN)
  Scan will end after an AP matching with the SSID has been detected.

Supplicant Contains:

- CONFIG_WPA_TESTING_OPTIONS
- CONFIG_WPA_WPS_SOFTAP_REGISTRAR
- CONFIG_WPA_11KV_SUPPORT
- CONFIG_WPA_11R_SUPPORT
- CONFIG_WPA_DFP_SUPPORT
- CONFIG_WPA_MBO_SUPPORT
- CONFIG_WPA_SUITE_B_192
- CONFIG_WPA_WAPI_PSK
- CONFIG_WPA_DEBUG_PRINT
- CONFIG_WPA_WPS_STRICT
- CONFIG_WPA_MBEDTLS_CRYPTO
**CONFIG_WPA_MBEDTLS_CRYPTO**

Use MbedTLS crypto APIs

*Found in: Component config > Supplicant*

Select this option to enable the use of MbedTLS crypto APIs. The internal crypto support within the supplicant is limited and may not suffice for all new security features, including WPA3.

It is recommended to always keep this option enabled. Additionally, note that MbedTLS can leverage hardware acceleration if available, resulting in significantly faster cryptographic operations.

**Default value:**

- Yes (enabled)

**CONFIG_WPA_MBEDTLS_TLS_CLIENT**

Use MbedTLS TLS client for WiFi Enterprise connection

*Found in: Component config > Supplicant > CONFIG_WPA_MBEDTLS_CRYPTO*

Select this option to use MbedTLS TLS client for WPA2 enterprise connection. Please note that from MbedTLS-3.0 onwards, MbedTLS does not support SSL-3.0, TLS-v1.0, TLS-v1.1 versions. In case your server is using one of these version, it is advisable to update your server. Please disable this option for compatibility with older TLS versions.

**Default value:**

- Yes (enabled)

**CONFIG_WPA_WAPI_PSK**

Enable WAPI PSK support

*Found in: Component config > Supplicant*

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**

- No (disabled)

**CONFIG_WPA_SUITE_B_192**

Enable NSA suite B support with 192 bit key

*Found in: Component config > Supplicant*

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

**CONFIG_WPA_DEBUG_PRINT**

Print debug messages from WPA Supplicant

*Found in: Component config > Supplicant*

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Default value:**

- No (disabled)
CONFIG_WPA_TESTING_OPTIONS

Add DPP testing code

*Found in: Component config > Supplicant*

Select this to enable unity test for DPP.

**Default value:**
- No (disabled)

CONFIG_WPA_WPS_STRICT

Strictly validate all WPS attributes

*Found in: Component config > Supplicant*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

**Default value:**
- No (disabled)

CONFIG_WPA_11KV_SUPPORT

Enable 802.11k, 802.11v APIs Support

*Found in: Component config > Supplicant*

Select this option to enable 802.11k 802.11v APIs (RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

**Default value:**
- No (disabled)

CONFIG_WPA_SCAN_CACHE

Keep scan results in cache

*Found in: Component config > Supplicant > CONFIG_WPA_11KV_SUPPORT*

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**
- No (disabled) if CONFIG_WPA_11KV_SUPPORT

CONFIG_WPA_MBO_SUPPORT

Enable Multi Band Operation Certification Support

*Found in: Component config > Supplicant*

Select this option to enable WiFi Multiband operation certification support.

**Default value:**
- No (disabled)
Chapter 2. API Reference

**CONFIG_WPA_DPP_SUPPORT**

Enable DPP support

*Found in: Component config > Supplicant*

Select this option to enable WiFi Easy Connect Support.

*Default value:*
  - No (disabled)

**CONFIG_WPA_11R_SUPPORT**

Enable 802.11R (Fast Transition) Support

*Found in: Component config > Supplicant*

Select this option to enable WiFi Fast Transition Support.

*Default value:*
  - No (disabled)

**CONFIG_WPA_WPS_SOFTAP_REGISTRAR**

Add WPS Registrar support in SoftAP mode

*Found in: Component config > Supplicant*

Select this option to enable WPS registrar support in softAP mode.

*Default value:*
  - No (disabled)

**Deprecated options and their replacements**

- **CONFIG_A2DP_ENABLE (CONFIG_BT_A2DP_ENABLE)**
- **CONFIG_A2D_INITIAL_TRACE_LEVEL (CONFIG_BT_LOG_A2D_TRACE_LEVEL)**
  - CONFIG_A2D_TRACE_LEVEL_NONE
  - CONFIG_A2D_TRACE_LEVEL_ERROR

2.8 Provisioning API

2.8.1 Protocol Communication

Overview

The Protocol Communication (protocomm) component manages secure sessions and provides the framework for multiple transports. The application can also use the protocomm layer directly to have application-specific extensions for the provisioning or non-provisioning use cases.

Following features are available for provisioning:

- Communication security at the application level
  - protocomm_security0 (no security)
  - protocomm_security1 (Curve25519 key exchange + AES-CTR encryption/decryption)
  - protocomm_security2 (SRP6a-based key exchange + AES-GCM encryption/decryption)
- Proof-of-possession (support with protocomm_security1 only)
- Salt and Verifier (support with protocomm_security2 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Users can choose to implement their own security (even without using protobuf). Protocomm can also be used without any security layer.

Protocomm provides the framework for various transports:

- Bluetooth LE
- Wi-Fi (SoftAP + HTTPD)
- Console, in which case the handler invocation is automatically taken care of on the device side. See Transport Examples below for code snippets.

Note that for protocomm_security1 and protocomm_security2, the client still needs to establish sessions by performing the two-way handshake. See Unified Provisioning for more details about the secure handshake logic.
Chapter 2. API Reference

Enabling Protocomm Security Version

The protocomm component provides a project configuration menu to enable/disable support of respective security versions. The respective configuration options are as follows:

- Support `protocomm_security0`, with no security. `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`, this option is enabled by default.
- Support `protocomm_security1` with Curve25519 key exchange + AES-CTR encryption/decryption: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`, this option is enabled by default.
- Support `protocomm_security2` with SRP6a-based key exchange + AES-GCM encryption/decryption: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`.

Note: Enabling multiple security versions at once offers the ability to control them dynamically but also increases the firmware size.

SoftAP + HTTP Transport Example with Security 2

For sample usage, see `wifi_provisioning/src/scheme_softap.c`.

```c
/* The endpoint handler to be registered with protocomm. This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                           const uint8_t *inbuf, ssize_t inlen,
                           uint8_t **outbuf, ssize_t *outlen,
                           void *priv_data)
{
    /* Session ID may be used for persistence. */
    printf("Session ID : %d", session_id);

    /* Echo back the received data. */
    *outbuf = malloc(inlen);
    /* Output the data length updated. */
    *outlen = inlen;
    /* This is to be deallocated outside. */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation. */
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

    /* Remove the endpoint identified by its unique name. */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove the security endpoint identified by its name. */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop the HTTP server. */
    protocomm_httpd_stop(pc);

    /* Delete, namely deallocate the protocomm instance. */
    protocomm_delete(pc);
}

Bluetooth LE Transport Example with Security 0

For sample usage, see wifi_provisioning/src/scheme_ble.c.
/* The example function for launching a secure protocomm instance over Bluetooth_LE. */

protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        /* security_endpoint, 0xFF51 */
        /* echo_req_endpoint, 0xFF52 */
    };

    /* Config for protocomm_ble_start(). */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <---------------------------------------
            * ---------------------------------------> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,
            0x00, 0x10, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_table[0]),
        .nu_lookup = nu_lookup_table
    };

    /* Start protocomm layer on top of Bluetooth LE. */
    protocomm_ble_start(pc, &config);

    /* For protocomm_security0, Proof of Possession is not used, and can be kept_NULL. */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security0, NULL);
    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler, NULL);
    return pc;
}

/* The example function for stopping a protocomm instance. */

void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop the Bluetooth LE protocomm service. */
    protocomm_ble_stop(pc);
    protocomm_delete(pc);
}

API Reference

Header File

- components/protocomm/include/common/protocomm.h

Functions

protocomm_t *protocomm_new (void)

Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t structure initialized to NULL.

Returns

- protocomm_t*: On success
Chapter 2. API Reference

- NULL : No memory for allocating new instance

```c
void protocomm_delete (protocomm_t *pc)
```
Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using protocomm_new().

**Parameters**
- pc -- [in] Pointer to the protocomm instance to be deleted

```c
esp_err_t protocomm_add_endpoint (protocomm_t *pc, const char *ep_name, protocomm_req_handler_t h, void *priv_data)
```
Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

**Note:**
- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().
- This function internally calls the registered add_endpoint() function of the selected transport which is a member of the protocomm_t instance structure.

**Parameters**
- pc -- [in] Pointer to the protocomm instance
- ep_name -- [in] Endpoint identifier(name) string
- h -- [in] Endpoint handler function
- priv_data -- [in] Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

**Returns**
- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

```c
esp_err_t protocomm_remove_endpoint (protocomm_t *pc, const char *ep_name)
```
Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

**Note:**
- This function internally calls the registered remove_endpoint() function which is a member of the protocomm_t instance structure.

**Parameters**
- pc -- [in] Pointer to the protocomm instance
- ep_name -- [in] Endpoint identifier(name) string

**Returns**
- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

```c
esp_err_t protocomm_open_session (protocomm_t *pc, uint32_t session_id)
```
Allocates internal resources for new transport session.

**Note:**
- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().
### Chapter 2. API Reference

#### Parameters
- `pc` - [in] Pointer to the protocomm instance
- `session_id` - [in] Unique ID for a communication session

#### Returns
- ESP_OK : Request handled successfully
- ESP_FAIL : Internal error in execution of registered handler
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_INVALID_ARG : Null instance/name arguments

#### *esp_err_t* protocomm_close_session(*protocomm_t* *pc, uint32_t session_id)
Frees internal resources used by a transport session.

**Note:**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

#### Parameters
- `pc` - [in] Pointer to the protocomm instance
- `session_id` - [in] Unique ID for a communication session

#### Returns
- ESP_OK : Request handled successfully
- ESP_ERR_INVALID_ARG : Null instance/name arguments

#### *esp_err_t* protocomm_req_handle(*protocomm_t* *pc, const char* ep_name, uint32_t session_id, const uint8_t* inbuf, ssize_t inlen, uint8_t** outbuf, ssize_t*outlen)
Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note:**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

#### Parameters
- `pc` - [in] Pointer to the protocomm instance
- `ep_name` - [in] Endpoint identifier (name) string
- `session_id` - [in] Unique ID for a communication session
- `inbuf` - [in] Input buffer contains input request data which is to be processed by the registered handler
- `inlen` - [in] Length of the input buffer
- `outbuf` - [out] Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- `outlen` - [out] Buffer length of the allocated output buffer

#### Returns
- ESP_OK : Request handled successfully
- ESP_FAIL : Internal error in execution of registered handler
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_INVALID_ARG : Null instance/name arguments

#### *esp_err_t* `protocomm_set_security`(*protocomm_t* *pc, const char* ep_name, const `protocomm_security_t`* sec, const void* sec_params)
Add endpoint security for a protocomm instance.
This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.
Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` and `protocomm_security2` are readily available.

### Parameters

- `pc` - [in] Pointer to the protocomm instance
- `ep_name` - [in] Endpoint identifier(name) string
- `sec` - [in] Pointer to endpoint security instance
- `sec_params` - [in] Pointer to security params (NULL if not needed) The pointer should contain the security params struct of appropriate security version. For protocomm security version 1 and 2 `sec_params` should contain pointer to struct of type `protocomm_security1_params_t` and `protocomm_security2_params_t` respectively. The contents of this pointer must be valid till the security session has been running and is not closed.

### Returns

- `ESP_OK` : Success
- `ESP_FAIL` : Error adding endpoint / Endpoint with this name already exists
- `ESP_ERR_INVALID_STATE` : Security endpoint already set
- `ESP_ERR_NO_MEM` : Error allocating endpoint resource
- `ESP_ERR_INVALID_ARG` : Null instance/name/handler arguments

```c
esp_err_t protocomm_unset_security (protocomm_t *pc, const char *ep_name)
```

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

### Parameters

- `pc` - [in] Pointer to the protocomm instance
- `ep_name` - [in] Endpoint identifier(name) string

### Returns

- `ESP_OK` : Success
- `ESP_ERR_NOT_FOUND` : Endpoint with specified name doesn’t exist
- `ESP_ERR_INVALID_ARG` : Null instance/name arguments

```c
esp_err_t protocomm_set_version (protocomm_t *pc, const char *ep_name, const char *version)
```

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

### Note:

- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
\textbf{esp_err_t protocomm_unset_version}(protocomm_t *pc, const char *ep_name)

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

\textbf{Parameters}

- \textbf{pc [in]} Pointer to the protocomm instance
- \textbf{ep_name [in]} Endpoint identifier(name) string

\textbf{Returns}

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

\section*{Type Definitions}

typedef \textit{esp_err_t (*protocomm_req_handler_t)}(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Function prototype for protocomm endpoint handler.

typedef struct protocomm protocomm_t

This structure corresponds to a unique instance of protocomm returned when the API \textit{protocomm_new()} is called. The remaining Protocomm APIs require this object as the first parameter.

\textbf{Note}: Structure of the protocomm object is kept private

\section*{Header File}

- components/protocomm/include/security/protocomm_security.h

\section*{Structures}

\textbf{struct protocomm_security1_params}

Protocomm Security 1 parameters: Proof Of Possession.

\textbf{Public Members}

- const uint8_t *\textbf{data}

  Pointer to buffer containing the proof of possession data

- uint16_t \textbf{len}

  Length (in bytes) of the proof of possession data

\textbf{struct protocomm_security2_params}

Protocomm Security 2 parameters: Salt and Verifier.

\textbf{Public Members}

- const char *\textbf{salt}

  Pointer to the buffer containing the salt
Chapter 2. API Reference

uint16_t salt_len
Length (in bytes) of the salt

const char *verifier
Pointer to the buffer containing the verifier

uint16_t verifier_len
Length (in bytes) of the verifier

struct protocomm_security
Protocomm security object structure.
The member functions are used for implementing secure protocomm sessions.

Note: This structure should not have any dynamic members to allow re-entrancy

Public Members

int ver
Unique version number of security implementation

esp_err_t (*init)(protocomm_security_handle_t *handle)
Function for initializing/allocating security infrastructure

esp_err_t (*cleanup)(protocomm_security_handle_t handle)
Function for deallocating security infrastructure

esp_err_t (*new_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
Starts new secure transport session with specified ID

esp_err_t (*close_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
Closes a secure transport session with specified ID

esp_err_t (*security_req_handler)(protocomm_security_handle_t handle, const void *sec_params, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
Handler function for authenticating connection request and establishing secure session

esp_err_t (*encrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
Function which implements the encryption algorithm

esp_err_t (*decrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
Function which implements the decryption algorithm

Type Definitions

typedef struct protocomm_security1_params protocomm_security1_params_t
Protocomm Security 1 parameters: Proof Of Possession.
typedef struct protocomm_security2_params protocomm_security2_params_t

Protocomm Security 2 parameters: Salt and Verifier.

typedef void *protocomm_security_handle_t

typedef struct protocomm_security protocomm_security_t

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note: This structure should not have any dynamic members to allow re-entrancy

Header File
- components/protocomm/include/security/protocomm_security0.h

Header File
- components/protocomm/include/security/protocomm_security1.h

Header File
- components/protocomm/include/transports/protocomm_httpd.h

Functions

esp_err_t protocomm_httpd_start (protocomm_t *pc, const protocomm_httpd_config_t *config)

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

Note: This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

Parameters
- pc [in] Protocomm instance pointer obtained from protocomm_new()
- config [in] Pointer to config structure for initializing HTTP server

Returns
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_SUPPORTED : Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE : Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM : Memory allocation for server resource failed
- ESP_ERR_HTTPD_* : HTTP server error on start

esp_err_t protocomm_httpd_stop (protocomm_t *pc)

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.
Parameters  **pc**  - [in]  Same protocomm instance that was passed to protocomm_httpd_start()

Returns
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

Unions

union **protocomm_httpd_config_data_t**

```
#include <protocomm_httpd.h>  Protocomm HTTPD Configuration Data
```

**Public Members**

```
void *handle
   HTTP Server Handle, if ext_handle_provided is set to true
```

```
protocomm_http_server_config_t config
   HTTP Server Configuration, if a server is not already active
```

Structures

struct **protocomm_http_server_config_t**

Config parameters for protocomm HTTP server.

**Public Members**

```
uint16_t port
   Port on which the HTTP server will listen
```

```
size_t stack_size
   Stack size of server task, adjusted depending upon stack usage of endpoint handler
```

```
unsigned task_priority
   Priority of server task
```

struct **protocomm_httpd_config_t**

Config parameters for protocomm HTTP server.

**Public Members**

```
bool ext_handle_provided
   Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will
   use the same HTTP Server and not start a new one internally.
```

```
protocomm_httpd_config_data_t data
   Protocomm HTTPD Configuration Data
```

**Macros**

```
PROTOCOMM_HTTPD_DEFAULT_CONFIG()
```
## Header File

- components/protocomm/include/transport/protocomm_ble.h

## Functions

### `esp_err_t protocomm_ble_start (protocomm_t *pc, const protocomm_ble_config_t *config)`

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

**Parameters**
- `pc` [in] Protocomm instance pointer obtained from `protocomm_new()`
- `config` [in] Pointer to config structure for initializing BLE

**Returns**
- ESP_OK: Success
- ESP_FAIL: Simple BLE start error
- ESP_ERR_NO_MEM: Error allocating memory for internal resources
- ESP_ERR_INVALID_STATE: Error in ble config
- ESP_ERR_INVALID_ARG: Null arguments

### `esp_err_t protocomm_ble_stop (protocomm_t *pc)`

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning.

**Parameters**
- `pc` [in] Same protocomm instance that was passed to `protocomm_ble_start()`

**Returns**
- ESP_OK: Success
- ESP_FAIL: Simple BLE stop error
- ESP_ERR_INVALID_ARG: Null / incorrect protocomm instance

## Structures

### `struct name_uuid`

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

**Public Members**

- `const char *name`
  - Name of the handler, which is passed to protocomm layer
- `uint16_t uuid`
  - UUID to be assigned to the BLE characteristic which is mapped to the handler

### `struct protocomm_ble_config`

Config parameters for protocomm BLE service.

**Public Members**
char **device_name[Max_BLE_DEVNAME_LEN + 1]
    BLE device name being broadcast at the time of provisioning

uint8_t service_uuid[BLE_UUID128_VAL_LENGTH]
    128 bit UUID of the provisioning service

uint8_t **manufacturer_data
    BLE device manufacturer data pointer in advertisement

ssize_t **manufacturer_data_len
    BLE device manufacturer data length in advertisement

ssize_t nu_lookup_count
    Number of entries in the Name-UUID lookup table

protocomm_ble_name_uuid_t *nu_lookup
    Pointer to the Name-UUID lookup table

unsigned ble_bonding
    BLE bonding

unsigned ble_sm_sc
    BLE security flag

unsigned ble_link_encryption
    BLE security flag

Macros

MAX_BLE_DEVNAME_LEN
    BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

BLE_UUID128_VAL_LENGTH

MAX_BLE_MANUFACTURER_DATA_LEN
    Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes. However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

Type Definitions

typedef struct name_uuid protocomm_ble_name_uuid_t
    This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct protocomm_ble_config protocomm_ble_config_t
    Config parameters for protocomm BLE service.
2.8.2 Unified Provisioning

Overview

The unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use case, it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. The developers can choose to extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. The followings are the important features of this implementation:

1. **Extensible Protocol**

   The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation is also left to the application to decide.

2. **Transport Flexibility**

   The protocol can work on Wi-Fi (SoftAP + HTTP server) or on Bluetooth LE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behavior can be supported on the transport.

3. **Security Scheme Flexibility**

   It is understood that each use case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that is WPA2 protected or Bluetooth LE with the “just-works” security. Or the applications may consider the transport to be insecure and may want application-level security. The unified provisioning framework allows the application to choose the security as deemed suitable.

4. **Compact Data Representation**

   The protocol uses Google Protobuf as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application-specific data and the developers may choose the representation of their choice.

Typical Provisioning Process

Deciding on Transport

The unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and Bluetooth LE (GATT based) transport schemes. The following points need to be considered while selecting the best possible transport for provisioning:

1. The Bluetooth LE-based transport has the advantage of maintaining an intact communication channel between the device and the client during the provisioning, which ensures reliable provisioning feedback.
2. The Bluetooth LE-based provisioning implementation makes the user experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring the user to go out of the phone app.
3. However, the Bluetooth LE transport consumes about 110 KB memory at runtime. If the product does not use the Bluetooth LE or Bluetooth functionality after provisioning is done, almost all the memory can be reclaimed and added into the heap.
4. The SoftAP-based transport is highly interoperable. However, there are a few considerations:
   • The device uses the same radio to host the SoftAP and also to connect to the configured AP. Since these could potentially be on different channels, it may cause connection status updates not to be reliably received by the phone
   • The phone (client) has to disconnect from its current AP in order to connect to the SoftAP. The original network will get restored only when the provisioning process is complete, and the softAP is taken down.
5. The SoftAP transport does not require much additional memory for the Wi-Fi use cases.
Fig. 28: Typical Provisioning Process

1. Transport-specific discovery and connection

   Some form of beaconing
   Client connects

2. Session Establishment

   Get Version Request
   Get Version Response
   Session Setup Request
   Session Setup Response

   One or multiple steps as per protocol

3. Configuration

   App-specific Set Config (optional)
   Set Config Response (optional)
   Wi-Fi SetConfig(SSID, Passphrase...)
   Wi-Fi SetConfig response
   Wi-Fi ApplyConfig cmd
   Wi-Fi ApplyConfig resp
   Wi-Fi GetStatus cmd (repeated)
   Wi-Fi GetStatus resp (repeated)

4. Close connection

   Close Connection
6. The SoftAP-based provisioning requires the phone-app user to go to System Settings to connect to the Wi-Fi network hosted by the device in the iOS system. The discovery (scanning) as well as connection APIs are not available for the iOS applications.

**Deciding on Security**

Depending on the transport and other constraints, the security scheme needs to be selected by the application developers. The following considerations need to be given from the provisioning-security perspective:

1. The configuration data sent from the client to the device and the response have to be secured.
2. The client should authenticate the device that it is connected to.
3. The device manufacturer may choose proof-of-possession (PoP), a unique per-device secret to be entered on the provisioning client as a security measure to make sure that only the user can provision the device in their possession.

There are two levels of security schemes, of which the developer may select one or a combination, depending on requirements.

1. **Transport Security**

For SoftAP provisioning, developers may choose WPA2-protected security with unique per-device passphrase. Unique per-device passphrase can also act as a proof-of-possession. For Bluetooth LE, the “just-works” security can be used as a transport-level security after assessing its provided level of security.

2. **Application Security**

The unified provisioning subsystem provides the application-level security (*Security 1 Scheme*) that provides data protection and authentication through PoP, if the application does not use the transport-level security, or if the transport-level security is not sufficient for the use case.

**Device Discovery**

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device-firmware application can choose appropriate method for advertisement and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the Bluetooth LE transport, device name or primary service included in the advertisement or a combination of both can be used for discovery.

**Architecture**

The below diagram shows the architecture of unified provisioning:

It relies on the base layer called *Protocol Communication* (protocomm) which provides a framework for security schemes and transport mechanisms. The Wi-Fi Provisioning layer uses protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition, the application can directly use protocomm to register custom handlers.

The application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to the logical channel for communication for specific type of information. For example, security handshake happens on a different endpoint from the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of the SoftAP+HTTP transport, the end-point corresponds to URI, whereas in case of Bluetooth LE, the end-point corresponds to the GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.
Security Schemes

At present, the unified provisioning supports the following security schemes:

1. Security 0
   No security (No encryption).

2. Security 1
   Curve25519-based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:
   a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key.
   b. No Auth (Null PoP) - Shared key derived through key exchange only.

3. Security 2
   SRP6a-based shared key derivation and AES256-GCM mode encryption of the data.

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to [Enabling Protocomm Security Version](#) for more details.

Security 1 Scheme

The Security 1 scheme details are shown in the below sequence diagram:

Security 2 Scheme

The Security 2 scheme is based on the Secure Remote Password (SRP6a) protocol, see [RFC 5054](#).

SessionResp1(dev_verify)

Verify Device

check (cli_pubkey == aes_ctr_dec(dev_verify...))

Device

Security 1
```
The protocol requires the Salt and Verifier to be generated beforehand with the help of the identifying username \( I \) and the plaintext password \( p \). The Salt and Verifier are then stored on ESP32.

- The password \( p \) and the username \( I \) are to be provided to the Phone App (Provisioning entity) by suitable means, e.g., QR code sticker.

Details about the Security 2 scheme are shown in the below sequence diagram:

**Sample Code**

Please refer to *Protocol Communication* and *Wi-Fi Provisioning* for API guides and code snippets on example usage. Application implementation can be found as an example under provision.

**Provisioning Tools**

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - Bluetooth LE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.

- **iOS:**
  - Bluetooth LE Provisioning app on App Store.
  - SoftAP Provisioning app on App Store.
  - Source code on GitHub: esp-idf-provisioning-ios.

- **Linux/macOS/Windows:** tools/esp_prov, a Python-based command line tool for provisioning.

The phone applications offer simple UI and are thus more user centric, while the command-line application is useful as a debugging tool for developers.

### 2.8.3 Wi-Fi Provisioning

**Overview**

This component provides APIs that control the Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or Bluetooth LE transport via secure *Protocol Communication* sessions. The set of *wifi_prov_mgr_* APIs help quickly implement a provisioning service that has necessary features with minimal amount of code and sufficient flexibility.

**Initialization** *wifi_prov_mgr_init()* is called to configure and initialize the provisioning manager, and thus must be called prior to invoking any other *wifi_prov_mgr_* APIs. Note that the manager relies on other components of ESP-IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi, and optionally mDNS, hence these components must be initialized beforehand. The manager can be de-initialized at any moment by making a call to *wifi_prov_mgr_deinit()*.

```c
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERROR_CHECK( wifiProvMgrInit(config) );
```

The configuration structure *wifi_prov_mgr_config_t* has a few fields to specify the desired behavior of the manager.
Fig. 31: Security 2

**Generate Key Pair**

- a (cli_prvkey) = 256 bit random value,
- A (cli_pubkey) = g^a
- q - generator, N - large safe prime,
- All arithmetic operations are performed in ring of integers modulo N,
- thus all occurrences like y^z should be read as y^z modulo N.

`SessionCmd0(cli_pubkey A, username l)`

**Obtain Salt and Verifier stored on esp**
- Salt s = 256 bit random value,
- Verifier v = g^x where x = H(s | l | p)

**Generate Key Pair**

- b (dev_prvkey) = 256 bit random value
- B(dev_pubkey) = k^v + g^b where k = H(N, g)

**Shared Key**

- Shared Key K = H(S) where,
- S = (A = v^u)^b
- u = H(A, B)

`SessionResp0(dev_pubkey B, dev_rand)`

**Shared Key**

- shared_key(K) = H(S) where,
- S = (B - k^v)^u (a + ux),
- u = H(A, B),
- k = H(N, g),
- v = g^x,
- x = H(s | l | p).

`SessionCmd1(client_proof M)`

**Verify Client**

- device generates M1 = H(H(N) XOR H(g) | H(l) | s | A | B | K)
- device verifies this M1 with the M1 obtained from Client

**Device generate device_proof M2 = H(A, M, K)**

**dev_rand = gen_16byte_random()**

This random number is to be used for AES-GCM operation for encryption and decryption of the data using the shared secret.

`SessionResp1(device_proof M2, dev_rand)`

**Verify Device**

- Client calculates device proof M2 as M2 = H(A, M, K)
- client verifies this M2 with M2 obtained from device
wifi_prov_mgr_config_t::scheme - This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, support the following options:

- wifi_prov_scheme_ble - Bluetooth LE transport and GATT Server for handling the provisioning commands.
- wifi_prov_scheme_softap - Wi-Fi SoftAP transport and HTTP Server for handling the provisioning commands.
- wifi_prov_scheme_console - Serial transport and console for handling the provisioning commands.

wifi_prov_mgr_config_t::scheme_event_handler - An event handler defined along with the scheme. Choosing the appropriate scheme-specific event handler allows the manager to take care of certain matters automatically. Presently, this option is not used for either the SoftAP or Console-based provisioning, but is very convenient for Bluetooth LE. To understand how, we must recall that Bluetooth requires a substantial amount of memory to function, and once the provisioning is finished, the main application may want to reclaim back this memory (or part of it) if it needs to use either Bluetooth LE or classic Bluetooth. Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using wifi_prov_scheme_ble, the scheme-specific handlers have been defined, and depending upon the chosen handler, the Bluetooth LE/classic Bluetooth/BTDM memory is freed automatically when the provisioning manager is de-initialized. The available options are:

- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM - Free both classic Bluetooth and Bluetooth LE/BTDM memory. Used when the main application does not require Bluetooth at all.
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE - Free only Bluetooth LE memory. Used when main application requires classic Bluetooth.
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT - Free only classic Bluetooth. Used when main application requires Bluetooth LE. In this case freeing happens right when the manager is initialized.
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_NONE - Do not use any scheme specific handler. Used when the provisioning scheme is not Bluetooth LE, i.e., using SoftAP or Console, or when main application wants to handle the memory reclaiming on its own, or needs both Bluetooth LE and classic Bluetooth to function.

wifi_prov_mgr_config_t::app_event_handler (Deprecated) - It is now recommended to catch WIFI_PROV_EVENT that is emitted to the default event loop handler. See definition of wifi_prov_cb_event_t for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
        case WIFI_PROV_START:
            ESP_LOGI(TAG, "Provisioning started");
            break;
        case WIFI_PROV_CRED_RECV:
            wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t *)event_data;
            ESP_LOGI(TAG, "Received Wi-Fi credentials"
                     "\nSSID : %s
                     Password : %s",
                     (const char *) wifi_sta_cfg->ssid, (const char *) wifi_sta_cfg->password);
            break;
        case WIFI_PROV_CRED_FAIL:
            wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_reason_t *)event_data;
            ESP_LOGE(TAG, "Provisioning failed!\nReason : %s"
                     "\nPleas reset to factory and retry...
                     provisioning",
                     (const char *) reason->reason);
            break;
        }
    }
}
```

(continues on next page)
The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.  

### Check the Provisioning State
Whether the device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently the manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi` APIs to set and get the credentials stored in NVS from the default location.

If the provisioning state needs to be reset, any of the following approaches may be taken:

- The associated part of NVS partition has to be erased manually
- The main application must implement some logic to call `esp_wifi` APIs for erasing the credentials at runtime
- The main application must implement some logic to force start the provisioning irrespective of the provisioning state

```c
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

### Start the Provisioning Service
At the time of starting provisioning we need to specify a service name and the corresponding key, that is to say:

- A Wi-Fi SoftAP SSID and a passphrase, respectively, when the scheme is `wifi_prov_scheme_softap`
- Bluetooth LE device name with the service key ignored when the scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession `pop`, followed by AES-CTR for encryption or decryption of subsequent messages.
- Security 0 is simply plain text communication. In this case the `pop` is simply ignored.

See **Unified Provisioning** for details about the security features.

```
c const char *service_name = "my_device";
c const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
c const char *pop = "abcd1234";
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );
```

(continued from previous page)
The provisioning service automatically finishes only if it receives valid Wi-Fi AP credentials followed by successful connection of device to the AP with IP obtained. Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**Note:** If the device fails to connect with the provided credentials, it does not accept new credentials anymore, but the provisioning service keeps on running, only to convey failure to the client, until the device is restarted. Upon restart, the provisioning state turns out to be true this time, as credentials are found in NVS, but the device does fail again to connect with those same credentials, unless an AP with the matching credentials somehow does become available. This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in *Check the Provisioning State*.

### Waiting for Completion

Typically, the main application waits for the provisioning to finish, then de-initializes the manager to free up resources, and finally starts executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```c
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_->name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT` and call `wifi_prov_mgr_deinit()` when event ID is `WIFI_PROV_END`:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize the manager once the provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

### User Side Implementation

When the service is started, the device to be provisioned is identified by the advertised service name, which, depending upon the selected transport, is either the Bluetooth LE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case, the host name set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using Bluetooth LE transport, a custom 128-bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID is to be included in the Bluetooth LE advertisement and corresponds to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic is formed using the primary service UUID as the base, with different auto-assigned 12th and 13th bytes, presumably counting from the 0th byte. Since an endpoint characteristic UUID is auto-assigned, it should not be used to identify the endpoint. Instead, client-side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to `55cc035e-fb27-4f80-be02-3c60828b7451`, each endpoint characteristic is assigned a UUID like `55cc____-fb27-4f80-be02-3c60828b7451`, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning-related protocolcomm endpoints can be identified as follows:
### Table 9: Endpoints Provided by the Provisioning Service

<table>
<thead>
<tr>
<th>Endpoint Name i.e., Bluetooth LE + GATT Server</th>
<th>URI, i.e., SoftAP + HTTP Server + mDNS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>the endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-ctrl</td>
<td><a href="http://wifi-prov.local/prov-ctrl">http://wifi-prov.local/prov-ctrl</a></td>
<td>the endpoint used for controlling Wi-Fi provisioning state</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>the endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>the endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version/capabilities information from the `proto-ver` endpoint. All communications to this endpoint are unencrypted, hence necessary information, which may be relevant for deciding compatibility, can be retrieved before establishing a secure session. The response is in JSON format and looks like:

```
prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] }, ...
```

Here label `prov` provides provisioning service version `ver` and capabilities `cap`. For now, only the `no_pop` capability is supported, which indicates that the service does not require proof of possession for authentication. Any application-related version or capabilities are given by other labels, e.g., `my_app` in this example. These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocol sessions as per the security scheme configured for use, which is not needed when the manager is configured to use protocol security 0.

See [Unified Provisioning](#) for more details about the secure handshake and encryption used. Applications must use the `.proto` files found under `protocomm/proto`, which define the Protobuf message structures supported by `prov-session` endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of `wifi_config` commands, serialized as Protobuf messages with the corresponding `.proto` files that can be found under `wifi_provisioning/proto`:

- **get_status** - For querying the Wi-Fi connection status. The device responds with a status which is one of connecting, connected or disconnected. If the status is disconnected, a disconnection reason is also to be included in the status response.
- **set_config** - For setting the Wi-Fi connection credentials.
- **apply_config** - For applying the credentials saved during `set_config` and starting the Wi-Fi station.

After session establishment, the client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands:

- **scan_start** - For starting Wi-Fi scan with various options:
  - `blocking` (input) - If true, the command returns only when the scanning is finished.
  - `passive` (input) - If true, the scan is started in passive mode, which may be slower, instead of active mode.
  - `group_channels` (input) - This specifies whether to scan all channels in one go when zero, or perform scanning of channels in groups, with 120 ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager waits for at least 120 ms after completing the scan on a group of channels, and thus allows the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting `group_channels` to 3 creates 5 groups, with each group having 3 channels, except the last...
one which has \(14 \div 3 = 2\) channels. So, when the scan is started, the first 3 channels will be scanned, followed by a 120 ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only a few channels in a group may increase the overall scan time, while having too many may again cause disconnection. Usually, a value of 4 should work for most cases. Note that for any other mode of transport, e.g. Bluetooth LE, this can be safely set to 0, and hence achieve the shortest overall scanning time.

- **period_ms** (input) - The scan parameter specifying how long to wait on each channel.
  - **scan_status** - It gives the status of scanning process:
    - **scan_finished** (output) - When the scan has finished, this returns true.
    - **result_count** (output) - This gives the total number of results obtained till now. If the scan is yet happening, this number keeps on updating.
  - **scan_result** - For fetching the scan results. This can be called even if the scan is still on going.
    - **start_index** (input) - Where the index starts from to fetch the entries from the results list.
    - **count** (input) - The number of entries to fetch from the starting index.
    - **entries** (output) - The list of entries returned. Each entry consists of ssid, channel and rssi information.

The client can also control the provisioning state of the device using wifi_ctrl endpoint. The wifi_ctrl endpoint supports the following protobuf commands:

- **ctrl_reset** - Resets internal state machine of the device and clears provisioned credentials only in case of provisioning failures.
- **ctrl_reprov** - Resets internal state machine of the device and clears provisioned credentials only in case the device is to be provisioned again for new credentials after a previous successful provisioning.

**Additional Endpoints**  
In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See Protocol Communication for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```c
wifisprov mgr_init(config);
wifisprov mgr_endpoint_create(“custom-endpoint”);
wifisprov mgr_start_provisioning(security, pop, service_name, service_ →key);
wifisprov mgr_endpoint_register(“custom-endpoint”, custom_ep_handler,␣ →custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When/How to Stop the Provisioning Service?**  
The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the apply_config command, the provisioning service stops, and Bluetooth LE or SoftAP turns off, automatically after responding to the next get_status command. If get_status command is not received by the device, the service stops after a 30s timeout.

On the other hand, if device is not able to connect using the provided Wi-Fi credentials, due to incorrect SSID or passphrase, the service keeps running, and get_status keeps responding with disconnection status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, are to be rejected. These credentials are preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service stops only after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.
The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange these credentials over a custom protocomm endpoint, then after successfully doing so, stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client-side application.

**Application Examples**

For complete example implementation see `provisioning/wifi_prov_mgr`.

**Provisioning Tools**

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - Bluetooth LE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.

- **iOS:**
  - Bluetooth LE Provisioning app on App Store.
  - SoftAP Provisioning app on App Store.
  - Source code on GitHub: esp-idf-provisioning-ios.

- **Linux/MacOS/Windows:**
  - tools/esp_prov, a Python-based command-line tool for provisioning.

The phone applications offer simple UI and are thus more user centric, while the command-line application is useful as a debugging tool for developers.

**API Reference**

**Header File**

- components/wifi Provisioning/include/wifi Provisioning/manager.h

**Functions**

```c
esp_err_t wifi_prov_mgr_init(wifi_prov_mgr_config_t config)
```

Initialize provisioning manager instance.

- Configures the manager and allocates internal resources
- Configuration specifies the provisioning scheme (transport) and event handlers
- Event WIFI_PROV_INIT is emitted right after initialization is complete

**Parameters**

- `config` - Configuration structure

**Returns**

- ESP_OK : Success
- ESP_FAIL : Fail

```c
void wifi_prov_mgr_deinit (void)
```

Stop provisioning (if running) and release resource used by the manager.

- Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished

- If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization
esp_err_t wifi_prov_mgr_is_provisioned(bool *provisioned)

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component

If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function
will still yield true (i.e. device will be found to be provisioned)

Note: Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of
what the state was prior to making the call.

Parameters provisioned ⚶[out] True if provisioned, else false

Returns

• ESP_OK : Retrieved provision state successfully
• ESP_FAIL : Wi-Fi not initialized
• ESP_ERR_INVALID_ARG : Null argument supplied

esp_err_t wifi_prov_mgr_start_provisioning(wifi_prov_security_t security, const void *

*wifi_prov_sec_params, const char *service_name,

const char *service_key)

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

• wifi_prov_scheme_ble : This starts protocomm_ble, which internally initializes BLE transport and starts
GATT server for handling provisioning requests
• wifi_prov_scheme_softap : This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which
internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts adv-
vertising service with type _esp_wifi_prov._tcp)

Event WIFI_PROV_START is emitted right after provisioning starts without failure

Note: This API will start provisioning service even if device is found to be already provisioned, i.e.
wifi_prov_mgr_is_provisioned() yields true

Parameters

• security ⚶[in] Specify which protocomm security scheme to use :
  – WIFI_PROV_SECURITY_0 : For no security
  – WIFI_PROV_SECURITY_1 : x25519 secure handshake for session establishment fol-
  lowed by AES-CTR encryption of provisioning messages
  – WIFI_PROV_SECURITY_2: SRP6a based authentication and key exchange followed
    by AES-GCM encryption/decryption of provisioning messages
• wifi_prov_sec_params ⚶[in] Pointer to security params (NULL if not

needed). This is not needed for protocomm security 0 This pointer should hold
the struct of type wifi_prov_security1_params_t for protocomm security 1 and
wifi_prov_security2_params_t for protocomm security 2 respectively. This pointer and
its contents should be valid till the provisioning service is running and has not been
stopped or de-initied.
• service_name ⚶[in] Unique name of the service. This translates to:
  – Wi-Fi SSID when provisioning mode is softAP
  – Device name when provisioning mode is BLE
• service_key ⚶[in] Key required by client to access the service (NULL if not needed).
  This translates to:
  – Wi-Fi password when provisioning mode is softAP
  – ignored when provisioning mode is BLE
Returns

- ESP_OK: Provisioning started successfully
- ESP_FAIL: Failed to start provisioning service
- ESP_ERR_INVALID_STATE: Provisioning manager not initialized or already started

void wifi_prov_mgr_stop_provisioning (void)

Stop provisioning service.

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with wifi_prov_mgr_disable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleanup delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

void wifi_prov_mgr_wait (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.

This will not block if provisioning is not started or not initialized.

esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

Note: This must be called before executing wifi_prov_mgr_start_provisioning()

Parameters cleanup_delay - [in] Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

Returns

- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started

esp_err_t wifi_prov_mgr_set_app_info (const char *label, const char *version, const char **capabilities, size_t total_capabilities)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.
This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

**Note:** This must be called before executing `wifi_prov_mgr_start_provisioning()`

**Parameters**
- `label` -in- String indicating the application name.
- `version` -in- String indicating the application version. There is no constraint on format.
- `capabilities` -in- Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- `total_capabilities` -in- Size of capabilities array

**Returns**
- `ESP_OK`: Success
- `ESP_ERR_INVALID_STATE`: Manager not initialized or provisioning service already started
- `ESP_ERR_NO_MEM`: Failed to allocate memory for version string
- `ESP_ERR_INVALID_ARG`: Null argument

```c
esp_err_t wifi_prov_mgr_endpoint_create(const char* ep_name)
```

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

**Note:** This API can only be called BEFORE provisioning is started

**Note:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Parameters** `ep_name` -in- unique name of the endpoint

**Returns**
- `ESP_OK`: Success
- `ESP_FAIL`: Failure

```c
esp_err_t wifi_prov_mgr_endpoint_register(const char* ep_name, protocomm_req_handler_t handler, void* user_ctx)
```

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.
Note: This API can only be called AFTER provisioning has started

Note: Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

Note: After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Parameters
- **ep_name** – [in] Name of the endpoint
- **handler** – [in] Endpoint handler function
- **user_ctx** – [in] User data

Returns
- ESP_OK: Success
- ESP_FAIL: Failure

void wifi_prov_mgr_endpoint_unregister (const char *ep_name)
Unregister the handler for an endpoint.
This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.
All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters **ep_name** – [in] Name of the endpoint

esp_err_t wifi_prov_mgr_get_wifi_state (wifi_prov_sta_state_t *state)
Get state of Wi-Fi Station during provisioning.

Parameters **state** – [out] Pointer to wifi_prov_sta_state_t variable to be filled

Returns
- ESP_OK: Successfully retrieved Wi-Fi state
- ESP_FAIL: Provisioning app not running

esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason (wifi_prov_sta_fail_reason_t *reason)
Get reason code in case of Wi-Fi station disconnection during provisioning.

Parameters **reason** – [out] Pointer to wifi_prov_sta_fail_reason_t variable to be filled

Returns
- ESP_OK: Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL: Provisioning app not running

esp_err_t wifi_prov_mgr_configure_sta (wifi_config_t *wifi_cfg)
Runs Wi-Fi as Station with the supplied configuration.
Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.
This is automatically called by provisioning service upon receiving new credentials.
If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.
Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

Parameters **wifi_cfg** – [in] Pointer to Wi-Fi configuration structure

Returns
- ESP_OK: Wi-Fi configured and started successfully
Chapter 2. API Reference

• ESP_FAIL: Failed to set configuration

```c
esp_err_t wifi_prov_mgr_reset_provisioning (void)
```
Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

**Returns**
- ESP_OK: Reset provisioning config successfully
- ESP_FAIL: Failed to reset provisioning config

```c
esp_err_t wifi_prov_mgr_reset_sm_state_on_failure (void)
```
Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

**Returns**
- ESP_OK: Reset provisioning state machine successfully
- ESP_FAIL: Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE: Manager not initialized

**Structures**

```c
struct wifi_prov_event_handler_t
```
Event handler that is used by the manager while provisioning service is active.

**Public Members**

```c
wifi_prov_cb_func_t event_cb
```
Callback function to be executed on provisioning events

```c
void *user_data
```
User context data to pass as parameter to callback function

```c
struct wifi_prov_scheme
```
Structure for specifying the provisioning scheme to be followed by the manager.

**Note:** Ready to use schemes are available:

- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

**Public Members**

```c
esp_err_t (*prov_start)(protocomm_t *pc, void *config)
```
Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

```c
esp_err_t (*prov_stop)(protocomm_t *pc)
```
Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance
void *(*new_config)(void)
    Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to prov_start()

void (*delete_config)(void *config)
    Function which is to be called by the manager to delete a configuration generated using new_config()

esp_err_t (*set_config_service)(void *config, const char *service_name, const char *service_key)
    Function which is to be called by the manager to set the service name and key values in the configuration structure

esp_err_t (*set_config_endpoint)(void *config, const char *endpoint_name, uint16_t uuid)
    Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

wifi_mode_t wifi_mode
    Sets mode of operation of Wi-Fi during provisioning. This is set to:
    • WIFI_MODE_APSTA for SoftAP transport
    • WIFI_MODE_STA for BLE transport

struct wifi_prov_mgr_config_t
    Structure for specifying the manager configuration.

Public Members

wifi_prov_scheme_t scheme
    Provisioning scheme to use. Following schemes are already available:
    • wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
    • wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server + mDNS (optional)
    • wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

wifi_prov_event_handler_t scheme_event_handler
    Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use WIFI_PROV_EVENT_HANDLER_NONE when not used. When using scheme wifi_prov_scheme_ble, the following options are available:
    • WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
    • WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
    • WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

wifi_prov_event_handler_t app_event_handler
    Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI_PROV_EVENT_HANDLER_NONE when not used.

Macros

WIFI_PROV_EVENT_HANDLER_NONE
    Event handler can be set to none if not used.
Type Definitions

typedef void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)

typedef struct wifi_prov_scheme wifi_prov_scheme_t

Structure for specifying the provisioning scheme to be followed by the manager.

Note: Ready to use schemes are available:

• wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
• wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
• wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

typedef enum wifi_prov_security wifi_prov_security_t

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm

typedef protocomm_security2_params_t wifi_prov_security2_params_t

Security 2 params structure This needs to be passed when using WIFI_PROV_SECURITY_2.

Enumerations

defined wifi_prov_cb_event_t

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:

enumerator WIFI_PROV_INIT

Emitted when the manager is initialized

denumerator WIFI_PROV_START

Indicates that provisioning has started

denumerator WIFI_PROV_CRED_RECV

Emitted when Wi-Fi AP credentials are received via protocomm endpoint wifi_config. The event data in this case is a pointer to the corresponding wifi_sta_config_t structure

denumerator WIFI_PROV_CRED_FAIL

Emitted when device fails to connect to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code with type wifi_prov_sta_fail_reason_t

denumerator WIFI_PROV_CRED_SUCCESS

Emitted when device successfully connects to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV

denumerator WIFI_PROV_END

Signals that provisioning service has stopped
enumerator WIFI_PROV_DEINIT
signals that manager has been de-initialized

enum wifi_prov_security
security modes supported by the Provisioning Manager.
these are same as the security modes provided by protocomm
values:

enumerator WIFI_PROV_SECURITY_0
No security (plain-text communication)

enumerator WIFI_PROV_SECURITY_1
This secure communication mode consists of X25519 key exchange
- proof of possession (pop) based authentication
- AES-CTR encryption

enumerator WIFI_PROV_SECURITY_2
This secure communication mode consists of SRP6a based authentication and key exchange
- AES-GCM encryption/decryption

header file
- components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h

functions
void wifi_prov_scheme_ble_event_cb_free_btdm (void *user_data, wifi_prov_cb_event_t event, void *event_data)
void wifi_prov_scheme_ble_event_cb_free_ble (void *user_data, wifi_prov_cb_event_t event, void *event_data)
void wifi_prov_scheme_ble_event_cb_free_bt (void *user_data, wifi_prov_cb_event_t event, void *event_data)

esp_err_t wifi_prov_scheme_ble_set_service_uuid (uint8_t *uuid128)
set the 128 bit GATT service UUID used for provisioning.
this API is used to override the default 128 bit provisioning service UUID, which is 0000fff-0000-1000-8000-00805f9b34fb.
this must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

note: the data being pointed to by the argument must be valid at least till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwords.

parameters uuid128  [in] A custom 128 bit UUID
returns
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument
**esp_err_t wifi_prov_scheme_ble_set_mfg_data** (uint8_t *mfg_data, ssize_t mfg_data_len)

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning().

**Note:** It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. (mfg_data_len + 2) < 31 - (device_name_length + 2). If the mfg_data length exceeds this limit, the length will be truncated.

**Parameters**

- mfg_data  [in] Custom manufacturer data
- mfg_data_len  [in] Manufacturer data length

**Returns**

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

**Macros**

- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

**Header File**

- components/wifi_provisioning/include/wifi_provisioning/scheme_software.h

**Functions**

- void wifi_prov_scheme_softap_set_httpd_handle (void *handle)

  Provide HTTPD Server handle externally.

  Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

  **Note:** This API should be called before wifi_prov_mgr_start_provisioning()
Chapter 2. API Reference

Functions

`esp_err_t wifi_prov_config_data_handler (uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)`

Handler for receiving and responding to requests from master.

This is to be registered as the `wifi_config` endpoint handler (`protocomm protocomm_req_handler_t`) using `protocomm_add_endpoint()`.

Structures

`struct wifi_prov_sta_conn_info_t` WiFi STA connected status information.

Public Members

- `char ip_addr[IP4ADDR_STRLEN_MAX]` IP Address received by station
- `char bssid[6]` BSSID of the AP to which connection was established
- `char ssid[33]` SSID of the to which connection was established
- `uint8_t channel` Channel of the AP
- `uint8_t auth_mode` Authorization mode of the AP

`struct wifi_prov_config_get_data_t` WiFi status data to be sent in response to `get_status` request from master.

Public Members

- `wifi_prov_sta_state_t wifi_state` WiFi state of the station
- `wifi_prov_sta_fail_reason_t fail_reason` Reason for disconnection (valid only when `wifi_state` is `WIFI_STATION_DISCONNECTED`)
- `wifi_prov_sta_conn_info_t conn_info` Connection information (valid only when `wifi_state` is `WIFI_STATION_CONNECTED`)

`struct wifi_prov_config_set_data_t` WiFi config data received by slave during `set_config` request from master.
Public Members

char ssid[33]
    SSID of the AP to which the slave is to be connected

char password[64]
    Password of the AP

char bssid[6]
    BSSID of the AP

uint8_t channel
    Channel of the AP

struct wifi_prov_config_handlers
    Internal handlers for receiving and responding to protocomm requests from master.
    This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler() when calling protocomm_add_endpoint()).

Public Members

esp_err_t (*get_status_handler)(wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)
    Handler function called when connection status of the slave (in WiFi station mode) is requested

esp_err_t (*set_config_handler)(const wifi_prov_config_set_data_t *req_data, wifi_prov_ctx_t **ctx)
    Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

esp_err_t (*apply_config_handler)(wifi_prov_ctx_t **ctx)
    Handler function for applying the configuration that was set in set_config_handler. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when get_status_handler is invoked again by the master.

wifi_prov_ctx_t *ctx
    Context pointer to be passed to above handler functions upon invocation

Type Definitions

typedef struct wifi_prov_ctx wifi_prov_ctx_t
    Type of context data passed to each get/set/apply handler function set in wifi_prov_config_handlers structure.
    This is passed as an opaque pointer, thereby allowing it to be defined later in application code as per requirements.

typedef struct wifi_prov_config_handlers wifi_prov_config_handlers_t
    Internal handlers for receiving and responding to protocomm requests from master.
    This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler() when calling protocomm_add_endpoint()).
Chapter 2. API Reference

Enumerations

```c
enum wifi_prov_sta_state_t
{
    WiFiSTAstatusforconveyingbacktotheprovisioningmaster.
    
    Values:
    
    enumerator WIFI_PROV_STA_CONNECTING
    
    enumerator WIFI_PROV_STA_CONNECTED
    
    enumerator WIFI_PROV_STA_DISCONNECTED
}
```

```c
enum wifi_prov_sta_fail_reason_t
{
    WiFiSTAconnectionfailreason.
    
    Values:
    
    enumerator WIFI_PROV_STA_AUTH_ERROR
    
    enumerator WIFI_PROV_STA_AP_NOT_FOUND
}
```

Code examples for above API are provided in the provisioning directory of ESP-IDF examples.

Code example for above API is provided in wifi/smart_config.

Code example for above API is provided in wifi/wifi_easy_connect/dpp-enrollee.

2.9 Storage API

2.9.1 FAT Filesystem Support

ESP-IDF uses the FatFs library to work with FAT filesystems. FatFs resides in the fatfs component. Although the library can be used directly, many of its features can be accessed via VFS using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.

Using FatFs with VFS

The header file fatfs/vfs/esp_vfs_fat.h defines the functions for connecting FatFs and VFS.

The function esp_vfs_fat_register() allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs.

The function esp_vfs_fat_unregister_path() deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with esp_vfs_fat_ functions:

1. Call esp_vfs_fat_register() to specify:
   - Path prefix where to mount the filesystem (e.g., "/sdcard", "/spiflash")
   - FatFs drive number
• A variable which will receive the pointer to the FATFS structure

2. Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.

3. Call the FatFs function `f_mount()`, and optionally `f_fdisk`, `f_mkfs`, to mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`. For more information, see FatFs documentation.

4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to `esp_vfs_register()` (for example, "/sdcard/hello.txt"). The filesystem uses 8.3 filenames format (SFN) by default. If you need to use long filenames (LFN), enable the `CONFIG_FATFS_LONG_FILENAMES` option. More details on the FatFs filenames are available here.

5. Optionally, by enabling the option `CONFIG_FATFS_USE_FASTSEEK`, you can use the POSIX `lseek` function to perform it faster. The fast seek will not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.

6. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix (for example, "/hello.txt").

7. Close all open files.

8. Call the FatFs function `f_mount` for the same drive number with NULL FATFS* argument to unmount the filesystem.

9. Call the FatFs function `ff_diskio_register()` with NULL `ff_diskio_impl_t*` argument and the same drive number to unregister the disk I/O driver.

10. Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.

The convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()`, and `esp_vfs_fat_sdcardUnmount()` wrap the steps described above and also handle SD card initialization. These functions are described in the next section.

### Using FatFs with VFS and SD Cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()`, and `esp_vfs_fat_sdcardUnmount()`. These functions perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmcUnmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.

### Using FatFs with VFS in Read-Only Mode

The header file `fatfs/vfs/esp_vfs_fat.h` also defines the convenience functions `esp_vfs_fat_spiflash_mount_ro()` and `esp_vfs_fat_spiflashUnmount_ro()`. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning which will not be changed by production application throughout the lifetime of the hardware.

### FatFS Disk IO Layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

These APIs provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmmc()`.

```c
void ff_diskio_register(BYTE pdrv, const ff_diskio_impl_t *discio_impl)
```

Register or unregister diskio driver for given drive number.

When FATFS library calls one of `disk_xxx` functions for driver number `pdrv`, corresponding function in `discio_impl` for given `pdrv` will be called.

### Parameters
• `pdrv` - drive number
• `discio_impl` - pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

**struct `ff_diskio_impl_t`**

Structure of pointers to disk IO driver functions.

See FatFs documentation for details about these functions

**Public Members**

DSTATUS (*`init`*)(unsigned char *pdrv)

disk initialization function

DSTATUS (*`status`*)(unsigned char *pdrv)

disk status check function

DRESULT (*`read`*)(unsigned char *pdrv, unsigned char *buff, uint32_t sector, unsigned count)

sector read function

DRESULT (*`write`*)(unsigned char *pdrv, const unsigned char *buff, uint32_t sector, unsigned count)

sector write function

DRESULT (*`ioctl`*)(unsigned char *pdrv, unsigned char cmd, void *buff)

function to get info about disk and do some misc operations

void `ff_diskio_register_sdmmc` (unsigned char *pdrv, sdmmc_card_t *card)

Register SD/MMC diskio driver

**Parameters**

• `pdrv` - drive number
• `card` - pointer to `sdmmc_card_t` structure describing a card; card should be initialized before calling `f_mount`.

esp_err_t `ff_diskio_register wl_partition` (unsigned char *pdrv, wl_handle_t flash_handle)

Register spi flash partition

**Parameters**

• `pdrv` - drive number
• `flash_handle` - handle of the wear levelling partition.

esp_err_t `ff_diskio_register_raw_partition` (unsigned char *pdrv, const `esp_partition_t` *part_handle)

Register spi flash partition

**Parameters**

• `pdrv` - drive number
• `part_handle` - pointer to raw flash partition.

**FatFs Partition Generator**

We provide a partition generator for FatFs ([wl_fatfsgen.py](#)) which is integrated into the build system and could be easily used in the user project.

The tool is used to create filesystem images on a host and populate it with content of the specified host folder.
Chapter 2. API Reference

The script is based on the partition generator (fatfsgen.py). Apart from generating partition, it can also initialize wear levelling.

The latest version supports both short and long file names, FAT12 and FAT16. The long file names are limited to 255 characters and can contain multiple periods (.) characters within the filename and additional characters +,.,;, =, [ and ].

**Build System Integration with FatFs Partition Generator**

It is possible to invoke FatFs generator directly from the CMake build system by calling `fatfs_create_spiflash_image`:

```
fatfs_create_spiflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

If you prefer generating partition without wear levelling support, you can use `fatfs_create_rawflash_image`:

```
fatfs_create_rawflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

`fatfs_create_spiflash_image` respectively `fatfs_create_rawflash_image` must be called from project’s CMakeLists.txt.

If you decide for any reason to use `fatfs_create_rawflash_image` (without wear levelling support), beware that it supports mounting only in read-only mode in the device.

The arguments of the function are as follows:

1. `partition` - the name of the partition as defined in the partition table (e.g. `storage/fatfsgen/partitions_example.csv`).
2. `base_dir` - the directory that will be encoded to FatFs partition and optionally flashed into the device. Beware that you have to specify the suitable size of the partition in the partition table.
3. `flag FLASH_IN_PROJECT` - optionally, users can have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash -p <PORT>` by specifying `FLASH_IN_PROJECT`.
4. `flag PRESERVE_TIME` - optionally, users can force preserving the timestamps from the source folder to the target image. Without preserving the time, every timestamp will be set to the FATFS default initial time (1st January 1980).

For example:

```
fatfs_create_spiflash_image(my_fatfs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py` or a custom build system target.

For an example, see `storage/fatfsgen`.

**FatFs Partition Analyzer**

(fatfsparse.py) is a partition analyzing tool for FatFs.

It is a reverse tool of (fatfsgen.py), i.e. it can generate the folder structure on the host based on the FatFs image.

Usage:

```
./fatfsparse.py [-h] [--long-name-support] [--wear-leveling] fatfs_image.img
```

**High-level API Reference**

**Header File**

- components/fatfs/vfs/esp_vfs_fat.h
Chapter 2. API Reference

Functions

**esp_err_t esp_vfs_fat_register** (const char *base_path, const char *fat_drive, size_t max_files, FATFS **out_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, fat_drive argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for f_mount call.

**Note:** This function doesn’t mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

### Parameters

- **base_path** — path prefix where FATFS should be registered
- **fat_drive** — FATFS drive specification; if only one drive is used, can be an empty string
- **max_files** — maximum number of files which can be open at the same time
- **out_fs** — [out] pointer to FATFS structure which can be used for FATFS f_mount call is returned via this argument.

### Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_register was already called
- ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

**esp_err_t esp_vfs_fat_unregister_path** (const char *base_path)

Un-register FATFS from VFS.

**Note:** FATFS structure returned by esp_vfs_fat_register is destroyed after this call. Make sure to call f_mount function to unmount it before calling esp_vfs_fat_unregister_ctx. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one.

### Parameters

**base_path** — path prefix where FATFS is registered. This is the same used when esp_vfs_fat_register was called

### Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

**esp_err_t esp_vfs_fat_sdmmc_mount** (const char *base_path, const sdmmc_host_t *host_config, const void *slot_config, const esp_vfs_fat_mount_config_t *mount_config, sdmmc_card_t **out_card)

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes SDMMC driver or SPI driver with configuration in host_config
- initializes SD card with configuration in slot_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note:** Use this API to mount a card through SDSPI is deprecated. Please call esp_vfs_fat_sdspi_mount() instead for that case.
**Parameters**

- **base_path** - path where partition should be registered (e.g. “/sdcard”)  
- **host_config** - Pointer to structure describing SDMMC host. When using SD-MMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SD-SPI_HOST_DEFAULT() macro.  
- **slot_config** - Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to `sdmmc_slot_config_t` structure initialized using SD-MMC_SLOT_CONFIG_DEFAULT.  
- **mount_config** - pointer to structure with extra parameters for mounting FATFS  
- **out_card** - [out] If not NULL, pointer to the card information structure will be returned via this argument

**Returns**

- ESP_OK on success  
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` was already called  
- ESP_ERR_NO_MEM if memory cannot be allocated  
- ESP_FAIL if partition cannot be mounted  
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

```c
esp_err_t esp_vfs_fat_sdspi_mount(const char* base_path, const sdmmc_host_t* host_config_input,  
const sdspi_device_config_t* slot_config, const  
esp_vfs_fat_mount_config_t* mount_config, sdmmc_card_t** out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:

- initializes an SPI Master device based on the SPI Master driver with configuration in slot_config, and attach it to an initialized SPI bus.  
- initializes SD card with configuration in host_config_input  
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config  
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note:** This function try to attach the new SD SPI device to the bus specified in host_config. Make sure the SPI bus specified in `host_config->slot` have been initialized by `spi_bus_initialize()` before.

**Parameters**

- **base_path** - path where partition should be registered (e.g. “/sdcard”)  
- **host_config_input** - Pointer to structure describing SDMMC host. This structure can be initialized using SDSPI_HOST_DEFAULT() macro.  
- **slot_config** - Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to `sdspi_device_config_t` structure initialized using SD-SPI_DEVICE_CONFIG_DEFAULT().  
- **mount_config** - pointer to structure with extra parameters for mounting FATFS  
- **out_card** - [out] If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it’s not suggested to use more than one card at the same time and unmount one of them in your application.

**Returns**

- ESP_OK on success  
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` was already called  
- ESP_ERR_NO_MEM if memory cannot be allocated  
- ESP_FAIL if partition cannot be mounted  
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers
**esp_err_t esp_vfs_fat_sdmmcUnmount (void)**

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount.

**Deprecated:**
Use esp_vfs_fat_sdcardUnmount() instead.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn’t been called

**esp_err_t esp_vfs_fat_sdcardUnmount (const char* base_path, sdmmc_card_t *card)**

Unmount an SD card from the FAT filesystem and release resources acquired using esp_vfs_fat_sdmmc_mount() or esp_vfs_fat_sdspi_mount().

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the card argument is unregistered
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount hasn’t been called

**esp_err_t esp_vfs_fat_spiflashMount_rw_wl (const char* base_path, const char* partition_label, const esp_vfs_fat_mount_config_t* mount_config, wl_handle_t* wl_handle)**

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

**Parameters**
- **base_path** – path where FATFS partition should be mounted (e.g. “/spiflash”)
- **partition_label** – label of the partition which should be used
- **mount_config** – pointer to structure with extra parameters for mounting FATFS
- **wl_handle** – [out] wear levelling driver handle

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

**esp_err_t esp_vfs_fat_spiflashUnmount_rw_wl (const char* base_path, wl_handle_t* wl_handle)**

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflashMount_rw_wl.

**Parameters**
- **base_path** – path where partition should be registered (e.g. “/spiflash”)
- **wl_handle** – wear levelling driver handle returned by esp_vfs_fat_spiflashMount_rw_wl

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflashMount_rw_wl hasn’t been called
**esp_err_t esp_vfs_fat_spiflash_mount_ro(const char *base_path, const char *partition_label, const esp_vfs_fat_mount_config_t *mount_config)**

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- mounts FAT partition using FATFS library
- registers FATFS library with VFS, with prefix given by base_prefix variable

**Note:** Wear levelling is not used when FAT is mounted in read-only mode using this function.

**Parameters**
- `base_path` – path where FATFS partition should be mounted (e.g. “/spiflash”)
- `partition_label` – label of the partition which should be used
- `mount_config` – pointer to structure with extra parameters for mounting FATFS

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_ro was already called for the same partition
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from SPI flash driver, or FATFS drivers

**esp_err_t esp_vfs_fat_spiflash_unmount_ro(const char *base_path, const char *partition_label)**

Unmount FAT filesystem and release resources acquired using esp_vfs_fat_spiflash_mount_ro.

**Parameters**
- `base_path` – path where partition should be registered (e.g. “/spiflash”)
- `partition_label` – label of partition to be unmounted

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_spiflash_mount_rw_wl hasn’t been called

**esp_err_t esp_vfs_fat_info(const char *base_path, uint64_t *out_total_bytes, uint64_t *out_free_bytes)**

Get information for FATFS partition.

**Parameters**
- `base_path` – Base path of the partition examined (e.g. “/spiflash”)
- `out_total_bytes` – [out] Size of the file system
- `out_free_bytes` – [out] Free bytes available in the file system

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if partition not found
- ESP_FAIL if another FRESULT error (saved in errno)

**Structures**

`struct esp_vfs_fat_mount_config_t`

Configuration arguments for esp_vfs_fat_sdmmc_mount and esp_vfs_fat_spiflash_mount_rw_wl functions.

**Public Members**
bool format_if_mount_failed

If FAT partition can not be mounted, and this parameter is true, create partition table and format the filesystem.

int max_files

Max number of open files.

size_t allocation_unit_size

If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes. For wear levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

bool disk_status_check_enable

Enables real ff_disk_status function implementation for SD cards (ff_sdmmc_status). Possibly slows down IO performance.

Try to enable if you need to handle situations when SD cards are not unmounted properly before physical removal or you are experiencing issues with SD cards.

Doesn’t do anything for other memory storage media.

Type Definitions

typedef esp_vfs_fat_mount_config_t esp_vfs_fat_sdmmc_mount_config_t

2.9.2 Manufacturing Utility

Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufacturing purposes. The NVS partition images are created from CSV files containing user-provided configurations and values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- esptool.py
- Flash Download tool (available on Windows only). Just download it, unzip, and follow the instructions inside the doc folder.
- Direct flash programming using custom production tools.

Prerequisites

This utility is dependent on esp-idf’s NVS partition utility.

- Operating System requirements:
  - Linux / MacOS / Windows (standard distributions)
- The following packages are needed to use this utility:
  - Python
Note:
Before using this utility, please make sure that:
- The path to Python is added to the PATH environment variable.
- You have installed the packages from requirement.txt, the file in the root of the esp-idf directory.

**Workflow**

![Workflow Diagram]

**CSV Configuration File**

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the `REPEAT` tag is optional):

```python
name1,namespace, <-- First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

**Note:** The first line in this file should always be the `namespace` entry.

Each line should have three parameters: `key`, `type`, `encoding`, separated by a comma. If the `REPEAT` tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

*Please refer to README of the NVS Partition Generator utility for detailed description of each parameter.*

Below is a sample example of such a configuration file:

```python
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

**Note:**

Make sure there are no spaces:
- before and after ','
- at the end of each line in a CSV file

**Master Value CSV File**

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:
Chapter 2. API Reference

key1,key2,key3,....
value1,value2,value3,....

Note: The first line in the file should always contain the key names. All the keys from the configuration file should be present here in the same order. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

Each line should contain the value of the corresponding keys, separated by a comma. If the key has the REPEAT tag, its corresponding value must be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

value Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fcddd,,102
3,1a2b3c4d5e6feeff,,103
```

Note: If the ‘REPEAT’ tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the ‘REPEAT’ tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key,type,encoding,value
key,namespace,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

**Running the utility**

**Usage:**

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

**Optional Arguments:**

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
</tbody>
</table>

**Commands:**

Run mfg_gen.py {command} -h for additional help

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
</tbody>
</table>
To generate factory images for each device (Default):

Usage:

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version (1,2)] [--keygen]
                          [--keyfile KEYFILE] [--inputkey INPUTKEY]
                          [--outdir OUTDIR]
                          conf values prefix size
```

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf</td>
<td>Path to configuration csv file to parse</td>
</tr>
<tr>
<td>values</td>
<td>Path to values csv file to parse</td>
</tr>
<tr>
<td>prefix</td>
<td>Unique name for each output filename prefix</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes</td>
</tr>
<tr>
<td></td>
<td>(must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--fileid</td>
<td>Unique file identifier(any key in values file) for each filename suffix (Default: numeric value(1,2,3⋯))</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--inputkey</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td>--outdir</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_→singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the file type relative to the directory from which you are running the utility.

To generate encrypted factory images for each device:

You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_→singlepage_blob.csv Sample 0x3000 --keygen
```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<prefix>-<fileid>.bin` is created. This newly created file having encryption keys in keys/ directory is compatible with NVS key-partition structure. Refer to `NVS Key Partition` for more details.

- Encrypt by providing the encryption keys as input binary file:
To generate only encryption keys:

Usage: python mfg_gen.py generate-key [-h] [keyfile KEYFILE] [-outdir OUTDIR]

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>show this help message and exit</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created. (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate only encryption keys using the command below:

```
python mfg_gen.py generate-key
```

Note: Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: %m-%d_%H-%M. To provide custom target filename use the --keyfile argument.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis. The default numeric value: 1, 2, 3... of the fileid argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified outdir directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

## 2.9.3 Non-volatile Storage Library

### Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

**Underlying Storage** Currently, NVS uses a portion of main flash memory through the `esp.partition` API. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open()` API function or any other partition by specifying its name using the `nvs_open_from_partition()` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

Note: if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides an `idf.py erase-flash` target to erase all contents of the flash chip.

Note: NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.
Keys and Values  NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: `uint8_t`, `int8_t`, `uint16_t`, `int16_t`, `uint32_t`, `int32_t`, `uint64_t`, `int64_t`
- zero-terminated string
- variable length binary data (blob)

**Note:** String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508,000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

Additional types, such as `float` and `double` might be added later.

Keys are required to be unique. Assigning a new value to an existing key works as follows:

- If the new value is of the same type as the old one, value is updated.
- If the new value has a different data type, an error is returned.

Data type check is also performed when reading a value. An error is returned if the data type of the read operation does not match the data type of the value.

Namespaces  To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Furthermore, there can be no more than 254 different namespaces in one NVS partition. Namespace name is specified in the `nvs_open()` or `nvs_open_from_partition` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_*`, `nvs_set_*`, and `nvs_commit()` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

NVS Iterators  Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find()` creates an opaque handle, which is used in subsequent calls to the `nvs_entry_next()` and `nvs_entry_info()` functions.
- `nvs_entry_next()` advances an iterator to the next key-value pair.
- `nvs_entry_info()` returns information about each key-value pair

In general, all iterators obtained via `nvs_entry_find()` have to be released using `nvs_release_iterator()`, which also tolerates NULL iterators. `nvs_entry_find()` and `nvs_entry_next()` will set the given iterator to NULL or a valid iterator in all cases except a parameter error occured (i.e., return `ESP_ERR_NVS_NOT_FOUND`). In case of a parameter error, the given iterator will not be modified. Hence, it is best practice to initialize the iterator to NULL before calling `nvs_entry_find()` to avoid complicated error checking before releasing the iterator.

Security, Tampering, and Robustness  NVS is not directly compatible with the ESP32 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32 flash encryption. Please refer to `NVS Encryption` for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one should be able to power off the device at any point and time and then power it back on. This should not result in loss of data, except for the new key-value pair if it was being written at the moment of powering off. The library should also be able to initialize properly with any random data present in flash memory.
Chapter 2. API Reference

NVS Encryption

Data stored in NVS partitions can be encrypted using AES-XTS in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one *sector* and relative address of the entry (w.r.t. partition-start) is fed to the encryption algorithm as *sector-number*. The NVS Encryption can be enabled by enabling `CONFIG_NVS_ENCRYPTION`. The keys required for NVS encryption are stored in yet another partition, which is protected using *Flash Encryption*. Therefore, enabling *Flash Encryption* is a prerequisite for NVS encryption.

The NVS Encryption is enabled by default when *Flash Encryption* is enabled. This is done because Wi-Fi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them as default choice if platform level encryption is already enabled.

For using NVS encryption, the partition table must contain the *NVS Key Partition*. Two partition tables containing the *NVS Key Partition* are provided for NVS encryption under the partition table option (`menuconfig > Partition Table`). They can be selected with the project configuration menu (`idf.py menuconfig`). Please refer to the example `security/flash_encryption` for how to configure and use NVS encryption feature.

NVS Key Partition

An application requiring NVS encryption support needs to be compiled with a key-partition of the type *data* and subtype *key*. This partition should be marked as *encrypted* and its size should be the minimum partition size (4KB). Refer to *Partition Tables* for more details. Two additional partition tables which contain the *NVS Key Partition* are provided under the partition table option (`menuconfig > Partition Table`). They can be directly used for *NVS Encryption*. The structure of these partitions is depicted below.

```
+-----------+--------------+-------------+----+
| XTS encryption key (32) |
+---------------------------------------------+
| XTS tweak key (32) |
+---------------------------------------------+
| CRC32  (4) |
+---------------------------------------------+
```

The XTS encryption keys in the *NVS Key Partition* can be generated in one of the following two ways.

1. Generate the keys on the ESP chip:

   When NVS encryption is enabled the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first *NVS Key Partition*. Then the API function automatically generates and stores the NVS keys in that partition by making use of the `nvs_flash_generate_keys()` API function provided by `nvs_flash/include/nvs_flash.h`. New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`. The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys()` API function provided by `nvs_flash.h`. The API function will then write those keys onto the key-partition in encrypted form.

   **Note:** Please note that *nvs_keys* partition must be completely erased before starting the application in this approach. Otherwise the application may generate `ESP_ERR_NVS_CORRUPT_KEY_PART` error code assuming that *nvs_keys* partition was not empty and contains malformatted data. You can use the following command for this:

   `parttool.py --port PORT --partition-table-file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE_OFFSET erase_partition --partition-type=data --partition-subtype=nvs_keys`

2. Use pre-generated key partition:
This option will be required by the user when keys in the NVS Key Partition are not generated by the application. The NVS Key Partition containing the XTS encryption keys can be generated with the help of NVS Partition Generator Utility. Then the user can store the pre generated key partition on the flash with help of the following two commands:
i) Build and flash the partition table

```python
idf.py partition-table partition-table-flash
```

ii) Store the keys in the NVS Key Partition (on the flash) with the help of parttool.py (see Partition Tool section in partition-tables for more details)

```python
parttool.py --port PORT --partition-table-offset PARTITION_TABLE_OFFSET
  write_partition --partition-name="name of nvs_key_partition" -
  input NVS_KEY_PARTITION_FILE
```

**Note:** If the device is encrypted in flash encryption development mode and you want to renew the NVS key partition, you need to tell parttool.py to encrypt the NVS key partition and you also need to give it a pointer to the unencrypted partition table in your build directory (build/partition_table) since the partition table on the device is encrypted, too. You can use the following command:

```python
parttool.py --esptool-write-args encrypt --port PORT --partition-table-file=PARTITION_TABLE_FILE
  --partition-table-offset PARTITION_TABLE_OFFSET
  write_partition --partition-name="name of nvs_key_partition" -
  input NVS_KEY_PARTITION_FILE
```

Since the key partition is marked as encrypted and Flash Encryption is enabled, the bootloader will encrypt this partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide correct key-partition/keys for the purpose of encryption/decryption.

**Encrypted Read/Write** The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of, and writing to an encrypted nvs partition as well.

**Encrypt the default NVS partition:** To enable encryption for the default NVS partition no additional steps are necessary. When `CONFIG_NVS_ENCRYPTION` is enabled, the `nvs_flash_init()` API function internally performs some additional steps using the first NVS Key Partition found to enable encryption for the default NVS partition (refer to the API documentation for more details). Alternatively, `nvs_flash_secure_init()` API function can also be used to enable encryption for the default NVS partition.

**Encrypt a custom NVS partition:** To enable encryption for a custom NVS partition, `nvs_flash_secure_init_partition()` API function is used instead of `nvs_flash_init_partition()`.

When `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` API functions are used, the applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled.

1. Find key partition and NVS data partition using `esp_partition_find*` API functions.
2. Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg()` or `nvs_flash_generate_keys()` API functions.
3. Initialise NVS flash partition using the `nvs_flash_secure_init()` or `nvs_flash_secure_init_partition()` API functions.
4. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
5. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
6. Deinitialise an NVS partition using `nvs_flash_deinit()`.
NVS Partition Generator Utility

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details, please refer to NVS Partition Generator Utility.

Application Example

You can find code examples in the storage directory of ESP-IDF examples:

storage/nvs_rw_value

Demonstrates how to read a single integer value from, and write it to NVS.

The value checked in this example holds the number of the ESP32 module restarts. The value’s function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read / write operation was successful, or if a certain value has not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the program flow and capture any issues on the way.

storage/nvs_rw_blob

Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32 module restarts.

• value - tracks the number of the ESP32 module soft and hard restarts.
• blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read / write operation was successful.

storage/nvs_rw_value_cxx

This example does exactly the same as storage/nvs_rw_value, except that it uses the C++ NVS handle class.

Internals

Log of Key-Value Pairs  NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

Pages and Entries  NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a sequence number associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

Empty/uninitialized  Flash storage for the page is empty (all bytes are 0xff). Page is not used to store any data at this point and does not have a sequence number.

Active  Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.

Full  Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.

Erasing  Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.
Corrupted Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in uninitialized state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

Structure of a Page For now, we assume that flash sector size is 4096 bytes and that ESP32 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32 flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs, an entry part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

```
+-----------+--------------+-------------+-------------------------+
| State (4) | Seq. no. (4) | version (1) | Unused (19) | CRC32 (4) | Header (32)
+-----------+--------------+-------------+-------------------------+
| Entry state bitmap (32) |
+-------------------+
| Entry 0 (32) |
+-------------------+
| Entry 1 (32) |
+-------------------+
| Entry 125 (32) |
+-------------------+
```

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption feature of ESP32 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore it is not necessary to erase the page to change its state unless that is a change to the erased state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

**Entry and Entry State Bitmap** Each entry can be in one of the following three states represented with two bits in the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

**Empty (2’ b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).
**Written (2'b10)**  A key-value pair (or part of key-value pair which spans multiple entries) has been written into the entry.

**Erased (2'b00)**  A key-value pair in this entry has been discarded. Contents of this entry will not be parsed anymore.

**Structure of Entry**  For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is stored called “blob index”. Earlier formats of blobs are still supported (can be read and modified). However, once the blobs are modified, they are stored using the new format.

```
+--------+----------+----------+----------------+-----------+---------------+------
| NS (1) | Type (1) | Span (1) | ChunkIndex (1) | CRC32 (4) | Key (16) | Data
|--------|----------|----------|----------------|-----------|---------------|------
| (8)    |          |          |                |           |               |      |

```
(Strings, Blob Data) +-----------------------------------
```

Individual fields in entry structure have the following meanings:

**NS**  Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

**Type**  One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.

**Span**  Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

**ChunkIndex**  Used to store the index of a blob-data chunk for blob types. For other types, this should be `0xff`.

**CRC32**  Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

**Key**  Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

**Data**  For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with `0xff`.

For “blob index” entry, these 8 bytes hold the following information about data-chunks:

- **Size**  (Only for blob index.) Size, in bytes, of complete blob data.
- **ChunkCount**  (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
- **ChunkStart**  (Only for blob index.) ChunkIndex of the first blob-data chunk of this blob. Subsequent chunks have chunkIndex incrementally allocated (step of 1).

For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:

- **Size**  (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
- **CRC32**  (Only for strings and blobs.) Checksum calculated over all bytes of data.
Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The `Span` field of the first entry indicates how many entries are used.

**Namespaces** As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.

```
+-------------------------------------------+
| NS=0 Type=uint8_t Key="wifi" Value=1   | Entry describing namespace "wifi"
+-------------------------------------------+
| NS=1 Type=uint32_t Key="channel" Value=6 | Key "channel" in namespace "wifi"
+-------------------------------------------+
| NS=0 Type=uint8_t Key="pwm" Value=2    | Entry describing namespace "pwm"
+-------------------------------------------+
| NS=2 Type=uint16_t Key="channel" Value=20 | Key "channel" in namespace "pwm"
+-------------------------------------------+
```

**Item Hash List** To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, `Page::findItem` first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item will be found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

**API Reference**

**Header File**

- components/nvs_flash/include/nvs_flash.h

**Functions**

`esp_err_t nvs_flash_init (void)`

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows

a. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)
b. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.
c. Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

**Returns**

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
• ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
• one of the error codes from the underlying flash storage driver
• error codes from nvs_flash_read_security_cfg API (when “NVS_ENCRYPTION” is enabled).
• error codes from nvs_flash_generate_keys API (when “NVS_ENCRYPTION” is enabled).
• error codes from nvs_flash_secure_init_partition API (when “NVS_ENCRYPTION” is enabled).

`esp_err_t nvs_flash_init_partition (const char *partition_label)`

Initialize NVS flash storage for the specified partition.

Parameters `partition_label` -[in] Label of the partition. Must be no longer than 16 characters.

Returns
• ESP_OK if storage was successfully initialized.
• ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
• ESP_ERR_NOT_FOUND if specified partition is not found in the partition table.
• ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
• one of the error codes from the underlying flash storage driver

`esp_err_t nvs_flash_init_partition_ptr (const esp_partition_t *partition)`

Initialize NVS flash storage for the partition specified by partition pointer.

Parameters `partition` -[in] pointer to a partition obtained by the ESP partition API.

Returns
• ESP_OK if storage was successfully initialized.
• ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
• ESP_ERR_INVALID_ARG in case partition is NULL
• ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
• one of the error codes from the underlying flash storage driver

`esp_err_t nvs_flash_deinit (void)`

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

Returns
• ESP_OK on success (storage was deinitialized)
• ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

`esp_err_t nvs_flash_deinit_partition (const char *partition_label)`

Deinitialize NVS storage for the given NVS partition.

Parameters `partition_label` -[in] Label of the partition

Returns
• ESP_OK on success
• ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

`esp_err_t nvs_flash_erase (void)`

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Returns**
• ESP_OK on success
• ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
• different error in case de-initialization fails (shouldn’t happen)

```
esp_err_t nvs_flash_erase_partition (const char *part_name)
```

Erase specified NVS partition.

Erase all content of a specified NVS partition

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Parameters**

- **part_name** - [in] Name (label) of the partition which should be erased

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn’t happen)

```
esp_err_t nvs_flash_erase_partition_ptr (const esp_partition_t *partition)
```

Erase custom partition.

Erase all content of specified custom partition.

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Parameters**

- **partition** - [in] pointer to a partition obtained by the ESP partition API.

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

```
esp_err_t nvs_flash_secure_init (nvs_sec_cfg_t *cfg)
```

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Parameters**

- **cfg** - [in] Security configuration (keys) to be used for NVS encryption/decryption.
  If cfg is NULL, no encryption is used.

**Returns**

- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVSS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

```
esp_err_t nvs_flash_secure_init_partition (const char *partition_label, nvs_sec_cfg_t *cfg)
```

Initialize NVS flash storage for the specified partition.

**Parameters**
Chapter 2. API Reference

- **partition_label** [in] Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations.
- **cfg** [in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is null, no encryption/decryption is used.

**Returns**
- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

```c
typedef enum esp_err_t {
    ESP_OK, ESP_ERR_NVS_NO_FREE_PAGES, ESP_ERR_NOT_FOUND, ESP_ERR_NO_MEM, 
    ...} esp_err_t;
```

**esp_err_t nvs_flash_generate_keys** (const esp_partition_t *partition, nvs_sec_cfg_t *cfg)

Generate and store NVS keys in the provided esp partition.

**Parameters**
- **partition** [in] Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **cfg** [out] Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

**Returns** -ESP_OK, if cfg was read successfully; -ESP_INVALID_ARG, if partition or cfg; -or error codes from esp_partition_write/erase APIs.

```c
typedef struct nvs_sec_cfg_t {
    uint8_t ek[y][NVS_KEY_SIZE];
    uint8_t tk[y][NVS_KEY_SIZE];
} nvs_sec_cfg_t;
```

**esp_err_t nvs_flash_read_security_cfg** (const esp_partition_t *partition, nvs_sec_cfg_t *cfg)

Read NVS security configuration from a partition.

**Parameters**
- **partition** [in] Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **cfg** [out] Pointer to nvs security configuration structure. Pointer must be non-NULL.

**Returns** -ESP_OK, if cfg was read successfully; -ESP_INVALID_ARG, if partition or cfg; -ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys. -ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt -or error codes from esp_partition_read API.

**Note:** Provided partition is assumed to be marked ‘encrypted’.

**Structures**

- **struct nvs_sec_cfg_t**
  Key for encryption and decryption.

**Public Members**

- `uint8_t ek[y][NVS_KEY_SIZE]`  
  XTS encryption and decryption key
- `uint8_t tk[y][NVS_KEY_SIZE]`  
  XTS tweak key

**Macros**

- **NVS_KEY_SIZE**
Header File

- components/nvs_flash/include/nvs.h

Functions

**esp_err_t nvs_set_i8** (nvs_handle_t handle, const char *key, int8_t value)

Set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until nvs_commit is called.

**Parameters**

- **handle** [in] Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- **key** [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **value** [in] The value to set.

**Returns**

- ESP_OK if value was set successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**esp_err_t nvs_set_u8** (nvs_handle_t handle, const char *key, uint8_t value)

Set uint8_t value for given key

This function is the same as nvs_set_i8 except for the data type.

**esp_err_t nvs_set_i16** (nvs_handle_t handle, const char *key, int16_t value)

Set int16_t value for given key

This function is the same as nvs_set_i8 except for the data type.

**esp_err_t nvs_set_u16** (nvs_handle_t handle, const char *key, uint16_t value)

Set uint16_t value for given key

This function is the same as nvs_set_i8 except for the data type.

**esp_err_t nvs_set_i32** (nvs_handle_t handle, const char *key, int32_t value)

Set int32_t value for given key

This function is the same as nvs_set_i8 except for the data type.

**esp_err_t nvs_set_u32** (nvs_handle_t handle, const char *key, uint32_t value)

Set uint32_t value for given key

This function is the same as nvs_set_i8 except for the data type.

**esp_err_t nvs_set_i64** (nvs_handle_t handle, const char *key, int64_t value)

Set int64_t value for given key

This function is the same as nvs_set_i8 except for the data type.

**esp_err_t nvs_set_u64** (nvs_handle_t handle, const char *key, uint64_t value)

Set uint64_t value for given key

This function is the same as nvs_set_i8 except for the data type.
**esp_err_t nvs_set_str** (nvs_handle_t handle, const char *key, const char *value)

set string for given key

Set value for the key, given its name. Note that the actual storage will not be updated until `nvs_commit` is called.

**Parameters**
- **handle** - [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **value** - [in] The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

**Returns**
- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of `nvs`, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

**esp_err_t nvs_get_i8** (nvs_handle_t handle, const char *key, int8_t *out_value)

get int8_t value for given key

These functions retrieve value for the key, given its name. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

`out_value` has to be a pointer to an already allocated variable of the given type.

```c
// Example of using nvs_get_i32:
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still have its default value.
```

**Parameters**
- **handle** - [in] Handle obtained from `nvs_open` function.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **out_value** - Pointer to the output value. May be NULL for `nvs_get_str` and `nvs_get_blob`, in this case required length will be returned in length argument.

**Returns**
- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data
Chapter 2. API Reference

```c
esp_err_t nvs_get_u8 (nvs_handle_t handle, const char *key, uint8_t *out_value)
get uint8_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_i16 (nvs_handle_t handle, const char *key, int16_t *out_value)
get int16_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_u16 (nvs_handle_t handle, const char *key, uint16_t *out_value)
get uint16_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_i32 (nvs_handle_t handle, const char *key, int32_t *out_value)
get int32_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_u32 (nvs_handle_t handle, const char *key, uint32_t *out_value)
get uint32_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_i64 (nvs_handle_t handle, const char *key, int64_t *out_value)
get int64_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_u64 (nvs_handle_t handle, const char *key, uint64_t *out_value)
get uint64_t value for given key
This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_str (nvs_handle_t handle, const char *key, char *out_value, size_t *length)
get string value for given key
These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.
In case of any error, out_value is not modified.
All functions expect out_value to be a pointer to an already allocated variable of the given type.
```

nvs_get_str and nvs_get_blob functions support WinAPI-style length queries. To get the size necessary to store the value, call nvs_get_str or nvs_get_blob with zero out_value and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For nvs_get_str, this length includes the zero terminator. When calling nvs_get_str and nvs_get_blob with non-zero out_value, length has to be non-zero and has to point to the length available in out_value. It is suggested that nvs_get/set_str is used for zero-terminated C strings, and nvs_get/set_blob used for arbitrary data structures.

```c
// Example (without error checking) of using nvs_get_str to get a string into a
// dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char * server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);
```

```c
// Example (without error checking) of using nvs_get_blob to get a binary data
into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```
Chapter 2. API Reference

Parameters

- **handle** - [in] Handle obtained from nvs_open function.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **out_value** - [out] Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.
- **length** - [inout] A non-zero pointer to the variable holding the length of out_value. In case out_value is a zero, will be set to the length required to hold the value. In case out_value is not zero, will be set to the actual length of the value written. For nvs_get_str this includes zero terminator.

Retruns

- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

```c
esp_err_t nvs_get_blob (nvs_handle_t handle, const char* key, void*out_value, size_t* length)
```

get blob value for given key

This function behaves the same as nvs_get_str, except for the data type.

```c
esp_err_t nvs_open (const char* namespace_name, nvs_open_mode_t open_mode, nvs_handle_t*out_handle)
```

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

Parameters

- **namespace_name** - [in] Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **open_mode** - [in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** - [out] If successful (return code is zero), handle will be returned in this argument.

Retruns

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “nvs” is not found
- ESP_ERR_NVS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- other error codes from the underlying storage driver

```c
esp_err_t nvs_open_from_partition (const char*part_name, const char*namespace_name,
                                    nvs_open_mode_t open_mode, nvs_handle_t*out_handle)
```

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.

Parameters
• **part_name** -[in] Label (name) of the partition of interest for object read/write/erase
• **namespace_name** -[in] Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
• **open_mode** -[in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
• **out_handle** -[out] If successful (return code is zero), handle will be returned in this argument.

**Returns**
- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVPS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVPS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVPS_NOT_FOUND id namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVPS_INVALID_NAME if namespace name doesn’t satisfy constraints
- ESP_ERR_NVPS_READ_ONLY if storage handle was opened as readonly
- ESP_ERR_NVPS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVPS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVPS_INVALID_NAME if namespacenamedoesn’t satisfystructrictions
- ESP_ERR_NVPS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- other error codes from the underlying storage driver

`esp_err_t nvs_set_blob (nvs_handle_t handle, const char* key, const void* value, size_t length)`

set variable length binary value for given key

This family of functions set value for the key, given its name. Note that actual storage will not be updated until nvs_commit function is called.

**Parameters**
- **handle** -[in] Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- **key** -[in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **value** -[in] The value to set.
- **length** -[in] length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

**Returns**
- ESP_OK if value was set successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVPS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVPS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVPS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVPS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVPS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVPS_INVALID_NAME if key namedoesn’t satisfy constraints
- ESP_ERR_NVPS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVPS_VALUE_TOO_LONG if the value is too long

`esp_err_t nvs_erase_key (nvs_handle_t handle, const char *key)`

Erase key-value pair with given key name.

Note that actual storage may not be updated until nvs_commit function is called.

**Parameters**
- **handle** -[in] Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.
- **key** -[in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.

**Returns**
- ESP_OK if erase operation was successful
• ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
• ESP_ERR_NVS_READ_ONLY if handle was opened as read only
• ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
• other error codes from the underlying storage driver

**esp_err_t nvs_erase_all (nvs_handle_t handle)**

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until nvs_commit function is called.

**Parameters**

- handle –[in] Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

**Returns**

- ESP_OK if erase operation was successful
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if handle was opened as read only
- other error codes from the underlying storage driver

**esp_err_t nvs_commit (nvs_handle_t handle)**

Write any pending changes to non-volatile storage.

After setting any values, nvs_commit() must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.

**Parameters**

- handle –[in] Storage handle obtained with nvs_open. Handles that were opened read only cannot be used.

**Returns**

- ESP_OK if the changes have been written successfully
- ESP.ERR.NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

**void nvs_close (nvs_handle_t handle)**

Close the storage handle and free any allocated resources.

This function should be called for each handle opened with nvs_open once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using nvs_commit function. Once this function is called on a handle, the handle should no longer be used.

**Parameters**

- handle –[in] Storage handle to close

**esp_err_t nvs_get_stats (const char *part_name, nvs_stats_t *nvs_stats)**

Fill structure nvs_stats_t. It provides info about used memory the partition.

This function calculates to runtime the number of used entries, free entries, total entries, and amount namespace in partition.

```c
// Example of nvs_get_stats() to get the number of used entries and free_
// entries:
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%d), FreeEntries = (%d), AllEntries = (%d)\n",
   nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.total_
   _entries);
```

**Parameters**

- part_name –[in] Partition name NVS in the partition table. If pass a NULL than will use NVS_DEFAULT_PART_NAME ( “nvs” ).
Chapter 2. API Reference

```
• nvs_stats -[out] Returns filled structure nvs_states_t. It provides info about used
  memory the partition.

Returns
  • ESP_OK if the changes have been written successfully. Return param nvs_stats will be
    filled.
  • ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “name” is not found. Return
    param nvs_stats will be filled 0.
  • ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return
    param nvs_stats will be filled 0.
  • ESP_ERR_NVS_INVALID_ARG if nvs_stats equal to NULL.
  • ESP_ERR_INVALID_STATE if there is page with the status of INVALID. Return param
    nvs_stats will be filled not with correct values because not all pages will be counted. Count-
    ing will be interrupted at the first INVALID page.
```

```
esp_err_t nvs_get_used_entry_count (nvs_handle_t handle, size_t *used_entries)
Calculate all entries in a namespace.
An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry.
Note that to find out the total number of entries occupied by the namespace, add one to the returned value
used_entries (if err is equal to ESP_OK). Because the namespace entry takes one entry.
```

```
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs...
-in one namespace:
    nvs_handle_t handle;
    nvs_open("namespace1", NVS_READWRITE, &handle);
    ...
    size_t used_entries;
    size_t total_entries_namespace;
    if( nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
        // the total number of entries occupied by the namespace
        total_entries_namespace = used_entries + 1;
    }
```

Parameters
  • handle -[in] Handle obtained from nvs_open function.
  • used_entries -[out] Returns amount of used entries from a namespace.

Returns
  • ESP_OK if the changes have been written successfully. Return param used_entries will be
    filled valid value.
  • ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return
    param used_entries will be filled 0.
  • ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return
    param used_entries will be filled 0.
  • ESP_ERR_INVALID_ARG if used_entriesequal to NULL.
  • Other error codes from the underlying storage driver. Return param used_entriescan be
    filled 0.

```
esp_err_t nvs_entry_find (const char* part_name, const char* namespace_name, nvs_type_t type,
    nvs_iterator_t *output_iterator)
Create an iterator to enumerate NVS entries based on one or more parameters.
```

```
// Example of listing all the key-value pairs of any type under specified...
--partition and namespace
    nvs_iterator_t it = NULL;
    esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE__
--ANY, &it);
(continues on next page)
```
while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
} nvs_release_iterator(it);

Parameters

• part_name –[in] Partition name
• namespace_name –[in] Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
• type –[in] One of nvs_type_t values.
• output_iterator –[out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except ESP_ERR_INVALID_ARG occurs, output_iterator is NULL, too. If ESP_ERR_INVALID_ARG occurs, output_iterator is not changed. If a valid iterator is obtained through this function, it has to be released using nvs_release_iterator when not used anymore, unless ESP_ERR_INVALID_ARG is returned.

Returns

• ESP_OK if no internal error or programming error occurred.
• ESP_ERR_NVU_NOT_FOUND if no element of specified criteria has been found.
• ESP_ERR_NO_MEM if memory has been exhausted during allocation of internal structures.
• ESP_ERR_INVALID_ARG if any of the parameters is NULL. Note: don’t release output_iterator in case ESP_ERR_INVALID_ARG has been returned

void nvs_release_iterator(nvs_iterator_t iterator)
Release iterator.

Parameters iterator –[in] Release iterator obtained from nvs_entry_find function. NULL argument is allowed.
Chapter 2. API Reference

**Structures**

`struct nvs_entry_info_t`

Information about entry obtained from `nvs_entry_info` function

**Public Members**

- `char namespace_name[16]`
  - Namespace to which key-value belong
- `char key[NVS_KEY_NAME_MAX_SIZE]`
  - Key of stored key-value pair
- `nvs_type_t type`
  - Type of stored key-value pair

**Note:** Info about storage space NVS.

`struct nvs_stats_t`

**Public Members**

- `size_t used_entries`
  - Amount of used entries.
- `size_t free_entries`
  - Amount of free entries.
- `size_t total_entries`
  - Amount all available entries.
- `size_t namespace_count`
  - Amount name space.

**Macros**

- `ESP_ERR_NVS_BASE`
  - Starting number of error codes
- `ESP_ERR_NVS_NOT_INITIALIZED`
  - The storage driver is not initialized
- `ESP_ERR_NVS_NOT_FOUND`
  - A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY
- `ESP_ERR_NVS_TYPE_MISMATCH`
  - The type of set or get operation doesn’t match the type of value stored in NVS
Chapter 2. API Reference

**ESP_ERR_NVS_READ_ONLY**
Storage handle was opened as read only

**ESP_ERR_NVS_NOT_ENOUGH_SPACE**
There is not enough space in the underlying storage to save the value

**ESP_ERR_NVS_INVALID_NAME**
Namespace name doesn’t satisfy constraints

**ESP_ERR_NVS_INVALID_HANDLE**
Handle has been closed or is NULL

**ESP_ERR_NVS_REMOVE_FAILED**
The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

**ESP_ERR_NVS_KEY_TOO_LONG**
Key name is too long

**ESP_ERR_NVS_PAGE_FULL**
Internal error; never returned by nvs API functions

**ESP_ERR_NVS_INVALID_STATE**
NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH**
String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES**
NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG**
Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND**
Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND**
NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED**
XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED**
XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED**
XTS configuration setting failed
Chapter 2. API Reference

ESP_ERR_NVS_XTS_CFG_NOT_FOUND
XTS configuration not found

ESP_ERR_NVS_ENCR_NOT_SUPPORTED
NVS encryption is not supported in this version

ESP_ERR_NVS_KEYS_NOT_INITIALIZED
NVS key partition is uninitialized

ESP_ERR_NVS_CORRUPT_KEY_PART
NVS key partition is corrupt

ESP_ERR_NVS_WRONG_ENCRYPTION
NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

ESP_ERR_NVS_CONTENT_DIFFERS
Internal error; never returned by nvs API functions. NVS key is different in comparison

NVS_DEFAULT_PART_NAME
Default partition name of the NVS partition in the partition table

NVS_PART_NAME_MAX_SIZE
maximum length of partition name (excluding null terminator)

NVS_KEY_NAME_MAX_SIZE
Maximum length of NVS key name (including null terminator)

Type Definitions
typedef uint32_t nvs_handle_t
Opaque pointer type representing non-volatile storage handle
typedef nvs_handle_t nvs_handle

typedef nvs_open_mode_t nvs_open_mode

typedef struct nvs_opaque_iterator_t *nvs_iterator_t
Opaque pointer type representing iterator to nvs entries

Enumerations
typedef enum nvs_open_mode_t
Mode of opening the non-volatile storage.

Values:

enumerator NVS_READONLY
Read only
enumerator **NVS_READWRITE**
   Read and write

enum **nvs_type_t**
   Types of variables.
   
   **Values:**
   
   enumerator **NVS_TYPE_U8**
      Type uint8_t
   
   enumerator **NVS_TYPE_I8**
      Type int8_t
   
   enumerator **NVS_TYPE_U16**
      Type uint16_t
   
   enumerator **NVS_TYPE_I16**
      Type int16_t
   
   enumerator **NVS_TYPE_U32**
      Type uint32_t
   
   enumerator **NVS_TYPE_I32**
      Type int32_t
   
   enumerator **NVS_TYPE_U64**
      Type uint64_t
   
   enumerator **NVS_TYPE_I64**
      Type int64_t
   
   enumerator **NVS_TYPE_STR**
      Type string
   
   enumerator **NVS_TYPE_BLOB**
      Type blob
   
   enumerator **NVS_TYPE_ANY**
      Must be last

### 2.9.4 NVS Partition Generator Utility

**Introduction**

The utility `nvs_flash/nvs_partition_generator/nvs_partition_gen.py` creates a binary file based on key-value pairs provided in a CSV file. The binary file is compatible with NVS architecture defined in *Non-Volatile Storage*. This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally
at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

**Prerequisites**

To use this utility in encryption mode, install the following packages:

- cryptography package

All the required packages are included in requirements.txt in the root of the esp-idf directory.

**CSV File Format**

Each line of a CSV file should contain 4 parameters, separated by a comma. The table below provides the description for each of these parameters.

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key</td>
<td>Key of the data. The data can be accessed later from an application using this key.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Type</td>
<td>Supported values are file, data, and namespace.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Encoding</td>
<td>Supported values are: u8, i8, u16, i16, u32, i32, u64, i64, string, hex2bin, base64, and binary. This specifies how actual data values are encoded in the resulting binary file. The difference between the string and binary encoding is that string data is terminated with a NULL character, whereas binary data is not.</td>
<td>As of now, for the file type, only hex2bin, base64, string, and binary encoding is supported.</td>
</tr>
<tr>
<td>4</td>
<td>Value</td>
<td>Data value</td>
<td>Encoding and Value cells for the namespace field type should be empty. Encoding and Value of namespace are fixed and are not configurable. Any values in these cells are ignored.</td>
</tr>
</tbody>
</table>

**Note:** The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:

```plaintext
key,type,encoding,value  <!-- column header
namespace_name,namespace,,  <!-- First entry should be of type "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

**Note:**

Make sure there are no spaces:

- before and after `'.'`
- at the end of each line in a CSV file
NVS Entry and Namespace Association

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

**Note:** First entry in a CSV file should always be a namespace entry.

Multipage Blob Support

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section Structure of Entry. If you intend to use an older format, the utility provides an option to disable this feature.

Encryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file. The utility uses the AES-XTS encryption. Please refer to NVS Encryption for more details.

Decryption Support

This utility allows you to decrypt an encrypted NVS binary file. The utility uses an NVS binary file encrypted using AES-XTS encryption. Please refer to NVS Encryption for more details.

Running the Utility

**Usage:**

```
python nvs_partition_gen.py [-h] {generate,generate-key,encrypt,decrypt} ...
```

**Optional Arguments:**

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h, --help</td>
<td>Show this help message and exit</td>
</tr>
</tbody>
</table>

**Commands:**

Run `nvs_partition_gen.py {command} -h` for additional help

<table>
<thead>

</tr>
</tbody>
</table>

To Generate NVS Partition (Default):  **Usage:**

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR] input output size
```
Chapter 2. API Reference

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>Show this help message and exit</td>
</tr>
<tr>
<td>--version</td>
<td>Set multipage blob version</td>
</tr>
<tr>
<td>-outdir</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate NVS partition using the command below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```

To Generate Only Encryption Key Partition:  Usage:

```
python nvs_partition_gen.py generate-key [-h] [--keyfile KEYFILE] [--outdir OUTDIR]
```

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>Show this help message and exit</td>
</tr>
<tr>
<td>--keyfile</td>
<td>Path to output encryption key partition file</td>
</tr>
<tr>
<td>--outdir</td>
<td>Output directory to store file created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate only the encryption key partition using the command below:

```
python nvs_partition_gen.py generate-key
```

To Generate Encrypted NVS Partition:  Usage:

```
python nvs_partition_gen.py encrypt [-h] [--version {1,2}] [--keygen] [--keyfile KEYFILE] [--inputkey INPUTKEY] [--outdir OUTDIR] input output size
```

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:
### Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>Show this help message and exit</td>
</tr>
<tr>
<td>--keygen</td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td>--keyfile KEY-FILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--inputkey INPUTKEY</td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td>--outdir OUT-DIR</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to encrypt NVS partition using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

  ```
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin --0x3000 --keygen
  ```

**Note:** Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

  ```
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin --0x3000 --keygen --keyfile sample_keys.bin
  ```

**Note:** Encryption key of the following format `<outdir>/keys/sample_keys.bin` is created.

**Note:** This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to [NVS Key Partition](#) for more details.

- Encrypt by providing the encryption keys as input binary file:

  ```
  python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin --0x3000 --inputkey sample_keys.bin
  ```

**To Decrypt Encrypted NVS Partition:** **Usage:**

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

**Positional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to encrypted NVS partition file to parse</td>
</tr>
<tr>
<td>key</td>
<td>Path to file having keys for decryption</td>
</tr>
<tr>
<td>output</td>
<td>Path to output decrypted binary file</td>
</tr>
</tbody>
</table>

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h, --help</td>
<td>Show this help message and exit</td>
</tr>
<tr>
<td>--outdir OUT-DIR</td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
</tbody>
</table>
You can run the utility to decrypt encrypted NVS partition using the command below:

```python
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

**You can also provide the format version number:**

- Multipage Blob Support Disabled (Version 1)
- Multipage Blob Support Enabled (Version 2)

**Multipage Blob Support Disabled (Version 1):** You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file is provided with the utility:

```python
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000 --version 1
```

**Multipage Blob Support Enabled (Version 2):** You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file is provided with the utility:

```python
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --version 2
```

**Note:** Minimum NVS Partition Size needed is 0x3000 bytes.

**Note:** When flashing the binary onto the device, make sure it is consistent with the application’s sdkconfig.

**Caveats**

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

### 2.9.5 SD/SDIO/MMC Driver

**Overview**

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers ([driver/include/driver/sdmmc_host.h](driver/include/driver/sdmmc_host.h) and [driver/include/driver/sdspi_host.h](driver/include/driver/sdspi_host.h)) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SDMMC host, see [SDMMC Host API](SDMMC_Host_API)
- SD SPI host, see [SD SPI Host API](SD_SPI_Host_API)
The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card initialization and data transfer commands.

The protocol layer works with the host via the `sdmmc_host_t` structure. This structure contains pointers to various functions of the host.

**Application Example**

An example which combines the SDMMC driver with the FATFS library is provided in the `storage/sd_card` directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.

**Combo (memory + IO) cards**  The driver does not support SD combo cards. Combo cards are treated as IO cards.

**Thread safety**  Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the `sdmmc_card_t` structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.

**Protocol layer API**

The protocol layer is given the `sdmmc_host_t` structure. This structure describes the SD/MMC host driver, lists its capabilities, and provides pointers to functions of the driver. The protocol layer stores card-specific information in the `sdmmc_card_t` structure. When sending commands to the SD/MMC host driver, the protocol layer uses the `sdmmc_command_t` structure to describe the command, arguments, expected return values, and data to transfer if there is any.

**Using API with SD memory cards**

1. To initialize the host, call the host driver functions, e.g., `sdmmc_host_init()`, `sdmmc_host_init_slot()`.
2. To initialize the card, call `sdmmc_card_init()` and pass to it the parameters `host` - the host driver information, and `card` - a pointer to the structure `sdmmc_card_t` which will be filled with information about the card when the function completes.
3. To read and write sectors of the card, use `sdmmc_read_sectors()` and `sdmmc_write_sectors()` respectively and pass to it the parameter `card` - a pointer to the card information structure.
4. If the card is not used anymore, call the host driver function - e.g., `sdmmc_host_deinit()` - to disable the host peripheral and free the resources allocated by the driver.

**Using API with eMMC chips**  From the protocol layer’s perspective, eMMC memory chips behave exactly like SD memory cards. Even though eMMCs are chips and do not have a card form factor, the terminology for SD cards can still be applied to eMMC due to the similarity of the protocol (`sdmmc_card_t`, `sdmmc_card_init`). Note that eMMC chips cannot be used over SPI, which makes them incompatible with the SD SPI host driver.

To initialize eMMC memory and perform read/write operations, follow the steps listed for SD cards in the previous section.

**Using API with SDIO cards**  Initialization and the probing process are the same as with SD memory cards. The only difference is in data transfer commands in SDIO mode.

During the card initialization and probing, performed with `sdmmc_card_init()`, the driver only configures the following registers of the IO card:

1. The IO portion of the card is reset by setting RES bit in the I/O Abort (0x06) register.
2. If 4-line mode is enabled in host and slot configuration, the driver attempts to set the Bus width field in the Bus Interface Control (0x07) register. If setting the filed is successful, which means that the slave supports 4-line mode, the host is also switched to 4-line mode.
3. If high-speed mode is enabled in the host configuration, the SHS bit is set in the High Speed (0x13) register. In particular, the driver does not set any bits in (1) I/O Enable and Int Enable registers, (2) I/O block sizes, etc. Applications can set them by calling `sdmmc_io_write_byte()`.

For card configuration and data transfer, choose the pair of functions relevant to your case from the table below.

<table>
<thead>
<tr>
<th>Action</th>
<th>Read Function</th>
<th>Write Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read and write a single byte using <strong>IO_RW_DIRECT</strong> (CMD52)</td>
<td><code>sdmmc_io_read_byte()</code></td>
<td><code>sdmmc_io_write_byte()</code></td>
</tr>
<tr>
<td>Read and write multiple bytes using <strong>IO_RW_EXTENDED</strong> (CMD53) in byte mode</td>
<td><code>sdmmc_io_read_bytes()</code></td>
<td><code>sdmmc_io_write_bytes()</code></td>
</tr>
<tr>
<td>Read and write blocks of data using <strong>IO_RW_EXTENDED</strong> (CMD53) in block mode</td>
<td><code>sdmmc_io_read_blocks()</code></td>
<td><code>sdmmc_io_write_blocks()</code></td>
</tr>
</tbody>
</table>

SDIO interrupts can be enabled by the application using the function `sdmmc_io_enable_int()`. When using SDIO in 1-line mode, the D1 line also needs to be connected to use SDIO interrupts.

If you want the application to wait until the SDIO interrupt occurs, use `sdmmc_io_wait_int()`.

There is a component ESSL (ESP Serial Slave Link) to use if you are communicating with an ESP32 SDIO slave. See *ESP Serial Slave Link* and example `peripherals/sdio/host`.

**API Reference**

**Header File**
- components.sdmmc/include/sdmmc_cmd.h

**Functions**

`esp_err_t sdmmc_card_init (const sdmmc_host_t *host, sdmmc_card_t *out_card)`

Probe and initialize SD/MMC card using given host

**Parameters**
- `host` - pointer to structure defining host controller
- `out_card` - pointer to structure which will receive information about the card when the function completes

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

`void sdmmc_card_print_info (FILE *stream, const sdmmc_card_t *card)`

Print information about the card to a stream.

**Parameters**
- `stream` - stream obtained using fopen or fdopen
- `card` - card information structure initialized using `sdmmc_card_init`

`esp_err_t sdmmc_get_status (sdmmc_card_t *card)`

Get status of SD/MMC card

**Parameters**
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**
- ESP_OK on success
• One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_write_sectors (sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)
```
Write given number of sectors to SD/MMC card

**Parameters**

- `card` – pointer to card information structure previously initialized using `sdmmc_card_init`
- `src` – pointer to data buffer to read data from; data size must be equal to `sector_count` * `card->csd.sector_size`
- `start_sector` – sector where to start writing
- `sector_count` – number of sectors to write

**Returns**

- ESP_OK on success
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_read_sectors (sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)
```
Read given number of sectors from the SD/MMC card

**Parameters**

- `card` – pointer to card information structure previously initialized using `sdmmc_card_init`
- `dst` – pointer to data buffer to write into; buffer size must be at least `sector_count` * `card->csd.sector_size`
- `start_sector` – sector where to start reading
- `sector_count` – number of sectors to read

**Returns**

- ESP_OK on success
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_erase_sectors (sdmmc_card_t *card, size_t start_sector, size_t sector_count, sdmmc_erase_arg_t arg)
```
Erase given number of sectors from the SD/MMC card

**Note:** When `sdmmc_erase_sectors` used with cards in SDSP mode, it was observed that card requires re-init after erase operation.

**Parameters**

- `card` – pointer to card information structure previously initialized using `sdmmc_card_init`
- `start_sector` – sector where to start erase
- `sector_count` – number of sectors to erase
- `arg` – erase command (CMD38) argument

**Returns**

- ESP_OK on success
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_can_discard (sdmmc_card_t *card)
```
Check if SD/MMC card supports discard

**Parameters**

- `card` – pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**

- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

```c
esp_err_t sdmmc_can_trim (sdmmc_card_t *card)
```
Check if SD/MMC card supports trim

**Parameters**

- `card` – pointer to card information structure previously initialized using `sdmmc_card_init`
Returns
• ESP_OK if supported by the card/device
• ESP_FAIL if not supported by the card/device

```
esp_err_t sdmmc_mmc_can_sanitize(sdmmc_card_t *card)
```

Check if SD/MMC card supports sanitize

**Parameters**
- `card` - pointer to card information structure previously initialized using sdmmc_card_init

**Returns**
• ESP_OK if supported by the card/device
• ESP_FAIL if not supported by the card/device

```
esp_err_t sdmmc_mmc_sanitize(sdmmc_card_t *card, uint32_t timeout_ms)
```

Sanitize the data that was unmapped by a Discard command

**Note:** Discard command has to precede sanitize operation. To discard, use MMC_DICARD_ARG with sdmmc_erase_sectors argument

**Parameters**
- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `timeout_ms` - timeout value in milliseconds required to sanitize the selected range of sectors.

**Returns**
• ESP_OK on success
• One of the error codes from SDMMC host controller

```
esp_err_t sdmmc_full_erase(sdmmc_card_t *card)
```

Erase complete SD/MMC card

**Parameters**
- `card` - pointer to card information structure previously initialized using sdmmc_card_init

**Returns**
• ESP_OK on success
• One of the error codes from SDMMC host controller

```
esp_err_t sdmmc_io_read_byte(sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)
```

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

**Parameters**
- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `function` - IO function number
- `reg` - byte address within IO function
- `out_byte` - [out] output, receives the value read from the card

**Returns**
• ESP_OK on success
• One of the error codes from SDMMC host controller

```
esp_err_t sdmmc_io_write_byte(sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)
```

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

**Parameters**
- `card` - pointer to card information structure previously initialized using sdmmc_card_init
- `function` - IO function number
- `reg` - byte address within IO function
- `in_byte` - value to be written
- `out_byte` - [out] if not NULL, receives new byte value read from the card (read-after-write).
Chapter 2. API Reference

Returns
- ESP_OK on success
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_read_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see `sdmmc_io_read_blocks`.

Parameters
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`
- `function` - IO function number
- `addr` - byte address within IO function where reading starts
- `dst` - buffer which receives the data read from card
- `size` - number of bytes to read

Returns
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_write_bytes (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

Parameters
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`
- `function` - IO function number
- `addr` - byte address within IO function where writing starts
- `src` - data to be written
- `size` - number of bytes to write

Returns
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_read_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

Parameters
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`
- `function` - IO function number
- `addr` - byte address within IO function where writing starts
- `dst` - buffer which receives the data read from card
- `size` - number of bytes to read, must be divisible by the card block size.

Returns
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_write_blocks (sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write blocks of data to an SDIO card using IO_RW_EXTENDED (CMD53)
This function performs write operation using CMD53 in block mode. For byte mode, see `sdmmc_io_write_bytes`.

**Parameters**
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`
- `function` - IO function number
- `addr` - byte address within IO function where writing starts
- `src` - data to be written
- `size` - number of bytes to read, must be divisible by the card block size.

**Returns**
- ESP_OK on success
- ESP_ERR_NO_FREE_BUFFER if no free buffer is available
- ESP_ERR_INVALID_FUNCTION if the function is not supported
- ESP_ERR_INVALID_ARG if any of the parameters are invalid
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_enable_int (sdmmc_card_t *card)
```

Enable SDIO interrupt in the SDMMC host

**Parameters**
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

```c
esp_err_t sdmmc_io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)
```

Block until an SDIO interrupt is received

**Parameters**
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`
- `timeout_ticks` - time to wait for the interrupt, in RTOS ticks

**Returns**
- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in `timeout_ticks`

```c
esp_err_t sdmmc_io_get_cis_data (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)
```

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

**Parameters**
- `card` - pointer to card information structure previously initialized using `sdmmc_card_init`
- `out_buffer` - Output buffer of the CIS data
- `buffer_size` - Size of the buffer.
- `inout_cis_size` - Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than `buffer_size`. The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if CIS_CODE_END is found.

**Returns**
- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but buffer_size is less than required size, which is stored in the `inout_cis_size` then.
- ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of `inout_cis_size` or set it to 0, if you still want to search for the end; output value of `inout_cis_size` is invalid in this case.
- and other error code return from `sdmmc_io_read_bytes`
`esp_err_t sdmmc_io_print_cis_info (uint8_t* buffer, size_t buffer_size, FILE *fp)`

Parse and print the CIS information of an SDIO card.

**Note:** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in sdmmc_io.c and contribute to the IDF through the Github repository.

```
using sdmmc_card_init
```

### Parameters
- **buffer** - Buffer to parse
- **buffer_size** - Size of the buffer.
- **fp** - File pointer to print to, set to NULL to print to stdout.

### Returns
- **ESP_OK**: on success
- **ESP_ERR_NOT_SUPPORTED**: if the value from the card is not supported to be parsed.
- **ESP_ERR_INVALID_SIZE**: if the CIS size fields are not correct.

### Header File
- `components/driver/include/driver/sdmmc_types.h`

### Structures

**struct sdmmc_csd_t**

Decoded values from SD card Card Specific Data register

#### Public Members

- **int csd_ver**
  
  CSD structure format

- **int mmc_ver**
  
  MMC version (for CID format)

- **int capacity**
  
  total number of sectors

- **int sector_size**
  
  sector size in bytes

- **int read_block_len**
  
  block length for reads

- **int card_command_class**
  
  Card Command Class for SD

- **int tr_speed**
  
  Max transfer speed

**struct sdmmc_cid_t**

Decoded values from SD card Card IDentification register
Chapter 2. API Reference

**Public Members**

```c
int mfg_id
    manufacturer identification number

int oem_id
    OEM/product identification number

char name[8]
    product name (MMC v1 has the longest)

int revision
    product revision

int serial
    product serial number

int date
    manufacturing date
```

```c
struct sdmmc_scr_t
Decoded values from SD Configuration Register Note: When new member is added, update reserved bits accordingly
```

```c
uint32_t sd_spec
    SD Physical layer specification version, reported by card

uint32_t erase_mem_state
    data state on card after erase whether 0 or 1 (card vendor dependent)

uint32_t bus_width
    bus widths supported by card: BIT(0) — 1-bit bus, BIT(2) — 4-bit bus

uint32_t reserved
    reserved for future expansion

uint32_t rsvd_mnf
    reserved for manufacturer usage
```

```c
struct sdmmc_ssr_t
Decoded values from SD Status Register Note: When new member is added, update reserved bits accordingly
```

```c
uint32_t alloc_unit_kb
    Allocation unit of the card, in multiples of kB (1024 bytes)
```
uint32_t `erase_size_au`
Erase size for the purpose of timeout calculation, in multiples of allocation unit

uint32_t `cur_bus_width`
SD current bus width

uint32_t `discard_support`
SD discard feature support

uint32_t `fule_support`
SD FULE (Full User Area Logical Erase) feature support

uint32_t `erase_timeout`
Timeout (in seconds) for erase of a single allocation unit

uint32_t `erase_offset`
Constant timeout offset (in seconds) for any erase operation

uint32_t `reserved`
reserved for future expansion

struct `sdmmc_ext_csd_t`
Decoded values of Extended Card Specific Data

**Public Members**

uint8_t `rev`
Extended CSD Revision

uint8_t `power_class`
Power class used by the card

uint8_t `erase_mem_state`
data state on card after erase whether 0 or 1 (card vendor dependent)

uint8_t `sec_feature`
secure data management features supported by the card

struct `sdmmc_switch_func_rsp_t`
SD SWITCH_FUNC response buffer

**Public Members**

uint32_t `data[512 / 8 / sizeof(uint32_t)]`
response data

struct `sdmmc_command_t`
SD/MMC command information
Public Members

```c
uint32_t opcode
    SD or MMC command index

uint32_t arg
    SD/MMC command argument
```

```c
sdmmc_response_t response
    response buffer
```

```c
void *data
    buffer to send or read into
```

```c
size_t datalen
    length of data buffer
```

```c
size_t blklen
    block length
```

```c
int flags
    see below
```

```c
esp_err_t error
    error returned from transfer
```

```c
uint32_t timeout_ms
    response timeout, in milliseconds
```

```c
struct sdmmc_host_t
    SD/MMC Host description
```

This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

Public Members

```c
uint32_t flags
    flags defining host properties
```

```c
int slot
    slot number, to be passed to host functions
```

```c
int max_freq_khz
    max frequency supported by the host
```

```c
float io_voltage
    I/O voltage used by the controller (voltage switching is not supported)
```
esp_err_t (*init)(void)
    Host function to initialize the driver

esp_err_t (*set_bus_width)(int slot, size_t width)
    host function to set bus width

size_t (*get_bus_width)(int slot)
    host function to get bus width

esp_err_t (*set_bus_ddr_mode)(int slot, bool ddr_enable)
    host function to set DDR mode

esp_err_t (*set_card_clk)(int slot, uint32_t freq_khz)
    host function to set card clock frequency

esp_err_t (*set_cclk_always_on)(int slot, bool cclk_always_on)
    host function to set whether the clock is always enabled

esp_err_t (*do_transaction)(int slot, sdmmc_command_t *cmdinfo)
    host function to do a transaction

esp_err_t (*deinit)(void)
    host function to deinitialize the driver

esp_err_t (*deinit_p)(int slot)
    host function to deinitialize the driver, called with the slot

esp_err_t (*io_int_enable)(int slot)
    Host function to enable SDIO interrupt line

esp_err_t (*io_int_wait)(int slot, TickType_t timeout_ticks)
    Host function to wait for SDIO interrupt line to be active

int command_timeout_ms
    timeout, in milliseconds, of a single command. Set to 0 to use the default value.

struct sdmmc_card_t
    SD/MMC card information structure

**Public Members**

sdmmc_host_t host
    Host with which the card is associated

uint32_t ocr
    OCR (Operation Conditions Register) value
**sdmmc_cid_t cid**
decoded CID (Card IDentification) register value

**sdmmc_response_t raw_cid**
raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode

**sdmmc_csd_t csd**
decoded CSD (Card-Specific Data) register value

**sdmmc_scr_t scr**
decoded SCR (SD card Configuration Register) value

**sdmmc_ssr_t ssr**
decoded SSR (SD Status Register) value

**sdmmc_ext_csd_t ext_csd**
decoded EXT_CSD (Extended Card Specific Data) register value

**uint16_t rca**
RCA (Relative Card Address)

**uint16_t max_freq_khz**
Maximum frequency, in kHz, supported by the card

**uint32_t is_mem**
Bit indicates if the card is a memory card

**uint32_t is_sdio**
Bit indicates if the card is an IO card

**uint32_t is_mmc**
Bit indicates if the card is MMC

**uint32_t num_io_functions**
If is_sdio is 1, contains the number of IO functions on the card

**uint32_t log_bus_width**
log2(bus width supported by card)

**uint32_t is_ddr**
Card supports DDR mode

**uint32_t reserved**
Reserved for future expansion

**Macros**

**SDMMC_HOST_FLAG_1BIT**
host supports 1-line SD and MMC protocol
**SDMMC_HOST_FLAG_4BIT**
host supports 4-line SD and MMC protocol

**SDMMC_HOST_FLAG_8BIT**
host supports 8-line MMC protocol

**SDMMC_HOST_FLAG_SPI**
host supports SPI protocol

**SDMMC_HOST_FLAG_DDR**
host supports DDR mode for SD/MMC

**SDMMC_HOST_FLAG_DEINIT_ARG**
host `deinit` function called with the slot argument

**SDMMC_FREQ_DEFAULT**
SD/MMC Default speed (limited by clock divider)

**SDMMC_FREQ_HIGHSPEED**
SD High speed (limited by clock divider)

**SDMMC_FREQ_PROBING**
SD/MMC probing speed

**SDMMC_FREQ_52M**
MMC 52MHz speed

**SDMMC_FREQ_26M**
MMC 26MHz speed

**Type Definitions**

typedef `uint32_t sdmmc_response_t[4]`  
SD/MMC command response buffer

**Enumerations**

enum `sdmmc_erase_arg_t`

SD/MMC erase command(38) arguments SD: ERASE: Erase the write blocks, physical/hard erase.

DISCARD: Card may deallocate the discarded blocks partially or completely. After discard operation the previously written data may be partially or fully read by the host depending on card implementation.

MMC: ERASE: Does TRIM, applies erase operation to write blocks instead of Erase Group.

DISCARD: The Discard function allows the host to identify data that is no longer required so that the device can erase the data if necessary during background erase events. Applies to write blocks instead of Erase Group. After discard operation, the original data may be remained partially or fully accessible to the host dependent on device.

*Values:*
Chapter 2. API Reference

enumerator SDMMC_ERASE_ARG
Erase operation on SD, Trim operation on MMC

enumerator SDMMC_DISCARD_ARG
Discard operation for SD/MMC

2.9.6 SPI Flash API

Overview

The spi_flash component contains API functions related to reading, writing, erasing, memory mapping for data in the external flash. The spi_flash component also has higher-level API functions which work with partitions defined in the partition table.

Different from the API before IDF v4.0, the functionality of esp_flash_* APIs is not limited to the “main” SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

Note: Instead of going through the cache connected to the SPI0 peripheral, most esp_flash_* APIs go through other SPI peripherals like SPI1, SPI2, etc. This makes them able to access not only the main flash, but also external flash.

However, due to limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations are also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

Note: Flash APIs after ESP-IDF v4.0 are no longer atomic. If a write operation occurs during another on-going read operation, and the flash addresses of both operations overlap, the data returned from the read operation may contain both old data and new data (that was updated written by the write operation).

Note: Encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

Support for Features of Flash Chips

Quad/Dual Mode Chips Features of different flashes are implemented in different ways and thus need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all 24-bits address flash chips are supported, because they do not need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on following chip types:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA
Optional Features

Optional features for flash Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- Auto Suspend & Resume
- Flash unique ID
- High performance mode
- OPI flash support
- 32-bit Address Flash Chips

Note:

- The features listed above need to be supported by both esp chips and flash chips.
- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact Espressif’s business team to know if we can supply such products for you.
- If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.

Attention: This document only shows that IDF code has supported the features of those flash chips. It’s not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own bought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

Auto Suspend & Resume ESP Chips List:

1. ESP32C3

Flash Chips List:

1. XM25QxxC series.

Flash unique ID Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

ESP Chips Lists:

ALL

Flash Chips List:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

High performance mode

Note: This section is provided for Dual mode (DOUT/DIO) and Quad mode (QIO/QOUT) flash chips. Octal flash used on ESP-chips support High performance mode by default so far, you can refer to the octal flash support list below.
High performance mode (HPM) means that the SPI1 and flash chip works under high frequency. Usually, when the operating frequency of the flash is greater than 80MHz, it is considered that the flash works under HPM. As far as we acknowledged, flash chips have more than two different coping strategies when flash work under HPM. For some flash chips, HPM is controlled by high performance flag (HPF) in status register and for some flash chips, HPM is controlled by dummy cycle bit.

For following conditions, IDF start code deals with HPM internally.

ESP Chips List:
1. ESP32S3

Flash Chips (name & ID) List:
1. GD25Q64C (ID: 0xC84017)
2. GD25Q32C (ID: 0xC84016)

Attention: It is hard to create several strategies to cover all situations, so all flash chips using HPM need to be supported explicitly. Therefore, if you try to use a flash not listed as supported under high performance mode, it might cause some error. So, when you try to use the flash chip beyond supported list, please test properly.

OPI flash support OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

ESP Chips List:
1. ESP32S3

Flash Chips List:
1. MX25UM25645G

32-bit Address Flash Chips Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regretfully, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

ESP Chips List:
ALL ESP Chips support this.

Flash Chips List:
1. W25Q256
2. GD25Q256

There are some features that are not supported by all flash chips, or not supported by all Espressif chips. These features include:

- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16 MB) that needs longer addresses.
- Flash unique ID - means that flash supports its unique 64-bits ID.

If you want to use these features, please ensure both ESP32 and ALL flash chips in your product support these features. For more details, refer to Optional features for flash.

You may also customise your own flash chip driver. See Overriding Default Chip Drivers for more details.
Warning: Customizing SPI Flash Chip Drivers is considered an “expert” feature. Users should only do so at their own risk. (See the notes below)

Overriding Default Chip Drivers  
During the SPI Flash driver’s initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated together with each IDF version. However, IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise, the driver will only search for the drivers in custom list you provided.

Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE CHIP DRIVER LIST` config option. This will prevent compilation and linking of the Default Chip Driver List (default_registered_chips) provided by IDF. Instead, the linker will search for the structure of the same name (default_registered_chips) that must be provided by the user.
2. Add a new component in your project, e.g. `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in IDF. This may include:
   - `spi_flash_chip_drivers.c` (to provide the default_registered_chips structure)
   - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
   - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly. Including:

- Change the default_registered_chips variable to non-static and remove the #ifdef logic around it.
- Update `linker.lf` file to rename the fragment header and the library name to match the new component.
- If reusing other drivers, some header names need prefixing with `spi_flash/` when included from outside `spi_flash` component.

Note:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
  2. Write a function named `spi_flash_chip_***(vendor)_get_caps`. Take the example below as a reference. (if the flash support suspend and read unique id).
  3. Points the the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```c
spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip) {
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash_suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH CHIP_CAP.Unique_ID;
    return caps_flags;
}
```
### Chapter 2. API Reference

```c
const spi_flash_chip_t esp_flash_chip_eon = {
  // Other function pointers
  .get_chip_caps = esp_flash_chip_eon_get_caps,
};
```

* You also can see how to implement this in the example `storage/custom_flash_driver`.

4. Write a new `CMakeLists.txt` file for the `custom_chip_driver` component, including an additional line to add a linker dependency from `spi_flash` to `custom_chip_driver`:

   ```cmake
   idf_component_register(SRCS "spi_flash_chip_drivers.c"
                         "spi_flash_chip_mychip.c" # modify as needed
                         REQUIRES hal
                         PRIV_REQUIRES spi_flash
                         LDFRAGMENTS linker.lf)
   idf_component_add_link_dependency(FROM spi_flash)
   ```

   * An example of this component CMakeLists.txt can be found in `storage/custom_flash_driver/components/custom_chip_driver/CMakeLists.txt`

5. The `linker.lf` is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See `Linker Script Generation` for more details. Make sure this file covers all the source files that you add.

6. Build your project, and you will see the new flash driver is used.

#### Example

See also `storage/custom_flash_driver`.

### Initializing a Flash Device

To use the `esp_flash_*` APIs, you need to initialise a flash chip on a certain SPI bus, as shown below:

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This function initializes the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device to the bus. This function allocates memory and fills the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This will also detect the chip type, and influence the following operations.

#### Note:

Multiple flash chips can be attached to the same bus now.

### SPI Flash Access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of `partition-specific functions`.

### SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000.
By default, the SPI flash size is detected by esptool.py when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in the project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

**Concurrency Constraints for Flash on SPI1**

The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32, these caches must be disabled while reading/writing/erasing.

**When the caches are disabled** Under this condition, all CPUs should always execute code and access data from internal RAM. The APIs documented in this file will disable the caches automatically and transparently.

The way that these APIs disable the caches will suspend all the other tasks. Besides, all non-IRAM-safe interrupts will be disabled. The other core will be polling in a busy loop. These will be restored until the Flash operation completes.

See also OS Functions and SPI Bus Lock.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between internal RAM (e.g. IRAM, DRAM) and flash cache, please refer to the application memory layout documentation.

**IRAM-Safe Interrupt Handlers** For interrupt handlers which need to execute when the cache is disabled (e.g., for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the interrupt handler is registered.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See How to place code in IRAM.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

**Note:** When working with strings in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both TAG and format string are placed into DRAM in that case.

**Non-IRAM-Safe Interrupt Handlers** If the `ESP_INTR_FLAG_IRAM` flag is not set when registering, the interrupt handler will not get executed when the caches are disabled. Once the caches are restored, the non-IRAM-safe interrupts will be re-enabled. After this moment, the interrupt handler will run normally again. This means that as long as caches are disabled, users won’t see the corresponding hardware event happening.

**Attention:** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) will cause significant influence to the whole system. See Concurrency Constraints for flash on SPI1 for more details.
Partition Table API

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information can be found in Partition Tables.

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find`.
- `esp_partition_find_first()` is a convenience function which returns the structure describing the first partition found by `esp_partition_find`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `esp_flash_read()`, `esp_flash_write()`, `esp_flash_erase_region()`, but operate within partition boundaries.

**Note:** Application code should mostly use these `esp_partition_*` API functions instead of lower level `esp_flash_*` API functions. Partition table API functions do bounds checking and calculate correct offsets in flash, based on data stored in a partition table.

SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the Flash Encryption documentation for more details.

Memory Mapping API

ESP32 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when flash encryption is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `spi_flash_mmap.h` and `esp_partition.h`:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition. It will adjust the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.
Note: mmap is supported by cache, so it can only be used on main flash.

**SPI Flash Implementation**

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g. lock, delay) in different stages (1st/2nd boot, or the app).

**Host driver** The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_types.h` (in the hal/include/hal folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32 memory-spi functionalities. However, due to the speed limitations of ESP32, the HAL layer cannot provide high-speed implementations to some reading commands (so the support for it was dropped). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the esp_flash API can access the flash regardless of the low-level hardware.

**Chip Driver** The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status afterwards. Some chips need different commands or values, or need special communication ways.

There is a type of chip called generic chip which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

**OS Functions** Currently the OS function layer provides entries of a lock and delay.

The lock (see SPI Bus Lock) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may require to use the bus monopolized during a period (especially when the device doesn’t have a CS wire, or the wire is controlled by software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

OS functions can also help to avoid a watchdog timeout when erasing large flash areas. During this time, the CPU is occupied with the flash erasing task. This stops other tasks from being executed. Among these tasks is the idle task to feed the watchdog timer (WDT). If the configuration option `CONFIG_ESP_TASK_WDT_PANIC` is selected and the flash operation time is longer than the watchdog timeout period, the system will reboot.

It’s pretty hard to totally eliminate this risk, because the erasing time varies with different flash chips, making it hard to be compatible in flash drivers. Therefore, users need to pay attention to it. Please use the following guidelines:
1. It is recommended to enable the `CONFIG_SPI_FLASH_YIELD_DURING_ERASE` option to allow the scheduler to re-schedule during erasing flash memory. Besides, following parameters can also be used.

   - Increase `CONFIG_SPI_FLASH_ERASE_YIELD_TICKS` or decrease `CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS` in menuconfig.
   - You can also increase `CONFIG_ESP_TASK_WDT_TIMEOUT_S` in menuconfig for a larger watchdog timeout period. However, with larger watchdog timeout period, previously detected timeouts may no longer be detected.

2. Please be aware of the consequences of enabling the `CONFIG_ESP_TASK_WDT_PANIC` option when doing long-running SPI flash operations which will trigger the panic handler when it times out. However, this option can also help dealing with unexpected exceptions in your application. Please decide whether this is needed to be enabled according to actual condition.

3. During your development, please carefully review the actual flash operation according to the specific requirements and time limits on erasing flash memory of your projects. Always allow reasonable redundancy based on your specific product requirements when configuring the flash erasing timeout threshold, thus improving the reliability of your product.

- Over The Air Update (OTA) API provides high-level API for updating app firmware stored in flash.
- Non-Volatile Storage (NVS) API provides a structured API for storing small pieces of data in SPI flash.

Implementation Details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation: - In a single-core setup, the SDK needs to disable interrupts or scheduler before performing the flash operation. - In a dual-core setup, the SDK needs to make sure that both CPUs are not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

API Reference - SPI Flash

Header File
- components/spi_flash/include/esp_flash_spi_init.h

Functions
**esp_err_t** spi_bus_add_flash_device *(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)*

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by *spi_bus_initialization*.

**Parameters**

- **out_chip** Pointer to hold the initialized chip.
- **config** Configuration of the chips to initialize.

**Returns**

- ESP_ERR_INVALID_ARG: out_chip is NULL, or some field in the config is invalid.
- ESP_ERR_NO_MEM: failed to allocate memory for the chip structures.
- ESP_OK: success.

**esp_err_t** spi_bus_remove_flash_device *(esp_flash_t *chip)*

Remove a SPI Flash device from the SPI bus.

**Parameters**

- **chip** The flash device to remove.

**Returns**

- ESP_ERR_INVALID_ARG: The chip is invalid.
- ESP_OK: success.

**Structures**

struct **esp_flash_spi_device_config_t**

Configurations for the SPI Flash to init.

**Public Members**

**spi_host_device_t** host_id

Bus to use.

**int** cs_io_num

GPIO pin to output the CS signal.

**esp_flash_io_mode_t** io_mode

IO mode to read from the Flash.

**enum** esp_flash_speed_s speed

Speed of the Flash clock. Replaced by freq_mhz.

**int** input_delay_ns

Input delay of the data pins, in ns. Set to 0 if unknown.

**int** cs_id

CS line ID, ignored when not host_id is not SPI1_HOST, or CONFIG_SPI_FLASH_SHARE_SPI1_BUS is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

**int** freq_mhz

The frequency of flash chip(MHZ)

**Header File**

- components/spi_flash/include/esp_flash.h
## Functions

### esp_err_t esp_flash_init (esp_flash_t *chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

| Note: Only the host and read_mode fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL. |

| Note: If the chip->drv pointer is NULL, chip chip_drv will be auto-detected based on its manufacturer & product IDs. See esp_flash_registered_flash_drivers pointer for details of this process. |

| Parameters chip – Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted. |
| Returns ESP_OK on success, or a flash error code if initialisation fails. |

### bool esp_flash_chip_driver_initialized (const esp_flash_t *chip)

Check if appropriate chip driver is set.

| Parameters chip – Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted. |
| Returns true if set, otherwise false. |

### esp_err_t esp_flash_read_id (esp_flash_t *chip, uint32_t *out_id)

Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

| Parameters |
| chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init() |
| out_id – [out] Pointer to receive ID value. |
| Returns ESP_OK on success, or a flash error code if operation failed. |

### esp_err_t esp_flash_get_size (esp_flash_t *chip, uint32_t *out_size)

Detect flash size based on flash ID.

| Note: 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected. |
| a. The out_size returned only stands for The out_size stands for the size in the binary image header. If you want to get the real size of the chip, please call esp_flash_get_physical_size instead. |

| Parameters |
| chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init() |
| out_size – [out] Detected size in bytes, standing for the size in the binary image header. |
| Returns ESP_OK on success, or a flash error code if operation failed. |

### esp_err_t esp_flash_get_physical_size (esp_flash_t *chip, uint32_t *flash_size)

Detect flash size based on flash ID.

| Note: Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected. |
Parameters
• chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().
• flash_size – [out] Detected size in bytes.

Returns ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_read_unique_chip_id(esp_flash_t *chip, uint64_t *out_id)
```

Read flash unique ID via the common “RDUID” SPI flash command.

ID is a 64-bit value.

Parameters
• chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().
• out_id – [out] Pointer to receive unique ID value.

Returns
• ESP_OK on success, or a flash error code if operation failed.
• ESP_ERR_NOT_SUPPORTED if the chip doesn’t support read id.

```c
esp_err_t esp_flash_erase_chip(esp_flash_t *chip)
```

Erase flash chip contents.

Parameters
• chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().

Returns
• ESP_OK on success,
• ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
• Other flash error code if operation failed.

```c
esp_err_t esp_flash_erase_region(esp_flash_t *chip, uint32_t start, uint32_t len)
```

Erase a region of the flash chip.

Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

Parameters
• chip – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init().
• start – Address to start erasing flash. Must be sector aligned.
• len – Length of region to erase. Must also be sector aligned.

Returns
• ESP_OK on success,
• ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
• Other flash error code if operation failed.

```c
esp_err_t esp_flash_get_chip_write_protect(esp_flash_t *chip, bool *write_protected)
```

Read if the entire chip is write protected.

Note: A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).
### api reference

#### Parameters
- **chip** - Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()

#### Returns
- **write_protected** - [out] Pointer to boolean, set to the value of the write protect flag.

**esp_err_t** esp_flash_set_chip_write_protect (esp_flash_t *chip, bool write_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

#### Parameters
- **chip** - Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()

- **write_protect** - Boolean value for the write protect flag

**Returns**
- ESP_OK on success, or a flash error code if operation failed.

**esp_err_t** esp_flash_get_protectable_regions (const esp_flash_t *chip, const esp_flash_region_t **out_regions, uint32_t *out_num_regions)

Read the list of individually protectable regions of this SPI flash chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

#### Parameters
- **chip** - Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()

- **out_regions** - [out] Pointer to receive a pointer to the array of protectable regions of the chip.

- **out_num_regions** - [out] Pointer to an integer receiving the count of protectable regions in the array returned in ‘regions’.

**Returns**
- ESP_OK on success, or a flash error code if operation failed.

**esp_err_t** esp_flash_get_protected_region (esp_flash_t *chip, const esp_flash_region_t *region, bool *out_protected)

Detect if a region of the SPI flash chip is protected.

**Note:** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

#### Parameters
- **chip** - Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• **region** - Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions()`.
• **out_protected** - [out] Pointer to a flag which is set based on the protected status for this region.

**Returns** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_set_protected_region (esp_flash_t *chip, const esp_flash_region_t *region, bool protect)
```

Update the protected status for a region of the SPI flash chip.

**Note:** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Parameters**
- **chip** - Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **region** - Pointer to a struct describing a protected region. This must match one of the regions returned from `esp_flash_get_protectable_regions()`.
- **protect** - Write protection flag to set.

**Returns** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_read (esp_flash_t *chip, void *buffer, uint32_t address, uint32_t length)
```

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Note:** If on-chip flash encryption is used, this function returns raw (i.e. encrypted) data. Use the flash cache to transparently decrypt data.

**Parameters**
- **chip** - Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **buffer** - Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** - Address on flash to read from. Must be less than chip->size field.
- **length** - Length (in bytes) of data to read.

**Returns**
- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

```c
esp_err_t esp_flash_write (esp_flash_t *chip, const void *buffer, uint32_t address, uint32_t length)
```

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**
• **chip** – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init().

• **address** – Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).

• **buffer** – Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.

• **length** – Length (in bytes) of data to write.

**Returns**

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

`esp_err_t esp_flash_write_encrypted(esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)`

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**Note:** Both address & length must be 16 byte aligned, as this is the encryption block size.

**Parameters**

- **chip** – Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.

- **address** – Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).

- **buffer** – Pointer to a buffer with the data to write.

- **length** – Length (in bytes) of data to write. 16 byte aligned.

**Returns**

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.

`esp_err_t esp_flash_read_encrypted(esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)`

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

**Parameters**

- **chip** – Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.

- **address** – Address on flash to read from.

- **out_buffer** – Pointer to a buffer for the data to read to.

- **length** – Length (in bytes) of data to read.

**Returns**

- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.

static inline bool `esp_flash_is_quad_mode(const esp_flash_t *chip)`

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Parameters**

- **chip** – Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

**Returns** true if flash works in quad mode, otherwise false

**Structures**

```
struct esp_flash_region_t

Structure for describing a region of flash.
```
Chapter 2. API Reference

Public Members

uint32_t **offset**
Start address of this region.

uint32_t **size**
Size of the region.

struct **esp_flash_os_functions_t**
OS-level integration hooks for accessing flash chips inside a running OS.

It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

**esp_err_t (*start*)(void *arg)**
Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).

**esp_err_t (*end*)(void *arg)**
Called after completing any flash operation.

**esp_err_t (*region_protected*)(void *arg, size_t start_addr, size_t size)**
Called before any erase/write operations to check whether the region is limited by the OS

**esp_err_t (*delay_us*)(void *arg, uint32_t us)**
Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’.

**void (*)(**get_temp_buffer**)(void *arg, size_t request_size, size_t *out_size)**
Called for get temp buffer when buffer from application cannot be directly read into/write from.

**void (*)(**release_temp_buffer**)(void *arg, void *temp_buf)**
Called for release temp buffer.

**esp_err_t (*)(**check_yield**)(void *arg, uint32_t chip_status, uint32_t *out_request)**
Yield to other tasks. Called during erase operations.

Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

**esp_err_t (*)(**yield**)(void *arg, uint32_t *out_status)**
Yield to other tasks. Called during erase operations.

**int64_t (*)(**get_system_time**)(void *arg)**
Called for get system time.
void (*set_flash_op_status)(uint32_t op_status)
    Call to set flash operation status

struct esp_flash_t
    Structure to describe a SPI flash chip connected to the system.
    Structure must be initialized before use (passed to esp_flash_init()). It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.
    For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

spi_flash_host_inst_t *host
    Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

const spi_flash_chip_t *chip_drv
    Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

const esp_flash_os_functions_t *os_func
    Pointer to os-specific hook structure. Call esp_flash_init_os_functions() to setup this field, after the host is properly initialized.

void *os_func_data
    Pointer to argument for os-specific hooks. Left NULL and will be initialized with os_func.

esp_flash_io_mode_t read_mode
    Configured SPI flash read mode. Set before esp_flash_init is called.

uint32_t size
    Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call esp_flash_get_physical_size.

uint32_t chip_id
    Detected chip id.

uint32_t busy
    This flag is used to verify chip’s status.

uint32_t hpm_dummy_ena
    This flag is used to verify whether flash works under HPM status.

uint32_t reserved_flags
    reserved.

Macros

SPI_FLASH_YIELD_REQ_YIELD
Chapter 2. API Reference

SPI_FLASH_YIELD_REQ_SUSPEND

SPI_FLASH_YIELD_STA_RESUME

SPI_FLASH_OS_IS_ERASING_STATUS_FLAG

Type Definitions

typedef struct spi_flash_chip_t spi_flash_chip_t

typedef struct esp_flash_t esp_flash_t

Header File

- components/spi_flash/include/spi_flash_mmap.h

Functions

esp_err_t spi_flash_mmap(size_t src_addr, size_t size, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if mmap/munmap are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use spi_flash_mmap_dump() function.

Parameters

- src_addr - Physical address in flash where requested region starts. This address must be aligned to 64kB boundary (SPI_FLASH_MMU_PAGE_SIZE)
- size - Size of region to be mapped. This size will be rounded up to a 64kB boundary
- memory - Address space where the region should be mapped (data or instruction)
- out_ptr - [out] Output, pointer to the mapped memory region
- out_handle - [out] Output, handle which should be used for spi_flash_munmap call

Returns

- ESP_OK on success, ESP_ERR_NO_MEM if pages cannot be allocated

esp_err_t spi_flash_mmap_pages(const int *pages, size_t page_count, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as spi_flash_mmap() but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

Parameters

- pages - An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- page_count - Number of entries in the pages array
- memory - Address space where the region should be mapped (instruction or data)
- out_ptr - [out] Output, pointer to the mapped memory region
- out_handle - [out] Output, handle which should be used for spi_flash_munmap call

Returns

- ESP_OK on success
- ESP_ERR_NO_MEM if pages cannot be allocated
- ESP_ERR_INVALID_ARG if pagecount is zero or pages array is not in internal memory
Chapter 2. API Reference

void spi_flash_munmap (spi_flash_mmap_handle_t handle)

Release region previously obtained using spi_flash_mmap.

**Note:** Calling this function will not necessarily unmmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

**Parameters**

- handle – Handle obtained from spi_flash_mmap

void spi_flash_mmap_dump (void)

Display information about mapped regions.

This function lists handles obtained using spi_flash_mmap, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

uint32_t spi_flash_mmap_get_free_pages (spi_flash_mmap_memory_t memory)

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual spi_flash_mmap (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

**Parameters**

- memory – memory type of MMU table free page

**Returns**

- number of free pages which can be mmaped

size_t spi_flash_cache2phys (const void* cached)

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have have been assigned via spi_flash_mmap(), any address in memory mapped flash space can be looked up.

**Parameters**

- cached – Pointer to flashed cached memory.

**Returns**

- SPI_FLASH_CACHE2PHYS_FAIL If cache address is outside flash cache region, or the address is not mapped.
  - Otherwise, returns physical offset in flash

const void *spi_flash_phys2cache (size_t phys_offs, spi_flash_mmap_memory_t memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via spi_flash_mmap(), any address in flash can be looked up.

**Note:** Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

**Note:** This function doesn’t impose any alignment constraints, but if memory argument is SPI_FLASH_MMAP_INST and phys_offs is not 4-byte aligned, then reading from the returned pointer will result in a crash.

**Parameters**

- phys_offs – Physical offset in flash memory to look up.
- memory – Address space type to look up a flash cache address mapping for (instruction or data)

**Returns**
Chapter 2. API Reference

- NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
- Cached memory address (in IROM or DROM space) corresponding to phys_offs.

Macros

ESP_ERR_FLASH_OP_FAIL

This file contains spi_flash_mmap_xx APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

ESP_ERR_FLASH_OP_TIMEOUT

SPI_FLASH_SEC_SIZE

SPI Flash sector size

SPI_FLASH_MMU_PAGE_SIZE

Flash cache MMU mapping page size

SPI_FLASH_CACHE2PHYS_FAIL

Type Definitions

typedef uint32_t spi_flash_mmap_handle_t

Opaque handle for memory region obtained from spi_flash_mmap.

Enumerations

enum spi_flash_mmap_memory_t

 Enumeration which specifies memory space requested in an mmap call.

 Values:

 enumerator SPI_FLASH_MMAP_DATA
     map to data memory (Vaddr0), allows byte-aligned access, 4 MB total

 enumerator SPI_FLASH_MMAP_INST
     map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total

Header File

- components/hal/include/hal/spi_flash_types.h

Structures

struct spi_flash_trans_t

Definition of a common transaction. Also holds the return value.

Public Members

uint8_t reserved

Reserved, must be 0.
uint8_t mosi_len
    Output data length, in bytes.

uint8_t miso_len
    Input data length, in bytes.

uint8_t address_bitlen
    Length of address in bits, set to 0 if command does not need an address.

uint32_t address
    Address to perform operation on.

cast uint8_t *mosi_data
    Output data to save.

uint8_t *miso_data
    [out] Input data from slave, little endian

uint32_t flags
    Flags for this transaction. Set to 0 for now.

uint16_t command
    Command to send.

uint8_t dummy_bitlen
    Basic dummy bits to use.

uint32_t io_mode
    Flash working mode when SPI_FLASH_IGNORE_BASEIO is specified.

struct spi_flash_sus_cmd_conf
    Configuration structure for the flash chip suspend feature.

Public Members

uint32_t sus_mask
    SUS/SUS1/SUS2 bit in flash register.

uint32_t cmd_rdsr
    Read flash status register(2) command.

uint32_t sus_cmd
    Flash suspend command.

uint32_t res_cmd
    Flash resume command.

uint32_t reserved
    Reserved, set to 0.
struct **spi_flash_encryption_t**  
Structure for flash encryption operations.

**Public Members**

void (*flash_encryption_enable)(void)  
Enable the flash encryption.

void (*flash_encryption_disable)(void)  
Disable the flash encryption.

void (*flash_encryption_data_prepare)(uint32_t address, const uint32_t *buffer, uint32_t size)  
Prepare flash encryption before operation.

**Note:** address and buffer must be 8-word aligned.

<table>

struct **spi_flash_host_inst_t**  
SPI Flash Host driver instance

**Public Members**

const struct **spi_flash_host_driver_s** *driver  
Pointer to the implementation function table.

struct **spi_flash_host_driver_s**  
Host driver configuration and context structure.

**Public Members**
Chapter 2. API Reference

```c
esp_err_t (*dev_config)(spi_flash_host_inst_t *host)
    Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

esp_err_t (*common_command)(spi_flash_host_inst_t *host, spi_flash_trans_t *t)
    Send an user-defined spi transaction to the device.

esp_err_t (*read_id)(spi_flash_host_inst_t *host, uint32_t *id)
    Read flash ID.

void (*erase_chip)(spi_flash_host_inst_t *host)
    Erase whole flash chip.

void (*erase_sector)(spi_flash_host_inst_t *host, uint32_t start_address)
    Erase a specific sector by its start address.

void (*erase_block)(spi_flash_host_inst_t *host, uint32_t start_address)
    Erase a specific block by its start address.

esp_err_t (*read_status)(spi_flash_host_inst_t *host, uint8_t *out_sr)
    Read the status of the flash chip.

esp_err_t (*set_write_protect)(spi_flash_host_inst_t *host, bool wp)
    Disable write protection.

void (*program_page)(spi_flash_host_inst_t *host, const void *buffer, uint32_t address, uint32_t length)
    Program a page of the flash. Check max_write_bytes for the maximum allowed writing length.

bool (*supports_direct_write)(spi_flash_host_inst_t *host, const void *p)
    Check whether the SPI host supports direct write.

    When cache is disabled, SPI1 doesn’t support directly write when buffer isn’t internal.

int (*write_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t
    *align_addr, uint32_t page_size)
    Slicer for write data. The program_page should be called iteratively with the return value of this function.

    Param address   Beginning flash address to write
    Param len      Length request to write
    Param align_addr Output of the aligned address to write to
    Param page_size Physical page size of the flash chip
    Return        Length that can be actually written in one program_page call

esp_err_t (*read)(spi_flash_host_inst_t *host, void *buffer, uint32_t address, uint32_t read_len)
    Read data from the flash. Check max_read_bytes for the maximum allowed reading length.

bool (*supports_direct_read)(spi_flash_host_inst_t *host, const void *p)
    Check whether the SPI host supports direct read.

    When cache is disabled, SPI1 doesn’t support directly read when the given buffer isn’t internal.
```
int (*read_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)
   Slicer for read data. The read should be called iteratively with the return value of this function.
   
   Param address  Beginning flash address to read
   Param len  Length request to read
   Param align_addr  Output of the aligned address to read
   Param page_size  Physical page size of the flash chip
   
   Return  Length that can be actually read in one read call

uint32_t (*host_status)(spi_flash_host_inst_t *host)
   Check the host status, 0: busy, 1: idle, 2: suspended.

esp_err_t (*configure_host_io_mode)(spi_flash_host_inst_t *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, esp_flash_io_mode_t io_mode)
   Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (*poll_cmd_done)(spi_flash_host_inst_t *host)
   Internal use, poll the HW until the last operation is done.

esp_err_t (*flush_cache)(spi_flash_host_inst_t *host, uint32_t addr, uint32_t size)
   For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

void (*check_suspend)(spi_flash_host_inst_t *host)
   Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (*resume)(spi_flash_host_inst_t *host)
   Resume flash from suspend manually

void (*suspend)(spi_flash_host_inst_t *host)
   Set flash in suspend status manually

esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)
   Suspend feature setup for setting cmd and status register mask.

Macros

SPI_FLASH_TRANS_FLAG_CMD16
   Send command of 16 bits.

SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO
   Not applying the basic io mode configuration for this transaction.

SPI_FLASH_TRANS_FLAG_BYTE_SWAP
   Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

SPI_FLASH_CONFIG_CONF_BITS
   OR the io_mode with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)
**SPI_FLASH_OPI_FLAG**

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

**SPI_FLASH_READ_MODE_MIN**

Slowest io mode supported by ESP32, currently SlowRd.

**Type Definitions**

typedef enum *esp_flash_speed_s* *esp_flash_speed_t*

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

typedef struct *spi_flash_host_driver_s* *spi_flash_host_driver_t*

**Enumerations**

enum *esp_flash_speed_s*

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the `ESP_FLASH_SPEED_MAX-1` or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

enumerator `ESP_FLASH_5MHZ`

The flash runs under 5MHz.

enumerator `ESP_FLASH_10MHZ`

The flash runs under 10MHz.

enumerator `ESP_FLASH_20MHZ`

The flash runs under 20MHz.

enumerator `ESP_FLASH_26MHZ`

The flash runs under 26MHz.

enumerator `ESP_FLASH_40MHZ`

The flash runs under 40MHz.

enumerator `ESP_FLASH_80MHZ`

The flash runs under 80MHz.

enumerator `ESP_FLASH_120MHZ`

The flash runs under 120MHz, 120MHZ can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator `ESP_FLASH_SPEED_MAX`

The maximum frequency supported by the host is `ESP_FLASH_SPEED_MAX-1`.
enum esp_flash_io_mode_t
    Mode used for reading from SPI flash.
    Values:

enumerator SPI_FLASH_SLOWRD
    Data read using single I/O, some limits on speed.

enumerator SPI_FLASH_FASTRD
    Data read using single I/O, no limit on speed.

enumerator SPI_FLASH_DOUT
    Data read using dual I/O.

enumerator SPI_FLASH_DIO
    Both address & data transferred using dual I/O.

enumerator SPI_FLASH_QOUT
    Data read using quad I/O.

enumerator SPI_FLASH_QIO
    Both address & data transferred using quad I/O.

enumerator SPI_FLASH_OPI_STR
    Only support on OPI flash, flash read and write under STR mode.

enumerator SPI_FLASH_OPI_DTR
    Only support on OPI flash, flash read and write under DTR mode.

enumerator SPI_FLASH_READ_MODE_MAX
    The fastest io mode supported by the host is ESP_FLASH_READ_MODE_MAX-1.

Header File

• components/hal/include/hal/esp_flash_err.h

Macros

ESP_ERR_FLASH_NOT_INITIALIZED
    esp_flash_chip_t structure not correctly initialised by esp_flash_init().

ESP_ERR_FLASH_UNSUPPORTED_HOST
    Requested operation isn’t supported via this host SPI bus (chip->spi field).

ESP_ERR_FLASH_UNSUPPORTED_CHIP
    Requested operation isn’t supported by this model of SPI flash chip.

ESP_ERR_FLASH_PROTECTED
    Write operation failed due to chip’s write protection being enabled.
Enumerations

enum [anonymous]

Values:

enumerator ESP_ERR_FLASH_SIZE_NOT_MATCH

The chip doesn’t have enough space for the current partition table.

enumerator ESP_ERR_FLASH_NO_RESPONSE

Chip did not respond to the command, or timed out.

API Reference - Partition Table

Header File

- components/esp_partition/include/esp_partition.h

Functions

const esp_partition_t *esp_partition_find_first (esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)

Find first partition based on one or more parameters.

Parameters

- type – Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
- subtype – Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- label – (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

Returns pointer to esp_partition_t structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

const esp_partition_t *esp_partition_get (esp_partition_iterator_t iterator)

Get esp_partition_t structure for given partition.

Parameters iterator – Iterator obtained using esp_partition_find. Must be non-NULL.

Returns pointer to esp_partition_t structure. This pointer is valid for the lifetime of the application.

esp_partition_iterator_t esp_partition_next (esp_partition_iterator_t iterator)

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.
Parameters \textit{iterator} – Iterator obtained using \texttt{esp_partition_find}. Must be non-NULL.

Returns \texttt{NULL} if no partition was found, valid \texttt{esp_partition_iterator_t} otherwise.

\texttt{void esp_partition_iterator_release (esp_partition_iterator_t \textit{iterator})}

Release partition iterator.

Parameters \textit{iterator} – Iterator obtained using \texttt{esp_partition_find}. The iterator is allowed to be \texttt{NULL}, so it is not necessary to check its value before calling this function.

\texttt{const esp_partition_t *} \texttt{esp_partition_verify (const esp_partition_t \* partition)}

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from \texttt{esp_partition_get()}, as a test for equality.

Parameters \textit{partition} – Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

Returns

- If partition not found, returns \texttt{NULL}.
- If found, returns a pointer to the \texttt{esp_partition_t} structure in flash. This pointer is always valid for the lifetime of the application.

\texttt{esp_err_t esp_partition_read (const esp_partition_t \* partition, size_t src_offset, void \* dst, size_t size)}

Read data from the partition.

Partitions marked with an encryption flag will automatically be be read and decrypted via a cache mapping.

Parameters

- \texttt{partition} – Pointer to partition structure obtained using \texttt{esp_partition_find_first} or \texttt{esp_partition_get}. Must be non-NULL.
- \texttt{dst} – Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least \dots{} bytes long.
- \texttt{src_offset} – Address of the data to be read, relative to the beginning of the partition.
- \texttt{size} – Size of data to be read, in bytes.

Returns \texttt{ESP_OK}, if data was read successfully; \texttt{ESP_ERR_INVALID_ARG}, if \texttt{src_offset} exceeds partition size; \texttt{ESP_ERR_INVALID_SIZE}, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

\texttt{esp_err_t esp_partition_write (const esp_partition_t \* partition, size_t dst_offset, const void \* src, size_t size)}

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using \texttt{esp_partition_erase_range} function.

Partitions marked with an encryption flag will automatically be written via the \texttt{esp_flash_write_encrypted()} function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the \texttt{esp_flash_write_encrypted()} function for more details. Unencrypted partitions do not have this restriction.

\textbf{Note:} Prior to writing to flash memory, make sure it has been erased with \texttt{esp_partition_erase_range} call.

Parameters

- \texttt{partition} – Pointer to partition structure obtained using \texttt{esp_partition_find_first} or \texttt{esp_partition_get}. Must be non-NULL.
- \texttt{dst_offset} – Address where the data should be written, relative to the beginning of the partition.
• src – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
• size – Size of data to be written, in bytes.

Returns ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

```c
esp_err_t esp_partition_read_raw(const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)
```

Read data from the partition without any transformation/decryption.

**Note:** This function is essentially the same as `esp_partition_read()` above. It just never decrypts data but returns it as is.

**Parameters**

- partition – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- dst – Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- src_offset – Address of the data to be read, relative to the beginning of the partition.
- size – Size of data to be read, in bytes.

**Returns** ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

```c
esp_err_t esp_partition_write_raw(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)
```

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

**Note:** This function is essentially the same as `esp_partition_write()` above. It just never encrypts data but writes it as is.

**Note:** Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

**Parameters**

- partition – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- dst_offset – Address where the data should be written, relative to the beginning of the partition.
- src – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- size – Size of data to be written, in bytes.

**Returns** ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; or one of the error codes from lower-level flash driver.

```c
esp_err_t esp_partition_erase_range(const esp_partition_t *partition, size_t offset, size_t size)
```

Erase part of the partition.
Chapter 2. API Reference

Parameters

- **partition** – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **offset** – Offset from the beginning of partition where erase operation should start. Must be aligned to partition->erase_size.
- **size** – Size of the range which should be erased, in bytes. Must be divisible by partition->erase_size.

Returns

ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or dst are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; or one of error codes from lower-level flash driver.

```c
esp_err_t esp_partition_mmap(const esp_partition_t *partition, size_t offset, size_t size, esp_partition_mmap_memory_t memory, const void **out_ptr, esp_partition_mmap_handle_t *out_handle)
```

Configure MMU to map partition into data memory.

Unlike spi_flash_mmap function, which requires a 64kB aligned base address, this function doesn’t impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via out_ptr argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via out_handle argument to esp_partition_munmap function.

Parameters

- **partition** – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **offset** – Offset from the beginning of partition where mapping should start.
- **size** – Size of the area to be mapped.
- **memory** – Memory space where the region should be mapped
- **out_ptr** – Output, pointer to the mapped memory region
- **out_handle** – Output, handle which should be used for esp_partition_munmap call

Returns

ESP_OK, if successful

```c
void esp_partition_munmap(esp_partition_mmap_handle_t handle)
```

Release region previously obtained using esp_partition_mmap.

Note: Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

Parameters

- **handle** – Handle obtained from spi_flash_mmap

```c
esp_err_t esp_partition_get_sha256(const esp_partition_t *partition, uint8_t *sha_256)
```

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

Parameters

- **partition** – [in] Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- **sha_256** – [out] Returned SHA-256 digest for a given partition.

Returns

- ESP_OK: In case of successful operation.
- ESP_ERR_IMAGE_INVALID: ARG: The size was 0 or the sha_256 was NULL.
- ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
• ESP_ERR_IMAGE_INVALID: App partition doesn’t contain a valid app image.
• ESP_FAIL: An allocation error occurred.

bool esp_partition_check_identity (const esp_partition_t *partition_1, const esp_partition_t *partition_2)

Check for the identity of two partitions by SHA-256 digest.

Parameters
• partition_1 – [in] Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
• partition_2 – [in] Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

Returns
• True: In case of the two firmware is equal.
• False: Otherwise

esp_err_t esp_partition_register_external (esp_flash_t *flash_chip, size_t offset, size_t size, const char* label, esp_partition_type_t type, esp_partition_subtype_t subtype, const esp_partition_t **out_partition)

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the esp_flash_t structure) as partitions. This allows using them with components which access SPI flash through the esp_partition API.

Parameters
• flash_chip – Pointer to the structure identifying the flash chip
• offset – Address in bytes, where the partition starts
• size – Size of the partition in bytes
• label – Partition name
• type – One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications can not be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
• subtype – One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.
• out_partition – [out] Output, if non-NULL, receives the pointer to the resulting esp_partition_t structure

Returns
• ESP_OK on success
• ESP_ERR_NO_MEM if memory allocation has failed
• ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
• ESP_ERR_INVALID_SIZE if the partition doesn’t fit into the flash chip size

esp_err_t esp_partition_deregister_external (const esp_partition_t *partition)

Deregister the partition previously registered using esp_partition_register_external.

Parameters partition – pointer to the partition structure obtained from esp_partition_register_external,

Returns
• ESP_OK on success
• ESP_ERR_NOT_FOUND if the partition pointer is not found
• ESP_ERR_INVALID_ARG if the partition comes from the partition table
• ESP_ERR_INVALID_ARG if the partition was not registered using esp_partition_register_external function.

Structures

struct esp_partition_t

partition information structure
This is not the format in flash, that format is esp_partition_info_t. However, this is the format used by this API.

**Public Members**

*esp_flash_t* `flash_chip`
SPI flash chip on which the partition resides

*esp_partition_type_t* `type`
partition type (app/data)

*esp_partition_subtype_t* `subtype`
partition subtype

`uint32_t` `address`
starting address of the partition in flash

`uint32_t` `size`
size of the partition, in bytes

`uint32_t` `erase_size`
size the erase operation should be aligned to

`char` `label[17]`
partition label, zero-terminated ASCII string

`bool` `encrypted`
flag is set to true if partition is encrypted

**Macros**

`ESP_PARTITION_SUBTYPE_OTA(i)`
Convenience macro to get esp_partition_subtype_t value for the i-th OTA partition.

**Type Definitions**

typedef `uint32_t` `esp_partition_mmap_handle_t`
Opaque handle for memory region obtained from esp_partition_mmap.

typedef struct esp_partition_iterator_opaque_* `esp_partition_iterator_t`
Opaque partition iterator type.

**Enumerations**

typedef enum `esp_partition_mmap_memory_t`
Enumeration which specifies memory space requested in an mmap call.

- `ESP_PARTITION_MMAP_DATA`
  map to data memory (Vaddr0), allows byte-aligned access, 4 MB total
Chapter 2. API Reference

enumerator ESP_PARTITION_MMAP_INST
map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total

enum esp_partition_type_t
Partition type.

**Note:** Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

**Values:**

enumerator ESP_PARTITION_TYPE_APP
Application partition type.

denominator ESP_PARTITION_TYPE_DATA
Data partition type.

denominator ESP_PARTITION_TYPE_ANY
Used to search for partitions with any type.

enum esp_partition_subtype_t
Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

**Note:** These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP and ESP_PARTITION_TYPE_DATA.

**Values:**

enumerator ESP_PARTITION_SUBTYPE_APP_FACTORY
Factory application partition.

denominator ESP_PARTITION_SUBTYPE_APP_OTA_MIN
Base for OTA partition subtypes.

denominator ESP_PARTITION_SUBTYPE_APP_OTA_0
OTA partition 0.

denominator ESP_PARTITION_SUBTYPE_APP_OTA_1
OTA partition 1.

denominator ESP_PARTITION_SUBTYPE_APP_OTA_2
OTA partition 2.

denominator ESP_PARTITION_SUBTYPE_APP_OTA_3
OTA partition 3.
enumerator ESP_PARTITION_SUBTYPE_APP_OTA_4
   OTA partition 4.

enumerator ESP_PARTITION_SUBTYPE_APP_OTA_5
   OTA partition 5.

enumerator ESP_PARTITION_SUBTYPE_APP_OTA_6
   OTA partition 6.

enumerator ESP_PARTITION_SUBTYPE_APP_OTA_7
   OTA partition 7.

enumerator ESP_PARTITION_SUBTYPE_APP_OTA_8
   OTA partition 8.

enumerator ESP_PARTITION_SUBTYPE_APP_OTA_9
   OTA partition 9.

enumerator ESP_PARTITION_SUBTYPE_APP_OTA_10
   OTA partition 10.

enumerator ESP_PARTITION_SUBTYPE_APP_OTA_11
   OTA partition 11.

enumerator ESP_PARTITION_SUBTYPE_APP_OTA_12
   OTA partition 12.

enumerator ESP_PARTITION_SUBTYPE_APP_OTA_13
   OTA partition 13.

enumerator ESP_PARTITION_SUBTYPE_APP_OTA_14
   OTA partition 14.

enumerator ESP_PARTITION_SUBTYPE_APP_OTA_15
   OTA partition 15.

enumerator ESP_PARTITION_SUBTYPE_APP_OTA_MAX
   Max subtype of OTA partition.

enumerator ESP_PARTITION_SUBTYPE_APP_TEST
   Test application partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_OTA
   OTA selection partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_PHY
   PHY init data partition.
enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS**  
NVS partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_COREDUMP**  
COREDUMP partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS**  
Partition for NVS keys.

enumerator **ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM**  
Partition for emulate eFuse bits.

enumerator **ESP_PARTITION_SUBTYPE_DATA_UNDEFINED**  
Undefined (or unspecified) data partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD**  
ESPHTTPD partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_FAT**  
FAT partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_SPIFFS**  
SPIFFS partition.

enumerator **ESP_PARTITION_SUBTYPE_ANY**  
Used to search for partitions with any subtype.

### API Reference - Flash Encrypt

#### Header File

- components/bootloader_support/include/esp_flash_encrypt.h

#### Functions

**bool esp_flash_encryption_enabled** (void)

Is flash encryption currently enabled in hardware?

- **Returns** true if flash encryption is enabled.

**esp_err_t esp_flash_encrypt_check_and_update** (void)

**bool esp_flash_encrypt_state** (void)

Returns the Flash Encryption state and prints it.

- **Returns** True - Flash Encryption is enabled False - Flash Encryption is not enabled

**bool esp_flash_encrypt_initialized_once** (void)

Checks if the first initialization was done.

- If the first initialization was done then FLASH_CRYPT_CNT != 0
- **Returns** true - the first initialization was done false - the first initialization was NOT done
**esp_err_t esp_flash_encrypt_init (void)**
The first initialization of Flash Encryption key and related eFuses.

**Returns**  ESP_OK if all operations succeeded

**esp_err_t esp_flash_encrypt_contents (void)**
Encrypts flash content.

**Returns**  ESP_OK if all operations succeeded

**esp_err_t esp_flash_encrypt_enable (void)**
Activates Flash encryption on the chip.

It burns FLASH_CRYPT_CNT eFuse based on the CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE option.

**Returns**  ESP_OK if all operations succeeded

**bool esp_flash_encrypt_is_write_protected (bool print_error)**
Returns True if the write protection of FLASH_CRYPT_CNT is set.

**Parameters**  
- **print_error** - Print error if it is write protected

**Returns**  true - if FLASH_CRYPT_CNT is write protected

**esp_err_t esp_flash_encrypt_region (uint32_t src_addr, size_t data_length)**
Encrypt-in-place a block of flash sectors.

**Note:** This function resets RTC_WDT between operations with sectors.

**Parameters**
- **src_addr** - Source offset in flash. Should be multiple of 4096 bytes.
- **data_length** - Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

**Returns**  ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

**void esp_flash_write_protect_crypt_cnt (void)**
Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

**Note:** On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp Efuse_disable_rom_download_mode() before calling this function.

**esp_flash_enc_mode_t esp_get_flash_encryption_mode (void)**
Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

**Returns**

**void esp_flash_encryption_init_checks (void)**
Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:
• Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
• Log warnings if the efuse config doesn’t match the project config in any way

Note: This function is called automatically during app startup, it doesn’t need to be called from the app.

```c
esp_err_t esp_flash_encryption_enable_secure_features (void)
Set all secure eFuse features related to flash encryption.

Returns
• ESP_OK - Successfully
```

```c
bool esp_flash_encryption_cfg_verify_release_mode (void)
Returns the verification status for all physical security features of flash encryption in release mode.

If the device has flash encryption feature configured in the release mode, then it is highly recommended to call this API in the application startup code. This API verifies the sanity of the eFuse configuration against the release (production) mode of the flash encryption feature.

Returns
• True - all eFuses are configured correctly
• False - not all eFuses are configured correctly.
```

```c
void esp_flash_encryption_set_release_mode (void)
Switches Flash Encryption from "Development" to "Release".

If already in "Release" mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:
• "disable encrypt in dl mode"
• set FLASH_CRYPT_CNT efuse to max
```

Enumerations

```c
enum esp_flash_enc_mode_t
Values:

enumerator ESP_FLASH_ENC_MODE_DISABLED
enumerator ESP_FLASH_ENC_MODE_DEVELOPMENT
enumerator ESP_FLASH_ENC_MODE_RELEASE
```

2.9.7 SPIFFS Filesystem

Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.
Notes

• Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under `/spiffs`, then creating a file with the path `/spiffs/tmp/myfile.txt` will create a file called `/tmp/myfile.txt` in SPIFFS, instead of `myfile.txt` in the directory `/spiffs/tmp`.
• It is not a real-time stack. One write operation might take much longer than another.
• For now, it does not detect or handle bad blocks.
• SPIFFS is able to reliably utilize only around 75% of assigned partition space.
• When the filesystem is running out of space, the garbage collector is trying to find free space by scanning the filesystem multiple times, which can take up to several seconds per write function call, depending on required space. This is caused by the SPIFFS design and the issue has been reported multiple times (e.g. here) and in the official SPIFFS github repository. The issue can be partially mitigated by the SPIFFS configuration.
• Deleting a file does not always remove the whole file, which leaves unusable sections throughout the filesystem.
• When the chip experiences a power loss during a file system operation it could result in SPIFFS corruption. However the file system still might be recovered via esp_spiffs_check function. More details in the official SPIFFS FAQ.

Tools

spiffsgen.py spiffsgen.py is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use spiffsgen.py, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

• **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
• **base_dir**: directory for which the SPIFFS image needs to be created.
• **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool’s help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using esptool.py or parttool.py.

Aside from invoking the spiffsgen.py standalone by manually running it from the command line or a script, it is also possible to invoke spiffsgen.py directly from the build system by calling spiffs_create_partition_image:

```
spiffs_create_partition_image({partition} {base_dir} [FLASH_IN_PROJECT] [DEPENDS... --dep dep dep...])
```

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the image_size is required for the standalone invocation, only the partition name is required when using spiffs_create_partition_image—the image size is automatically obtained from the project’s partition table.

**spiffs_create_partition_image** must be called from one of the component CMakeLists.txt files.

Optionally, users can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on idf.py flash by specifying FLASH_IN_PROJECT. For example:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```
Chapter 2. API Reference

If FLASH_IN_PROJECT/SPIFFS.IMAGE_FLASH_IN_PROJECT is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py`, `parttool.py`, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use DEPENDS/SPIFFS_IMAGE_DEPENDS to specify targets that should be executed before generating the image:

```
add_custom_target(dep COMMAND ...)
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```

For an example, see `storage/spiffsgen`.

**mkspiffs**  
Another tool for creating SPIFFS partition images is `mkspiffs`. Similar to `spiffsgen.py`, it can be used to create an image from a given folder and then flash that image using `esptool.py`.

For that, you need to obtain the following parameters:

- **Block Size**: 4096 (standard for SPI Flash)
- **Page Size**: 256 (standard for SPI Flash)
- **Image Size**: Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset**: Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32 at offset 0x110000, run:

```
python esptool.py --chip esp32 --port [port] --baud [baud] write_flash -z 0x110000... --spiffs.bin
```

**Notes on which SPIFFS tool to use**  
The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

Use `spiffsgen.py` in the following cases:

1. If you want to simply generate a SPIFFS image during the build. `spiffsgen.py` makes it very convenient by providing functions/commands from the build system itself.
2. If the host has no C/C++ compiler available, because `spiffsgen.py` does not require compilation.

Use `mkspiffs` in the following cases:

1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with `spiffsgen.py`.
2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled `mkspiffs` binary can do the job. However, there is no build system integration for `mkspiffs` and the user has to do the corresponding work: compiling `mkspiffs` during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

- **Partition Table documentation**

**Application Example**

An example of using SPIFFS is provided in the `storage/spiffs` directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.
Chapter 2. API Reference

High-level API Reference

Header File

- components/spiffs/include/esp_spiffs.h

Functions

**esp_err_t esp_vfs_spiffs_register**(const *esp_vfs_spiffs_conf_t* conf)

Register and mount SPIFFS to VFS with given path prefix.

Parameters

- **conf** - Pointer to *esp_vfs_spiffs_conf_t* configuration structure

Returns

- ESP_OK if success
- ESP_ERR_NO_MEM if objects could not be allocated
- ESP_ERR_INVALID_STATE if already mounted or partition is encrypted
- ESP_ERR_NOT_FOUND if partition for SPIFFS was not found
- ESP_FAIL if mount or format fails

**esp_err_t esp_vfs_spiffs_unregister**(const char* partition_label)

Unregister and unmount SPIFFS from VFS

Parameters

- **partition_label** - Same label as passed to esp_vfs_spiffs_register.

Returns

- ESP_OK if successful
- ESP_ERR_INVALID_STATE already unregistered

**bool esp_spiffs_mounted**(const char* partition_label)

Check if SPIFFS is mounted

Parameters

- **partition_label** - Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

Returns

- true if mounted
- false if not mounted

**esp_err_t esp_spiffs_format**(const char* partition_label)

Format the SPIFFS partition

Parameters

- **partition_label** - Same label as passed to esp_vfs_spiffs_register.

Returns

- ESP_OK if successful
- ESP_FAIL on error

**esp_err_t esp_spiffs_info**(const char* partition_label, size_t* total_bytes, size_t* used_bytes)

Get information for SPIFFS

Parameters

- **partition_label** - Same label as passed to esp_vfs_spiffs_register
- **total_bytes** - [out] Size of the file system
- **used_bytes** - [out] Current used bytes in the file system

Returns

- ESP_OK if success
- ESP_ERR_INVALID_STATE if not mounted

**esp_err_t esp_spiffs_check**(const char* partition_label)

Check integrity of SPIFFS

Parameters

- **partition_label** - Same label as passed to esp_vfs_spiffs_register

Returns

- ESP_OK if successful
- ESP_ERR_INVALID_STATE if not mounted
- ESP_FAIL on error
Perform garbage collection in SPIFFS partition.

Call this function to run GC and ensure that at least the given amount of space is available in the partition. This function will fail with ESP_ERR_NOT_FINISHED if it is not possible to reclaim the requested space (that is, not enough free or deleted pages in the filesystem). This function will also fail if it fails to reclaim the requested space after CONFIG_SPIFFS_GC_MAX_RUNS number of GC iterations. On one GC iteration, SPIFFS will erase one logical block (4kB). Therefore the value of CONFIG_SPIFFS_GC_MAX_RUNS should be set at least to the maximum expected size_to_gc, divided by 4096. For example, if the application expects to make room for a 1MB file and calls esp_spiffs_gc(label, 1024 * 1024), CONFIG_SPIFFS_GC_MAX_RUNS should be set to at least 256. On the other hand, increasing CONFIG_SPIFFS_GC_MAX_RUNS value increases the maximum amount of time for which any SPIFFS GC or write operation may potentially block.

**Parameters**
- `partition_label` - Label of the partition to be garbage-collected. The partition must be already mounted.
- `size_to_gc` - The number of bytes that the GC process should attempt to make available.

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_FINISHED if GC fails to reclaim the size given by size_to_gc
- ESP_ERR_INVALID_STATE if the partition is not mounted
- ESP_FAIL on all other errors

**Structures**

```c
struct esp_vfs_spiffs_conf_t
```

Configuration structure for esp_vfs_spiffs_register.

**Public Members**

- `const char *base_path`
  File path prefix associated with the filesystem.

- `const char *partition_label`
  Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

- `size_t max_files`
  Maximum files that could be open at the same time.

- `bool format_if_mount_failed`
  If true, it will format the file system if it fails to mount.

## 2.9.8 Virtual filesystem component

**Overview**

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.
This component allows C library functions, such as fopen and fprintf, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the /fat prefix and call fopen("/fat/file.txt", "w"). The VFS component will then call the function open of the FAT driver and pass the argument /file.txt to it together with appropriate mode flags. All subsequent calls to C library functions for the returned FILE* stream will also be forwarded to the FAT driver.

**FS registration**

To register an FS driver, an application needs to define an instance of the esp_vfs_t structure and populate it with function pointers to FS APIs:

```c
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way how the FS driver declares its API functions, either read, write, etc., or read_p, write_p, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```c
ssize_t myfs_write(int fd, const void * data, size_t size);
```

```c
// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
// ... other members initialized
// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```c
ssize_t myfs_write(myfs_t *fs, int fd, const void * data, size_t size);
```

```c
// In definition of esp_vfs_t:
    .flags = ESP_VFS_FLAG_CONTEXT_PTR,
    .write_p = &myfs_write,
// ... other members initialized
// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t * myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));
// Can register another instance:
myfs_t * myfs_inst2 = myfs_mount(partition2->offset, partition2->size);
ESP_ERROR_CHECK(esp_vfs_register("/data2", &myfs, myfs_inst2));
```

**Synchronous input/output multiplexing**  Synchronous input/output multiplexing by select() is supported in the VFS component. The implementation works in the following way.
1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()`, described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.
5. Results are collected from each VFS driver and all drivers are stopped by de-initialization of the environment for checking events.
6. The `select()` call ends and returns the appropriate results.

### Non-socket VFS drivers

If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver, then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```c
// In definition of esp_vfs_t:
.start_select = &uart_start_select,
.end_select = &uart_end_select,
// ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

`end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

**Note:** `end_select()` might be called without a previous `start_select()` call in some rare circumstances. `end_select()` should fail gracefully if this is the case (i.e., should not crash but return an error instead).

Please refer to the reference implementation for the UART peripheral in `vfs/vfs_uart.c` and most particularly to the functions `esp_vfs_dev_uart_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:

- `peripherals/uart/uart_select`
- `system/select`

### Socket VFS drivers

A socket VFS driver is using its own internal implementation of `select()` and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```c
// In definition of esp_vfs_t:
.socket_select = &lwip_select,
.get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
.stop_socket_select = &lwip_stop_socket_select,
.stop_socket_select_isr = &lwip_stop_socket_select_isr,
// ... other members initialized
```

`socket_select()` is the internal implementation of `select()` for the socket driver. It works only with file descriptors belonging to the socket VFS.

`get_socket_select_semaphore()` returns the signalization object (semaphore) which will be used in non-socket drivers to stop the waiting in `socket_select()`.

`stop_socket_select()` call is used to stop the waiting in `socket_select()` by passing the object returned by `get_socket_select_semaphore()`.
stop_socket_select_isr() has the same functionality as stop_socket_select() but it can be used from ISR.

Please see lwip/port/esp32/vfs_lwip.c for a reference socket driver implementation using LWIP.

Note: If you use select() for socket file descriptors only then you can disable the CONFIG_VFS_SUPPORT_SELECT option to reduce the code size and improve performance. You should not change the socket driver during an active select() call or you might experience some undefined behavior.

Paths

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following filesystems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called /data/log.txt
- FS 2 will be used when opening a file called /data/static/index.html
- Even if /index.html" does not exist in FS 2, FS 1 will not be searched for /static/index.html.

As a general rule, mount point names must start with the path separator (/) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” filesystem or to override VFS functionality altogether. Such filesystem will be used if no prefix matches the path given.

VFS does not handle dots (.) in path names in any special way. VFS does not treat .. as a reference to the parent directory. In the above example, using a path /data/static/../log.txt will not result in a call to FS 1 to open /log.txt. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The myfs driver is registered with /data as a path prefix.
2. The application calls fopen("/data/config.json", ...).
3. The VFS component calls myfs_open("/config.json", ...).
4. The myfs driver opens the /config.json file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to ESP_VFS_PATH_MAX characters. Individual FS drivers may have their own filename length limitations.

File descriptors

File descriptors are small positive integers from 0 to FD_SETSIZE - 1, where FD_SETSIZE is defined in newlib's sys/types.h. The largest file descriptors (configured by CONFIG_LWIP_MAX SOCKETS) are reserved for sockets. The VFS component contains a lookup-table called s_fd_table for mapping global file descriptors to VFS driver indexes registered in the s_vfs array.

Standard IO streams (stdin, stdout, stderr)

If the menuconfig option UART for console output is not set to None, then stdin, stdout, and stderr are configured to read from, and write to, a UART. It is possible to use UART0 or UART1 for standard IO. By default, UART0 is used with 115200 baud rate; TX pin is GPIO1; RX pin is GPIO3. These parameters can be changed in menuconfig.
Writing to stdout or stderr will send characters to the UART transmit FIFO. Reading from stdin will retrieve characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as fscanf("%d\n", &var), might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver’s interrupt driven, blocking read and write functions instead. This can be done using a call to the esp_vfs_dev_uart_use_driver function. It is also possible to revert to the basic non-blocking functions using a call to esp_vfs_dev_uart_use_nonblocking.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF (‘n’) character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via menuconfig, or by calls to the functions esp_vfs_dev_uart_port_set_rx_line_endings and esp_vfs_dev_uart_port_set_tx_line_endings.

Standard streams and FreeRTOS tasks FILE objects for stdin, stdout, and stderr are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task struct _reent.

The following code is transferred to fprintf(__getreent()->_stderr, "42\n"); by the preprocessor:

```c
fprintf(stderr, "42\n");
```

The __getreent() function returns a per-task pointer to struct _reent in newlib libc. This structure is allocated on the TCB of each task. When a task is initialized, _stdin, _stdout, and _stderr members of struct _reent are set to the values of _stdin, _stdout, and _stderr of _GLOBAL_REENT (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

- It is possible to set stdin, stdout, and stderr for any given task without affecting other tasks, e.g., by doing stdin = fopen("/dev/uart/1", "r").
- Closing default stdin, stdout, or stderr using fclose will close the FILE stream object, which will affect all other tasks.
- To change the default stdin, stdout, stderr streams for new tasks, modify _GLOBAL_REENT->_stdin(_stdout,_stderr) before creating the task.

Event fds

eventfd() call is a powerful tool to notify a select() based loop of custom events. The eventfd() implementation in ESP-IDF is generally the same as described in man(2) eventfd except for:

- esp_vfs_eventfd_register() has to be called before calling eventfd()
- Options EFD_CLOEXEC, EFD_NONBLOCK and EFD_SEMAPHORE are not supported in flags.
- Option EFD_SUPPORT_ISR has been added in flags. This flag is required to read and write the eventfd in an interrupt handler.

Note that creating an eventfd with EFD_SUPPORT_ISR will cause interrupts to be temporarily disabled when reading, writing the file and during the beginning and the ending of the select() when this file is set.

API Reference

Header File

- components/vfs/include/esp_vfs.h
Functions

ssize_t esp_vfs_write (struct _reent *r, int fd, const void *data, size_t size)

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

off_t esp_vfs_lseek (struct _reent *r, int fd, off_t size, int mode)

ssize_t esp_vfs_read (struct _reent *r, int fd, void *dst, size_t size)

int esp_vfs_open (struct _reent *r, const char *path, int flags, int mode)

int esp_vfs_close (struct _reent *r, int fd)

int esp_vfs_fstat (struct _reent *r, int fd, struct stat *st)

int esp_vfs_stat (struct _reent *r, const char *path, struct stat *st)

int esp_vfs_link (struct _reent *r, const char *n1, const char *n2)

int esp_vfs_unlink (struct _reent *r, const char *path)

int esp_vfs_rename (struct _reent *r, const char *src, const char *dst)

int esp_vfs_utime (const char *path, const struct utimbuf *times)

esp_err_t esp_vfs_register (const char *base_path, const esp_vfs_t *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

Parameters

• base_path – file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to ESP_VFS_PATH_MAX characters long, and at least 2 characters long. Name must start with a `/` and must not end with `/`. For example, `/data` or `/dev/spi` are valid. These VFSes would then be called to handle file paths such as `/data/myfile.txt` or `/dev/spi/0`. In the special case of an empty base_path, a “fallback” VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.

• vfs – Pointer to esp_vfs_t, a structure which maps syscalls to the filesystem driver functions. VFS component doesn’t assume ownership of this pointer.

• ctx – If vfs->flags has ESP_VFS_FLAG_CONTEXT_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

esp_err_t esp_vfs_register_fd_range (const esp_vfs_t *vfs, void *ctx, int min_fd, int max_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min_fd; max_fd>

This is a special-purpose function intended for registering LWIP sockets to VFS.

Parameters

• vfs – Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().

• ctx – Pointer to context structure. Meaning is the same as for esp_vfs_register().

• min_fd – The smallest file descriptor this VFS will use.

• max_fd – Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

esp_err_t esp_vfs_register_with_id (const esp_vfs_t *vfs, void *ctx, esp_vfs_id_t *vfs_id)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn’t pre-registers an interval of file descriptors. File descriptors can be registered later, by using esp_vfs_register_fd.

Parameters

• vfs – Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
• **ctx** – Pointer to context structure. Meaning is the same as for esp_vfs_register().
• **vfs_id** – Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.

**Returns**
- ESP_OK if successful,
- ESP_ERR_NO_MEM if too many VFSes are registered,
- ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

`esp_err_t esp_vfs_unregister (const char* base_path)`

Unregister a virtual filesystem for given path prefix

**Parameters**
- **base_path** – File prefix previously used in esp_vfs_register call

**Returns**
- ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

`esp_err_t esp_vfs_unregister_with_id (esp_vfs_id_t vfs_id)`

Unregister a virtual filesystem with the given index

**Parameters**
- **vfs_id** – The VFS ID returned by esp_vfs_register_with_id

**Returns**
- ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for the given index hasn’t been registered

`esp_err_t esp_vfs_register_fd (esp_vfs_id_t vfs_id, int*fd)`

Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id.

**Parameters**
- **vfs_id** – VFS identifier returned by esp_vfs_register_with_id.
- **fd** – The registered file descriptor will be written to this address.

**Returns**
- ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

`esp_err_t esp_vfs_register_fd_with_local_fd (esp_vfs_id_t vfs_id, int local_fd, bool permanent, int *fd)`

Special function for registering another file descriptor with given local_fd for a VFS registered by esp_vfs_register_with_id.

**Parameters**
- **vfs_id** – VFS identifier returned by esp_vfs_register_with_id.
- **local_fd** – The fd in the local vfs. Passing -1 will set the local fd as the (*fd) value.
- **permanent** – Whether the fd should be treated as permanet (not removed after close())
- **fd** – The registered file descriptor will be written to this address.

**Returns**
- ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

`esp_err_t esp_vfs_unregister_fd (esp_vfs_id_t vfs_id, int fd)`

Special function for unregistering a file descriptor belonging to a VFS registered by esp_vfs_register_with_id.

**Parameters**
- **vfs_id** – VFS identifier returned by esp_vfs_register_with_id.
- **fd** – File descriptor which should be unregistered.

**Returns**
- ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

`int esp_vfs_select (int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)`

Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

**Parameters**
- **nfds** – Specifies the range of descriptors which should be checked. The first nfds descriptors will be checked in each set.
- **readfds** – If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- **writefds** – If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
**errorfds** – If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.

**timeout** – If not NULL, then points to timeval structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

**Returns** The number of descriptors set in the descriptor sets, or -1 when an error (specified by errno) have occurred.

```c
void esp_vfs_select_triggered(esp_vfs_select_sem_t sem)
```

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

**Parameters**

- `sem` – semaphore structure which was passed to the driver by the start_select call

```c
void esp_vfs_select_triggered_isr(esp_vfs_select_sem_t sem, BaseType_t *woken)
```

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to start_select.

**Parameters**

- `sem` – semaphore structure which was passed to the driver by the start_select call
- `woken` – is set to pdTRUE if the function wakes up a task with higher priority

```c
ssize_t esp_vfs_pread(int fd, void *dst, size_t size, off_t offset)
```

Implements the VFS layer of POSIX pread()

**Parameters**

- `fd` - File descriptor used for read
- `dst` – Pointer to the buffer where the output will be written
- `size` – Number of bytes to be read
- `offset` – Starting offset of the read

**Returns** A positive return value indicates the number of bytes read. -1 is return on failure and errno is set accordingly.

```c
ssize_t esp_vfs_pwrite(int fd, const void *src, size_t size, off_t offset)
```

Implements the VFS layer of POSIX pwrite()

**Parameters**

- `fd` - File descriptor used for write
- `src` – Pointer to the buffer from where the output will be read
- `size` – Number of bytes to write
- `offset` – Starting offset of the write

**Returns** A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

**Structures**

```c
struct esp_vfs_select_sem_t
```

VFS semaphore type for select()

**Public Members**

```c
bool is_sem_local
```

type of “sem” is SemaphoreHandle_t when true, defined by socket driver otherwise
void *sem

Semaphore instance

struct esp_vfs_t

VFS definition structure.

This structure should be filled with pointers to corresponding FS driver functions.

VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The
caller sees a global FD which is prefixed with an pre-filesystem-implementation.

Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument.
For these implementations, populate the members of this structure which have _p suffix, set flags member
to ESP_VFS_FLAG_CONTEXT_PTR and provide the context pointer to esp_vfs_register function. If the
implementation doesn’t use this extra argument, populate the members without _p suffix and set flags member
to ESP_VFS_FLAG_DEFAULT.

If the FS driver doesn’t provide some of the functions, set corresponding members to NULL.

Public Members

int flags

ESP_VFS_FLAG_CONTEXT_PTR or ESP_VFS_FLAG_DEFAULT

ssize_t (*write_p)(void *p, int fd, const void *data, size_t size)

Write with context pointer

ssize_t (*write)(int fd, const void *data, size_t size)

Write without context pointer

off_t (*lseek_p)(void *p, int fd, off_t size, int mode)

Seek with context pointer

off_t (*lseek)(int fd, off_t size, int mode)

Seek without context pointer

ssize_t (*read_p)(void *ctx, int fd, void *dst, size_t size)

Read with context pointer

ssize_t (*read)(int fd, void *dst, size_t size)

Read without context pointer

ssize_t (*pread_p)(void *ctx, int fd, void *dst, size_t size, off_t offset)

pread with context pointer

ssize_t (*pread)(int fd, void *dst, size_t size, off_t offset)

pread without context pointer

ssize_t (*pwrite_p)(void *ctx, int fd, const void *src, size_t size, off_t offset)

pwrite with context pointer
Chapter 2. API Reference

ssize_t (*pwrite)(int fd, const void *src, size_t size, off_t offset)
    write without context pointer

int (*open_p)(void *ctx, const char *path, int flags, int mode)
    open with context pointer

int (*open)(const char *path, int flags, int mode)
    open without context pointer

int (*close_p)(void *ctx, int fd)
    close with context pointer

int (*close)(int fd)
    close without context pointer

int (*fstat_p)(void *ctx, int fd, struct stat *st)
    fstat with context pointer

int (*fstat)(int fd, struct stat *st)
    fstat without context pointer

int (*stat_p)(void *ctx, const char *path, struct stat *st)
    stat with context pointer

int (*stat)(const char *path, struct stat *st)
    stat without context pointer

int (*link_p)(void *ctx, const char *n1, const char *n2)
    link with context pointer

int (*link)(const char *n1, const char *n2)
    link without context pointer

int (*unlink_p)(void *ctx, const char *path)
    unlink with context pointer

int (*unlink)(const char *path)
    unlink without context pointer

int (*rename_p)(void *ctx, const char *src, const char *dst)
    rename with context pointer

int (*rename)(const char *src, const char *dst)
    rename without context pointer

DIR *(*opendir_p)(void *ctx, const char *name)
    opendir with context pointer
DIR *(*opendir)(const char *name)
opendir without context pointer

struct dirent *(*readdir_p)(void *ctx, DIR *pdir)
readdir with context pointer

struct dirent *(*readdir)(DIR *pdir)
readdir without context pointer

int (*readdir_r_p)(void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
readdir_r with context pointer

int (*readdir_r)(DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
readdir_r without context pointer

long (*telldir_p)(void *ctx, DIR *pdir)
telldir with context pointer

long (*telldir)(DIR *pdir)
telldir without context pointer

void (*seekdir_p)(void *ctx, DIR *pdir, long offset)
seekdir with context pointer

void (*seekdir)(DIR *pdir, long offset)
seekdir without context pointer

int (*closedir_p)(void *ctx, DIR *pdir)
closedir with context pointer

int (*closedir)(DIR *pdir)
closedir without context pointer

int (*mkdir_p)(void *ctx, const char *name, mode_t mode)
mkdir with context pointer

int (*mkdir)(const char *name, mode_t mode)
mkdir without context pointer

int (*rmdir_p)(void *ctx, const char *name)
rmdir with context pointer

int (*rmdir)(const char *name)
rmdir without context pointer

int (*fcntl_p)(void *ctx, int fd, int cmd, int arg)
fcntl with context pointer
int (*fcntl)(int fd, int cmd, int arg)
fcntl without context pointer

int (*ioctl_p)(void *ctx, int fd, int cmd, va_list args)
ioctl with context pointer

int (*ioctl)(int fd, int cmd, va_list args)
ioctl without context pointer

int (*fsync_p)(void *ctx, int fd)
fsync with context pointer

int (*fsync)(int fd)
fsync without context pointer

int (*access_p)(void *ctx, const char *path, int amode)
access with context pointer

int (*access)(const char *path, int amode)
access without context pointer

int (*truncate_p)(void *ctx, const char *path, off_t length)
truncate with context pointer

int (*truncate)(const char *path, off_t length)
truncate without context pointer

int (*ftruncate_p)(void *ctx, int fd, off_t length)
ftruncate with context pointer

int (*ftruncate)(int fd, off_t length)
ftruncate without context pointer

int (*utime_p)(void *ctx, const char *path, const struct utimbuf *times)
utime with context pointer

int (*utime)(const char *path, const struct utimbuf *times)
utime without context pointer

int (*tcsetattr_p)(void *ctx, int fd, int optional_actions, const struct termios *p)
tcsetattr with context pointer

int (*tcsetattr)(int fd, int optional_actions, const struct termios *p)
tcsetattr without context pointer

int (*tcgetattr_p)(void *ctx, int fd, struct termios *p)
tcgetattr with context pointer
int (*tcgetattr)(int fd, struct termios *p)

tcgetattr without context pointer

int (*tcdrain_p)(void *ctx, int fd)

tcdrain with context pointer

int (*tcdrain)(int fd)

tcdrain without context pointer

int (*tcflush_p)(void *ctx, int fd, int select)

tcflush with context pointer

int (*tcflush)(int fd, int select)

tcflush without context pointer

int (*tcflow_p)(void *ctx, int fd, int action)

tcflow with context pointer

int (*tcflow)(int fd, int action)

tcflow without context pointer

pid_t (*tcgetsid_p)(void *ctx, int fd)

tcgetsid with context pointer

pid_t (*tcgetsid)(int fd)

tcgetsid without context pointer

int (*tcsendbreak_p)(void *ctx, int fd, int duration)

tcsendbreak with context pointer

int (*tcsendbreak)(int fd, int duration)

tcsendbreak without context pointer

esp_err_t (*start_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds, esp_vfs_select_sem_t sem, void **end_select_args)

start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the given VFS

int (*socket_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)

socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (*stop_socket_select)(void *sem)

called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (*stop_socket_select_isr)(void *sem, BaseType_t *woken)

stop_socket_select which can be called from ISR; set only for the socket driver
void *(*get_socket_select_semaphore)(void)
    end_select is called to stop the I/O multiplexing and deinitialize the environment created by start_select for the given VFS

esp_err_t (*end_select)(void *end_select_args)
    get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

Macros

MAX_FDS
    Maximum number of (global) file descriptors.

ESP_VFS_PATH_MAX
    Maximum length of path prefix (not including zero terminator)

ESP_VFS_FLAG_DEFAULT
    Default value of flags member in esp_vfs_t structure.

ESP_VFS_FLAG_CONTEXT_PTR
    Flag which indicates that FS needs extra context pointer in syscalls.

Type Definitions

typedef int esp_vfs_id_t

Header File

• components/vfs/include/esp_vfs_dev.h

Functions

void esp_vfs_dev_uart_register (void)
    add /dev/uart virtual filesystem driver

void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)
    Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines (’, LF) passed into stdin:

• ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
• ESP_LINE_ENDINGS_CR: convert CR to LF
• ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. reading from UART

Parameters mode – line endings expected on UART
void esp_vfs_dev_uart_set_tx_line_endings (esp_line_endings_t mode)
    Set the line endings to sent to UART.

This specifies the conversion between newlines (’
    ’ , LF) on stdout and line endings sent over UART:

• ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
• ESP_LINE_ENDINGS_CR: convert LF to CR
• ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. writing to UART

Parameters

mode – line endings to send to UART

int esp_vfs_dev_uart_port_set_rx_line_endings (int uart_num, esp_line_endings_t mode)
    Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines (’
    ’ , LF) passed into stdin:

• ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
• ESP_LINE_ENDINGS_CR: convert CR to LF
• ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. reading from UART

Parameters

• uart_num – the UART number
• mode – line endings to send to UART

Returns 0 if succeeded, or -1 when an error (specified by errno) have occurred.

int esp_vfs_dev_uart_port_set_tx_line_endings (int uart_num, esp_line_endings_t mode)
    Set the line endings to sent to specified UART.

This specifies the conversion between newlines (’
    ’ , LF) on stdout and line endings sent over UART:

• ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
• ESP_LINE_ENDINGS_CR: convert LF to CR
• ESP_LINE_ENDINGS_LF: no modification

Note: this function is not thread safe w.r.t. writing to UART

Parameters

• uart_num – the UART number
Chapter 2. API Reference

- **mode** - line endings to send to UART

  **Returns** 0 if succeeded, or -1 when an error (specified by errno) have occurred.

```c
void esp_vfs_dev_uart_use_nonblocking (int uart_num)
```

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Parameters**
- **uart_num** – UART peripheral number

```c
void esp_vfs_dev_uart_use_driver (int uart_num)
```

set VFS to use UART driver for reading and writing

**Note:** application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

```c
Parameters uart_num – UART peripheral number
```

```c
void esp_vfs_usb_serial_jtag_use_driver (void)
```

set VFS to use USB-SERIAL-JTAG driver for reading and writing

**Note:** application must configure USB-SERIAL-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

```c
void esp_vfs_usb_serial_jtag_use_nonblocking (void)
```

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Header File**

- `components/vfs/include/esp_vfs_eventfd.h`

**Functions**

```c
esp_err_t esp_vfs_eventfd_register (const esp_vfs_eventfd_config_t *config)
```

Registers the event vfs.

**Returns**
- ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

```c
esp_err_t esp_vfs_eventfd_unregister (void)
```

Unregisters the event vfs.

**Returns**
- ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

```c
int eventfd (unsigned int initval, int flags)
```

**Structures**

```c
struct esp_vfs_eventfd_config_t
```

Eventfd vfs initialization settings.

**Public Members**

```c
size_t max_fds
```

The maximum number of eventfds supported
Chapter 2. API Reference

Macros

EFD_SUPPORT_ISR
ESP_VFS_EVENTD_CONFIG_DEFAULT()

2.9.9 Wear Levelling API

Overview

Most of flash memory and especially SPI flash that is used in ESP32 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.

The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in \textit{FAT filesystem}.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

- **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.
- **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows:

- Sector size is 512 bytes
- Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

Wear Levelling access API functions

This is the set of API functions for working with data in flash:

- \texttt{wl\_mount} - initializes the wear levelling module and mounts the specified partition
- \texttt{wl\_unmount} - unmounts the partition and deinitializes the wear levelling module
- \texttt{wl\_erase\_range} - erases a range of addresses in flash
- \texttt{wl\_write} - writes data to a partition
- \texttt{wl\_read} - reads data from a partition
- \texttt{wl\_size} - returns the size of available memory in bytes
- \texttt{wl\_sector\_size} - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

Memory Size

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.
Chapter 2. API Reference

Application Example

An example that combines the wear levelling driver with the FATFS library is provided in the storage/wear_levelling directory. This example initializes the wear levelling driver, mounts FatFs partition, as well as writes and reads data from it using POSIX and C library APIs. See storage/wear_levelling/README.md for more information.

High-level API Reference

Header Files

- fatfs/vfs/esp_vfs_fat.h

High-level wear levelling functions esp_vfs_fat_spiflash_mount_rw_wl() , esp_vfs_fat_spiflashUnmount_rw_wl() and struct esp_vfs_fat_mount_config_t are described in FAT Filesystem Support.

Mid-level API Reference

Header File

- components/wear_levelling/include/wear_levelling.h

Functions

esp_err_t wl_mount (const esp_partition_t *partition, wl_handle_t *out_handle)

Mount WL for defined partition.

Parameters

- partition – that will be used for access
- out_handle – handle of the WL instance

Returns

- ESP_OK, if the allocation was successfully;
- ESP_ERR_INVALID_ARG, if WL allocation was unsuccessful;
- ESP_ERR_NO_MEM, if there was no memory to allocate WL components;

esp_err_t wlUnmount (wl_handle_t handle)

Unmount WL for defined partition.

Parameters handle – WL partition handle

Returns

- ESP_OK, if the operation completed successfully;
- or one of error codes from lower-level flash driver.

esp_err_t wl_erase_range (wl_handle_t handle, size_t start_addr, size_t size)

Erase part of the WL storage.

Parameters

- handle – WL handle that are related to the partition
- start_addr – Address where erase operation should start. Must be aligned to the result of function wl_sector_size(⋯).
- size – Size of the range which should be erased, in bytes. Must be divisible by result of function wl_sector_size(⋯).

Returns

- ESP_OK, if the range was erased successfully;
- ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
Chapter 2. API Reference

- ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

```c
esp_err_t wl_write (wl_handle_t handle, size_t dest_addr, const void *src, size_t size)
```

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `wl_erase_range` function.

**Note:** Prior to writing to WL storage, make sure it has been erased with `wl_erase_range` call.

### Parameters
- **handle** - WL handle that are related to the partition
- **dest_addr** - Address where the data should be written, relative to the beginning of the partition.
- **src** - Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- **size** - Size of data to be written, in bytes.

### Returns
- ESP_OK, if data was written successfully;
- ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

```c
esp_err_t wl_read (wl_handle_t handle, size_t src_addr, void *dest, size_t size)
```

Read data from the WL storage.

### Parameters
- **handle** - WL module instance that was initialized before
- **dest** - Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- **src_addr** - Address of the data to be read, relative to the beginning of the partition.
- **size** - Size of data to be read, in bytes.

### Returns
- ESP_OK, if data was read successfully;
- ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

```c
size_t wl_size (wl_handle_t handle)
```

Get size of the WL storage.

### Parameters
- **handle** - WL module handle that was initialized before

### Returns
usable size, in bytes

```c
size_t wl_sector_size (wl_handle_t handle)
```

Get sector size of the WL instance.

### Parameters
- **handle** - WL module handle that was initialized before

### Returns
sector size, in bytes

### Macros

**WL_INVALID_HANDLE**

### Type Definitions
typedef int32_t wl_handle_t
wear levelling handle

Code examples for this API section are provided in the storage directory of ESP-IDF examples.

2.10 System API

2.10.1 App Image Format

An application image consists of the following structures:

1. The esp_image_header_t structure describes the mode of SPI flash and the count of memory segments.
2. The esp_image_segment_header_t structure describes each segment, its length, and its location in ESP32's memory, followed by the data with a length of data_len. The data offset for each segment in the image is calculated in the following way:

   - offset for 0 Segment = sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t).
   - offset for 1 Segment = offset for 0 Segment + length of 0 Segment + sizeof(esp_image_segment_header_t).
   - offset for 2 Segment = offset for 1 Segment + length of 1 Segment + sizeof(esp_image_segment_header_t).

   The count of each segment is defined in the segment_count field that is stored in esp_image_header_t. The count cannot be more than ESP_IMAGE_MAX_SEGMENTS.

To get the list of your image segments, please run the following command:

esptool.py --chip esp32 image_info build/app.bin

You can also see the information on segments in the ESP-IDF logs while your application is booting:

I (443) esp_image: segment 0: paddr=0x00020020 vaddr=0x3f400020 size=0x13ce0 (-_ exploitation_ - map)
I (489) esp_image: segment 1: paddr=0x00033d08 vaddr=0x3f800000 size=0x00000 ( 0)-- load
I (530) esp_image: segment 2: paddr=0x00033d10 vaddr=0x3f800000 size=0x00000 ( 0)-- load

(continues on next page)
### Application Description

The DROM segment starts with the `esp_app_desc_t` structure which carries specific fields describing the application:

- **magic_word**: the magic word for the `esp_app_desc` structure.
- **secure_version**: see Anti-rollback.
- **version**: see App version.*
- **project_name** is filled from PROJECT_NAME.*
- **time and date**: compile time and date.
- **idf_ver**: version of ESP-IDF.*
- **app_elf_sha256**: contains sha256 for the elf application file.

* - The maximum length is 32 characters, including null-termination character. For example, if the length of PROJECT_NAME exceeds 32 characters, the excess characters will be disregarded.

This structure is useful for identification of images uploaded OTA because it has a fixed offset = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`. As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued or not.

### Adding a Custom Structure to an Application

Users also have the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

---

For more details on the type of memory segments and their address ranges, see *ESP32 Technical Reference Manual > System and Memory > Embedded Memory* [PDF].

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.

4. If the hash_appended field from `esp_image_header_t` is set then a SHA256 checksum will be appended. The value of SHA256 is calculated on the range from the first byte and up to this field. The length of this field is 32 bytes.

5. If the options **CONFIG_SECURE_SIGNED_APPS_SCHEME** is set to ECDSA then the application image will have additional 68 bytes for an ECDSA signature, which includes:

- version word (4 bytes),
- signature data (64 bytes).

</tr>
</tbody>
</table>
Offset for custom structure is sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t).

To guarantee that the custom structure is located in the image even if it is not used, you need to add target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc") into CMakeLists.txt.

**API Reference**

**Header File**

- components/bootloader_support/include/esp_app_format.h

**Structures**

struct esp_image_header_t

Main header of binary image.

**Public Members**

- uint8_t magic
  
  Magic word ESP_IMAGE_HEADER_MAGIC

- uint8_t segment_count
  
  Count of memory segments

- uint8_t spi_mode
  
  Flash read mode (esp_image_spi_mode_t as uint8_t)

- uint8_t spi_speed
  
  Flash frequency (esp_image_spi_freq_t as uint8_t)

- uint8_t spi_size
  
  Flash chip size (esp_image_flash_size_t as uint8_t)

- uint32_t entry_addr
  
  Entry address

- uint8_t wp_pin
  
  WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to configure the WP pin and sets this field to 0xEE=disabled)

- uint8_t spi_pin_drv[3]
  
  Drive settings for the SPI flash pins (read by ROM bootloader)

- esp_chip_id_t chip_id
  
  Chip identification number
Chapter 2. API Reference

**uint8_t min_chip_rev**

Minimal chip revision supported by image. After the Major and Minor revision eFuses were introduced into the chips, this field is no longer used. But for compatibility reasons, we keep this field and the data in it. Use min_chip_rev_full instead. The software interprets this as a Major version for most of the chips and as a Minor version for the ESP32-C3.

**uint16_t min_chip_rev_full**

Minimal chip revision supported by image, in format: major * 100 + minor

**uint16_t max_chip_rev_full**

Maximal chip revision supported by image, in format: major * 100 + minor

**uint8_t reserved[4]**

Reserved bytes in additional header space, currently unused

**uint8_t hash_appended**

If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included in image length. This digest is separate to secure boot and only used for detecting corruption. For secure boot signed images, the signature is appended after this (and the simple hash is included in the signed data).

**struct esp_image_segment_header_t**

Header of binary image segment.

**Public Members**

**uint32_t load_addr**

Address of segment

**uint32_t data_len**

Length of data

**Macros**

**ESP_IMAGE_HEADER_MAGIC**

The magic word for the `esp_image_header_t` structure.

**ESP_IMAGE_MAX_SEGMENTS**

Max count of segments in the image.

**Enumerations**

**enum esp_chip_id_t**

ESP chip ID.

**Values:**

enumerator **ESP_CHIP_ID_ESP32**

chip ID: ESP32
Chapter 2. API Reference

enumerator ESP_CHIP_ID_ESP32S2
    chip ID: ESP32-S2

enumerator ESP_CHIP_ID_ESP32C3
    chip ID: ESP32-C3

enumerator ESP_CHIP_ID_ESP32S3
    chip ID: ESP32-S3

enumerator ESP_CHIP_ID_ESP32C2
    chip ID: ESP32-C2

enumerator ESP_CHIP_ID_INVALID
    Invalid chip ID (we defined it to make sure the esp_chip_id_t is 2 bytes size)

enum esp_image_spi_mode_t
    SPI flash mode, used in esp_image_header_t.
    Values:

    enumerator ESP_IMAGE_SPI_MODE_QIO
        SPI mode QIO

    enumerator ESP_IMAGE_SPI_MODE_QOUT
        SPI mode QOUT

    enumerator ESP_IMAGE_SPI_MODE_DIO
        SPI mode DIO

    enumerator ESP_IMAGE_SPI_MODE_DOUT
        SPI mode DOUT

    enumerator ESP_IMAGE_SPI_MODE_FAST_READ
        SPI mode FAST_READ

    enumerator ESP_IMAGE_SPI_MODE_SLOW_READ
        SPI mode SLOW_READ

enum esp_image_spi_freq_t
    SPI flash clock division factor.
    Values:

    enumerator ESP_IMAGE_SPI_SPEED_DIV_2
        The SPI flash clock frequency is divided by 2 of the clock source

    enumerator ESP_IMAGE_SPI_SPEED_DIV_3
        The SPI flash clock frequency is divided by 3 of the clock source

    enumerator ESP_IMAGE_SPI_SPEED_DIV_4
        The SPI flash clock frequency is divided by 4 of the clock source
Chapter 2. API Reference

enumerator **ESP_IMAGE_SPI_SPEED_DIV_1**
   The SPI flash clock frequency equals to the clock source

enum **esp_image_flash_size_t**
   Supported SPI flash sizes.

2.10.2 Application Level Tracing

Overview

IDF provides a useful feature for program behavior analysis called Application Level Tracing. The feature can be enabled in menuconfig and allows transfer of arbitrary data between the host and ESP32 via JTAG interface with minimal overhead on program execution. Developers can use this library to send application specific state of execution to the host and receive commands or other type of info in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see Application Specific Tracing
2. Lightweight logging to the host, see Logging to Host
3. System behaviour analysis, see System Behavior Analysis with SEGGER SystemView
API Reference

Header File

- components/app_trace/include/esp_app_trace.h

Functions

`esp_err_t esp_apptrace_init (void)`

Initializes application tracing module.

**Note:** Should be called before any esp_apptrace_xxx call.

**Returns** ESP_OK on success, otherwise see esp_err_t

`void esp_apptrace_down_buffer_config (uint8_t *buf, uint32_t size)`

Configures down buffer.

**Note:** Needs to be called before attempting to receive any data using esp_apptrace_down_buffer_get and esp_apptrace_read. This function does not protect internal data by lock.

**Parameters**
- `buf` – Address of buffer to use for down channel (host to target) data.
- `size` – Size of the buffer.

`uint8_t *esp_apptrace_buffer_get (esp_apptrace_dest_t dest, uint32_t size, uint32_t tmo)`

Allocates buffer for trace data. Once the data in the buffer is ready to be sent, esp_apptrace_buffer_put must be called to indicate it.

**Parameters**
- `dest` – Indicates HW interface to send data.
- `size` – Size of data to write to trace buffer.
- `tmo` – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**Returns** non-NULL on success, otherwise NULL.

`esp_err_t esp_apptrace_buffer_put (esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)`

Indicates that the data in the buffer is ready to be sent. This function is a counterpart of and must be preceded by esp_apptrace_buffer_get.

**Parameters**
- `dest` – Indicates HW interface to send data. Should be identical to the same parameter in call to esp_apptrace_buffer_get.
- `ptr` – Address of trace buffer to release. Should be the value returned by call to esp_apptrace_buffer_get.
- `tmo` – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**Returns** ESP_OK on success, otherwise see esp_err_t

`esp_err_t esp_apptrace_write (esp_apptrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)`

Writes data to trace buffer.

**Parameters**
- `dest` – Indicates HW interface to send data.
- `data` – Address of data to write to trace buffer.
- `size` – Size of data to write to trace buffer.
- `tmo` – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
Returns ESP_OK on success, otherwise see esp_err_t

int esp_apptrace_vprintf_to (esp_apptrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)

vprintf-like function to send log messages to host via specified HW interface.

Parameters
- **dest** -- Indicates HW interface to send data.
- **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
- **fmt** -- Address of format string.
- **ap** -- List of arguments.

Returns Number of bytes written.

int esp_apptrace_vprintf (const char *fmt, va_list ap)

vprintf-like function to send log messages to host.

Parameters
- **fmt** -- Address of format string.
- **ap** -- List of arguments.

Returns Number of bytes written.

*esp_err_t* esp_apptrace_flush (esp_apptrace_dest_t dest, uint32_t tmo)

Flushes remaining data in trace buffer to host.

Parameters
- **dest** -- Indicates HW interface to flush data on.
- **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

*esp_err_t* esp_apptrace_flush_nolock (esp_apptrace_dest_t dest, uint32_t min_sz, uint32_t tmo)

Flushes remaining data in trace buffer to host without locking internal data. This is a special version of esp_apptrace_flush which should be called from panic handler.

Parameters
- **dest** -- Indicates HW interface to flush data on.
- **min_sz** -- Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

*esp_err_t* esp_apptrace_read (esp_apptrace_dest_t dest, void *data, uint32_t *size, uint32_t tmo)

Reads host data from trace buffer.

Parameters
- **dest** -- Indicates HW interface to read the data on.
- **data** -- Address of buffer to put data from trace buffer.
- **size** -- Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- **tmo** -- Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

Returns ESP_OK on success, otherwise see esp_err_t

uint8_t *esp_apptrace_down_buffer_get (esp_apptrace_dest_t dest, uint32_t *size, uint32_t tmo)

Retrieves incoming data buffer if any. Once data in the buffer is processed, esp_apptrace_down_buffer_put must be called to indicate it.

Parameters
- **dest** -- Indicates HW interface to receive data.
- **size** -- Address to store size of available data in down buffer. Must be initialized with requested value.
Chapter 2. API Reference

- **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

  **Returns** non-NULL on success, otherwise NULL.

  ```c
  esp_err_t esp_apptrace_down_buffer_put (esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)
  ```

  Indicates that the data in the down buffer is processed. This function is a counterpart of and must be preceded by esp_apptrace_down_buffer_get.

  **Parameters**
  - **dest** – Indicates HW interface to receive data. Should be identical to the same parameter in call to esp_apptrace_down_buffer_get.
  - **ptr** – Address of trace buffer to release. Should be the value returned by call to esp_apptrace_down_buffer_get.
  - **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

  **Returns** ESP_OK on success, otherwise see esp_err_t

  ```c
  bool esp_apptrace_host_is_connected (esp_apptrace_dest_t dest)
  ```

  Checks whether host is connected.

  **Parameters** **dest** – Indicates HW interface to use.

  **Returns** true if host is connected, otherwise false

  ```c
  void *esp_apptrace_fopen (esp_apptrace_dest_t dest, const char*path, const char *mode)
  ```

  Opens file on host. This function has the same semantic as ‘fopen’ except for the first argument.

  **Parameters**
  - **dest** – Indicates HW interface to use.
  - **path** – Path to file.
  - **mode** – Mode string. See fopen for details.

  **Returns** non zero file handle on success, otherwise 0

  ```c
  int esp_apptrace_fclose (esp_apptrace_dest_t dest, void *stream)
  ```

  Closes file on host. This function has the same semantic as ‘fclose’ except for the first argument.

  **Parameters**
  - **dest** – Indicates HW interface to use.
  - **stream** – File handle returned by esp_aptrace_fopen.

  **Returns** Zero on success, otherwise non-zero. See fclose for details.

  ```c
  size_t esp_apptrace_fwrite (esp_apptrace_dest_t dest, const void *ptr, size_t size, size_t nmemb, void *stream)
  ```

  Writes to file on host. This function has the same semantic as ‘fwrite’ except for the first argument.

  **Parameters**
  - **dest** – Indicates HW interface to use.
  - **ptr** – Address of data to write.
  - **size** – Size of an item.
  - **nmemb** – Number of items to write.
  - **stream** – File handle returned by esp_aptrace_fopen.

  **Returns** Number of written items. See fwrite for details.

  ```c
  size_t esp_apptrace_fread (esp_apptrace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)
  ```

  Read file on host. This function has the same semantic as ‘fread’ except for the first argument.

  **Parameters**
  - **dest** – Indicates HW interface to use.
  - **ptr** – Address to store read data.
  - **size** – Size of an item.
  - **nmemb** – Number of items to read.
  - **stream** – File handle returned by esp_aptrace_fopen.

  **Returns** Number of read items. See fread for details.
int esp_apptrace_fseek (esp_apptrace_dest_t dest, void *stream, long offset, int whence)

    Set position indicator in file on host. This function has the same semantic as `fseek` except for the first argument.

    Parameters
    • dest - Indicates HW interface to use.
    • stream - File handle returned by esp_apptrace_fopen.
    • offset - Offset. See fseek for details.
    • whence - Position in file. See fseek for details.

    Returns  Zero on success, otherwise non-zero. See fseek for details.

int esp_apptrace_ftell (esp_apptrace_dest_t dest, void *stream)

    Get current position indicator for file on host. This function has the same semantic as `ftell` except for the first argument.

    Parameters
    • dest - Indicates HW interface to use.
    • stream - File handle returned by esp_apptrace_fopen.

    Returns  Current position in file. See ftell for details.

int esp_apptrace_fstop (esp_apptrace_dest_t dest)

    Indicates to the host that all file operations are complete. This function should be called after all file operations are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

    Parameters  dest - Indicates HW interface to use.

    Returns  ESP_OK on success, otherwise see esp_err_t

void esp_gcov_dump (void)

    Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations

enum esp_apptrace_dest_t

    Application trace data destinations bits.

    Values:

    enumerator ESP_APPTRACE_DEST_JTAG

    JTAG destination.

    enumerator ESP_APPTRACE_DEST_TRAX

    xxx_TRAX name is obsolete, use more common xxx_JTAG

    enumerator ESP_APPTRACE_DEST_UART

    UART destination.

    enumerator ESP_APPTRACE_DEST_MAX

    enumerator ESP_APPTRACE_DEST_NUM

Header File

• components/app_trace/include/esp_sysview_trace.h
Functions

static inline esp_err_t esp_sysview_flush(uint32_t tmo)

Flushes remaining data in SystemView trace buffer to host.

Parameters  
  tmo - Timeout for operation (in us). Use ESP_APPTTRACE_TMO_INFINITE to wait indefinitely.

Returns  ESP_OK.

int esp_sysview_vprintf(const char *format, va_list args)

vprintf-like function to send log messages to the host.

Parameters  
  • format - Address of format string.
  • args - List of arguments.

Returns  Number of bytes written.

esp_err_t esp_sysview_heap_trace_start(uint32_t tmo)

Starts SystemView heap tracing.

Parameters  
  tmo - Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.

Returns  ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.

esp_err_t esp_sysview_heap_trace_stop(void)

Stops SystemView heap tracing.

Returns  ESP_OK.

void esp_sysview_heap_trace_alloc(void *addr, uint32_t size, const void *callers)

Sends heap allocation event to the host.

Parameters  
  • addr - Address of allocated block.
  • size - Size of allocated block.
  • callers - Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

void esp_sysview_heap_trace_free(void *addr, const void *callers)

Sends heap de-allocation event to the host.

Parameters  
  • addr - Address of de-allocated block.
  • callers - Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

2.10.3  Call function with external stack

Overview

A given function can be executed with a user allocated stack space which is independent of current task stack, this mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as printf. The given function can be called inside the shared stack space which is a callback function deferred by calling esp_execute_shared_stack_function(), passing that function as parameter.

Usage

esp_execute_shared_stack_function() takes four arguments:

  • a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack
  • a pointer to the top of stack used for that fuction
  • the size of stack in bytes
  • a pointer to the shared stack function
The user defined function will be deferred as a callback and can be called using the user allocated space without taking space from current task stack.

The usage may look like the code below:

```c
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let's suppose we want to call printf using a separated stack space
//allowing the app to reduce its stack size.
void app_main()
{
    //Allocate a stack buffer, from heap or as a static form:
    portSTACK_TYPE *shared_stack = malloc(8192 * sizeof(portSTACK_TYPE));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //Call the desired function using the macro helper:
    esp_execute_shared_stack_function(printf_lock,
                                       shared_stack,
                                       8192,
                                       external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}
```

### API Reference

#### Header File

- `components/esp_system/include/esp_expression_with_stack.h`

#### Functions

```c
void esp_execute_shared_stack_function(SemaphoreHandle_t lock, void *stack, size_t stack_size, shared_stack_function function)
```

Calls user defined shared stack space function.

**Note:** if either lock, stack or stack size is invalid, the expression will be called using the current stack.

**Parameters**

- `lock` - Mutex object to protect in case of shared stack
- `stack` - Pointer to user allocated stack
- `stack_size` - Size of current stack in bytes
- `function` - pointer to the shared stack function to be executed

**Macros**

```c
ESP_EXECUTE_EXPRESSION_WITH_STACK(lock, stack, stack_size, expression)
```

**Type Definitions**
typedef void (*shared_stack_function)(void)

2.10.4 Chip Revision

Overview

A new chip versioning logic was introduced in new chips. Chips have several eFuse version fields:

- Major wafer version (WAFER_VERSION_MAJOR eFuse)
- Minor wafer version (WAFER_VERSION_MINOR eFuse)
- Ignore maximal revision (DISABLE_WAFER_VERSION_MAJOR eFuse)

The new versioning logic is being introduced to distinguish changes in chips as breaking changes and non-breaking changes. Chips with non-breaking changes can run the same software as the previous chip. The previous chip means that the major version is the same.

If the newly released chip does not have breaking changes, that means it can run the same software as the previous chip, then in that chip we keep the same major version and increment the minor version by 1. Otherwise, if there is a breaking change in the newly released chip, meaning it can not run the same software as the previous chip, then in that chip we increase the major version and set the minor version to 0.

The software supports a number of revisions, from the minimum to the maximum (the min/max configs are defined in Kconfig). If the software is unaware of a new chip (when the chip version is out of range), it will refuse to run on it unless the Ignore maximum revision restrictions bit is set. This bit removes the upper revision limit.

Minimum versions limits the software to only run on a chip revision that is high enough to support some features. Maximum version is the maximum version that is well-supported by current software. When chip version is above the maximum version, software will reject to boot, because it may not work on, or work with risk on the chip.

Adding the major and minor wafer revision make the versioning logic is branchable.

**Note:** The previous versioning logic was based on a single eFuse version field (WAFER_VERSION). This approach makes it impossible to mark chips as breaking or non-breaking changes, and the versioning logic becomes linear.

Using the branched versioning scheme allows us to support more chips in the software without updating the software when a new released compatible chip is used. Thus, the software will be compatible with as many new chip revisions as possible. If the software is no longer compatible with a new chip with breaking changes, the software will abort.

**Revisions**

<table>
<thead>
<tr>
<th>ECO</th>
<th>Revision (Major.Minor)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ECO0</td>
<td>v0.0</td>
</tr>
<tr>
<td>ECO1</td>
<td>v1.0</td>
</tr>
<tr>
<td>ECO1.1</td>
<td>v1.1</td>
</tr>
<tr>
<td>ECO2</td>
<td>v2.0</td>
</tr>
<tr>
<td>ECO3</td>
<td>v3.0</td>
</tr>
<tr>
<td>ECO4</td>
<td>v3.1</td>
</tr>
</tbody>
</table>

Chip Revision vX.Y, where:

- X means Major wafer version. If it is changed, it means that the current software version is not compatible with this released chip and the software must be updated to use this chip.
- Y means Minor wafer version. If it is changed that means the current software version is compatible with the released chip, and there is no need to update the software.

The vX.Y chip version format will be used further instead of the ECO number.
Chapter 2. API Reference

Representing Revision Requirement Of A Binary Image

The 2nd stage bootloader and the application binary images have the `esp_image_header_t` header, which stores the revision numbers of the chip on which the software can be run. This header has 3 fields related to revisions:

- **min_chip_rev** - Minimal chip MAJOR revision required by image (but for ESP32-C3 it is MINOR revision). Its value is determined by `CONFIG_ESP32_REV_MIN`.
- **min_chip_rev_full** - Minimal chip MINOR revision required by image in format: `major * 100 + minor`. Its value is determined by `CONFIG_ESP32_REV_MIN`.
- **max_chip_rev_full** - Maximal chip revision required by image in format: `major * 100 + minor`. Its value is determined by `CONFIG_ESP32_REV_MAX_FULL`. It cannot be changed by user. Only Espressif can change it when a new version will be supported in IDF.

Chip Revision APIs

These APIs help to get chip revision from eFuses:

- `efuse_hal_chip_revision()`. It returns revision in the `major * 100 + minor` format.
- `efuse_hal_get_major_chip_version()`. It returns Major revision.
- `efuse_hal_get_minor_chip_version()`. It returns Minor revision.

The following Kconfig definitions (in `major * 100 + minor` format) that can help add the chip revision dependency to the code:

- `CONFIG_ESP32_REV_MIN_FULL`
- `CONFIG_ESP_REV_MIN_FULL`
- `CONFIG_ESP32_REV_MAX_FULL`
- `CONFIG_ESP_REV_MAX_FULL`

Maximal And Minimal Revision Restrictions

The order for checking the minimum and maximum revisions:

1. The 1st stage bootloader (ROM bootloader) does not check minimal and maximal revision fields from `esp_image_header_t` before running the 2nd stage bootloader.
2. The 2nd stage bootloader checks at the initialization phase that bootloader itself can be launched on the chip of this revision. It extracts the minimum revision from the header of the bootloader image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision, the bootloader refuses to boot up and aborts. The maximum revision is not checked at this phase.
3. Then the 2nd stage bootloader checks the revision requirements of the application. It extracts the minimum and maximum revisions from the header of the application image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision, the bootloader refuses to boot up and aborts. However, if the Ignore maximal revision bit is set, the maximum revision constraint can be ignored. The ignore bit is set by the customer themselves when there is confirmation that the software is able to work with this chip revision.
4. Further, at the OTA update stage, the running application checks if the new software matches the chip revision. It extracts the minimum and maximum revisions from the header of the new application image and checks against the chip revision from eFuses. It checks for revision matching in the same way that the bootloader does, so that the chip revision is between the min and max revisions (logic of ignoring max revision also applies).

Issues

1. If the 2nd stage bootloader is run on the chip revision < minimum revision shown in the image, a reboot occurs. The following message will be printed:

   Image requires chip rev >= v3.0, but chip is v1.0

To resolve this issue:
• make sure the chip you are using is suitable for the software, or use a chip with the required minimum revision or higher.
• update the software with `CONFIG_ESP32_REV_MIN` to get it <= the revision of chip being used

2. If application does not match minimal and maximal chip revisions, a reboot occurs. The following message will be printed:

```
Image requires chip rev <= v2.99, but chip is v3.0
```

To resolve this issue, update the IDF to a newer version that supports the used chip (`CONFIG_ESP32_REV_MAX_FULL`). Another way to fix this is to set the Ignore maximal revision bit in eFuse or use a chip that is suitable for the software.

## Backward Compatible With Bootloaders Built By Older ESP-IDF Versions

The old bootloaders (IDF < 5.0) do not know about Major and Minor wafer version eFuses. They use one single eFuse for this - wafer version.

The old bootloaders did not read the minor wafer version eFuse, the major version can be only <= 3. So it means that the old bootloader can detect correctly only chip version in range v0.0 - v3.0, where the minor version is always 0.

Please check the chip version using `esptool chip_id` command.

## API Reference

### Header File

- `components/hal/include/hal/efuse_hal.h`

### Functions

- `void efuse_hal_get_mac(uint8_t*mac)`
  
  Get factory mac address

- `uint32_t efuse_hal_chip_revision(void)`
  
  Returns chip version.

  **Returns** Chip version in format: Major * 100 + Minor

- `bool efuse_hal_flash_encryption_enabled(void)`
  
  Is flash encryption currently enabled in hardware?

  Flash encryption is enabled if the FLASH_CRYPT_CNT eFuse has an odd number of bits set.

  **Returns** true if flash encryption is enabled.

- `uint32_t efuse_hal_get_major_chip_version(void)`
  
  Returns major chip version.

- `uint32_t efuse_hal_get_minor_chip_version(void)`
  
  Returns minor chip version.

## 2.10.5 Console

ESP-IDF provides `console` component, which includes building blocks needed to develop an interactive console over serial port. This component includes following facilities:

- Line editing, provided by `linenoise` library. This includes handling of backspace and arrow keys, scrolling through command history, command auto-completion, and argument hints.
- Splitting of command line into arguments.
Chapter 2. API Reference

- Argument parsing, provided by `argtable3` library. This library includes APIs used for parsing GNU style command line arguments.
- Functions for registration and dispatching of commands.
- Functions to establish a basic REPL (Read-Evaluate-Print-Loop) environment.

**Note:** These facilities can be used together or independently. For example, it is possible to use line editing and command registration features, but use `getopt` or custom code for argument parsing, instead of `argtable3`. Likewise, it is possible to use simpler means of command input (such as `fgets`) together with the rest of the means for command splitting and argument parsing.

**Line editing**

Line editing feature lets users compose commands by typing them, erasing symbols using ‘backspace’ key, navigating within the command using left/right keys, navigating to previously typed commands using up/down keys, and performing autocompletion using ‘tab’ key.

**Note:** This feature relies on ANSI escape sequence support in the terminal application. As such, serial monitors which display raw UART data cannot be used together with the line editing library. If you see `[6n or similar escape sequence when running `system/console` example instead of a command prompt (e.g. `esp>`), it means that the serial monitor does not support escape sequences. Programs which are known to work are GNU screen, minicom, and `idf_monitor.py` (which can be invoked using `idf.py monitor` from project directory).

Here is an overview of functions provided by `linenoise` library.

**Configuration** Linenoise library does not need explicit initialization. However, some configuration defaults may need to be changed before invoking the main line editing function.

`linenoiseClearScreen()`

Clear terminal screen using an escape sequence and position the cursor at the top left corner.

`linenoiseSetMultiLine()`

Switch between single line and multi line editing modes. In single line mode, if the length of the command exceeds the width of the terminal, the command text is scrolled within the line to show the end of the text. In this case the beginning of the text is hidden. Single line needs less data to be sent to refresh screen on each key press, so exhibits less glitching compared to the multi line mode. On the flip side, editing commands and copying command text from terminal in single line mode is harder. Default is single line mode.

`linenoiseAllowEmpty()`

Set whether linenoise library will return a zero-length string (if `true`) or `NULL` (if `false`) for empty lines. By default, zero-length strings are returned.

`linenoiseSetMaxLineLen()`

Set maximum length of the line for linenoise library. Default length is 4096. If you need optimize RAM memory usage, you can do it by this function by setting a value less than default 4 KB.

**Main loop** `linenoise()`

In most cases, console applications have some form of read/eval loop. `linenoise()` is the single function which handles user’s key presses and returns completed line once ‘enter’ key is pressed. As such, it handles the ‘read’ part of the loop.

`linenoiseFree()`

This function must be called to release the command line buffer obtained from `linenoise()` function.
Hints and completions

`linenoiseSetCompletionCallback()`

When user presses ‘tab’ key, linenoise library invokes completion callback. The callback should inspect the contents of the command typed so far and provide a list of possible completions using calls to `linenoiseAddCompletion()` function. `linenoiseSetCompletionCallback()` function should be called to register this completion callback, if completion feature is desired.

Console component provides a ready made function to provide completions for registered commands, `esp_console_get_completion()` (see below).

`linenoiseAddCompletion()`

Function to be called by completion callback to inform the library about possible completions of the currently typed command.

`linenoiseSetHintsCallback()`

Whenever user input changes, linenoise invokes hints callback. This callback can inspect the command line typed so far, and provide a string with hints (which can include list of command arguments, for example). The library then displays the hint text on the same line where editing happens, possibly with a different color.

`linenoiseSetFreeHintsCallback()`

If hint string returned by hints callback is dynamically allocated or needs to be otherwise recycled, the function which performs such cleanup should be registered via `linenoiseSetFreeHintsCallback()`.

History

`linenoiseHistorySetMaxLen()`

This function sets the number of most recently typed commands to be kept in memory. Users can navigate the history using up/down arrows.

`linenoiseHistoryAdd()`

Linenoise does not automatically add commands to history. Instead, applications need to call this function to add command strings to the history.

`linenoiseHistorySave()`

Function saves command history from RAM to a text file, for example on an SD card or on a filesystem in flash memory.

`linenoiseHistoryLoad()`

Counterpart to `linenoiseHistorySave()`, loads history from a file.

`linenoiseHistoryFree()`

Releases memory used to store command history. Call this function when done working with linenoise library.

Splitting of command line into arguments

Console component provides `esp_console_split_argv()` function to split command line string into arguments. The function returns the number of arguments found (argc) and fills an array of pointers which can be passed as `argc, argv` argument to any function which accepts arguments in `argc, argv` format.

The command line is split into arguments according to the following rules:

- Arguments are separated by spaces
- If spaces within arguments are required, they can be escaped using `\` (backslash) character.
- Other escape sequences which are recognized are `\` (which produces literal backslash) and `"`, which produces a double quote.
Arguments can be quoted using double quotes. Quotes may appear only in the beginning and at the end of the argument. Quotes within the argument must be escaped as mentioned above. Quotes surrounding the argument are stripped by esp_console_split_argv function.

Examples:
- `abc def 1 20 .3` → `[abc, def, 1, 20, .3]`
- `abc "123 456" def` → `[abc, 123 456, def]`
- `a b\c"` → `[a b\c]`

**Argument parsing**

For argument parsing, console component includes argtable3 library. Please see tutorial for an introduction to argtable3. Github repository also includes examples.

**Command registration and dispatching**

console component includes utility functions which handle registration of commands, matching commands typed by the user to registered ones, and calling those commands with the arguments given on the command line.

Application first initializes command registration module using a call to esp_console_init(), and calls esp_console_cmd_register() function to register command handlers.

For each command, application provides the following information (in the form of esp_console_cmd_t structure):
- Command name (string without spaces)
- Help text explaining what the command does
- Optional hint text listing the arguments of the command. If application uses Argtable3 for argument parsing, hint text can be generated automatically by providing a pointer to argtable argument definitions structure instead.
- The command handler function.

A few other functions are provided by the command registration module:

- esp_console_run()
  - This function takes the command line string, splits it into argc/argv argument list using esp_console_split_argv(), looks up the command in the list of registered components, and if it is found, executes its handler.

- esp_console_register_help_command()
  - Adds help command to the list of registered commands. This command prints the list of all the registered commands, along with their arguments and help texts.

- esp_console_get_completion()
  - Callback function to be used with linenoiseSetCompletionCallback() from linenoise library. Provides completions to linenoise based on the list of registered commands.

- esp_console_get_hint()
  - Callback function to be used with linenoiseSetHintsCallback() from linenoise library. Provides argument hints for registered commands to linenoise.

**Initialize console REPL environment**

To establish a basic REPL environment, console component provides several useful APIs, combining those functions described above.
In a typical application, you only need to call `esp_console_new_repl_uart()` to initialize the REPL environment based on UART device, including driver install, basic console configuration, spawning a thread to do REPL task and register several useful commands (e.g. `help`).

After that, you can register your own commands with `esp_console_cmd_register()`. The REPL environment keeps in init state until you call `esp_console_start_repl()`.

**Application Example**

Example application illustrating usage of the `console` component is available in `system/console` directory. This example shows how to initialize UART and VFS functions, set up line noise library, read and handle commands from UART, and store command history in Flash. See README.md in the example directory for more details.

Besides that, ESP-IDF contains several useful examples which based on `console` component and can be treated as “tools” when developing applications. For example, `peripherals/i2c/i2c_tools`, `wifi/iperf`.

**API Reference**

**Header File**

- components/console/esp_console.h

**Functions**

`esp_err_t esp_console_init(const esp_console_config_t *config)`

initialize console module

**Note:** Call this once before using other console module features

- **Parameters** config – console configuration
- **Returns**
  - ESP_OK on success
  - ESP_ERR_NO_MEM if out of memory
  - ESP_ERR_INVALID_STATE if already initialized
  - ESP_ERR_INVALID_ARG if the configuration is invalid

`esp_err_t esp_console_deinit(void)`

de-initialize console module

**Note:** Call this once when done using console module functions

- **Returns**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if not initialized yet

`esp_err_t esp_console_cmd_register(const esp_console_cmd_t *cmd)`

Register console command.

- **Parameters** cmd – pointer to the command description; can point to a temporary value
- **Returns**
  - ESP_OK on success
  - ESP_ERR_NO_MEM if out of memory
  - ESP_ERR_INVALID_ARG if command description includes invalid arguments
**esp_err_t esp_console_run** (const char *cmdline, int *cmd_ret)

Run command line.

**Parameters**
- `cmdline` – command line (command name followed by a number of arguments)
- `cmd_ret` – [out] return code from the command (set if command was run)

**Returns**
- ESP_OK, if command was run
- ESP_ERR_INVALID_ARG, if the command line is empty, or only contained whitespace
- ESP_ERR_NOT_FOUND, if command with given name wasn’t registered
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

**size_t esp_console_split_argv** (char *line, char **argv, size_t argv_size)

Split command line into arguments in place.

```
* - This function finds whitespace-separated arguments in the given input line.
* - 'abc def 1 20 .3' -> ['abc', 'def', '1', '20', '.3']
* - Argument which includes spaces may be surrounded with quotes. In this case spaces are preserved and quotes are stripped.
* - 'abc "123 456" def' -> ['abc', '123 456', 'def']
* - Escape sequences may be used to produce backslash, double quote, and space:
* - 'a\ b\c"' -> ['a b\c"
```

**Note:** Pointers to at most argv_size - 1 arguments are returned in argv array. The pointer after the last one (i.e. argv[argc]) is set to NULL.

**void esp_console_get_completion** (const char *buf, linenoiseCompletions *lc)

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:
```
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

**Parameters**
- `buf` – the string typed by the user
- `lc` – linenoiseCompletions to be filled in

**const char *esp_console_get_hint** (const char *buf, int *color, int *bold)

Callback which provides command hints for linenoise library.

When using linenoise for line editing, hints support can be enabled as follows:
```
linenoiseSetHintsCallback((linenoiseHintsCallback*) &esp_console_get_hint);
```

The extra cast is needed because linenoiseHintsCallback is defined as returning a char* instead of const char*.

**Parameters**
- `buf` – line typed by the user
Chapter 2. API Reference

- color -[out] ANSI color code to be used when displaying the hint
- bold -[out] set to 1 if hint has to be displayed in bold

Returns string containing the hint text. This string is persistent and should not be freed (i.e. linenoiseSetFreeHintsCallback should not be used).

`esp_err_t esp_console_register_help_command (void)`

Register a ‘help’ command.

Default ‘help’ command prints the list of registered commands along with hints and help strings.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

`esp_err_t esp_console_new_repl_uart (const esp_console_dev_uart_config_t *dev_config, const esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)`

Establish a console REPL environment over UART driver.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

Note: This is an all-in-one function to establish the environment needed for REPL, includes:
- Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)
- Configures the stdin/stdout to go through the UART driver
- Initializes linenoise
- Spawn new thread to run REPL in the background

Parameters

- dev_config -[in] UART device configuration
- repl_config -[in] REPL configuration
- ret_repl -[out] return REPL handle after initialization succeed, return NULL otherwise

Returns

- ESP_OK on success
- ESP_FAIL Parameter error

`esp_err_t esp_console_start_repl (esp_console_repl_t *repl)`

Start REPL environment.

Note: Once the REPL gets started, it won’t be stopped until the user calls repl->del(repl) to destroy the REPL environment.

Parameters repl -[in] REPL handle returned from esp_console_new_repl_xxx

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE, if repl has started already

Structures

struct esp_console_config_t

Parameters for console initialization.
Public Members

size_t max_cmdline_length
length of command line buffer, in bytes

size_t max_cmdline_args
maximum number of command line arguments to parse

int hint_color
ASCII color code of hint text.

int hint_bold
Set to 1 to print hint text in bold.

struct esp_console_repl_config_t
Parameters for console REPL (Read Eval Print Loop)

Public Members

uint32_t max_history_len
maximum length for the history

const char *history_save_path
file path used to save history commands, set to NULL won’t save to file system

uint32_t task_stack_size
repl task stack size

uint32_t task_priority
repl task priority

const char *prompt
prompt (NULL represents default: “esp> “)

size_t max_cmdline_length
maximum length of a command line. If 0, default value will be used

struct esp_console_dev_uart_config_t
Parameters for console device: UART.

Public Members

int channel
UART channel number (count from zero)

int baud_rate
Communication baud rate.
int tx_gpio_num
    GPIO number for TX path, -1 means using default one.

int rx_gpio_num
    GPIO number for RX path, -1 means using default one.

struct esp_console_cmd_t
    Console command description.

Public Members

const char *command
    Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call
to esp_console_deinit.

const char *help
    Help text for the command, shown by help command. If set, the pointer must be valid until the call to
esp_console_deinit. If not set, the command will not be listed in ‘help’ output.

const char *hint
    Hint text, usually lists possible arguments. If set to NULL, and ‘argtable’ field is non-NULL, hint will
be generated automatically

esp_console_cmd_func_t func
    Pointer to a function which implements the command.

void *argtable
    Array or structure of pointersto arg_xxx structures, may be NULL. Used to generate hint text if ‘hint’
is set to NULL. Array/structure which this field points to must end with an arg_end. Only used for the
duration of esp_console_cmd_register call.

struct esp_console_repl_s
    Console REPL base structure.

Public Members

esp_err_t (*del)(esp_console_repl_t *repl)
    Delete console REPL environment.
    Param repl [in] REPL handle returned from esp_console_new_repl_xxx
    Return
    • ESP_OK on success
    • ESP_FAIL on errors

Macros

ESP_CONSOLE_CONFIG_DEFAULT ()
    Default console configuration value.

ESP_CONSOLE_REPL_CONFIG_DEFAULT ()
    Default console repl configuration value.
Chapter 2. API Reference

ESP_CONSOLE_DEV_UART_CONFIG_DEFAULT()

**Type Definitions**

typedef struct linenoiseCompletions linenoiseCompletions

typedef int (*esp_console_cmd_func_t)(int argc, char **argv)

Console command main function.

- **Param argc** number of arguments
- **Param argv** array with arg entries, each pointing to a zero-terminated string argument
- **Return** console command return code, 0 indicates “success”

typedef struct esp_console_repl_s esp_console_repl_t

Type defined for console REPL.

### 2.10.6 eFuse Manager

**Introduction**

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

**Hardware description**

The ESP32 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0).

For more details, see [ESP32 Technical Reference Manual > eFuse Controller (eFuse) [PDF]](https://www.espressif.com/cn/handbook/technical-reference-manual). Some eFuse bits are available for user applications.

ESP32 has 4 eFuse blocks each of the size of 256 bits (not all bits are available):

- EFUSE_BLK0 is used entirely for system purposes;
- EFUSE_BLK1 is used for flash encrypt key. If not using that Flash Encryption feature, they can be used for another purpose;
- EFUSE_BLK2 is used for security boot key. If not using that Secure Boot feature, they can be used for another purpose;
- EFUSE_BLK3 can be partially reserved for the custom MAC address, or used entirely for user application. Note that some bits are already used in IDF.

Each block is divided into 8 32-bits registers.

**eFuse Manager component**

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool `efuse_table_gen.py`. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a custom file from the user’s project directory, the utility will check with the `common CSV file`.

CSV files:
• common (esp_efuse_table.csv) - contains EFUSE fields which are used inside the IDF. C-source generation should be done manually when changing this file (run command idf.py efuse-common-table). Note that changes in this file can lead to incorrect operation.
• custom (optional and can be enabled by CONFIG_EFUSE_CUSTOM_TABLE) contains EFUSE fields that are used by the user in their application. C-source generation should be done manually when changing this file and running idf.py efuse-custom-table.

Description CSV file

The CSV file contains a description of the EFUSE fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK3), bit_start(0..255), bit_count(1..256), comment
```

Individual params in CSV file the following meanings:

**field_name** Name of field. The prefix ESP_EFUSE_ will be added to the name, and this field name will be available in the code. This name will be used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see MAC_FACTORY field in the common table). The field_name supports structured format using . to show that the field belongs to another field (see WR_DIS and RD_DIS in the common table).

**efuse_block** Block number. It determines where the EFUSE bits will be placed for this field. Available EFUSE_BLK0..EFUSE_BLK3.

**bit_start** Start bit number (0..255). The bit_start field can be omitted. In this case, it will be set to bit_start + bit_count from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.

**bit_count** The number of bits to use in this field (1..-). This parameter cannot be omitted. This field also may be MAX_BLK_LEN in this case, the field length will have the maximum block length, taking into account the coding scheme (applicable for ESP_EFUSE_SECURE_BOOT_KEY and ESP_EFUSE_ENCRYPT_FLASH_KEY fields). The value MAX_BLK_LEN depends on CONFIG_EFUSE_CODE_SCHEME_SELECTOR, will be replaced with “None” - 256, “3/4” - 192, “REPEAT” - 128.

**comment** This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, this will indicate that it belongs to one field. For example two fields MAC_FACTORY and MAC_FACTORY_CRC:

```
# Factory MAC address #
#################################
MAC_FACTORY, EFUSE_BLK0, 72, 8, Factory MAC addr [0]
, EFUSE_BLK0, 64, 8, Factory MAC addr [1]
, EFUSE_BLK0, 56, 8, Factory MAC addr [2]
, EFUSE_BLK0, 48, 8, Factory MAC addr [3]
, EFUSE_BLK0, 40, 8, Factory MAC addr [4]
, EFUSE_BLK0, 32, 8, Factory MAC addr [5]
MAC_FACTORY_CRC, EFUSE_BLK0, 80, 8, CRC8 for factory MAC address
```

This field will available in code as ESP_EFUSE_MAC_FACTORY and ESP_EFUSE_MAC_FACTORY_CRC.

Structured efuse fields

```
WR_DIS,       EFUSE_BLK0, 0, 32, Write protection
WR_DIS.RD_DIS, EFUSE_BLK0, 0, 1, Write protection for..
```

(continues on next page)
The structured eFuse field looks like WR_DIS.RD_DIS where the dot points that this field belongs to the parent field - WR_DIS and can not be out of the parent’s range.

It is possible to use some levels of structured fields as WR_DIS.FIELD_2.B1 and B2. These fields should not be crossed each other and should be in the range of two fields: WR_DIS and WR_DIS.FIELD_2.

It is possible to create aliases for fields with the same range, see WR_DIS.FIELD_3 and WR_DIS.FIELD_3_ALIAS.

The IDF names for structured efuse fields should be unique. The efuse_table_gen tool will generate the final names where the dot will be replaced by _. The names for using in IDF are ESP_EFUSE_WR_DIS, ESP_EFUSE_WR_DIS_RDWR_DIS, ESP_EFUSE_WR_DIS_FIELD_2_B1, etc.

The efuse_table_gen tool checks that the fields do not overlap each other and must be within the range of a field if there is a violation, then throws the following error:

Field at USER_DATA, EFUSE_BLK3, 0, 256 intersected with SERIAL_NUMBER, EFUSE_BLK3, 0, 32

Solution: Describe SERIAL_NUMBER to be included in USER_DATA.(USER_DATA.SERIAL_NUMBER).

Field at FIELD, EFUSE_BLK3, 0, 50 out of range FIELD.MAJOR_NUMBER, EFUSE_BLK3, 0, 60, 32

Solution: Change bit_start for FIELD.MAJOR_NUMBER from 60 to 0, so MAJOR_NUMBER is in the FIELD range.

**efuse_table_gen.py tool**

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional custom file is used, it will be checked with the existing common file (esp_efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type esp_efuse_desc_t.

To generate a common files, use the following command idf.py efuse-common-table or:

cd $IDF_PATH/components/efuse/.efuse_table_gen.py --idf_target esp32 esp32/esp_efuse_table.csv

After generation in the folder $IDF_PATH/components/efuse/esp32 create:

- esp_efuse_table.c file.
- In include folder esp_efuse_table.c file.

To generate a custom files, use the following command idf.py efuse-custom-table or:
Chapter 2. API Reference

```bash
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py --idf_target esp32 esp32/esp_efuse_table.csv PROJECT_PATH/
→main/esp_efuse_custom_table.csv
```

After generation in the folder PROJECT_PATH/main create:

- `esp_efuse_custom_table.c` file.
- In `include` folder `esp_efuse_custom_table.c` file.

To use the generated fields, you need to include two files:

```c
#include "esp_efuse.h"
#include "esp_efuse_table.h" // or "esp_efuse_custom_table.h"
```

Supported coding scheme

eFuse have three coding schemes:

- None (value 0).
- 3/4 (value 1).
- Repeat (value 2).

The coding scheme affects only EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3 blocks. EUSE_BLK0 block always has a coding scheme None. Coding changes the number of bits that can be written into a block, the block length is constant 256, some of these bits are used for encoding and not available for the user.

When using a coding scheme, the length of the payload that can be written is limited (for more details 20.3.1.3 System Parameter coding_scheme):

- None 256 bits.
- 3/4 192 bits.
- Repeat 128 bits.

You can find out the coding scheme of your chip:

- Run `espefuse.py -p PORT summary` command.
- From `esptool` utility logs (during flashing).
- Calling the function in the code `esp_efuse_get_coding_scheme()` for the EFUSE_BLK3 block.

eFuse tables must always comply with the coding scheme in the chip. There is an `CONFIG_EFUSE_CODE_SCHEME_SELECTOR` option to select the coding type for tables in a Kconfig. When generating source files, if your tables do not follow the coding scheme, an error message will be displayed. Adjust the length or offset fields. If your program was compiled with None encoding and 3/4 is used in the chip, then the ESP_ERR_CODING error may occur when calling the eFuse API (the field is outside the block boundaries). If the field matches the new block boundaries, then the API will work without errors.

Also, 3/4 coding scheme imposes restrictions on writing bits belonging to one coding unit. The whole block with a length of 256 bits is divided into 4 coding units, and in each coding unit there are 6 bytes of useful data and 2 service bytes. These 2 service bytes contain the checksum of the previous 6 data bytes.

It turns out that only one field can be written into one coding unit. Repeated rewriting in one coding unit is prohibited. But if the record was made in advance or through a `esp_efuse_write_block()` function, then reading the fields belonging to one coding unit is possible.

In case 3/4 coding scheme, the writing process is divided into the coding units and we can not use the usual mode of writing some fields. We can prepare all the data for writing and burn it in one time. You can also use this mode for None coding scheme but it is not necessary. It is important for 3/4 coding scheme. The batch writing mode blocks `esp_efuse_read...` operations.

After changing the coding scheme, run `efuse_common_table` and `efuse_custom_table` commands to check the tables of the new coding scheme.

To write some fields into one block, or different blocks in one time, you need to use the batch writing mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write...
some fields as usual using the `esp_efuse_write_...` functions. At the end to burn them, call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

**Note:** If there is already pre-written data in the eFuse block using the 3/4 or Repeat encoding scheme, then it is not possible to write anything extra (even if the required bits are empty) without breaking the previous encoding data. This encoding data will be overwritten with new encoding data and completely destroyed (however, the payload eFuses are not damaged). It can be related to: CUSTOM_MAC, SPI_PAD_CONFIG_HD, SPI_PAD_CONFIG_CS, etc. Please contact Espressif to order the required pre-burnt eFuses.

FOR TESTING ONLY (NOT RECOMMENDED): You can ignore or suppress errors that violate encoding scheme data in order to burn the necessary bits in the eFuse block.

### eFuse API

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1”.
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as “1”.
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
- `esp_efuse_write_reg()` - writes value to eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - set the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.
- `esp_efuse_get_key_dis_read()` - Returns a read protection for the key block.
- `esp_efuse_set_key_dis_read()` - Sets a read protection for the key block.
- `esp_efuse_get_key_dis_write()` - Returns a write protection for the key block.
- `esp_efuse_set_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_get_key_purpose()` - Returns the current purpose set for an eFuse key block.
- `esp_efuse_write_key()` - Programs a block of key data to an eFuse block.
- `esp_efuse_write_keys()` - Programs keys to unused eFuse blocks.
- `esp_efuse_find_purpose()` - Finds a key block with the particular purpose set.
- `esp_efuse_get_keypurpose_dis_write()` - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- `esp_efuse_key_block_unused()` - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this `esp_efuse_get_pkg_ver()`.

### How to add a new field

1. Find a free bits for field. Show `esp_efuse_table.csv` file or run `idf.py show-efuse-table` or the next command:

```
$ ./efuse_table_gen.py esp32/esp_efuse_table.csv --info
```

Parsing efuse CSV input file $IDF_PATH/components/efuse/esp32/esp_efuse_table.csv ...

Used bits in efuse table:

EFUSE_BLK0

EFUSE_BLK1

EFUSE_BLK2

(continues on next page)
Note: Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for Espressif)

The number of bits not included in square brackets is free (some bits are reserved for Espressif). All fields are checked for overlapping.

To add fields to an existing field, use the \textit{Structured efuse fields} technique. For example, adding the fields: SERIAL\_NUMBER, MODEL\_NUMBER and HARDWARE REV to an existing USER\_DATA field. Use . (dot) to show an attachment in a field.

\begin{verbatim}
USER\_DATA.SERIAL\_NUMBER,    EFUSE\_BLK3,  0,  32,
USER\_DATA.MODEL\_NUMBER,    EFUSE\_BLK3,  32,  10,
USER\_DATA.HARDWARE\_REV,    EFUSE\_BLK3,  42,  10,
\end{verbatim}

2. Fill a line for field: field\_name, efuse\_block, bit\_start, bit\_count, comment.
3. Run a \texttt{show\_efuse\_table} command to check eFuse table. To generate source files run \texttt{efuse\_common\_table} or \texttt{efuse\_custom\_table} command.

You may get errors such as \texttt{intersects with} or \texttt{out of range}. Please see how to solve them in the \textit{Structured efuse fields} article.

\textbf{Bit Order}

The eFuses bit order is little endian (see the example below), it means that eFuse bits are read and written from LSB to MSB:

\begin{verbatim}
$ espefuse.py dump
USER\_DATA (BLOCK3 ) [3 ] read\_regs: 03020100 07060504 0B0A0908...
  0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C
BLOCK4 (BLOCK4 ) [4 ] read\_regs: 03020100 07060504 0B0A0908...
  0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C
\end{verbatim}

where is the register representation:

\begin{verbatim}
EFUSE\_RD\_USR\_DATA0\_REG = 0x03020100
EFUSE\_RD\_USR\_DATA1\_REG = 0x07060504
EFUSE\_RD\_USR\_DATA2\_REG = 0x0B0A0908
EFUSE\_RD\_USR\_DATA3\_REG = 0x0F0E0D0C
EFUSE\_RD\_USR\_DATA4\_REG = 0x13121111
EFUSE\_RD\_USR\_DATA5\_REG = 0x17161514
EFUSE\_RD\_USR\_DATA6\_REG = 0x1B1A1918
EFUSE\_RD\_USR\_DATA7\_REG = 0x1F1E1D1C
\end{verbatim}

where is the byte representation:

\begin{verbatim}
byte[0] = 0x00, byte[1] = 0x01, ... byte[3] = 0x03, byte[4] = 0x04, ..., byte[31]...= 0x1F
\end{verbatim}

For example, csv file describes the USER\_DATA field, which occupies all 256 bits (a whole block).

\begin{verbatim}
USER\_DATA,    EFUSE\_BLK3,  0,  256,    User data
USER\_DATA.FIELD1,    EFUSE\_BLK3,  16,  16, Field1
ID,    EFUSE\_BLK4,  8,  3, ID bit[0..2]
,    EFUSE\_BLK4,  16,  2, ID bit[3..4]
,    EFUSE\_BLK4,  32,  3, ID bit[5..7]
\end{verbatim}
Thus, reading the eFuse USER_DATA block written as above gives the following results:

```c
uint8_t buf[32] = { 0 };
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &buf, sizeof(buf) * 8);
// buf[0] = 0x00, buf[1] = 0x01, ... buf[31] = 0x1F

uint32_t field1 = 0;
size_t field1_size = ESP_EFUSE_USER_DATA[0]->bit_count; // can be used for this case because it only consists of one entry
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1, field1_size);
// field1 = 0x0302

uint32_t field1_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &field1_1, 2); // reads only first 2 bits
// field1 = 0x0002

uint8_t id = 0;
size_t id_size = esp_efuse_get_field_size(ESP_EFUSE_ID); // returns 6
// size_t id_size = ESP_EFUSE_USER_DATA[0]->bit_count; // can NOT be used because it consists of 3 entries. It returns 3 not 6.
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id, id_size);
// id = 0x91
// b'100 10 001
// [3] [2] [3]

uint8_t id_1 = 0;
esp_efuse_read_field_blob(ESP_EFUSE_ID, &id_1, 3);
// id = 0x01
// b'001
```

**Debug eFuse & Unit tests**

**Virtual eFuses** The Kconfig option `CONFIG_EFUSE_VIRTUAL` will virtualize eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the `CONFIG_EFUSE_VIRTUAL` option there is `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option that adds a feature to keep eFuses in flash memory. To use this mode the partition_table should have the `efuse` partition. partition.csv: "efuse_em, data, efuse, , 0x2000, ". During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test secure_boot and flash_encryption_features with this option).

**Flash Encryption Testing** Flash Encryption (FE) is a hardware feature that requires the physical burning of eFuses: key and FLASH_CRYPT_CNT. If FE is not actually enabled then enabling the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option just gives testing possibilities and does not encrypt anything in the flash, even though the logs say encryption happens. The `bootloader_flash_write()` is adapted for this purpose. But if FE is already enabled on the chip and you run an application or bootloader created with the `CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH` option then the flash encryption/decryption operations will work properly (data are encrypted as it is written into an encrypted flash partition and decrypted when they are read from an encrypted partition).

**esefuse.py** esptool includes a useful tool for reading/writing ESP32 eFuse bits - `esefuse.py`.

```
esefuse.py -p PORT summary

Enumerations

enum esp_efuse_block_t

Espressif Systems 1834 Release v5.0.4-384-ge42bcf2e88
Submit Document Feedback
Chapter 2 - API Reference

Type of eFuse blocks for ESP32.

Values:

enumerator **EFUSE_BLK0**
Number of eFuse block. Reserved.

enumerator **EFUSE_BLK1**
Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can be used for another purpose.

enumerator **EFUSE_BLK_KEY0**
Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can be used for another purpose.

enumerator **EFUSE_BLK_ENCRYPT_FLASH**
Number of eFuse block. Used for Flash Encryption. If not using that Flash Encryption feature, they can be used for another purpose.

enumerator **EFUSE_BLK2**
Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used for another purpose.

enumerator **EFUSE_BLK_KEY1**
Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used for another purpose.

enumerator **EFUSE_BLK_SECURE_BOOT**
Number of eFuse block. Used for Secure Boot. If not using that Secure Boot feature, they can be used for another purpose.

enumerator **EFUSE_BLK3**
Number of eFuse block. Uses for the purpose of the user.

enumerator **EFUSE_BLK_KEY2**
Number of eFuse block. Uses for the purpose of the user.

enumerator **EFUSE_BLK_KEY_MAX**

enumerator **EFUSE_BLK_MAX**

enum **esp_efuse_coding_scheme_t**
Type of coding scheme.

Values:

enumerator **EFUSE_CODING_SCHEME_NONE**
None

enumerator **EFUSE_CODING_SCHEME_3_4**
3/4 coding
enumerator **EFUSE_CODING_SCHEME_REPEAT**

Repeat coding

enum **esp_efuse_purpose_t**

Type of key purpose (virtual because ESP32 has only fixed purposes for blocks)

*Values:*

enumerator **ESP_EFUSE_KEY_PURPOSE_USER**

BLOCK3

enumerator **ESP_EFUSE_KEY_PURPOSE_SYSTEM**

BLOCK0

enumerator **ESP_EFUSE_KEY_PURPOSE_FLASH_ENCRYPTION**

BLOCK1

enumerator **ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_V2**

BLOCK2

enumerator **ESP_EFUSE_KEY_PURPOSE_MAX**

MAX PURPOSE

**Header File**

- components/efuse/include/esp_efuse.h

**Functions**

```c
esp_err_t esp_efuse_read_field_blob (const esp_efuse_desc_t *field[], void *dst, size_t dst_size_bits)
```

Reads bits from EFUSE field and writes it into an array.

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**

- **field** – [in] A pointer to the structure describing the fields of efuse.
- **dst** – [out] A pointer to array that will contain the result of reading.
- **dst_size_bits** – [in] The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

```c
bool esp_efuse_read_field_bit (const esp_efuse_desc_t *field[])
```

Read a single bit eFuse field as a boolean value.

**Note:** The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call esp_efuse_read_field_blob() and check the returned value instead.
Note: If assertions are enabled and the parameter is invalid, execution will abort.

Note: Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**

field – [in] A pointer to the structure describing the fields of efuse.

**Returns**

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

**esp_err_t esp_efuse_read_field_cnt** (const esp_efuse_desc_t *field[], size_t *out_cnt)

Reads bits from EFUSE field and returns number of bits programmed as “1”.
If the bits are set not sequentially, they will still be counted.

Note: Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**

- out_cnt – [out] A pointer that will contain the number of programmed as “1” bits.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

**esp_err_t esp_efuse_write_field_blob** (const esp_efuse_desc_t *field[], const void *src, size_t src_size_bits)

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

**Parameters**

- src – [in] A pointer to array that contains the data for writing.
- src_size_bits – [in] The number of bits required to write.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**esp_err_t esp_efuse_write_field_cnt** (const esp_efuse_desc_t *field[], size_t cnt)

Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1”, ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

**Parameters**

- cnt – [in] Required number of programmed as “1” bits.

**Returns**

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

`esp_err_t esp_efuse_write_field_bit(const esp_efuse_desc_t *field[])`

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp_efuse_write_field_cnt() with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

**Parameters**

field – [in] Pointer to the structure describing the eFuse field.

**Returns**

• ESP_OK: The operation was successfully completed, or the bit was already set to value 1.
• ESP.ERR_INVALID_ARG: Error in the passed arguments, including if the eFuse field is not 1 bit wide.

`esp_err_t esp_efuse_set_write_protect(esp_efuse_block_t blk)`

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

**Parameters**

blk – [in] Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

**Returns**

• ESP_OK: The operation was successfully completed.
• ESP.ERR_INVALID_ARG: Error in the passed arguments.
• ESP.ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

`esp_err_t esp_efuse_set_read_protect(esp_efuse_block_t blk)`

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

**Parameters**

blk – [in] Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

**Returns**

• ESP_OK: The operation was successfully completed.
• ESP.ERR_INVALID_ARG: Error in the passed arguments.

`int esp_efuse_get_field_size(const esp_efuse_desc_t *field[])`

Returns the number of bits used by field.

**Parameters**

field – [in] A pointer to the structure describing the fields of eFuse.

**Returns**

Returns the number of bits used by field.

`uint32_t esp_efuse_read_reg(esp_efuse_block_t blk, unsigned int num_reg)`

Returns value of eFuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

**Note:** Please note that reading in the batch mode does not show uncommitted changes.
esp_err_t esp_efuse_write_reg(esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)
Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

Parameters
- blk –[in] Block number of eFuse.
- num_reg –[in] The register number in the block.
- val –[in] Value to write.

Returns
- ESP_OK: The operation was successfully completed.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

esp_efuse_coding_scheme_t esp_efuse_get_coding_scheme(esp_efuse_block_t blk)
Return efuse coding scheme for blocks.

Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

Parameters blk –[in] Block number of eFuse.

Returns Return efuse coding scheme for blocks

esp_err_t esp_efuse_read_block(esp_efuse_block_t blk, void* dst_key, size_t offset_in_bits, size_t size_bits)
Read key to efuse block starting at the offset and the required size.

Note: Please note that reading in the batch mode does not show uncommitted changes.

Parameters
- blk –[in] Block number of eFuse.
- dst_key –[in] A pointer to array that will contain the result of reading.
- offset_in_bits –[in] Start bit in block.
- size_bits –[in] The number of bits required to read.

Returns
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

esp_err_t esp_efuse_write_block(esp_efuse_block_t blk, const void* src_key, size_t offset_in_bits, size_t size_bits)
Write key to efuse block starting at the offset and the required size.

Parameters
- blk –[in] Block number of eFuse.
- src_key –[in] A pointer to array that contains the key for writing.
- offset_in_bits –[in] Start bit in block.
- size_bits –[in] The number of bits required to write.

Returns
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits

uint32_t esp_efuse_get_pkg_ver (void)
Returns chip package from efuse.

Returns chip package
void esp_efuse_reset (void)
    Reset efuse write registers.

    Efuse write registers are written to zero, to negate any changes that have been staged here.

    **Note:** This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller’s responsibility to serialise.

void esp_efuse_disable_basic_rom_console (void)
    Disable BASIC ROM Console via efuse.

    By default, if booting from flash fails the ESP32 will boot a BASIC console in ROM.

    Call this function (from bootloader or app) to permanently disable the console on this chip.

esp_err_t esp_efuse_disable_rom_download_mode (void)
    Disable ROM Download Mode via eFuse.

    Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

    **Note:** Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

    **Note:** If ROM Download Mode is already disabled, this function does nothing and returns success.

Returns

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode
- ESP_ERR_INVALID_STATE (ESP32 only) This eFuse is write protected and cannot be written

esp_err_t esp_efuse_set_rom_log_scheme (esp_efuse_rom_log_scheme_t log_scheme)
    Set boot ROM log scheme via eFuse.

    **Note:** By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can’t be changed again.

Parameters log_scheme – Supported ROM log scheme

Returns

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme
- ESP_ERR_INVALID_STATE This eFuse is write protected or has been burned already

uint32_t esp_efuse_read_secure_version (void)
    Return secure_version from efuse field.

    **Returns** Secure version from efuse field

bool esp_efuse_check_secure_version (uint32_t secure_version)
    Check secure_version from app and secure_version and from efuse field.

    **Parameters** secure_version – Secure version from app.
Returns

- True: If version of app is equal or more then secure_version from efuse.

```c
esp_err_t esp_efuse_update_secure_version(uint32_t secure_version)
```
Write efuse field by secure_version value.

Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

**Parameters**

- `secure_version` - Secure version from app.

**Returns**

- ESP_OK: Successful.
- ESP_FAIL: secure_version of app cannot be set to efuse field.
- ESP_ERR_NOT_SUPPORTED: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

```c
esp_err_t esp_efuse_batch_write_begin(void)
```
Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call begin() then perform as usually the necessary operations read and write and at the end call commit() to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

```c
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3); // ESP_EFUSE_1 == 1, here we write a new value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1 because uncommitted changes are not readable, it will be available only after commit.

// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be done in the last commit().

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 3.
```
Note: Please note that reading in the batch mode does not show uncommitted changes.

Returns
• ESP_OK: Successful.

`esp_err_t esp_efuse_batch_write_cancel (void)`
Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

Returns
• ESP_OK: Successful.
• ESP_ERR_INVALID_STATE: The batch mode was not set.

`esp_err_t esp_efuse_batch_write_commit (void)`
Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

Returns
• ESP_OK: Successful.
• ESP_ERR_INVALID_STATE: The deferred writing mode was not set.

`bool esp_efuse_block_is_empty (esp_efuse_block_t block)`
Checks that the given block is empty.

Returns
• True: The block is empty.
• False: The block is not empty or was an error.

`bool esp_efuse_get_key_dis_read (esp_efuse_block_t block)`
Returns a read protection for the key block.

Parameters block - [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns True: The key block is read protected False: The key block is readable.

`esp_err_t esp_efuse_set_key_dis_read (esp_efuse_block_t block)`
Sets a read protection for the key block.

Parameters block - [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns
• ESP_OK: Successful.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
• ESP_ERR_CODING: Error range of data does not match the coding scheme.

`bool esp_efuse_get_key_dis_write (esp_efuse_block_t block)`
Returns a write protection for the key block.

Parameters block - [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns True: The key block is write protected False: The key block is writeable.

`esp_err_t esp_efuse_set_key_dis_write (esp_efuse_block_t block)`
Sets a write protection for the key block.

Parameters block - [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns
• ESP_OK: Successful.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
• ESP_ERR_CODING: Error range of data does not match the coding scheme.

bool esp_efuse_key_block_unused (esp_efuse_block_t block)

Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0 (ESP_EFUSE_KEY_PURPOSE_USER)

Parameters block – key block to check.

Returns
• True if key block is unused,
• False if key block is used or the specified block index is not a key block.

bool esp_efuse_find_purpose (esp_efuse_purpose_t purpose, esp_efuse_block_t *block)

Find a key block with the particular purpose set.

Parameters
• purpose – [in] Purpose to search for.
• block – [out] Pointer in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX which will be set to the key block if found. Can be NULL, if only need to test the key block exists.

Returns
• True: If found,
• False: If not found (value at block pointer is unchanged).

bool esp_efuse_get_keypurpose_dis_write (esp_efuse_block_t block)

Returns a write protection of the key purpose field for an efuse key block.

Note: For ESP32: no keypurpose, it returns always True.

Parameters block – [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns True: The key purpose is write protected. False: The key purpose is writeable.

esp_efuse_purpose_t esp_efuse_get_key_purpose (esp_efuse_block_t block)

Returns the current purpose set for an efuse key block.

Parameters block – [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

Returns
• Value: If Successful, it returns the value of the purpose related to the given key block.
• ESP_EFUSE_KEY_PURPOSE_MAX: Otherwise.

esp_err_t esp_efuse_write_key (esp_efuse_block_t block, esp_efuse_purpose_t purpose, const void *key, size_t key_size_bytes)

Program a block of key data to an efuse block.
The burn of a key, protection bits, and a purpose happens in batch mode.

Parameters
• block – [in] Block to read purpose for. Must be in range EFUSE_BLK_KEY0 to EFUSE_BLK_KEY_MAX. Key block must be unused (esp_efuse_key_block_unused).
• purpose – [in] Purpose to set for this key. Purpose must be already unset.
• key – [in] Pointer to data to write.
• key_size_bytes – [in] Bytes length of data to write.

Returns
• ESP_OK: Successful.
• ESP_ERR_INVALID_ARG: Error in the passed arguments.
• ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
Chapter 2. API Reference

- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_write_keys (const esp_efuse_purpose_t purposes[], uint8_t keys[][32], unsigned number_of_keys)
``
Program keys to unused efuse blocks.
The burn of keys, protection bits, and purposes happens in batch mode.

**Parameters**
- `purposes` - [in] Array of purposes (purpose[number_of_keys]).
- `keys` - [in] Array of keys (uint8_t keys[number_of_keys][32]). Each key is 32 bytes long.
- `number_of_keys` - [in] The number of keys to write (up to 6 keys).

**Returns**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS: Error not enough unused key blocks available
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_check_errors (void)
``
Checks eFuse errors in BLOCK0.

It does a BLOCK0 check if eFuse EFUSE_ERR_RST_ENABLE is set. If BLOCK0 has an error, it prints the error and returns ESP_FAIL, which should be treated as esp_restart.

**Note:** Refers to ESP32-C3 only.

**Returns**
- ESP_OK: No errors in BLOCK0.
- ESP_FAIL: Error in BLOCK0 requiring reboot.

**Structures**

struct esp_efuse_desc_t
Type definition for an eFuse field.

**Public Members**

`esp_efuse_block_t efuse_block`
Block of eFuse

`uint8_t bit_start`
Start bit [0..255]

`uint16_t bit_count`
Length of bit field [1..-]
Chapter 2. API Reference

**Macros**

**ESP_ERR_EFUSE**
Base error code for efuse api.

**ESP_OK_EFUSE_CNT**
OK the required number of bits is set.

**ESP_ERR_EFUSE_CNT_IS_FULL**
Error field is full.

**ESP_ERR_EFUSE_REPEATED_PROG**
Error repeated programming of programmed bits is strictly forbidden.

**ESP_ERR_CODING**
Error while a encoding operation.

**ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS**
Error not enough unused key blocks available

**ESP_ERR_DAMAGED_READING**
Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

**Enumerations**

```c
enum esp_efuse_rom_log_scheme_t
{
  
  ESP_EFUSE_ROM_LOG_ALWAYS_ON,
  ESP_EFUSE_ROM_LOG_ON_GPIO_LOW,
  ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH,
  ESP_EFUSE_ROM_LOG_ALWAYS_OFF,
}
```

Type definition for ROM log scheme.

**Values:**

- **ESP_EFUSE_ROM_LOG_ALWAYS_ON**
  Always enable ROM logging

- **ESP_EFUSE_ROM_LOG_ON_GPIO_LOW**
  ROM logging is enabled when specific GPIO level is low during start up

- **ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH**
  ROM logging is enabled when specific GPIO level is high during start up

- **ESP_EFUSE_ROM_LOG_ALWAYS_OFF**
  Disable ROM logging permanently

**2.10.7 Error Codes and Helper Functions**

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling. For general information about error codes in ESP-IDF, see *Error Handling*. For the full list of error codes defined in ESP-IDF, see *Error Code Reference*. 
API Reference

Header File

- components/esp_common/include/esp_check.h

Macros

**ESP_RETURN_ON_ERROR**(x, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns. In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros. The first one is using the GNU extension `##__VA_ARGS__`. The second one is using the C++20 feature `VA_OPT(,)`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using `##__VA_ARGS__`. Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns.

**ESP_RETURN_ON_ERROR_ISR**(x, log_tag, format, ...)

A version of ESP_RETURN_ON_ERROR() macro that can be called from ISR.

**ESP_GOTO_ON_ERROR**(x, goto_tag, log_tag, format, ...)

Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message, sets the local variable ‘ret’ to the code, and then exits by jumping to ‘goto_tag’.

**ESP_GOTO_ON_ERROR_ISR**(x, goto_tag, log_tag, format, ...)

A version of ESP_GOTO_ON_ERROR() macro that can be called from ISR.

**ESP_RETURN_ON_FALSE**(a, err_code, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message and returns with the supplied ‘err_code’.

**ESP_RETURN_ON_FALSE_ISR**(a, err_code, goto_tag, log_tag, format, ...)

A version of ESP_RETURN_ON_FALSE() macro that can be called from ISR.

**ESP_GOTO_ON_FALSE**(a, err_code, goto_tag, log_tag, format, ...)

Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message, sets the local variable ‘ret’ to the supplied ‘err_code’, and then exits by jumping to ‘goto_tag’.

**ESP_GOTO_ON_FALSE_ISR**(a, err_code, goto_tag, log_tag, format, ...)

A version of ESP_GOTO_ON_FALSE() macro that can be called from ISR.

Header File

- components/esp_common/include/esp_err.h

Functions

const char *esp_err_to_name (esp_err_t code)

Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

**Parameters**

- **code** – esp_err_t error code

**Returns**

string error message

const char *esp_err_to_name_r (esp_err_t code, char *buf, size_t buflen)

Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.
The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

**Parameters**

- **code** - esp_err_t error code
- **buf** - [out] buffer where the error message should be written
- **buflen** - Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

**Returns**

buf containing the string error message

**Macros**

**ESP_OK**

esp_err_t value indicating success (no error)

**ESP_FAIL**

Generic esp_err_t code indicating failure

**ESP_ERR_NO_MEM**

Out of memory

**ESP_ERR_INVALID_ARG**

Invalid argument

**ESP_ERR_INVALID_STATE**

Invalid state

**ESP_ERR_INVALID_SIZE**

Invalid size

**ESP_ERR_NOT_FOUND**

Requested resource not found

**ESP_ERR_NOT_SUPPORTED**

Operation or feature not supported

**ESP_ERR_TIMEOUT**

Operation timed out

**ESP_ERR_INVALID_RESPONSE**

Received response was invalid

**ESP_ERR_INVALID_CRC**

CRC or checksum was invalid

**ESP_ERR_INVALID_VERSION**

Version was invalid

**ESP_ERR_INVALID_MAC**

MAC address was invalid
Chapter 2. API Reference

ESP_ERR_NOT_FINISHED
There are items remained to retrieve

ESP_ERR_WIFI_BASE
Starting number of WiFi error codes

ESP_ERR_MESH_BASE
Starting number of MESH error codes

ESP_ERR_FLASH_BASE
Starting number of flash error codes

ESP_ERR_HW_CRYPTO_BASE
Starting number of HW cryptography module error codes

ESP_ERR_MEMPROT_BASE
Starting number of Memory Protection API error codes

ESP_ERROR_CHECK(x)
Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK. Prints the error code, error location, and the failed statement to serial output.
Disabled if assertions are disabled.

ESP_ERROR_CHECK_WITHOUT_ABORT(x)
Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn’t terminating the program.

Type Definitions
typedef int esp_err_t

2.10.8 ESP HTTPS OTA

Overview
esp_https_ota provides simplified APIs to perform firmware upgrades over HTTPS. It’s an abstraction layer over existing OTA APIs.

Application Example

```c
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char *)server_cert_pem_start,
    };
    esp_https_ota_config_t ota_config = {
        .http_config = &config,
    };
    esp_err_t ret = esp_https_ota(&ota_config);
    if (ret == ESP_OK) {
(continues on next page)
```
Server Verification

Please refer to ESP-TLS: TLS Server Verification for more information on server verification. The root certificate (in PEM format) needs to be provided to the `esp_http_client_config_t::cert_pem` member.

**Note:** The server-endpoint root certificate should be used for verification instead of any intermediate ones from the certificate chain. The reason being that the root certificate has the maximum validity and usually remains the same for a long period of time. Users can also use the ESP x509 Certificate Bundle feature for verification, which covers most of the trusted root certificates (using the `esp_http_client_config_t::crt_bundle_attach` member).

Partial Image Download over HTTPS

To use partial image download feature, enable `partial_http_download` configuration in `esp_https_ota_config_t`. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified size. Maximum content length of each request can be specified by setting `max_http_request_size` to required value.

This option is useful while fetching image from a service like AWS S3, where mbedtls TLS Rx buffer size (`CONFIGMBEDTLS_SSL_IN_CONTENT_LEN`) can be set to lower value which is not possible without enabling this configuration.

Default value of mbedtls TLS Rx buffer size is set to 16K. By using `partial_http_download` with `max_http_request_size` of 4K, size of mbedtls TLS Rx buffer can be reduced to 4K. With this configuration, memory saving of around 12K is expected.

Signature Verification

For additional security, signature of OTA firmware images can be verified. For that, refer Secure OTA Updates Without Secure boot

Advanced APIs

`esp_https_ota` also provides advanced APIs which can be used if more information and control is needed during the OTA process.

Example that uses advanced ESP HTTPS OTA APIs: `system/ota/advanced_https_ota`.

OTA Upgrades with Pre-Encrypted Firmware

To perform OTA upgrades with Pre-Encrypted Firmware, please enable `CONFIG_ESP_HTTPS_OTA_DECRYPT_CB` in component menuconfig.

Example that performs OTA upgrade with Pre-Encrypted Firmware: `system/ota/pre_encrypted_ota`.

```c
esp_restart();
} else {
    return ESP_FAIL;
}
return ESP_OK;
```
OTA System Events

ESP HTTPS OTA has various events for which a handler can be triggered by the Event Loop library when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps in event handling for ESP HTTPS OTA. `esp_https_ota_event_t` has all the events which can happen when performing OTA upgrade using ESP HTTPS OTA.

Event Handler Example

```c
/* Event handler for catching system events */
static void event_handler(void* arg, esp_event_base_t event_base, int32_t event_id, void* event_data)
{
    if (event_base == ESP_HTTPS_OTA_EVENT) {
        switch (event_id) {
            case ESP_HTTPS_OTA_START:
                ESP_LOGI(TAG, "OTA started");
                break;
            case ESP_HTTPS_OTA_CONNECTED:
                ESP_LOGI(TAG, "Connected to server");
                break;
            case ESP_HTTPS_OTA_GET_IMG_DESC:
                ESP_LOGI(TAG, "Reading Image Description");
                break;
            case ESP_HTTPS_OTA_VERIFY_CHIP_ID:
                ESP_LOGI(TAG, "Verifying chip id of new image: %d", *(esp_chip_id_t *)event_data);
                break;
            case ESP_HTTPS_OTA_DECRYPT_CB:
                ESP_LOGI(TAG, "Callback to decrypt function");
                break;
            case ESP_HTTPS_OTA_WRITE_FLASH:
                ESP_LOGD(TAG, "Writing to flash: %d written", *(int*)event_data);
                break;
            case ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION:
                ESP_LOGI(TAG, "Boot partition updated. Next Partition: %d", *(esp_partition_subtype_t *)event_data);
                break;
            case ESP_HTTPS_OTA_FINISH:
                ESP_LOGI(TAG, "OTA finish");
                break;
            case ESP_HTTPS_OTA_ABORT:
                ESP_LOGI(TAG, "OTA abort");
                break;
        }
    }
}
```

Expected data type for different ESP HTTPS OTA events in the system event loop:

- `ESP_HTTPS_OTA_START`: NULL
- `ESP_HTTPS_OTA_CONNECTED`: NULL
- `ESP_HTTPS_OTA_GET_IMG_DESC`: NULL
- `ESP_HTTPS_OTA_VERIFY_CHIP_ID`: esp_chip_id_t
- `ESP_HTTPS_OTA_DECRYPT_CB`: NULL
- `ESP_HTTPS_OTA_WRITE_FLASH`: int
- `ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION`: esp_partition_subtype_t
- `ESP_HTTPS_OTA_FINISH`: NULL
- `ESP_HTTPS_OTA_ABORT`: NULL
Chapter 2. API Reference

API Reference

Header File

- components/esp_https_ota/include/esp_https_ota.h

Functions

**esp_err_t esp_https_ota** (const esp_https_ota_config_t *ota_config)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image
data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation.
This API supports URL redirection, but if CA cert of URLs differ then it should be appended to cert_pem
member of ota_config->http_config.

**Note:** This API handles the entire OTA operation, so if this API is being used then no other APIs from
esp_https_ota component should be called. If more information and control is needed during the HTTPS
OTA process, then one can use esp_https_ota_begin and subsequent APIs. If this API returns success-
fully, esp_restart() must be called to boot from the new firmware image.

**Parameters**

ota_config  [in]  pointer to esp_https_ota_config_t structure.

**Returns**

- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write
  failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

**esp_err_t esp_https_ota_begin** (const esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must
be invoked first. If this function returns successfully, then esp_https_ota_perform should be called
to continue with the OTA process and there should be a call to esp_https_ota_finish on completion
of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert
of URLs differ then it should be appended to cert_pem member of http_config, which is a part of
ota_config. In case of error, this API explicitly sets handle to NULL.

**Note:** This API is blocking, so setting is_async member of http_config structure will result in an
error.

**Parameters**

ota_config  [in]  pointer to esp_https_ota_config_t structure

handle  [out]  pointer to an allocated data of type esp_https_ota_handle_t
  which will be initialised in this function

**Returns**

- ESP_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection es-
  tablished
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in app_update component and esp_http_client
  component in esp-idf.
esp_err_t esp_https_ota_perform(esp_https_ota_handle_t https_ota_handle)

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called only if esp_https_ota_begin() returns successfully. This function must be called in a loop since it returns after every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

**Parameters**

https_ota_handle [in] pointer to esp_https_ota_handle_t structure

**Returns**

- ESP_ERR_HTTPS_OTA_IN_PROGRESS: OTA update is in progress, call this API again to continue.
- ESP_OK: OTA update was successful
- ESP_FAIL: OTA update failed
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_VERSION: Invalid chip revision in image header
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

bool esp_https_ota_is_complete_data_received(esp_https_ota_handle_t https_ota_handle)

Checks if complete data was received or not.

**Note:** This API can be called just before esp_https_ota_finish() to validate if the complete image was indeed received.

**Parameters**

https_ota_handle [in] pointer to esp_https_ota_handle_t structure

**Returns**

- false
- true

esp_err_t esp_https_ota_finish(esp_https_ota_handle_t https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

**Note:** If this API returns successfully, esp_restart() must be called to boot from the new firmware image esp_https_ota_finish should not be called after calling esp_https_ota_abort

**Parameters**

https_ota_handle [in] pointer to esp_https_ota_handle_t structure

**Returns**

- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image

esp_err_t esp_https_ota_abort(esp_https_ota_handle_t https_ota_handle)

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

**Note:** esp_https_ota_abort should not be called after calling esp_https_ota_finish
**Parameters**  
\texttt{https\_ota\_handle} [\texttt{in}] pointer to \texttt{esp\_https\_ota\_handle\_t} structure

**Returns**

- \texttt{ESP\_OK}: Clean-up successful
- \texttt{ESP\_ERR\_INVALID\_STATE}: Invalid ESP HTTPS OTA state
- \texttt{ESP\_FAIL}: OTA not started
- \texttt{ESP\_ERR\_NOT\_FOUND}: OTA handle not found
- \texttt{ESP\_ERR\_INVALID\_ARG}: Invalid argument

\begin{verbatim}
esp\_err\_t esp\_https\_ota\_get\_img\_desc (esp\_https\_ota\_handle\_t https\_ota\_handle, esp\_app\_desc\_t *new\_app\_info)
\end{verbatim}

Reads app description from image header. The app description provides information like the “Firmware version” of the image.

**Note:** This API can be called only after \texttt{esp\_https\_ota\_begin()} and before \texttt{esp\_https\_ota\_perform()}. Calling this API is not mandatory.

**Parameters**

- \texttt{https\_ota\_handle} [\texttt{in}] pointer to \texttt{esp\_https\_ota\_handle\_t} structure
- \texttt{new\_app\_info} [\texttt{out}] pointer to an allocated \texttt{esp\_app\_desc\_t} structure

**Returns**

- \texttt{ESP\_ERR\_INVALID\_ARG}: Invalid arguments
- \texttt{ESP\_ERR\_INVALID\_STATE}: Invalid state to call this API. \texttt{esp\_https\_ota\_begin()} not called yet.
- \texttt{ESP\_FAIL}: Failed to read image descriptor
- \texttt{ESP\_OK}: Successfully read image descriptor

\begin{verbatim}
int esp\_https\_ota\_get\_image\_len\_read (esp\_https\_ota\_handle\_t https\_ota\_handle)
\end{verbatim}

This function returns OTA image data read so far.

**Note:** This API should be called only if \texttt{esp\_https\_ota\_perform()} has been called at least once or if \texttt{esp\_https\_ota\_get\_img\_desc} has been called before.

**Parameters**  
\texttt{https\_ota\_handle} [\texttt{in}] pointer to \texttt{esp\_https\_ota\_handle\_t} structure

**Returns**

- \texttt{-1} On failure
- total bytes read so far

\begin{verbatim}
int esp\_https\_ota\_get\_image\_size (esp\_https\_ota\_handle\_t https\_ota\_handle)
\end{verbatim}

This function returns OTA image total size.

**Note:** This API should be called after \texttt{esp\_https\_ota\_begin()} has been already called. This can be used to create some sort of progress indication (in combination with \texttt{esp\_https\_ota\_get\_image\_len\_read()})

**Parameters**  
\texttt{https\_ota\_handle} [\texttt{in}] pointer to \texttt{esp\_https\_ota\_handle\_t} structure

**Returns**

- \texttt{-1} On failure or chunked encoding
- total bytes of image

**Structures**

\begin{verbatim}
struct esp\_https\_ota\_config\_t
\end{verbatim}

ESP HTTPS OTA configuration.
Public Members

const esp_http_client_config_t *http_config
ESP HTTP client configuration

http_client_init_cb_t http_client_init_cb
Callback after ESP HTTP client is initialised

bool bulk_flash_erase
Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

bool partial_http_download
Enable Firmware image to be downloaded over multiple HTTP requests

int max_http_request_size
Maximum request size for partial HTTP download

Macros

ESP_ERR_HTTPS_OTA_BASE
ESP_ERR_HTTPS_OTA_IN_PROGRESS

Type Definitions

typedef void *esp_https_ota_handle_t

typedef esp_err_t (*http_client_init_cb_t)(esp_http_client_handle_t)

Enumerations

enum esp_https_ota_event_t
Events generated by OTA process.
Values:

enumerator ESP_HTTPS_OTA_START
OTA started

enumerator ESP_HTTPS_OTA_CONNECTED
Connected to server

enumerator ESP_HTTPS_OTA_GET_IMG_DESC
Read app description from image header

enumerator ESP_HTTPS_OTA_VERIFY_CHIP_ID
Verify chip id of new image
enumerator **ESP_HTTPS_OTA_DECRYPT_CB**
   Callback to decrypt function

enumerator **ESP_HTTPS_OTA_WRITE_FLASH**
   Flash write operation

enumerator **ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION**
   Boot partition update after successful ota update

enumerator **ESP_HTTPS_OTA_FINISH**
   OTA finished

enumerator **ESP_HTTPS_OTA_ABORT**
   OTA aborted

### 2.10.9 Event Loop Library

#### Overview

The event loop library allows components to declare events to which other components can register handlers – code which will execute when those events occur. This allows loosely coupled components to attach desired behavior to changes in state of other components without application involvement. For instance, a high level connection handling library may subscribe to events produced by the Wi-Fi subsystem directly and act on those events. This also simplifies event processing by serializing and deferring code execution to another context.

#### Using esp_event APIs

There are two objects of concern for users of this library: events and event loops.

Events are occurrences of note. For example, for Wi-Fi, a successful connection to the access point may be an event. Events are referenced using a two part identifier which are discussed more here. Event loops are the vehicle by which events get posted by event sources and handled by event handler functions. These two appear prominently in the event loop API.

Using this library roughly entails the following flow:

1. A user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler. It should have the same signature as `esp_event_handler_t`.
2. An event loop is created using `esp_event_loop_create()`, which outputs a handle to the loop of type `esp_event_loop_handle_t`. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which are discussed here.
3. Components register event handlers to the loop using `esp_event_handler_register_with()`. Handlers can be registered with multiple loops, more on that here.
4. Event sources post an event to the loop using `esp_event_post_to()`.  
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using `esp_event_handler_unregister_with()`.
6. Event loops which are no longer needed can be deleted using `esp_event_loop_delete()`.

In code, the flow above may look like as follows:

```c
// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void* event_data) {
    // Event handler logic
```

(continues on next page)
```c
void app_main()
{
    // 2. A configuration structure of type esp_event_loop_args_t is needed to
    // specify the properties of the loop to be
    // created. A handle of type esp_event_loop_handle_t is obtained, which is
    // needed by the other APIs to reference the loop
    // to perform their operations on.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...,
        .task_priority = ...,
        .task_stack_size = ...,
        .task_core_id = ...,
    };

    esp_event_loop_handle_t loop_handle;
    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID
    // specifies a hypothetical
    // event that handler run_on_event should execute on when it gets posted to
    // the loop.
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event, ...);

    // 4. Post events to the loop. This queues the event on the event loop. At
    // some point in time
    // the event loop executes the event handler registered to the posted event,
    // in this case run_on_event.
    // For simplicity sake this example calls esp_event_post_to from app_main, but
    // posting can be done from
    // any other tasks (which is the more interesting use case).
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

    // 5. Unregistering an unneeded handler
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event);

    // 6. Deleting an unneeded event loop
    esp_event_loop_delete(loop_handle);
}
```

### Declaring and defining events

As mentioned previously, events consists of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person’s last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:
Chapter 2. API Reference

ESP_EVENT_DECLARE_BASE(EVENT_BASE)

Event base definition:

ESP_EVENT_DEFINE_BASE(EVENT_BASE)

Note: In IDF, the base identifiers for system events are uppercase and are postfixed with _EVENT. For example, the base for Wi-Fi events is declared and defined as WIFI_EVENT, the ethernet event base ETHERNET_EVENT, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros ESP_EVENT_DECLARE_BASE and ESP_EVENT_DEFINE_BASE).

For event ID’s, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

Default Event Loop

The default event loop is a special type of loop used for system events (Wi-Fi events, for example). The handle for this loop is hidden from the user. The creation, deletion, handler registration/unregistration and posting of events is done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loop equivalents.

<table>
<thead>
<tr>
<th>User Event Loops</th>
<th>Default Event Loops</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_event_loop_create()</td>
<td>esp_event_loop_create_default()</td>
</tr>
<tr>
<td>esp_event_loop_delete()</td>
<td>esp_event_loop_delete_default()</td>
</tr>
<tr>
<td>esp_event_handler_register_with()</td>
<td>esp_event_handler_register()</td>
</tr>
<tr>
<td>esp_event_handler_unregister_with()</td>
<td>esp_event_handler_unregister()</td>
</tr>
<tr>
<td>esp_event_post_to()</td>
<td>esp_event_post()</td>
</tr>
</tbody>
</table>

If you compare the signatures for both, they are mostly similar except for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted to, there is no difference to how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

Notes on Handler Registration

It is possible to register a single handler to multiple events individually, i.e. using multiple calls to `esp_event_handler_register_with()`. For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases it is desirable for a handler to execute on (1) all events that get posted to a loop or (2) all events of a particular base identifier. This is possible using the special event base identifier ESP_EVENT_ANY_BASE and special event ID ESP_EVENT_ANY_ID. These special identifiers may be passed as the event base and event ID arguments for `esp_event_handler_register_with()`.

Therefore, the valid arguments to `esp_event_handler_register_with()` are:
Chapter 2. API Reference

1. `<event base>, <event ID>` - handler executes when the event with base `<event base>` and event ID `<event ID>` gets posted to the loop
2. `<event base>, ESP_EVENT_ANY_ID` - handler executes when any event with base `<event base>` gets posted to the loop
3. ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```c
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID, run_on_event_3, ...);
```

If the hypothetical event MY_EVENT_BASE, MY_EVENT_ID is posted, all three handlers run_on_event_1, run_on_event_2, and run_on_event_3 would execute.

If the hypothetical event MY_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only run_on_event_2 and run_on_event_3 would execute.

If the hypothetical event MY_OTHER_EVENT_BASE, MY_OTHER_EVENT_ID is posted, only run_on_event_3 would execute.

**Handler Registration and Handler Dispatch Order** The general rule is that for handlers that match a certain posted event during dispatch, those which are registered first also get executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first will also get their handlers registered first. Handlers registered one after the other by a single task will still be dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task which also registers handlers; then during dispatch those handlers will also get executed in between.

**Event loop profiling**

A configuration option `CONFIG_ESP_EVENT_LOOP_PROFILING` can be enabled in order to activate statistics collection for all event loops created. The function `esp_event_dump()` can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the `esp_event_dump()` API Reference.

**Application Example**

Examples on using the `esp_event` library can be found in `system/esp_event`. The examples cover event declaration, loop creation, handler registration and unregistration and event posting.

Other examples which also adopt esp_event library:

- NMEA Parser, which will decode the statements received from GPS.

**API Reference**

**Header File**

- components/esp_event/include/esp_event.h
Chapter 2. API Reference

Functions

**esp_err_t esp_event_loop_create**(const **esp_event_loop_args_t** *event_loop_args,
**esp_event_loop_handle_t** *event_loop)

Create a new event loop.

**Parameters**

- **event_loop_args** – [in] configuration structure for the event loop to create
- **event_loop** – [out] handle to the created event loop

**Returns**

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: event_loop_args or event_loop was NULL
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_FAIL: Failed to create task loop
- Others: Fail

**esp_err_t esp_event_loop_delete**(**esp_event_loop_handle_t** event_loop)

Delete an existing event loop.

**Parameters**

- **event_loop** – [in] event loop to delete, must not be NULL

**Returns**

- ESP_OK: Success
- Others: Fail

**esp_err_t esp_event_loop_create_default**(void)

Create default event loop.

**Returns**

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_ERR_INVALID_STATE: Default event loop has already been created
- ESP_FAIL: Failed to create task loop
- Others: Fail

**esp_err_t esp_event_loop_delete_default**(void)

Delete the default event loop.

**Returns**

- ESP_OK: Success
- Others: Fail

**esp_err_t esp_event_loop_run**(**esp_event_loop_handle_t** event_loop, **TickType_t** ticks_to_run)

Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all the allotted time waiting on the event queue. Once an event has been dequeued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the dequeued event, and (2) during dispatch of the dequeued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last dequeued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

**Note:** encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

**Parameters**
Chapter 2. API Reference

- **event_loop**  - [in] event loop to dispatch posted events from, must not be NULL
- **ticks_to_run**  - [in] number of ticks to run the loop

**Returns**
- ESP_OK: Success
- Others: Fail

```c
esp_err_t esp_event_handler_register
    (esp_event_base_t event_base, int32_t event_id,
     esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.

**Note:** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register()` instead.

**Note:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called.

**Parameters**
- **event_base**  - [in] the base ID of the event to register the handler for
- **event_id**  - [in] the ID of the event to register the handler for
- **event_handler**  - [in] the handler function which gets called when the event is dispatched
- **event_handler_arg**  - [in] data, aside from event data, that is passed to the handler when it is called

**Returns**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_register_with
    (esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id,
     esp_event_handler_t event_handler, void *event_handler_arg)
```

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as `esp_event_handler_register`, except the additional specification of the event loop to register the handler to.

**Note:** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_register_with()` instead.
**Note:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

### Parameters
- `event_loop` - [in] the event loop to register this handler function to, must not be NULL
- `event_base` - [in] the base ID of the event to register the handler for
- `event_id` - [in] the ID of the event to register the handler for
- `event_handler` - [in] the handler function which gets called when the event is dispatched
- `event_handler_arg` - [in] data, aside from event data, that is passed to the handler when it is called

### Returns
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_instance_register_with(esp_event_loop_handle_t event_loop,
                                                esp_event_base_t event_base, int32_t event_id,
                                                esp_event_handler_t event_handler, void *event_handler_arg,
                                                esp_event_handler_instance_t *instance)
```

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove (unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

**Note:** the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

### Parameters
- `event_loop` - [in] the event loop to register this handler function to, must not be NULL
- `event_base` - [in] the base ID of the event to register the handler for
- `event_id` - [in] the ID of the event to register the handler for
- `event_handler` - [in] the handler function which gets called when the event is dispatched
- `event_handler_arg` - [in] data, aside from event data, that is passed to the handler when it is called
- `instance` - [out] An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same
for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

Returns
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

```c
esp_err_t esp_event_handler_instance_register(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg, esp_event_handler_instance_t *instance)
```

Register an instance of event handler to the default loop.

This function does the same as `esp_event_handler_instance_register_with`, except that it registers the handler to the default event loop.

**Note:** the event loop library does not maintain a copy of `event_handler_arg`, therefore the user should ensure that `event_handler_arg` still points to a valid location by the time the handler gets called

**Parameters**
- **event_base** `[in]` the base ID of the event to register the handler for
- **event_id** `[in]` the ID of the event to register the handler for
- **event_handler** `[in]` the handler function which gets called when the event is dispatched
- **event_handler_arg** `[in]` data, aside from event data, that is passed to the handler when it is called
- **instance** `[out]` An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

Returns
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

```c
esp_err_t esp_event_handler_unregister(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)
```

Unregisters a handler with the system event loop (legacy).

Unregisters a handler, so it will no longer be called during dispatch. Handlers can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler, the event_base and event_id arguments must match exactly the arguments passed to `esp_event_handler_register()` when that handler was registered. Passing `ESP_EVENT_ANY_BASE` and/or `ESP_EVENT_ANY_ID` will only unregister handlers that were registered with the same wildcard arguments.

**Note:** This function is obsolete and will be deprecated soon, please use `esp_event_handler_instance_unregister()` instead.

---

Submit Document Feedback
Note: When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

Parameters
- `event_base` [in] the base of the event with which to unregister the handler
- `event_id` [in] the ID of the event with which to unregister the handler
- `event_handler` [in] the handler to unregister

Returns
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t esp_event_handler_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as esp_event_handler_unregister, except the additional specification of the event loop to unregister the handler with.

Note: This function is obsolete and will be deprecated soon, please use esp_event_handler_instance_unregister_with() instead.

Parameters
- `event_loop` [in] the event loop with which to unregister this handler function, must not be NULL
- `event_base` [in] the base of the event with which to unregister the handler
- `event_id` [in] the ID of the event with which to unregister the handler
- `event_handler` [in] the handler to unregister

Returns
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

esp_err_t esp_event_handler_instance_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance)

Unregister a handler instance from a specific event loop.

Unregisters a handler instance, so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler instance, the event_base and event_id arguments must match exactly the arguments passed to esp_event_handler_instance_register() when that handler instance was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handler instances that were registered with the same wildcard arguments.

Note: When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

Parameters
• **event_loop** [in] the event loop with which to unregister this handler function, must not be NULL
• **event_base** [in] the base of the event with which to unregister the handler
• **event_id** [in] the ID of the event with which to unregister the handler
• **instance** [in] the instance object of the registration to be unregistered

**Returns**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_instance_unregister
(esp_event_base_t event_base, int32_t event_id,
 esp_event_handler_instance_t instance)
```

Unregister a handler from the system event loop.

This function does the same as esp_event_handler_instance_unregister_with, except that it unregisters the handler instance from the default event loop.

**Parameters**
- **event_base** [in] the base of the event with which to unregister the handler
- **event_id** [in] the ID of the event with which to unregister the handler
- **instance** [in] the instance object of the registration to be unregistered

**Returns**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_post
(esp_event_base_t event_base, int32_t event_id,
 const void *event_data, size_t event_data_size,
 TickType_t ticks_to_wait)
```

Posts an event to the system default event loop. The event loop library keeps a copy of event_data and manages its lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

**Parameters**
- **event_base** [in] the event base that identifies the event
- **event_id** [in] the event ID that identifies the event
- **event_data** [in] the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** [in] the size of the event data
- **ticks_to_wait** [in] number of ticks to block on a full event queue

**Returns**
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_post_to
(esp_event_loop_handle_t event_loop, esp_event_base_t event_base,
 int32_t event_id, const void *event_data, size_t event_data_size,
 TickType_t ticks_to_wait)
```

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages its lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp_event_post_to, except the additional specification of the event loop to post the event to.

**Parameters**
- **event_loop** [in] the event loop to post to, must not be NULL
- **event_base** [in] the event base that identifies the event
- **event_id** [in] the event ID that identifies the event
**event_data** - [in] the data, specific to the event occurrence, that gets passed to the handler

**event_data_size** - [in] the size of the event data

**ticks_to_wait** - [in] number of ticks to block on a full event queue

**Returns**

- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

`esp_err_t esp_event_isr_post`(esp_event_base_t event_base, int32_t event_id, const void* event_data, size_t event_data_size, BaseType_t *task_unblocked)

Special variant of `esp_event_post` for posting events from interrupt handlers.

**Note:** this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

**Parameters**

- **event_base** - [in] the event base that identifies the event
- **event_id** - [in] the event ID that identifies the event
- **event_data** - [in] the data, specific to the event occurrence, that gets passed to the handler
- **event_data_size** - [in] the size of the event data; max is 4 bytes
- **task_unblocked** - [out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

**Returns**

- ESP_OK: Success
- ESP_FAIL: Event queue for the default event loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

`esp_err_t esp_event_isr_post_to`(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, const void* event_data, size_t event_data_size, BaseType_t *task_unblocked)

Special variant of `esp_event_post_to` for posting events from interrupt handlers.

**Note:** this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

**Parameters**

- **event_loop** - [in] the event loop to post to, must not be NULL
- **event_base** - [in] the event base that identifies the event
- **event_id** - [in] the event ID that identifies the event
- **event_data** - [in] the data, specific to the event occurrence, that gets passed to the handler
• **event_data_size** [in] the size of the event data
• **task_unblocked** [out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

**Returns**
• ESP_OK: Success
• ESP_FAIL: Event queue for the loop full
• ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
• Others: Fail

```c
esp_err_t esp_event_dump(FILE *file)
```

Dumps statistics of all event loops.

Dumps event loop info in the format:

```
event loop
handler
handler
...

event loop
handler
handler
...
```

where:

```
event loop
  format: address,name rx:total_received dr:total_dropped
  where:
    address - memory address of the event loop
    name - name of the event loop, 'none' if no dedicated task
    total_received - number of successfully posted events
    total_dropped - number of events unsuccessfully posted due to queue full

distributor
  format: address ev:base,id inv:total_invoked run:total_runtime
  where:
    address - address of the handler function base,id - the event specified by event base and ID this handler executes
    total_invoked - number of times this handler has been invoked
    total_runtime - total amount of time used for invoking this handler
```

**Note:** this function is a noop when CONFIG_ESP_EVENT_LOOP_PROFILING is disabled

**Parameters**
- **file** [in] the file stream to output to

**Returns**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- Others: Fail

**Structures**

```c
struct esp_event_loop_args_t
```

Configuration for creating event loops.
Public Members

```cpp
int32_t queue_size
    size of the event loop queue

const char *task_name
    name of the event loop task; if NULL, a dedicated task is not created for event loop

UBaseType_t task_priority
    priority of the event loop task, ignored if task name is NULL

uint32_t task_stack_size
    stack size of the event loop task, ignored if task name is NULL

 BaseType_t task_core_id
    core to which the event loop task is pinned to, ignored if task name is NULL
```

Header File

- components/esp_event/include/esp_event_base.h

Macros

```cpp
ESP_EVENT_DECLARE_BASE (id)
ESP_EVENT_DEFINE_BASE (id)
```

```cpp
ESP_EVENT_ANY_BASE
    register handler for any event base
```

```cpp
ESP_EVENT_ANY_ID
    register handler for any event id
```

Type Definitions

```cpp
typedef void *esp_event_loop_handle_t
    a number that identifies an event with respect to a base
```

```cpp
typedef void (*esp_event_handler_t)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
    function called when an event is posted to the queue
```

```cpp
typedef void *esp_event_handler_instance_t
    context identifying an instance of a registered event handler
```

2.10.10 FreeRTOS (Overview)

Overview

FreeRTOS is an open source real-time operating system kernel that acts as the operating system for ESP-IDF applications and is integrated into ESP-IDF as a component. The FreeRTOS component in ESP-IDF contains ports
of the FreeRTOS kernel for all the CPU architectures used by ESP targets (i.e., Xtensa and RISC-V). Furthermore, ESP-IDF provides different implementations of FreeRTOS in order to support SMP (Symmetric Multiprocessing) on multi-core ESP targets. This document provides an overview of the FreeRTOS component, the FreeRTOS implementations offered by ESP-IDF, and the common aspects across all implementations.

Implementations

The official FreeRTOS (henceforth referred to as Vanilla FreeRTOS) is a single-core RTOS. In order to support the various multi-core ESP targets, ESP-IDF supports different FreeRTOS implementations, namely ESP-IDF FreeRTOS and Amazon SMP FreeRTOS.

ESP-IDF FreeRTOS ESP-IDF FreeRTOS is a FreeRTOS implementation based on Vanilla FreeRTOS v10.4.3, but contains significant modifications to support SMP. ESP-IDF FreeRTOS only supports two cores at most (i.e., dual core SMP), but is more optimized for this scenario by design. For more details regarding ESP-IDF FreeRTOS and its modifications, please refer to the FreeRTOS (ESP-IDF) document.

Note: ESP-IDF FreeRTOS is currently the default FreeRTOS implementation for ESP-IDF.

Amazon SMP FreeRTOS Amazon SMP FreeRTOS is an SMP implementation of FreeRTOS that is officially supported by Amazon. Amazon SMP FreeRTOS is able to support N-cores (i.e., more than two cores). Amazon SMP FreeRTOS can be enabled via the CONFIG_FREERTOS_SMP option. For more details regarding Amazon SMP FreeRTOS, please refer to the official Amazon SMP FreeRTOS documentation.

Warning: The Amazon SMP FreeRTOS implementation (and its port in ESP-IDF) are currently in experimental/beta state. Therefore, significant behavioral changes and breaking API changes can occur.

Configuration

Kernel Configuration Vanilla FreeRTOS requires that ports and applications configure the kernel by adding various #define config... macros to FreeRTOSConfig.h. Vanilla FreeRTOS supports a list of kernel configuration options which allow various kernel behaviors and features to be enabled or disabled.

However, for all FreeRTOS ports in ESP-IDF, the ”FreeRTOSConfig.h” file is considered private and must not be modified by users. A large number of kernel configuration options in FreeRTOSConfig.h are hard coded as they are either required or not supported in ESP-IDF. All kernel configuration options that are configurable by the user will be exposed via menuconfig under Component Config/FreeRTOS/Kernel.

For the full list of user configurable kernel options, see Project Configuration. The list below highlights some commonly used kernel configuration options:

- **CONFIG_FREERTOS_UNICORE** will run FreeRTOS only on CPU0. Note that this is not equivalent to running Vanilla FreeRTOS. Furthermore, this option may affect behavior of components other than freertos. For more details regarding the effects of running FreeRTOS on a single core, refer to ESP-IDF FreeRTOS Single Core (if using ESP-IDF FreeRTOS) or the official Amazon SMP FreeRTOS documentation. Alternatively, users can also search for occurrences of CONFIG_FREERTOS_UNICORE in the ESP-IDF components.

- **CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY** enables backward compatibility with some FreeRTOS macros/types/functions that were deprecated from v8.0 onwards.

Port Configuration All other FreeRTOS related configuration options that are not part of the kernel configuration are exposed via menuconfig under Component Config/FreeRTOS/Port. These options configure aspects such as:

- The FreeRTOS ports themselves (e.g., tick timer selection, ISR stack size)
• Additional features added to the FreeRTOS implementation or ports

**Using FreeRTOS**

**Application Entry Point** Unlike Vanilla FreeRTOS, users of FreeRTOS in ESP-IDF **must never call** `vTaskStartScheduler()` **and** `vTaskEndScheduler()`. Instead, ESP-IDF will start FreeRTOS automatically. Users must define a `void app_main(void)` function which acts as the entry point for user’s application and is automatically called on ESP-IDF startup.

- Typically, users would spawn the rest of their application’s task from `app_main`.
- The `app_main` function is allowed to return at any point (i.e., before the application terminates).
- The `app_main` function is called from the main task.

**Background Tasks** During startup, ESP-IDF and FreeRTOS will automatically create multiple tasks that run in the background (listed in the the table below).

<table>
<thead>
<tr>
<th>Task Name</th>
<th>Description</th>
<th>Stack/Align/Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>Idle Tasks (IDLEX)</td>
<td>An idle task (IDLEX) is created for (and pinned to) each CPU core, where x is the CPU core’s number. The x is dropped when single-core configuration is enabled.</td>
<td>CPU0</td>
</tr>
<tr>
<td>FreeRTOS Timer Task (Tmr Svc)</td>
<td>FreeRTOS will create the Timer Service/Daemon Task if any FreeRTOS Timer APIs are called by the application.</td>
<td>CPU0</td>
</tr>
<tr>
<td>Main Task (main)</td>
<td>Task that simply calls <code>app_main</code>. This task will self delete when <code>app_main</code> returns</td>
<td>CPU1</td>
</tr>
<tr>
<td>IPC Tasks (ipcx)</td>
<td>When <code>CONFIG_FREERTOS_UNICORE</code> is false, an IPC task (ipcx) is created for (and pinned to) each CPU. IPC tasks are used to implement the Inter-processor Call (IPC) feature.</td>
<td>CPU24</td>
</tr>
<tr>
<td>ESP Timer Task (esp_timer)</td>
<td>ESP-IDF will create the ESP Timer Task used to process ESP Timer callbacks.</td>
<td>CPU2</td>
</tr>
</tbody>
</table>

**Note:** Note that if an application uses other ESP-IDF features (e.g., WiFi or Bluetooth), those features may create their own background tasks in addition to the tasks listed in the table above.

**FreeRTOS Additions**

ESP-IDF provides some supplemental features to FreeRTOS such as Ring Buffers, ESP-IDF style Tick and Idle Hooks, and TLSP deletion callbacks. See **FreeRTOS (Supplemental Features)** for more details.

**2.10.11 FreeRTOS (ESP-IDF)**
Chapter 2. API Reference

Overview

The original FreeRTOS (hereinafter referred to as Vanilla FreeRTOS) is a small and efficient Real Time Operating System supported on many single-core MCUs and SoCs. However, to support numerous dual core ESP targets (such as the ESP32 and ESP32-S3), ESP-IDF provides a dual core SMP (Symmetric Multiprocessing) capable implementation of FreeRTOS, (hereinafter referred to as ESP-IDF FreeRTOS).

ESP-IDF FreeRTOS is based on Vanilla FreeRTOS v10.4.3, but contains significant modifications to both API and kernel behavior in order to support dual core SMP. This document describes the API and behavioral differences between Vanilla FreeRTOS and ESP-IDF FreeRTOS.

Note: This document assumes that the reader has a requisite understanding of Vanilla FreeRTOS (its features, behavior, and API usage). Refer to the Vanilla FreeRTOS documentation for more details.

Note: ESP-IDF FreeRTOS can be built for single core by enabling the `CONFIG_FREERTOS_UNICORE` configuration option. ESP targets that are single core will always have the `CONFIG_FREERTOS_UNICORE` option enabled. However, note that building with `CONFIG_FREERTOS_UNICORE` enabled does not equate to building with Vanilla FreeRTOS (i.e., some of the behavioral and API changes of ESP-IDF will still be present). For more details, see ESP-IDF FreeRTOS Single Core for more details.

This document is split into the following parts.

Contents

- FreeRTOS (ESP-IDF)
  - Overview
  - Symmetric Multiprocessing
  - Tasks
  - SMP Scheduler
  - Critical Sections

  - API Reference

Symmetric Multiprocessing

Basic Concepts  SMP (Symmetric Multiprocessing) is a computing architecture where two or more identical CPUs (cores) are connected to a single shared main memory and controlled by a single operating system. In general, an SMP system —

- has multiple cores running independently. Each core has its own register file, interrupts, and interrupt handling.
- presents an identical view of memory to each core. Thus a piece of code that accesses a particular memory address will have the same effect regardless of which core it runs on.

The main advantages of an SMP system compared to single core or Asymmetric Multiprocessing systems are that —

- the presence of multiple CPUs allows for multiple hardware threads, thus increases overall processing throughput.
- having symmetric memory means that threads can switch cores during execution. This in general can lead to better CPU utilization.

Although an SMP system allows threads to switch cores, there are scenarios where a thread must/should only run on a particular core. Therefore, threads in an SMP systems will also have a core affinity that specifies which particular core the thread is allowed to run on.

- A thread that is pinned to a particular core will only be able to run on that core.
• A thread that is unpinned will be allowed to switch between cores during execution instead of being pinned to a particular core.

**SMP on an ESP Target** ESP targets (such as the ESP32, ESP32-S3) are dual core SMP SoCs. These targets have the following hardware features that make them SMP capable:

- Two identical cores known as CPU0 (i.e., Protocol CPU or **PRO_CPU**) and CPU1 (i.e., Application CPU or **APP_CPU**). This means that the execution of a piece of code is identical regardless of which core it runs on.
- Symmetric memory (with some small exceptions).
  - If multiple cores access the same memory address, their access will be serialized at the memory bus level.
  - True atomic access to the same memory address is achieved via an atomic compare-and-swap instruction provided by the ISA.
- Cross-core interrupts that allow one CPU to trigger and interrupt on another CPU. This allows cores to signal each other.

**Note:** The “**PRO_CPU**” and “**APP_CPU**” aliases for CPU0 and CPU1 exist in ESP-IDF as they reflect how typical IDF applications will utilize the two CPUs. Typically, the tasks responsible for handling wireless networking (e.g., WiFi or Bluetooth) will be pinned to CPU0 (thus the name **PRO_CPU**), whereas the tasks handling the remainder of the application will be pinned to CPU1 (thus the name **APP_CPU**).

---

### Tasks

**Creation** Vanilla FreeRTOS provides the following functions to create a task:

- `xTaskCreate()` creates a task. The task’s memory is dynamically allocated
- `xTaskCreateStatic()` creates a task. The task’s memory is statically allocated (i.e., provided by the user)

However, in an SMP system, tasks need to be assigned a particular affinity. Therefore, ESP-IDF provides a **PinnedToCore** version of Vanilla FreeRTOS’s task creation functions:

- `xTaskCreatePinnedToCore()` creates a task with a particular core affinity. The task’s memory is dynamically allocated.
- `xTaskCreateStaticPinnedToCore()` creates a task with a particular core affinity. The task’s memory is statically allocated (i.e., provided by the user)

The **PinnedToCore** versions of the task creation functions API differ from their vanilla counterparts by having an extra `xCOREID` parameter that is used to specify the created task’s core affinity. The valid values for core affinity are:

- 0 which pins the created task to CPU0
- 1 which pins the created task to CPU1
- `tskNO_AFFINITY` which allows the task to be run on both CPUs

**Note:** ESP-IDF FreeRTOS also changes the units of `ulStackDepth` in the task creation functions. Task stack sizes in Vanilla FreeRTOS are specified in number of words, whereas in ESP-IDF FreeRTOS, the task stack sizes are specified in bytes.

**Execution** The anatomy of a task in ESP-IDF FreeRTOS is the same as Vanilla FreeRTOS. More specifically, ESP-IDF FreeRTOS tasks:

- Can only be in one of following states: Running, Ready, Blocked, or Suspended.
- Task functions are typically implemented as an infinite loop
- Task functions should never return
Deletion  Task deletion in Vanilla FreeRTOS is called via `vTaskDelete()`. The function allows deletion of another task or the currently running task (if the provided task handle is `NULL`). The actual freeing of the task’s memory is sometimes delegated to the idle task (if the task being deleted is the currently running task).

ESP-IDF FreeRTOS provides the same `vTaskDelete()` function. However, due to the dual core nature, there are some behavioral differences when calling `vTaskDelete()` in ESP-IDF FreeRTOS:

- When deleting a task that is pinned to the other core, that task’s memory is always freed by the idle task of the other core (due to the need to clear FPU registers).
- When deleting a task that is currently running on the other core, a yield is triggered on the other core and the task’s memory is freed by one of the idle tasks (depending on the task’s core affinity)
- A deleted task’s memory is freed immediately if:
  - The task is currently running on this core and is also pinned to this core
  - The task is not currently running and is not pinned to any core

Users should avoid calling `vTaskDelete()` on a task that is currently running on the other core. This is due to the fact that it is difficult to know what the task currently running on the other core is executing, thus can lead to unpredictable behavior such as:

- Deleting a task that is holding a mutex
- Deleting a task that has yet to free memory it previously allocated

Where possible, users should design their application such that `vTaskDelete()` is only ever called on tasks in a known state. For example:

- Tasks self deleting (via `vTaskDelete(NULL)`) when their execution is complete and have also cleaned up all resources used within the task.
- Tasks placing themselves in the suspend state (via `vTaskSuspend()`) before being deleted by another task.

SMP Scheduler

The Vanilla FreeRTOS scheduler is best described as a Fixed Priority Preemptive scheduler with Time Slicing meaning that:

- Each tasks is given a constant priority upon creation. The scheduler executes highest priority ready state task
- The scheduler can switch execution to another task without the cooperation of the currently running task
- The scheduler will periodically switch execution between ready state tasks of the same priority (in a round robin fashion). Time slicing is governed by a tick interrupt.

The ESP-IDF FreeRTOS scheduler supports the same scheduling features (i.e., Fixed Priority, Preemption, and Time Slicing) albeit with some small behavioral differences.

Fixed Priority  In Vanilla FreeRTOS, when scheduler selects a new task to run, it will always select the current highest priority ready state task. In ESP-IDF FreeRTOS, each core will independently schedule tasks to run. When a particular core selects a task, the core will select the highest priority ready state task that can be run by the core. A task can be run by the core if:

- The task has a compatible affinity (i.e., is either pinned to that core or is unpinned)
- The task is not currently being run by another core

However, users should not assume that the two highest priority ready state tasks are always run by the scheduler as a task’s core affinity must also be accounted for. For example, given the following tasks:

- Task A of priority 10 pinned to CPU0
- Task B of priority 9 pinned to CPU0
- Task C of priority 8 pinned to CPU1

The resulting schedule will have Task A running on CPU0 and Task C running on CPU1. Task B is not run even though it is the second highest priority task.
Preemption  In Vanilla FreeRTOS, the scheduler can preempt the currently running task if a higher priority task becomes ready to execute. Likewise in ESP-IDF FreeRTOS, each core can be individually preempted by the scheduler if the scheduler determines that a higher priority task can run on that core.

However, there are some instances where a higher priority task that becomes ready can be run on multiple cores. In this case, the scheduler will only preempt one core. The scheduler always gives preference to the current core when multiple cores can be preempted. In other words, if the higher priority ready task is unpinned and has a higher priority than the current priority of both cores, the scheduler will always choose to preempt the current core. For example, given the following tasks:

- Task A of priority 8 currently running on CPU0
- Task B of priority 9 currently running on CPU1
- Task C of priority 10 that is unpinned and was unblocked by Task B

The resulting schedule will have Task A running on CPU0 and Task C preempting Task B given that the scheduler always gives preference to the current core.

Time Slicing  The Vanilla FreeRTOS scheduler implements time slicing meaning that if current highest ready priority contains multiple ready tasks, the scheduler will switch between those tasks periodically in a round robin fashion.

However, in ESP-IDF FreeRTOS, it is not possible to implement perfect Round Robin time slicing due to the fact that a particular task may not be able to run on a particular core due to the following reasons:

- The task is pinned to the another core.
- For unpinned tasks, the task is already being run by another core.

Therefore, when a core searches the ready state task list for a task to run, the core may need to skip over a few tasks in the same priority list or drop to a lower priority in order to find a ready state task that the core can run.

The ESP-IDF FreeRTOS scheduler implements a Best Effort Round Robin time slicing for ready state tasks of the same priority by ensuring that tasks that have been selected to run will be placed at the back of the list, thus giving unselected tasks a higher priority on the next scheduling iteration (i.e., the next tick interrupt or yield).

The following example demonstrates the Best Effort Round Robin time slicing in action. Assume that:

- There are four ready state tasks of the same priority $AX, B0, C1, D1$ where:
  - The priority is the current highest priority with ready state tasks
  - The first character represents the task’s names (i.e., A, B, C, D)
  - And the second character represents the tasks core pinning (and $X$ means unpinned)
- The task list is always searched from the head

1. Starting state. None of the ready state tasks have been selected to run

   Head [ AX , B0 , C1 , D0 ] Tail

2. Core 0 has tick interrupt and searches for a task to run.
   Task A is selected and is moved to the back of the list

   Core0--|
   Head [ AX , B0 , C1 , D0 ] Tail

   0
   Head [ B0 , C1 , D0 , AX ] Tail

3. Core 1 has a tick interrupt and searches for a task to run.
   Task B cannot be run due to incompatible affinity, so core 1 skips to Task C.
   Task C is selected and is moved to the back of the list

(continues on next page)
4. Core 0 has another tick interrupt and searches for a task to run.
   Task B is selected and moved to the back of the list

5. Core 1 has another tick and searches for a task to run.
   Task D cannot be run due to incompatible affinity, so core 1 skips to Task A
   Task A is selected and moved to the back of the list

The implications to users regarding the Best Effort Round Robin time slicing:

- Users cannot expect multiple ready state tasks of the same priority to run sequentially (as is the case in Vanilla FreeRTOS). As demonstrated in the example above, a core may need to skip over tasks.
- However, given enough ticks, a task will eventually be given some processing time.
- If a core cannot find a task runnable task at the highest ready state priority, it will drop to a lower priority to search for tasks.
- To achieve ideal round robin time slicing, users should ensure that all tasks of a particular priority are pinned to the same core.

**Tick Interrupts**

Vanilla FreeRTOS requires that a periodic tick interrupt occurs. The tick interrupt is responsible for:

- Incrementing the scheduler’s tick count
- Unblocking any blocked tasks that have timed out
- Checking if time slicing is required (i.e., triggering a context switch)
- Executing the application tick hook

In ESP-IDF FreeRTOS, each core will receive a periodic interrupt and independently run the tick interrupt. The tick interrupts on each core are of the same period but can be out of phase. However, the tick responsibilities listed above are not run by all cores:

- CPU0 will execute all of the tick interrupt responsibilities listed above
- CPU1 will only check for time slicing and execute the application tick hook

**Note:** CPU0 is solely responsible for keeping time in ESP-IDF FreeRTOS. Therefore anything that prevents CPU0 from incrementing the tick count (such as suspending the scheduler on CPU0) will cause the entire schedulers time keeping to lag behind.
Idle Tasks  Vanilla FreeRTOS will implicitly create an idle task of priority 0 when the scheduler is started. The idle task runs when no other task is ready to run, and it has the following responsibilities:

- Freeing the memory of deleted tasks
- Executing the application idle hook

In ESP-IDF FreeRTOS, a separate pinned idle task is created for each core. The idle tasks on each core have the same responsibilities as their vanilla counterparts.

Scheduler Suspension  Vanilla FreeRTOS allows the scheduler to be suspended/resumed by calling `vTaskSuspendAll()` and `xTaskResumeAll()` respectively. While the scheduler is suspended:

- Task switching is disabled but interrupts are left enabled.
- Calling any blocking/yielding function is forbidden, and time slicing is disabled.
- The tick count is frozen (but the tick interrupt will still occur to execute the application tick hook)

On scheduler resumption, `xTaskResumeAll()` will catch up all of the lost ticks and unblock any timed out tasks.

In ESP-IDF FreeRTOS, suspending the scheduler across multiple cores is not possible. Therefore when `vTaskSuspendAll()` is called on a particular core (e.g., core A):

- Task switching is disabled only on core A but interrupts for core A are left enabled
- Calling any blocking/yielding function on core A is forbidden. Time slicing is disabled on core A.
- If an interrupt on core A unblocks any tasks, those tasks will go into core A’s own pending ready task list
- If core A is CPU0, the tick count is frozen and a pended tick count is incremented instead. However, the tick interrupt will still occur in order to execute the application tick hook.

When `xTaskResumeAll()` is called on a particular core (e.g., core A):

- Any tasks added to core A’s pending ready task list will be resumed
- If core A is CPU0, the pended tick count is unwound to catch up the lost ticks.

**Warning:** Given that scheduler suspension on ESP-IDF FreeRTOS will only suspend scheduling on a particular core, scheduler suspension is **NOT** a valid method ensuring mutual exclusion between tasks when accessing shared data. Users should use proper locking primitives such as mutexes or spinlocks if they require mutual exclusion.

Disabling Interrupts  Vanilla FreeRTOS allows interrupts to be disabled and enabled by calling `taskDISABLE_INTERRUPTS` and `taskENABLE_INTERRUPTS` respectively.

ESP-IDF FreeRTOS provides the same API, however interrupts will only disabled or enabled on the current core.

**Warning:** Disabling interrupts is a valid method of achieve mutual exclusion in Vanilla FreeRTOS (and single core systems in general). However, in an SMP system, disabling interrupts is **NOT** a valid method ensuring mutual exclusion. Refer to Critical Sections for more details.

Critical Sections

API Changes  Vanilla FreeRTOS implements critical sections by disabling interrupts. This prevents preemptive context switches and the servicing of ISRs during a critical section. Thus a task/ISR that enters a critical section is guaranteed to be the sole entity to access a shared resource. Critical sections in Vanilla FreeRTOS have the following API:

- `taskENTER_CRITICAL()` enters a critical section by disabling interrupts
- `taskEXIT_CRITICAL()` exits a critical section by reenabling interrupts
- `taskENTER_CRITICAL_FROM_ISR()` enters a critical section from an ISR by disabling interrupt nesting
- `taskEXIT_CRITICAL_FROM_ISR()` exits a critical section from an ISR by reenabling interrupt nesting
However, in an SMP system, merely disabling interrupts does not constitute a critical section as the presence of other cores means that a shared resource can still be concurrently accessed. Therefore, critical sections in ESP-IDF FreeRTOS are implemented using spinlocks. To accommodate the spinlocks, the ESP-IDF FreeRTOS critical section APIs contain an additional spinlock parameter as shown below:

- Spinlocks are of `portMUX_TYPE` (not to be confused to FreeRTOS mutexes)
- `taskENTER_CRITICAL(&mux)` enters a critical from a task context
- `taskEXIT_CRITICAL(&mux)` exits a critical section from a task context
- `taskENTER_CRITICAL_ISR(&mux)` enters a critical section from an interrupt context
- `taskEXIT_CRITICAL_ISR(&mux)` exits a critical section from an interrupt context

**Note:** The critical section API can be called recursively (i.e., nested critical sections). Entering a critical section multiple times recursively is valid so long as the critical section is exited the same number of times it was entered. However, given that critical sections can target different spinlocks, users should take care to avoid dead locking when entering critical sections recursively.

**Implementation** In ESP-IDF FreeRTOS, the process of a particular core entering and exiting a critical section is as follows:

- **For `taskENTER_CRITICAL(&mux)` (or `taskENTER_CRITICAL_ISR(&mux)`)**
  1. The core disables its interrupts (or interrupt nesting) up to `configMAX_SYSCALL_INTERRUPT_PRIORITY`
  2. The core then spins on the spinlock using an atomic compare-and-set instruction until it acquires the lock. A lock is acquired when the core is able to set the lock’s owner value to the core’s ID.
  3. Once the spinlock is acquired, the function returns. The remainder of the critical section runs with interrupts (or interrupt nesting) disabled.
- **For `taskEXIT_CRITICAL(&mux)` (or `taskEXIT_CRITICAL_ISR(&mux)`)**
  1. The core releases the spinlock by clearing the spinlock’s owner value
  2. The core re-enables interrupts (or interrupt nesting)

**Restrictions and Considerations** Given that interrupts (or interrupt nesting) are disabled during a critical section, there are multiple restrictions regarding what can be done within a critical sections. During a critical section, users should keep the following restrictions and considerations in mind:

- Critical sections should be as kept as short as possible
  - The longer the critical section lasts, the longer a pending interrupt can be delayed.
  - A typical critical section should only access a few data structures and/or hardware registers
  - If possible, defer as much processing and/or event handling to the outside of critical sections.
- FreeRTOS API should not be called from within a critical section
- Users should never call any blocking or yielding functions within a critical section

**Misc**

**Floating Point Usage** Usually, when a context switch occurs:

- the current state of a CPU’s registers are saved to the stack of task being switch out
- the previously saved state of the CPU’s registers are loaded from the stack of the task being switched in

However, ESP-IDF FreeRTOS implements Lazy Context Switching for the FPU (Floating Point Unit) registers of a CPU. In other words, when a context switch occurs on a particular core (e.g., CPU0), the state of the core’s FPU registers are not immediately saved to the stack of the task getting switched out (e.g., Task A). The FPU’s registers are left untouched until:

- A different task (e.g., Task B) runs on the same core and uses the FPU. This will trigger an exception that will save the FPU registers to Task A’s stack.
- Task A gets scheduled to the same core and continues execution. Saving and restoring the FPU’s registers is not necessary in this case.
However, given that tasks can be unpinned thus can be scheduled on different cores (e.g., Task A switches to CPU1), it is unfeasible to copy and restore the FPU’s registers across cores. Therefore, when a task utilizes the FPU (by using a float type in its call flow), ESP-IDF FreeRTOS will automatically pin the task to the current core it is running on. This ensures that all tasks that use the FPU are always pinned to a particular core.

Furthermore, ESP-IDF FreeRTOS by default does not support the usage of the FPU within an interrupt context given that the FPU’s register state is tied to a particular task.

**Note:** ESP targets that contain an FPU do not support hardware acceleration for double precision floating point arithmetic (double). Instead double is implemented via software hence the behavioral restrictions regarding the float type do not apply to double. Note that due to the lack of hardware acceleration, double operations may consume significantly more CPU time in comparison to float.

**ESP-IDF FreeRTOS Single Core** Although ESP-IDF FreeRTOS is an SMP scheduler, some ESP targets are single core (such as the ESP32-S2 and ESP32-C3). When building ESP-IDF applications for these targets, ESP-IDF FreeRTOS is still used but the number of cores will be set to 1 (i.e., the `CONFIG_FREERTOS_UNICORE` will always be enabled for single core targets).

For multicore targets (such as the ESP32 and ESP32-S3), `CONFIG_FREERTOS_UNICORE` can also be set. This will result in ESP-IDF FreeRTOS only running on CPU0, and all other cores will be inactive.

**Note:** Users should bear in mind that enabling `CONFIG_FREERTOS_UNICORE` is NOT equivalent to running Vanilla FreeRTOS. The additional API of ESP-IDF FreeRTOS can still be called, and the behavior changes of ESP-IDF FreeRTOS will incur a small amount of overhead even when compiled for only a single core.

**API Reference**

This section contains documentation of FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

**Task API**

**Header File**

- components/freertos/FreeRTOS-Kernel/include/freertos/task.h

**Functions**

```c
BaseType_t xTaskCreatePinnedToCore(TaskFunction_t pvTaskCode, const char*const pcName, const uint32_t usStackDepth, void*const pvParameters, UBaseType_t uxPriority, TaskHandle_t *const pvCreatedTask, const BaseType_t xCoreID)
```

Create a new task with a specified affinity.

This function is similar to xTaskCreate, but allows setting task affinity in SMP system.

**Parameters**

- **pvTaskCode** - Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** - A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- **usStackDepth** - The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** - Pointer that will be used as the parameter for the task being created.
Chapter 2. API Reference

**uxPriority** - The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).

**pvCreatedTask** - Used to pass back a handle by which the created task can be referenced.

**xCOREID** - If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

**Returns** - pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h.

The `xTaskCreate` function is used to create new tasks and add them to the list of tasks that are ready to run. Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task's data structures. The second block is used by the task as its stack. If a task is created using `xTaskCreate()` then both blocks of memory are automatically dynamically allocated inside the `xTaskCreate()` function. (see https://www.FreeRTOS.org/a00111.html). If a task is created using `xTaskCreateStatic()` then the application writer must provide the required memory. `xTaskCreateStatic()` therefore allows a task to be created without using any dynamic memory allocation.

See `xTaskCreateStatic()` for a version that does not use any dynamic memory allocation.

`xTaskCreate()` can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using `xTaskCreateRestricted()`.

**Example usage:**

```c
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for(;;)
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter _ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared _static. If it was just an
    // an automatic stack variable it might no longer exist, or at least have _been corrupted, by the time
    // the new task attempts to access it.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_         
    // PRIORITY, &xHandle);
    configASSERT( xHandle );

    // Use the handle to delete the task.
    if( xHandle != NULL )
```

(continues on next page)
{ vTaskDelete( xHandle ); }

Note: If program uses thread local variables (ones specified with "__thread" keyword) then storage for them will be allocated on the task’s stack.

Parameters

- **pvTaskCode** - Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** - A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
- **usStackDepth** - The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** - Pointer that will be used as the parameter for the task being created.
- **uxPriority** - The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
- **pxCreatedTask** - Used to pass back a handle by which the created task can be referenced.

Returns

pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

```c
TaskHandle_t xTaskCreateStaticPinnedToCore(TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const pxStackBuffer, StaticTask_t *const pxTaskBuffer, const BaseType_t xCoreID)
```

Create a new task with a specified affinity.

This function is similar to xTaskCreateStatic, but allows specifying task affinity in an SMP system.

Parameters

- **pvTaskCode** - Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** - A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- **ulStackDepth** - The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** - Pointer that will be used as the parameter for the task being created.
- **uxPriority** - The priority at which the task will run.
- **pxStackBuffer** - Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** - Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.
- **xCOREID** - If the value is tskNO_AFFINITY, the created task is not pinned to any CPU, and the scheduler can run it on any core available. Values 0 or 1 indicate the index number of the CPU which the task should be pinned to. Specifying values larger than (portNUM_PROCESSORS - 1) will cause the function to fail.

Returns

If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not
be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

```c
static inline TaskHandle_t xTaskCreateStatic( TaskFunction_t pvTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const puxStackBuffer, StaticTask_t *const pxTaskBuffer)
```

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see http://www.freertos.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

Example usage:

```c
// Dimensions the buffer that the task being created will use as its stack.  
// NOTE: This is the number of bytes the stack will hold, not the number of  
// words as found in vanilla FreeRTOS.  
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.  
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is  
// an array of StackType_t variables. The size of StackType_t is dependent on  
// the RTOS port.  
StackType_t xStack[ STACK_SIZE ];

// Function that implements the task being created.  
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the  
    // pvParameters value in the call to xTaskCreateStatic().  
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.  
    }
}

// Function that creates a task.  
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.  
    xHandle = xTaskCreateStatic{
        vTaskCode,  // Function that implements the task.  
        "NAME",  // Text name for the task.  
        STACK_SIZE,  // Stack size in bytes, not words.  
        ( void * ) 1,  // Parameter passed into the task.  
        tskIDLE_PRIORITY,  // Priority at which the task is created.  
        xStack,  // Array to use as the task's stack.  
        &xTaskBuffer };  // Variable to hold the task's data...
                        
    // puxStackBuffer and pxTaskBuffer were not NULL, so the task will have  
    // been created, and xHandle will be the task's handle. Use the handle
```
// to suspend the task.
vTaskSuspend( xHandle );
}

Note: If program uses thread local variables (ones specified with “__thread” keyword) then storage for them will be allocated on the task’s stack.

Parameters

- **pvTaskCode** - Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop), or should be terminated using vTaskDelete function.
- **pcName** - A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- **ulStackDepth** - The size of the task stack specified as the number of bytes. Note that this differs from vanilla FreeRTOS.
- **pvParameters** - Pointer that will be used as the parameter for the task being created.
- **uxPriority** - The priority at which the task will run.
- **puxStackBuffer** - Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** - Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

Returns

If neither pxStackBuffer or pxTaskBuffer are NULL, then the task will be created and pdPASS is returned. If either pxStackBuffer or pxTaskBuffer are NULL then the task will not be created and errCOULD_NOT_ALLOCATE_REQUIRED_MEMORY is returned.

BaseType_t xTaskCreateRestricted(const TaskParameters_t *const pxTaskDefinition, TaskHandle_t *pxCreatedTask)

Only available when configSUPPORT_DYNAMIC_ALLOCATION is set to 1.

xTaskCreateRestricted() should only be used in systems that include an MPU implementation.

Create a new task and add it to the list of tasks that are ready to run. The function parameters define the memory regions and associated access permissions allocated to the task.

See xTaskCreateRestrictedStatic() for a version that does not use any dynamic memory allocation.

return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

Example usage:

```c
// Create an TaskParameters_t structure that defines the task to be created.
static const TaskParameters_t xCheckTaskParameters =
{
  vATask,       // pvTaskCode - the function that implements the task.
  "ATask",     // pcName - just a text name for the task to assist debugging.
  100,         // usStackDepth - the stack size DEFINED IN WORDS.
  NULL,        // pvParameters - passed into the task function as the function...
  --parameters.
  ( 1UL | portPRIVILEGE_BIT ),// uxPriority - task priority, set the...
  --portPRIVILEGE_BIT if the task should run in a privileged state.
  cStackBuffer, // puxStackBuffer - the buffer to be used as the task stack.
  // xRegions - Allocate up to three separate memory regions for access by
```
// the task, with appropriate access permissions. Different processors have
// different memory alignment requirements - refer to the FreeRTOS_
// documentation
// for full information.
{
  // Base address Length Parameters
  { cReadWriteArray, 32, portMPU_REGION_READ_WRITE },
  { cReadOnlyArray, 32, portMPU_REGION_READ_ONLY },
  { cPrivilegedOnlyAccessArray, 128, portMPU_REGION_PRIVILEGED_READ_
    WRITE }
}

int main( void )
{
  TaskHandle_t xHandle;

  // Create a task from the const structure defined above. The task handle
  // is requested (the second parameter is not NULL) but in this case just for
  // demonstration purposes as its not actually used.
  xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

  // Start the scheduler.
  vTaskStartScheduler();

  // Will only get here if there was insufficient memory to create the idle
  // and/or timer task.
  for( ;; );
}

Parameters
• pxTaskDefinition – Pointer to a structure that contains a member for each of the
  normal xTaskCreate() parameters (see the xTaskCreate() API documentation) plus an
  optional stack buffer and the memory region definitions.
• pxCreatedTask – Used to pass back a handle by which the created task can be refer-
  enced.

void vTaskAllocateMPURegions( TaskHandle_t xTask, const MemoryRegion_t *const pxRegions )

Only available when configSUPPORT_STATIC_ALLOCATION is set to 1.

xTaskCreateRestrictedStatic() should only be used in systems that include an MPU implementation.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to
hold the task’s data structures. The second block is used by the task as its stack. If a task is created using
xTaskCreateRestricted() then the stack is provided by the application writer, and the memory used to hold the
task’s data structure is automatically dynamically allocated inside the xTaskCreateRestricted() function. If a
task is created using xTaskCreateRestrictedStatic() then the application writer must provide the memory used
to hold the task’s data structures too. xTaskCreateRestrictedStatic() therefore allows a memory protected
task to be created without using any dynamic memory allocation.

return pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined
in the file projdefs.h

Example usage:

// Create an TaskParameters_t structure that defines the task to be created.
// The StaticTask_t variable is only included in the structure when
// configSUPPORT_STATIC_ALLOCATION is set to 1. The PRIVILEGED_DATA macro can
// be used to force the variable into the RTOS kernel's privileged data area.
```c
static PRIVILEGED_DATA StaticTask_t xTaskBuffer;
static const TaskParameters_t xCheckTaskParameters =
{
    vATask,   // pvTaskCode - the function that implements the task.
    ATask",   // pcName - just a text name for the task to assist debugging.
    100,      // usStackDepth - the stack size DEFINED IN BYTES.
    NULL,     // pvParameters - passed into the task function as the function...
    /*parameters.*/
    { 1UL | portPRIVILEGE_BIT }, // usxPriority - task priority, set the...
    /*portPRIVILEGE_BIT if the task should run in a privileged state.
    cStackBuffer, // puxStackBuffer - the buffer to be used as the task stack.

    // xRegions - Allocate up to three separate memory regions for access by
    // the task, with appropriate access permissions. Different processors have
    // different memory alignment requirements - refer to the FreeRTOS...
    // documentation
    // for full information.
    {
        // Base address Length Parameters
        { cReadWriteArray, 32, portMPU_REGION_READ_WRITE },
        { cReadOnlyArray, 32, portMPU_REGION_READ_ONLY },
        { cPrivilegedOnlyAccessArray, 128, portMPU_REGION_PRIVILEGED_READ_  
          WRITE }
    }

    &xTaskBuffer; // Holds the task's data structure.
};

int main( void )
{
    TaskHandle_t xHandle;

    // Create a task from the const structure defined above. The task handle
    // is requested (the second parameter is not NULL) but in this case just for
    // demonstration purposes as its not actually used.
    xTaskCreateRestricted( &xRegTest1Parameters, &xHandle );

    // Start the scheduler.
    vTaskStartScheduler();

    // Will only get here if there was insufficient memory to create the idle
    // and/or timer task.
    for( ;; );
}
```

Memory regions are assigned to a restricted task when the task is created by a call to `xTaskCreateRestricted()`. These regions can be redefined using `vTaskAllocateMPURegions()`.

Example usage:

```c
// Define an array of MemoryRegion_t structures that configures an MPU region
// allowing read/write access for 1024 bytes starting at the beginning of the
// ucOneKByte array. The other two of the maximum 3 definable regions are
// unused so set to zero.
static const MemoryRegion_t xAltRegions[ portNUM_CONFIGURABLE_REGIONS ] =
{
    // Base address Length Parameters
    { ucOneKByte, 1024, portMPU_REGION_READ_WRITE },
    { 0, 0, 0 },
    { 0, 0, 0 }
};
```

(continues on next page)
void vATask( void *pvParameters )
{
// This task was created such that it has access to certain regions of
// memory as defined by the MPU configuration. At some point it is
// desired that these MPU regions are replaced with that defined in the
// xAltRegions const struct above. Use a call to vTaskAllocateMPURegions()
// for this purpose. NULL is used as the task handle to indicate that this
// function should modify the MPU regions of the calling task.
// Now the task can continue its function, but from this point on can only
// access its stack and the ucOneKByte array (unless any other statically
// defined or shared regions have been declared elsewhere).
}

Parameters

- **pxTaskDefinition** – Pointer to a structure that contains a member for each of
  the normal xTaskCreate() parameters (see the xTaskCreate() API documentation)
  plus an optional stack buffer and the memory region definitions. If configSUP-
  PORT_STATIC_ALLOCATION is set to 1 the structure contains an additional member,
  which is used to point to a variable of type StaticTask_t - which is then used to hold the
task’s data structure.
- **pxCreatedTask** – Used to pass back a handle by which the created task can be refer-
  enced.
- **xTask** – The handle of the task being updated.
- **pxRegions** – A pointer to an MemoryRegion_t structure that contains the new memory
  region definitions.

void vTaskDelete( TaskHandle_t xTaskToDelete )

INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section
for more information.

Remove a task from the RTOS real time kernel’s management. The task being deleted will be removed from
all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted.
It is therefore important that the idle task is not starved of microcontroller processing time if your application
makes any calls to vTaskDelete(). Memory allocated by the task code is not automatically freed, and should
be freed before the task is deleted.

See the demo application file death.c for sample code that utilises vTaskDelete().

Example usage:

```c
void vOtherFunction( void )
{
  TaskHandle_t xHandle;

  // Create the task, storing the handle.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_~);

  // Use the handle to delete the task.
  vTaskDelete( xHandle );
}"
```
**Parameters** `xTaskToDelete`—The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

```c
void vTaskDelay (const TickType_t xTicksToDelay)
```

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant `portTICK_PERIOD_MS` can be used to calculate real time from the tick rate - with the resolution of one tick period.

`INCLUDE_vTaskDelay` must be defined as 1 for this function to be available. See the configuration section for more information.

`vTaskDelay()` specifies a time at which the task wishes to unblock relative to the time at which `vTaskDelay()` is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after `vTaskDelay()` is called. `vTaskDelay()` does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will effect the frequency at which `vTaskDelay()` gets called and therefore the time at which the task next executes. See `xTaskDelayUntil()` for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```c
void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for( ;; )
    {
        // Simply toggle the LED every 500ms, blocking between each toggle.
        vToggleLED();
        vTaskDelay( xDelay );
    }
}
```

**Parameters** `xTicksToDelay`—The amount of time, in tick periods, that the calling task should block.

```c
BaseType_t xTaskDelayUntil (TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement)
```

`INCLUDE_xTaskDelayUntil` must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from `vTaskDelay()` in one important aspect: `vTaskDelay()` will cause a task to block for the specified number of ticks from the time `vTaskDelay()` is called. It is therefore difficult to use `vTaskDelay()` by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling `vTaskDelay()` may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas `vTaskDelay()` specifies a wake time relative to the time at which the function is called, `xTaskDelayUntil()` specifies the absolute (exact) time at which it wishes to unblock.

The macro `pdMS_TO_TICKS()` can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:
// Perform an action every 10 ticks.
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;
    BaseType_t xWasDelayed;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount();
    for( ;; )
    {
        // Wait for the next cycle.
        xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here. xWasDelayed value can be used to determine
        // whether a deadline was missed if the code here took too long.
    }
}

Parameters

- **pxPreviousWakeTime** - Pointer to a variable that holds the time at which the task
  was last unblocked. The variable must be initialised with the current time prior to its first
  use (see the example below). Following this the variable is automatically updated within
  xTaskDelayUntil().

- **xTimeIncrement** - The cycle time period. The task will be unblocked at time *pxPreviousWakeTime + xTimeIncrement.* Calling xTaskDelayUntil with the same xTimeIncrement parameter value will cause the task to execute with a fixed interface period.

Returns Value which can be used to check whether the task was actually delayed. Will be pdTRUE
if the task way delayed and pdFALSE otherwise. A task will not be delayed if the next expected
wake time is in the past.

BaseType_t xTaskAbortDelay( TaskHandle_t xTask )

INCLUDE_xTaskAbortDelay must be defined as 1 in FreeRTOSConfig.h for this function to be available.
A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when vTaskDelay() is called, or an event on an object, such as when
xQueueReceive() or ulTaskNotifyTake() is called. If the handle of a task that is in the Blocked state is used
in a call to xTaskAbortDelay() then the task will leave the Blocked state, and return from whichever function
call placed the task into the Blocked state.

There is no ‘FromISR’ version of this function as an interrupt would need to know which object a task
was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the
interrupt handler would then need to know if the queue was locked.

Parameters **xTask** - The handle of the task to remove from the Blocked state.

Returns If the task referenced by xTask was not in the Blocked state then pdFAIL is returned.
Otherwise pdPASS is returned.

UBaseType_t uxTaskPriorityGet( const TaskHandle_t xTask )

INCLUDE_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration
section for more information.

Obtain the priority of any task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Perform an action every 10 ticks.
    void vTaskFunction( void * pvParameters )
    {
        TickType_t xLastWakeTime;
        const TickType_t xFrequency = 10;
        BaseType_t xWasDelayed;

        // Initialise the xLastWakeTime variable with the current time.
        xLastWakeTime = xTaskGetTickCount();
        for( ;; )
        {
            // Wait for the next cycle.
            xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

            // Perform action here. xWasDelayed value can be used to determine
            // whether a deadline was missed if the code here took too long.
        }
    }

    // Call the function with the handle.
    vTaskFunction( &xHandle );
}
```
// Create a task, storing the handle.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_~);

// ...

// Use the handle to obtain the priority of the created task.
// It was created with tskIDLE_PRIORITY, but may have changed
// it itself.
if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY )
    { // The task has changed it's priority. }

// ...

// Is our priority higher than the created task?
if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) )
    { // Our priority (obtained using NULL handle) is higher. }

Parameters xTask – Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

Returns The priority of xTask.

UBaseType_t uxTaskPriorityGetFromISR (const TaskHandle_t xTask)
A version of uxTaskPriorityGet() that can be used from an ISR.

eTaskState eTaskGetState (TaskHandle_t xTask)
INCLUDE_eTaskGetStateMachine must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the state of any task. States are encoded by the eTaskState enumerated type.

Parameters xTask – Handle of the task to be queried.

Returns The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

void vTaskGetInfo (TaskHandle_t xTask, TaskStatus_t pxTaskStatus, BaseType_t xGetFreeStackSpace, eTaskState eState)
configUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus_t structure with information about a task.

Example usage:

```c
void vAFunction ( void )
{
  TaskHandle_t xHandle;
  TaskStatus_t xTaskDetails;

  // Obtain the handle of a task from its name.
  xHandle = xTaskGetHandle( "Task_Name" );

  // Obtain its state.
  xTaskDetails = eTaskGetState( xHandle);

  // Obtain its priority.
  xTaskDetails = uxTaskPriorityGetFromISR( xHandle);

  // Get the status.
  pxTaskStatus = &xTaskDetails;

  // Get the free stack space.
  xGetFreeStackSpace = xGetFreeStackSpace();

  // Get the task state.
  eState = eTaskGetState( xHandle);
}
```
// Check the handle is not NULL.
configASSERT( xHandle );

// Use the handle to obtain further information about the task.
vTaskGetInfo( xHandle,
   ixTaskDetails,
   pdTRUE, // Include the high water mark in xTaskDetails.
   eInvalid ); // Include the task state in xTaskDetails.
}

Parameters

- **xTask** – Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus** – A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSpace** – The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus_t structure if xGetFreeStackSpace is not set to pdFALSE;
- **eState** – The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus_t structure.

void vTaskPrioritySet( TaskHandle_t xTask, UBaseType_t uxNewPriority )

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.

A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```c
void vAFunctio( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle_--);

    // ...

    // Use the handle to raise the priority of the created task.
    vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

    // ...

    // Use a NULL handle to raise our priority to the same value.
    vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}
```

Parameters
• **xTask** – Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.

• **uxNewPriority** – The priority to which the task will be set.

```c
void vTaskSuspend (TaskHandle_t xTaskToSuspend)

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to vTaskSuspend are not accumulative - i.e. calling vTaskSuspend () twice on the same task still only requires one call to vTaskResume () to ready the suspended task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;
    
    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );
    
    // ...
    
    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );
    
    // ...
    
    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).
    
    //...
    
    // Suspend ourselves.
    vTaskSuspend( NULL );
    
    // We cannot get here unless another task calls vTaskResume
    // with our handle as the parameter.
}
```

**Parameters**

**xTaskToSuspend** – Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

```c
void vTaskResume (TaskHandle_t xTaskToResume)

INCLUDE_vTaskSuspend must be defined as 1 for this function to be available. See the configuration section for more information.

Resumes a suspended task.

A task that has been suspended by one or more calls to vTaskSuspend () will be made available for running again by a single call to vTaskResume ()..

Example usage:
```
Chapter 2. API Reference

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless another task calls vTaskResume( xHandle ).

    // ...

    // Resume the suspended task ourselves.
    vTaskResume( xHandle );

    // The created task will once again get microcontroller processing time in accordance with its priority within the system.
}
```

**Parameters**

- `xTaskToResume` – Handle to the task being readied.

```c
BaseType_t xTaskResumeFromISR( TaskHandle_t xTaskToResume )
```

INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of vTaskResume() that can be called from within an ISR.

A task that has been suspended by one or more calls to vTaskSuspend() will be made available for running again by a single call to xTaskResumeFromISR().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

**Parameters**

- `xTaskToResume` – Handle to the task being readied.

**Returns**

- `pdTRUE` if resuming the task should result in a context switch, otherwise `pdFALSE`. This is used by the ISR to determine if a context switch may be required following the ISR.

```c
void vTaskStartScheduler( void )
```

Starts the real time kernel tick processing. After calling the kernel has control over which tasks are executed and when.

**NOTE:** In ESP-IDF the scheduler is started automatically during application startup, vTaskStartScheduler() should not be called from ESP-IDF applications.

See the demo application file main.c for an example of creating tasks and starting the kernel.

**Example usage:**

```c
void vAFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );
}
```
void vTaskEndScheduler (void)

NOTE: At the time of writing only the x86 real mode port, which runs on a PC in place of DOS, implements this function.

Stops the real time kernel tick. All created tasks will be automatically deleted and multitasking (either preemptive or cooperative) will stop. Execution then resumes from the point where vTaskStartScheduler () was called, as if vTaskStartScheduler () had just returned.

See the demo application file main. c in the demo/PC directory for an example that uses vTaskEndScheduler ().

vTaskEndScheduler () requires an exit function to be defined within the portable layer (see vPortEndScheduler () in port. c for the PC port). This performs hardware specific operations such as stopping the kernel tick.

vTaskEndScheduler () will cause all of the resources allocated by the kernel to be freed - but will not free resources allocated by application tasks.

Example usage:

```c
void vTaskCode( void * pvParameters )
{
    for(;;)
    {
        // Task code goes here.
        // At some point we want to end the real time kernel processing
        // so call ...
        vTaskEndScheduler ();
    }
}

void vAFunction( void )
{
    // Create at least one task before starting the kernel.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, NULL );

    // Start the real time kernel with preemption.
    vTaskStartScheduler ();

    // Will only get here when the vTaskCode () task has called
    // vTaskEndScheduler (). When we get here we are back to single task
    // execution.
}
```

void vTaskSuspendAll (void)

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is suspended.

After calling vTaskSuspendAll () the calling task will continue to execute without risk of being swapped out until a call to xTaskResumeAll () has been made.

API functions that have the potential to cause a context switch (for example, vTaskDelayUntil(), xQueueSend(), etc.) must not be called while the scheduler is suspended.

Example usage:

```c
// Start the real time kernel with preemption.
vTaskStartScheduler ();

// Will not get here unless a task calls vTaskEndScheduler ()
```
void vTask1( void * pvParameters )
{
    for(;; )
    {
        // Task code goes here.
        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the kernel
        // tick count will be maintained.

        // ...

        // The operation is complete. Restart the kernel.
        xTaskResumeAll ();
    }
}

BaseType_t xTaskResumeAll ( void )
Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().

xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by
a call to vTaskSuspend().

Example usage:

void vTask1( void * pvParameters )
{
    for(;; )
    {
        // Task code goes here.
        // ...

        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL ()/taskEXIT_CRITICAL () as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.

        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll ();

        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the real
        // time kernel tick count will be maintained.

        // ...
    }
}
// The operation is complete. Restart the kernel. We want to force
// a context switch - but there is no point if resuming the scheduler
// caused a context switch already.
if (!xTaskResumeAll ( ) )
{
    taskYIELD ( );
}

Returns If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise pdFALSE is returned.

TickType_t xTaskGetTickCount (void)

Returns The count of ticks since vTaskStartScheduler was called.

TickType_t xTaskGetTickCountFromISR (void)

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is
the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being
used.

Returns The count of ticks since vTaskStartScheduler was called.

UBaseType_t uxTaskGetNumberOfTasks (void)

Returns The number of tasks that the real time kernel is currently managing. This includes all
ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle
task will also be included in the count.

char *pcTaskGetName (TaskHandle_t xTaskToQuery)

Returns The text (human readable) name of the task referenced by the handle xTaskToQuery. A
task can query its own name by either passing in its own handle, or by setting xTaskToQuery
to NULL.

TaskHandle_t xTaskGetHandle (const char *pcNameToQuery)

NOTE: This function takes a relatively long time to complete and should be used sparingly.

Returns The handle of the task that has the human readable name pcNameToQuery. NULL
is returned if no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in
FreeRTOSConfig.h for pcTaskGetHandle() to be available.

UBaseType_t uxTaskGetStackHighWaterMark (TaskHandle_t xTask)

Returns the high water mark of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there
has been (in bytes not words, unlike vanilla FreeRTOS) since the task started. The smaller the returned number
the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return
type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around
the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications
that expect an 8-bit return type.

Parameters xTask - Handle of the task associated with the stack to be checked. Set xTask to
NULL to check the stack of the calling task.

Returns The smallest amount of free stack space there has been (in bytes not words, unlike vanilla
FreeRTOS) since the task referenced by xTask was created.
Chapter 2. API Reference

configSTACK_DEPTH_TYPE uxTaskGetStackHighWaterMark2 (TaskHandle_t xTask)

Returns the start of the stack associated with xTask.

INCLUDE_uxTaskGetStackHighWaterMark2 must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Parameters xTask – Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

Returns The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

uint8_t *pxTaskGetStackStart (TaskHandle_t xTask)

Returns the start of the stack associated with xTask.

INCLUDE_pxTaskGetStackStart must be set to 1 in FreeRTOSConfig.h for this function to be available.

Returns the lowest stack memory address, regardless of whether the stack grows up or down.

Parameters xTask – Handle of the task associated with the stack returned. Set xTask to NULL to return the stack of the calling task.

Returns A pointer to the start of the stack.

void vTaskSetApplicationTaskTag (TaskHandle_t xTask, TaskHookFunction_t pxHookFunction)

Sets pxHookFunction to be the task hook function used by the task xTask.

Parameters

• xTask – Handle of the task to set the hook function for. Passing xTask as NULL has the effect of setting the calling tasks hook function.

• pxHookFunction – Pointer to the hook function.

TaskHookFunction_t xTaskGetApplicationTaskTag (TaskHandle_t xTask)

Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine - call xTaskGetApplicationTaskTagFromISR() instead.

TaskHookFunction_t xTaskGetApplicationTaskTagFromISR (TaskHandle_t xTask)

Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.

void vTaskSetThreadLocalStoragePointer (TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue)

Set local storage pointer specific to the given task.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Parameters

• xTaskToSet – Task to set thread local storage pointer for

• xIndex – The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

• pvValue – Pointer value to set.

void *pvTaskGetThreadLocalStoragePointer (TaskHandle_t xTaskToQuery, BaseType_t xIndex)

Get local storage pointer specific to the given task.
Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Parameters

• xTaskToQuery – Task to get thread local storage pointer for
• xIndex – The index of the pointer to get, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.

Returns Pointer value

void vTaskSetThreadLocalStoragePointerAndDelCallback (TaskHandle_t xTaskToSet, BaseType_t xIndex, void *pvValue, TlsDeleteCallbackFunction_t pvDelCallback)

Set local storage pointer and deletion callback.

Each task contains an array of pointers that is dimensioned by the configNUM_THREAD_LOCAL_STORAGE_POINTERS setting in FreeRTOSConfig.h. The kernel does not use the pointers itself, so the application writer can use the pointers for any purpose they wish.

Local storage pointers set for a task can reference dynamically allocated resources. This function is similar to vTaskSetThreadLocalStoragePointer, but provides a way to release these resources when the task gets deleted. For each pointer, a callback function can be set. This function will be called when task is deleted, with the local storage pointer index and value as arguments.

Parameters

• xTaskToSet – Task to set thread local storage pointer for
• xIndex – The index of the pointer to set, from 0 to configNUM_THREAD_LOCAL_STORAGE_POINTERS - 1.
• pvValue – Pointer value to set.
• pvDelCallback – Function to call to dispose of the local storage pointer when the task is deleted.

void vApplicationGetIdleTaskMemory (StaticTask_t **pxxIdleTaskTCBBuffer, StackType_t **pxxIdleTaskStackBuffer, uint32_t *pulIdleTaskStackSize)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

Parameters

• pxxIdleTaskTCBBuffer – A handle to a statically allocated TCB buffer
• pxxIdleTaskStackBuffer – A handle to a statically allocated Stack buffer for the idle task
• pulIdleTaskStackSize – A pointer to the number of elements that will fit in the allocated stack buffer

BaseType_t xTaskCallApplicationTaskHook (TaskHandle_t xTask, void *pvParameter)

Calls the hook function associated with xTask. Passing xTask as NULL has the effect of calling the Running tasks (the calling task) hook function.

Parameters

• xTask – Handle of the task to call the hook for.
• pvParameter – Parameter passed to the hook function for the task to interpret as it wants. The return value is the value returned by the task hook function registered by the user.

TaskHandle_t xTaskGetIdleTaskHandle (void)

xTaskGetIdleTaskHandle() is only available if INCLUDE_xTaskGetIdleTaskHandle is set to 1 in FreeRTOSConfig.h.

Simply returns the handle of the idle task. It is not valid to call xTaskGetIdleTaskHandle() before the scheduler has been started.
Chapter 2. API Reference

UBaseType_t uxTaskGetSystemState(TaskStatus_t *const pxTaskStatusArray, const UBaseType_t uxArraySize, uint32_t *const pulTotalRunTime)

configUSE_TRACE_FACILITY must be defined as 1 in FreeRTOSConfig.h for uxTaskGetSystemState() to be available.

uxTaskGetSystemState() populates a TaskStatus_t structure for each task in the system. TaskStatus_t structures contain, among other things, members for the task handle, task name, task priority, task state, and total amount of run time consumed by the task. See the TaskStatus_t structure definition in this file for the full member list.

NOTE: This function is intended for debugging use only as its use results in the scheduler remaining suspended for an extended period.

Example usage:

```c
// This example demonstrates how a human readable table of run time stats
// information is generated from raw data provided by uxTaskGetSystemState().
// The human readable table is written to pcWriteBuffer.
void vTaskGetRunTimeStats( char *pcWriteBuffer )
{
    TaskStatus_t *pxTaskStatusArray;
    volatile UBaseType_t uxArraySize, x;
    uint32_t ulTotalRunTime, ulStatsAsPercentage;

    // Make sure the write buffer does not contain a string.
    *pcWriteBuffer = 0x00;

    // Take a snapshot of the number of tasks in case it changes while this
    // function is executing.
    uxArraySize = uxTaskGetNumberOfTasks();

    // Allocate a TaskStatus_t structure for each task. An array could be
    // allocated statically at compile time.
    pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

    if( pxTaskStatusArray != NULL )
    {
        // Generate raw status information about each task.
        uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &ulTotalRunTime );

        // For percentage calculations.
        ulTotalRunTime /= 100UL;

        // Avoid divide by zero errors.
        if( ulTotalRunTime > 0 )
        {
            // For each populated position in the pxTaskStatusArray array,
            // format the raw data as human readable ASCII data
            for( x = 0; x < uxArraySize; x++ )
            {
                // What percentage of the total run time has the task used?
                // This will always be rounded down to the nearest integer.
                // ulTotalRunTimeDiv100 has already been divided by 100.
                ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter - ulTotalRunTime;

                if( ulStatsAsPercentage > 0UL )
                {
                    sprintf( pcWriteBuffer, "%s\t\t\t%lu\t\t%lu%%\n", pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter, ulStatsAsPercentage );
                }
            }
        }
    }
}(continues on next page)
} else {
    // If the percentage is zero here then the task has consumed less than 1% of the total run time.
    sprintf(pcWriteBuffer, "%s\t%lu\t<1\%

    " pxTaskStatusArray[x].pcTaskName, pxTaskStatusArray[x].ulRunTimeCounter);

    pcWriteBuffer += strlen((char *) pcWriteBuffer);
}

// The array is no longer needed, free the memory it consumes.
vPortFree(pxTaskStatusArray);
}

Parameters

- **pxTaskStatusArray** – A pointer to an array of TaskStatus_t structures. The array must contain at least one TaskStatus_t structure for each task that is under the control of the RTOS. The number of tasks under the control of the RTOS can be determined using the uxTaskGetNumberOfTasks() API function.

- **uxArraySize** – The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.

- **pulTotalRunTime** – If configGENERATE_RUN_TIME_STATS is set to 1 in FreeRTOSConfig.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see https://www.FreeRTOS.org/rtos-run-time-stats.html) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

Returns

The number of TaskStatus_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberOfTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.

```c
void vTaskList(char *pcWriteBuffer)
{
    List all the current tasks.

    configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

    NOTE 1: This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

    Lists all the current tasks, along with their current state and stack usage high water mark.

    Tasks are reported as blocked ('B'), ready ('R'), deleted ('D') or suspended ('S').

    PLEASE NOTE:

    This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

    vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task names, states and stack usage.

    vTaskList() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).
```

Espressif Systems 1897 Release v5.0.4-384-ge42bcf2e88
Submit Document Feedback
It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

**Parameters**

- **pcWriteBuffer** — A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

```c
void vTaskGetRunTimeStats(char *pcWriteBuffer)
```

Get the state of running tasks as a string

configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timer’s current count value respectively. The counter should be at least 10 times the frequency of the tick count.

**NOTE 1:** This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. Calling vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

**NOTE 2:**

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskGetRunTimeStats() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

vTaskGetRunTimeStats() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskGetRunTimeStats().

**Parameters**

- **pcWriteBuffer** — A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

```c
uint32_t ulTaskGetIdleRunTimeCounter(void)
```

configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timer’s current count value respectively. The counter should be at least 10 times the frequency of the tick count.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. While uxTaskGetSystemState() and vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, ulTaskGetIdleRunTimeCounter() returns the total execution time of just the idle task.

**Returns**

The total run time of the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() macros.
BaseType_t xTaskGenericNotify(TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotify() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotify() is equivalent to calling xTaskNotifyIndexed() with the uxIndexToNotify parameter set to 0.

eSetBits - The target notification value is bitwise ORed with ulValue. xTaskNotifyIndexed() always returns pdPASS in this case.

eIncrement - The target notification value is incremented. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

eSetValueWithOverwrite - The target notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). xTaskNotifyIndexed() always returns pdPASS in this case.

eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending at the same array index then the target notification value is set to ulValue and xTaskNotifyIndexed() will return pdPASS. If the task being notified already had a notification pending at the same array index then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification at the specified array index without the notification value at that index being updated. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

Parameters

- **xTaskToNotify** - The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().

Espressif Systems

1899

Release v5.0.4-384-ge42bcf2e88

Submit Document Feedback
• **uxIndexToNotify** – The index within the target task’s array of notification values to which the notification is to be sent. `uxIndexToNotify` must be less than `configTASK_NOTIFICATION_ARRAY_ENTRIES`. `xTaskNotify()` does not have this parameter and always sends notifications to index 0.

• **ulValue** – Data that can be sent with the notification. How the data is used depends on the value of the `eAction` parameter.

• **eAction** – Specifies how the notification updates the task’s notification value, if at all. Valid values for `eAction` are as follows:

  • **pulPreviousNotificationValue** → Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.

    **Returns** Dependent on the value of `eAction`. See the description of the `eAction` parameter.

    ```c
    BaseType_t xTaskGenericNotifyFromISR( TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, uint32_t ulValue, eNotifyAction eAction, uint32_t *pulPreviousNotificationValue, BaseType_t *pxHigherPriorityTaskWoken )
    ```

    `configUSE_TASK_NOTIFICATIONS` must be undefined or defined as 1 for these functions to be available.

    A version of `xTaskNotifyIndexed()` that can be used from an interrupt service routine (ISR).

    Each task has a private array of “notification values” (or “notifications”), each of which is a 32-bit unsigned integer (uint32_t). The constant `configTASK_NOTIFICATION_ARRAY_ENTRIES` sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

    Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

    A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as lightweight and fast binary or counting semaphores.

    A task can use `xTaskNotifyWaitIndexed()` to [optionally] block to wait for a notification to be pending, or `ulTaskNotifyTakeIndexed()` to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

    A notification sent to a task will remain pending until it is cleared by the task calling `xTaskNotifyWaitIndexed()` or `ulTaskNotifyTakeIndexed()` (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

    **NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

    **Backward compatibility information:** Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. `xTaskNotifyFromISR()` is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling `xTaskNotifyFromISR()` is equivalent to calling `xTaskNotifyIndexedFromISR()` with the `uxIndexToNotify` parameter set to 0.

    **eSetBits** - The task’s notification value is bitwise ORed with `ulValue`. `xTaskNotify()` always returns `pdPASS` in this case.

    **eIncrement** - The task’s notification value is incremented. `ulValue` is not used and `xTaskNotify()` always returns `pdPASS` in this case.

    **eSetValueWithOverwrite** - The task’s notification value is set to the value of `ulValue`, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). `xTaskNotify()` always returns `pdPASS` in this case.
eSetValueWithoutOverwrite - If the task being notified did not already have a notification pending then the task’s notification value is set to ulValue and xTaskNotify() will return pdPASS. If the task being notified already had a notification pending then no action is performed and pdFAIL is returned.

eNoAction - The task receives a notification without its notification value being updated. ulValue is not used and xTaskNotify() always returns pdPASS in this case.

Parameters

- **uxIndexToNotify** – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyFromISR() does not have this parameter and always sends notifications to index 0.

- **xTaskToNotify** – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().

- **ulValue** – Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.

- **eAction** – Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:
  - **pulPreviousNotificationValue** – Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.
  - **pxHigherPriorityTaskWoken** – xTaskNotifyFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If xTaskNotifyFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

- **pulPreviousNotificationValue** – Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.

- **pxHigherPriorityTaskWoken** – xTaskNotifyFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If xTaskNotifyFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

Returns

Dependent on the value of eAction. See the description of the eAction parameter.

BaseType_t **xTaskGenericNotifyWait** (UBaseType_t uxIndexToWaitOn, uint32_t ulBitsToClearOnEntry, uint32_t ulBitsToClearOnExit, uint32_t *pulNotificationValue, TickType_t xTicksToWait)

Waits for a direct to task notification to be pending at a given index within an array of direct to task notifications.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.
Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyWait() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyWait() is equivalent to calling xTaskNotifyWaitIndexed() with the uxIndexToWaitOn parameter set to 0.

**Parameters**

- **uxIndexToWaitOn** - The index within the calling task’s array of notification values on which the calling task will wait for a notification to be received. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyWait() does not have this parameter and always waits for notifications on index 0.

- **ulBitsToClearOnEntry** - Bits that are set in ulBitsToClearOnEntry value will be cleared in the calling task’s notification value before the task is marked as waiting for a new notification (provided a notification is not already pending). Optionally blocks if no notifications are pending. Setting ulBitsToClearOnEntry to ULONG_MAX (if limits.h is included) or OxfffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0. Setting ulBitsToClearOnEntry to 0 will leave the task’s notification value unchanged.

- **ulBitsToClearOnExit** - If a notification is pending or received before the calling task exits the xTaskNotifyWait() function then the task’s notification value (see the xTaskNotify() API function) is passed out using the pulNotificationValue parameter. Then any bits that are set in ulBitsToClearOnExit will be cleared in the task’s notification value (note *pulNotificationValue is set before any bits are cleared). Setting ulBitsToClearOnExit to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0 before the function exits. Setting ulBitsToClearOnExit to 0 will leave the task’s notification value unchanged when the function exits (in which case the value passed out in pulNotificationValue will match the task’s notification value).

- **pulNotificationValue** - Used to pass the task’s notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by ulBitsToClearOnExit being non-zero.

- **xTicksToWait** - The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when xTaskNotifyWait() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(value_in_ms) can be used to convert a time specified in milliseconds to a time specified in ticks.

**Returns**

If a notification was received (including notifications that were already pending when xTaskNotifyWait was called) then pdPASS is returned. Otherwise pdFAIL is returned.

```c
void vTaskGenericNotifyGiveFromISR (TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, BaseType_t *pxHigherPriorityTaskWoken)
```

A version of xTaskNotifyGiveIndexed() that can be called from an interrupt service routine (ISR).

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this macro to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.
vTaskNotifyGiveIndexedFromISR() is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the xSemaphoreGiveFromISR() API function, the equivalent action that instead uses a task notification is vTaskNotifyGiveIndexedFromISR().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTakeIndexed() API function rather than the xTaskNotifyWaitIndexed() API function.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyGiveFromISR() is equivalent to calling xTaskNotifyGiveIndexedFromISR() with the uxIndexToNotify parameter set to 0.

**Parameters**

- **xTaskToNotify** - The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- **uxIndexToNotify** - The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGiveFromISR() does not have this parameter and always sends notifications to index 0.
- **pxHigherPriorityTaskWoken** - vTaskNotifyGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If vTaskNotifyGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

```c
uint32_t ulTaskGenericNotifyTake ( UBaseType_t uxIndexToWaitOn, BaseType_t xClearCountOnExit, TickType_t xTicksToWait )
```

Waits for a direct to task notification on a particular index in the calling task’s notification array in a manner similar to taking a counting semaphore.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

ulTaskNotifyTakeIndexed() is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the xSemaphoreTake() API function, the equivalent action that instead uses a task notification is ulTaskNotifyTakeIndexed().

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the xTaskNotifyGiveIndexed() macro, or xTaskNotifyIndex() function with the eAction parameter set to eIncrement.
ulTaskNotifyTakeIndexed() can either clear the task’s notification value at the array index specified by the uxIndexToWaitOn parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use ulTaskNotifyTakeIndexed() to optionally block to wait for the task’s notification value to be non-zero. The task does not consume any CPU time while it is in the Blocked state.

Where as xTaskNotifyWaitIndexed() will return when a notification is pending, ulTaskNotifyTakeIndexed() will return when the task’s notification value is not zero.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyTake() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling ulTaskNotifyTake() is equivalent to calling ulTaskNotifyTakeIndexed() with the uxIndexToWaitOn parameter set to 0.

**Parameters**

- **uxIndexToWaitOn** – The index within the calling task’s array of notification values on which the calling task will wait for a notification to be non-zero. uxIndexToWaitOn must be less than configTASK-notification Array_ENTRIES. xTaskNotifyTake() does not have this parameter and always waits for notifications on index 0.

- **xClearCountOnExit** – if xClearCountOnExit is pdFALSE then the task’s notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If xClearCountOnExit is not pdFALSE then the task’s notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.

- **xTicksToWait** – The maximum amount of time that the task should wait in the Blocked state for the task’s notification value to be greater than zero, should the count not already be greater than zero when ulTaskNotifyTake() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS(value_in_ms) can be used to convert a time specified in milliseconds to a time specified in ticks.

**Returns** The task’s notification count before it is either cleared to zero or decremented (see the xClearCountOnExit parameter).

BaseType_t xTaskGenericNotifyStateClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be ‘pending’ until it is read or explicitly cleared by the receiving task. xTaskNotifyStateClearIndexed() is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set xTask to NULL to clear the notification state of the calling task.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyStateClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyStateClear() is equivalent to calling xTaskNotifyStateClearIndexed() with the uxIndexToNotify parameter set to 0.

**Parameters**
• **xTask** – The handle of the RTOS task that will have a notification state cleared. Set xTask to NULL to clear a notification state in the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().

• **uxIndexToClear** – The index within the target task’s array of notification values to act upon. For example, setting uxIndexToClear to 1 will clear the state of the notification at index 1 within the array. uxIndexToClear must be less than config-TASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyStateClear() does not have this parameter and always acts on the notification at index 0.

**Returns**  
pdTRUE if the task’s notification state was set to eNotWaitingNotification, otherwise pdFALSE.

```c
uint32_t ulTaskGenericNotifyValueClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)
```

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

ulTaskNotifyValueClearIndexed() clears the bits specified by the ulBitsToClear bit mask in the notification value at array index uxIndexToClear of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyValueClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling ulTaskNotifyValueClear() is equivalent to calling ulTaskNotifyValueClearIndexed() with the uxIndexToClear parameter set to 0.

**Parameters**

• **xTask** – The handle of the RTOS task that will have bits in one of its notification values cleared. Set xTask to NULL to clear bits in a notification value of the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().

• **uxIndexToClear** – The index within the target task’s array of notification values in which to clear the bits. uxIndexToClear must be less than config-TASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyValueClear() does not have this parameter and always clears bits in the notification value at index 0.

• **ulBitsToClear** – Bit mask of the bits to clear in the notification value of xTask. Set a bit to 1 to clear the corresponding bits in the task’s notification value. Set ulBitsToClear to 0xffffffff (UINT_MAX on 32-bit architectures) to clear the notification value to 0. Set ulBitsToClear to 0 to query the task’s notification value without clearing any bits.

**Returns**  
The value of the target task’s notification value before the bits specified by ulBitsToClear were cleared.

```c
void vTaskSetTimeOutState(TimeOut_t *const pxTimeOut)
```

```c
BaseType_t xTaskCheckForTimeOut(TimeOut_t *const pxTimeOut, TickType_t *const pxTicksToWait)
```

Determines if pxTicksToWait ticks has passed since a time was captured using a call to vTaskSetTimeOutState(). The captured time includes the tick count and the number of times the tick count has overflowed.

**Example Usage:**
// Driver library function used to receive uxWantedBytes from an Rx buffer
// that is filled by a UART interrupt. If there are not enough bytes in the
// Rx buffer then the task enters the Blocked state until it is notified that
// more data has been placed into the buffer. If there is still not enough
// data then the task re-enters the Blocked state, and xTaskCheckForTimeOut()
// is used to re-calculate the Block time to ensure the total amount of time
// spent in the Blocked state does not exceed MAX_TIME_TO_WAIT. This
// continues until either the buffer contains at least uxWantedBytes bytes,
// or the total amount of time spent in the Blocked state reaches
// MAX_TIME_TO_WAIT – at which point the task reads however many bytes are
// available up to a maximum of uxWantedBytes.

task_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    Timeout_t xTimeOut;

    // Initialize xTimeOut. This records the time at which this function
    // was entered.
    vTaskSetTimeOutState( &xTimeOut );

    // Loop until the buffer contains the wanted number of bytes, or a
    // timeout occurs.
    while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
    {
        // The buffer didn't contain enough data so this task is going to
        // enter the Blocked state. Adjusting xTicksToWait to account for
        // any time that has been spent in the Blocked state within this
        // function so far to ensure the total amount of time spent in the
        // Blocked state does not exceed MAX_TIME_TO_WAIT.
        if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
        {
            // Timed out before the wanted number of bytes were available,
            // exit the loop.
            break;
        }

        // Wait for a maximum of xTicksToWait ticks to be notified that the
        // receive interrupt has placed more data into the buffer.
        ulTaskNotifyTake( pdTRUE, xTicksToWait );
    }

    // Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
    // The actual number of bytes read (which might be less than
    // uxWantedBytes) is returned.
    uxReceived = UART_read_from_receive_buffer( pxUARTInstance,
                                              pucBuffer,
                                              uxWantedBytes );

    return uxReceived;
}

See also:
https://www.FreeRTOS.org/xTaskCheckForTimeOut.html

Parameters

- **pxTimeOut** – The time status as captured previously using vTaskSetTimeOutState. If the timeout has not yet occurred, it is updated to reflect the current time status.

- **pxTicksToWait** – The number of ticks to check for timeout i.e. if pxTicksToWait ticks have passed since pxTimeOut was last updated (either by vTaskSetTimeOutState())
or xTaskCheckForTimeOut(), the timeout has occurred. If the timeout has not occurred, pxTicksToWait is updated to reflect the number of remaining ticks.

**Returns** If timeout has occurred, pdTRUE is returned. Otherwise pdFALSE is returned and pxTicksToWait is updated to reflect the number of remaining ticks.

BaseType_t **xTaskCatchUpTicks**(TickType_t xTicksToCatchUp)

**Macros**

- tskKERNEL_VERSION_NUMBER
- tskKERNEL_VERSION_MAJOR
- tskKERNEL_VERSION_MINOR
- tskKERNEL_VERSION_BUILD
- tskMPU_REGION_READ_ONLY
- tskMPU_REGION_READ_WRITE
- tskMPU_REGION_EXECUTE_NEVER
- tskMPU_REGION_NORMAL_MEMORY
- tskMPU_REGION_DEVICE_MEMORY
- tskDEFAULT_INDEX_TO_NOTIFY
- tskNO_AFFINITY
- tskIDLE_PRIORITY

  Defines the priority used by the idle task. This must not be modified.

**taskYIELD()**

  Macro for forcing a context switch.

**taskENTER_CRITICAL()**

  Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

**Note:** This may alter the stack (depending on the portable implementation) so must be used with care!

**taskENTER_CRITICAL_FROM_ISR()**

**taskENTER_CRITICAL_ISR()**
taskEXIT_CRITICAL()

Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

**Note:** This may alter the stack (depending on the portable implementation) so must be used with care!

taskEXIT_CRITICAL_FROM_ISR(x)
taskEXIT_CRITICAL_ISR()
taskDISABLE_INTERRUPTS()

Macro to disable all maskable interrupts.
taskENABLE_INTERRUPTS()

Macro to enable microcontroller interrupts.
taskSCHEDULER_SUSPENDED

taskSCHEDULER_NOT_STARTED

taskSCHEDULER_RUNNING

vTaskDelayUntil(pxPreviousWakeTime, xTimeIncrement)
xTaskNotify(xTaskToNotify, ulValue, eAction)
xTaskNotifyIndexed(xTaskToNotify, uxIndexToNotify, ulValue, eAction)
xTaskNotifyAndQuery(xTaskToNotify, ulValue, eAction, pulPreviousNotifyValue)

xTaskNotifyAndQueryIndexed() performs the same operation as xTaskNotifyIndexed() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyAndQuery() performs the same operation as xTaskNotify() with the addition that it also returns the subject task’s prior notification value (the notification value as it was at the time the function is called, rather than when the function returns) in the additional pulPreviousNotifyValue parameter.

xTaskNotifyAndQueryIndexed(xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotifyValue)

xTaskNotifyFromISR(xTaskToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)
xTaskNotifyIndexedFromISR(xTaskToNotify, uxIndexToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)
xTaskNotifyAndQueryIndexedFromISR(xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)

xTaskNotifyAndQueryIndexedFromISR() performs the same operation as xTaskNotifyIndexedFromISR() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotificationValue parameter.

xTaskNotifyAndQueryFromISR() performs the same operation as xTaskNotifyFromISR() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional pulPreviousNotificationValue parameter.
Chapter 2. API Reference

\textbf{xTaskNotifyAndQueryFromISR} (xTaskToNotify, ulValue, eAction, pulPreviousNotificationValue, pxHigherPriorityTaskWoken)

\textbf{xTaskNotifyWait} (ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

\textbf{xTaskNotifyWaitIndexed} (uxIndexToWaitOn, ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

\textbf{xTaskNotifyGiveIndexed} (xTaskToNotify, uxIndexToNotify)

Sends a direct to task notification to a particular index in the target task’s notification array in a manner similar to giving a counting semaphore.

See \url{https://www.FreeRTOS.org/RTOS-task-notifications.html} for more details.

\textbf{Parameters}

- \textbf{xTaskToNotify} – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().

- \textbf{uxIndexToNotify} – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than config\_TASK\_NOTIFICATION\_ARRAY\_ENTRIES. xTaskNotifyGive() does not have this parameter and always sends notifications to index 0.

\textbf{Returns} xTaskNotifyGive() is a macro that calls xTaskNotify() with the eAction parameter set to eIncrement - so pdPASS is always returned.

\textbf{xTaskNotifyGive} (xTaskToNotify)

\textbf{vTaskNotifyGiveFromISR} (xTaskToNotify, pxHigherPriorityTaskWoken)

\textbf{vTaskNotifyGiveIndexedFromISR} (xTaskToNotify, uxIndexToNotify, pxHigherPriorityTaskWoken)

config\_USE\_TASK\_NOTIFICATIONS must be undefined or defined as 1 for these macros to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant config\_TASK\_NOTIFICATION\_ARRAY\_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

xTaskNotifyGiveIndexed() is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the xSemaphoreGive() API function, the equivalent action that instead uses a task notification is xTaskNotifyGiveIndexed().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotificationTakeIndexed() API function rather than the xTaskNotifyWaitIndexed() API function.

\textbf{NOTE} Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value” , and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyGive() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyGive() is equivalent to calling xTaskNotifyGiveIndexed() with the uxIndexToNotify parameter set to 0.
Chapter 2. API Reference

ulTaskNotifyTake (xClearCountOnExit, xTicksToWait)
ulTaskNotifyTakeIndexed (uxIndexToWaitOn, xClearCountOnExit, xTicksToWait)
xTaskNotifyStateClear (xTask)
xTaskNotifyStateClearIndexed (xTask, uxIndexToClear)
ulTaskNotifyValueClear (xTask, ulBitsToClear)
ulTaskNotifyValueClearIndexed (xTask, uxIndexToClear, ulBitsToClear)

Type Definitions
typedef struct tskTaskControlBlock *TaskHandle_t
typedef BaseType_t (*TaskHookFunction_t)(void*)
typedef void (*TlsDeleteCallbackFunction_t)(int, void*)

Prototype of local storage pointer deletion callback.

Enumerations
enum eTaskState
    Task states returned by eTaskGetState.
    Values:
    enumerator eRunning
    enumerator eReady
    enumerator eBlocked
    enumerator eSuspended
    enumerator eDeleted
    enumerator eInvalid

enum eNotifyAction
    Values:
    enumerator eNoAction
    enumerator eSetBits
    enumerator eIncrement
    enumerator eSetValueWithOverwrite
Chapter 2. API Reference

enumerator eSetValueWithoutOverwrite

enum eSleepModeStatus
    Possible return values for eTaskConfirmSleepModeStatus().
    Values:

enumerator eAbortSleep

enumerator eStandardSleep

enumerator eNoTasksWaitingTimeout

Queue API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/queue.h

Functions

BaseType_t xQueueGenericSend[QueueHandle_t xQueue, const void *const pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition]

It is preferred that the macros xQueueSend(), xQueueSendToFront() and xQueueSendToBack() are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

```c
struct AMESSAGE
{
    char ucMessageID;
    char ucData[20];
} xMessage;
uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMESSAGE *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMESSAGE structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMESSAGE * ) );

    // ...
    if( xQueue1 != 0 )
    {
        // ...
    }
    if( xQueue2 != 0 )
    {
        // ...
    }
```

(continues on next page)
// Send an uint32_t. Wait for 10 ticks for space to become available if necessary.

```c
if (xQueueGenericSend( xQueue1, (void *) &ulVar, (TickType_t) 10, queueSEND_TO_BACK ) != pdPASS)
{
    // Failed to post the message, even after 10 ticks.
}
```

```c
if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
    pxMessage = & xMessage;
    xQueueGenericSend( xQueue2, (void *) pxMessage, (TickType_t) 0, queueSEND_TO_BACK );
}
```

// ... Rest of task code.

### Parameters

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** - The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.
- **xCopyPosition** - Can take the value queueSEND_TO_BACK to place the item at the back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue (for high priority messages).

### Returns

- **pdTRUE** if the item was successfully posted, otherwise **errQUEUE_FULL**.

---

### Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{

(continues on next page)
struct AMessage *pxMessage;

// Create a queue capable of containing 10 pointers to AMessage structures. // These should be passed by pointer as they contain a lot of data.
xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
if( xQueue == 0 )
{
    // Failed to create the queue.
}

// ... Send a pointer to a struct AMessage object. Don't block if the // queue is already full.
pxMessage = & xMessage;
xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

// ... Rest of task code.

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a // message is not immediately available.
        if( xQueuePeek( xQueue, & pxRxedMessage ), ( TickType_t ) 10 )
        {
            // pcRxedMessage now points to the struct AMessage variable posted // by vATask, but the item still remains on the queue.
        }
    }

    // ... Rest of task code.
}

Parameters
• xQueue - The handle to the queue from which the item is to be received.
• pvBuffer - Pointer to the buffer into which the received item will be copied.
• xTicksToWait - The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t xQueuePeekFromISR( QueueHandle_t xQueue, void *const pvBuffer )
A version of xQueuePeek() that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to xQueueReceive().

Parameters
• xQueue - The handle to the queue from which the item is to be received.
**pvBuffer** - Pointer to the buffer into which the received item will be copied.

**Returns**  pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

**BaseType_t xQueueReceive** *(QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait)*

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See xQueueReceiveFromISR for an alternative that can.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;
QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof(struct AMessage *) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ...

    // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
    pxMessage = &xMessage;
    xQueueSend( xQueue, (void *)&pxMessage, (TickType_t )0 );

    // ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 )
    {
        // Receive a message on the created queue. Block for 10 ticks if a message is not immediately available.
        if( xQueueReceive( xQueue, &(*pxRxedMessage), (TickType_t )10 ) )
        {
            // pcRxedMessage now points to the struct AMessage variable posted by vATask.
        }
    }
}
```
// ... Rest of task code.
}

Parameters

- **xQueue** - The handle to the queue from which the item is to be received.
- **pvBuffer** - Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** - The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. xQueueReceive() will return immediately if xTicksToWait is zero and the queue is empty. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns  pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

```c
UBaseType_t uxQueueMessagesWaiting( const QueueHandle_t xQueue )
```

Return the number of messages stored in a queue.

Parameters  **xQueue** – A handle to the queue being queried.

Returns  The number of messages available in the queue.

```c
UBaseType_t uxQueueSpacesAvailable( const QueueHandle_t xQueue )
```

Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to the queue before the queue becomes full if no items are removed.

Parameters  **xQueue** – A handle to the queue being queried.

Returns  The number of spaces available in the queue.

```c
void vQueueDelete( QueueHandle_t xQueue )
```

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

Parameters  **xQueue** – A handle to the queue to be deleted.

```c
BaseType_t xQueueGenericSendFromISR( QueueHandle_t xQueue, const void *pvItemToQueue,
                                      BaseType_t *pxHigherPriorityTaskWoken, const
                                      BaseType_t xCopyPosition)
```

It is preferred that the macros xQueueSendFromISR(), xQueueSendToFrontFromISR() and xQueueSendToBackFromISR() be used in place of calling this function directly. xQueueGiveFromISR() is an equivalent for use by semaphores that don’t actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWokenByPost;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWokenByPost = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );
    }
    // ... Rest of task code.
}
```

(continues on next page)
// Post each byte.
xQueueGenericSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost, queueSEND_TO_BACK );
}
while( portINPUT_BYTE( BUFFER_COUNT ) );

// Now the buffer is empty we can switch context if necessary. Note that the
// name of the yield function required is port specific.
if{ xHigherPriorityTaskWokenByPost }
{
    taskYIELD_YIELD_FROM_ISR();
}
}

Parameters

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken [out]** - xQueueGenericSendFromISR() will set
  *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to un-
  block, and the unblocked task has a priority higher than the currently running task. If
  xQueueGenericSendFromISR() sets this value to pdTRUE then a context switch should
  be requested before the interrupt is exited.
- **xCopyPosition** - Can take the value queueSEND_TO_BACK to place the item at the
  back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue
  (for high priority messages).

Returns pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

BaseType_t xQueueGiveFromISR (QueueHandle_t xQueue, BaseType_t*const pxHigherPriorityTaskWoken)

BaseType_t xQueueReceiveFromISR (QueueHandle_t xQueue, void *const pvBuffer, BaseType_t*const
pxHigherPriorityTaskWoken)

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

```c
QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction( void *pvParameters )
{
    char cValueToPost;
    const TickType_t xTicksToWait = (TickType_t)0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate( 10, sizeof( char ) );
    if{ xQueue == 0 }
    {
        // Failed to create the queue.
    }
    // ...

    // Post some characters that will be used within an ISR. If the queue
    // is full then this task will block for xTicksToWait ticks.
    cValueToPost = 'a';
    xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
```

(continues on next page)
cValueToPost = 'b';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );

// ... keep posting characters ... this task may block when the queue
// becomes full.

cValueToPost = 'c';
xQueueSend( xQueue, ( void * ) &cValueToPost, xTicksToWait );
}

// ISR that outputs all the characters received on the queue.

void vISR_Routine( void )
{
    BaseType_t xTaskWokenByReceive = pdFALSE;
    char cRxedChar;

    while( xQueueReceiveFromISR( xQueue, ( void * ) &cRxedChar, &
                                   xTaskWokenByReceive) )
    {
        // A character was received. Output the character now.
        vOutputCharacter( cRxedChar );

        // If removing the character from the queue woke the task that was
        // posting onto the queue cTaskWokenByReceive will have been set to
        // pdTRUE. No matter how many times this loop iterates only one
        // task will be woken.
    }

    if( cTaskWokenByPost != ( char ) pdFALSE; )
    {
        taskYIELD ();
    }
}

Parameters

- **xQueue** - The handle to the queue from which the item is to be received.
- **pvBuffer** - Pointer to the buffer into which the received item will be copied.
- **pxHigherPriorityTaskWoken [out]** A task may be blocked waiting for space to
  become available on the queue. If xQueueReceiveFromISR causes such a task to unblock
  *pxTaskWoken will get set to pdTRUE, otherwise *pxTaskWoken will remain unchanged.

Returns  pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

BaseType_t xQueueIsQueueEmptyFromISR (const QueueHandle_t xQueue)

BaseType_t xQueueIsQueueFullFromISR (const QueueHandle_t xQueue)

UBaseType_t uxQueueMessagesWaitingFromISR (const QueueHandle_t xQueue)

void vQueueAddToRegistry (QueueHandle_t xQueue, const char *pcQueueName)

    The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call
    vQueueAddToRegistry() add a queue, semaphore or mutex handle to the registry if you want the handle to be
    available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be
    ignored.

    configQUEUE_REGISTRY_SIZE defines the maximum number of handles the registry can hold. configQUEUE_REGISTRY_SIZE must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not effect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

Parameters
• **xQueue** – The handle of the queue being added to the registry. This is the handle returned by a call to `xQueueCreate()`. Semaphore and mutex handles can also be passed in here.

• **pcQueueName** – The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

```c
void vQueueUnregisterQueue (QueueHandle_t xQueue)
```

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `vQueueAddToRegistry()` add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and `vQueueUnregisterQueue()` to remove the queue, semaphore or mutex from the register. If you are not using a kernel aware debugger then this function can be ignored.

**Parameters**

- **xQueue** – The handle of the queue being removed from the registry.

```c
const char* pcQueueGetName (QueueHandle_t xQueue)
```

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `pcQueueGetName()` to look up and return the name of a queue in the queue registry from the queue’s handle.

**Parameters**

- **xQueue** – The handle of the queue the name of which will be returned.

**Returns**

- If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

```c
QueueHandle_t xQueueGenericCreate (const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, const uint8_t ucQueueType)
```

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

```c
QueueHandle_t xQueueGenericCreateStatic (const UBaseType_t uxQueueLength, const UBaseType_t uxItemSize, uint8_t *pucQueueStorage, StaticQueue_t *pxStaticQueue, const uint8_t ucQueueType)
```

Generic version of the function used to create a queue using dynamic memory allocation. This is called by other functions and macros that create other RTOS objects that use the queue structure as their base.

```c
QueueSetHandle_t xQueueCreateSet (const UBaseType_t uxEventQueueLength)
```

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to `xQueueCreateSet()` before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to `xQueueAddToSet()`. `xQueueSelectFromSet()` is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on [https://www.FreeRTOS.org/RTOS-queue-sets.html](https://www.FreeRTOS.org/RTOS-queue-sets.html) for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

**Parameters**

- **uxEventQueueLength** – Queue sets store events that occur on the queues and semaphores contained in the set. `uxEventQueueLength` specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost `uxEventQueueLength` should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:
• If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then `uxEventQueueLength` should be set to \( (5 + 12 + 1) \), or 18.
• If a queue set is to hold three binary semaphores then `uxEventQueueLength` should be set to \( (1 + 1 + 1) \), or 3.
• If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then `uxEventQueueLength` should be set to \( (5 + 3) \), or 8.

**Returns** If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

```c
BaseType_t xQueueAddToSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)
```

Adds a queue or semaphore to a queue set that was previously created by a call to `xQueueCreateSet()`.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**Parameters**
- `xQueueOrSemaphore` – The handle of the queue or semaphore being added to the queue set (cast to an `QueueSetMemberHandle_t` type).
- `xQueueSet` – The handle of the queue set to which the queue or semaphore is being added.

**Returns** If the queue or semaphore was successfully added to the queue set then `pdPASS` is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then `pdFAIL` is returned.

```c
BaseType_t xQueueRemoveFromSet (QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)
```

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**Parameters**
- `xQueueOrSemaphore` – The handle of the queue or semaphore being removed from the queue set (cast to an `QueueSetMemberHandle_t` type).
- `xQueueSet` – The handle of the queue set in which the queue or semaphore is included.

**Returns** If the queue or semaphore was successfully removed from the queue set then `pdPASS` is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then `pdFAIL` is returned.

```c
QueueSetMemberHandle_t xQueueSelectFromSet (QueueSetHandle_t xQueueSet, const TickType_t xTicksToWait)
```

`xQueueSelectFromSet()` selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). `xQueueSelectFromSet()` effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**Note 1:** See the documentation on [https://www.FreeRTOS.org/RTOS-queue-sets.html](https://www.FreeRTOS.org/RTOS-queue-sets.html) for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

**Note 2:** Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

**Note 3:** A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to `xQueueSelectFromSet()` has first returned a handle to that set member.

**Parameters**
• \textit{xQueueSet} – The queue set on which the task will (potentially) block.
• \textit{xTicksToWait} – The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

\textbf{Returns} \textit{xQueueSelectFromSet()} will return the handle of a queue (cast to a \textit{QueueSetMemberHandle\_t} type) contained in the queue set that contains data, or the handle of a semaphore (cast to a \textit{QueueSetMemberHandle\_t} type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before before the specified block time expires.

\textit{QueueSetMemberHandle\_t} \textit{xQueueSelectFromSetFromISR (QueueSetHandle\_t xQueueSet)}

A version of \textit{xQueueSelectFromSet()} that can be used from an ISR.

\textbf{Macros} \textit{xQueueCreate (uxQueueLength, uxItemSize)}

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using \textit{xQueueCreate()} then both blocks of memory are automatically dynamically allocated inside the \textit{xQueueCreate()} function. (see \url{https://www.FreeRTOS.org/a00111.html}). If a queue is created using \textit{xQueueCreateStatic()} then the application writer must provide the memory that will get used by the queue. \textit{xQueueCreateStatic()} therefore allows a queue to be created without using any dynamic memory allocation. \url{https://www.FreeRTOS.org/Embedded-RTOS-Queues.html}

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32\_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32\_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue2 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // ... Rest of task code.
}
```

\textbf{Parameters} 
• \textit{uxQueueLength} – The maximum number of items that the queue can contain.
• \textit{uxItemSize} – The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
Returns If the queue is successfully created then a handle to the newly created queue is returned.
If the queue cannot be created then 0 is returned.

\texttt{xQueueCreateStatic(uxQueueLength,uxItemSize,pucQueueStorage,pxQueueBuffer)}

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used
\texttt{to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue}
\texttt{is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside}
\texttt{the xQueueCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a queue is created using}
\texttt{xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue.}
\texttt{xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.}

\texttt{https://www.FreeRTOS.org/Embedded-RTOS-Queues.html}

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [queue length] * ( queue item size) bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can...
                                    ITEM_SIZE // The size of each item in the queue
                                    & ucQueueStorage[ 0 ], // The buffer that will...
                                    &xQueueBuffer ); // The buffer that will hold the...
                        queue structure.

    // The queue is guaranteed to be created successfully as no dynamic memory
    // allocation is used. Therefore xQueue1 is now a handle to a valid queue.

    // ... Rest of task code.
}
```

Parameters

- \texttt{uxQueueLength} - The maximum number of items that the queue can contain.
- \texttt{uxItemSize} - The number of bytes each item in the queue will require. Items are
  queued by copy, not by reference, so this is the number of bytes that will be copied for
  each posted item. Each item on the queue must be the same size.
- \texttt{pucQueueStorage} - If \texttt{uxItemSize} is not zero then \texttt{pucQueueStorageBuffer} must point to
  a uint8_t array that is at least large enough to hold the maximum number of items that
  can be in the queue at any one time - which is \texttt{(uxQueueLength * uxItemSize)} bytes. If
  \texttt{uxItemSize} is zero then \texttt{pucQueueStorageBuffer} can be NULL.
• **pxQueueBuffer** – Must point to a variable of type StaticQueue_t, which will be used to hold the queue’s data structure.

  **Returns** If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL then NULL is returned.

### xQueueSendToFront(xQueue, pvItemToQueue, xTicksToWait)

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

**Example usage:**

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask(void *pvParameters)
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate(10, sizeof(uint32_t));

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate(10, sizeof(struct AMessage *));

    // ...
    if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
        if( xQueueSendToFront(xQueue1, (void *) &ulVar, (TickType_t)10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }

    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
        pxMessage = &xMessage;
        xQueueSendToFront(xQueue2, (void *) &pxMessage, (TickType_t)0);
    }

    // ... Rest of task code.
}
```

**Parameters**

- **xQueue** – The handle to the queue on which the item is to be posted.
- **pvItemToQueue** – A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes
will be copied from pvItemToQueue into the queue storage area.

- **xTicksToWait**: The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

**Returns**  
- **pdTRUE** if the item was successfully posted, otherwise **errQUEUE_FULL**.

### xQueueSendToBack (xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

**Example usage:**

```c
struct AMessage
{
  char ucMessageID;
  char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
  QueueHandle_t xQueue1, xQueue2;
  struct AMessage *pxMessage;

  // Create a queue capable of containing 10 uint32_t values.
  xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

  // Create a queue capable of containing 10 pointers to AMessage structures.
  // These should be passed by pointer as they contain a lot of data.
  xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

  // ...

  if( xQueue1 != 0 )
  {
    // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
    if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) !=
        pdPASS )
    {
      // Failed to post the message, even after 10 ticks.
    }
  }

  if( xQueue2 != 0 )
  {
    // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
    pxMessage = &xMessage;
    xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
  }

  // ... Rest of task code.
}
```

**Parameters**
• **xQueue** - The handle to the queue on which the item is to be posted.
• **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
• **xTicksToWait** - The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant `portTICK_PERIOD_MS` should be used to convert to real time if this is required.

**Returns** pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

**xQueueSend(xQueue, pvItemToQueue, xTicksToWait)**

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equivalent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

    ... if( xQueue1 != 0 )
    {
        // Send an uint32_t. Wait for 10 ticks for space to become available if necessary.
        if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
        {
            // Failed to post the message, even after 10 ticks.
        }
    }
    if( xQueue2 != 0 )
    {
        // Send a pointer to a struct AMessage object. Don't block if the queue is already full.
        pxMessage = &xMessage;
        xQueueSend( xQueue2, ( void * ) pxMessage, ( TickType_t ) 0 );
    }

    (continues on next page)
Parameters

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** - The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns

- pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

`xQueueOverwrite(xQueue, pvItemToQueue)`

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See `xQueueOverwriteFromISR()` for an alternative which may be used in an ISR.

Example usage:

```c
void vFunction( void *pvParameters )
{
    QueueHandle_t xQueue;
    uint32_t ulVarToSend, ulValReceived;

    // Create a queue to hold one uint32_t value. It is strongly recommended *not* to use xQueueOverwrite() on queues that can contain more than one value, and doing so will trigger an assertion if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

    // Write the value 10 to the queue using xQueueOverwrite().
    ulVarToSend = 10;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // Peeking the queue should now return 10, but leave the value 10 in the queue. A block time of zero is used as it is known that the queue holds a value.
    ulValReceived = 0;
    xQueuePeek( xQueue, &ulValReceived, 0 );

    if( ulValReceived != 10 )
    {
        // Error unless the item was removed by a different task.
    }

    // The queue is still full. Use xQueueOverwrite() to overwrite the value held in the queue with 100.
    ulVarToSend = 100;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // This time read from the queue, leaving the queue empty once more.
}
```

(continues on next page)
// A block time of 0 is used again.
xQueueReceive( xQueue, &ulValReceived, 0 );

// The value read should be the last value written, even though the
// queue was already full when the value was written.
if ( ulValReceived != 100 )
{
    // Error!
}

// ...

Parameters

- **xQueue** – The handle of the queue to which the data is being sent.
- **pvItemToQueue** – A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.

Returns

xQueueOverwrite() is a macro that calls xQueueGenericSend(), and therefore has the
same return values as xQueueSendToFront(). However, pdPASS is the only value that can be
returned because xQueueOverwrite() will write to the queue even when the queue is already
full.

---

**xQueueSendToFrontFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called
from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        portYIELD_FROM_ISR ();
    }
}
```
Parameters

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** - [out] xQueueSendToFrontFromISR() will set pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToFromFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

### xQueueSendToBackFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR().

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        portYIELD_FROM_ISR ();
    }
}
```

Parameters

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** - [out] xQueueSendToBackFromISR() will set pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendToBackFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.
### xQueueOverwriteFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of xQueueOverwrite() that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

#### Example usage:

```c
QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwriteFromISR() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler( void )
{
    // xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;

    uint32_t ulVarToSend, ulValReceived;

    // Write the value 10 to the queue using xQueueOverwriteFromISR().
    ulVarToSend = 10;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // The queue is full, but calling xQueueOverwriteFromISR() again will still
    // pass because the value held in the queue will be overwritten with the
    // new value.
    ulVarToSend = 100;
    xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

    // Reading from the queue will now return 100.
    // ...
    if( xHigherPriorityTaskWoken == pdTRUE )
    {
        // Writing to the queue caused a task to unblock and the unblocked task
        // has a priority higher than or equal to the priority of the currently
        // executing task (the task this interrupt interrupted). Perform a...
        // switch so this interrupt returns directly to the unblocked task.
        portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
    }
}

#### Parameters

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** - [out] xQueueOverwriteFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be
Chapter 2. API Reference

requested before the interrupt is exited.

**Returns**
xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

**xQueueSendFromISR** (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        // Actual macro used here is port specific.
        portYIELD_FROM_ISR();
    }
}
```

**Parameters**

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** - [out] xQueueSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueSendFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**Returns**
pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

**xQueueReset** (xQueue)

Reset a queue back to its original empty state. The return value is now obsolete and is always set to pdPASS.
Type Definitions

typedef struct QueueDefinition *QueueHandle_t

typedef struct QueueDefinition *QueueSetHandle_t

Type by which queue sets are referenced. For example, a call to xQueueCreateSet() returns an xQueueSet variable that can then be used as a parameter to xQueueSelectFromSet(), xQueueAddToSet(), etc.

typedef struct QueueDefinition *QueueSetMemberHandle_t

Queue sets can contain both queues and semaphores, so the QueueSetMemberHandle_t is defined as a type to be used where a parameter or return value can be either an QueueHandle_t or an SemaphoreHandle_t.

Semaphore API

Header File

• components/freertos/FreeRTOS-Kernel/include/freertos/semphr.h

Macros

semBINARY_SEMAPHORE_QUEUE_LENGTH

semSEMAPHORE_QUEUE_ITEM_LENGTH

semGIVE_BLOCK_TIME

vSemaphoreCreateBinary (xSemaphore)

xSemaphoreCreateBinary ()

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! https://www.FreeRTOS.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see https://www.FreeRTOS.org/a00111.html). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old vSemaphoreCreateBinary() macro is now deprecated in favour of this xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the the semaphore must first be ‘given’ before it can be ‘taken’.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:
SemaphoreHandle_t xSemaphore = NULL;

void vATask ( void * pvParameters )
{
  // Semaphore cannot be used before a call to xSemaphoreCreateBinary().
  // This is a macro so pass the variable in directly.
  xSemaphore = xSemaphoreCreateBinary();

  if( xSemaphore != NULL )
  {
    // The semaphore was created successfully.
    // The semaphore can now be used.
  }
}

**Returns** Handle to the created semaphore, or NULL if the memory required to hold the semaphore’s data structures could not be allocated.

**xSemaphoreCreateBinaryStatic** (pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

**NOTE:** In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using xSemaphoreCreateBinary() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateBinary() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a binary semaphore is created using xSemaphoreCreateBinaryStatic() then the application writer must provide the memory. xSemaphoreCreateBinaryStatic() therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask ( void * pvParameters )
{
  // Semaphore cannot be used before a call to xSemaphoreCreateBinary() or
  // xSemaphoreCreateBinaryStatic().
  // The semaphore's data structures will be placed in the xSemaphoreBuffer
  // variable, the address of which is passed into the function. The
  // function's parameter is not NULL, so the function will not attempt any
  // dynamic memory allocation, and therefore the function will not return
  // NULL.
  xSemaphore = xSemaphoreCreateBinaryStatic( &xSemaphoreBuffer );

  // Rest of task code goes here.
}
```

**Parameters**

- **pxStaticSemaphore** – Must point to a variable of type StaticSemaphore_t, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.
Returns If the semaphore is created then a handle to the created semaphore is returned. If pxSemaphoreBuffer is NULL then NULL is returned.

**xSemaphoreTake**(xSemaphore, xBlockTime)

Macro to obtain a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

param xSemaphore A handle to the semaphore being taken - obtained when the semaphore was created.

param xBlockTime The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.
            // ...

            // We have finished accessing the shared resource. Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
        else
        {
            // We could not obtain the semaphore and can therefore not access
            // the shared resource safely.
        }
    }
}
```

Returns pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

**xSemaphoreTakeRecursive**(xMutex, xBlockTime)

Macro to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex():

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.
This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```c
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the
            // shared resource.

            // ...
            // For some reason due to the nature of the code further calls to
            // xSemaphoreTakeRecursive() are made on the same mutex. In real
            // code these would not be just sequential calls as this would make
            // no sense. Instead the calls are likely to be buried inside
            // a more complex call structure.
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
            xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

            // The mutex has now been 'taken' three times, so will not be
            // available to another task until it has also been given back
            // three times. Again it is unlikely that real code would have
            // these calls sequentially, but instead buried in a more complex
            // call structure. This is just for illustrative purposes.
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );
            xSemaphoreGiveRecursive( xMutex );

            // Now the mutex can be taken by other tasks.
        }
        else
        {
            // We could not obtain the mutex and can therefore not access
            // the shared resource safely.
        }
    }
}
```

Parameters
Chapter 2. API Reference

• **xMutex** - A handle to the mutex being obtained. This is the handle returned by xSemaphoreCreateRecursiveMutex();

• **xBlockTime** - The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. If the task already owns the semaphore then xSemaphoreTakeRecursive() will return immediately no matter what the value of xBlockTime.

**Returns** pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

**xSemaphoreGive**(xSemaphore)

*Macro* to release a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting(), and obtained using xSemaphoreTake().

This macro must not be used from an ISR. See xSemaphoreGiveFromISR() for an alternative which can be used from an ISR.

This macro must also not be used on semaphores created using xSemaphoreCreateRecursiveMutex().

**Example usage:**

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        if( xSemaphoreGive( xSemaphore ) != pdTRUE )
        {
            // We would expect this call to fail because we cannot give
            // a semaphore without first "taking" it!
        }

        // Obtain the semaphore - don't block if the semaphore is not
        // immediately available.
        if( xSemaphoreTake( xSemaphore, ( TickType_t ) 0 ) )
        {
            // We now have the semaphore and can access the shared resource.
            // ...

            // We have finished accessing the shared resource so can free the
            // semaphore.
            if( xSemaphoreGive( xSemaphore ) != pdTRUE )
            {
                // We would not expect this call to fail because we must have
                // obtained the semaphore to get here.
            }
        }
    }
}
```

**Parameters**

• **xSemaphore** - A handle to the semaphore being released. This is the handle returned when the semaphore was created.
Chapter 2. API Reference

Returns pdTRUE if the semaphore was released. pdFALSE if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

**xSemaphoreGiveRecursive** (xMutex)

Macro to recursively release, or ‘give’ a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

`configUSE_RECURSIVE_MUTEXES` must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```c
SemaphoreHandle_t xMutex = NULL;

void vATask( void * pvParameters )
{
  // Create the mutex to guard a shared resource.
  xMutex = xSemaphoreCreateRecursiveMutex();
}

void vAnotherTask( void * pvParameters )
{
  // ... Do other things.
  if( xMutex != NULL )
  {
    // See if we can obtain the mutex. If the mutex is not available
    // wait 10 ticks to see if it becomes free.
    if( xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 ) == pdTRUE )
    {
      // We were able to obtain the mutex and can now access the
      // shared resource.

      // ... For some reason due to the nature of the code further calls to
      // xSemaphoreTakeRecursive() are made on the same mutex. In real
      // code these would not be just sequential calls as this would make
      // no sense. Instead the calls are likely to be buried inside
      // a more complex call structure.
      xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );
      xSemaphoreTakeRecursive( xMutex, ( TickType_t ) 10 );

      // The mutex has now been 'taken' three times, so will not be
      // available to another task until it has also been given back
      // three times. Again it is unlikely that real code would have
      // these calls sequentially, it would be more likely that the calls
      // to xSemaphoreGiveRecursive() would be called as a call stack
      // unwound. This is just for demonstrative purposes.
      xSemaphoreGiveRecursive( xMutex );
      xSemaphoreGiveRecursive( xMutex );
      xSemaphoreGiveRecursive( xMutex );
  }
}
```

(continues on next page)
// Now the mutex can be taken by other tasks.
}  
else
{
    // We could not obtain the mutex and can therefore not access
    // the shared resource safely.
}
}

Parameters

- **xMutex** - A handle to the mutex being released, or 'given'. This is the handle returned by `xSemaphoreCreateMutex()`.  

**Returns**  
`pdTRUE` if the semaphore was given.

### `xSemaphoreGiveFromISR(xSemaphore, pxHigherPriorityTaskWoken)`  

*Macro* to release a semaphore. The semaphore must have previously been created with a call to `xSemaphoreCreateBinary()` or `xSemaphoreCreateCounting()`.  

Mutex type semaphores (those created using a call to `xSemaphoreCreateMutex()`) must not be used with this macro.  

This macro can be used from an ISR.

Example usage:

```c
#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;

// Repetitive task.
void vATask( void * pvParameters )
{
    for( ;; )
    {
        // We want this task to run every 10 ticks of a timer. The semaphore
        // was created before this task was started.

        // Block waiting for the semaphore to become available.
        if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
        {
            // It is time to execute.
            // ...

            // We have finished our task. Return to the top of the loop where
            // we will block on the semaphore until it is time to execute
            // again. Note when using the semaphore for synchronisation with an
            // ISR in this manner there is no need to 'give' the semaphore back.
        }
    }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;
}
```

(continues on next page)
// A timer tick has occurred.
// ... Do other time functions.

// Is it time for vATask() to run?
xHigherPriorityTaskWoken = pdFALSE;
ucLocalTickCount += 1;
if( ucLocalTickCount >= TICKS_TO_WAIT )
{
    // Unblock the task by releasing the semaphore.
    xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );
    // Reset the count so we release the semaphore again in 10 ticks time.
    ucLocalTickCount = 0;
}
if( xHigherPriorityTaskWoken != pdFALSE )
{
    // We can force a context switch here. Context switching from an
    // ISR uses port specific syntax. Check the demo task for your port
    // to find the syntax required.
}

Parameters

- **xSemaphore** – A handle to the semaphore being released. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** – xSemaphoreGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns

- pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.

**xSemaphoreTakeFromISR** (xSemaphore, pxHigherPriorityTaskWoken)

Macro to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

Parameters

- **xSemaphore** – A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** – [out] xSemaphoreTakeFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns

- pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

**xSemaphoreCreateMutex()**

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required
memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Returns** If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.

**xSemaphoreCreateMutexStatic**(pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provide the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}

Parameters

- **pxMutexBuffer** – Must point to a variable of type StaticSemaphore_t, which will be
  used to hold the mutex’s data structure, removing the need for the memory to be allocated
dynamically.

Returns
If the mutex was successfully created then a handle to the created mutex is returned. If
pxMutexBuffer was NULL then NULL is returned.

xSemaphoreCreateCounting(uxMaxCount, uxInitialCount)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex
can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex
structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the
required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see http://www.freertos.org/a00111.html). If a recursive mutex is created using xSemaphoreCreateRe-
cursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex.
xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any
dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphore-
GiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available
again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example,
if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task
until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS
‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See vSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation
(where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and
from within interrupt service routines.

Example usage:

SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();
}

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
if( xSemaphore != NULL )
{
    // The semaphore was created successfully.
    // The semaphore can now be used.
}
```

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a
    // recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold
    // the mutexes data structures - so no dynamic memory allocation will be
    // attempted.
    xSemaphore = xSemaphoreCreateRecursiveMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! https://www.FreeRTOS.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using xSemaphoreCreateCounting() then the required memory is automatically dynamically allocated inside the xSemaphoreCreate-
Chapter 2. API Reference

Counting() function. (see https://www.FreeRTOS.org/a00111.html). If a counting semaphore is created using xSemaphoreCreateCountingStatic() then the application writer can instead optionally provide the memory that will get used by the counting semaphore. xSemaphoreCreateCountingStatic() therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;

    // Semaphore cannot be used before a call to xSemaphoreCreateCounting().
    // The max value to which the semaphore can count should be 10, and the
    // initial value assigned to the count should be 0.
    xSemaphore = xSemaphoreCreateCounting( 10, 0 );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Returns**
xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle_t.

**Parameters**

- `pxStaticSemaphore` - Must point to a variable of type StaticSemaphore_t, which will then be used to hold the recursive mutex’s data structure, removing the need for the memory to be allocated dynamically.
- `uxMaxCount` - The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- `uxInitialCount` - The count value assigned to the semaphore when it is created.

**Returns**
If the recursive mutex was successfully created then a handle to the created recursive mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

**Returns**
Handle to the created semaphore. Null if the semaphore could not be created.

```c
xSemaphoreCreateCountingStatic(uxMaxCount, uxInitialCount, pxSemaphoreBuffer)
```

Creates a new counting semaphore instance, and returns a handle by which the new counting semaphore can be referenced.
In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a counting semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

Internally, within the FreeRTOS implementation, counting semaphores use a block of memory, in which the counting semaphore structure is stored. If a counting semaphore is created using `xSemaphoreCreateCounting()` then the required memory is automatically dynamically allocated inside the `xSemaphoreCreateCounting()` function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a counting semaphore is created using `xSemaphoreCreateCountingStatic()` then the application writer must provide the memory. `xSemaphoreCreateCountingStatic()` therefore allows a counting semaphore to be created without using any dynamic memory allocation.

Counting semaphores are typically used for two things:

1) Counting events.

In this usage scenario an event handler will ‘give’ a semaphore each time an event occurs (incrementing the semaphore count value), and a handler task will ‘take’ a semaphore each time it processes an event (decrementing the semaphore count value). The count value is therefore the difference between the number of events that have occurred and the number that have been processed. In this case it is desirable for the initial count value to be zero.

2) Resource management.

In this usage scenario the count value indicates the number of resources available. To obtain control of a resource a task must first obtain a semaphore - decrementing the semaphore count value. When the count value reaches zero there are no free resources. When a task finishes with the resource it ‘gives’ the semaphore back - incrementing the semaphore count value. In this case it is desirable for the initial count value to be equal to the maximum count value, indicating that all resources are free.

Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    SemaphoreHandle_t xSemaphore = NULL;
    
    // Counting semaphore cannot be used before they have been created. Create
    // a counting semaphore using xSemaphoreCreateCountingStatic(). The max
    // value to which the semaphore can count is 10, and the initial value
    // assigned to the count will be 0. The address of xSemaphoreBuffer is
    // passed in and will be used to hold the semaphore structure, so no dynamic
    // memory allocation will be used.
    xSemaphore = xSemaphoreCreateCounting( 10, 0, &xSemaphoreBuffer );
    
    // No memory allocation was attempted so xSemaphore cannot be NULL, so there
    // is no need to check its value.
}
```

**Parameters**

- `uxMaxCount` – The maximum count value that can be reached. When the semaphore reaches this value it can no longer be ‘given’.
- `uxInitialCount` – The count value assigned to the semaphore when it is created.
- `pxSemaphoreBuffer` – Must point to a variable of type `StaticSemaphore_t`, which will then be used to hold the semaphore’s data structure, removing the need for the memory to be allocated dynamically.

**Returns** If the counting semaphore was successfully created then a handle to the created counting semaphore is returned. If `pxSemaphoreBuffer` was `NULL` then `NULL` is returned.
vSemaphoreDelete (xSemaphore)
Delete a semaphore. This function must be used with care. For example, do not delete a mutex type semaphore if the mutex is held by a task.

Parameters
- xSemaphore – A handle to the semaphore to be deleted.

xSemaphoreGetMutexHolder (xSemaphore)
If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

Note: This is a good way of determining if the calling task is the mutex holder, but not a good way of determining the identity of the mutex holder as the holder may change between the function exiting and the returned value being tested.

xSemaphoreGetMutexHolderFromISR (xSemaphore)
If xMutex is indeed a mutex type semaphore, return the current mutex holder. If xMutex is not a mutex type semaphore, or the mutex is available (not held by a task), return NULL.

uxSemaphoreGetCount (xSemaphore)
If the semaphore is a counting semaphore then uxSemaphoreGetCount() returns its current count value. If the semaphore is a binary semaphore then uxSemaphoreGetCount() returns 1 if the semaphore is available, and 0 if the semaphore is not available.

typedef QueueHandle_t SemaphoreHandle_t

Timer API

Header File
- components/freertos/FreeRTOS-Kernel/include/freertos/timers.h

Functions
TimerHandle_t xTimerCreate (const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction)

TimerHandle_t xTimerCreate( const char * const pcTimerName, TickType_t xTimerPeriodInTicks, UBaseType_t uxAutoReload, void * pvTimerID, TimerCallbackFunction_t pxCallbackFunction);

Creates a new software timer instance, and returns a handle by which the created software timer can be referenced.

Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:
#define NUM_TIMERS 5

// An array to hold handles to the created timers.
TimerHandle_t xTimers[NUM_TIMERS];

// An array to hold a count of the number of times each timer expires.
int32_t lExpireCounters[NUM_TIMERS] = { 0 };

// Define a callback function that will be used by multiple timer instances.
// The callback function does nothing but count the number of times the
// associated timer expires, and stop the timer once the timer has expired
// 10 times.
void vTimerCallback(TimerHandle_t pxTimer)
{
  int32_t lArrayIndex;
  const int32_t xMaxExpireCountBeforeStopping = 10;

  // Optionally do something if the pxTimer parameter is NULL.
  configASSERT(pxTimer);

  // Which timer expired?
  lArrayIndex = (int32_t)pvTimerGetTimerID(pxTimer);

  // Increment the number of times that pxTimer has expired.
  lExpireCounters[lArrayIndex] += 1;

  // If the timer has expired 10 times then stop it from running.
  if (lExpireCounters[lArrayIndex] == xMaxExpireCountBeforeStopping)
  {
    // Do not use a block time if calling a timer API function from a
    // timer callback function, as doing so could cause a deadlock!
    xTimerStop(pxTimer, 0);
  }
}

void main(void)
{
  int32_t x;

  // Create then start some timers. Starting the timers before the scheduler
  // has been started means the timers will start running immediately that
  // the scheduler starts.
  for (x = 0; x < NUM_TIMERS; x++)
  {
    xTimers[x] = xTimerCreate("Timer", // Just a text name,
      (100 * x), // The timer period
      pdTRUE, // The timers will
      auto-reload themselves when they expire.
      (void*)x, // Assign each timer
      a unique id equal to its array index.
      vTimerCallback // Each timer calls
      the same callback when it expires.
    );

    if (xTimers[x] == NULL)
    {
      // The timer was not created.
    }
    else
      (continues on next page)
Parameters

- **pcTimerName** — A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.

- **xTimerPeriodInTicks** — The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. Time timer period must be greater than 0.

- **uxAutoReload** — If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

- **pvTimerID** — An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.

- **pxCallbackFunction** — The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is “void vCallbackFunction( TimerHandle_t xTimer );”.

Returns

If the timer is successfully created then a handle to the newly created timer is returned. If the timer cannot be created (because either there is insufficient FreeRTOS heap remaining to allocate the timer structures, or the timer period was set to 0) then NULL is returned.

```c
TimerHandle_t xTimerCreateStatic(const char *const pcTimerName, const TickType_t xTimerPeriodInTicks, const UBaseType_t uxAutoReload, void *const pvTimerID, TimerCallbackFunction_t pxCallbackFunction, StaticTimer_t*pxTimerBuffer);
```

Creates a new software timer instance, and returns a handle by which the created software timer can be refer-
Internally, within the FreeRTOS implementation, software timers use a block of memory, in which the timer data structure is stored. If a software timer is created using xTimerCreate() then the required memory is automatically dynamically allocated inside the xTimerCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a software timer is created using xTimerCreateStatic() then the application writer must provide the memory that will get used by the software timer. xTimerCreateStatic() therefore allows a software timer to be created without using any dynamic memory allocation.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```c
* // The buffer used to hold the software timer's data structure.
* static StaticTimer_t xTimerBuffer;
*
* // A variable that will be incremented by the software timer's callback
* // function.
* UBaseType_t uxVariableToIncrement = 0;
*
* // A software timer callback function that increments a variable passed to
* // it when the software timer was created. After the 5th increment the
* // callback function stops the software timer.
* static void prvTimerCallback( TimerHandle_t xExpiredTimer )
* {
*   UBaseType_t *puxVariableToIncrement;
*   BaseType_t xReturned;
*   
*   // Obtain the address of the variable to increment from the timer ID.
*   puxVariableToIncrement = ( UBaseType_t * ) pvTimerGetTimerID(xExpiredTimer);
*   
*   // Increment the variable to show the timer callback has executed.
*   ( *puxVariableToIncrement )++;
*   
*   // If this callback has executed the required number of times, stop the
*   // timer.
*   if( *puxVariableToIncrement == 5 )
*   {
*     // This is called from a timer callback so must not block.
*     xTimerStop( xExpiredTimer, staticDONT_BLOCK );
*   }
* }
*
* void main( void )
* {
*   // Create the software time. xTimerCreateStatic() has an extra parameter
*   // than the normal xTimerCreate() API function. The parameter is a
*   // pointer
*   // to the StaticTimer_t structure that will hold the software timer
*   // structure. If the parameter is passed as NULL then the structure...
*   // will be
*   // allocated dynamically, just as if xTimerCreate() had been called.
*   xTimer = xTimerCreateStatic("T1", // Text name for the task.
*   // Helps debugging only. Not used by FreeRTOS.
*   xTimerPeriod, // The period of the...
*   //timer in ticks.
* ```
This is an auto-reload timer.

variable incremented by the software timer’s callback function

execute when the timer expires.

hold the software timer structure.

The scheduler has not started yet so a block time is not used.

xReturned = xTimerStart( xTimer, 0 );

Create tasks here.

// Starting the scheduler will start the timers running as they have already

// been set into the active state.

vTaskStartScheduler();

Should not reach here.

for( ;; );

Parameters

- **pcTimerName** – A text name that is assigned to the timer. This is done purely to assist debugging. The kernel itself only ever references a timer by its handle, and never by its name.

- **xTimerPeriodInTicks** – The timer period. The time is defined in tick periods so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xTimerPeriodInTicks should be set to 100. Alternatively, if the timer must expire after 500ms, then xPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000. The timer period must be greater than 0.

- **uxAutoReload** – If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the xTimerPeriodInTicks parameter. If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

- **pvTimerID** – An identifier that is assigned to the timer being created. Typically this would be used in the timer callback function to identify which timer expired when the same callback function is assigned to more than one timer.

- **pxCallbackFunction** – The function to call when the timer expires. Callback functions must have the prototype defined by TimerCallbackFunction_t, which is “void vCallbackFunction( TimerHandle_t xTimer );”.

- **pxTimerBuffer** – Must point to a variable of type StaticTimer_t, which will be then be used to hold the software timer’s data structures, removing the need for the memory to be allocated dynamically.

Returns If the timer is created then a handle to the created timer is returned. If pxTimerBuffer was NULL then NULL is returned.

```c
void *pvTimerGetTimerID( const TimerHandle_t xTimer )
void *pvTimerGetTimerID( TimerHandle_t xTimer );
```

Returns the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer, and by calling the vTimerSetTimerID() API function.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

**Parameters**

- **xTimer** – The timer being queried.
- **pvNewID** – The ID assigned to the timer being queried.

**Returns**

The ID assigned to the timer being queried.

```c
void vTimerSetTimerID(TimerHandle_t xTimer, void* pvNewID);
```

Sets the ID assigned to the timer.

IDs are assigned to timers using the pvTimerID parameter of the call to xTimerCreated() that was used to create the timer.

If the same callback function is assigned to multiple timers then the timer ID can be used as time specific (timer local) storage.

Example usage:

See the xTimerCreate() API function example usage scenario.

**Parameters**

- **xTimer** – The timer being updated.
- **pvNewID** – The ID to assign to the timer.

```c
BaseType_t xTimerIsTimerActive(TimerHandle_t xTimer);
```

Queries a timer to see if it is active or dormant.

A timer will be dormant if: 1) It has been created but not started, or 2) It is an expired one-shot timer that has not been restarted.

Timers are created in the dormant state. The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() and xTimerChangePeriodFromISR() API functions can all be used to transition a timer into the active state.

Example usage:

```c
/* // This function assumes xTimer has already been created.
 * void vAPfunction( TimerHandle_t xTimer )
 * {
 *   if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and...
 *     // equivalently "if( xTimerIsTimerActive( xTimer ) )"
 *     {
 *       // xTimer is active, do something.
 *     }
 *     else
 *     {
 *       // xTimer is not active, do something else.
 *     }
 *   }
 */
```

**Parameters**

- **xTimer** – The timer being queried.

**Returns**

pdFALSE will be returned if the timer is dormant. A value other than pdFALSE will be returned if the timer is active.
**TaskHandle_t** xTimerGetTimerDaemonTaskHandle (void)

Simply returns the handle of the timer service/daemon task. It is not valid to call xTimerGetTimerDaemonTaskHandle() before the scheduler has been started.

**BaseType_t** xTimerPendFunctionCallFromISR (PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, BaseType_t *pxHigherPriorityTaskWoken)

Used from application interrupt service routines to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in timers.c and is prefixed with ‘Timer’).

Ideally an interrupt service routine (ISR) is kept as short as possible, but sometimes an ISR either has a lot of processing to do, or needs to perform processing that is not deterministic. In these cases xTimerPendFunctionCallFromISR() can be used to defer processing of a function to the RTOS daemon task.

A mechanism is provided that allows the interrupt to return directly to the task that will subsequently execute the pended callback function. This allows the callback function to execute contiguously in time with the interrupt - just as if the callback had executed in the interrupt itself.

Example usage:

```c
* // The callback function that will execute in the context of the daemon...task.
* // Note callback functions must all use this same prototype.
* void vProcessInterface( void *pvParameter1, uint32_t ulParameter2 )
* {
*     BaseType_t xInterfaceToService;
*     // The interface that requires servicing is passed in the second
*     // parameter. The first parameter is not used in this case.
*     xInterfaceToService = ( BaseType_t ) ulParameter2;
*     // ...Perform the processing here...
* }
* // An ISR that receives data packets from multiple interfaces
* void vAnISR( void )
* {
*     BaseType_t xInterfaceToService, xHigherPriorityTaskWoken;
*     // Query the hardware to determine which interface needs processing.
*     xInterfaceToService = prvCheckInterfaces();
*     // The actual processing is to be deferred to a task. Request the
*     // vProcessInterface() callback function is executed, passing in the
*     // number of the interface that needs processing. The interface to
*     // service is passed in the second parameter. The first parameter is
*     // not used in this case.
*     xHigherPriorityTaskWoken = pdFALSE;
*     xTimerPendFunctionCallFromISR( vProcessInterface, NULL, ( uint32_t )
*         xInterfaceToService, &xHigherPriorityTaskWoken );
*     // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
*     // switch should be requested. The macro used is port specific and will
*     // be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() - refer to
*     // the documentation page for the port being used.
*     portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
* }
* (continues on next page)
```
### Parameters

- **xFunctionToPend** - The function to execute from the timer service/daemon task. The function must conform to the `PendedFunction_t` prototype.
- **pvParameter1** - The value of the callback function’s first parameter. The parameter has a `void*` type to allow it to be used to pass any type. For example, unsigned longs can be cast to a `void*`, or the `void*` can be used to point to a structure.
- **ulParameter2** - The value of the callback function’s second parameter.
- **pxHigherPriorityTaskWoken** - As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task (which is set using `configTIMER_TASK_PRIORITY` in `FreeRTOSConfig.h`) is higher than the priority of the currently running task (the task the interrupt interrupted) then `pxHigherPriorityTaskWoken` will be set to `pdTRUE` within `xTimerPendFunctionCallFromISR()`, indicating that a context switch should be requested before the interrupt exits. For that reason `pxHigherPriorityTaskWoken` must be initialised to `pdFALSE`. See the example code below.

### Returns

- `pdPASS` is returned if the message was successfully sent to the timer daemon task, otherwise `pdFALSE` is returned.

```c
BaseType_t xTimerPendFunctionCall( PendedFunction_t xFunctionToPend, void *pvParameter1, uint32_t ulParameter2, TickType_t xTicksToWait );
```

Used to defer the execution of a function to the RTOS daemon task (the timer service task, hence this function is implemented in `timers.c` and is prefixed with ‘Timer’).

### Parameters

- **xFunctionToPend** - The function to execute from the timer service/daemon task. The function must conform to the `PendedFunction_t` prototype.
- **pvParameter1** - The value of the callback function’s first parameter. The parameter has a `void*` type to allow it to be used to pass any type. For example, unsigned longs can be cast to a `void*`, or the `void*` can be used to point to a structure.
- **ulParameter2** - The value of the callback function’s second parameter.
- **xTicksToWait** - Calling this function will result in a message being sent to the timer daemon task on a queue. `xTicksToWait` is the amount of time the calling task should remain in the Blocked state (so not using any processing time) for space to become available on the timer queue if the queue is found to be full.

### Returns

- `pdPASS` is returned if the message was successfully sent to the timer daemon task, otherwise `pdFALSE` is returned.

```c
const char* const pcTimerGetName( TimerHandle_t xTimer );
```

Returns the name that was assigned to a timer when the timer was created.

### Parameters

- **xTimer** - The handle of the timer being queried.

### Returns

The name assigned to the timer specified by the `xTimer` parameter.

```c
void vTimerSetReloadMode( TimerHandle_t xTimer, const UBaseType_t uxAutoReload );
```

Updates a timer to be either an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

### Parameters

- **xTimer** - The handle of the timer being updated.
• **uxAutoReload** – If uxAutoReload is set to pdTRUE then the timer will expire repeatedly with a frequency set by the timer’s period (see the xTimerPeriodInTicks parameter of the xTimerCreate() API function). If uxAutoReload is set to pdFALSE then the timer will be a one-shot timer and enter the dormant state after it expires.

```c
UBaseType_t uxTimerGetReloadMode (TimerHandle_t xTimer);
```

Queries a timer to determine if it is an auto-reload timer, in which case the timer automatically resets itself each time it expires, or a one-shot timer, in which case the timer will only expire once unless it is manually restarted.

**Parameters**
- **xTimer** – The handle of the timer being queried.

**Returns**
- If the timer is an auto-reload timer then pdTRUE is returned, otherwise pdFALSE is returned.

```c
TickType_t xTimerGetPeriod (TimerHandle_t xTimer);
```

Returns the period of a timer.

**Parameters**
- **xTimer** – The handle of the timer being queried.

**Returns**
- The period of the timer in ticks.

```c
TickType_t xTimerGetExpiryTime (TimerHandle_t xTimer);
```

Returns the time in ticks at which the timer will expire. If this is less than the current tick count then the expiry time has overflowed from the current time.

**Parameters**
- **xTimer** – The handle of the timer being queried.

**Returns**
- If the timer is running then the time in ticks at which the timer will next expire is returned.
- If the timer is not running then the return value is undefined.

```c
void vApplicationGetTimerTaskMemory(StaticTask_t **ppxTimerTaskTCBBuffer, StackType_t **ppxTimerTaskStackBuffer, uint32_t *pulTimerTaskStackSize);
```

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Timer Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: [https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION](https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION)

**Parameters**
- **ppxTimerTaskTCBBuffer** – A handle to a statically allocated TCB buffer
- **ppxTimerTaskStackBuffer** – A handle to a statically allocated Stack buffer for the idle task
- **pulTimerTaskStackSize** – A pointer to the number of elements that will fit in the allocated stack buffer

xTimerStart (xTimer, xTicksToWait)

BaseType_t xTimerStart (TimerHandle_t xTimer, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStart() starts a timer that was previously created using the xTimerCreate() API function. If the timer had already been started and was already in the active state, then xTimerStart() has equivalent functionality to the xTimerReset() API function.

Starting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after xTimerStart() was called, where ‘n’ is the timers defined period.

It is valid to call xTimerStart() before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when xTimerStart() was called.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStart() to be available.

Example usage:

See the xTimerCreate() API function example usage scenario.

Parameters

• xTimer - The handle of the timer being started/restarted.

• xTicksToWait - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the start command to be successfully sent to the timer command queue, should the queue already be full when xTimerStart() was called. xTicksToWait is ignored if xTimerStart() is called before the scheduler is started.

Returns pdFAIL will be returned if the start command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.
```
**xTimerStop** (xTimer, xTicksToWait)

BaseType_t xTimerStop( TimerHandle_t xTimer, TickType_t xTicksToWait );

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerStop() stops a timer that was previously started using either of the The xTimerStart(), xTimerReset(), xTimerStartFromISR(), xTimerResetFromISR(), xTimerChangePeriod() or xTimerChangePeriodFromISR() API functions.

Stopping a timer ensures the timer is not in the active state.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerStop() to be available.

Example usage:

See the xTimerCreate() API function example usage scenario.

**Parameters**

- **xTimer** - The handle of the timer being stopped.
- **xTicksToWait** - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the stop command to be successfully sent to the timer command queue, should the queue already be full when xTimerStop() was called. xTicksToWait is ignored if xTimerStop() is called before the scheduler is started.

**Returns**

pdFAIL will be returned if the stop command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**xTimerChangePeriod** (xTimer, xNewPeriod, xTicksToWait)

BaseType_t xTimerChangePeriod( TimerHandle_t xTimer, TickType_t xNewPeriod, TickType_t xTicksToWait );

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the configTIMER_QUEUE_LENGTH configuration constant.

xTimerChangePeriod() changes the period of a timer that was previously created using the xTimerCreate() API function.

xTimerChangePeriod() can be called to change the period of an active or dormant state timer.

The configUSE_TIMERS configuration constant must be set to 1 for xTimerChangePeriod() to be available.

Example usage:

```c
/* // This function assumes xTimer has already been created. If the timer */ /* // referenced by xTimer is already active when it is called, then the timer */ /* // is deleted. If the timer referenced by xTimer is not active when it is */ /* // called, then the period of the timer is set to 500ms and the timer is */ /* // started. */ void vAFunction( TimerHandle_t xTimer )
*
*  { /*
*   if( xTimerIsTimerActive( xTimer ) != pdFALSE ) // or more simply and..
*       equivalently "if( xTimerIsTimerActive( xTimer ) )"
*   */
*  }
```

(continues on next page)
xTimerDelete( xTimer );

else {
  // xTimer is not active, change its period to 500ms. This will also
  // cause the timer to start. Block for a maximum of 100 ticks if the
  // change period command cannot immediately be sent to the timer
  // command queue.
  if( xTimerChangePeriod( xTimer, 500 / portTICK_PERIOD_MS, 100 ) == pdPASS ) {
    // The command was successfully sent.
  } else {
    // The command could not be sent, even after waiting for 100
    // ticks
    // to pass. Take appropriate action here.
  }
}

Parameters

- **xTimer** - The handle of the timer that is having its period changed.
- **xNewPeriod** - The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to \((\frac{500}{\text{portTICK\_PERIOD\_MS}})\) provided configTICK\_RATE\_HZ is less than or equal to 1000.
- **xTicksToWait** - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the change period command to be successfully sent to the timer command queue, should the queue already be full when xTimerChangePeriod() was called. xTicksToWait is ignored if xTimerChangePeriod() is called before the scheduler is started.

Returns

pdFAIL will be returned if the change period command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER\_TASK\_PRIORITY configuration constant.

Example usage:

See the xTimerChangePeriod() API function example usage scenario.
Chapter 2. API Reference

**Parameters**
- `xTimer` - The handle of the timer being deleted.
- `xTicksToWait` - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the delete command to be successfully sent to the timer command queue, should the queue already be full when `xTimerDelete()` was called. `xTicksToWait` is ignored if `xTimerDelete()` is called before the scheduler is started.

**Returns**
`pdFAIL` will be returned if the delete command could not be sent to the timer command queue even after `xTicksToWait` ticks had passed. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

**xTimerReset** (xTimer, xTicksToWait)

BaseType_t xTimerReset(TimerHandle_t xTimer, TickType_t xTicksToWait);

Timer functionality is provided by a timer service/daemon task. Many of the public FreeRTOS timer API functions send commands to the timer service task through a queue called the timer command queue. The timer command queue is private to the kernel itself and is not directly accessible to application code. The length of the timer command queue is set by the `configTIMER_QUEUE_LENGTH` configuration constant.

`xTimerReset()` re-starts a timer that was previously created using the `xTimerCreate()` API function. If the timer had already been started and was already in the active state, then `xTimerReset()` will cause the timer to re-evaluate its expiry time so that it is relative to when `xTimerReset()` was called. If the timer was in the dormant state then `xTimerReset()` has equivalent functionality to the `xTimerStart()` API function.

Resetting a timer ensures the timer is in the active state. If the timer is not stopped, deleted, or reset in the mean time, the callback function associated with the timer will get called ‘n’ ticks after `xTimerReset()` was called, where ‘n’ is the timers defined period.

It is valid to call `xTimerReset()` before the scheduler has been started, but when this is done the timer will not actually start until the scheduler is started, and the timers expiry time will be relative to when the scheduler is started, not relative to when `xTimerReset()` was called.

The `configUSE_TIMERS` configuration constant must be set to 1 for `xTimerReset()` to be available.

**Example usage:**

```c
* // When a key is pressed, an LCD back-light is switched on. If 5 seconds...
* //pass
* // without a key being pressed, then the LCD back-light is switched off. In
* // this case, the timer is a one-shot timer.
* * TimerHandle_t xBacklightTimer = NULL;
* * // The callback function assigned to the one-shot timer. In this case the
* * // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
* // The timer expired, therefore 5 seconds must have passed since a key
* // was pressed. Switch off the LCD back-light.
* vSetBacklightState( BACKLIGHT_OFF );
* }
* * // The key press event handler.
* void vKeyPressEventHandler( char cKey )
* {
* // Ensure the LCD back-light is on, then reset the timer that is
* // responsible for turning the back-light off after 5 seconds of
* // key inactivity. Wait 10 ticks for the command to be successfully sent
* // if it cannot be sent immediately.
* (continues on next page)
```
vSetBacklightState( BACKLIGHT_ON );
if( xTimerReset( xBacklightTimer, 100 ) != pdPASS ) {
    // The reset command was not executed successfully. Take appropriate
    // action here.
}
// Perform the rest of the key processing here.

void main( void ) {
    int32_t x;
    // Create then start the one-shot timer that is responsible for turning
    // the back-light off if no keys are pressed within a 5 second period.
    xBacklightTimer = xTimerCreate( "BacklightTimer", // Just a...
        ( 5000 / portTICK_PERIOD_MS), // The...
        pdFALSE, // The timer...
        0, // The id is...
        vBacklightTimerCallback // The...
        );
    if( xBacklightTimer == NULL ) {
        // The timer was not created.
    } else {
        // Start the timer. No block time is specified, and even if one was
        // it would be ignored because the scheduler has not yet been
        // started.
        if( xTimerStart( xBacklightTimer, 0 ) != pdPASS ) {
            // The timer could not be set into the Active state.
        }
    }
    // ...
    // Create tasks here.
    // ...
    // Starting the scheduler will start the timer running as it has already
    // been set into the active state.
    vTaskStartScheduler();
    // Should not reach here.
    for( ;; );
}

Parameters

- **xTimer** - The handle of the timer being reset/started/restarted.
- **xTicksToWait** - Specifies the time, in ticks, that the calling task should be held in the Blocked state to wait for the reset command to be successfully sent to the timer command queue, should the queue already be full when xTimerReset() was called. xTicksToWait is
ignored if xTimerReset() is called before the scheduler is started.

**Returns**
pdFAIL will be returned if the reset command could not be sent to the timer command queue even after xTicksToWait ticks had passed. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when xTimerStart() is actually called. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**xTimerStartFromISR**

```
BaseType_t xTimerStartFromISR(TimerHandle_t pxTimer, BaseType_t*pxHigherPriorityTaskWoken);
```

A version of xTimerStart() that can be called from an interrupt service routine.

**Example usage:**

```c
void vBacklightTimerCallback( TimerHandle_t pxTimer )
{
    // This scenario assumes xBacklightTimer has already been created. When a
    // key is pressed, an LCD back-light is switched on. If 5 seconds pass
    // without a key being pressed, then the LCD back-light is switched off. In
    // this case, the timer is a one-shot timer, and unlike the example given for
    // the xTimerReset() function, the key press event handler is an interrupt
    // service routine.
    // The callback function assigned to the one-shot timer. In this case the
    // parameter is not used.
    vSetBacklightState( BACKLIGHT_OFF );

    // The key press interrupt service routine.
    void vKeyPressEventInterruptHandler( void )
    {
        BaseType_t xHigherPriorityTaskWoken = pdFALSE;

        // Ensure the LCD back-light is on, then restart the timer that is
        // responsible for turning the back-light off after 5 seconds of
        // key inactivity. This is an interrupt service routine so can only
        // call FreeRTOS API functions that end in "FromISR".
        vSetBacklightState( BACKLIGHT_ON );

        // xTimerStartFromISR() or xTimerResetFromISR() could be called here
        // as both cause the timer to re-calculate its expiry time.
        // xHigherPriorityTaskWoken was initialised to pdFALSE when it was
        // declared (in this function).
        if( xTimerStartFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS )
        {
            // The start command was not executed successfully. Take appropriate
            // action here.
        }

        // Perform the rest of the key processing here.

        // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
        // should be performed. The syntax required to perform a context switch
        // from inside an ISR varies from port to port, and from compiler to
        // compiler. Inspect the demos for the port you are using to find the
        // actual syntax required.
    }
```
Parameters

- **xTimer** - The handle of the timer being started/restarted.
- **pxHigherPriorityTaskWoken** - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerStartFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerStartFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `*pxHigherPriorityTaskWoken` will get set to `pdTRUE` internally within the `xTimerStartFromISR()` function. If `xTimerStartFromISR()` sets this value to `pdTRUE` then a context switch should be performed before the interrupt exits.

Returns `pdFAIL` will be returned if the start command could not be sent to the timer command queue. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerStartFromISR()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

`xTimerStopFromISR( xTimer, pxHigherPriorityTaskWoken )`

`BaseType_t xTimerStopFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken );`

A version of `xTimerStop()` that can be called from an interrupt service routine.

Example usage:

```
/* // This scenario assumes xTimer has already been created and started. When
 * // an interrupt occurs, the timer should be simply stopped.
 * */

/* // The interrupt service routine that stops the timer.
 * void vAnExampleInterruptServiceRoutine( void )
*/

/* BaseType_t xHigherPriorityTaskWoken = pdFALSE;
 * */

/* // The interrupt has occurred - simply stop the timer.
 * // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
 * // (within this function). As this is an interrupt service routine, only
 * // FreeRTOS API functions that end in "FromISR" can be used.
 * if( xTimerStopFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
 */

/* // The stop command was not executed successfully. Take appropriate
 * // action here.
 */

/* */

/* // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
 * // should be performed. The syntax required to perform a context switch
 * // from inside an ISR varies from port to port, and from compiler to
 * // compiler. Inspect the demos for the port you are using to find the
 * // actual syntax required.
 * if( xHigherPriorityTaskWoken != pdFALSE )
 */
```
Chapter 2. API Reference

*x { 
  // Call the interrupt safe yield function here (actual function
  // depends on the FreeRTOS port being used).
  *
  }
*}

Parameters

- **xTimer** - The handle of the timer being stopped.
- **pxHigherPriorityTaskWoken** - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerStopFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerStopFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the `xTimerStopFromISR()` function. If xTimerStopFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Returns pdFAIL will be returned if the stop command could not be sent to the timer command queue. pdPASS will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

`xTimerChangePeriodFromISR(xTimer, xNewPeriod, pxHigherPriorityTaskWoken)`

```c
BaseType_t xTimerChangePeriodFromISR( TimerHandle_t xTimer, TickType_t xNewPeriod, BaseType_t *pxHigherPriorityTaskWoken );
```

A version of `xTimerChangePeriod()` that can be called from an interrupt service routine.

Example usage:

```c
/* // This scenario assumes xTimer has already been created and started. When
   // an interrupt occurs, the period of xTimer should be changed to 500ms.
   *
   // The interrupt service routine that changes the period of xTimer.
   void vAnExampleInterruptServiceRoutine( void )
   {
     BaseType_t xHigherPriorityTaskWoken = pdFALSE;
     *
     // The interrupt has occurred - change the period of xTimer to 500ms.
     // xHigherPriorityTaskWoken was set to pdFALSE where it was defined
     // (within this function). As this is an interrupt service routine, only
     // FreeRTOS API functions that end in "FromISR" can be used.
     if( xTimerChangePeriodFromISR( xTimer, &xHigherPriorityTaskWoken ) != pdPASS )
       {
         // The command to change the timers period was not executed
         // successfully. Take appropriate action here.
       }
     *
     // If xHigherPriorityTaskWoken equals pdTRUE, then a context switch
     // should be performed. The syntax required to perform a context switch
     // from inside an ISR varies from port to port, and from compiler to
     // compiler. Inspect the demos for the port you are using to find the
     // actual syntax required.
     if( xHigherPriorityTaskWoken != pdFALSE )
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
{  
  // Call the interrupt safe yield function here (actual function  
  // depends on the FreeRTOS port being used).
  
}
```

Parameters

- **xTimer** - The handle of the timer that is having its period changed.
- **xNewPeriod** - The new period for xTimer. Timer periods are specified in tick periods, so the constant portTICK_PERIOD_MS can be used to convert a time that has been specified in milliseconds. For example, if the timer must expire after 100 ticks, then xNewPeriod should be set to 100. Alternatively, if the timer must expire after 500ms, then xNewPeriod can be set to (500 / portTICK_PERIOD_MS) provided configTICK_RATE_HZ is less than or equal to 1000.
- **pxHigherPriorityTaskWoken** - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling xTimerChangePeriodFromISR() writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling xTimerChangePeriodFromISR() causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then *pxHigherPriorityTaskWoken will get set to pdTRUE internally within the xTimerChangePeriodFromISR() function. If xTimerChangePeriodFromISR() sets this value to pdTRUE then a context switch should be performed before the interrupt exits.

Returns **pdFAIL** will be returned if the command to change the timer's period could not be sent to the timer command queue. **pdPASS** will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system. The timer service/daemon task priority is set by the configTIMER_TASK_PRIORITY configuration constant.

**xTimerResetFromISR** (xTimer, pxHigherPriorityTaskWoken)

```c
BaseType_t xTimerResetFromISR( TimerHandle_t xTimer, BaseType_t *pxHigherPriorityTaskWoken );
```

A version of xTimerReset() that can be called from an interrupt service routine.

Example usage:

```c
* // This scenario assumes xBacklightTimer has already been created. When a  
* // key is pressed, an LCD back-light is switched on. If 5 seconds pass  
* // without a key being pressed, then the LCD back-light is switched off. In  
* // this case, the timer is a one-shot timer, and unlike the example given for  
* // the xTimerReset() function, the key press event handler is an interrupt  
* // service routine.
* 
* // The callback function assigned to the one-shot timer. In this case the  
* // parameter is not used.
* void vBacklightTimerCallback( TimerHandle_t pxTimer )
* {
*  
*    // The timer expired, therefore 5 seconds must have passed since a key  
*    // was pressed. Switch off the LCD back-light.
*    vSetBacklightState( BACKLIGHT_OFF );
*  
* }
* 
* // The key press interrupt service routine.
* void vKeyPressEventInterruptHandler( void )
```

(continues on next page)
{ BaseType_t xHigherPriorityTaskWoken = pdFALSE; /*
   // Ensure the LCD back-light is on, then reset the timer that is responsible for turning the back-light off after 5 seconds of key inactivity. This is an interrupt service routine so can only call FreeRTOS API functions that end in "FromISR".
   vSetBacklightState( BACKLIGHT_ON );
   */
   if( xTimerResetFromISR( xBacklightTimer, &xHigherPriorityTaskWoken ) != pdPASS )
   { /*
      // The reset command was not executed successfully. Take appropriate action here.
   */
   }
   /*
   // Perform the rest of the key processing here.
   */
   if( xHigherPriorityTaskWoken != pdFALSE )
   { /*
      // Call the interrupt safe yield function here (actual function depends on the FreeRTOS port being used).
   */
   }
   /*
   */
}

Parameters

- **xTimer** - The handle of the timer that is to be started, reset, or restarted.
- **pxHigherPriorityTaskWoken** - The timer service/daemon task spends most of its time in the Blocked state, waiting for messages to arrive on the timer command queue. Calling `xTimerResetFromISR()` writes a message to the timer command queue, so has the potential to transition the timer service/daemon task out of the Blocked state. If calling `xTimerResetFromISR()` causes the timer service/daemon task to leave the Blocked state, and the timer service/daemon task has a priority equal to or greater than the currently executing task (the task that was interrupted), then `pxHigherPriorityTaskWoken` will get set to `pdTRUE` internally within the `xTimerResetFromISR()` function. If `xTimerResetFromISR()` sets this value to `pdTRUE` then a context switch should be performed before the interrupt exits.

Returns

`pdFAIL` will be returned if the reset command could not be sent to the timer command queue. `pdPASS` will be returned if the command was successfully sent to the timer command queue. When the command is actually processed will depend on the priority of the timer service/daemon task relative to other tasks in the system, although the timers expiry time is relative to when `xTimerResetFromISR()` is actually called. The timer service/daemon task priority is set by the `configTIMER_TASK_PRIORITY` configuration constant.

Type Definitions

typedef struct tmrTimerControl *TimerHandle_t

typedef void (*TimerCallbackFunction_t)(TimerHandle_t xTimer)
typedef void (*PendedFunction_t)(void*, uint32_t)

Event Group API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/event_groups.h

Functions

EventGroupHandle_t xEventGroupCreate (void)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which
the event group’s structure is stored. If an event group is created using xEventGroupCreate() then the
required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see
https://www.FreeRTOS.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then
the application writer must instead provide the memory that will get used by the event group. xEventGroupCre-
ateStatic() therefore allows an event group to be created without using any dynamic memory allocation.

Although event groups are not related to ticks, for internal implementation reasons the number of bits avail-
able for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h.
If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If config-
USE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t
type is used to store event bits within an event group.

Example usage:

```c
// Declare a variable to hold the created event group.
EventGroupHandle_t xCreatedEventGroup;

// Attempt to create the event group.
xCreatedEventGroup = xEventGroupCreate();

// Was the event group created successfully?
if( xCreatedEventGroup == NULL )
{
  // The event group was not created because there was insufficient
  // FreeRTOS heap available.
}
else
{
  // The event group was created.
}
```

Returns  If the event group was created then a handle to the event group is returned. If there was
insufficient FreeRTOS heap available to create the event group then NULL is returned. See
https://www.FreeRTOS.org/a00111.html

EventGroupHandle_t xEventGroupCreateStatic (StaticEventGroup_t *pxEventGroupBuffer)

Create a new event group.

Internally, within the FreeRTOS implementation, event groups use a [small] block of memory, in which
the event group’s structure is stored. If an event group is created using xEventGroupCreate() then the
required memory is automatically dynamically allocated inside the xEventGroupCreate() function. (see
https://www.FreeRTOS.org/a00111.html). If an event group is created using xEventGroupCreateStatic() then
the application writer must instead provide the memory that will get used by the event group. xEventGroupCre-
ateStatic() therefore allows an event group to be created without using any dynamic memory allocation.
Although event groups are not related to ticks, for internal implementation reasons the number of bits available for use in an event group is dependent on the configUSE_16_BIT_TICKS setting in FreeRTOSConfig.h. If configUSE_16_BIT_TICKS is 1 then each event group contains 8 usable bits (bit 0 to bit 7). If configUSE_16_BIT_TICKS is set to 0 then each event group has 24 usable bits (bit 0 to bit 23). The EventBits_t type is used to store event bits within an event group.

Example usage:

```
// StaticEventGroup_t is a publicly accessible structure that has the same // size and alignment requirements as the real event group structure. It is // provided as a mechanism for applications to know the size of the event // group (which is dependent on the architecture and configuration file // settings) without breaking the strict data hiding policy by exposing the // real event group internals. This StaticEventGroup_t variable is passed // into the xSemaphoreCreateEventGroupStatic() function and is used to store // the event group's data structures
StaticEventGroup_t xEventGroupBuffer;

// Create the event group without dynamically allocating any memory.
xEventGroup = xEventGroupCreateStatic( &xEventGroupBuffer );
```

**Parameters pxEventGroupBuffer** - pxEventGroupBuffer must point to a variable of type StaticEventGroup_t, which will be then be used to hold the event group’s data structures, removing the need for the memory to be allocated dynamically.

**Returns** If the event group was created then a handle to the event group is returned. If pxEventGroupBuffer was NULL then NULL is returned.

```
EventBits_t xEventGroupWaitBits( EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToWaitFor, const BaseType_t xClearOnExit, const BaseType_t xWaitForAllBits, TickType_t xTicksToWait )
```

[Potentially] block to wait for one or more bits to be set within a previously created event group.

This function cannot be called from an interrupt.

Example usage:

```
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;
    const TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

    // Wait a maximum of 100ms for either bit 0 or bit 4 to be set within // the event group. Clear the bits before exiting.
    uxBits = xEventGroupWaitBits( xEventGroup, BIT_0 | BIT_4, // The event group being tested.
        xTicksToWait ); // Wait a maximum of 100ms for either bit to... // The bits within the event group to wait... // for.
        pdFALSE, // Don't wait for both bits, either bit will...
        BIT_0 | BIT_4 ); // BIT_0 and BIT_4 should be cleared before...
        // The event group being tested.
        BIT_0 | BIT_4 | BIT_0 | BIT_4 ) == ( BIT_0 | BIT_4 )
```

(continues on next page)
{ // xEventGroupWaitBits() returned because both bits were set. }
else if ( ( uxBits & BIT_0 ) != 0 )
{ // xEventGroupWaitBits() returned because just BIT_0 was set. }
else if ( ( uxBits & BIT_4 ) != 0 )
{ // xEventGroupWaitBits() returned because just BIT_4 was set. }
else
{ // xEventGroupWaitBits() returned because xTicksToWait ticks passed // without either BIT_0 or BIT_4 becoming set. }

Parameters

• xEventGroup – The event group in which the bits are being tested. The event group must have previously been created using a call to xEventGroupCreate().
• uxBitsToWaitFor – A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and/or bit 2 set uxBitsToWaitFor to 0x05. To wait for bits 0 and/or bit 1 and/or bit 2 set uxBitsToWaitFor to 0x07. Etc.
• xClearOnExit – If xClearOnExit is set to pdTRUE then any bits within uxBitsToWaitFor that are set within the event group will be cleared before xEventGroupWaitBits() returns if the wait condition was met (if the function returns for a reason other than a time-out). If xClearOnExit is set to pdFALSE then the bits set in the event group are not altered when the call to xEventGroupWaitBits() returns.
• xWaitForAllBits – If xWaitForAllBits is set to pdTRUE then xEventGroupWaitBits() will return when either all the bits in uxBitsToWaitFor are set or the specified block time expires. If xWaitForAllBits is set to pdFALSE then xEventGroupWaitBits() will return when any one of the bits set in uxBitsToWaitFor is set or the specified block time expires. The block time is specified by the xTicksToWait parameter.
• xTicksToWait – The maximum amount of time (specified in ‘ticks’) to wait for one/all (depending on the xWaitForAllBits value) of the bits specified by uxBitsToWaitFor to become set.

Returns

The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If xEventGroupWaitBits() returned because its timeout expired then not all the bits being waited for will be set. If xEventGroupWaitBits() returned because the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared in the case that xClearOnExit parameter was set to pdTRUE.

EventBits_t xEventGroupClearBits ( EventGroupHandle_t xEventGroup, const EventBits_t uxBitsToClear )
Clear bits within an event group. This function cannot be called from an interrupt.

Example usage:

#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{ 
  EventBits_t uxBits;
  // Clear bit 0 and bit 4 in xEventGroup.
uxBits = xEventGroupClearBits(
    xEventGroup,    // The event group being updated.
    BIT_0 | BIT_4 );    // The bits being cleared.

if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
{
    // Both bit 0 and bit 4 were set before xEventGroupClearBits() was
    // called. Both will now be clear (not set).
}
else if( ( uxBits & BIT_0 ) != 0 )
{
    // Bit 0 was set before xEventGroupClearBits() was called. It will
    // now be clear.
}
else if( ( uxBits & BIT_4 ) != 0 )
{
    // Bit 4 was set before xEventGroupClearBits() was called. It will
    // now be clear.
}
else
{
    // Neither bit 0 nor bit 4 were set in the first place.
}

Parameters
• xEventGroup – The event group in which the bits are to be cleared.
• uxBitsToClear – A bitwise value that indicates the bit or bits to clear in the event
  group. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit
  0 set uxBitsToClear to 0x09.

Returns The value of the event group before the specified bits were cleared.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

void aFunction( EventGroupHandle_t xEventGroup )
{
    EventBits_t uxBits;

    // Set bit 0 and bit 4 in xEventGroup.
    uxBits = xEventGroupSetBits(
        xEventGroup,    // The event group being updated.
        BIT_0 | BIT_4 );    // The bits being set.

    if( ( uxBits & ( BIT_0 | BIT_4 ) ) == ( BIT_0 | BIT_4 ) )
    {
        // Both bit 0 and bit 4 remained set when the function returned.
    }
    else if( ( uxBits & BIT_0 ) != 0 )
    {
        // Bit 0 remained set when the function returned, but bit 4 was
```
Parameters

- **xEventGroup** – The event group in which the bits are to be set.
- **uxBitsToSet** – A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.

Returns

- The value of the event group at the time the call to xEventGroupSetBits() returns. There are two reasons why the returned value might have the bits specified by the uxBitsToSet parameter cleared. First, if setting a bit results in a task that was waiting for the bit leaving the blocked state then it is possible the bit will be cleared automatically (see the xClearBitOnExit parameter of xEventGroupWaitBits()). Second, any unblocked (or otherwise Ready state) task that has a priority above that of the task that called xEventGroupSetBits() will execute and may change the event group value before the call to xEventGroupSetBits() returns.

Example usage:

```c
// Bits used by the three tasks.
#define TASK_0_BIT ( 1 << 0 )
#define TASK_1_BIT ( 1 << 1 )
#define TASK_2_BIT ( 1 << 2 )

#define ALL_SYNC_BITS ( TASK_0_BIT | TASK_1_BIT | TASK_2_BIT )

// Use an event group to synchronise three tasks. It is assumed this event group has already been created elsewhere.
EventGroupHandle_t xEventGroup;

void vTask0( void *pvParameters )
{
    // (continues on next page)
```
EventBits_t uxReturn;
TickType_t xTicksToWait = 100 / portTICK_PERIOD_MS;

for(;; )
{
    // Perform task functionality here.

    // Set bit 0 in the event flag to note this task has reached the
    // sync point. The other two tasks will set the other two bits defined
    // by ALL_SYNC_BITS. All three tasks have reached the synchronisation
    // point when all the ALL_SYNC_BITS are set. Wait a maximum of 100ms
    // for this to happen.
    uxReturn = xEventGroupSync( xEventBits, TASK_0_BIT, ALL_SYNC_BITS,
    -xTicksToWait );

    if( ( uxReturn & ALL_SYNC_BITS ) == ALL_SYNC_BITS )
    {
        // All three tasks reached the synchronisation point before the call
        // to xEventGroupSync() timed out.
    }
}

void vTask1( void *pvParameters )
{
    for(;; )
    {
        // Perform task functionality here.

        // Set bit 1 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_1_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}

void vTask2( void *pvParameters )
{
    for(;; )
    {
        // Perform task functionality here.

        // Set bit 2 in the event flag to note this task has reached the
        // synchronisation point. The other two tasks will set the other two
        // bits defined by ALL_SYNC_BITS. All three tasks have reached the
        // synchronisation point when all the ALL_SYNC_BITS are set. Wait
        // indefinitely for this to happen.
        xEventGroupSync( xEventBits, TASK_2_BIT, ALL_SYNC_BITS, portMAX_DELAY );

        // xEventGroupSync() was called with an indefinite block time, so
        // this task will only reach here if the synchronisation was made by all
        // three tasks, so there is no need to test the return value.
    }
}
Parameters

- `xEventGroup` - The event group in which the bits are being tested. The event group must have previously been created using a call to `xEventGroupCreate()`.
- `uxBitsToSet` - The bits to set in the event group before determining if, and possibly waiting for, all the bits specified by the `uxBitsToWait` parameter are set.
- `uxBitsToWaitFor` - A bitwise value that indicates the bit or bits to test inside the event group. For example, to wait for bit 0 and bit 2 set `uxBitsToWaitFor` to 0x05. To wait for bits 0 and bit 1 and bit 2 set `uxBitsToWaitFor` to 0x07. Etc.
- `xTicksToWait` - The maximum amount of time (specified in ‘ticks’) to wait for all of the bits specified by `uxBitsToWaitFor` to become set.

Returns

The value of the event group at the time either the bits being waited for became set, or the block time expired. Test the return value to know which bits were set. If `xEventGroupSync()` returned because its timeout expired then not all the bits being waited for will be set. If `xEventGroupSync()` returned because all the bits it was waiting for were set then the returned value is the event group value before any bits were automatically cleared.

EventBits_t `xEventGroupGetBitsFromISR (EventGroupHandle_t xEventGroup)`

A version of `xEventGroupGetBits()` that can be called from an ISR.

Parameters `xEventGroup` - The event group being queried.

Returns

The event group bits at the time `xEventGroupGetBitsFromISR()` was called.

void `vEventGroupDelete (EventGroupHandle_t xEventGroup)`

Delete an event group that was previously created by a call to `xEventGroupCreate()`. Tasks that are blocked on the event group will be unblocked and obtain 0 as the event group’s value.

Parameters `xEventGroup` - The event group being deleted.

Macros

`xEventGroupClearBitsFromISR (xEventGroup, uxBitsToClear)`

A version of `xEventGroupClearBits()` that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed while interrupts are disabled, so protects event groups that are accessed from tasks by suspending the scheduler rather than disabling interrupts. As a result event groups cannot be accessed directly from an interrupt service routine. Therefore `xEventGroupClearBitsFromISR()` sends a message to the timer task to have the clear operation performed in the context of the timer task.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to
// xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    // Clear bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupClearBitsFromISR(
        xEventGroup,  // The event group being updated.
        BIT_0 | BIT_4 ); // The bits being set.

    if( xResult == pdPASS )
    {
        // The message was posted successfully.
    }
}
```

(continues on next page)
Parameters

- **xEventGroup** - The event group in which the bits are to be cleared.
- **uxBitsToClear** - A bitwise value that indicates the bit or bits to clear. For example, to clear bit 3 only, set uxBitsToClear to 0x08. To clear bit 3 and bit 0 set uxBitsToClear to 0x09.

Returns If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

**xEventGroupSetBitsFromISR** (xEventGroup, uxBitsToSet, pxHigherPriorityTaskWoken)

A version of xEventGroupSetBits() that can be called from an interrupt.

Setting bits in an event group is not a deterministic operation because there are an unknown number of tasks that may be waiting for the bit or bits being set. FreeRTOS does not allow nondeterministic operations to be performed in interrupts or from critical sections. Therefore xEventGroupSetBitsFromISR() sends a message to the timer task to have the set operation performed in the context of the timer task - where a scheduler lock is used in place of a critical section.

Example usage:

```c
#define BIT_0 ( 1 << 0 )
#define BIT_4 ( 1 << 4 )

// An event group which it is assumed has already been created by a call to // xEventGroupCreate().
EventGroupHandle_t xEventGroup;

void anInterruptHandler( void )
{
    BaseType_t xHigherPriorityTaskWoken, xResult;

    // xHigherPriorityTaskWoken must be initialised to pdFALSE.
    xHigherPriorityTaskWoken = pdFALSE;

    // Set bit 0 and bit 4 in xEventGroup.
    xResult = xEventGroupSetBitsFromISR( xEventGroup, // The event group being updated.
                                          BIT_0 | BIT_4, // The bits being set.
                                          &xHigherPriorityTaskWoken );

    // Was the message posted successfully?
    if( xResult == pdPASS )
    {
        // If xHigherPriorityTaskWoken is now set to pdTRUE then a context
        // switch should be requested. The macro used is port specific and
        // will be either portYIELD_FROM_ISR() or portEND_SWITCHING_ISR() -
        // refer to the documentation page for the port being used.
        portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
    }
}
```

Parameters

- **xEventGroup** - The event group in which the bits are to be set.
- **uxBitsToSet** - A bitwise value that indicates the bit or bits to set. For example, to set bit 3 only, set uxBitsToSet to 0x08. To set bit 3 and bit 0 set uxBitsToSet to 0x09.
- **pxHigherPriorityTaskWoken** - As mentioned above, calling this function will result in a message being sent to the timer daemon task. If the priority of the timer daemon task is higher than the priority of the currently running task (the task the interrupt interrupted) then `*pxHigherPriorityTaskWoken` will be set to pdTRUE by `xEVENTGROUPSETBITSFROMISR()`, indicating that a context switch should be requested before the interrupt exits. For that reason `*pxHigherPriorityTaskWoken` must be initialised to pdFALSE. See the example code below.

**Returns**

If the request to execute the function was posted successfully then pdPASS is returned, otherwise pdFALSE is returned. pdFALSE will be returned if the timer service queue was full.

**xEVENTGROUPGETBITS**(xEVENTGROUP)

Returns the current value of the bits in an event group. This function cannot be used from an interrupt.

**Parameters**

- **xEVENTGROUP** - The event group being queried.

**Returns**

The event group bits at the time `xEVENTGROUPGETBITS()` was called.

**Type Definitions**

typedef struct EventGroupDef_t *EventGroupHandle_t

typedef TickType_t EventBits_t

**Stream Buffer API**

**Header File**

- components/freertos/FreeRTOS-Kernel/include/freertos/stream_buffer.h

**Functions**

```c
size_t xStreamBufferSend(StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t xDataLengthBytes, TickType_t xTicksToWait)
```

Sends bytes to a stream buffer. The bytes are copied into the stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xStreamBufferSend()`) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as `xStreamBufferReceive()`) inside a critical section and set the receive block time to 0.

Use `xStreamBufferSend()` to write to a stream buffer from a task. Use `xStreamBufferSendFromISR()` to write to a stream buffer from an interrupt service routine (ISR).

**Example use:**

```c
void vAFunction(StreamBufferHandle_t xStreamBuffer)
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";
    const TickType_t x100ms = pdMS_TO_TICKS( 100 );
}
```

(continues on next page)
// Send an array to the stream buffer, blocking for a maximum of 100ms to
// wait for enough space to be available in the stream buffer.
xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) ucArrayToSend, ...
--sizeof( ucArrayToSend ), x100ms );

if( xBytesSent != sizeof( ucArrayToSend ) )
{
    // The call to xStreamBufferSend() times out before there was enough
    // space in the buffer for the data to be written, but it did
    // successfully write xBytesSent bytes.
}

// Send the string to the stream buffer. Return immediately if there is not
// enough space in the buffer.
xBytesSent = xStreamBufferSend( xStreamBuffer, ( void * ) pcStringToSend, ...
--strlen( pcStringToSend ), 0 );

if( xBytesSent != strlen( pcStringToSend ) )
{
    // The entire string could not be added to the stream buffer because
    // there was not enough free space in the buffer, but xBytesSent bytes
    // were sent. Could try again to send the remaining bytes.
}

Parameters

- xStreamBuffer – The handle of the stream buffer to which a stream is being sent.
- pvTxData – A pointer to the buffer that holds the bytes to be copied into the stream
  buffer.
- xDataLengthBytes – The maximum number of bytes to copy from pvTxData into the
  stream buffer.
- xTicksToWait – The maximum amount of time the task should remain in the Blocked
  state to wait for enough space to become available in the stream buffer, should the
  stream buffer contain too little space to hold the other xDataLengthBytes bytes. The
  block time is specified in tick periods, so the absolute time it represents is dependent
  on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time
  specified in milliseconds into a time specified in ticks. Setting xTicksToWait to port-
  MAX_DELAY will cause the task to wait indefinitely (without timing out), provided IN-
  CLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h. If a task times out before it can
  write all xDataLengthBytes into the buffer it will still write as many bytes as possible. A
  task does not use any CPU time when it is in the blocked state.

Returns

The number of bytes written to the stream buffer. If a task times out before it can write
all xDataLengthBytes into the buffer it will still write as many bytes as possible.

size_t xStreamBufferSendFromISR( StreamBufferHandle_t xStreamBuffer, const void *pvTxData, size_t
xDataLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken )

Interrupt safe version of the API function that sends a stream of bytes to the stream buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferSend() to write to a stream buffer from a task. Use xStreamBufferSendFromISR() to write
Example use:

```c
// A stream buffer that has already been created.
StreamBufferHandle_t xStreamBuffer;

void xAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Attempt to send the string to the stream buffer.
    xBytesSent = xStreamBufferSendFromISR( xStreamBuffer,
                                           ( void * ) pcStringToSend,
                                           strlen( pcStringToSend ),
                                           &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // There was not enough free space in the stream buffer for the entire
        // string to be written, ut xBytesSent bytes were written.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

**Parameters**

- `xStreamBuffer` - The handle of the stream buffer to which a stream is being sent.
- `pvTxData` - A pointer to the data that is to be copied into the stream buffer.
- `xDataLengthBytes` - The maximum number of bytes to copy from `pvTxData` into the stream buffer.
- `pxHigherPriorityTaskWoken` - It is possible that a stream buffer will have a task blocked on it waiting for data. Calling `xStreamBufferSendFromISR()` can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling `xStreamBufferSendFromISR()` causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, `xStreamBufferSendFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE`. If `xStreamBufferSendFromISR()` sets this value to `pdTRUE`, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. `*pxHigherPriorityTaskWoken` should be set to `pdFALSE` before it is passed into the function. Check the example code below for an example.

**Returns** The number of bytes actually written to the stream buffer, which will be less than `xDataLengthBytes` if the stream buffer didn’t have enough free space for all the bytes to be written.

```c
size_t xStreamBufferReceive( StreamBufferHandle_t xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, TickType_t xTicksToWait)
```

Receives bytes from a stream buffer.
Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xStreamBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xStreamBufferReceive()) inside a critical section and set the receive block time to 0.

Use xStreamBufferReceive() to read from a stream buffer from a task. Use xStreamBufferReceiveFromISR() to read from a stream buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( StreamBuffer_t xStreamBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive up to another sizeof( ucRxData ) bytes from the stream buffer.
    // Wait in the Blocked state (so not using any CPU processing time) for a
    // maximum of 100ms for the full sizeof( ucRxData ) number of bytes to be
    // available.
    xReceivedBytes = xStreamBufferReceive( xStreamBuffer,
                                          ( void * ) ucRxData,
                                          sizeof( ucRxData ),
                                          xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains another xRecievedBytes bytes of data, which can
        // be processed here....
    }
}
```

**Parameters**

- `xStreamBuffer` - The handle of the stream buffer from which bytes are to be received.
- `pvRxData` - A pointer to the buffer into which the received bytes will be copied.
- `xBufferLengthBytes` - The length of the buffer pointed to by the `pvRxData` parameter. This sets the maximum number of bytes to receive in one call. `xStreamBufferReceive` will return as many bytes as possible up to a maximum set by `xBufferLengthBytes`.
- `xTicksToWait` - The maximum amount of time the task should remain in the Blocked state to wait for data to become available if the stream buffer is empty. `xStreamBufferReceive()` will return immediately if `xTicksToWait` is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro `pdMS_TO_TICKS()` can be used to convert a time specified in milliseconds into a time specified in ticks. Setting `xTicksToWait` to `portMAX_DELAY` will cause the task to wait indefinitely (without timing out), provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`. A task does not use any CPU time when it is in the Blocked state.

**Returns**

The number of bytes actually read from the stream buffer, which will be less than `xBufferLengthBytes` if the call to `xStreamBufferReceive()` timed out before `xBufferLengthBytes` were available.

```c
size_t xStreamBufferReceiveFromISR( StreamBufferHandle_t xStreamBuffer, void *pvRxData, size_t xBufferLengthBytes, BaseType_t *const pxHigherPriorityTaskWoken )
```

An interrupt safe version of the API function that receives bytes from a stream buffer.
Use `xStreamBufferReceive()` to read bytes from a stream buffer from a task. Use `xStreamBufferReceiveFromISR()` to read bytes from a stream buffer from an interrupt service routine (ISR).

Example use:

```c
// A stream buffer that has already been created.
StreamBuffer_t xStreamBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next stream from the stream buffer.
    xReceivedBytes = xStreamBufferReceiveFromISR(
        xStreamBuffer,
        (void *) ucRxData,
        sizeof( ucRxData ),
        &xHigherPriorityTaskWoken);

    if( xReceivedBytes > 0 )
    {
        // ucRxData contains xReceivedBytes read from the stream buffer.
        // Process the stream here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xStreamBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into taskYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    taskYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

**Parameters**
- `xStreamBuffer` - The handle of the stream buffer from which a stream is being received.
- `pvRxData` - A pointer to the buffer into which the received bytes are copied.
- `xBufferLengthBytes` - The length of the buffer pointed to by the `pvRxData` parameter. This sets the maximum number of bytes to receive in one call. `xStreamBufferReceive` will return as many bytes as possible up to a maximum set by `xBufferLengthBytes`.
- `pxHigherPriorityTaskWoken` - It is possible that a stream buffer will have a task blocked on it waiting for space to become available. Calling `xStreamBufferReceiveFromISR()` can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling `xStreamBufferReceiveFromISR()` causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, `xStreamBufferReceiveFromISR()` will set `pxHigherPriorityTaskWoken` to `pdTRUE`. If `xStreamBufferReceiveFromISR()` sets this value to `pdTRUE`, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. `pxHigherPriorityTaskWoken` should be set to `pdFALSE` before it is passed into the function. See the code example below for an example.

**Returns**
The number of bytes read from the stream buffer, if any.

```c
void vStreamBufferDelete (StreamBufferHandle_t xStreamBuffer)
```

Deletes a stream buffer that was previously created using a call to `xStreamBufferCreate()` or `xStreamBuffer-`
CreateStatic(). If the stream buffer was created using dynamic memory (that is, by xStreamBufferCreate()), then the allocated memory is freed.

A stream buffer handle must not be used after the stream buffer has been deleted.

**Parameters**

- **xStreamBuffer** – The handle of the stream buffer to be deleted.

**BaseType_t xStreamBufferIsFull(StreamBufferHandle_t xStreamBuffer)**

Queries a stream buffer to see if it is full. A stream buffer is full if it does not have any free space, and therefore cannot accept any more data.

**Parameters**

- **xStreamBuffer** – The handle of the stream buffer being queried.

**Returns**

- If the stream buffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

**BaseType_t xStreamBufferIsEmpty(StreamBufferHandle_t xStreamBuffer)**

Queries a stream buffer to see if it is empty. A stream buffer is empty if it does not contain any data.

**Parameters**

- **xStreamBuffer** – The handle of the stream buffer being queried.

**Returns**

- If the stream buffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

**BaseType_t xStreamBufferReset(StreamBufferHandle_t xStreamBuffer)**

Resets a stream buffer to its initial, empty, state. Any data that was in the stream buffer is discarded. A stream buffer can only be reset if there are no tasks blocked waiting to either send to or receive from the stream buffer.

**Parameters**

- **xStreamBuffer** – The handle of the stream buffer being reset.

**Returns**

- If the stream buffer is reset then pdPASS is returned. If there was a task blocked waiting to send to or read from the stream buffer then the stream buffer is not reset and pdFAIL is returned.

**size_t xStreamBufferSpacesAvailable(StreamBufferHandle_t xStreamBuffer)**

Queries a stream buffer to see how much free space it contains, which is equal to the amount of data that can be sent to the stream buffer before it is full.

**Parameters**

- **xStreamBuffer** – The handle of the stream buffer being queried.

**Returns**

- The number of bytes that can be written to the stream buffer before the stream buffer would be full.

**size_t xStreamBufferBytesAvailable(StreamBufferHandle_t xStreamBuffer)**

Queries a stream buffer to see how much data it contains, which is equal to the number of bytes that can be read from the stream buffer before the stream buffer would be empty.

**Parameters**

- **xStreamBuffer** – The handle of the stream buffer being queried.

**Returns**

- The number of bytes that can be read from the stream buffer before the stream buffer would be empty.

**BaseType_t xStreamBufferSetTriggerLevel(StreamBufferHandle_t xStreamBuffer, size_t xTriggerLevel)**

A stream buffer’s trigger level is the number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

A trigger level is set when the stream buffer is created, and can be modified using xStreamBufferSetTriggerLevel().

**Parameters**

- **xStreamBuffer** – The handle of the stream buffer being updated.
- **xTriggerLevel** – The new trigger level for the stream buffer.
**Returns** If xTriggerLevel was less than or equal to the stream buffer’s length then the trigger level will be updated and pdTRUE is returned. Otherwise pdFALSE is returned.

```c
BaseType_t xStreamBufferSendCompletedFromISR (StreamBufferHandle_t xStreamBuffer, BaseType_t *pxHigherPriorityTaskWoken)
```

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferSendCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Parameters**

- **xStreamBuffer** – The handle of the stream buffer to which data was written.
- **pxHigherPriorityTaskWoken** – *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferSendCompletedFromISR(). If calling xStreamBufferSendCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**Returns** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

```c
BaseType_t xStreamBufferReceiveCompletedFromISR (StreamBufferHandle_t xStreamBuffer,
                                                BaseType_t *pxHigherPriorityTaskWoken)
```

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. xStreamBufferReceiveCompletedFromISR() does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Parameters**

- **xStreamBuffer** – The handle of the stream buffer from which data was read.
- **pxHigherPriorityTaskWoken** – *pxHigherPriorityTaskWoken should be initialised to pdFALSE before it is passed into xStreamBufferReceiveCompletedFromISR(). If calling xStreamBufferReceiveCompletedFromISR() removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then *pxHigherPriorityTaskWoken will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**Returns** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

**Macros**

```c
xStreamBufferCreate (xBuffSizeBytes, xTriggerLevelBytes)
```

Creates a new stream buffer using dynamically allocated memory. See xStreamBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

configSUPPORT_DYNAMIC_ALLOCATION must be set to 1 or left undefined in FreeRTOSConfig.h for xStreamBufferCreate() to be available.

Example use:
```c
void vAFunction( void )
{
StreamBufferHandle_t xStreamBuffer;
const size_t xStreamBufferSizeBytes = 100, xTriggerLevel = 10;

// Create a stream buffer that can hold 100 bytes. The memory used to hold // both the stream buffer structure and the data in the stream buffer is // allocated dynamically.
xStreamBuffer = xStreamBufferCreate( xStreamBufferSizeBytes, xTriggerLevel );

if( xStreamBuffer == NULL )
{
    // There was not enough heap memory space available to create the // stream buffer.
}
else
{
    // The stream buffer was created successfully and can now be used.
}
}
```

**Parameters**

- **xBufferSizeBytes** - The total number of bytes the stream buffer will be able to hold at any one time.
- **xTriggerLevelBytes** - The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.

**Returns**

If NULL is returned, then the stream buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the stream buffer data structures and storage area. A non-NULL value being returned indicates that the stream buffer has been created successfully - the returned value should be stored as the handle to the created stream buffer.

**xStreamBufferCreateStatic**

(xBufferSizeBytes, xTriggerLevelBytes, pucStreamBufferStorageArea, pxStaticStreamBuffer)

Creates a new stream buffer using statically allocated memory. See xStreamBufferCreate() for a version that uses dynamically allocated memory.

configSUPPORT_STATIC_ALLOCATION must be set to 1 in FreeRTOSConfig.h for xStreamBufferCreateStatic() to be available.

---

Example use:

```c
// Used to dimension the array used to hold the streams. The available space // will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the streams within the stream // buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the stream buffer structure.
```
StaticStreamBuffer_t xStreamBufferStruct;

```c
void MyFunction( void )
{
    StreamBufferHandle_t xStreamBuffer;
    const size_t xTriggerLevel = 1;

    xStreamBuffer = xStreamBufferCreateStatic( sizeof( ucBufferStorage ),
                                             xTriggerLevel,
                                             ucBufferStorage,
                                             &xStreamBufferStruct );

    // As neither the pucStreamBufferStorageArea or pxStaticStreamBuffer
    // parameters were NULL, xStreamBuffer will not be NULL, and can be used to
    // reference the created stream buffer in other stream buffer API calls.

    // Other code that uses the stream buffer can go here.
}
```

### Parameters

- **xBufferSizeBytes** – The size, in bytes, of the buffer pointed to by the pucStreamBufferStorageArea parameter.
- **xTriggerLevelBytes** – The number of bytes that must be in the stream buffer before a task that is blocked on the stream buffer to wait for data is moved out of the blocked state. For example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 1 then the task will be unblocked when a single byte is written to the buffer or the task’s block time expires. As another example, if a task is blocked on a read of an empty stream buffer that has a trigger level of 10 then the task will not be unblocked until the stream buffer contains at least 10 bytes or the task’s block time expires. If a reading task’s block time expires before the trigger level is reached then the task will still receive however many bytes are actually available. Setting a trigger level of 0 will result in a trigger level of 1 being used. It is not valid to specify a trigger level that is greater than the buffer size.
- **pucStreamBufferStorageArea** – Must point to a uint8_t array that is at least xBufferSizeBytes + 1 big. This is the array to which streams are copied when they are written to the stream buffer.
- **pxStaticStreamBuffer** – Must point to a variable of type StaticStreamBuffer_t, which will be used to hold the stream buffer’s data structure.

### Returns

If the stream buffer is created successfully then a handle to the created stream buffer is returned. If either pucStreamBufferStorageArea or pxStaticStreamBuffer are NULL then NULL is returned.

### Type Definitions

typedef struct StreamBufferDef_t *StreamBufferHandle_t

### Message Buffer API

### Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/message_buffer.h

### Macros
**xMessageBufferCreate** (*xBufferSizeBytes*)

Creates a new message buffer using dynamically allocated memory. See xMessageBufferCreateStatic() for a version that uses statically allocated memory (memory that is allocated at compile time).

`configSUPPORT_DYNAMIC_ALLOCATION` must be set to 1 or left undefined in FreeRTOSConfig.h for `xMessageBufferCreate()` to be available.

Example use:

```c
void vAFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;
    const size_t xMessageBufferSizeBytes = 100;

    // Create a message buffer that can hold 100 bytes. The memory used to hold
    // both the message buffer structure and the messages themselves is allocated
    // dynamically. Each message added to the buffer consumes an additional 4
    // bytes which are used to hold the length of the message.
    xMessageBuffer = xMessageBufferCreate( xMessageBufferSizeBytes );

    if( xMessageBuffer == NULL )
    {
        // There was not enough heap memory space available to create the
        // message buffer.
    }
    else
    {
        // The message buffer was created successfully and can now be used.
    }
}
```

**Parameters**

- **xBufferSizeBytes** - The total number of bytes (not messages) the message buffer will be able to hold at any one time. When a message is written to the message buffer an additional `sizeof( size_t )` bytes are also written to store the message’s length. `sizeof( size_t )` is typically 4 bytes on a 32-bit architecture, so on most 32-bit architectures a 10 byte message will take up 14 bytes of message buffer space.

**Returns** If NULL is returned, then the message buffer cannot be created because there is insufficient heap memory available for FreeRTOS to allocate the message buffer data structures and storage area. A non-NULL value being returned indicates that the message buffer has been created successfully - the returned value should be stored as the handle to the created message buffer.

**xMessageBufferCreateStatic** (*xBufferSizeBytes, pucMessageBufferStorageArea, pxStaticMessageBuffer*)

Creates a new message buffer using statically allocated memory. See xMessageBufferCreate() for a version that uses dynamically allocated memory.

Example use:

```c
// Used to dimension the array used to hold the messages. The available space
// will actually be one less than this, so 999.
#define STORAGE_SIZE_BYTES 1000

// Defines the memory that will actually hold the messages within the message
// buffer.
static uint8_t ucStorageBuffer[ STORAGE_SIZE_BYTES ];

// The variable used to hold the message buffer structure.
```

(continues on next page)
StaticMessageBuffer_t xMessageBufferStruct;

void MyFunction( void )
{
    MessageBufferHandle_t xMessageBuffer;

    xMessageBuffer = xMessageBufferCreateStatic( sizeof( ucBufferStorage ),
        ucBufferStorage,
        &xMessageBufferStruct );

    // As neither the pucMessageBufferStorageArea or pxStaticMessageBuffer
    // parameters were NULL, xMessageBuffer will not be NULL, and can be used to
    // reference the created message buffer in other message buffer API calls.

    // Other code that uses the message buffer can go here.
}

Parameters

- **xBufferSizeBytes** – The size, in bytes, of the buffer pointed to by the pucMessageBufferStorageArea parameter. When a message is written to the message buffer an additional sizeof(size_t) bytes are also written to store the message’s length. sizeof(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture a 10 byte message will take up 14 bytes of message buffer space. The maximum number of bytes that can be stored in the message buffer is actually (xBufferSizeBytes - 1).

- **pucMessageBufferStorageArea** – Must point to a uint8_t array that is at least xBufferSizeBytes + 1 big. This is the array to which messages are copied when they are written to the message buffer.

- **pxStaticMessageBuffer** – Must point to a variable of type StaticMessageBuffer_t, which will be used to hold the message buffer’s data structure.

Returns If the message buffer is created successfully then a handle to the created message buffer is returned. If either pucMessageBufferStorageArea or pxStaticMessageBuffer are NULL then NULL is returned.

**xMessageBufferSend** (xMessageBuffer, pvTxData, xDataLengthBytes, xTicksToWait)

Sends a discrete message to the message buffer. The message can be any length that fits within the buffer’s free space, and is copied into the buffer.

- Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```
void vAFunction( MessageBufferHandle_t xMessageBuffer )
{
    size_t xBytesSent;
    uint8_t ucArrayToSend[] = { 0, 1, 2, 3 };
    char *pcStringToSend = "String to send";

    // Send a message
    xMessageBufferSend( xMessageBuffer, ucArrayToSend, sizeof( ucArrayToSend ), 0 );

    // Send a string
    xMessageBufferSend( xMessageBuffer, pcStringToSend, strlen( pcStringToSend ), 0 );
}
```
```c
const TickType_t x100ms = pdMS_TO_TICKS( 100 );

// Send an array to the message buffer, blocking for a maximum of 100ms to
// wait for enough space to be available in the message buffer.
xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) ucArrayToSend, -
"sizeof( ucArrayToSend ), x100ms );

if( xBytesSent != sizeof( ucArrayToSend ) )
{
    // The call to xMessageBufferSend() times out before there was enough
    // space in the buffer for the data to be written.
}

// Send the string to the message buffer. Return immediately if there is
// not enough space in the buffer.
xBytesSent = xMessageBufferSend( xMessageBuffer, ( void * ) pcStringToSend, -
"strlen( pcStringToSend ), 0 );

if( xBytesSent != strlen( pcStringToSend ) )
{
    // The string could not be added to the message buffer because there was
    // not enough free space in the buffer.
}
```

**Parameters**

- `xMessageBuffer` - The handle of the message buffer to which a message is being sent.
- `pvTxData` - A pointer to the message that is to be copied into the message buffer.
- `xDataLengthBytes` - The length of the message. That is, the number of bytes to copy from `pvTxData` into the message buffer. When a message is written to the message buffer an additional `sizeof( size_t )` bytes are also written to store the message’s length. `sizeof( size_t )` is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting `xDataLengthBytes` to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- `xTicksToWait` - The maximum amount of time the calling task should remain in the Blocked state to wait for enough space to become available in the message buffer, should the message buffer have insufficient space when `xMessageBufferSend()` is called. The calling task will never block if `xTicksToWait` is zero. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro `pdMS_TO_TICKS()` can be used to convert a time specified in milliseconds into a time specified in ticks. Setting `xTicksToWait` to `portMAX_DELAY` will cause the task to wait indefinitely (without timing out), provided `INCLUDE_vTaskSuspend` is set to 1 in `FreeRTOSConfig.h`. Tasks do not use any CPU time when they are in the Blocked state.

**Returns**

The number of bytes written to the message buffer. If the call to `xMessageBufferSend()` times out before there was enough space to write the message into the message buffer then zero is returned. If the call did not time out then `xDataLengthBytes` is returned.

**xMessageBufferSendFromISR(xMessageBuffer, pvTxData, xDataLengthBytes, pxHigherPriorityTaskWoken)**

Interrupt safe version of the API function that sends a discrete message to the message buffer. The message can be any length that fits within the buffer’s free space, and is copied into the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as `xMessageBufferSend()`)) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers
then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferSend() to write to a message buffer from a task. Use xMessageBufferSendFromISR() to write to a message buffer from an interrupt service routine (ISR).

Example use:

```c
// A message buffer that has already been created.
MessageBufferHandle_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    size_t xBytesSent;
    char *pcStringToSend = "String to send";
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;  // Initialised to pdFALSE.

    // Attempt to send the string to the message buffer.
    xBytesSent = xMessageBufferSendFromISR( xMessageBuffer,
                                            ( void * ) pcStringToSend,
                                            strlen( pcStringToSend ),
                                            &xHigherPriorityTaskWoken );

    if( xBytesSent != strlen( pcStringToSend ) )
    {
        // The string could not be added to the message buffer because there was
        // not enough free space in the buffer.
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferSendFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
```

Parameters

- **xMessageBuffer** – The handle of the message buffer to which a message is being sent.
- **pvTxData** – A pointer to the message that is to be copied into the message buffer.
- **xDataLengthBytes** – The length of the message. That is, the number of bytes to copy from pvTxData into the message buffer. When a message is written to the message buffer an additional sizef(size_t) bytes are also written to store the message’s length. sizef(size_t) is typically 4 bytes on a 32-bit architecture, so on most 32-bit architecture setting xDataLengthBytes to 20 will reduce the free space in the message buffer by 24 bytes (20 bytes of message data and 4 bytes to hold the message length).
- **pxHigherPriorityTaskWoken** – It is possible that a message buffer will have a task blocked on it waiting for data. Calling xMessageBufferSendFromISR() can make data available, and so cause a task that was waiting for data to leave the Blocked state. If calling xMessageBufferSendFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferSendFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. This will ensure that the interrupt returns directly to the highest priority Ready state task. *px-HigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.
Returns  The number of bytes actually written to the message buffer. If the message buffer didn’t have enough free space for the message to be stored then 0 is returned, otherwise xDataLengthBytes is returned.

\textbf{xBMessageBufferReceive} (xBMessageBuffer, pvRxData, xBufferLengthBytes, xTicksToWait)

Receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

```c
void vAFunction( MessageBuffer_t xMessageBuffer )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    const TickType_t xBlockTime = pdMS_TO_TICKS( 20 );

    // Receive the next message from the message buffer. Wait in the Blocked
    // state (so not using any CPU processing time) for a maximum of 100ms for
    // a message to become available.
    xReceivedBytes = xMessageBufferReceive( xMessageBuffer,
        ( void * ) ucRxData,
        sizeof( ucRxData ),
        xBlockTime );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }
}
```

Parameters

- **xBMessageBuffer** - The handle of the message buffer from which a message is being received.
- **pvRxData** - A pointer to the buffer into which the received message is to be copied.
- **xBufferLengthBytes** - The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.
- **xTicksToWait** - The maximum amount of time the task should remain in the Blocked state to wait for a message, should the message buffer be empty. xMessageBufferReceive() will return immediately if xTicksToWait is zero and the message buffer is empty. The block time is specified in tick periods, so the absolute time it represents is dependent on the tick frequency. The macro pdMS_TO_TICKS() can be used to convert a time specified in milliseconds into a time specified in ticks. Setting xTicksToWait to portMAX_DELAY will cause the task to wait indefinitely (without timing out), provided IN-
Chapter 2. API Reference

CLIDE_yTaskSuspend is set to 1 in FreeRTOSConfig.h. Tasks do not use any CPU time when they are in the Blocked state.

Returns The length, in bytes, of the message read from the message buffer, if any. If xMessageBufferReceive() times out before a message became available then zero is returned. If the length of the message is greater than xBufferLengthBytes then the message will be left in the message buffer and zero is returned.

\texttt{xMessageBufferReceiveFromISR} (xMessageBuffer, pvRxData, xBufferLengthBytes, pxHigherPriorityTaskWoken)

An interrupt safe version of the API function that receives a discrete message from a message buffer. Messages can be of variable length and are copied out of the buffer.

: Uniquely among FreeRTOS objects, the stream buffer implementation (so also the message buffer implementation, as message buffers are built on top of stream buffers) assumes there is only one task or interrupt that will write to the buffer (the writer), and only one task or interrupt that will read from the buffer (the reader). It is safe for the writer and reader to be different tasks or interrupts, but, unlike other FreeRTOS objects, it is not safe to have multiple different writers or multiple different readers. If there are to be multiple different writers then the application writer must place each call to a writing API function (such as xMessageBufferSend()) inside a critical section and set the send block time to 0. Likewise, if there are to be multiple different readers then the application writer must place each call to a reading API function (such as xMessageBufferRead()) inside a critical section and set the receive block time to 0.

Use xMessageBufferReceive() to read from a message buffer from a task. Use xMessageBufferReceiveFromISR() to read from a message buffer from an interrupt service routine (ISR).

Example use:

\begin{verbatim}
// A message buffer that has already been created.
MessageBuffer_t xMessageBuffer;

void vAnInterruptServiceRoutine( void )
{
    uint8_t ucRxData[ 20 ];
    size_t xReceivedBytes;
    BaseType_t xHigherPriorityTaskWoken = pdFALSE; // Initialised to pdFALSE.

    // Receive the next message from the message buffer.
    xReceivedBytes = xMessageBufferReceiveFromISR( xMessageBuffer,
    { void * } ucRxData,
    sizeof( ucRxData ),
    &xHigherPriorityTaskWoken );

    if( xReceivedBytes > 0 )
    {
        // A ucRxData contains a message that is xReceivedBytes long. Process
        // the message here....
    }

    // If xHigherPriorityTaskWoken was set to pdTRUE inside
    // xMessageBufferReceiveFromISR() then a task that has a priority above the
    // priority of the currently executing task was unblocked and a context
    // switch should be performed to ensure the ISR returns to the unblocked
    // task. In most FreeRTOS ports this is done by simply passing
    // xHigherPriorityTaskWoken into portYIELD_FROM_ISR(), which will test the
    // variables value, and perform the context switch if necessary. Check the
    // documentation for the port in use for port specific instructions.
    portYIELD_FROM_ISR( xHigherPriorityTaskWoken );
}
\end{verbatim}

Parameters
• **xMessageBuffer** – The handle of the message buffer from which a message is being received.

• **pvRxData** – A pointer to the buffer into which the received message is to be copied.

• **xBufferLengthBytes** – The length of the buffer pointed to by the pvRxData parameter. This sets the maximum length of the message that can be received. If xBufferLengthBytes is too small to hold the next message then the message will be left in the message buffer and 0 will be returned.

• **pxHigherPriorityTaskWoken** – It is possible that a message buffer will have a task blocked on it waiting for space to become available. Calling xMessageBufferReceiveFromISR() can make space available, and so cause a task that is waiting for space to leave the Blocked state. If calling xMessageBufferReceiveFromISR() causes a task to leave the Blocked state, and the unblocked task has a priority higher than the currently executing task (the task that was interrupted), then, internally, xMessageBufferReceiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE. If xMessageBufferReceiveFromISR() sets this value to pdTRUE, then normally a context switch should be performed before the interrupt is exited. That will ensure the interrupt returns directly to the highest priority Ready state task. *pxHigherPriorityTaskWoken should be set to pdFALSE before it is passed into the function. See the code example below for an example.

**Returns** The length, in bytes, of the message read from the message buffer, if any.

### `{vMessageBufferDelete}` (`xMessageBuffer`)  
Deletes a message buffer that was previously created using a call to xMessageBufferCreate() or xMessageBufferCreateStatic(). If the message buffer was created using dynamic memory (that is, by xMessageBufferCreate()), then the allocated memory is freed.

A message buffer handle must not be used after the message buffer has been deleted.

**Parameters**

• **xMessageBuffer** – The handle of the message buffer to be deleted.

### `{xMessageBufferIsFull}` (`xMessageBuffer`)  
Tests to see if a message buffer is full. A message buffer is full if it cannot accept any more messages, of any size, until space is made available by a message being removed from the message buffer.

**Parameters**

• **xMessageBuffer** – The handle of the message buffer being queried.

**Returns** If the message buffer referenced by xMessageBuffer is full then pdTRUE is returned. Otherwise pdFALSE is returned.

### `{xMessageBufferIsEmpty}` (`xMessageBuffer`)  
Tests to see if a message buffer is empty (does not contain any messages).

**Parameters**

• **xMessageBuffer** – The handle of the message buffer being queried.

**Returns** If the message buffer referenced by xMessageBuffer is empty then pdTRUE is returned. Otherwise pdFALSE is returned.

### `{xMessageBufferReset}` (`xMessageBuffer`)  
Resets a message buffer to its initial empty state, discarding any message it contained.

A message buffer can only be reset if there are no tasks blocked on it.

**Parameters**

• **xMessageBuffer** – The handle of the message buffer being reset.

**Returns** If the message buffer was reset then pdPASS is returned. If the message buffer could not be reset because either there was a task blocked on the message queue to wait for space to become available, or to wait for a a message to be available, then pdFAIL is returned.

### `{xMessageBufferSpaceAvailable}` (`xMessageBuffer`)  
Returns the number of bytes of free space in the message buffer.

**Parameters**
• **xMessageBuffer** - The handle of the message buffer being queried.

**Returns** The number of bytes that can be written to the message buffer before the message buffer would be full. When a message is written to the message buffer an additional sizeof( size_t ) bytes are also written to store the message’s length. sizeof( size_t ) is typically 4 bytes on a 32-bit architecture, so if `xMessageBufferSpacesAvailable()` returns 10, then the size of the largest message that can be written to the message buffer is 6 bytes.

**xMessageBufferSpacesAvailable** *(xMessageBuffer)*

**xMessageBufferNextLengthBytes** *(xMessageBuffer)*

Returns the length (in bytes) of the next message in a message buffer. Useful if `xMessageBufferReceive()` returned 0 because the size of the buffer passed into `xMessageBufferReceive()` was too small to hold the next message.

**Parameters**

• **xMessageBuffer** - The handle of the message buffer being queried.

**Returns** The length (in bytes) of the next message in the message buffer, or 0 if the message buffer is empty.

**xMessageBufferSendCompletedFromISR** *(xMessageBuffer, pxHigherPriorityTaskWoken)*

For advanced users only.

The sbSEND_COMPLETED() macro is called from within the FreeRTOS APIs when data is sent to a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbSEND_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. `xMessageBufferSendCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of sbSEND_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Parameters**

• **xMessageBuffer** - The handle of the stream buffer to which data was written.

• **pxHigherPriorityTaskWoken** — `pxHigherPriorityTaskWoken` should be initialised to pdFALSE before it is passed into `xMessageBufferSendCompletedFromISR()`. If calling `xMessageBufferSendCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then `pxHigherPriorityTaskWoken` will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.

**Returns** If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

**xMessageBufferReceiveCompletedFromISR** *(xMessageBuffer, pxHigherPriorityTaskWoken)*

For advanced users only.

The sbRECEIVE_COMPLETED() macro is called from within the FreeRTOS APIs when data is read out of a message buffer or stream buffer. If there was a task that was blocked on the message or stream buffer waiting for data to arrive then the sbRECEIVE_COMPLETED() macro sends a notification to the task to remove it from the Blocked state. `xMessageBufferReceiveCompletedFromISR()` does the same thing. It is provided to enable application writers to implement their own version of sbRECEIVE_COMPLETED(), and MUST NOT BE USED AT ANY OTHER TIME.

See the example implemented in FreeRTOS/Demo/Minimal/MessageBufferAMP.c for additional information.

**Parameters**

• **xMessageBuffer** - The handle of the stream buffer from which data was read.

• **pxHigherPriorityTaskWoken** — `pxHigherPriorityTaskWoken` should be initialised to pdFALSE before it is passed into `xMessageBufferReceiveCompletedFromISR()`. If calling `xMessageBufferReceiveCompletedFromISR()` removes a task from the Blocked state, and the task has a priority above the priority of the currently running task, then `pxHigherPriorityTaskWoken` will get set to pdTRUE indicating that a context switch should be performed before exiting the ISR.
Returns If a task was removed from the Blocked state then pdTRUE is returned. Otherwise pdFALSE is returned.

Type Definitions

typedef void *MessageBufferHandle_t

Type by which message buffers are referenced. For example, a call to xMessageBufferCreate() returns an MessageBufferHandle_t variable that can then be used as a parameter to xMessageBufferSend(), xMessageBufferReceive(), etc.

2.10.12 FreeRTOS (Supplemental Features)

ESP-IDF provides multiple features to supplement the features offered by FreeRTOS. These supplemental features are available on all FreeRTOS implementations supported by ESP-IDF (i.e., ESP-IDF FreeRTOS and Amazon SMP FreeRTOS). This document describes these supplemental features and is split into the following sections:

Overview

ESP-IDF adds various new features to supplement the capabilities of FreeRTOS as follows:

- **Ring buffers**: Ring buffers provide a FIFO buffer that can accept entries of arbitrary lengths.
- **ESP-IDF Tick and Idle Hooks**: ESP-IDF provides multiple custom tick interrupt hooks and idle task hooks that are more numerous and more flexible when compared to FreeRTOS tick and idle hooks.
- **Thread Local Storage Pointer (TLSP) Deletion Callbacks**: TLSP Deletion callbacks are run automatically when a task is deleted, thus allowing users to clean up their TLSPs automatically.
- **Component Specific Properties**: Currently added only one component specific property ORIG_INCLUDE_PATH.

Ring Buffers

FreeRTOS provides stream buffers and message buffers as the primary mechanisms to send arbitrarily sized data between tasks and ISRs. However, FreeRTOS stream buffers and message buffers have the following limitations:

- Strictly single sender and single receiver
- Data is passed by copy
- Unable to reserve buffer space for a deferred send (i.e., send acquire)

Therefore, ESP-IDF provides a separate ring buffer implementation to address the issues above. ESP-IDF ring buffers are strictly FIFO buffers that supports arbitrarily sized items. Ring buffers are a more memory efficient alternative to FreeRTOS queues in situations where the size of items is variable. The capacity of a ring buffer is not measured by the number of items it can store, but rather by the amount of memory used for storing items. The ring buffer provides APIs to send an item, or to allocate space for an item in the ring buffer to be filled manually by the user. For efficiency reasons, **items are always retrieved from the ring buffer by reference**. As a result, all retrieved
items must also be returned to the ring buffer by using vRingbufferReturnItem() or vRingbufferReturnItemFromISR(), in order for them to be removed from the ring buffer completely. The ring buffers are split into the three following types:

**No-Split buffers** will guarantee that an item is stored in contiguous memory and will not attempt to split an item under any circumstances. Use No-Split buffers when items must occupy contiguous memory. Only this buffer type allows you to get the data item address and write to the item by yourself. Refer the documentation of the functions xRingbufferSendAcquire() and xRingbufferSendComplete() for more details.

**Allow-Split buffers** will allow an item to be split in two parts when wrapping around the end of the buffer if there is enough space at the tail and the head of the buffer combined to store the item. Allow-Split buffers are more memory efficient than No-Split buffers but can return an item in two parts when retrieving.

**Byte buffers** do not store data as separate items. All data is stored as a sequence of bytes, and any number of bytes can be sent or retrieved each time. Use byte buffers when separate items do not need to be maintained (e.g. a byte stream).

**Note:** No-Split buffers and Allow-Split buffers will always store items at 32-bit aligned addresses. Therefore, when retrieving an item, the item pointer is guaranteed to be 32-bit aligned. This is useful especially when you need to send some data to the DMA.

**Note:** Each item stored in No-Split or Allow-Split buffers will require an additional 8 bytes for a header. Item sizes will also be rounded up to a 32-bit aligned size (multiple of 4 bytes), however the true item size is recorded within the header. The sizes of No-Split and Allow-Split buffers will also be rounded up when created.

**Usage** The following example demonstrates the usage of xRingbufferCreate() and xRingbufferSend() to create a ring buffer and then send an item to it.

```c
#include "freertos/ringbuf.h"
static char tx_item[] = "test_item";
...

//Create ring buffer
RingbufferHandle_t buf_handle;
buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
if (buf_handle == NULL) {
    printf("Failed to create ring buffer\n");
}

//Send an item
UBaseType_t res = xRingbufferSend(buf_handle, tx_item, sizeof(tx_item), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to send item\n");
}
```

The following example demonstrates the usage of xRingbufferSendAcquire() and xRingbufferSendComplete() instead of xRingbufferSend() to acquire memory on the ring buffer (of type RINGBUF_TYPE_NOSPLIT) and then send an item to it. This adds one more step, but allows getting the address of the memory to write to, and writing to the memory yourself.

```c
#include "freertos/ringbuf.h"
#include "soc/lldesc.h"

typedef struct {
    lldesc_t dma_desc;
}(continues on next page)
Chapter 2. API Reference

```c
uint8_t buf[1];
} dma_item_t;

#define DMA_ITEM_SIZE(N) (sizeof(lldesc_t)+((N)+3)&(~3))
...

//Retrieve space for DMA descriptor and corresponding data buffer
//This has to be done with SendAcquire, or the address may be different when...

 dma_item_t item;
UBaseType_t res = xRingbufferSendAcquire(buf_handle, &item, DMA_ITEM_SIZE(buffer_size), pdMS_TO_TICKS(1000));
if (res != pdTRUE) {
    printf("Failed to acquire memory for item\n");
}
item->dma_desc = (lldesc_t) {
    .size = buffer_size,
    .length = buffer_size,
    .eof = 0,
    .owner = 1,
    .buf = &item->buf,
};
//Actually send to the ring buffer for consumer to use
res = xRingbufferSendComplete(buf_handle, &item);
if (res != pdTRUE) {
    printf("Failed to send item\n");
}

The following example demonstrates retrieving and returning an item from a No-Split ring buffer using xRingbufferReceive() and vRingbufferReturnItem()
...

//Receive an item from no-split ring buffer
size_t item_size;
char *item = (char *)xRingbufferReceive(buf_handle, &item_size, pdMS_TO_TICKS(1000));

//Check received item
if (item != NULL) {
    //Print item
    for (int i = 0; i < item_size; i++) {
        printf("%c", item[i]);
    }
    printf("\n");
    //Return Item
    vRingbufferReturnItem(buf_handle, item);
} else {
    //Failed to receive item
    printf("Failed to receive item\n");
}
```

The following example demonstrates retrieving and returning an item from an Allow-Split ring buffer using xRingbufferReceiveSplit() and vRingbufferReturnItem()
...

//Receive an item from allow-split ring buffer
size_t item_size1, item_size2;
char *item1, *item2;
```
BaseType_t ret = xRingbufferReceiveSplit(buf_handle, (void **)item1, (void **)item2, &item_size1, &item_size2, pdMS_TO_TICKS(1000));

// Check received item
if (ret == pdTRUE && item1 != NULL) {
    for (int i = 0; i < item_size1; i++) {
        printf("%c", item1[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item1);
}
// Check if item was split
if (item2 != NULL) {
    for (int i = 0; i < item_size2; i++) {
        printf("%c", item2[i]);
    }
    vRingbufferReturnItem(buf_handle, (void *)item2);
}
printf("\n");
else {
    // Failed to receive item
    printf("Failed to receive item\n");
}

The following example demonstrates retrieving and returning an item from a byte buffer using xRingbufferReceiveUpTo() and vRingbufferReturnItem()

...  
  
  // Receive data from byte buffer
  size_t item_size;
  char *item = (char *)xRingbufferReceiveUpTo(buf_handle, &item_size, pdMS_TO_TICKS(1000), sizeof(tx_item));

  // Check received data
  if (item != NULL) {
      // Print item
      for (int i = 0; i < item_size; i++) {
          printf("%c", item[i]);
      }
      printf("\n");
      // Return item
      vRingbufferReturnItem(buf_handle, (void *)item);
  } else {
      // Failed to receive item
      printf("Failed to receive item\n");
  }

For ISR safe versions of the functions used above, call xRingbufferSendFromISR(), xRingbufferReceiveFromISR(), xRingbufferReceiveSplitFromISR(), xRingbufferReceiveUpToFromISR(), and vRingbufferReturnItemFromISR()

**Note:** Two calls to RingbufferReceive[UpTo][FromISR]() are required if the bytes wraps around the end of the ring buffer.

**Sending to Ring Buffer** The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers with regard to sending items/data. The diagrams assume that three items of sizes 18, 3, and 27 bytes are sent respectively to a buffer of 128 bytes.

For No-Split and Allow-Split buffers, a header of 8 bytes precedes every data item. Furthermore, the space occupied by each item is **rounded up to the nearest 32-bit aligned size** in order to maintain overall 32-bit alignment.
However, the true size of the item is recorded inside the header which will be returned when the item is retrieved. Referring to the diagram above, the 18, 3, and 27 byte items are rounded up to 20, 4, and 28 bytes respectively. An 8 byte header is then added in front of each item.

Fig. 33: Sending items to byte buffers

Byte buffers treat data as a sequence of bytes and does not incur any overhead (no headers). As a result, all data sent to a byte buffer is merged into a single item. Referring to the diagram above, the 18, 3, and 27 byte items are sequentially written to the byte buffer and merged into a single item of 48 bytes.

Using SendAcquire and SendComplete Items in No-Split buffers are acquired (by SendAcquire) in strict FIFO order and must be sent to the buffer by SendComplete for the data to be accessible by the consumer. Multiple items can be sent or acquired without calling SendComplete, and the items do not necessarily need to be completed in the order they were acquired. However, the receiving of data items must occur in FIFO order, therefore not calling SendComplete for the earliest acquired item will prevent the subsequent items from being received.

The following diagrams illustrate what will happen when SendAcquire and SendComplete don’t happen in the same order. At the beginning, there is already a data item of 16 bytes sent to the ring buffer. Then SendAcquire is called to acquire space of 20, 8, 24 bytes on the ring buffer.

Fig. 34: SendAcquire/SendComplete items in No-Split ring buffers

After that, we fill (use) the buffers, and send them to the ring buffer by SendComplete in the order of 8, 24, 20. When 8 bytes and 24 bytes data are sent, the consumer still can only get the 16 bytes data item. Hence, if
Chapter 2. API Reference

**SendComplete** is not called for the 20 bytes, it will not be available, nor will the data items following the 20 bytes item.

When the 20 bytes item is finally completed, all the 3 data items can be received now, in the order of 20, 8, 24 bytes, right after the 16 bytes item existing in the buffer at the beginning.

Allow-Split buffers and byte buffers do not allow using **SendAcquire** or **SendComplete** since acquired buffers are required to be complete (not wrapped).

**Wrap around** The following diagrams illustrate the differences between No-Split, Allow-Split, and byte buffers when a sent item requires a wrap around. The diagrams assume a buffer of **128 bytes** with **56 bytes of free space** that wraps around and a sent item of **28 bytes**.

---

![Diagram](image)

**Fig. 35: Wrap around in No-Split buffers**

No-Split buffers will only store an item in continuous free space and will not split an item under any circumstances. When the free space at the tail of the buffer is insufficient to completely store the item and its header, the free space at the tail will be marked as dummy data. The buffer will then wrap around and store the item in the free space at the head of the buffer.

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the 16 bytes is marked as dummy data and the item is written to the free space at the head of the buffer instead.

---

![Diagram](image)

**Fig. 36: Wrap around in Allow-Split buffers**

Allow-Split buffers will attempt to split the item into two parts when the free space at the tail of the buffer is insufficient to store the item data and its header. Both parts of the split item will have their own headers (therefore incurring an extra 8 bytes of overhead).

Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to store the 28 byte item. Therefore, the item is split into two parts (8 and 20 bytes) and written as two parts to the buffer.

**Note:** Allow-Split buffers treat both parts of the split item as two separate items, therefore call **xRingbufferReceiveSplit()** instead of **xRingbufferReceive()** to receive both parts of a split item in a thread safe manner.

Byte buffers will store as much data as possible into the free space at the tail of buffer. The remaining data will then be stored in the free space at the head of the buffer. No overhead is incurred when wrapping around in byte buffers.
Referring to the diagram above, the 16 bytes of free space at the tail of the buffer is insufficient to completely store the 28 bytes of data. Therefore, the 16 bytes of free space is filled with data, and the remaining 12 bytes are written to the free space at the head of the buffer. The buffer now contains data in two separate continuous parts, and each continuous part will be treated as a separate item by the byte buffer.

Retrieving/Returning The following diagrams illustrate the differences between No-Split and Allow-Split buffers as compared to byte buffers in retrieving and returning data.

Referring to the diagram above, the 16, 20, and 8 byte items are retrieved in FIFO order. However, the items are not returned in the order they were retrieved. First, the 20 byte item is returned followed by the 8 byte and the 16 byte items. The space is not freed until the first item, i.e., the 16 byte item is returned.
Byte buffers do not allow multiple retrievals before returning (every retrieval must be followed by a return before another retrieval is permitted). When using `xRingbufferReceive()` or `xRingbufferReceiveFromISR()`, all continuous stored data will be retrieved. `xRingbufferReceiveUpTo()` or `xRingbufferReceiveUpToFromISR()` can be used to restrict the maximum number of bytes retrieved. Since every retrieval must be followed by a return, the space will be freed as soon as the data is returned.

Referring to the diagram above, the 38 bytes of continuous stored data at the tail of the buffer is retrieved, returned, and freed. The next call to `xRingbufferReceive()` or `xRingbufferReceiveFromISR()` then wraps around and does the same to the 30 bytes of continuous stored data at the head of the buffer.

### Ring Buffers with Queue Sets

Ring buffers can be added to FreeRTOS queue sets using `xRingbufferAddToQueueSetRead()` such that every time a ring buffer receives an item or data, the queue set is notified. Once added to a queue set, every attempt to retrieve an item from a ring buffer should be preceded by a call to `xQueueSelectFromSet()`. To check whether the selected queue set member is the ring buffer, call `xRingbufferCanRead()`.

The following example demonstrates queue set usage with ring buffers.

```c
#include "freertos/queue.h"
#include "freertos/ringbuf.h"
...

//Create ring buffer and queue set
RingbufHandle_t buf_handle = xRingbufferCreate(1028, RINGBUF_TYPE_NOSPLIT);
QueueSetHandle_t queue_set = xQueueCreateSet(3);

//Add ring buffer to queue set
if (xRingbufferAddToQueueSetRead(buf_handle, queue_set) != pdTRUE) {
    printf("Failed to add to queue set\n");
}
...

//Block on queue set
QueueSetMemberHandle_t member = xQueueSelectFromSet(queue_set, pdMS_TO_TICKS(1000));

//Check if member is ring buffer
if (member != NULL && xRingbufferCanRead(buf_handle, member) == pdTRUE) {
    //Member is ring buffer, receive item from ring buffer
    size_t item_size;
    char *item = (char *)xRingbufferReceive(buf_handle, &item_size, 0);
    //Handle item
    ...
} else { }
```

### Ring Buffers with Static Allocation

The `xRingbufferCreateStatic()` can be used to create ring buffers with specific memory requirements (such as a ring buffer being allocated in external RAM). All blocks of memory used by a ring buffer must be manually allocated beforehand then passed to the `xRingbufferCreateStatic()` to be initialized as a ring buffer. These blocks include the following:

- The ring buffer’s data structure of type `StaticRingbuffer_t`
- The ring buffer’s storage area of size `xBUFFERSize`. Note that `xBUFFERSize` must be 32-bit aligned for No-Split and Allow-Split buffers.
The manner in which these blocks are allocated will depend on the users requirements (e.g. all blocks being statically declared, or dynamically allocated with specific capabilities such as external RAM).

**Note:** When deleting a ring buffer created via `xRingbufferCreateStatic()`, the function `vRingbufferDelete()` will not free any of the memory blocks. This must be done manually by the user after `vRingbufferDelete()` is called.

The code snippet below demonstrates a ring buffer being allocated entirely in external RAM.

```c
#include "freertos/ringbuf.h"
#include "freertos/semphr.h"
#include "esp_heap_caps.h"

#define BUFFER_SIZE 400  //32-bit aligned size
#define BUFFER_TYPE RINGBUF_TYPE_NOSPLIT
...

//Allocate ring buffer data structure and storage area into external RAM
StaticRingbuffer_t *buffer_struct = (StaticRingbuffer_t *)heap_caps_malloc(sizeof(StaticRingbuffer_t), MALLOC_CAP_SPIRAM);
uint8_t *buffer_storage = (uint8_t *)heap_caps_malloc(sizeof(uint8_t) * BUFFER_SIZE, MALLOC_CAP_SPIRAM);

//Create a ring buffer with manually allocated memory
RingbufHandle_t handle = xRingbufferCreateStatic(BUFFER_SIZE, BUFFER_TYPE, buffer_,
  storage, buffer_struct);
...

//Delete the ring buffer after used
vRingbufferDelete(handle);

//Manually free all blocks of memory
free(buffer_struct);
free(buffer_storage);
```

**Priority Inversion** Ideally, ring buffers can be used with multiple tasks in an SMP fashion where the highest priority task will always be serviced first. However due to the usage of binary semaphores in the ring buffer’s underlying implementation, priority inversion may occur under very specific circumstances.

The ring buffer governs sending by a binary semaphore which is given whenever space is freed on the ring buffer. The highest priority task waiting to send will repeatedly take the semaphore until sufficient free space becomes available or until it times out. Ideally this should prevent any lower priority tasks from being serviced as the semaphore should always be given to the highest priority task.

However, in between iterations of acquiring the semaphore, there is a gap in the critical section which may permit another task (on the other core or with an even higher priority) to free some space on the ring buffer and as a result give the semaphore. Therefore, the semaphore will be given before the highest priority task can re-acquire the semaphore. This will result in the semaphore being acquired by the second-highest priority task waiting to send, hence causing priority inversion.

This side effect will not affect ring buffer performance drastically given if the number of tasks using the ring buffer simultaneously is low, and the ring buffer is not operating near maximum capacity.

**ESP-IDF Tick and Idle Hooks**

FreeRTOS allows applications to provide a tick hook and an idle hook at compile time:

- FreeRTOS tick hook can be enabled via the `CONFIG_FREERTOS_USE_TICK_HOOK` option. The application must provide the `void vApplicationTickHook( void )` callback.
FreeRTOS idle hook can be enabled via the `CONFIG_FREERTOS_USE_IDLE_HOOK` option. The application must provide the `void vApplicationIdleHook( void )` callback.

However, the FreeRTOS tick hook and idle hook have the following drawbacks:

- The FreeRTOS hooks are registered at compile time
- Only one of each hook can be registered
- On multi-core targets, the FreeRTOS hooks are symmetric, meaning each CPU’s tick interrupt and idle tasks ends up calling the same hook.

Therefore, ESP-IDF tick and idle hooks are provided to supplement the features of FreeRTOS tick and idle hooks. The ESP-IDF hooks have the following features:

- The hooks can be registered and deregistered at run-time
- Multiple hooks can be registered (with a maximum of 8 hooks of each type per CPU)
- On multi-core targets, the hooks can be asymmetric, meaning different hooks can be registered to each CPU

ESP-IDF hooks can be registered and deregistered using the following API:

- For tick hooks:
  - Register using `esp_register_freertos_tick_hook()` or `esp_register_freertos_tick_hook_for_cpu()`  
  - Deregister using `esp_deregister_freertos_tick_hook()` or `esp_deregister_freertos_tick_hook_for_cpu()`

- For idle hooks:
  - Register using `esp_register_freertos_idle_hook()` or `esp_register_freertos_idle_hook_for_cpu()`  
  - Deregister using `esp_deregister_freertos_idle_hook()` or `esp_deregister_freertos_idle_hook_for_cpu()`

**Note:** The tick interrupt stays active while the cache is disabled, therefore any tick hook (FreeRTOS or ESP-IDF) functions must be placed in internal RAM. Please refer to the SPI flash API documentation for more details.

**TLSP Deletion Callbacks**

Vanilla FreeRTOS provides a Thread Local Storage Pointers (TLSP) feature. These are pointers stored directly in the Task Control Block (TCB) of a particular task. TLSPs allow each task to have its own unique set of pointers to data structures. Vanilla FreeRTOS expects users to:

- set a task’s TLSPs by calling `vTaskSetThreadLocalStoragePointer()` after the task has been created.
- get a task’s TLSPs by calling `pvTaskGetThreadLocalStoragePointer()` during the task’s life-time.
- free the memory pointed to by the TLSPs before the task is deleted.

However, there can be instances where users may want the freeing of TLSP memory to be automatic. Therefore, ESP-IDF provides the additional feature of TLSP deletion callbacks. These user provided deletion callbacks are called automatically when a task is deleted, thus allowing the TLSP memory to be cleaned up without needing to add the cleanup logic explicitly to the code of every task.

The TLSP deletion callbacks are set in a similar fashion to the TLSPs themselves.

- `vTaskSetThreadLocalStoragePointerAndDelCallback()` sets both a particular TLSP and its associated callback.
- Calling the Vanilla FreeRTOS function `vTaskSetThreadLocalStoragePointer()` will simply set the TLSP’s associated Deletion Callback to `NULL` meaning that no callback will be called for that TLSP during task deletion.

When implementing TLSP callbacks, users should note the following:

- The callback must never attempt to block or yield and critical sections should be kept as short as possible
• The callback is called shortly before a deleted task’s memory is freed. Thus, the callback can either be called from `vTaskDelete()` itself, or from the idle task.

Component Specific Properties

Besides standard component variables that are available with basic cmake build properties, FreeRTOS component also provides arguments (only one so far) for simpler integration with other modules:

• `ORIG_INCLUDE_PATH` - contains an absolute path to freertos root include folder. Thus instead of `#include "freertos/FreeRTOS.h"` you can refer to headers directly: `#include "FreeRTOS.h"`.

API Reference

Ring Buffer API

Header File

• components/esp_ringbuf/include/freertos/ringbuf.h

Functions

RingbufHandle_t xRingbufferCreate(size_t xBufferSize, RingbufferType_t xBufferType)

Create a ring buffer.

Note: xBufferSize of no-split/allow-split buffers will be rounded up to the nearest 32-bit aligned size.

Parameters

• xBufferSize – [in] Size of the buffer in bytes. Note that items require space for a header in no-split/allow-split buffers
• xBufferType – [in] Type of ring buffer, see documentation.

Returns A handle to the created ring buffer, or NULL in case of error.

RingbufHandle_t xRingbufferCreateNoSplit(size_t xItemSize, size_t xItemNum)

Create a ring buffer of type RINGBUF_TYPE_NOSPLIT for a fixed item_size.

This API is similar to xRingbufferCreate(), but it will internally allocate additional space for the headers.

Parameters

• xItemSize – [in] Size of each item to be put into the ring buffer
• xItemNum – [in] Maximum number of items the buffer needs to hold simultaneously

Returns A RingbufHandle_t handle to the created ring buffer, or NULL in case of error.

RingbufHandle_t xRingbufferCreateStatic(size_t xBufferSize, RingbufferType_t xBufferType, uint8_t *pucRingbufferStorage, StaticRingbuffer_t *pxStaticRingbuffer)

Create a ring buffer but manually provide the required memory.

Note: xBufferSize of no-split/allow-split buffers MUST be 32-bit aligned.

Parameters

• xBufferSize – [in] Size of the buffer in bytes.
• xBufferType – [in] Type of ring buffer, see documentation
• pucRingbufferStorage – [in] Pointer to the ring buffer’s storage area. Storage area must have the same size as specified by xBufferSize
**pxStaticRingbuffer**  – [in] Pointed to a struct of type StaticRingbuffer_t which will be used to hold the ring buffer’s data structure

**Returns** A handle to the created ring buffer

```c
BaseType_t xRingbufferSend(RingbufHandle_t xRingbuffer, const void *pvItem, size_t xItemSize, TickType_t xTicksToWait)
```

Insert an item into the ring buffer.

Attempt to insert an item into the ring buffer. This function will block until enough free space is available or until it times out.

**Note:** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Parameters**
- **xRingbuffer** – [in] Ring buffer to insert the item into
- **pvItem** – [in] Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **xItemSize** – [in] Size of data to insert.
- **xTicksToWait** – [in] Ticks to wait for room in the ring buffer.

**Returns**
- pdTRUE if succeeded
- pdFALSE on time-out or when the data is larger than the maximum permissible size of the buffer

```c
BaseType_t xRingbufferSendFromISR(RingbufHandle_t xRingbuffer, const void *pvItem, size_t xItemSize, BaseType_t *pxHigherPriorityTaskWoken)
```

Insert an item into the ring buffer in an ISR.

Attempt to insert an item into the ring buffer from an ISR. This function will return immediately if there is insufficient free space in the buffer.

**Note:** For no-split/allow-split ring buffers, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.

**Parameters**
- **xRingbuffer** – [in] Ring buffer to insert the item into
- **pvItem** – [in] Pointer to data to insert. NULL is allowed if xItemSize is 0.
- **xItemSize** – [in] Size of data to insert.
- **pxHigherPriorityTaskWoken** – [out] Value pointed to will be set to pdTRUE if the function woke up a higher priority task.

**Returns**
- pdTRUE if succeeded
- pdFALSE when the ring buffer does not have space.

```c
BaseType_t xRingbufferSendAcquire(RingbufHandle_t xRingbuffer, void **ppvItem, size_t xItemSize, TickType_t xTicksToWait)
```

Acquire memory from the ring buffer to be written to by an external source and to be sent later.

Attempt to allocate buffer for an item to be sent into the ring buffer. This function will block until enough free space is available or until it times out.

The item, as well as the following items SendAcquire or Send after it, will not be able to be read from the ring buffer until this item is actually sent into the ring buffer.

**Note:** Only applicable for no-split ring buffers now, the actual size of memory that the item will occupy will be rounded up to the nearest 32-bit aligned size. This is done to ensure all items are always stored in 32-bit aligned fashion.
aligned fashion.

**Parameters**
- `xRingbuffer` — [in] Ring buffer to allocate the memory
- `ppvItem` — [out] Double pointer to memory acquired (set to NULL if no memory were retrieved)
- `xItemSize` — [in] Size of item to acquire.
- `xTicksToWait` — [in] Ticks to wait for room in the ring buffer.

**Returns**
- `pdTRUE` if succeeded
- `pdFALSE` on time-out or when the data is larger than the maximum permissible size of the buffer

**BaseType_t xRingbufferSendComplete (RingbufHandle_t xRingbuffer, void *pvItem)**
Actually send an item into the ring buffer allocated before by `xRingbufferSendAcquire`.

**Note:** Only applicable for no-split ring buffers. Only call for items allocated by `xRingbufferSendAcquire`.

**Parameters**
- `xRingbuffer` — [in] Ring buffer to insert the item into
- `pvItem` — [in] Pointer to item in allocated memory to insert.

**Returns**
- `pdTRUE` if succeeded
- `pdFALSE` if fail for some reason.

void *xRingbufferReceive (RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait)
Retrieve an item from the ring buffer.
Attempt to retrieve an item from the ring buffer. This function will block until an item is available or until it times out.

**Note:** A call to `vRingbufferReturnItem()` is required after this to free the item retrieved.

**Parameters**
- `xRingbuffer` — [in] Ring buffer to retrieve the item from
- `pxItemSize` — [out] Pointer to a variable to which the size of the retrieved item will be written.
- `xTicksToWait` — [in] Ticks to wait for items in the ring buffer.

**Returns**
- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
- NULL on timeout, `*pxItemSize` is untouched in that case.

void *xRingbufferReceiveFromISR (RingbufHandle_t xRingbuffer, size_t *pxItemSize)
Retrieve an item from the ring buffer in an ISR.
Attempt to retrieve an item from the ring buffer. This function returns immediately if there are no items available for retrieval

**Note:** A call to `vRingbufferReturnItemFromISR()` is required after this to free the item retrieved.

**Note:** Byte buffers do not allow multiple retrievals before returning an item
Note: Two calls to RingbufferReceiveFromISR() are required if the bytes wrap around the end of the ring buffer.

Parameters
- **xRingbuffer** [in] Ring buffer to retrieve the item from
- **pxItemSize** [out] Pointer to a variable to which the size of the retrieved item will be written.

Returns
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty. *pxItemSize is untouched in that case.

BaseType_t `xRingbufferReceiveSplit` (`RingbufHandle_t` xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize, TickType_t xTicksToWait)

Retrieve a split item from an allow-split ring buffer.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function will block until an item is available or until it times out.

Note: Call(s) to vRingbufferReturnItem() is required after this to free up the item(s) retrieved.

Note: This function should only be called on allow-split buffers

Parameters
- **xRingbuffer** [in] Ring buffer to retrieve the item from
- **ppvHeadItem** [out] Double pointer to first part (set to NULL if no items were retrieved)
- **ppvTailItem** [out] Double pointer to second part (set to NULL if item is not split)
- **pxHeadItemSize** [out] Pointer to size of first part (unmodified if no items were retrieved)
- **pxTailItemSize** [out] Pointer to size of second part (unmodified if item is not split)
- **xTicksToWait** [in] Ticks to wait for items in the ring buffer.

Returns
- pdTRUE if an item (split or unsplit) was retrieved
- pdFALSE when no item was retrieved

BaseType_t `xRingbufferReceiveSplitFromISR` (`RingbufHandle_t` xRingbuffer, void **ppvHeadItem, void **ppvTailItem, size_t *pxHeadItemSize, size_t *pxTailItemSize)

Retrieve a split item from an allow-split ring buffer in an ISR.

Attempt to retrieve a split item from an allow-split ring buffer. If the item is not split, only a single item is retrieved. If the item is split, both parts will be retrieved. This function returns immediately if there are no items available for retrieval.

Note: Calls to vRingbufferReturnItemFromISR() is required after this to free up the item(s) retrieved.

Note: This function should only be called on allow-split buffers

Parameters
Chapter 2. API Reference

- `xRingbuffer` [in] Ring buffer to retrieve the item from
- `ppvHeadItem` [out] Double pointer to first part (set to NULL if no items were retrieved)
- `ppvTailItem` [out] Double pointer to second part (set to NULL if item is not split)
- `pxHeadItemSize` [out] Pointer to size of first part (unmodified if no items were retrieved)
- `pxTailItemSize` [out] Pointer to size of second part (unmodified if item is not split)

**Returns**
- `pdTRUE` if an item (split or unsplit) was retrieved
- `pdFALSE` when no item was retrieved

```c
void *xRingbufferReceiveUpTo(RingbufHandle_t xRingbuffer, size_t *pxItemSize, TickType_t xTicksToWait, size_t xMaxSize)
```

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve.

Attempt to retrieve data from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will block until there is data available for retrieval or until it times out.

**Note:** A call to `vRingbufferReturnItem()` is required after this to free up the data retrieved.

**Note:** This function should only be called on byte buffers

**Note:** Byte buffers do not allow multiple retrievals before returning an item

**Note:** Two calls to `RingbufferReceiveUpTo()` are required if the bytes wrap around the end of the ring buffer.

**Parameters**
- `xRingbuffer` [in] Ring buffer to retrieve the item from
- `pxItemSize` [out] Pointer to a variable to which the size of the retrieved item will be written.
- `xTicksToWait` [in] Ticks to wait for items in the ring buffer.
- `xMaxSize` [in] Maximum number of bytes to return.

**Returns**
- Pointer to the retrieved item on success; `*pxItemSize` filled with the length of the item.
- `NULL` on timeout, `*pxItemSize` is untouched in that case.

```c
void *xRingbufferReceiveUpToFromISR(RingbufHandle_t xRingbuffer, size_t *pxItemSize, size_t xMaxSize)
```

Retrieve bytes from a byte buffer, specifying the maximum amount of bytes to retrieve. Call this from an ISR.

Attempt to retrieve bytes from a byte buffer whilst specifying a maximum number of bytes to retrieve. This function will return immediately if there is no data available for retrieval.

**Note:** A call to `vRingbufferReturnItemFromISR()` is required after this to free up the data received.

**Note:** This function should only be called on byte buffers

**Note:** Byte buffers do not allow multiple retrievals before returning an item
Parameters
- `xRingbuffer` - **[in]** Ring buffer to retrieve the item from
- `pxItemSize` - **[out]** Pointer to a variable to which the size of the retrieved item will be written.
- `xMaxSize` - **[in]** Maximum number of bytes to return.

Returns
- Pointer to the retrieved item on success; *pxItemSize filled with the length of the item.
- NULL when the ring buffer is empty, *pxItemSize is untouched in that case.

```c
void vRingbufferReturnItem(RingbufHandle_t xRingbuffer, void *pvItem)
Return a previously-retrieved item to the ring buffer.
```

Note: If a split item is retrieved, both parts should be returned by calling this function twice.

Parameters
- `xRingbuffer` - **[in]** Ring buffer the item was retrieved from
- `pvItem` - **[in]** Item that was received earlier

```c
void vRingbufferReturnItemFromISR(RingbufHandle_t xRingbuffer, void *pvItem, BaseType_t *pxHigherPriorityTaskWoken)
Return a previously-retrieved item to the ring buffer from an ISR.
```

Note: If a split item is retrieved, both parts should be returned by calling this function twice.

Parameters
- `xRingbuffer` - **[in]** Ring buffer the item was retrieved from
- `pvItem` - **[in]** Item that was received earlier
- `pxHigherPriorityTaskWoken` - **[out]** Value pointed to will be set to **pdTRUE** if the function woke up a higher priority task.

```c
void vRingbufferDelete(RingbufHandle_t xRingbuffer)
Delete a ring buffer.
```

Note: This function will not deallocate any memory if the ring buffer was created using `xRingbufferCreateStatic()`. Deallocation must be done manually by the user.

Parameters `xRingbuffer` - **[in]** Ring buffer to delete

```c
size_t xRingbufferGetMaxItemSize(RingbufHandle_t xRingbuffer)
Get maximum size of an item that can be placed in the ring buffer.
```

This function returns the maximum size an item can have if it was placed in an empty ring buffer.

Note: The max item size for a no-split buffer is limited to `((buffer_size/2)-header_size)`. This limit is imposed so that an item of max item size can always be sent to an empty no-split buffer regardless of the internal positions of the buffer’s read/write/free pointers.

Parameters `xRingbuffer` - **[in]** Ring buffer to query

Returns Maximum size, in bytes, of an item that can be placed in a ring buffer.
size_t xRingbufferGetCurFreeSize(RingbufHandle_t xRingbuffer)
Get current free size available for an item/data in the buffer.

This gives the real time free space available for an item/data in the ring buffer. This represents the maximum size an item/data can have if it was currently sent to the ring buffer.

**Note:** An empty no-split buffer has a max current free size for an item that is limited to ((buffer_size/2)-header_size). See API reference for xRingbufferGetMaxItemSize().

---

**Warning:** This API is not thread safe. So, if multiple threads are accessing the same ring buffer, it is the application’s responsibility to ensure atomic access to this API and the subsequent Send

### Parameters
- **xRingbuffer** - [in] Ring buffer to query

### Returns
- Current free size, in bytes, available for an entry

---

 BaseType_t xRingbufferAddToQueueSetRead(RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)
Add the ring buffer’s read semaphore to a queue set.

The ring buffer’s read semaphore indicates that data has been written to the ring buffer. This function adds the ring buffer’s read semaphore to a queue set.

**Parameters**
- **xRingbuffer** - [in] Ring buffer to add to the queue set
- **xQueueSet** - [in] Queue set to add the ring buffer’s read semaphore to

**Returns**
- pdTRUE on success, pdFALSE otherwise

---

 BaseType_t xRingbufferCanRead(RingbufHandle_t xRingbuffer, QueueSetMemberHandle_t xMember)
Check if the selected queue set member is the ring buffer’s read semaphore.

This API checks if queue set member returned from xQueueSelectFromSet() is the read semaphore of this ring buffer. If so, this indicates the ring buffer has items waiting to be retrieved.

**Parameters**
- **xRingbuffer** - [in] Ring buffer which should be checked
- **xMember** - [in] Member returned from xQueueSelectFromSet

**Returns**
- pdTRUE when semaphore belongs to ring buffer
- pdFALSE otherwise.

---

 BaseType_t xRingbufferRemoveFromQueueSetRead(RingbufHandle_t xRingbuffer, QueueSetHandle_t xQueueSet)
Remove the ring buffer’s read semaphore from a queue set.

This specifically removes a ring buffer’s read semaphore from a queue set. The read semaphore is used to indicate when data has been written to the ring buffer

**Parameters**
- **xRingbuffer** - [in] Ring buffer to remove from the queue set
- **xQueueSet** - [in] Queue set to remove the ring buffer’s read semaphore from

**Returns**
- pdTRUE on success
- pdFALSE otherwise

---

void vRingbufferGetInfo(RingbufHandle_t xRingbuffer, UBaseType_t *uxFree, UBaseType_t *uxRead, UBaseType_t *uxWrite, UBaseType_t *uxAcquire, UBaseType_t *uxItemsWaiting)
Get information about ring buffer status.

Get information of a ring buffer’s current status such as free/read/write/acquire pointer positions, and number of items waiting to be retrieved. Arguments can be set to NULL if they are not required.

**Parameters**
- **xRingbuffer** –[in] Ring buffer to remove from the queue set
- **uxFree** –[out] Pointer use to store free pointer position
- **uxRead** –[out] Pointer use to store read pointer position
- **uxWrite** –[out] Pointer use to store write pointer position
- **uxAcquire** –[out] Pointer use to store acquire pointer position
- **uxItemsWaiting** –[out] Pointer use to store number of items (bytes for byte buffer) waiting to be retrieved

```c
void xRingbufferPrintInfo (RingbufHandle_t xRingbuffer)
```
Debugging function to print the internal pointers in the ring buffer.

**Parameters**
- **xRingbuffer** –Ring buffer to show

**Structures**

```c
struct xSTATIC_RINGBUFFER
```
Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

**Type Definitions**

```c
typedef void *RingbufHandle_t
```
Type by which ring buffers are referenced. For example, a call to xRingbufferCreate() returns a RingbufHandle_t variable that can then be used as a parameter to xRingbufferSend(), xRingbufferReceive(), etc.

```c
typedef struct xSTATIC_RINGBUFFER StaticRingbuffer_t
```
Struct that is equivalent in size to the ring buffer’s data structure.

The contents of this struct are not meant to be used directly. This structure is meant to be used when creating a statically allocated ring buffer where this struct is of the exact size required to store a ring buffer’s control data structure.

**Enumerations**

```c
enum RingbufferType_t
```
Values:

- **RINGBUF_TYPE_NOSPLIT**
  No-split buffers will only store an item in contiguous memory and will never split an item. Each item requires an 8 byte overhead for a header and will always internally occupy a 32-bit aligned size of space.

- **RINGBUF_TYPE_ALLOWSPLIT**
  Allow-split buffers will split an item into two parts if necessary in order to store it. Each item requires an 8 byte overhead for a header, splitting incurs an extra header. Each item will always internally occupy a 32-bit aligned size of space.
enumerator **RINGBUF_TYPE_BYTEBUF**

Byte buffers store data as a sequence of bytes and do not maintain separate items, therefore byte buffers have no overhead. All data is stored as a sequence of byte and any number of bytes can be sent or retrieved each time.

enumerator **RINGBUF_TYPE_MAX**

## Hooks API

### Header File

- components/esp_system/include/esp_freertos_hooks.h

### Functions

```c
esp_err_t esp_register_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t new_idle_cb, UBaseType_t cpuid)
```

Register a callback to be called from the specified core’s idle hook. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning:** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**Parameters**
- new_idle_cb –[in] Callback to be called
- cpuid –[in] id of the core

**Returns**
- ESP_OK: Callback registered to the specified core’s idle hook
- ESP_ERR_NO_MEM: No more space on the specified core’s idle hook to register callback
- ESP_ERR_INVALID_ARG: cpuid is invalid

```c
esp_err_t esp_register_freertos_idle_hook(esp_freertos_idle_cb_t new_idle_cb)
```

Register a callback to the idle hook of the core that calls this function. The callback should return true if it should be called by the idle hook once per interrupt (or FreeRTOS tick), and return false if it should be called repeatedly as fast as possible by the idle hook.

**Warning:** Idle callbacks MUST NOT, UNDER ANY CIRCUMSTANCES, CALL A FUNCTION THAT MIGHT BLOCK.

**Parameters**
- new_idle_cb –[in] Callback to be called

**Returns**
- ESP_OK: Callback registered to the calling core’s idle hook
- ESP_ERR_NO_MEM: No more space on the calling core’s idle hook to register callback

```c
esp_err_t esp_register_freertos_tick_hook_for_cpu(esp_freertos_tick_cb_t new_tick_cb, UBaseType_t cpuid)
```

Register a callback to be called from the specified core’s tick hook.

**Parameters**
- new_tick_cb –[in] Callback to be called
- cpuid –[in] id of the core
Returns

- ESP_OK: Callback registered to specified core’s tick hook
- ESP_ERR_NO_MEM: No more space on the specified core’s tick hook to register the callback
- ESP_ERR_INVALID_ARG: cpuID is invalid

`esp_err_t esp_register_freertos_tick_hook(esp_freertos_tick_cb_t new_tick_cb)`

Register a callback to be called from the calling core’s tick hook.

**Parameters**

new_tick_cb - [in] Callback to be called

**Returns**

- ESP_OK: Callback registered to the calling core’s tick hook
- ESP_ERR_NO_MEM: No more space on the calling core’s tick hook to register the callback

`void esp_deregister_freertos_idle_hook_for_cpu(esp_freertos_idle_cb_t old_idle_cb, UBaseType_t cpuid)`

Unregister an idle callback from the idle hook of the specified core.

**Parameters**

- old_idle_cb - [in] Callback to be unregistered
- cpuid - [in] id of the core

`void esp_deregister_freertos_idle_hook(esp_freertos_idle_cb_t old_idle_cb)`

Unregister an idle callback. If the idle callback is registered to the idle hooks of both cores, the idle hook will be unregistered from both cores.

**Parameters**

- old_idle_cb - [in] Callback to be unregistered

`void esp_deregister_freertos_tick_hook_for_cpu(esp_freertos_tick_cb_t old_tick_cb, UBaseType_t cpuid)`

Unregister a tick callback from the tick hook of the specified core.

**Parameters**

- old_tick_cb - [in] Callback to be unregistered
- cpuid - [in] id of the core

`void esp_deregister_freertos_tick_hook(esp_freertos_tick_cb_t old_tick_cb)`

Unregister a tick callback. If the tick callback is registered to the tick hooks of both cores, the tick hook will be unregistered from both cores.

**Parameters**

- old_tick_cb - [in] Callback to be unregistered

**Type Definitions**

typedef bool (*esp_freertos_idle_cb_t)(void)

typedef void (*esp_freertos_tick_cb_t)(void)

**2.10.13 Heap Memory Allocation**

**Stack and Heap**

ESP-IDF applications use the common computer architecture patterns of stack (dynamic memory allocated by program control flow) and heap (dynamic memory allocated by function calls), as well as statically allocated memory (allocated at compile time).

Because ESP-IDF is a multi-threaded RTOS environment, each RTOS task has its own stack. By default, each of these stacks is allocated from the heap when the task is created. (See `xTaskCreateStatic()` for the alternative where stacks are statically allocated.)
Because ESP32 uses multiple types of RAM, it also contains multiple heaps with different capabilities. A capabilities-based memory allocator allows apps to make heap allocations for different purposes.

For most purposes, the standard libc `malloc()` and `free()` functions can be used for heap allocation without any special consideration.

However, in order to fully make use of all of the memory types and their characteristics, ESP-IDF also has a capabilities-based heap memory allocator. If you want to have memory with certain properties (for example, DMA-Capable Memory or executable-memory), you can create an OR-mask of the required capabilities and pass that to `heap_caps_malloc()`.

### Memory Capabilities

The ESP32 contains multiple types of RAM:

- **DRAM** (Data RAM) is memory used to hold data. This is the most common kind of memory accessed as heap.
- **IRAM** (Instruction RAM) usually holds executable data only. If accessed as generic memory, all accesses must be **32-bit aligned**.
- **D/IRAM** is RAM which can be used as either Instruction or Data RAM.

For more details on these internal memory types, see Memory Types.

It’s also possible to connect external SPI RAM to the ESP32 - external RAM can be integrated into the ESP32’s memory map using the flash cache, and accessed similarly to DRAM.

DRAM uses capability `MALLOC_CAP_8BIT` (accessible in single byte reads and writes). To test the free DRAM heap size at runtime, call `cpp:func:heap_caps_get_free_size(MALLOC_CAP_8BIT)`.

When calling `malloc()`, the ESP-IDF `malloc()` implementation internally calls `cpp:func:heap_caps_malloc_default(size)`. This will allocate memory with capability `MALLOC_CAP_DEFAULT`, which is byte-addressable.

Because `malloc` uses the capabilities-based allocation system, memory allocated using `heap_caps_malloc()` can be freed by calling the standard `free()` function.

### Available Heap

**DRAM** At startup, the DRAM heap contains all data memory which is not statically allocated by the app. Reducing statically allocated buffers will increase the amount of available free heap.

To find the amount of statically allocated memory, use the `idf.py size` command.

**Note:** Due to a technical limitation, the maximum statically allocated DRAM usage is 160KB. The remaining 160KB (for a total of 320KB of DRAM) can only be allocated at runtime as heap.

**Note:** At runtime, the available heap DRAM may be less than calculated at compile time, because at startup some memory is allocated from the heap before the FreeRTOS scheduler is started (including memory for the stacks of initial FreeRTOS tasks).

**IRAM** At startup, the IRAM heap contains all instruction memory which is not used by the app executable code.

The `idf.py size` command can be used to find the amount of IRAM used by the app.

**D/IRAM** Some memory in the ESP32 is available as either DRAM or IRAM. If memory is allocated from a D/IRAM region, the free heap size for both types of memory will decrease.
Heap Sizes At startup, all ESP-IDF apps log a summary of all heap addresses (and sizes) at level Info:

<table>

Finding available heap See Heap Information.

Special Capabilities

DMA-Capable Memory Use the MALLOC_CAP_DMA flag to allocate memory which is suitable for use with hardware DMA engines (for example SPI and I2S). This capability flag excludes any external PSRAM.

32-Bit Accessible Memory If a certain memory structure is only addressed in 32-bit units, for example an array of ints or pointers, it can be useful to allocate it with the MALLOC_CAP_32BIT flag. This also allows the allocator to give out IRAM memory; something which it can’t do for a normal malloc() call. This can help to use all the available memory in the ESP32.

Memory allocated with MALLOC_CAP_32BIT can only be accessed via 32-bit reads and writes, any other type of access will generate a fatal LoadStoreError exception.

External SPI Memory When external RAM is enabled, external SPI RAM under 4MiB in size can be allocated using standard malloc calls, or via heap_caps_malloc(MALLOC_CAP_SPIRAM), depending on configuration. See Configuring External RAM for more details.

To use the region above the 4MiB limit, you can use the himem API.

Thread Safety

Heap functions are thread safe, meaning they can be called from different tasks simultaneously without any limitations.

It is technically possible to call malloc, free, and related functions from interrupt handler (ISR) context (see Calling heap related functions from ISR). However this is not recommended, as heap function calls may delay other interrupts. It is strongly recommended to refactor applications so that any buffers used by an ISR are pre-allocated outside of the ISR. Support for calling heap functions from ISRs may be removed in a future update.

Calling heap related functions from ISR

The following functions from the heap component can be called form interrupt handler (ISR):

- heap_caps_malloc()
- heap_caps_malloc_default()
- heap_caps_realloc_default()
- heap_caps_malloc_prefer()
- heap_caps_realloc_prefer()
- heap_caps_calloc_prefer()
- heap_caps_free()
- heap_caps_realloc()
- heap_caps_calloc()
- heap_caps_aligned_alloc()
- heap_caps_aligned_free()

Note however this practice is strongly discouraged.
Heap Tracing & Debugging

The following features are documented on the Heap Memory Debugging page:

- Heap Information (free space, etc.)
- Heap Corruption Detection
- Heap Tracing (memory leak detection, monitoring, etc.)

Implementation Notes

Knowledge about the regions of memory in the chip comes from the “soc” component, which contains memory layout information for the chip, and the different capabilities of each region. Each region’s capabilities are prioritised, so that (for example) dedicated DRAM and IRAM regions will be used for allocations ahead of the more versatile D/IRAM regions.

Each contiguous region of memory contains its own memory heap. The heaps are created using the multi_heap functionality. multi_heap allows any contiguous region of memory to be used as a heap.

The heap capabilities allocator uses knowledge of the memory regions to initialize each individual heap. Allocation functions in the heap capabilities API will find the most appropriate heap for the allocation (based on desired capabilities, available space, and preferences for each region’s use) and then calling multi_heap_malloc() for the heap situated in that particular region.

Calling free() involves finding the particular heap corresponding to the freed address, and then calling multi_heap_free() on that particular multi_heap instance.

API Reference - Heap Allocation

Header File

- components/heap/include/esp_heap_caps.h

Functions

esp_err_t heap_caps_register_failed_alloc_callback (esp_alloc_failed_hook_t callback)

registers a callback function to be invoked if a memory allocation operation fails

Parameters callback – caller defined callback to be invoked

Returns ESP_OK if callback was registered.

void *heap_caps_malloc (size_t size, uint32_t caps)

Allocate a chunk of memory which has the given capabilities.

Equivalent semantics to libc malloc(), for capability-aware memory.

Parameters

- size – Size, in bytes, of the amount of memory to allocate
- caps – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

Returns A pointer to the memory allocated on success, NULL on failure

void heap_caps_free (void *ptr)

Free memory previously allocated via heap_caps_malloc() or heap_caps_realloc().

Equivalent semantics to libc free(), for capability-aware memory.

In IDF, free(p) is equivalent to heap_caps_free(p).

Parameters ptr – Pointer to memory previously returned from heap_caps_malloc() or heap_caps_realloc(). Can be NULL.
void *heap_caps_realloc(void *ptr, size_t size, uint32_t caps)
Reallocate memory previously allocated via heap_caps_malloc() or heap_caps_realloc().
Equivalent semantics to libc realloc(), for capability-aware memory.
In IDF, realloc(p, s) is equivalent to heap_caps_realloc(p, s, MALLOC_CAP_8BIT).
‘caps’ parameter can be different to the capabilities that any original ‘ptr’ was allocated with. In this way, realloc can be used to ‘move’ a buffer if necessary to ensure it meets a new set of capabilities.

Parameters
  • ptr – Pointer to previously allocated memory, or NULL for a new allocation.
  • size – Size of the new buffer requested, or 0 to free the buffer.
  • caps – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory desired for the new allocation.

Returns Pointer to a new buffer of size ‘size’ with capabilities ‘caps’, or NULL if allocation failed.

void *heap_caps_aligned_alloc(size_t alignment, size_t size, uint32_t caps)
Allocate an aligned chunk of memory which has the given capabilities.
Equivalent semantics to libc aligned_alloc(), for capability-aware memory.

Parameters
  • alignment – How the pointer received needs to be aligned must be a power of two
  • size – Size in bytes, of the amount of memory to allocate
  • caps – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

Returns A pointer to the memory allocated on success, NULL on failure

void heap_caps_aligned_free(void *ptr)
Used to deallocate memory previously allocated with heap_caps_aligned_alloc.

Note: This function is deprecated, please consider using heap_caps_free() instead

Parameters ptr – Pointer to the memory allocated

void *heap_caps_aligned_calloc(size_t alignment, size_t n, size_t size, uint32_t caps)
Allocate an aligned chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.

Parameters
  • alignment – How the pointer received needs to be aligned must be a power of two
  • n – Number of continuing chunks of memory to allocate
  • size – Size in bytes, of a chunk of memory to allocate
  • caps – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned

Returns A pointer to the memory allocated on success, NULL on failure

void *heap_caps_calloc(size_t n, size_t size, uint32_t caps)
Allocate a chunk of memory which has the given capabilities. The initialized value in the memory is set to zero.
Equivalent semantics to libc calloc(), for capability-aware memory.
In IDF, calloc(p) is equivalent to heap_caps_calloc(p, MALLOC_CAP_8BIT).

Parameters
  • n – Number of continuing chunks of memory to allocate
  • size – Size in bytes, of a chunk of memory to allocate
  • caps – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory to be returned
Chapter 2. API Reference

**Returns**  A pointer to the memory allocated on success, NULL on failure

```c
size_t heap_caps_get_total_size (uint32_t caps)
```

Get the total size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the total space they have.

**Parameters**  `caps`  – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

**Returns**  Total size in bytes

```c
size_t heap_caps_get_free_size (uint32_t caps)
```

Get the total free size of all the regions that have the given capabilities.

This function takes all regions capable of having the given capabilities allocated in them and adds up the free space they have.

**Note:**  Note that because of heap fragmentation it is probably not possible to allocate a single block of memory of this size. Use `heap_caps_get_largest_free_block()` for this purpose.

**Parameters**  `caps`  – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

**Returns**  Amount of free bytes in the regions

```c
size_t heap_caps_get_minimum_free_size (uint32_t caps)
```

Get the total minimum free memory of all regions with the given capabilities.

This adds all the low watermarks of the regions capable of delivering the memory with the given capabilities.

**Note:**  Note the result may be less than the global all-time minimum available heap of this kind, as “low watermarks” are tracked per-region. Individual regions’ heaps may have reached their “low watermarks” at different points in time. However, this result still gives a “worst case” indication for all-time minimum free heap.

**Parameters**  `caps`  – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

**Returns**  Amount of free bytes in the regions

```c
size_t heap_caps_get_largest_free_block (uint32_t caps)
```

Get the largest free block of memory able to be allocated with the given capabilities.

Returns the largest value of $s$ for which `heap_caps_malloc(s, caps)` will succeed.

**Parameters**  `caps`  – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

**Returns**  Size of the largest free block in bytes.

```c
void heap_caps_get_info (multi_heap_info_t *info, uint32_t caps)
```

Get heap info for all regions with the given capabilities.

Calls `multi_heap_info()` on all heaps which share the given capabilities. The information returned is an aggregate across all matching heaps. The meanings of fields are the same as defined for `multi_heap_info_t`, except that `minimum_free_bytes` has the same caveats described in `heap_caps_get_minimum_free_size()`.

**Parameters**

- `info`  – Pointer to a structure which will be filled with relevant heap metadata.
- `caps`  – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

```c
void heap_caps_print_heap_info (uint32_t caps)
```

Print a summary of all memory with the given capabilities.

Calls `multi_heap_info` on all heaps which share the given capabilities, and prints a two-line summary for each, then a total summary.
Parameters **caps** – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

bool **heap_caps_check_integrity_all** (bool print_errors)

Check integrity of all heap memory in the system.

Calls multi_heap_check on all heaps. Optionally print errors if heaps are corrupt.

Calling this function is equivalent to calling heap_caps_check_integrity with the caps argument set to MALLOC_CAP_INVALID.

Parameters **print_errors** – Print specific errors if heap corruption is found.

Returns True if all heaps are valid, False if at least one heap is corrupt.

bool **heap_caps_check_integrity** (uint32_t caps, bool print_errors)

Check integrity of all heaps with the given capabilities.

Calls multi_heap_check on all heaps which share the given capabilities. Optionally print errors if the heaps are corrupt.

See also heap_caps_check_integrity_all to check all heap memory in the system and heap_caps_check_integrity_addr to check memory around a single address.

Parameters

• **caps** – Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

• **print_errors** – Print specific errors if heap corruption is found.

Returns True if all heaps are valid, False if at least one heap is corrupt.

bool **heap_caps_check_integrity_addr** (intptr_t addr, bool print_errors)

Check integrity of heap memory around a given address.

This function can be used to check the integrity of a single region of heap memory, which contains the given address.

This can be useful if debugging heap integrity for corruption at a known address, as it has a lower overhead than checking all heap regions. Note that if the corrupt address moves around between runs (due to timing or other factors) then this approach won’t work, and you should call heap_caps_check_integrity or heap_caps_check_integrity_all instead.

**Note:** The entire heap region around the address is checked, not only the adjacent heap blocks.

Parameters

• **addr** – Address in memory. Check for corruption in region containing this address.

• **print_errors** – Print specific errors if heap corruption is found.

Returns True if the heap containing the specified address is valid, False if at least one heap is corrupt or the address doesn’t belong to a heap region.

void **heap_caps_malloc_extmem_enable** (size_t limit)

Enable malloc() in external memory and set limit below which malloc() attempts are placed in internal memory.

When external memory is in use, the allocation strategy is to initially try to satisfy smaller allocation requests with internal memory and larger requests with external memory. This sets the limit between the two, as well as generally enabling allocation in external memory.

Parameters **limit** – Limit, in bytes.

void * **heap_caps_malloc_prefer** (size_t size, size_t num, ...)

Allocate a chunk of memory as preference in decreasing order.

**Attention** The variable parameters are bitwise OR of MALLOC_CAP_* flags indicating the type of memory.

This API prefers to allocate memory with the first parameter. If failed, allocate memory with the next parameter. It will try in this order until allocating a chunk of memory successfully or fail to allocate memories with any of the parameters.
Chapter 2. API Reference

Parameters
- **size** - Size, in bytes, of the amount of memory to allocate
- **num** - Number of variable parameters

Returns A pointer to the memory allocated on success, NULL on failure

```c
void *heap_caps_realloc_prefer (void *ptr, size_t size, size_t num, ...)
```

Reallocate a chunk of memory as preference in decreasing order.

Parameters
- **ptr** - Pointer to previously allocated memory, or NULL for a new allocation.
- **size** - Size of the new buffer requested, or 0 to free the buffer.
- **num** - Number of variable parameters

Returns Pointer to a new buffer of size ‘size’, or NULL if allocation failed.

```c
void *heap_caps_calloc_prefer (size_t n, size_t size, size_t num, ...)
```

Allocate a chunk of memory as preference in decreasing order.

Parameters
- **n** - Number of continuing chunks of memory to allocate
- **size** - Size, in bytes, of a chunk of memory to allocate
- **num** - Number of variable parameters

Returns A pointer to the memory allocated on success, NULL on failure

```c
void heap_caps_dump (uint32_t caps)
```

Dump the full structure of all heaps with matching capabilities.

Prints a large amount of output to serial (because of locking limitations, the output bypasses stdout/stderr).

For each (variable sized) block in each matching heap, the following output is printed on a single line:

- Block address (the data buffer returned by malloc is 4 bytes after this if heap debugging is set to Basic, or 8 bytes otherwise).
- Data size (the data size may be larger than the size requested by malloc, either due to heap fragmentation or because of heap debugging level).
- Address of next block in the heap.
- If the block is free, the address of the next free block is also printed.

Parameters **caps** - Bitwise OR of MALLOC_CAP_* flags indicating the type of memory

```c
void heap_caps_dump_all (void)
```

Dump the full structure of all heaps.

Covers all registered heaps. Prints a large amount of output to serial.

Output is the same as for heap_caps_dump.

```c
size_t heap_caps_get_allocated_size (void *ptr)
```

Return the size that a particular pointer was allocated with.

**Note:** The app will crash with an assertion failure if the pointer is not valid.

Parameters **ptr** - Pointer to currently allocated heap memory. Must be a pointer value previously returned by heap_caps_malloc, malloc, calloc, etc. and not yet freed.

Arguments **ptr**

Returns Size of the memory allocated at this block.

**Macros**
Chapter 2. API Reference

**MALLOC_CAP_EXEC**
Flags to indicate the capabilities of the various memory systems.
Memory must be able to run executable code.

**MALLOC_CAP_32BIT**
Memory must allow for aligned 32-bit data accesses.

**MALLOC_CAP_8BIT**
Memory must allow for 8/16/…-bit data accesses.

**MALLOC_CAP_DMA**
Memory must be able to accessed by DMA.

**MALLOC_CAP_PID2**
Memory must be mapped to PID2 memory space (PIDs are not currently used)

**MALLOC_CAP_PID3**
Memory must be mapped to PID3 memory space (PIDs are not currently used)

**MALLOC_CAP_PID4**
Memory must be mapped to PID4 memory space (PIDs are not currently used)

**MALLOC_CAP_PID5**
Memory must be mapped to PID5 memory space (PIDs are not currently used)

**MALLOC_CAP_PID6**
Memory must be mapped to PID6 memory space (PIDs are not currently used)

**MALLOC_CAP_PID7**
Memory must be mapped to PID7 memory space (PIDs are not currently used)

**MALLOC_CAP_SPIRAM**
Memory must be in SPI RAM.

**MALLOC_CAP_INTERNAL**
Memory must be internal; specifically it should not disappear when flash/spiram cache is switched off.

**MALLOC_CAP_DEFAULT**
Memory can be returned in a non-capability-specific memory allocation (e.g. malloc(), calloc()) call.

**MALLOC_CAP_IRAM_8BIT**
Memory must be in IRAM and allow unaligned access.

**MALLOC_CAP_RETENTION**
Memory must be able to accessed by retention DMA.

**MALLOC_CAP_RTCRAM**
Memory must be in RTC fast memory.
**MALLOC_CAP_INVALID**

Memory can’t be used / list end marker.

**Type Definitions**

typedef void (*esp_alloc_failed_hook_t)(size_t size, uint32_t caps, const char *function_name)

callback called when an allocation operation fails, if registered

- **Param size** in bytes of failed allocation
- **Param caps** capabilities requested of failed allocation
- **Param function_name** function which generated the failure

**API Reference - Initialisation**

**Header File**

- components/heap/include/esp_heap_caps_init.h

**Functions**

`void heap_caps_init (void)`

Initialize the capability-aware heap allocator.

This is called once in the IDF startup code. Do not call it at other times.

`void heap_caps_enable_nonos_stack_heaps (void)`

Enable heap(s) in memory regions where the startup stacks are located.

On startup, the pro/app CPUs have a certain memory region they use as stack, so we cannot do allocations in the regions these stack frames are. When FreeRTOS is completely started, they do not use that memory anymore and heap(s) there can be enabled.

`esp_err_t heap_caps_add_region (intptr_t start, intptr_t end)`

Add a region of memory to the collection of heaps at runtime.

Most memory regions are defined in soc_memory_layout.c for the SoC, and are registered via heap_caps_init(). Some regions can’t be used immediately and are later enabled via heap_caps_enable_nonos_stack_heaps().

Call this function to add a region of memory to the heap at some later time.

This function does not consider any of the “reserved” regions or other data in soc_memory_layout, caller needs to consider this themselves.

All memory within the region specified by start & end parameters must be otherwise unused.

The capabilities of the newly registered memory will be determined by the start address, as looked up in the regions specified in soc_memory_layout.c.

Use heap_caps_add_region_with_caps() to register a region with custom capabilities.

**Note:** Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

<table>
<thead>
<tr>
<th>Existing region: 0x1000 &lt;-&gt; 0x3000</th>
</tr>
</thead>
<tbody>
<tr>
<td>New region: 0x1000 &lt;-&gt; 0x3000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x1000 &lt;-&gt; 0x2000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x0000 &lt;-&gt; 0x1000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x3000 &lt;-&gt; 0x4000 (Allowed)</td>
</tr>
<tr>
<td>New region: 0x0000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region: 0x0100 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
<tr>
<td>New region: 0x2000 &lt;-&gt; 0x4000 (NOT Allowed)</td>
</tr>
</tbody>
</table>
Parameters

- **start** – Start address of new region.
- **end** – End address of new region.

Returns ESP_OK on success, ESP_ERR_INVALID_ARG if a parameter is invalid, ESP_ERR_NOT_FOUND if the specified start address doesn’t reside in a known region, or any error returned by heap_caps_add_region_with_caps().

```c
esp_err_t heap_caps_add_region_with_caps(const uint32_t caps[], intptr_t start, intptr_t end)
```

Add a region of memory to the collection of heaps at runtime, with custom capabilities.

Similar to `heap_caps_add_region()`, only custom memory capabilities are specified by the caller.

**Note:** Please refer to following example for memory regions allowed for addition to heap based on an existing region (address range for demonstration purpose only):

| Existing region: 0x1000 <-> 0x3000 |
|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|
| New region:     0x1000 <-> 0x3000 (Allowed) |
| New region:     0x1000 <-> 0x2000 (Allowed) |
| New region:     0x0000 <-> 0x1000 (Allowed) |
| New region:     0x3000 <-> 0x4000 (Allowed) |
| New region:     0x0000 <-> 0x2000 (NOT Allowed) |
| New region:     0x0000 <-> 0x4000 (NOT Allowed) |
| New region:     0x1000 <-> 0x4000 (NOT Allowed) |
| New region:     0x2000 <-> 0x4000 (NOT Allowed) |

Parameters

- **caps** – Ordered array of capability masks for the new region, in order of priority. Must have length SOC_MEMORY_TYPE_NO_PRIOS. Does not need to remain valid after the call returns.
- **start** – Start address of new region.
- **end** – End address of new region.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if a parameter is invalid
- ESP_ERR_NO_MEM if no memory to register new heap.
- ESP_ERR_INVALID_SIZE if the memory region is too small to fit a heap
- ESP_FAIL if region overlaps the start and/or end of an existing region

API Reference - Multi Heap API

(Note: The multi heap API is used internally by the heap capabilities allocator. Most IDF programs will never need to call this API directly.)

**Header File**

- components/heap/include/multi_heap.h

**Functions**

- `multi_heap_aligned_alloc(multi_heap_handle_t heap, size_t size, size_t alignment)`

allocate a chunk of memory with specific alignment

**Parameters**

- **heap** – Handle to a registered heap.
- **size** – Size in bytes of memory chunk
• **alignment** – how the memory must be aligned

**Returns** pointer to the memory allocated, NULL on failure

```c
void *multi_heap_malloc (multi_heap_handle_t heap, size_t size)
```

`malloc()` a buffer in a given heap

Semantics are the same as standard `malloc()`, only the returned buffer will be allocated in the specified heap.

**Parameters**

- **heap** – Handle to a registered heap.
- **size** – Size of desired buffer.

**Returns** Pointer to new memory, or NULL if allocation fails.

```c
void multi_heap_aligned_free (multi_heap_handle_t heap, void *p)
```

`free()` a buffer aligned in a given heap.

**Note:** This function is deprecated, consider using `multi_heap_free()` instead

**Parameters**

- **heap** – Handle to a registered heap.
- **p** – NULL, or a pointer previously returned from `multi_heap_aligned_alloc()` for the same heap.

```c
void multi_heap_free (multi_heap_handle_t heap, void *p)
```

`free()` a buffer in a given heap.

Semantics are the same as standard `free()`, only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Parameters**

- **heap** – Handle to a registered heap.
- **p** – NULL, or a pointer previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.

```c
void *multi_heap_realloc (multi_heap_handle_t heap, void *p, size_t size)
```

`realloc()` a buffer in a given heap.

Semantics are the same as standard `realloc()`, only the argument ‘p’ must be NULL or have been allocated in the specified heap.

**Parameters**

- **heap** – Handle to a registered heap.
- **p** – NULL, or a pointer previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.
- **size** – Desired new size for buffer.

**Returns** New buffer of `size` containing contents of ‘p’, or NULL if reallocation failed.

```c
size_t multi_heap_get_allocated_size (multi_heap_handle_t heap, void *p)
```

Return the size that a particular pointer was allocated with.

**Parameters**

- **heap** – Handle to a registered heap.
- **p** – Pointer, must have been previously returned from `multi_heap_malloc()` or `multi_heap_realloc()` for the same heap.

**Returns** Size of the memory allocated at this block. May be more than the original size argument, due to padding and minimum block sizes.

```c
multi_heap_handle_t multi_heap_register (void *start, size_t size)
```

Register a new heap for use.

This function initialises a heap at the specified address, and returns a handle for future heap operations.
There is no equivalent function for deregistering a heap - if all blocks in the heap are free, you can immediately start using the memory for other purposes.

**Parameters**
- `start` - Start address of the memory to use for a new heap.
- `size` - Size (in bytes) of the new heap.

**Returns** Handle of a new heap ready for use, or NULL if the heap region was too small to be initialised.

```c
void multi_heap_set_lock (multi_heap_handle_t heap, void *lock)
```

Associate a private lock pointer with a heap.

The lock argument is supplied to the `MULTI_HEAP_LOCK()` and `MULTI_HEAP_UNLOCK()` macros, defined in `multi_heap_platform.h`.

The lock in question must be recursive.

When the heap is first registered, the associated lock is NULL.

**Parameters**
- `heap` - Handle to a registered heap.
- `lock` - Optional pointer to a locking structure to associate with this heap.

```c
void multi_heap_dump (multi_heap_handle_t heap)
```

Dump heap information to stdout.

For debugging purposes, this function dumps information about every block in the heap to stdout.

**Parameters** `heap` - Handle to a registered heap.

```c
bool multi_heap_check (multi_heap_handle_t heap, bool print_errors)
```

Check heap integrity.

Walks the heap and checks all heap data structures are valid. If any errors are detected, an error-specific message can be optionally printed to stderr. Print behaviour can be overridden at compile time by defining `MULTI_CHECK_FAIL_PRINTF` in `multi_heap_platform.h`.

**Note:** This function is not thread-safe as it sets a global variable with the value of `print_errors`.

**Parameters**
- `heap` - Handle to a registered heap.
- `print_errors` - If true, errors will be printed to stderr.

**Returns** true if heap is valid, false otherwise.

```c
size_t multi_heap_free_size (multi_heap_handle_t heap)
```

Return free heap size.

Returns the number of bytes available in the heap.

Equivalent to the `total_free_bytes` member returned by `multi_heap_get_heap_info()`.

Note that the heap may be fragmented, so the actual maximum size for a single malloc() may be lower. To know this size, see the `largest_free_block` member returned by `multi_heap_get_heap_info()`.

**Parameters** `heap` - Handle to a registered heap.

**Returns** Number of free bytes.

```c
size_t multi_heap_minimum_free_size (multi_heap_handle_t heap)
```

Return the lifetime minimum free heap size.

Equivalent to the `minimum_free_bytes` member returned by `multi_heap_get_info()`.

Returns the lifetime “low watermark” of possible values returned from `multi_free_heap_size()`, for the specified heap.
Parameters heap – Handle to a registered heap.
Returns Number of free bytes.

```c
void multi_heap_get_info (multi_heap_handle_t heap, multi_heap_info_t *info)
```

Return metadata about a given heap.

Fills a `multi_heap_info_t` structure with information about the specified heap.

**Parameters**
- `heap` - Handle to a registered heap.
- `info` - Pointer to a structure to fill with heap metadata.

**Structures**

```c
struct multi_heap_info_t
```

Structure to access heap metadata via `multi_heap_get_info`.

**Public Members**

- `size_t total_free_bytes`
  - Total free bytes in the heap. Equivalent to `multi_free_heap_size()`.
- `size_t total_allocated_bytes`
  - Total bytes allocated to data in the heap.
- `size_t largest_free_block`
  - Size of the largest free block in the heap. This is the largest malloc-able size.
- `size_t minimum_free_bytes`
  - Lifetime minimum free heap size. Equivalent to `multi_minimum_free_heap_size()`.
- `size_t allocated_blocks`
  - Number of (variable size) blocks allocated in the heap.
- `size_t free_blocks`
  - Number of (variable size) free blocks in the heap.
- `size_t total_blocks`
  - Total number of (variable size) blocks in the heap.

**Type Definitions**

```c
typedef struct multi_heap_info *multi_heap_handle_t
```

Opaque handle to a registered heap.

### 2.10.14 Heap Memory Debugging

**Overview**

ESP-IDF integrates tools for requesting heap information, detecting heap corruption, and tracing memory leaks. These can help track down memory-related bugs.

For general information about the heap memory allocator, see the [Heap Memory Allocation](#) page.
Heap Information

To obtain information about the state of the heap:

- `xPortGetFreeHeapSize()` is a FreeRTOS function which returns the number of free bytes in the (data memory) heap. This is equivalent to calling `heap_caps_get_free_size(MALLOC_CAP_8BIT)`.
- `heap_caps_get_free_size()` can also be used to return the current free memory for different memory capabilities.
- `heap_caps_get_largest_free_block()` can be used to return the largest free block in the heap. This is the largest single allocation which is currently possible. Tracking this value and comparing to total free heap allows you to detect heap fragmentation.
- `xPortGetMinimumEverFreeHeapSize()` and the related `heap_caps_get_minimum_free_size()` can be used to track the “low watermark” since boot.
- `heap_caps_get_info()` returns a `multi_heap_info_t` structure which contains the information from the above functions, plus some additional heap-specific data (number of allocations, etc.).
- `heap_caps_print_heap_info()` prints a summary to stdout of the information returned by `heap_caps_get_info()`.
- `heap_caps_dump()` and `heap_caps_dump_all()` will output detailed information about the structure of each block in the heap. Note that this can be large amount of output.

Heap Corruption Detection

Heap corruption detection allows you to detect various types of heap memory errors:

- Out of bounds writes & buffer overflow.
- Writes to freed memory.
- Reads from freed or uninitialized memory.

Assertions  The heap implementation (`multi_heap.c`, etc.) includes a lot of assertions which will fail if the heap memory is corrupted. To detect heap corruption most effectively, ensure that assertions are enabled in the project configuration menu under Compiler options -> `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`.

If a heap integrity assertion fails, a line will be printed like `CORRUPT HEAP: multi_heap.c:225 detected at 0x3ffbb71c`. The memory address which is printed is the address of the heap structure which has corrupt content.

It’s also possible to manually check heap integrity by calling `heap_caps_check_integrity_all()` or related functions. This function checks all of requested heap memory for integrity, and can be used even if assertions are disabled. If the integrity check prints an error, it will also contain the address(es) of corrupt heap structures.

Memory Allocation Failed Hook  Users can use `heap_caps_register_failed_alloc_callback()` to register a callback that will be invoked every time an allocation operation fails.

Additionally, users can enable the generation of a system abort if an allocation operation fails by following the steps below: - In the project configuration menu, navigate to Component config -> Heap Memory Debugging and select Abort if memory allocation fails option (see `CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS`).

The example below shows how to register an allocation failure callback:

```c
#include "esp_heap_caps.h"

void heap_caps_alloc_failed_hook(size_t requested_size, uint32_t caps, const char *function_name)
{
    printf("%s was called but failed to allocate %d bytes with 0x%X capabilities.\n", function_name, requested_size, caps);
}
```

(continues on next page)
void app_main()
{
  ...
  esp_err_t error = heap_caps_register_failed_alloc_callback(heap_caps_alloc_
    ->failed_hook);
  ...
  void *ptr = heap_caps_malloc(allocation_size, MALLOC_CAP_DEFAULT);
  ...
}

Finding Heap Corruption  Memory corruption can be one of the hardest classes of bugs to find and fix, as one area of memory can be corrupted from a totally different place. Some tips:

  • A crash with a CORRUPT_HEAP: message will usually include a stack trace, but this stack trace is rarely useful. The crash is the symptom of memory corruption when the system realises the heap is corrupt, but usually the corruption happened elsewhere and earlier in time.

  • Increasing the Heap memory debugging Configuration level to “Light impact” or “Comprehensive” can give you a more accurate message with the first corrupt memory address.

  • Adding regular calls to heap_caps_check_integrity_all() or heap_caps_check_integrity_addr() in your code will help you pin down the exact time that the corruption happened. You can move these checks around to “close in on” the section of code that corrupted the heap.

  • Based on the memory address which is being corrupted, you can use JTAG debugging to set a watchpoint on this address and have the CPU halt when it is written to.

  • If you don’t have JTAG, but you do know roughly when the corruption happens, then you can set a watchpoint in software just beforehand via esp_cpu_set_watchpoint(). A fatal exception will occur when the watchpoint triggers. The following is an example of how to use the function - esp_cpu_set_watchpoint(0, (void *)addr, 4, ESP_WATCHPOINT_STORE). Note that watchpoints are per-CPU and are set on the current running CPU only, so if you don’t know which CPU is corrupting memory then you will need to call this function on both CPUs.

  • For buffer overflows, heap tracing in HEAP_TRACE_ALL mode lets you see which callers are allocating which addresses from the heap. See Heap Tracing To Find Heap Corruption for more details. If you can find the function which allocates memory with an address immediately before the address which is corrupted, this will probably be the function which overflows the buffer.

  • Calling heap_caps_dump() or heap_caps_dump_all() can give an indication of what heap blocks are surrounding the corrupted region and may have overflowed/underflowed/etc.

Configuration  Temporarily increasing the heap corruption detection level can give more detailed information about heap corruption errors.

In the project configuration menu, under Component config there is a menu Heap memory debugging. The setting CONFIG_HEAP_CORRUPTION_DETECTION can be set to one of three levels:

Basic (no poisoning)  This is the default level. No special heap corruption features are enabled, but provided assertions are enabled (the default configuration) then a heap corruption error will be printed if any of the heap’s internal data structures appear overwritten or corrupted. This usually indicates a buffer overrun or out of bounds write.

If assertions are enabled, an assertion will also trigger if a double-free occurs (the same memory is freed twice).

Calling heap_caps_check_integrity() in Basic mode will check the integrity of all heap structures, and print errors if any appear to be corrupted.

Light Impact  At this level, heap memory is additionally “poisoned” with head and tail “canary bytes” before and after each block which is allocated. If an application writes outside the bounds of allocated buffers, the canary bytes will be corrupted and the integrity check will fail.
The head canary word is 0xABBA1234 (3412BAAB in byte order), and the tail canary word is 0xBAAD5678 (7856ADBA in byte order).

“Basic” heap corruption checks can also detect most out of bounds writes, but this setting is more precise as even a single byte overrun can be detected. With Basic heap checks, the number of overrun bytes before a failure is detected will depend on the properties of the heap.

Enabling “Light Impact” checking increases memory usage, each individual allocation will use 9 to 12 additional bytes of memory (depending on alignment).

Each time free() is called in Light Impact mode, the head and tail canary bytes of the buffer being freed are checked against the expected values.

When heap_caps_check_integrity() is called, all allocated blocks of heap memory have their canary bytes checked against the expected values.

In both cases, the check is that the first 4 bytes of an allocated block (before the buffer returned to the user) should be the word 0xABBA1234. Then the last 4 bytes of the allocated block (after the buffer returned to the user) should be the word 0xBAAD5678.

Different values usually indicate buffer underrun or overrun, respectively.

**Comprehensive** This level incorporates the “light impact” detection features plus additional checks for uninitialised-access and use-after-free bugs. In this mode, all freshly allocated memory is filled with the pattern 0xCE, and all freed memory is filled with the pattern 0xFE.

Enabling “Comprehensive” detection has a substantial runtime performance impact (as all memory needs to be set to the allocation patterns each time a malloc/free completes, and the memory also needs to be checked each time.) However, it allows easier detection of memory corruption bugs which are much more subtle to find otherwise. It is recommended to only enable this mode when debugging, not in production.

**Crashes in Comprehensive Mode** If an application crashes reading/writing an address related to 0xCECECECE in Comprehensive mode, this indicates it has read uninitialized memory. The application should be changed to either use calloc() (which zeroes memory), or initialize the memory before using it. The value 0xCECECECE may also be seen in stack-allocated automatic variables, because in IDF most task stacks are originally allocated from the heap and in C stack memory is uninitialized by default.

If an application crashes and the exception register dump indicates that some addresses or values were 0xFEFEFEFE, this indicates it is reading heap memory after it has been freed (a “use after free bug”). The application should be changed to not access heap memory after it has been freed.

If a call to malloc() or realloc() causes a crash because it expected to find the pattern 0xFEFEFEFE in free memory and a different pattern was found, then this indicates the app has a use-after-free bug where it is writing to memory which has already been freed.

**Manual Heap Checks in Comprehensive Mode** Calls to heap_caps_check_integrity() may print errors relating to 0xFEFEFEFE, 0xABBA1234 or 0xBAAD5678. In each case the checker is expecting to find a given pattern, and will error out if this is not found:

- For free heap blocks, the checker expects to find all bytes set to 0xFE. Any other values indicate a use-after-free bug where free memory has been incorrectly overwritten.
- For allocated heap blocks, the behaviour is the same as for Light Impact mode. The canary bytes 0xABBA1234 and 0xBAAD5678 are checked at the head and tail of each allocated buffer, and any variation indicates a buffer overrun/underrun.

**Heap Task Tracking**

Heap Task Tracking can be used to get per task info for heap memory allocation. Application has to specify the heap capabilities for which the heap allocation is to be tracked.

Example code is provided in system/heap_task_tracking
Heap Tracing

Heap Tracing allows tracing of code which allocates/frees memory. Two tracing modes are supported:

- **Standalone.** In this mode trace data are kept on-board, so the size of gathered information is limited by the buffer assigned for that purposes. Analysis is done by the on-board code. There are a couple of APIs available for accessing and dumping collected info.
- **Host-based.** This mode does not have the limitation of the standalone mode, because trace data are sent to the host over JTAG connection using app_trace library. Later on they can be analysed using special tools.

Heap tracing can perform two functions:

- Leak checking: find memory which is allocated and never freed.
- Heap use analysis: show all functions that are allocating/freeing memory while the trace is running.

**How To Diagnose Memory Leaks**  If you suspect a memory leak, the first step is to figure out which part of the program is leaking memory. Use the `xPortGetFreeHeapSize()`, `heap_caps_get_free_size()`, or related functions to track memory use over the life of the application. Try to narrow the leak down to a single function or sequence of functions where free memory always decreases and never recovers.

**Standalone Mode**  Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> Heap tracing and select Standalone option (see `CONFIG_HEAP_TRACING_DEST`).
- Call the function `heap_trace_init_standalone()` early in the program, to register a buffer which can be used to record the memory trace.
- Call the function `heap_trace_start()` to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory.
- Call the function `heap_trace_stop()` to stop the trace once the suspect piece of code has finished executing.
- Call the function `heap_trace_dump()` to dump the results of the heap trace.

An example:

```c
#include "esp_heap_trace.h"
#define NUM_RECORDS 100
static heap_trace_record_t trace_record[NUM_RECORDS]; // This buffer must be in...
... internal RAM

void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_standalone(trace_record, NUM_RECORDS) );
    ...
}

void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    heap_trace_dump();
    ...
}
```

The output from the heap trace will look something like this:
Chapter 2. API Reference

2 allocations trace (100 entry buffer)
32 bytes (@ 0x3ffaf214) allocated CPU 0 ccount 0x2e9b7384 caller...
  ←0x400d276d:0x400d27c1
0x400d276d: leak_some_memory at /path/to/idf/examples/get-started/blink/main/.
  ←0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/.blink.c:27

0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/.blink.c:52
8 bytes (@ 0x3ffaf804) allocated CPU 0 ccount 0x2e9b79c0 caller...
  ←0x400d2776:0x400d27c1
0x400d2776: leak_some_memory at /path/to/idf/examples/get-started/blink/main/.
  ←0x400d27c1: blink_task at /path/to/idf/examples/get-started/blink/main/.blink.c:52

40 bytes 'leaked' in trace (2 allocations)
total allocations 2 total frees 0

(Above example output is using IDF Monitor to automatically decode PC addresses to their source files & line number.)

The first line indicates how many allocation entries are in the buffer, compared to its total size.

In HEAP_TRACE_LEAKS mode, for each traced memory allocation which has not already been freed a line is printed with:

- XX bytes is the number of bytes allocated
- @ 0x... is the heap address returned from malloc/calloc.
- CPU x is the CPU (0 or 1) running when the allocation was made.
- ccount 0x... is the CCOUNT (CPU cycle count) register value when the allocation was made. Is different for CPU 0 vs CPU 1.
- caller 0x... gives the call stack of the call to malloc()/free(), as a list of PC addresses. These can be decoded to source files and line numbers, as shown above.

The depth of the call stack recorded for each trace entry can be configured in the project configuration menu, under Heap Memory Debugging -> Enable heap tracing-> Heap tracing stack depth. Up to 10 stack frames can be recorded for each allocation (the default is 2). Each additional stack frame increases the memory usage of each heap_trace_record_t record by eight bytes.

Finally, the total number of ‘leaked’ bytes (bytes allocated but not freed while trace was running) is printed, and the total number of allocations this represents.

A warning will be printed if the trace buffer was not large enough to hold all the allocations which happened. If you see this warning, consider either shortening the tracing period or increasing the number of records in the trace buffer.

Host-Based Mode Once you’ve identified the code which you think is leaking:

- In the project configuration menu, navigate to Component settings -> Heap Memory Debugging -> CONFIG_HEAP_TRACING_DEST and select Host-Based.
- In the project configuration menu, navigate to Component settings -> Application Level Tracing -> CONFIG_APPTRACE_DESTINATION1 and select Trace memory.
- In the project configuration menu, navigate to Component settings -> Application Level Tracing -> FreeRTOS SystemView Tracing and enable CONFIG_APPTRACE_SV_ENABLE.
- Call the function heap_trace_init_tohost() early in the program, to initialize JTAG heap tracing module.
- Call the function heap_trace_start() to begin recording all mallocs/frees in the system. Call this immediately before the piece of code which you suspect is leaking memory. In host-based mode, the argument to this function is ignored, and the heap tracing module behaves like HEAP_TRACE_ALL was passed: all allocations and deallocations are sent to the host.
- Call the function heap_trace_stop() to stop the trace once the suspect piece of code has finished executing.
Chapter 2. API Reference

An example:

```c
#include "esp_heap_trace.h"
...
void app_main()
{
    ...
    ESP_ERROR_CHECK( heap_trace_init_tohost() );
    ...
}
void some_function()
{
    ESP_ERROR_CHECK( heap_trace_start(HEAP_TRACE_LEAKS) );
    do_something_you_suspect_is_leaking();
    ESP_ERROR_CHECK( heap_trace_stop() );
    ...
}
```

To gather and analyse heap trace do the following on the host:

1. Build the program and download it to the target as described in Getting Started Guide.
2. Run OpenOCD (see JTAG Debugging).

**Note:** In order to use this feature you need OpenOCD version v0.10.0-esp32-20181105 or later.

3. You can use GDB to start and/or stop tracing automatically. To do this you need to prepare special `gdbinit` file:

   ```
   target remote :3333
   mon reset halt
   flushregs
   tb heap_trace_start
   commands
   mon esp sysview start file:///tmp/heap.svdat
   c
   end
   tb heap_trace_stop
   commands
   mon esp sysview stop
   end
   c
   ```

Using this file GDB will connect to the target, reset it, and start tracing when program hits breakpoint at `heap_trace_start()`. Trace data will be saved to `/tmp/heap_log.svdat`. Tracing will be stopped when program hits breakpoint at `heap_trace_stop()`.

4. Run GDB using the following command `xtensa-esp32-elf-gdb -x gdbinit </path/to/program/elf>`
5. Quit GDB when program stops at `heap_trace_stop()`. Trace data are saved in `/tmp/heap.svdat`
6. Run processing script `$IDF_PATH/tools/esp_app_trace/sysviewtrace_proc.py -p -b </path/to/program/elf> /tmp/heap_log.svdat`

The output from the heap trace will look something like this:
Parse trace from '/tmp/heap.svdat'...
Stop parsing trace. (Timeout 0.000000 sec while reading 1 bytes!)
Process events from '/tmp/heap.svdat'...

Heap Tracing To Find Heap Corruption

Heap tracing can also be used to help track down heap corruption. When a region in heap is corrupted, it may be from some other part of the program which allocated memory at a nearby address.

If you have some idea at what time the corruption occurred, enabling heap tracing in `HEAP_TRACE_ALL` mode allows you to record all the functions which allocated memory, and the addresses of the allocations.

Using heap tracing in this way is very similar to memory leak detection as described above. For memory which is allocated and not freed, the output is the same. However, records will also be shown for memory which has been freed.

Performance Impact

Enabling heap tracing in menuconfig increases the code size of your program, and has a very small negative impact on performance of heap allocation/free operations even when heap tracing is not running.

When heap tracing is running, heap allocation/free operations are substantially slower than when heap tracing is stopped. Increasing the depth of stack frames recorded for each allocation (see above) will also increase this performance impact.

False-Positive Memory Leaks

Not everything printed by `heap_trace_dump()` is necessarily a memory leak. Among things which may show up here, but are not memory leaks:

- Any memory which is allocated after `heap_trace_start()` but then freed after `heap_trace_stop()` will appear in the leak dump.
• Allocations may be made by other tasks in the system. Depending on the timing of these tasks, it’s quite possible this memory is freed after `heap_trace_stop()` is called.
• The first time a task uses stdio - for example, when it calls `printf()` - a lock (RTOS mutex semaphore) is allocated by the libc. This allocation lasts until the task is deleted.
• Certain uses of `printf()`, such as printing floating point numbers, will allocate some memory from the heap on demand. These allocations last until the task is deleted.
• The Bluetooth, Wi-Fi, and TCP/IP libraries will allocate heap memory buffers to handle incoming or outgoing data. These memory buffers are usually short-lived, but some may be shown in the heap leak trace if the data was received/transmitted by the lower levels of the network while the leak trace was running.
• TCP connections will continue to use some memory after they are closed, because of the `TIME_WAIT` state. After the `TIME_WAIT` period has completed, this memory will be freed.

One way to differentiate between “real” and “false positive” memory leaks is to call the suspect code multiple times while tracing is running, and look for patterns (multiple matching allocations) in the heap trace output.

### API Reference - Heap Tracing

#### Header File

- `components/heap/include/esp_heap_trace.h`

#### Functions

**`esp_err_t heap_trace_init_standalone(heap_trace_record_t *record_buffer, size_t num_records)`**

Initialise heap tracing in standalone mode.

This function must be called before any other heap tracing functions.

To disable heap tracing and allow the buffer to be freed, stop tracing and then call `heap_trace_init_standalone(NULL, 0);

**Parameters**

- `record_buffer` – Provide a buffer to use for heap trace data. Must remain valid any time heap tracing is enabled, meaning it must be allocated from internal memory not in PSRAM.
- `num_records` – Size of the heap trace buffer, as number of record structures.

**Returns**

- `ESP_ERR_NOT_SUPPORTED` Project was compiled without heap tracing enabled in menuconfig.
- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

**`esp_err_t heap_trace_init_tohost(void)`**

Initialise heap tracing in host-based mode.

This function must be called before any other heap tracing functions.

**Returns**

- `ESP_ERR_INVALID_STATE` Heap tracing is currently in progress.
- `ESP_OK` Heap tracing initialised successfully.

**`esp_err_t heap_trace_start(heap_trace_mode_t mode)`**

Start heap tracing. All heap allocations & frees will be traced, until `heap_trace_stop()` is called.

**Note:** `heap_trace_init_standalone()` must be called to provide a valid buffer, before this function is called.

**Note:** Calling this function while heap tracing is running will reset the heap trace state and continue tracing.

**Parameters**

- `mode` – Mode for tracing.
• HEAP_TRACE_ALL means all heap allocations and frees are traced.
• HEAP_TRACE_LEAKS means only suspected memory leaks are traced. (When memory
  is freed, the record is removed from the trace buffer.)

Returns
• ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in
  menuconfig.
• ESP_ERR_INVALID_STATE A non-zero-length buffer has not been set via
  heap_trace_init_standalone().
• ESP_OK Tracing is started.

esp_err_t heap_trace_stop (void)
Stop heap tracing.

Returns
• ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in
  menuconfig.
• ESP_ERR_INVALID_STATE Heap tracing was not in progress.
• ESP_OK Heap tracing stopped.

esp_err_t heap_trace_resume (void)
Resume heap tracing which was previously stopped.
Unlike heap_trace_start(), this function does not clear the buffer of any pre-existing trace records.
The heap trace mode is the same as when heap_trace_start() was last called (or HEAP_TRACE_ALL if
heap_trace_start() was never called).

Returns
• ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in
  menuconfig.
• ESP_ERR_INVALID_STATE Heap tracing was already started.
• ESP_OK Heap tracing resumed.

size_t heap_trace_get_count (void)
Return number of records in the heap trace buffer.
It is safe to call this function while heap tracing is running.

esp_err_t heap_trace_get (size_t index, heap_trace_record_t *record)
Return a raw record from the heap trace buffer.

Note: It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode
record indexing may skip entries unless heap tracing is stopped first.

Parameters
• index –Index (zero-based) of the record to return.
• record –[out] Record where the heap trace record will be copied.

Returns
• ESP_ERR_NOT_SUPPORTED Project was compiled without heap tracing enabled in
  menuconfig.
• ESP_ERR_INVALID_STATE Heap tracing was not initialised.
• ESP_ERR_INVALID_ARG Index is out of bounds for current heap trace record count.
• ESP_OK Record returned successfully.

void heap_trace_dump (void)
Dump heap trace record data to stdout.
**Note:** It is safe to call this function while heap tracing is running, however in HEAP_TRACE_LEAK mode the dump may skip entries unless heap tracing is stopped first.

### Structures

**struct heap_trace_record_t**

Trace record data type. Stores information about an allocated region of memory.

#### Public Members

- `uint32_t ccound`
  
  CCOUNT of the CPU when the allocation was made. LSB (bit value 1) is the CPU number (0 or 1).

- `void *address`
  
  Address which was allocated.

- `size_t size`
  
  Size of the allocation.

- `void *allocated_by[CONFIG_HEAP_TRACING_STACK_DEPTH]`
  
  Call stack of the caller which allocated the memory.

- `void *freed_by[CONFIG_HEAP_TRACING_STACK_DEPTH]`
  
  Call stack of the caller which freed the memory (all zero if not freed.)

### Macros

`CONFIG_HEAP_TRACING_STACK_DEPTH`

### Enumerations

**enum heap_trace_mode_t**

*Values:*

- `HEAP_TRACE_ALL`

- `HEAP_TRACE_LEAKS`

### 2.10.15 High Resolution Timer (ESP Timer)

#### Overview

Although FreeRTOS provides software timers, these timers have a few limitations:

- Maximum resolution is equal to RTOS tick period
- Timer callbacks are dispatched from a low-priority task
Hardware timers are free from both of the limitations, but often they are less convenient to use. For example, application components may need timer events to fire at certain times in the future, but the hardware timer only contains one “compare” value used for interrupt generation. This means that some facility needs to be built on top of the hardware timer to manage the list of pending events can dispatch the callbacks for these events as corresponding hardware interrupts happen.

An interrupt level of the handler depends on the `CONFIG_ESP_TIMER_INTERRUPT_LEVEL` option. It allows to set this: 1, 2 or 3 level (by default 1). Raising the level, the interrupt handler can reduce the timer processing delay.

The `esp_timer` set of APIs provides one-shot and periodic timers, microsecond time resolution, and 64-bit range.

Internally, `esp_timer` uses a 64-bit hardware timer, where the implementation depends on the target. LAC timer is used for ESP32.

Timer callbacks can be dispatched by two methods:

- **ESP_TIMER_TASK**: Available only if `CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD` is enabled (by default disabled).
- **ESP_TIMER_ISR**: Timer callbacks are dispatched from a high-priority `esp_timer` task. Because all the callbacks are dispatched from the same task, it is recommended to only do the minimal possible amount of work from the callback itself, posting an event to a lower priority task using a queue instead.

If other tasks with priority higher than `esp_timer` are running, callback dispatching will be delayed until `esp_timer` task has a chance to run. For example, this will happen if an SPI Flash operation is in progress.

**ESP_TIMER_ISR**: Timer callbacks are dispatched directly from the timer interrupt handler. This method is useful for some simple callbacks which aim for lower latency.

Creating and starting a timer, and dispatching the callback takes some time. Therefore, there is a lower limit to the timeout value of one-shot `esp_timer`. If `esp_timer_start_once()` is called with a timeout value less than 20us, the callback will be dispatched only after approximately 20us.

Periodic `esp_timer` also imposes a 50us restriction on the minimal timer period. Periodic software timers with period of less than 50us are not practical since they would consume most of the CPU time. Consider using dedicated hardware peripherals or DMA features if you find that a timer with small period is required.

### Using `esp_timer` APIs

Single timer is represented by `esp_timer_handle_t` type. Timer has a callback function associated with it. This callback function is called from the `esp_timer` task each time the timer elapses.

- To create a timer, call `esp_timer_create()`.
- To delete the timer when it is no longer needed, call `esp_timer_delete()`.

The timer can be started in one-shot mode or in periodic mode.

- To start the timer in one-shot mode, call `esp_timer_start_once()`, passing the time interval after which the callback should be called. When the callback gets called, the timer is considered to be stopped.
- To start the timer in periodic mode, call `esp_timer_start_periodic()`, passing the period with which the callback should be called. The timer keeps running until `esp_timer_stop()` is called.

Note that the timer must not be running when `esp_timer_start_once()` or `esp_timer_start_periodic()` is called. To restart a running timer, call `esp_timer_stop()` first, then call one of the start functions.

### Callback functions

**Note**: Keep the callback functions as short as possible otherwise it will affect all timers.
Timer callbacks which are processed by `ESP_TIMER_ISR` method should not call the context switch call - `portYIELD_FROM_ISR()`, instead of this you should use the `esp_timer_isr_dispatch_need_yield()` function. The context switch will be done after all ISR dispatch timers have been processed, if required by the system.

**esp_timer during the light sleep**

During light sleep, the esp_timer counter stops and no callback functions are called. Instead, the time is counted by the RTC counter. Upon waking up, the system gets the difference between the counters and calls a function that advances the esp_timer counter. Since the counter has been advanced, the system starts calling callbacks that were not called during sleep. The number of callbacks depends on the duration of the sleep and the period of the timers. It can lead to overflow of some queues. This only applies to periodic timers, one-shot timers will be called once.

This behavior can be changed by calling `esp_timer_stop()` before sleeping. In some cases, this can be inconvenient, and instead of the stop function, you can use the `skip_unhandled_events` option during `esp_timer_create()`. When the `skip_unhandled_events` is true, if a periodic timer expires one or more times during light sleep then only one callback is called on wake.

Using the `skip_unhandled_events` option with automatic light sleep (see Power Management APIs) helps to reduce the consumption of the system when it is in light sleep. The duration of light sleep is also determined by esp_timers. Timers with `skip_unhandled_events` option will not wake up the system.

**Handling callbacks**

esp_timer is designed to achieve a high-resolution low latency timer and the ability to handle delayed events. If the timer is late then the callback will be called as soon as possible, it will not be lost. In the worst case, when the timer has not been processed for more than one period (for periodic timers), in this case the callbacks will be called one after the other without waiting for the set period. This can be bad for some applications, and the `skip_unhandled_events` option was introduced to eliminate this behavior. If `skip_unhandled_events` is set then a periodic timer that has expired multiple times without being able to call the callback will still result in only one callback event once processing is possible.

**Obtaining Current Time**

`esp_timer` also provides a convenience function to obtain the time passed since start-up, with microsecond precision: `esp_timer_get_time()`. This function returns the number of microseconds since `esp_timer` was initialized, which usually happens shortly before `app_main` function is called.

Unlike `gettimeofday` function, values returned by `esp_timer_get_time()`:

- Start from zero after the chip wakes up from deep sleep
- Do not have timezone or DST adjustments applied

**Application Example**

The following example illustrates usage of `esp_timer` APIs: `system/esp_timer`.

**API Reference**

**Header File**

- `components/esp_timer/include/esp_timer.h`
Chapter 2. API Reference

Functions

`esp_err_t esp_timer_early_init (void)`

Minimal initialization of esp_timer.

This function can be called very early in startup process, after this call only esp_timer_get_time function can be used.

**Note:** This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs.

**Returns**

- ESP_OK on success

`esp_err_t esp_timer_init (void)`

Initialize esp_timer library.

**Note:** This function is called from startup code. Applications do not need to call this function before using other esp_timer APIs. Before calling this function, esp_timer_early_init must be called by the startup code.

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized
- other errors from interrupt allocator

`esp_err_t esp_timer_deinit (void)`

De-initialize esp_timer library.

**Note:** Normally this function should not be called from applications

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not yet initialized

`esp_err_t esp_timer_create (const esp_timer_create_args_t *create_args, esp_timer_handle_t *out_handle)`

Create an esp_timer instance.

**Note:** When done using the timer, delete it with esp_timer_delete function.

**Parameters**

- `create_args` – Pointer to a structure with timer creation arguments. Not saved by the library, can be allocated on the stack.
- `out_handle` – [out] Output, pointer to esp_timer_handle_t variable which will hold the created timer handle.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if some of the create_args are not valid
- ESP_ERR_INVALID_STATE if esp_timer library is not initialized yet
- ESP_ERR_NO_MEM if memory allocation fails
**esp_err_t esp_timer_start_once** *(esp_timer_handle_t timer, uint64_t timeout_us)*

Start one-shot timer.

**Parameters**
- `timer` – timer handle created using esp_timer_create
- `timeout_us` – timer timeout, in microseconds relative to the current moment

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

**esp_err_t esp_timer_start_periodic** *(esp_timer_handle_t timer, uint64_t period)*

Start a periodic timer.

**Parameters**
- `timer` – timer handle created using esp_timer_create
- `period` – timer period, in microseconds

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is already running

**esp_err_t esp_timer_restart** *(esp_timer_handle_t timer, uint64_t timeout_us)*

Restart a currently running timer.

If the given timer is a one-shot timer, the timer is restarted immediately and will timeout once in `timeout_us` microseconds. If the given timer is a periodic timer, the timer is restarted immediately with a new period of `timeout_us` microseconds.

**Parameters**
- `timer` – timer handle created using esp_timer_create
- `timeout_us` – Timeout, in microseconds relative to the current time. In case of a periodic timer, also represents the new period.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the handle is invalid
- ESP_ERR_INVALID_STATE if the timer is not running

**esp_err_t esp_timer_stop** *(esp_timer_handle_t timer)*

Stop the timer.

This function stops the timer previously started using esp_timer_start_once or esp_timer_start_periodic.

**Parameters**
- `timer` – timer handle created using esp_timer_create

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is not running

**esp_err_t esp_timer_delete** *(esp_timer_handle_t timer)*

Delete an esp_timer instance.

The timer must be stopped before deleting. A one-shot timer which has expired does not need to be stopped.

**Parameters**
- `timer` – timer handle allocated using esp_timer_create

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if the timer is running
int64_t **esp_timer_get_time**(void)

Get time in microseconds since boot.

**Returns** number of microseconds since underlying timer has been started

int64_t **esp_timer_get_next_alarm**(void)

Get the timestamp when the next timeout is expected to occur.

**Returns** Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by **esp_timer_get_time**.

int64_t **esp_timer_get_next_alarm_for_wake_up**(void)

Get the timestamp when the next timeout is expected to occur skipping those which have skip_unhandled_events flag.

**Returns** Timestamp of the nearest timer event, in microseconds. The timebase is the same as for the values returned by **esp_timer_get_time**.

**esp_err_t** **esp_timer_get_period**(esp_timer_handle_t *timer, uint64_t *period)

Get the period of a timer.

This function fetches the timeout period of a timer.

**Note:** The timeout period is the time interval with which a timer restarts after expiry. For one-shot timers, the period is 0 as there is no periodicity associated with such timers.

**Parameters**

- *timer* — timer handle allocated using **esp_timer_create**
- *period* — memory to store the timer period value in microseconds

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid

**esp_err_t** **esp_timer_get_expiry_time**(esp_timer_handle_t *timer, uint64_t *expiry)

Get the expiry time of a one-shot timer.

This function fetches the expiry time of a one-shot timer.

**Note:** This API returns a valid expiry time only for a one-shot timer. It returns an error if the timer handle passed to the function is for a periodic timer.

**Parameters**

- *timer* — timer handle allocated using **esp_timer_create**
- *expiry* — memory to store the timeout value in microseconds

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the arguments are invalid
- ESP_ERR_NOT_SUPPORTED if the timer type is periodic

**esp_err_t** **esp_timer_dump**(FILE *stream)

Dump the list of timers to a stream.

If CONFIG_ESP_TIMER_PROFILING option is enabled, this prints the list of all the existing timers. Otherwise, only the list active timers is printed.

The format is:

name period alarm times_armed times_triggered total_callback_run_time

where:
name — timer name (if CONFIG_ESP_TIMER_PROFILING is defined), or timer pointer period — period of timer, in microseconds, or 0 for one-shot timer alarm - time of the next alarm, in microseconds since boot, or 0 if the timer is not started

The following fields are printed if CONFIG_ESP_TIMER_PROFILING is defined:

- times_armed — number of times the timer was armed via esp_timer_start
- times_triggered — number of times the callback was called
- total_callback_run_time — total time taken by callback to execute, across all calls

**Parameters**

**stream** — stream (such as stdout) to dump the information to

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if cannot allocate temporary buffer for the output

```c
void esp_timer_isr_dispatch_need_yield(void)
```

Requests a context switch from a timer callback function.

This only works for a timer that has an ISR dispatch method. The context switch will be called after all ISR dispatch timers have been processed.

```c
bool esp_timer_is_active(esp_timer_handle_t timer)
```

Returns status of a timer, active or not.

This function is used to identify if the timer is still active or not.

**Parameters**

**timer** — timer handle created using esp_timer_create

**Returns**

- 1 if timer is still active
- 0 if timer is not active.

**Structures**

```c
struct esp_timer_create_args_t
```

Timer configuration passed to esp_timer_create.

**Public Members**

```c
esp_timer_cb_t callback
```

Function to call when timer expires.

```c
void *arg
```

Argument to pass to the callback.

```c
esp_timer_dispatch_t dispatch_method
```

Call the callback from task or from ISR.

```c
const char *name
```

Timer name, used in esp_timer_dump function.

```c
bool skip_unhandled_events
```

Skip unhandled events for periodic timers.

**Type Definitions**

```c
typedef struct esp_timer *esp_timer_handle_t
```

Opaque type representing a single esp_timer.
typedef void (*esp_timer_cb_t)(void *arg)
    Timer callback function type.

Param arg  pointer to opaque user-specific data

Enumerations

enum esp_timer_dispatch_t
    Method for dispatching timer callback.

Values:

enumerator ESP_TIMER_TASK
    Callback is called from timer task.

enumerator ESP_TIMER_MAX
    Count of the methods for dispatching timer callback.

2.10.16 Internal and Unstable APIs

This section is listing some APIs that are internal or likely to be changed or removed in the next releases of ESP-IDF.

API Reference

Header File

• components/esp_rom/include/esp_rom_sys.h

Functions

int esp_rom_printf(const char *fmt, ...)
    Print formatted string to console device.

Note: float and long long data are not supported!

Parameters

  • fmt  – Format string
  • ...  – Additional arguments, depending on the format string

Returns  int: Total number of characters written on success; A negative number on failure.

void esp_rom_delay_us(uint32_t us)
    Pauses execution for us microseconds.

Parameters  us  – Number of microseconds to pause

void esp_rom_install_channel_putchar(int channel, void (*putc)(char c))
    esp_rom_printf can print message to different channels simultaneously. This function can help install the low
    level putc function for esp_rom_printf.

Parameters

  • channel  – Channel number (starting from 1)
  • putc  – Function pointer to the putc implementation. Set NULL can disconnect
    esp_rom_printf with putc.
void **esp_rom_install_uart_printf** (void)

Install UART1 as the default console channel, equivalent to `esp_rom_install_channel_putc(1, esp_rom_uart_putc)`

soc_reset_reason_t **esp_rom_get_reset_reason** (int cpu_no)

Get reset reason of CPU.

Parameters cpu_no - CPU number

Returns Reset reason code (see in soc/reset_reasons.h)

void **esp_rom_route_intr_matrix** (int cpu_core, uint32_t periph_intr_id, uint32_t cpu_intr_num)

Route peripheral interrupt sources to CPU’s interrupt port by matrix.

Usually there’re 4 steps to use an interrupt:

a. Route peripheral interrupt source to CPU, e.g. `esp_rom_route_intr_matrix(0, ETS_WIFI_MAC_INTR_SOURCE, ETS_WMAC_INUM)`

b. Set interrupt handler for CPU

c. Enable CPU interrupt

d. Enable peripheral interrupt

Parameters

- **cpu_core** - The CPU number, which the peripheral interrupt will inform to
- **periph_intr_id** - The peripheral interrupt source number
- **cpu_intr_num** - The CPU interrupt number

uint32_t **esp_rom_get_cpu_ticks_per_us** (void)

Get the real CPU ticks per us.

Returns CPU ticks per us

### 2.10.17 Inter-Processor Call

**Note:** The IPC is an Inter-Processor Call and NOT Inter-Process Communication as found on other operating systems.

**Overview**

Due to the dual core nature of the ESP32, there are instances where a certain callback must be run in the context of a particular CPU such as:

- When allocating an ISR to an interrupt source of a particular CPU (applies to freeing a particular CPU’s interrupt source as well).
- On particular chips (such as the ESP32), accessing memory that is exclusive to a particular CPU (such as RTC Fast Memory).
- Reading the registers/state of another CPU.

The IPC (Inter-Processor Call) feature allows a particular CPU (the calling CPU) to trigger the execution of a callback function on another CPU (the target CPU). The IPC feature allows execution of a callback function on the target CPU in either a task context, or a High Priority Interrupt context (see High-Level Interrupts for more details). Depending on the context that the callback function is executed in, different restrictions apply to the implementation of the callback function.
IPC in Task Context

The IPC feature implements callback execution in a task context by creating an IPC task for each CPU during application startup. When the calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the target CPU’s IPC task.

When using IPCs in a task context, users need to consider the following:

- IPC callbacks should ideally be simple and short. An IPC callback should avoid attempting to block or yield.
- The IPC tasks are created at the highest possible priority (i.e., configMAX_PRIORITIES - 1) thus the callback should also run at that priority as a result. However, CONFIG_ESP_IPC_USES_CALLERS_PRIORITY is enabled by default which will temporarily lower the priority of the target CPU’s IPC task to the calling CPU before executing the callback.
- Depending on the complexity of the callback, users may need to configure the stack size of the IPC task via CONFIG_ESP_IPC_TASK_STACK_SIZE.
- The IPC feature is internally protected by a mutex. Therefore, simultaneous IPC calls from two or more calling CPUs will be handled on a first come first serve basis.

API Usage  Task Context IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)`
- The callback should avoid attempting to block or yield as this will result in the target CPU’s IPC task blocking or yielding.
- The callback must avoid changing any aspect of the IPC task (e.g., by calling `vTaskPrioritySet(NULL, x)`).

The IPC feature offers the API listed below to execute a callback in a task context on a target CPU. The API allows the calling CPU to block until the callback’s execution has completed, or return immediately once the callback’s execution has started.

- `esp_ipc_call()` will trigger an IPC call on the target CPU. This function will block until the target CPU’s IPC task begins execution of the callback.
- `esp_ipc_call_blocking()` will trigger an IPC on the target CPU. This function will block until the target CPU’s IPC task completes execution of the callback.

IPC in ISR Context

In some cases, we need to quickly obtain the state of another CPU such as in a core dump, GDB stub, various unit tests, and DPORT workaround. For such scenarios, the IPC feature supports execution of callbacks in a High Priority Interrupt context. The IPC feature implements the High Priority Interrupt context by reserving a High Priority Interrupt on each CPU for IPC usage. When a calling CPU needs to execute a callback on the target CPU, the callback will execute in the context of the High Priority Interrupt of the target CPU.

When using IPCs in High Priority Interrupt context, users need to consider the following:

- Since the callback is executed in a High Priority Interrupt context, the callback must be written entirely in assembly. See the API Usage below for more details regarding writing assembly callbacks.
- The priority of the reserved High Priority Interrupt is dependent on the `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL` option

  When the callback executes:
  - The calling CPU will disable interrupts of level 3 and lower
  - Although the priority of the reserved interrupt depends on `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`, during the execution IPC ISR callback, the target CPU will disable interrupts of level 5 and lower regardless of what `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL` is set to.

API Usage  High Priority Interrupt IPC callbacks have the following restrictions:

- The callback must be of type `void func(void *arg)` but implemented entirely in assembly
Chapter 2. API Reference

- The callback is invoked via the CALLX0 instruction with register windowing disabled, thus the callback:
  - Must not call any register window related instructions (e.g., entry and retw).
  - Must not call other C functions as register windowing is disabled
  - The callback should be placed in IRAM at a 4-byte aligned address
  - (On invocation of/after returning from) the callback, the registers a2, a3, a4 are (saved/restored) automatically thus:
    - a2 will contain the void *arg of the callback
    - a3/a4 are free to use as scratch registers

The IPC feature offers the API listed below to execute a callback in a High Priority Interrupt context.

- esp_ipc_isr_asm_call() will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU begins execution of the callback.
- esp_ipc_isr_asm_call_blocking() will trigger an IPC call on the target CPU. This function will busy-wait until the target CPU completes execution of the callback.

The following code-blocks demonstrates a High Priority Interrupt IPC callback written in assembly that simply reads the target CPU’s cycle count.

```c
/* esp_test_ipc_isr_get_cycle_count_other_cpu(void *arg) */
// this function reads CCOUNT of the target CPU and stores it in arg.
// use only a2, a3 and a4 regs here.
.section .iram1, "ax"
.align 4
.global esp_test_ipc_isr_get_cycle_count_other_cpu
.type esp_test_ipc_isr_get_cycle_count_other_cpu, @function
// Args:
//@ a2 - void* arg
esp_test_ipc_isr_get_cycle_count_other_cpu:
rsr.ccount a3
s32i a3, a2, 0
ret

unit32_t cycle_count;
esp_ipc_isr_asm_call_blocking(esp_test_ipc_isr_get_cycle_count_other_cpu, (void*)cycle_count);
```

Note: The number of scratch registers available for use is sufficient for most simple use cases. But if your callback requires more scratch registers, void *arg can point to a buffer that is used as a register save area. The callback can then save and restore more registers. See the system/ipc/ipc_isr.

Note: For more examples of High Priority Interrupt IPC callbacks, see components/esp_system/port/arch/xtensa/esp_ipc_isr_routines.S and components/esp_system/test/test_ipc_isr.S

The High Priority Interrupt IPC API also provides the following convenience functions that can stall/resume the target CPU. These API utilize the High Priority Interrupt IPC, but supply their own internal callbacks:

- esp_ipc_isr_stall_other_cpu() stalls the target CPU. The calling CPU disables interrupts of level 3 and lower while the target CPU will busy-wait with interrupts of level 5 and lower disabled. The target CPU will busy-wait until esp_ipc_isr_release_other_cpu() is called.
- esp_ipc_isr_release_other_cpu() resumes the target CPU.

API Reference

Header File

- components/esp_system/include/esp_ipc.h
Chapter 2. API Reference

Functions

esp_err_t esp_ipc_call (uint32_t cpu_id, esp_ipc_func_t func, void *arg)

Execute a callback on a given CPU.

Execute a given callback on a particular CPU. The callback must be of type `esp_ipc_func_t` and will be invoked in the context of the target CPU’s IPC task.

- This function will block the target CPU’s IPC task has begun execution of the callback.
- If another IPC call is ongoing, this function will block until the ongoing IPC call completes.
- The stack size of the IPC task can be configured via the `CONFIG_ESP_IPC_TASK_STACK_SIZE` option.

Note: In single-core mode, returns ESP_ERR_INVALID_ARG for cpu_id 1.

Parameters

- **cpu_id** [in] CPU where the given function should be executed (0 or 1)
- **func** [in] Pointer to a function of type `void func(void* arg)` to be executed
- **arg** [in] Arbitrary argument of type `void*` to be passed into the function

Returns

- ESP_ERR_INVALID_ARG if cpu_id is invalid
- ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
- ESP_OK otherwise

esp_err_t esp_ipc_call_blocking (uint32_t cpu_id, esp_ipc_func_t func, void *arg)

Execute a callback on a given CPU until and block until it completes.

This function is identical to esp_ipc_call() except that this function will block until the execution of the callback completes.

Note: In single-core mode, returns ESP_ERR_INVALID_ARG for cpu_id 1.

Parameters

- **cpu_id** [in] CPU where the given function should be executed (0 or 1)
- **func** [in] Pointer to a function of type `void func(void* arg)` to be executed
- **arg** [in] Arbitrary argument of type `void*` to be passed into the function

Returns

- ESP_ERR_INVALID_ARG if cpu_id is invalid
- ESP_ERR_INVALID_STATE if the FreeRTOS scheduler is not running
- ESP_OK otherwise

Type Definitions

typedef void (*esp_ipc_func_t)(void *arg)

IPC Callback.

A callback of this type should be provided as an argument when calling esp_ipc_call() or esp_ipc_call_blocking().

Header File

- components/esp_system/include/esp_ipc_isr.h
Chapter 2. API Reference

Functions

void esp_ipc_isr_asm_call (esp_ipc_isr_func_t func, void *arg)

Execute an assembly callback on the other CPU.

- Execute a given callback on the other CPU in the context of a High Priority Interrupt.
- This function will busy-wait in a critical section until the other CPU has started execution of the callback
- The callback must be written in assembly, is invoked using a CALLX0 instruction, and has a2, a3, a4 as scratch registers. See docs for more details

Note: This function is not available in single-core mode.

Parameters

- func - [in] Pointer to a function of type void func(void* arg) to be executed
- arg - [in] Arbitrary argument of type void* to be passed into the function

void esp_ipc_isr_asm_call_blocking (esp_ipc_isr_func_t func, void *arg)

Execute an assembly callback on the other CPU and busy-wait until it completes.

This function is identical to esp_ipc_isr_asm_call() except that this function will busy-wait until the execution of the callback completes.

Note: This function is not available in single-core mode.

Parameters

- func - [in] Pointer to a function of type void func(void* arg) to be executed
- arg - [in] Arbitrary argument of type void* to be passed into the function

void esp_ipc_isr_stall_other_cpu (void)

Stall the other CPU.

This function will stall the other CPU. The other CPU is stalled by busy-waiting in the context of a High Priority Interrupt. The other CPU will not be resumed until esp_ipc_isr_release_other_cpu() is called.

- This function is internally implemented using IPC ISR
- This function is used for DPORT workaround.
- If the stall feature is paused using esp_ipc_isr_stall_pause(), this function will have no effect

Note: This function is not available in single-core mode.

Note: It is the caller’s responsibility to avoid deadlocking on spinlocks

void esp_ipc_isr_release_other_cpu (void)

Release the other CPU.

This function will release the other CPU that was previously stalled from calling esp_ipc_isr_stall_other_cpu() 

- This function is used for DPORT workaround.
- If the stall feature is paused using esp_ipc_isr_stall_pause(), this function will have no effect
Note: This function is not available in single-core mode.

void esp_ipc_isr_stall_pause (void)
Pauses the CPU stall feature.

This function will pause the CPU stall feature. Once paused, calls to esp_ipc_isr_stall_other_cpu() and esp_ipc_isr_release_other_cpu() will have no effect. If a IPC ISR call is already in progress, this function will busy-wait until the call completes before pausing the CPU stall feature.

void esp_ipc_isr_stall_abort (void)
Aborts a CPU stall.

This function will abort any stalling routine of the other CPU due to a previous call to esp_ipc_isr_stall_other_cpu(). This function aborts the stall in a non-recoverable manner, thus should only be called in case of a panic().

• This function is used in panic handling code.

void esp_ipc_isr_stall_resume (void)
Resumes the CPU stall feature.

This function will resume the CPU stall feature that was previously paused by calling esp_ipc_isr_stall_pause(). Once resumed, calls to esp_ipc_isr_stall_other_cpu() and esp_ipc_isr_release_other_cpu() will have effect again.

Type Definitions

typedef void (*esp_ipc_isr_func_t)(void *arg)
IPC ISR Callback.
A callback of this type should be provided as an argument when calling esp_ipc_isr_asm_call() or esp_ipc_isr_asm_call_blocking().

2.10.18 Interrupt allocation

Overview

The ESP32 has two cores, with 32 interrupts each. Each interrupt has a certain priority level, most (but not all) interrupts are connected to the interrupt mux.

Because there are more interrupt sources than interrupts, sometimes it makes sense to share an interrupt in multiple drivers. The esp_intr_alloc() abstraction exists to hide all these implementation details.

A driver can allocate an interrupt for a certain peripheral by calling esp_intr_alloc() (or esp_intr_alloc_intrstatus()). It can use the flags passed to this function to set the type of interrupt allocated, specifying a particular level or trigger method. The interrupt allocation code will then find an applicable interrupt, use the interrupt mux to hook it up to the peripheral, and install the given interrupt handler and ISR to it.

This code presents two different types of interrupts, handled differently: shared interrupts and non-shared interrupts. The simplest ones are non-shared interrupts: a separate interrupt is allocated per esp_intr_alloc() call and this interrupt is solely used for the peripheral attached to it, with only one ISR that will get called. On the other hand, shared interrupts can have multiple peripherals triggering them, with multiple ISRs being called when one of the peripherals attached signals an interrupt. Thus, ISRs that are intended for shared interrupts should check the interrupt status of the peripheral they service in order to check if any action is required.

Non-shared interrupts can be either level- or edge-triggered. Shared interrupts can only be level interrupts due to the chance of missed interrupts when edge interrupts are used.
For example, let’s say DevA and DevB share an interrupt. DevB signals an interrupt, so INT line goes high. The ISR handler calls code for DevA but does nothing. Then, ISR handler calls code for DevB, but while doing that, DevA signals an interrupt. DevB’s ISR is done, it clears interrupt status for DevB and exits interrupt code. Now, an interrupt for DevA is still pending, but because the INT line never went low, as DevA kept it high even when the interrupt for DevB was cleared, the interrupt is never serviced.

**Multicore issues**

Peripherals that can generate interrupts can be divided in two types:

- External peripherals, within the ESP32 but outside the Xtensa cores themselves. Most ESP32 peripherals are of this type.
- Internal peripherals, part of the Xtensa CPU cores themselves.

Interrupt handling differs slightly between these two types of peripherals.

**Internal peripheral interrupts**

Each Xtensa CPU core has its own set of six internal peripherals:

- Three timer comparators
- A performance monitor
- Two software interrupts.

Internal interrupt sources are defined in esp_intr_alloc.h as ETS_INTERNAL_*_INTR_SOURCE.

These peripherals can only be configured from the core they are associated with. When generating an interrupt, the interrupt they generate is hard-wired to their associated core; it’s not possible to have, for example, an internal timer comparator of one core generate an interrupt on another core. That is why these sources can only be managed using a task running on that specific core. Internal interrupt sources are still allocatable using esp_intr_alloc() as normal, but they cannot be shared and will always have a fixed interrupt level (namely, the one associated in hardware with the peripheral).

**External Peripheral Interrupts**

The remaining interrupt sources are from external peripherals. These are defined in soc/soc.h as ETS_*_INTR_SOURCE.

Non-internal interrupt slots in both CPU cores are wired to an interrupt multiplexer, which can be used to route any external interrupt source to any of these interrupt slots.

- Allocating an external interrupt will always allocate it on the core that does the allocation.
- Freeing an external interrupt must always happen on the same core it was allocated on.
- Disabling and enabling external interrupts from another core is allowed.
- Multiple external interrupt sources can share an interrupt slot by passing ESP_INTR_FLAG_SHARED as a flag to esp_intr_alloc().

Care should be taken when calling esp_intr_alloc() from a task which is not pinned to a core. During task switching, these tasks can migrate between cores. Therefore it is impossible to tell which CPU the interrupt is allocated on, which makes it difficult to free the interrupt handle and may also cause debugging difficulties. It is advised to use xTaskCreatePinnedToCore() with a specific CoreID argument to create tasks that will allocate interrupts. In the case of internal interrupt sources, this is required.

**IRAM-Safe Interrupt Handlers**

The ESP_INTR_FLAG_IRAM flag registers an interrupt handler that always runs from IRAM (and reads all its data from DRAM), and therefore does not need to be disabled during flash erase and write operations.

This is useful for interrupts which need a guaranteed minimum execution latency, as flash write and erase operations can be slow (erasers can take tens or hundreds of milliseconds to complete).

It can also be useful to keep an interrupt handler in IRAM if it is called very frequently, to avoid flash cache misses.

Refer to the [SPI flash API documentation](https://docs.espressif.com/projects/spi_flash/en/latest/api.html) for more details.
Multiple Handlers Sharing A Source

Several handlers can be assigned to a same source, given that all handlers are allocated using the `ESP_INTR_FLAG_SHARED` flag. They will all be allocated to the interrupt, which the source is attached to, and called sequentially when the source is active. The handlers can be disabled and freed individually. The source is attached to the interrupt (enabled), if one or more handlers are enabled, otherwise detached. A handler will never be called when disabled, while its source may still be triggered if any one of its handler enabled.

Sources attached to non-shared interrupt do not support this feature.

Though the framework support this feature, you have to use it very carefully. There usually exist two ways to stop an interrupt from being triggered: disable the source or mask peripheral interrupt status. IDF only handles enabling and disabling of the source itself, leaving status and mask bits to be handled by users. Status bits shall either be masked before the handler responsible for it is disabled, either be masked and then properly handled in another enabled interrupt. Please note that leaving some status bits unhandled without masking them, while disabling the handlers for them, will cause the interrupt(s) to be triggered indefinitely, resulting therefore in a system crash.

API Reference

Header File

- components/esp_hw_support/include/esp_intr_alloc.h

Functions

`esp_err_t esp_intr_mark_shared` (int intno, int cpu, bool is_in_iram)

Mark an interrupt as a shared interrupt.

This will mark a certain interrupt on the specified CPU as an interrupt that can be used to hook shared interrupt handlers to.

**Parameters**

- `intno` – The number of the interrupt (0-31)
- `cpu` – CPU on which the interrupt should be marked as shared (0 or 1)
- `is_in_iram` – Shared interrupt is for handlers that reside in IRAM and the int can be left enabled while the flash cache is disabled.

**Returns**

ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

`esp_err_t esp_intr_reserve` (int intno, int cpu)

Reserve an interrupt to be used outside of this framework.

This will mark a certain interrupt on the specified CPU as reserved, not to be allocated for any reason.

**Parameters**

- `intno` – The number of the interrupt (0-31)
- `cpu` – CPU on which the interrupt should be marked as shared (0 or 1)

**Returns**

ESP_ERR_INVALID_ARG if cpu or intno is invalid ESP_OK otherwise

`esp_err_t esp_intr_alloc` (int source, int flags, `intr_handler_t` handler, void *arg, `intr_handle_t` *ret_handle)

Allocate an interrupt with the given parameters.

This finds an interrupt that matches the restrictions as given in the flags parameter, maps the given interrupt source to it and hooks up the given interrupt handler (with optional argument) as well. If needed, it can return a handle for the interrupt as well.

The interrupt will always be allocated on the core that runs this function.

If ESP_INTR_FLAG_IRAM flag is used, and handler address is not in IRAM or RTC_FAST_MEM, then ESP_ERR_INVALID_ARG is returned.

**Parameters**
• **source** – The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.

• **flags** – An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.

• **handler** – The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.

• **arg** – Optional argument for passed to the interrupt handler

• **ret_handle** – Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

**Returns**
- ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_OK otherwise

```c
esp_err_t esp_intr_alloc_intrstatus(int source, int flags, uint32_t intrstatusreg, uint32_t intrstatusmask, intr_handler_t handler, void *arg, intr_handle_t *ret_handle)
```

Allocate an interrupt with the given parameters.

This essentially does the same as esp_intr_alloc, but allows specifying a register and mask combo. For shared interrupts, the handler is only called if a read from the specified register, ANDed with the mask, returns non-zero. By passing an interrupt status register address and a fitting mask, this can be used to accelerate interrupt handling in the case a shared interrupt is triggered; by checking the interrupt statuses first, the code can decide which ISRs can be skipped.

**Parameters**

• **source** – The interrupt source. One of the ETS_*_INTR_SOURCE interrupt mux sources, as defined in soc/soc.h, or one of the internal ETS_INTERNAL_*_INTR_SOURCE sources as defined in this header.

• **flags** – An ORred mask of the ESP_INTR_FLAG_* defines. These restrict the choice of interrupts that this routine can choose from. If this value is 0, it will default to allocating a non-shared interrupt of level 1, 2 or 3. If this is ESP_INTR_FLAG_SHARED, it will allocate a shared interrupt of level 1. Setting ESP_INTR_FLAG_INTRDISABLED will return from this function with the interrupt disabled.

• **intrstatusreg** – The address of an interrupt status register

• **intrstatusmask** – A mask. If a read of address intrstatusreg has any of the bits that are 1 in the mask set, the ISR will be called. If not, it will be skipped.

• **handler** – The interrupt handler. Must be NULL when an interrupt of level >3 is requested, because these types of interrupts aren’t C-callable.

• **arg** – Optional argument for passed to the interrupt handler

• **ret_handle** – Pointer to an intr_handle_t to store a handle that can later be used to request details or free the interrupt. Can be NULL if no handle is required.

**Returns**
- ESP_ERR_INVALID_ARG if the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_OK otherwise

```c
esp_err_t esp_intr_free(intr_handle_t handle)
```

Disable and free an interrupt.

Use an interrupt handle to disable the interrupt and release the resources associated with it. If the current core is not the core that registered this interrupt, this routine will be assigned to the core that allocated this interrupt, blocking and waiting until the resource is successfully released.

**Note:** When the handler shares its source with other handlers, the interrupt status bits it’s responsible for should be managed properly before freeing it. See esp_intr_disable for more details. Please do not call this function in esp_ipc_call_blocking.
Chapter 2. API Reference

**Parameters** `handle` - The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

**Returns** ESP_ERR_INVALID_ARG the handle is NULL ESP_FAIL failed to release this handle ESP_OK otherwise

```c
int esp_intr_get_cpu (intr.handle_t handle)
```

Get CPU number an interrupt is tied to.

**Parameters** `handle` - The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

**Returns** The core number where the interrupt is allocated

```c
int esp_intr_get_intno (intr.handle_t handle)
```

Get the allocated interrupt for a certain handle.

**Parameters** `handle` - The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus

**Returns** The interrupt number

```c
esp_err_t esp_intr_disable (intr.handle_t handle)
```

Disable the interrupt associated with the handle.

**Note:**

a. For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

b. When several handlers sharing a same interrupt source, interrupt status bits, which are handled in the handler to be disabled, should be masked before the disabling, or handled in other enabled interrupts properly. Miss of interrupt status handling will cause infinite interrupt calls and finally system crash.

```c
esp_err_t esp_intr_enable (intr.handle_t handle)
```

Enable the interrupt associated with the handle.

**Note:** For local interrupts (ESP_INTERNAL_* sources), this function has to be called on the CPU the interrupt is allocated on. Other interrupts have no such restriction.

```c
esp_err_t esp_intr_set_in_iram (intr.handle_t handle, bool is_in_iram)
```

Set the “in IRAM” status of the handler.

**Note:** Does not work on shared interrupts.

**Parameters**

- `handle` - The handle, as obtained by esp_intr_alloc or esp_intr_alloc_intrstatus
- `is_in_iram` - Whether the handler associated with this handle resides in IRAM. Handlers residing in IRAM can be called when cache is disabled.

**Returns** ESP_ERR_INVALID_ARG if the combination of arguments is invalid. ESP_OK otherwise
void **esp_intr_noniram_disable**(void)

Disable interrupts that aren’t specifically marked as running from IRAM.

void **esp_intr_noniram_enable**(void)

Re-enable interrupts disabled by **esp_intr_noniram_disable**.

void **esp_intr_enable_source**(int inum)

Enable the interrupt source based on its number

**Parameters**

inum – interrupt number from 0 to 31

void **esp_intr_disable_source**(int inum)

Disable the interrupt source based on its number

**Parameters**

inum – interrupt number from 0 to 31

static inline int **esp_intr_flags_to_level**(int flags)

Get the lowest interrupt level from the flags.

**Parameters**

flags - The same flags that pass to **esp_intr_alloc_intrstatus** API

**Macros**

**ESP_INTR_FLAG_LEVEL1**

Interrupt allocation flags.

These flags can be used to specify which interrupt qualities the code calling **esp_intr_alloc** needs. Accept a Level 1 interrupt vector (lowest priority)

**ESP_INTR_FLAG_LEVEL2**

Accept a Level 2 interrupt vector.

**ESP_INTR_FLAG_LEVEL3**

Accept a Level 3 interrupt vector.

**ESP_INTR_FLAG_LEVEL4**

Accept a Level 4 interrupt vector.

**ESP_INTR_FLAG_LEVEL5**

Accept a Level 5 interrupt vector.

**ESP_INTR_FLAG_LEVEL6**

Accept a Level 6 interrupt vector.

**ESP_INTR_FLAG_NMI**

Accept a Level 7 interrupt vector (highest priority)

**ESP_INTR_FLAG_SHARED**

Interrupt can be shared between ISRs.

**ESP_INTR_FLAG_EDGE**

Edge-triggered interrupt.

**ESP_INTR_FLAG_IRAM**

ISR can be called if cache is disabled.
**ESP_INTR_FLAG_INTRDISABLED**
Return with this interrupt disabled.

**ESP_INTR_FLAG_LOWMED**
Low and medium priot interrupts. These can be handled in C.

**ESP_INTR_FLAG_HIGH**
High level interrupts. Need to be handled in assembly.

**ESP_INTR_FLAG_LEVELMASK**
Mask for all level flags.

**ETS_INTERNAL_TIMER0_INTR_SOURCE**
Platform timer 0 interrupt source.
The esp_intr_alloc* functions can allocate an int for all ETS_*_INTR_SOURCE interrupt sources that are routed through the interrupt mux. Apart from these sources, each core also has some internal sources that do not pass through the interrupt mux. To allocate an interrupt for these sources, pass these pseudo-sources to the functions.

**ETS_INTERNAL_TIMER1_INTR_SOURCE**
Platform timer 1 interrupt source.

**ETS_INTERNAL_TIMER2_INTR_SOURCE**
Platform timer 2 interrupt source.

**ETS_INTERNAL_SW0_INTR_SOURCE**
Software int source 1.

**ETS_INTERNAL_SW1_INTR_SOURCE**
Software int source 2.

**ETS_INTERNAL_PROFILING_INTR_SOURCE**
Int source for profiling.

**ETS_INTERNAL_UNUSED_INTR_SOURCE**
Interrupt is not assigned to any source.

**ETS_INTERNAL_INTR_SOURCE_OFF**
Provides SystemView with positive IRQ IDs, otherwise scheduler events are not shown properly

**ESP_INTR_ENABLE**(inum)
Enable interrupt by interrupt number

**ESP_INTR_DISABLE**(inum)
Disable interrupt by interrupt number

**Type Definitions**

```c
typedef void (*intr_handler_t)(void *arg)
Function prototype for interrupt handler function
```
typedef struct intr_handle_data_t intr_handle_data_t
    Interrupt handler associated data structure

typedef intr_handle_data_t *intr_handle_t
    Handle to an interrupt handler

### 2.10.19 Logging library

**Overview**

The logging library provides two ways for setting log verbosity:

- **At compile time**: in menuconfig, set the verbosity level using the option `CONFIG_LOG_DEFAULT_LEVEL`. Optionally, also in menuconfig, set the maximum verbosity level using the option `CONFIG_LOG_MAXIMUM_LEVEL`. By default this is the same as the default level, but it can be set higher in order to compile more optional logs into the firmware.
- **At runtime**: all logs for verbosity levels lower than `CONFIG_LOG_DEFAULT_LEVEL` are enabled by default. The function `esp_log_level_set()` can be used to set a logging level on a per module basis. Modules are identified by their tags, which are human-readable ASCII zero-terminated strings.

There are the following verbosity levels:

- Error (lowest)
- Warning
- Info
- Debug
- Verbose (highest)

**Note:** The function `esp_log_level_set()` cannot set logging levels higher than specified by `CONFIG_LOG_MAXIMUM_LEVEL`. To increase log level for a specific file above this maximum at compile time, use the macro `LOG_LOCAL_LEVEL` (see the details below).

---

**How to use this library**

In each C file that uses logging functionality, define the TAG variable as shown below:

```
static const char* TAG = "MyModule";
```

Then use one of logging macros to produce output, e.g:

```
ESP_LOGW(TAG, "Baud rate error %.1f%. Requested: %d baud, actual: %d baud", error,... 100, baud_req, baud_real);
```

Several macros are available for different verbosity levels:

- ESP_LOGE - error (lowest)
- ESP_LOGW - warning
- ESP_LOGI - info
- ESP_LOGD - debug
- ESP_LOGV - verbose (highest)

Additionally, there are ESP_EARLY_LOGx versions for each of these macros, e.g. `ESP_EARLY_LOGE`. These versions have to be used explicitly in the early startup code only, before heap allocator and syscalls have been initialized. Normal ESP_LOGx macros can also be used while compiling the bootloader, but they will fall back to the same implementation as ESP_EARLY_LOGx macros.
There are also ESP_DRAM_LOGx versions for each of these macros, e.g. ESP_DRAM_LOGE. These versions are used in some places where logging may occur with interrupts disabled or with flash cache inaccessible. Use of this macros should be as sparing as possible, as logging in these types of code should be avoided for performance reasons.

**Note:** Inside critical sections interrupts are disabled so it’s only possible to use ESP_DRAM_LOGx (preferred) or ESP_EARLY_LOGx. Even though it’s possible to log in these situations, it’s better if your program can be structured not to require it.

To override default verbosity level at file or component scope, define the LOG_LOCAL_LEVEL macro. At file scope, define it before including esp_log.h, e.g.:

```c
#define LOG_LOCAL_LEVEL ESP_LOG_VERBOSE
#include "esp_log.h"
```

At component scope, define it in the component makefile:

```c
target_compile_definitions({${COMPONENT_LIB} PUBLIC "-DLOG_LOCAL_LEVEL=ESP_LOG_\_VERBOSE"
```

To configure logging output per module at runtime, add calls to the function esp_log_level_set() as follows:

```c
esp_log_level_set("*", ESP_LOG_ERROR); // set all components to ERROR level
esp_log_level_set("wifi", ESP_LOG_WARN); // enable WARN logs from WiFi stack
esp_log_level_set("dhcpc", ESP_LOG_INFO); // enable INFO logs from DHCP client
```

**Note:** The “DRAM” and “EARLY” log macro variants documented above do not support per module setting of log verbosity. These macros will always log at the “default” verbosity level, which can only be changed at runtime by calling esp_log_level("*", level).

**Logging to Host via JTAG** By default, the logging library uses the printf-like function to write formatted output to the dedicated UART. By calling a simple API, all log output may be routed to JTAG instead, making logging several times faster. For details, please refer to Section Logging to Host.

**Application Example**

The logging library is commonly used by most esp-idf components and examples. For demonstration of log functionality, check ESP-IDF’s examples directory. The most relevant examples that deal with logging are the following:

- system/ota
- storage/sd_card
- protocols/https_request

**API Reference**

**Header File**

- components/log/include/esp_log.h

**Functions**

```c
void esp_log_level_set (const char *tag, esp_log_level_t level)
```

Set log level for given tag.

If logging for given component has already been enabled, changes previous setting.
Note: Note that this function can not raise log level above the level set using CONFIG_LOG_MAXIMUM_LEVEL setting in menuconfig. To raise log level above the default one for a given file, define LOG_LOCAL_LEVEL to one of the ESP_LOG_* values, before including esp_log.h in this file.

Parameters
- **tag** – Tag of the log entries to enable. Must be a non-NULL zero terminated string. Value “*” resets log level for all tags to the given value.
- **level** – Selects log level to enable. Only logs at this and lower verbosity levels will be shown.

```c
esp_log_level_t esp_log_level_get(const char* tag)
```

Get log level for a given tag, can be used to avoid expensive log statements.

**Parameters**
- **tag** – Tag of the log to query current level. Must be a non-NULL zero terminated string.

**Returns**
The current log level for the given tag

```c
vprintf_like_t esp_log_set_vprintf(vprintf_like_t func)
```

Set function used to output log entries.

By default, log output goes to UART0. This function can be used to redirect log output to some other destination, such as file or network. Returns the original log handler, which may be necessary to return output to the previous destination.

**Note:** Please note that function callback here must be re-entrant as it can be invoked in parallel from multiple thread context.

**Parameters**
- **func** – new Function used for output. Must have same signature as vprintf.

**Returns**
func old Function used for output.

```c
uint32_t esp_log_timestamp(void)
```

Function which returns timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros. In the 2nd stage bootloader, and at early application startup stage this function uses CPU cycle counter as time source. Later when FreeRTOS scheduler start running, it switches to FreeRTOS tick count.

For now, we ignore millisecond counter overflow.

**Returns**
timestamp, in milliseconds

```c
char* esp_log_system_timestamp(void)
```

Function which returns system timestamp to be used in log output.

This function is used in expansion of ESP_LOGx macros to print the system time as “HH:MM:SS.sss”. The system time is initialized to 0 on startup, this can be set to the correct time with an SNTP sync, or manually with standard POSIX time functions.

Currently, this will not get used in logging from binary blobs (i.e. Wi-Fi & Bluetooth libraries), these will still print the RTOS tick time.

**Returns**
timestamp, in “HH:MM:SS.sss”

```c
uint32_t esp_log_early_timestamp(void)
```

Function which returns timestamp to be used in log output.

This function uses HW cycle counter and does not depend on OS, so it can be safely used after application crash.
Returns  timestamp, in milliseconds

void esp_log_write (esp_log_level_t level, const char* tag, const char* format, ...)
Write message into the log.

This function is not intended to be used directly. Instead, use one of ESP_LOGE, ESP_LOGW, ESP_LOGI, ESP_LOGD, ESP_LOGV macros.

This function or these macros should not be used from an interrupt.

void esp_log_writev (esp_log_level_t level, const char* tag, const char* format, va_list args)
Write message into the log, va_list variant.

This function is provided to ease integration toward other logging framework, so that esp_log can be used as a log sink.

See also:
esp_log_write()

Macros

ESP_LOG_BUFFER_HEX_LEVEL (tag, buffer, buff_len, level)
Log a buffer of hex bytes at specified level, separated into 16 bytes each line.

Parameters
• tag – description tag
• buffer – Pointer to the buffer array
• buff_len – length of buffer in bytes
• level – level of the log

ESP_LOG_BUFFER_CHAR_LEVEL (tag, buffer, buff_len, level)
Log a buffer of characters at specified level, separated into 16 bytes each line. Buffer should contain only printable characters.

Parameters
• tag – description tag
• buffer – Pointer to the buffer array
• buff_len – length of buffer in bytes
• level – level of the log

ESP_LOG_BUFFER_HEXDUMP (tag, buffer, buff_len, level)
Dump a buffer to the log at specified level.
The dump log shows just like the one below:

| W (195) log_example: 0x3ffb4280 | 45 53 50 33 32 20 69 73 20 67 72 65 61 74 _ |
| 2c 20 |ESP32 is great, | |
| W (195) log_example: 0x3ffb4290 | 77 6f 72 6b 69 6e 67 20 61 6c 6f 6e 67 20 _ |
| 77 69 |working along wi | |
| W (205) log_example: 0x3ffb42a0 | 74 68 20 74 68 65 20 49 44 46 2e 00 _ |
| 44 46 2e 00 |th the IDF.. | |

It is highly recommended to use terminals with over 102 text width.

Parameters
• tag – description tag
• buffer – Pointer to the buffer array
• buff_len – length of buffer in bytes
• level – level of the log
**ESP_LOG_BUFFER_HEX** (tag, buffer, buff_len)

Log a buffer of hex bytes at Info level.

See also:

esp_log_buffer_hex_level

**Parameters**

• **tag** – description tag
• **buffer** – Pointer to the buffer array
• **buff_len** – length of buffer in bytes

**ESP_LOG_BUFFER_CHAR** (tag, buffer, buff_len)

Log a buffer of characters at Info level. Buffer should contain only printable characters.

See also:

esp_log_buffer_char_level

**Parameters**

• **tag** – description tag
• **buffer** – Pointer to the buffer array
• **buff_len** – length of buffer in bytes

**ESP_EARLY_LOGE** (tag, format, ...)

Macro to output logs in startup code, before heap allocator and syscalls have been initialized. Log at ESP_LOG_ERROR level.

See also:

printf, ESP_LOGE, ESP_DRAM_LOGE

In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros which are using variadic arguments. The first one is using the GNU extension `##__VA_ARGS__`. The second one is using the C++20 feature `VA_OPT(,)`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using `##__VA_ARGS__`.

**ESP_EARLY_LOGW** (tag, format, ...)

Macro to output logs in startup code at ESP_LOG_WARN level.

See also:

ESP_EARLY_LOGE, ESP_LOGE, printf

**ESP_EARLY_LOGI** (tag, format, ...)

Macro to output logs in startup code at ESP_LOG_INFO level.

See also:

ESP_EARLY_LOGE, ESP_LOGE, printf

**ESP_EARLY_LOGD** (tag, format, ...)

Macro to output logs in startup code at ESP_LOG_DEBUG level.

See also:

ESP_EARLY_LOGE, ESP_LOGE, printf
ESP_EARLY_LOGV (tag, format, ...)
   macro to output logs in startup code at ESP_LOG_VERBOSE level.

   See also:
   ESP_EARLY_LOGE,ESP_LOGE,printf

_ESP_LOG_EARLY_ENABLED (log_level)

ESP_LOG_EARLY_IMPL (tag, format, log_level, log_tag_letter, ...)

ESP_LOGE (tag, format, ...)

ESP_LOGW (tag, format, ...)

ESP_LOGI (tag, format, ...)

ESP_LOGD (tag, format, ...)

ESP_LOGV (tag, format, ...)

ESP_LOG_LEVEL (level, tag, format, ...)
   runtime macro to output logs at a specified level.

   See also:
   printf

   Parameters
   • tag – tag of the log, which can be used to change the log level by esp_log_level_set at runtime.
   • level – level of the output log.
   • format – format of the output log. See printf
   • ... – variables to be replaced into the log. See printf

ESP_LOG_LEVEL_LOCAL (level, tag, format, ...)
   runtime macro to output logs at a specified level. Also check the level with LOG_LOCAL_LEVEL.

   See also:
   printf,ESP_LOG_LEVEL

ESP_DRAM_LOGE (tag, format, ...)
   Macro to output logs when the cache is disabled. Log at ESP_LOG_ERROR level.

   Similar to
   Usage: ESP_DRAM_LOGE(DRAM_STR("my_tag"), "format", orESP_DRAM_LOGE(TAG, "format", "..."), where TAG is a char* that points to a str in the DRAM.

   See also:
   ESP_EARLY_LOGE, the log level cannot be changed per-tag, however esp_log_level_set( "*", level) will set the default level which controls these log lines also.

   See also:
   esp_rom_printf,ESP_LOGE
Note: Unlike normal logging macros, it’s possible to use this macro when interrupts are disabled or inside an ISR.

Note: Placing log strings in DRAM reduces available DRAM, so only use when absolutely essential.

ESP_DRAM_LOGW (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_WARN level.

See also:
ESP_DRAM_LOGW, ESP_LOGW, esp_rom_printf

ESP_DRAM_LOGI (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_INFO level.

See also:
ESP_DRAM_LOGI, ESP_LOGI, esp_rom_printf

ESP_DRAM_LOGD (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_DEBUG level.

See also:
ESP_DRAM_LOGD, ESP_LOGD, esp_rom_printf

ESP_DRAM_LOGV (tag, format, ...)
macro to output logs when the cache is disabled at ESP_LOG_VERBOSE level.

See also:
ESP_DRAM_LOGV, ESP_LOGV, esp_rom_printf

Type Definitions
typedef int (*vprintf_like_t)(const char*, va_list)

Enumerations
enum esp_log_level_t
Log level.
Values:

enumerator ESP_LOG_NONE
No log output

enumerator ESP_LOG_ERROR
Critical errors, software module can not recover on its own
Chapter 2. API Reference

enumerator **ESP_LOG_WARN**
Error conditions from which recovery measures have been taken

enumerator **ESP_LOG_INFO**
Information messages which describe normal flow of events

enumerator **ESP_LOG_DEBUG**
Extra information which is not necessary for normal use (values, pointers, sizes, etc).

enumerator **ESP_LOG_VERBOSE**
Bigger chunks of debugging information, or frequent messages which can potentially flood the output.

### 2.10.20 Miscellaneous System APIs

#### Software Reset

To perform software reset of the chip, the *esp_restart()* function is provided. When the function is called, execution of the program stops, both CPUs are reset, and the application is loaded by the bootloader and starts execution again.

Additionally, the *esp_register_shutdown_handler()* function can register a routine that will be automatically called before a restart (that is triggered by *esp_restart()* ) occurs. This is similar to the functionality of atexit POSIX function.

#### Reset Reason

ESP-IDF applications can be started or restarted due to a variety of reasons. To get the last reset reason, call *esp_reset_reason()* function. See description of *esp_reset_reason_t* for the list of possible reset reasons.

#### Heap Memory

Two heap-memory-related functions are provided:

- *esp_get_free_heap_size()* returns the current size of free heap memory.
- *esp_get_minimum_free_heap_size()* returns the minimum size of free heap memory that has ever been available (i.e., the smallest size of free heap memory in the applications lifetime).

Note that ESP-IDF supports multiple heaps with different capabilities. The functions mentioned in this section return the size of heap memory that can be allocated using the malloc family of functions. For further information about heap memory, see *Heap Memory Allocation*.

#### MAC Address

These APIs allow querying and customizing MAC addresses for different supported network interfaces (e.g., Wi-Fi, Bluetooth, Ethernet).

To fetch the MAC address for a specific network interface (e.g., Wi-Fi, Bluetooth, Ethernet), call the function *esp_read_mac()*.
In ESP-IDF, the MAC addresses for the various network interfaces are calculated from a single base MAC address. By default, the Espressif base MAC address is used. This base MAC address is pre-programmed into the ESP32 eFuse in the factory during production.

<table>
<thead>
<tr>
<th>Interface</th>
<th>MAC Address (4 universally administered, default)</th>
<th>MAC Address (2 universally administered)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wi-Fi Station</td>
<td>base_mac</td>
<td>base_mac</td>
</tr>
<tr>
<td>Wi-Fi SoftAP</td>
<td>base_mac, +1 to the last octet</td>
<td>Local MAC (derived from Wi-Fi Station MAC)</td>
</tr>
<tr>
<td>Bluetooth</td>
<td>base_mac, +2 to the last octet</td>
<td>base_mac, +1 to the last octet</td>
</tr>
<tr>
<td>Ethernet</td>
<td>base_mac, +3 to the last octet</td>
<td>Local MAC (derived from Bluetooth MAC)</td>
</tr>
</tbody>
</table>

**Note:** The configuration configures the number of universally administered MAC addresses that are provided by Espressif.

**Custom Base MAC** The default base MAC is pre-programmed by Espressif in eFuse BLK0. To set a custom base MAC instead, call the function esp_base_mac_addr_set() before initializing any network interfaces or calling the esp_read_mac() function. The custom MAC address can be stored in any supported storage device (e.g., flash, NVS).

The custom base MAC addresses should be allocated such that derived MAC addresses will not overlap. Based on the table above, users can configure the option CONFIG_ESP32_UNIVERSAL_MAC_ADDRESSES to set the number of valid universal MAC addresses that can be derived from the custom base MAC.

**Note:** It is also possible to call the function esp_netif_set_mac() to set the specific MAC used by a network interface after network initialization. But it is recommended to use the base MAC approach documented here to avoid the possibility of the original MAC address briefly appearing on the network before being changed.

**Custom MAC Address in eFuse** When reading custom MAC addresses from eFuse, ESP-IDF provides a helper function esp_efuse_mac_get_custom(). This loads the MAC address from eFuse BLK3. This function assumes that the custom base MAC address is stored in the following format:

<table>
<thead>
<tr>
<th>Field</th>
<th># of bits</th>
<th>Range of bits</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>8</td>
<td>191:184</td>
<td>0: invalid, others — valid</td>
</tr>
<tr>
<td>Reserved</td>
<td>128</td>
<td>183:56</td>
<td></td>
</tr>
<tr>
<td>MAC address</td>
<td>48</td>
<td>55:8</td>
<td></td>
</tr>
<tr>
<td>MAC address CRC</td>
<td>8</td>
<td>7:0</td>
<td>CRC-8-CCITT, polynomial 0x07</td>
</tr>
</tbody>
</table>

**Note:** If the 3/4 coding scheme is enabled, all eFuse fields in this block must be burnt at the same time.

Once MAC address has been obtained using esp_efuse_mac_get_custom(), call esp_base_mac_addr_set() to set this MAC address as base MAC address.

**Local vs Universal MAC Addresses** ESP32 comes pre-programmed with enough valid Espressif universally administered MAC addresses for all internal interfaces. The table above shows how to calculate and derive the MAC address for a specific interface according to the base MAC address.

When using a custom MAC address scheme, it is possible that not all interfaces can be assigned with a universally administered MAC address. In these cases, a locally administered MAC address is assigned. Note that these addresses are intended for use on a single local network only.
See this article for the definition of locally and universally administered MAC addresses.

Function `esp_derive_local_mac()` is called internally to derive a local MAC address from a universal MAC address. The process is as follows:

1. The U/L bit (bit value 0x2) is set in the first octet of the universal MAC address, creating a local MAC address.
2. If this bit is already set in the supplied universal MAC address (i.e., the supplied “universal” MAC address was in fact already a local MAC address), then the first octet of the local MAC address is XORed with 0x4.

**Chip Version**

`esp_chip_info()` function fills `esp_chip_info_t` structure with information about the chip. This includes the chip revision, number of CPU cores, and a bit mask of features enabled in the chip.

**SDK Version**

`esp_get_idf_version()` returns a string describing the ESP-IDF version which is used to compile the application. This is the same value as the one available through `IDF_VER` variable of the build system. The version string generally has the format of `git describe` output.

To get the version at build time, additional version macros are provided. They can be used to enable or disable parts of the program depending on the ESP-IDF version.

- `ESP_IDF_VERSION_MAJOR`, `ESP_IDF_VERSION_MINOR`, `ESP_IDF_VERSION_PATCH` are defined to integers representing major, minor, and patch version.
- `ESP_IDF_VERSION_VAL` and `ESP_IDF_VERSION` can be used when implementing version checks:

```
#include "esp_idf_version.h"

#if ESP_IDF_VERSION >= ESP_IDF_VERSION_VAL(4, 0, 0)
  // enable functionality present in ESP-IDF v4.0
#endif
```

**App Version**

The application version is stored in `esp_app_desc_t` structure. It is located in DROM sector and has a fixed offset from the beginning of the binary file. The structure is located after `esp_image_header_t` and `esp_image_segment_header_t` structures. The type of the field version is string and it has a maximum length of 32 chars.

To set the version in your project manually, you need to set the `PROJECT_VER` variable in the CMakeLists.txt of your project. In application CMakeLists.txt, put `set(PROJECT_VER "0.1.0.1")` before including project.cmake.

If the `CONFIG_APP_PROJECT_VER_FROM_CONFIG` option is set, the value of `CONFIG_APP_PROJECT_VER` will be used. Otherwise, if the `PROJECT_VER` variable is not set in the project, it will be retrieved either from the $(PROJECT_PATH)/version.txt file (if present) or using `git describe` command. If neither is available, `PROJECT_VER` will be set to “1”. Application can make use of this by calling `esp_app_get_description()` or `esp_ota_get_partition_description()` functions.

**API Reference**

**Header File**

- `components/esp_system/include/esp_system.h`
Functions

`esp_err_t esp_register_shutdown_handler(shutdown_handler_t handle)`

Register shutdown handler.

This function allows you to register a handler that gets invoked before the application is restarted using esp_restart function.

**Parameters** handle – function to execute on restart

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the handler has already been registered
- ESP_ERR_NO_MEM if no more shutdown handler slots are available

`esp_err_t esp_unregister_shutdown_handler(shutdown_handler_t handle)`

Unregister shutdown handler.

This function allows you to unregister a handler which was previously registered using esp_register_shutdown_handler function.

- ESP_OK on success
- ESP_ERR_INVALID_STATE if the given handler hasn’t been registered before

`void esp_restart(void)`

Restart PRO and APP CPUs.

This function can be called both from PRO and APP CPUs. After successful restart, CPU reset reason will be SW_CPU_RESET. Peripherals (except for Wi-Fi, BT, UART0, SPI1, and legacy timers) are not reset. This function does not return.

`esp_reset_reason_t esp_reset_reason(void)`

Get reason of last reset.

**Returns** See description of esp_reset_reason_t for explanation of each value.

`uint32_t esp_get_free_heap_size(void)`

Get the size of available heap.

**Note:** Note that the returned value may be larger than the maximum contiguous block which can be allocated.

**Returns** Available heap size, in bytes.
