

# ESP32-C2

## ESP-IDF Programming Guide

Release v5.1.4-335-ge3c4c76b17

Espressif Systems

Jun 13, 2024

# Table of contents

<b>Table of contents</b>	<b>i</b>
<b>1 Get Started</b>	<b>3</b>
1.1 Introduction	3
1.2 What You Need	3
1.2.1 Hardware	3
1.2.2 Software	4
1.3 Installation	4
1.3.1 IDE	4
1.3.2 Manual Installation	4
1.4 Build Your First Project	36
1.5 Uninstall ESP-IDF	36
<b>2 API Reference</b>	<b>37</b>
2.1 API Conventions	37
2.1.1 Error Handling	37
2.1.2 Configuration Structures	37
2.1.3 Private APIs	39
2.1.4 Components in Example Projects	39
2.1.5 API Stability	39
2.2 Application Protocols	40
2.2.1 ASIO port	40
2.2.2 ESP-Modbus	40
2.2.3 ESP-MQTT	41
2.2.4 ESP-TLS	59
2.2.5 ESP HTTP Client	74
2.2.6 ESP Local Control	91
2.2.7 ESP Serial Slave Link	101
2.2.8 ESP x509 Certificate Bundle	115
2.2.9 HTTP Server	117
2.2.10 HTTPS Server	145
2.2.11 ICMP Echo	148
2.2.12 mDNS Service	153
2.2.13 Mbed TLS	154
2.2.14 IP Network Layer	156
2.3 Bluetooth API	156
2.3.1 BT COMMON	156
2.3.2 BT LE	164
2.3.3 Controller && VHCI	304
2.3.4 NimBLE-based host APIs	313
2.4 Error Codes Reference	315
2.5 Networking APIs	321
2.5.1 Wi-Fi	321
2.5.2 Ethernet	414
2.5.3 Thread	448
2.5.4 ESP-NETIF	458
2.5.5 IP Network Layer	493

2.5.6	Application Layer	495
2.6	Peripherals API	496
2.6.1	Analog to Digital Converter (ADC) Oneshot Mode Driver	496
2.6.2	Analog to Digital Converter (ADC) Calibration Driver	505
2.6.3	Clock Tree	508
2.6.4	GPIO & RTC GPIO	517
2.6.5	General Purpose Timer (GPTimer)	535
2.6.6	Dedicated GPIO	549
2.6.7	Inter-Integrated Circuit (I2C)	554
2.6.8	LCD	570
2.6.9	LED Control (LEDC)	584
2.6.10	SD SPI Host Driver	602
2.6.11	SPI Flash API	607
2.6.12	SPI Master Driver	636
2.6.13	SPI Slave Driver	658
2.6.14	SPI Slave Half Duplex	664
2.6.15	Temperature Sensor	672
2.6.16	Universal Asynchronous Receiver/Transmitter (UART)	675
2.7	Project Configuration	700
2.7.1	Introduction	700
2.7.2	Project Configuration Menu	700
2.7.3	Using sdkconfig.defaults	700
2.7.4	Kconfig Format Rules	700
2.7.5	Backward Compatibility of Kconfig Options	701
2.7.6	Configuration Options Reference	701
2.8	Provisioning API	1011
2.8.1	Protocol Communication	1011
2.8.2	Unified Provisioning	1029
2.8.3	Wi-Fi Provisioning	1036
2.9	Storage API	1054
2.9.1	FAT Filesystem Support	1054
2.9.2	Manufacturing Utility	1063
2.9.3	Non-volatile Storage Library	1067
2.9.4	NVS Partition Generator Utility	1089
2.9.5	NVS Partition Parser Utility	1094
2.9.6	SD/SDIO/MMC Driver	1095
2.9.7	Partitions API	1108
2.9.8	SPIFFS Filesystem	1117
2.9.9	Virtual filesystem component	1121
2.9.10	Wear Levelling API	1136
2.10	System API	1139
2.10.1	App Image Format	1139
2.10.2	Application Level Tracing	1145
2.10.3	Call function with external stack	1150
2.10.4	Chip Revision	1152
2.10.5	Console	1154
2.10.6	eFuse Manager	1163
2.10.7	Error Codes and Helper Functions	1187
2.10.8	ESP HTTPS OTA	1190
2.10.9	Event Loop Library	1197
2.10.10	FreeRTOS (Overview)	1209
2.10.11	FreeRTOS (ESP-IDF)	1212
2.10.12	FreeRTOS (Supplemental Features)	1333
2.10.13	Heap Memory Allocation	1356
2.10.14	Memory Management for MMU Supported Memory	1370
2.10.15	Heap Memory Debugging	1376
2.10.16	High Resolution Timer (ESP Timer)	1388
2.10.17	Internal and Unstable APIs	1395

2.10.18	Interrupt allocation	1396
2.10.19	Logging library	1402
2.10.20	Miscellaneous System APIs	1409
2.10.21	Over The Air Updates (OTA)	1426
2.10.22	Power Management	1437
2.10.23	POSIX Threads Support	1443
2.10.24	Random Number Generation	1448
2.10.25	Sleep Modes	1450
2.10.26	SoC Capabilities	1461
2.10.27	System Time	1469
2.10.28	The Async memcpy API	1476
2.10.29	Watchdogs	1480
<b>3</b>	<b>Hardware Reference</b>	<b>1487</b>
<b>4</b>	<b>API Guides</b>	<b>1489</b>
4.1	Application Level Tracing library	1489
4.1.1	Overview	1489
4.1.2	Modes of Operation	1489
4.1.3	Configuration Options and Dependencies	1490
4.1.4	How to Use This Library	1491
4.2	Application Startup Flow	1499
4.2.1	First stage bootloader	1499
4.2.2	Second stage bootloader	1500
4.2.3	Application startup	1500
4.3	BluFi	1501
4.3.1	Overview	1501
4.3.2	The BluFi Flow	1502
4.3.3	The Flow Chart of BluFi	1502
4.3.4	The Frame Formats Defined in BluFi	1502
4.3.5	The Security Implementation of ESP32-C2	1508
4.3.6	GATT Related Instructions	1509
4.4	Bootloader	1509
4.4.1	Bootloader Compatibility	1510
4.4.2	Log Level	1510
4.4.3	Factory Reset	1510
4.4.4	Boot from Test Firmware	1511
4.4.5	Rollback	1511
4.4.6	Watchdog	1511
4.4.7	Bootloader Size	1512
4.4.8	Custom Bootloader	1512
4.5	Build System	1512
4.5.1	Overview	1513
4.5.2	Using the Build System	1513
4.5.3	Example Project	1515
4.5.4	Project CMakeLists File	1516
4.5.5	Component CMakeLists Files	1517
4.5.6	Component Configuration	1519
4.5.7	Preprocessor Definitions	1519
4.5.8	Component Requirements	1520
4.5.9	Overriding Parts of the Project	1524
4.5.10	Configuration-Only Components	1525
4.5.11	Debugging CMake	1525
4.5.12	Example Component CMakeLists	1525
4.5.13	Custom Sdkconfig Defaults	1529
4.5.14	Flash Arguments	1530
4.5.15	Building the Bootloader	1530
4.5.16	Writing Pure CMake Components	1530

4.5.17	Using Third-Party CMake Projects with Components	1531
4.5.18	Using Prebuilt Libraries with Components	1532
4.5.19	Using ESP-IDF in Custom CMake Projects	1532
4.5.20	ESP-IDF CMake Build System API	1532
4.5.21	File Globbing & Incremental Builds	1537
4.5.22	Build System Metadata	1537
4.5.23	Build System Internals	1538
4.5.24	Migrating from ESP-IDF GNU Make System	1539
4.6	RF Coexistence	1541
4.6.1	Overview	1541
4.6.2	Supported Coexistence Scenario for ESP32-C2	1541
4.6.3	Coexistence Mechanism and Policy	1541
4.6.4	How to Use the Coexistence Feature	1542
4.7	Core Dump	1544
4.7.1	Overview	1544
4.7.2	Configurations	1544
4.7.3	Core Dump to Flash	1545
4.7.4	Core Dump to UART	1545
4.7.5	Core Dump Commands	1547
4.7.6	ROM Functions in Backtraces	1547
4.7.7	Dumping Variables on Demand	1547
4.7.8	Running <code>idf.py coredump-info</code> and <code>idf.py coredump-debug</code>	1548
4.8	C++ Support	1550
4.8.1	<code>esp-idf-cxx</code> Component	1550
4.8.2	C++ language standard	1550
4.8.3	Multithreading	1550
4.8.4	Exception Handling	1550
4.8.5	Runtime Type Information (RTTI)	1551
4.8.6	Developing in C++	1551
4.8.7	Limitations	1552
4.8.8	What to Avoid	1553
4.9	Error Handling	1553
4.9.1	Overview	1553
4.9.2	Error codes	1553
4.9.3	Converting error codes to error messages	1553
4.9.4	<code>ESP_ERROR_CHECK</code> macro	1554
4.9.5	<code>ESP_ERROR_CHECK_WITHOUT_ABORT</code> macro	1554
4.9.6	<code>ESP_RETURN_ON_ERROR</code> macro	1554
4.9.7	<code>ESP_GOTO_ON_ERROR</code> macro	1554
4.9.8	<code>ESP_RETURN_ON_FALSE</code> macro	1554
4.9.9	<code>ESP_GOTO_ON_FALSE</code> macro	1555
4.9.10	CHECK MACROS Examples	1555
4.9.11	Error handling patterns	1555
4.9.12	C++ Exceptions	1556
4.10	Fatal Errors	1556
4.10.1	Overview	1556
4.10.2	Panic Handler	1557
4.10.3	Register Dump and Backtrace	1557
4.10.4	GDB Stub	1560
4.10.5	RTC Watchdog Timeout	1561
4.10.6	Guru Meditation Errors	1561
4.10.7	Other Fatal Errors	1562
4.11	Flash Encryption	1565
4.11.1	Introduction	1565
4.11.2	Encrypted Partitions	1565
4.11.3	Relevant eFuses	1566
4.11.4	Flash Encryption Process	1566
4.11.5	Flash Encryption Configuration	1567

4.11.6	Possible Failures	1573
4.11.7	ESP32-C2 Flash Encryption Status	1574
4.11.8	Reading and Writing Data in Encrypted Flash	1574
4.11.9	Updating Encrypted Flash	1575
4.11.10	Disabling Flash Encryption	1576
4.11.11	Key Points About Flash Encryption	1576
4.11.12	Limitations of Flash Encryption	1577
4.11.13	Flash Encryption and Secure Boot	1577
4.11.14	Advanced Features	1577
4.11.15	Technical Details	1579
4.12	Hardware Abstraction	1579
4.12.1	Architecture	1579
4.12.2	LL (Low Level) Layer	1580
4.12.3	HAL (Hardware Abstraction Layer)	1581
4.13	JTAG Debugging	1582
4.13.1	Introduction	1582
4.13.2	How it Works?	1583
4.13.3	Selecting JTAG Adapter	1583
4.13.4	Setup of OpenOCD	1584
4.13.5	Configuring ESP32-C2 Target	1584
4.13.6	Launching Debugger	1586
4.13.7	Debugging Examples	1586
4.13.8	Building OpenOCD from Sources	1587
4.13.9	Tips and Quirks	1591
4.13.10	Related Documents	1596
4.14	Linker Script Generation	1621
4.14.1	Overview	1621
4.14.2	Quick Start	1622
4.14.3	Linker Script Generation Internals	1624
4.15	lwIP	1631
4.15.1	Supported APIs	1631
4.15.2	BSD Sockets API	1632
4.15.3	Netconn API	1635
4.15.4	lwIP FreeRTOS Task	1636
4.15.5	IPv6 Support	1636
4.15.6	esp-lwip custom modifications	1637
4.15.7	Performance Optimization	1638
4.16	Memory Types	1639
4.16.1	DRAM (Data RAM)	1640
4.16.2	IRAM (Instruction RAM)	1640
4.16.3	IROM (code executed from flash)	1641
4.16.4	DROM (data stored in flash)	1641
4.16.5	DMA Capable Requirement	1641
4.16.6	DMA Buffer in the Stack	1642
4.17	OpenThread	1642
4.17.1	Modes of the OpenThread stack	1642
4.17.2	How to Write an OpenThread Application	1643
4.17.3	The OpenThread Border Router	1644
4.18	Partition Tables	1644
4.18.1	Overview	1645
4.18.2	Built-in Partition Tables	1645
4.18.3	Creating Custom Tables	1645
4.18.4	Generating Binary Partition Table	1648
4.18.5	Partition Size Checks	1648
4.18.6	Flashing the Partition Table	1648
4.18.7	Partition Tool (parttool.py)	1649
4.19	Performance	1650
4.19.1	How to Optimize Performance	1650

4.19.2	Guides	1651
4.20	Reproducible Builds	1668
4.20.1	Introduction	1668
4.20.2	Reasons for non-reproducible builds	1668
4.20.3	Enabling reproducible builds in ESP-IDF	1668
4.20.4	How reproducible builds are achieved	1669
4.20.5	Reproducible builds and debugging	1669
4.20.6	Factors which still affect reproducible builds	1669
4.21	RF Calibration	1669
4.21.1	Partial Calibration	1670
4.21.2	Full Calibration	1670
4.21.3	No Calibration	1670
4.21.4	PHY Initialization Data	1670
4.21.5	API Reference	1670
4.22	Security	1678
4.22.1	Goals	1678
4.22.2	Platform Security	1678
4.22.3	Network Security	1679
4.22.4	Product Security	1680
4.22.5	Security Policy	1681
4.23	Secure Boot V2	1681
4.23.1	Background	1682
4.23.2	Advantages	1682
4.23.3	Secure Boot V2 Process	1682
4.23.4	Signature Block Format	1683
4.23.5	Secure Padding	1683
4.23.6	Verifying a Signature Block	1684
4.23.7	Verifying an Image	1684
4.23.8	Bootloader Size	1684
4.23.9	eFuse usage	1684
4.23.10	How To Enable Secure Boot V2	1684
4.23.11	Restrictions after Secure Boot is enabled	1685
4.23.12	Generating Secure Boot Signing Key	1685
4.23.13	Remote Signing of Images	1686
4.23.14	Secure Boot Best Practices	1687
4.23.15	Technical Details	1687
4.23.16	Secure Boot & Flash Encryption	1687
4.23.17	Signed App Verification Without Hardware Secure Boot	1687
4.23.18	Advanced Features	1688
4.24	Thread Local Storage	1688
4.24.1	Overview	1688
4.24.2	FreeRTOS Native APIs	1689
4.24.3	Pthread APIs	1689
4.24.4	C11 Standard	1689
4.25	Tools	1689
4.25.1	IDF Frontend - idf.py	1689
4.25.2	IDF Docker Image	1694
4.25.3	IDF Windows Installer	1696
4.25.4	IDF Component Manager	1697
4.25.5	IDF Clang Tidy	1699
4.25.6	Downloadable Tools	1699
4.26	Unit Testing in ESP32-C2	1714
4.26.1	Normal Test Cases	1714
4.26.2	Multi-device Test Cases	1715
4.26.3	Multi-stage Test Cases	1716
4.26.4	Tests For Different Targets	1716
4.26.5	Building Unit Test App	1717
4.26.6	Running Unit Tests	1717

4.26.7	Timing Code with Cache Compensated Timer	1719
4.26.8	Mocks	1719
4.27	Running Applications on Host	1721
4.27.1	Introduction	1722
4.27.2	Requirements	1722
4.27.3	Build and Run	1723
4.27.4	Component Linux/Mock Support Overview	1723
4.28	Wi-Fi Driver	1723
4.28.1	ESP32-C2 Wi-Fi Feature List	1723
4.28.2	How To Write a Wi-Fi Application	1724
4.28.3	ESP32-C2 Wi-Fi API Error Code	1724
4.28.4	ESP32-C2 Wi-Fi API Parameter Initialization	1725
4.28.5	ESP32-C2 Wi-Fi Programming Model	1725
4.28.6	ESP32-C2 Wi-Fi Event Description	1726
4.28.7	ESP32-C2 Wi-Fi Station General Scenario	1729
4.28.8	ESP32-C2 Wi-Fi AP General Scenario	1731
4.28.9	ESP32-C2 Wi-Fi Scan	1733
4.28.10	ESP32-C2 Wi-Fi Station Connecting Scenario	1739
4.28.11	ESP32-C2 Wi-Fi Station Connecting When Multiple APs Are Found	1746
4.28.12	Wi-Fi Reconnect	1746
4.28.13	Wi-Fi Beacon Timeout	1746
4.28.14	ESP32-C2 Wi-Fi Configuration	1746
4.28.15	Wi-Fi Easy Connect™ (DPP)	1750
4.28.16	Wireless Network Management	1751
4.28.17	Radio Resource Measurement	1751
4.28.18	Fast BSS Transition	1752
4.28.19	Wi-Fi Location	1752
4.28.20	ESP32-C2 Wi-Fi Power-saving Mode	1752
4.28.21	ESP32-C2 Wi-Fi Throughput	1754
4.28.22	Wi-Fi 80211 Packet Send	1754
4.28.23	Wi-Fi Sniffer Mode	1756
4.28.24	Wi-Fi Multiple Antennas	1757
4.28.25	Wi-Fi HT20/40	1758
4.28.26	Wi-Fi QoS	1758
4.28.27	Wi-Fi AMSDU	1759
4.28.28	Wi-Fi Fragment	1759
4.28.29	WPS Enrollee	1759
4.28.30	Wi-Fi Buffer Usage	1759
4.28.31	How to Improve Wi-Fi Performance	1760
4.28.32	Wi-Fi Menuconfig	1762
4.28.33	Troubleshooting	1765
4.29	Wi-Fi Security	1768
4.29.1	ESP32-C2 Wi-Fi Security Features	1768
4.29.2	Protected Management Frames (PMF)	1771
4.29.3	WiFi Enterprise	1772
4.29.4	WPA3-Personal	1772
4.29.5	Wi-Fi Enhanced Open™	1773
4.30	Low Power Mode User Guide	1774
<b>5</b>	<b>Migration Guides</b>	<b>1775</b>
5.1	ESP-IDF 5.x Migration Guide	1775
5.1.1	Migration from 4.4 to 5.0	1775
5.1.2	Migration from 5.0 to 5.1	1799
<b>6</b>	<b>Libraries and Frameworks</b>	<b>1803</b>
6.1	Cloud Frameworks	1803
6.1.1	ESP RainMaker	1803
6.1.2	AWS IoT	1803

6.1.3	Azure IoT	1803
6.1.4	Google IoT Core	1803
6.1.5	Aliyun IoT	1803
6.1.6	Joylink IoT	1803
6.1.7	Tencent IoT	1804
6.1.8	Tencentyun IoT	1804
6.1.9	Baidu IoT	1804
6.2	Espressif's Frameworks	1804
6.2.1	Espressif Audio Development Framework	1804
6.2.2	ESP-CSI	1804
6.2.3	Espressif DSP Library	1804
6.2.4	ESP-WIFI-MESH Development Framework	1805
6.2.5	ESP-WHO	1805
6.2.6	ESP RainMaker	1805
6.2.7	ESP-IoT-Solution	1805
6.2.8	ESP-Protocols	1805
6.2.9	ESP-BSP	1806
6.2.10	ESP-IDF-CXX	1806
<b>7</b>	<b>Contributions Guide</b>	<b>1807</b>
7.1	How to Contribute	1807
7.2	Before Contributing	1807
7.3	Pull Request Process	1807
7.4	Legal Part	1808
7.5	Related Documents	1808
7.5.1	Espressif IoT Development Framework Style Guide	1808
7.5.2	Install pre-commit Hook for ESP-IDF Project	1816
7.5.3	Documenting Code	1817
7.5.4	Creating Examples	1822
7.5.5	API Documentation Template	1823
7.5.6	Contributor Agreement	1825
7.5.7	Copyright Header Guide	1827
7.5.8	ESP-IDF Tests with Pytest Guide	1829
<b>8</b>	<b>ESP-IDF Versions</b>	<b>1839</b>
8.1	Releases	1839
8.2	Which Version Should I Start With?	1839
8.3	Versioning Scheme	1839
8.4	Support Periods	1840
8.5	Checking the Current Version	1841
8.6	Git Workflow	1842
8.7	Updating ESP-IDF	1842
8.7.1	Updating to Stable Release	1843
8.7.2	Updating to a Pre-Release Version	1843
8.7.3	Updating to Master Branch	1843
8.7.4	Updating to a Release Branch	1844
<b>9</b>	<b>Resources</b>	<b>1845</b>
9.1	PlatformIO	1845
9.1.1	What is PlatformIO?	1845
9.1.2	Installation	1845
9.1.3	Configuration	1846
9.1.4	Tutorials	1846
9.1.5	Project Examples	1846
9.1.6	Next Steps	1846
9.2	Useful Links	1846

This is the documentation for Espressif IoT Development Framework ([esp-idf](#)). ESP-IDF is the official development framework for the [ESP32](#), [ESP32-S](#), [ESP32-C](#) and [ESP32-H Series SoCs](#).

This document describes using ESP-IDF with the ESP32-C2 SoC.

		
<a href="#">Get Started</a>	<a href="#">API Reference</a>	<a href="#">API Guides</a>

# Chapter 1

## Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-C2 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-C2 board.

---

**Note:** This is documentation for branch `release/v5.1` of ESP-IDF. Other *ESP-IDF Versions* are also available.

---

### 1.1 Introduction

ESP32-C2 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth Low Energy
- High performance 32-bit RISC-V single-core processor
- Multiple peripherals
- Intended for simple, high-volume IoT applications

Powered by 40 nm technology, ESP32-C2 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-C2 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

### 1.2 What You Need

#### 1.2.1 Hardware

- An **ESP32-C2** board.
- **USB cable** - USB A / micro USB B.
- **Computer** running Windows, Linux, or macOS.

---

**Note:** Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!

---

If you have one of ESP32-C2 official development boards listed below, you can click on the link to learn more about the hardware.

## 1.2.2 Software

To start using ESP-IDF on **ESP32-C2**, install the following software:

- **Toolchain** to compile code for ESP32-C2
- **Build tools** - CMake and Ninja to build a full **Application** for ESP32-C2
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32-C2 and scripts to operate the **Toolchain**

## 1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

### 1.3.1 IDE

---

**Note:** We highly recommend installing the ESP-IDF through your favorite IDE.

---

- [Eclipse Plugin](#)
- [VSCode Extension](#)

### 1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.

## Standard Setup of Toolchain for Windows

**Introduction** ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we're going to use the Command Prompt, but after ESP-IDF is installed you can use [Eclipse Plugin](#) or another graphical IDE with CMake support instead.

---

**Note:** Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with "Unicode UTF-8" support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option "Beta: Use Unicode UTF-8 for worldwide language support" - Ok and reboot the computer.

---

**ESP-IDF Tools Installer** The easiest way to install ESP-IDF's prerequisites is to download one of ESP-IDF Tools Installers.

**What is the usecase for Online and Offline Installer** Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including [Git For Windows](#) during the installation process. The installer stores downloaded files in the cache directory `%userprofile%\.espressif`

Offline Installer does not require any network connection. The installer contains all required dependencies including [Git For Windows](#) .

**Components of the installation** The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

**Launching ESP-IDF Environment** At the end of the installation process you can check out option `Run ESP-IDF PowerShell Environment` or `Run ESP-IDF Command Prompt (cmd.exe)`. The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Fig. 1: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (cmd.exe):

**Using the Command Prompt** For the remaining Getting Started steps, we're going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (`PATH`, `IDF_PATH` and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in `PATH`. If you get errors related to Python or Git not being found, use the first option.

**First Steps on ESP-IDF** Now since all requirements are met, the next topic will guide you on how to start your first project.

```
ESP-IDF PowerShell

Using Python in C:/Users/developer/.espressif/python_env/idf4.1_py3.8_env/scripts
Python 3.8.7
Using Git in c:/Program Files/Git/cmd/
git version 2.29.2.windows.1
Setting IDF_PATH: C:\Users\developer\Desktop\esp-idf
Adding ESP-IDF tools to PATH...

  C:\Users\test\.espressif\python_env\idf4.3_py3.7_env\Scripts
  C:\Users\test\esp\esp-idf\tools

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

idf.py build

C:\Users\test\esp\esp-idf>
```

Fig. 4: ESP-IDF Command Prompt

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-C2 and build, flash, and monitor the device output.

---

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

---

**Start a Project** Now you are ready to prepare your application for ESP32-C2. You can start with [get-started/hello\\_world](#) project from [examples](#) directory in ESP-IDF.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

Copy the project [get-started/hello\\_world](#) to `~/esp` directory:

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

---

**Note:** There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

---

**Connect Your Device** Now connect your ESP32-C2 board to the computer and check under which serial port the board is visible.

Serial port names start with COM in Windows.

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-C2](#) for full details.

---

**Note:** Keep the port name handy as you will need it in the next steps.

---

**Configure Your Project** Navigate to your `hello_world` directory, set ESP32-C2 as the target, and run the project configuration utility `menuconfig`.

## Windows

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32c2
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32c2`. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See [Select the Target Chip: set-target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for "hello\_word", since this example runs with default configuration.

---

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

---

Fig. 5: Project configuration - Home window

**Build the Project** Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_esp component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../..../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin files.

**Flash onto the Device** To flash the binaries that you just built for the ESP32-C2 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace `PORT` with your ESP32-C2 board's USB port name. If the `PORT` is not defined, the `idf.py` will try to connect automatically using the available USB ports.

For more information on `idf.py` arguments, see [idf.py](#).

---

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

---

Encountered Issues While Flashing? See this [Flashing Troubleshooting](#) page or [Establish Serial Connection with ESP32-C2](#) for more detailed information.

**Normal Operation** When flashing, you will see the output log similar to the following:

```
...
esptool.py esp32c2 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_
↳reset write_flash --flash_mode dio --flash_freq 60m --flash_size 2MB 0x0_
↳bootloader/bootloader.bin 0x10000 hello_world.bin 0x8000 partition_table/
↳partition-table.bin
esptool.py v3.3.1
Serial port /dev/ttyUSB0

Leaving...
Hard resetting via RTS pin...
```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello\_world” application.

If you'd like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out [Eclipse Plugin](#), [VSCode Extension](#).

**Monitor the Output** To check if “hello\_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace `PORT` with your serial port name).

This command launches the *IDF Monitor* application:

```

$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...

```

After startup and diagnostic logs scroll up, you should see "Hello world!" printed out by the application.

```

...
Hello world!
Restarting in 10 seconds...
This is esp32c2 chip with 1 CPU core(s), WiFi/BLE, silicon revision 0, 2 MB_
↪embedded flash
Minimum free heap size: 203888 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...

```

To exit IDF monitor use the shortcut Ctrl+].

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26 MHz crystal. Most development board designs use 40 MHz, so ESP-IDF uses this frequency as a default value.

```

e000)(Xn@0y.!00(0PW+)00Hn9a~/90!0t500P0~0k00e0ea050jA
~zY00Y(10,1 00 e000)(Xn@0y.!Dr0zY(0 jpi0|0+z5Ymvp

```

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to menuconfig.
3. Go to Component config --> Hardware Settings --> Main XTAL Config --> Main XTAL frequency, then change `CONFIG_XTAL_FREQ_SEL` to 26 MHz.
4. After that, build and flash the application again.

In the current version of ESP-IDF, main XTAL frequencies supported by ESP32-C2 are as follows:

- 26 MHz
- 40 MHz

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- [IDF Monitor](#) for handy shortcuts and more details on using IDF monitor.
- [idf.py](#) for a full reference of `idf.py` commands and options.

**That's all that you need to get started with ESP32-C2!**

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32-C2 because required hardware is not included in ESP32-C2 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-C2 target, or the table does not exist at all, the example will work on ESP32-C2.

---

### Additional Tips

**Permission issues /dev/ttyUSB0** With some Linux distributions, you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32-C2. *This can be solved by adding the current user to the dialout group.*

**Python compatibility** ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

**Flash Erase** Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Related Documents** For advanced users who want to customize the install process:

- [Updating ESP-IDF tools on Windows](#)
- [Establish Serial Connection with ESP32-C2](#)
- [Eclipse Plugin](#)
- [VSCode Extension](#)
- [IDF Monitor](#)

### Updating ESP-IDF tools on Windows

**Install ESP-IDF tools using a script** From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

**Add ESP-IDF tools to PATH using an export script** ESP-IDF tools installer creates a Start menu shortcut for "ESP-IDF Command Prompt". This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn't started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

### Establish Serial Connection with ESP32-C2

Establishing a serial connection with the ESP32-C2 target device could be done using a USB-to-UART bridge.

Some development boards have the USB-to-UART bridge installed. If a board does not have a bridge then an external bridge may be used.

**USB-to-UART Bridge on Development Board** For boards with an installed USB-to-UART bridge, the connection between the personal computer and the bridge is USB and between the bridge and ESP32-C2 is UART.

Fig. 6: Development Board with USB-to-UART Bridge

**External USB-to-UART Bridge** Sometimes the USB-to-UART bridge is external. This is often used in small development boards or finished products when space and costs are crucial.

**Flash using UART** This section provides guidance on how to establish a serial connection between ESP32-C2 and PC using USB-to-UART Bridge, either installed on the development board or external.

**Connect ESP32-C2 to PC** Connect the ESP32-C2 board to the PC using the USB cable. If device driver does not install automatically, identify USB-to-UART bridge on your ESP32-C2 board (or external converter dongle), search for drivers in internet and install them.

Fig. 7: External USB-to-UART Bridge

Below is the list of USB to serial converter chips installed on most of the ESP32-C2 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB-to-UART bridge chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

For devices downloaded using a USB-to-UART bridge, you can run the following command including the optional argument to define the baud rate.

```
idf.py -p PORT [-b BAUD] flash
```

You can change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

**Note:** If the device does not support the auto download mode, you need to get into the download mode manually. To do so, press and hold the BOOT button and then press the RESET button once. After that release the BOOT button.

**Check port on Windows** Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-C2 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

**Check port on Linux and macOS** To check the device name for the serial port of your ESP32-C2 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```

**Note:** macOS users: if you don't see the serial port then check you have the USB/serial drivers installed. See Section [Connect ESP32-C2 to PC](#) for links to drivers. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about "System Software from developer ..." where the developer name is Silicon Labs or FTDI.

Fig. 8: USB to UART bridge of ESP32-DevKitC in Windows Device Manager

Fig. 9: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager

**Adding user to dialout on Linux** The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to `dialout` group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to `uucp` group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

**Verify serial connection** Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32-C2.

The default console baud rate on ESP32-C2 is 115200 when a 40 MHz XTAL is used, or 74880 when a 26 MHz XTAL is used.

**Windows and Linux** In this example we will use [PuTTY SSH Client](#) that is available for both Windows and Linux. You can use other serial programs and set communication parameters like below.

Run terminal and set identified serial port. Baud rate = 115200 (if needed, change this to the default baud rate of the chip in use), data bits = 8, stop bits = 1, and parity = N. Below are example screenshots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Fig. 10: Setting Serial Communication in PuTTY on Windows

Then open serial port in terminal and check, if you see any log printed out by ESP32-C2. The log contents will depend on application loaded to ESP32-C2, see [Example Output](#).

Fig. 11: Setting Serial Communication in PuTTY on Linux

**Note:** Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

---

**macOS** To spare you the trouble of installing a serial terminal program, macOS offers the **screen** command.

- As discussed in *Check port on Linux and macOS*, run:

```
ls /dev/cu.*
```

- You should see similar output:

```
/dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_
↳USBtoUART7
```

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run (if needed, change "115200" to the default baud rate of the chip in use):

```
screen /dev/cu.device_name 115200
```

Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the **screen**. The log contents will depend on application loaded to ESP32-C2, see *Example Output*. To exit the **screen** session type `Ctrl-A + \`.

---

**Note:** Do not forget to **exit the screen session** after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

---

**Example Output** An example log is shown below. Reset the board if you do not see anything.

```
ets Jun  8 2016 00:22:57

rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57

rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload an application to ESP32-C2.

---

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-C2 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) *do not* have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](#) for more details.

---

If you got here from *Step 5. First Steps on ESP-IDF* when installing s/w for ESP32-C2 development, then you can continue with *Step 5. First Steps on ESP-IDF*.

## Flashing Troubleshooting

**Failed to Connect** If you run the given command and see errors such as "Failed to connect", there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is to manually reset as described below. If it does not help, you can find more details about possible issues in the [esptool troubleshooting](#) page.

`esptool.py` resets ESP32-C2 automatically by asserting DTR and RTS control lines of the USB-to-UART bridge, i.e., FTDI or CP210x (for more information, see [Establish Serial Connection with ESP32-C2](#)). The DTR and RTS control lines are in turn connected to `GPIO9` and `CHIP_PU (EN)` pins of ESP32-C2, thus changes in the voltage levels of DTR and RTS will boot ESP32-C2 into Firmware Download mode. As an example, check the [schematic](#) for the ESP32 DevKitC development board.

In general, you should have no problems with the [official esp-idf development boards](#). However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to `GPIO9` and `CHIP_PU`.
- The DTR and RTS lines are configured differently.
- There are no such serial control lines at all.

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-C2 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the `BOOT` button (`GPIO9`) and press the `EN` button (`CHIP_PU`).
- For other types of hardware, try pulling `GPIO9` down.

## IDF Monitor

IDF Monitor uses the [esp-idf-monitor](#) package as a serial terminal program which relays serial data to and from the target device's serial port. It also provides some IDF-specific features.

IDF Monitor can be launched from an IDF project by running `idf.py monitor`.

**Keyboard Shortcuts** For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.

Keyboard Shortcut	Action	Description
Ctrl+] ]	Exit the program	
Ctrl+T	Menu escape key	Press and follow it by one of the keys given below.
• Ctrl+T	Send the menu character itself to remote	
• Ctrl+] ]	Send the exit character itself to remote	
• Ctrl+P	Reset target into bootloader to pause app via RTS line	Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.
• Ctrl+R	Reset target board via RTS	Resets the target board and re-starts the application via the RTS line (if connected).
• Ctrl+F	Build and flash the project	Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.
• Ctrl+A (or A)	Build and flash the app only	Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.
• Ctrl+Y	Stop/resume log output printing on screen	Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.
• Ctrl+L	Stop/resume log output saved to file	Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).
• Ctrl+I (or I)	Stop/resume printing timestamps	IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.
• Ctrl+H (or H)	Display all keyboard shortcuts	
• Ctrl+X (or X)	Exit the program	
Ctrl+C	Interrupt running application	Pauses IDF Monitor and runs GDB project debugger to debug the application at runtime. This requires :ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME option to be enabled.

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

### IDF-specific features

**Automatic Address Decoding** Whenever the chip outputs a hexadecimal address that points to executable code, IDF monitor looks up the location in the source code (file name and line number) and prints the location on the next line in yellow.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

```

abort() was called at PC 0x42067cd5 on core 0

```

To decode each address, IDF Monitor runs the following command in the background:

```
riscv32-esp-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS
```

If an address is not matched in the app source code, IDF monitor also checks the ROM code. Instead of printing the source file name and line number, only the function name followed by in ROM is displayed:

```

abort() was called at PC 0x400481c1 on core 0

The ROM ELF file is automatically loaded from a location based on the `IDF_PATH` and `ESP_ROM_ELF_DIR` environment variables. This can be overridden by calling `esp_idf_monitor` and providing a path to a specific ROM ELF file: `python -m esp_idf_monitor --rom-elf-file [path to ROM ELF file]`.

**Note:** Set environment variable `ESP_MONITOR_DECODE` to 0 or call `esp_idf_monitor` with specific command line option: `python -m esp_idf_monitor --disable-address-decoding` to disable address decoding.

**Target Reset on Connection** By default, IDF Monitor will reset the target when connecting to it. The reset of the target chip is performed using the DTR and RTS serial lines. To prevent IDF Monitor from automatically resetting the target on connection, call IDF Monitor with the `--no-reset` option (e.g., `idf.py monitor --no-reset`).

**Note:** The `--no-reset` option applies the same behavior even when connecting IDF Monitor to a particular port (e.g., `idf.py monitor --no-reset -p [PORT]`).

**Launching GDB with GDBStub** GDBStub is a useful runtime debugging feature that runs on the target and connects to the host over the serial port to receive debugging commands. GDBStub supports commands such as reading memory and variables, examining call stack frames etc. Although GDBStub is less versatile than JTAG debugging, it does not require any special hardware (such as a JTAG to USB bridge) as communication is done entirely over the serial port.

A target can be configured to run GDBStub in the background by setting the `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on runtime. GDBStub will run in the background until a `Ctrl+C` message is sent over the serial port and causes the GDBStub to break (i.e., stop the execution of) the program, thus allowing GDBStub to handle debugging commands.

Furthermore, the panic handler can be configured to run GDBStub on a crash by setting the `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on panic. When a crash occurs, GDBStub will output a special string pattern over the serial port to indicate that it is running.

In both cases (i.e., sending the `Ctrl+C` message, or receiving the special string pattern), IDF Monitor will automatically launch GDB in order to allow the user to send debugging commands. After GDB exits, the target is reset via the RTS serial line. If this line is not connected, users can reset their target (by pressing the board's Reset button).

**Note:** In the background, IDF Monitor runs the following command to launch GDB:

```
riscv32-esp-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex ↵
↵interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

**Output Filtering** IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed. Filtering can also be configured using the `ESP_IDF_MONITOR_PRINT_FILTER` environment variable.

**Note:** When using both the environment variable `ESP_IDF_MONITOR_PRINT_FILTER` and the argument `--print-filter`, the setting from the CLI argument will take precedence.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set {N, E, W, I, D, V, \*} referring to a level for *logging*.

For example, `--print_filter="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e., `ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using `*` defaults to a Verbose level.

---

**Note:** Use primary logging to disable at compilation the outputs you do not need through the *logging library*. Output filtering with the IDF monitor is a secondary solution that can be useful for adjusting the filtering options without recompiling the application.

---

Your app tags must not contain spaces, asterisks `*`, or colons `:` to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

### Examples of Filtering Rules:

- `*` can be used to match any tags. However, the string `--print_filter="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `"*:N"` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules `"tag1:V"`, `"tag1:v"`, `"tag1:"`, `"tag1:*"`, and `"tag1"` are equivalent.
- Rule `"tag1:W tag1:E"` is equivalent to `"tag1:E"` because any consequent occurrence of the same tag name overwrites the previous one.
- Rule `"tag1:I tag2:W"` only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule `"tag1:I tag2:W tag3:N"` is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
- `tag3:N` in the rule `"tag1:I tag2:W tag3:N *:V"` is more meaningful because without `tag3:N` the `tag3` messages could have been printed; the errors for `tag1` and `tag2` will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

**A More Complex Filtering Example** The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_
↪1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `--print_filter="wifi esp_image:E light_driver:I"` is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `--print_filter="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

## Known Issues with IDF Monitor

### Issues Observed on Windows

- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when "idf.py" exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When "gdb" is run, it might stall for a short time before it begins communicating with the GDBStub.

## Standard Toolchain Setup for Linux and macOS

**Installation Step by Step** This is a detailed roadmap to walk you through the installation process.

**Setting up Development Environment** These are the steps for setting up the ESP-IDF for your ESP32-C2.

- *Step 1. Install Prerequisites*
- *Step 2. Get ESP-IDF*
- *Step 3. Set up the tools*
- *Step 4. Set up the environment variables*
- *Step 5. First Steps on ESP-IDF*

**Step 1. Install Prerequisites** In order to use ESP-IDF with the ESP32-C2, you need to install some software packages based on your Operating System. This setup guide will help you on getting everything installed on Linux and macOS based systems.

**For Linux Users** To compile using ESP-IDF you will need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-venv
cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
```

- CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake
ninja-build ccache dfu-util libusbx
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja
ccache dfu-util libusb
```

---

### Note:

- CMake version 3.16 or newer is required for use with ESP-IDF. Run "tools/idf\_tools.py install cmake" to install a suitable version if your OS versions doesn't have one.

- If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.
- 

**For macOS Users** ESP-IDF will use the version of Python installed by default on macOS.

- Install CMake & Ninja build:
  - If you have [HomeBrew](#), you can run:

```
brew install cmake ninja dfu-util
```

- If you have [MacPorts](#), you can run:

```
sudo port install cmake ninja dfu-util
```

- Otherwise, consult the [CMake](#) and [Ninja](#) home pages for macOS installation downloads.
- It is strongly recommended to also install [ccache](#) for faster builds. If you have [HomeBrew](#), this can be done via `brew install ccache` or `sudo port install ccache` on [MacPorts](#).

---

**Note:** If an error like this is shown during any step:

```
xcrun: error: invalid active developer path (/Library/Developer/CommandLineTools),  
↳ missing xcrun at: /Library/Developer/CommandLineTools/usr/bin/xcrun
```

Then you will need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

---

**Apple M1 Users** If you use Apple M1 platform and see an error like this:

```
WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is  
↳ present, but tool was not found  
ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to  
↳ install it.
```

or:

```
zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-  
↳ patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc
```

Then you will need to install Apple Rosetta 2 by running

```
/usr/sbin/softwareupdate --install-rosetta --agree-to-license
```

**Installing Python 3** Based on macOS [Catalina 10.15 release notes](#), use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn't already installed on your computer:

```
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with [HomeBrew](#) can be done as follows:

```
brew install python3
```

- If you have [MacPorts](#), you can run:

```
sudo port install python38
```

**Step 2. Get ESP-IDF** To build applications for the ESP32-C2, you need the software libraries provided by Espressif in [ESP-IDF repository](#).

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone -b release/v5.1 --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult [ESP-IDF Versions](#) for information about which ESP-IDF version to use in a given situation.

**Step 3. Set up the tools** Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc, for projects supporting ESP32-C2.

```
cd ~/esp/esp-idf
./install.sh esp32c2
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32c2
```

The above commands install tools for ESP32-C2 only. If you intend to develop projects for more chip targets then you should list all of them and run for example:

```
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

In order to install tools for all supported targets please run the following command:

```
cd ~/esp/esp-idf
./install.sh all
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish all
```

---

**Note:** For macOS users, if an error like this is shown during any step:

```
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable
↳to get local issuer certificate (_ssl.c:xxx)
```

You may run `Install Certificates` command in the Python folder of your computer to install certificates. For details, see [Download Error While Installing ESP-IDF Tools](#).

---

**Alternative File Downloads** The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif's download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn't change the URLs used to access any Git repositories.

---

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**Customizing the tools installation path** The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the `IDF_TOOLS_PATH`, make sure it is set to the same value every time the Install script (`install.bat`, `install.ps1` or `install.sh`) and an Export script (`export.bat`, `export.ps1` or `export.sh`) are executed.

**Step 4. Set up the environment variables** The installed tools are not yet added to the `PATH` environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
. $HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
. $HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use `esp-idf` frequently, you can create an alias for executing `export.sh`:

1. Copy and paste the following command to your shell's profile (`.profile`, `.bashrc`, `.zprofile`, etc.)

```
alias get_idf='. $HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run `get_idf` to set up or refresh the `esp-idf` environment in any terminal session.

Technically, you can add `export.sh` to your shell's profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

**Step 5. First Steps on ESP-IDF** Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-C2 and build, flash, and monitor the device output.

---

**Note:** If you have not yet installed ESP-IDF, please go to [Installation](#) and follow the instruction in order to get all the software needed to use this guide.

---

**Start a Project** Now you are ready to prepare your application for ESP32-C2. You can start with [get-started/hello\\_world](#) project from [examples](#) directory in ESP-IDF.

---

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

---

Copy the project [get-started/hello\\_world](#) to `~/esp` directory:

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

---

**Note:** There is a range of example projects in the [examples](#) directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

---

**Connect Your Device** Now connect your ESP32-C2 board to the computer and check under which serial port the board is visible.

Serial ports have the following naming patterns:

- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu.`

If you are not sure how to check the serial port name, please refer to [Establish Serial Connection with ESP32-C2](#) for full details.

---

**Note:** Keep the port name handy as you will need it in the next steps.

---

**Configure Your Project** Navigate to your `hello_world` directory, set ESP32-C2 as the target, and run the project configuration utility `menuconfig`.

```
cd ~/esp/hello_world
idf.py set-target esp32c2
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32c2`. Note that existing builds and configurations in the project, if any, will be cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See [Select the Target Chip: set-target](#) for additional information.

If the previous steps have been done correctly, the following menu appears:

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with `menuconfig` may be skipped for "hello\_world", since this example runs with default configuration.

```

```

Fig. 12: Project configuration - Home window

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

**Build the Project** Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```

$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_esp component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash -
↪-flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
↪bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
↪partition-table.bin
or run 'idf.py -p PORT flash'

```

If there are no errors, the build will finish by generating the firmware binary `.bin` files.

**Flash onto the Device** To flash the binaries that you just built for the ESP32-C2 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace `PORT` with your ESP32-C2 board's USB port name. If the `PORT` is not defined, the `idf.py` will try to connect automatically using the available USB ports.

For more information on `idf.py` arguments, see [idf.py](#).

---

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

---

Encountered Issues While Flashing? See this [Flashing Troubleshooting](#) page or [Establish Serial Connection with ESP32-C2](#) for more detailed information.

**Normal Operation** When flashing, you will see the output log similar to the following:

```
...
esptool.py esp32c2 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_
↳reset write_flash --flash_mode dio --flash_freq 60m --flash_size 2MB 0x0_
↳bootloader/bootloader.bin 0x10000 hello_world.bin 0x8000 partition_table/
↳partition-table.bin
esptool.py v3.3.1

Leaving...
Hard resetting via RTS pin...
```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello\_world” application.

If you'd like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out [Eclipse Plugin](#), [VSCode Extension](#).

**Monitor the Output** To check if "hello\_world" is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the *IDF Monitor* application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]esp/hello_world/build
Executing "python [...]esp-idf/tools/idf_monitor.py -b 115200 [...]esp/hello_
↪world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun  8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see "Hello world!" printed out by the application.

```
...
Hello world!
Restarting in 10 seconds...
This is esp32c2 chip with 1 CPU core(s), WiFi/BLE, silicon revision 0, 2 MB_
↪embedded flash
Minimum free heap size: 203888 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+]`.

If IDF monitor fails shortly after the upload, or, if instead of the messages above, you see random garbage similar to what is given below, your board is likely using a 26 MHz crystal. Most development board designs use 40 MHz, so ESP-IDF uses this frequency as a default value.

```
e000)(Xn@0y.!00(0PW+)00Hn9a~/90!0t500P0~0k00e0ea050jA
~zY00Y(10,1 00 e000)(Xn@0y.!Dr0zY(0 jpi0|0+z5Ymvp
```

If you have such a problem, do the following:

1. Exit the monitor.
2. Go back to `menuconfig`.
3. Go to Component config --> Hardware Settings --> Main XTAL Config --> Main XTAL frequency, then change `CONFIG_XTAL_FREQ_SEL` to 26 MHz.
4. After that, build and flash the application again.

In the current version of ESP-IDF, main XTAL frequencies supported by ESP32-C2 are as follows:

- 26 MHz
- 40 MHz

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- *IDF Monitor* for handy shortcuts and more details on using IDF monitor.
- *idf.py* for a full reference of `idf.py` commands and options.

### That's all that you need to get started with ESP32-C2!

Now you are ready to try some other [examples](#), or go straight to developing your own applications.

---

**Important:** Some of examples do not support ESP32-C2 because required hardware is not included in ESP32-C2 so it cannot be supported.

If building an example, please check the README file for the `Supported Targets` table. If this is present including ESP32-C2 target, or the table does not exist at all, the example will work on ESP32-C2.

---

### Additional Tips

**Permission issues /dev/ttyUSB0** With some Linux distributions, you may get the `Failed to open port /dev/ttyUSB0` error message when flashing the ESP32-C2. *This can be solved by adding the current user to the dialout group.*

**Python compatibility** ESP-IDF supports Python 3.7 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from [sources](#) or the use of a Python version management system such as [pyenv](#).

**Flash Erase** Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Tip: Updating ESP-IDF** It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see [ESP-IDF Versions](#).

The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in [Step 2. Get ESP-IDF](#).

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at [Step 3. Set up the tools](#).

Once the new tools are installed, update the environment using the Export script. See instructions at [Step 4. Set up the environment variables](#).

## 1.4 Build Your First Project

If you already have the ESP-IDF installed and not using IDE, you can build your first project from the command line following the [Start a Project on Windows](#) or [Start a Project on Linux and macOS](#).

## 1.5 Uninstall ESP-IDF

If you want to remove ESP-IDF, please follow [Uninstall ESP-IDF](#).

# Chapter 2

## API Reference

### 2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures, and types.
- Build system functions, predefined variables, and options. These are documented in the [ESP-IDF CMake Build System API](#).
- *Kconfig* options can be used in code and in the build system (`CMakeLists.txt`) files.
- *Host tools* and their command line parameters are also part of the ESP-IDF interfaces.

ESP-IDF is made up of multiple components where these components either contain code specifically written for ESP chips, or contain a third-party library (i.e., a third-party component). In some cases, third-party components will contain an "ESP-IDF specific" wrapper in order to provide an interface that is either simpler or better integrated with the rest of ESP-IDF's features. In other cases, third-party components will present the original API of the underlying library directly.

The following sections explain some of the aspects of ESP-IDF APIs and their usage.

#### 2.1.1 Error Handling

Most ESP-IDF APIs return error codes defined with the `esp_err_t` type. See [Error Handling](#) section for more information about error handling approaches. [Error Codes Reference](#) contains the list of error codes returned by ESP-IDF components.

#### 2.1.2 Configuration Structures

---

**Important:** Correct initialization of configuration structures is an important part of making the application compatible with future versions of ESP-IDF.

---

Most initialization, configuration, and installation functions in ESP-IDF (typically named `..._init()`, `..._config()`, and `..._install()`) take a configuration structure pointer as an argument. For example:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = callback_arg,
    .name = "my_timer"
};
esp_timer_handle_t my_timer;
esp_err_t err = esp_timer_create(&my_timer_args, &my_timer);
```

These functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 [designated initializers](#) for structure initialization since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    /* Correct, fields .arg and .name are zero-initialized */
};
```

The C++ language supports designated initializer syntax, too, but the initializers must be in the order of declaration. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```
/* Correct, fields .dispatch_method, .name and .skip_unhandled_events are zero-
↳ initialized */
const esp_timer_create_args_t my_timer_args = {
    .callback = &my_timer_callback,
    .arg = &my_arg,
};

/**/
/* Incorrect, .arg is declared after .callback in esp_timer_create_args_t */
//const esp_timer_create_args_t my_timer_args = {
//    .arg = &my_arg,
//    .callback = &my_timer_callback,
//};
```

For more information on designated initializers, see [Designated Initializers](#). Note that C++ language versions older than C++20, which are not the default in the current version of ESP-IDF, do not support designated initializers. If you have to compile code with an older C++ standard than C++20, you may use GCC extensions to produce the following pattern:

```
esp_timer_create_args_t my_timer_args = {};
/* All the fields are zero-initialized */
my_timer_args.callback = &my_timer_callback;
```

## Default Initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer. Now all fields are_
↳ set to the default values, and any field can still be modified: */
config.server_port = 8081;
```

(continues on next page)

```
httpd_handle_t server;  
esp_err_t err = httpd_start(&server, &config);
```

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

### 2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code rather than by the applications. Such header files often contain `private` or `esp_private` in their name or path. Certain components, such as *hal* only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

### 2.1.4 Components in Example Projects

ESP-IDF examples contain a variety of projects demonstrating the usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples. This includes components located in `common_components` directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via `EXTRA_COMPONENT_DIRS` build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Before using, take time to read the code and understand if it is applicable to your use case.

### 2.1.5 API Stability

ESP-IDF uses [Semantic Versioning](#) as explained in the *Versioning Scheme*.

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

#### Source-level Compatibility

ESP-IDF guarantees source-level compatibility of C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Source-level compatibility implies that the application source code can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source-level compatibility:

- Deprecating functions (using the `deprecated` attribute) and header files (using a preprocessor `#warning`). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however, this is not mandatory. Deprecated functions and files can be removed from major versions of ESP-IDF.
- Renaming components, moving source and header files between components — provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system's *backward compatibility* ensures that the original Kconfig option names can still be used by the application in `sdkconfig` file, CMake files, and source code.

## Lack of Binary Compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source-level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See [Configuration Structures](#) for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

## Other Exceptions from Compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issuing reports about any unintended breaking changes that don't fall into the categories below.

- [Private APIs](#).
- [Components in Example Projects](#).
- Features clearly marked as "beta", "preview", or "experimental".
- Changes made to mitigate security issues or to replace insecure default behaviors with secure ones.
- Features that were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features that depend on non-functional chip hardware features.
- Unexpected or undefined behavior that is not documented explicitly may be fixed/changed, such as due to missing validation of argument ranges.
- Location of [Kconfig](#) options in `menuconfig`.
- Location and names of example projects.

## 2.2 Application Protocols

### 2.2.1 ASIO port

Asio is a cross-platform C++ library, see <https://think-async.com/Asio/>. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component *ASIO* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ASIO component on GitHub](#)

To add ASIO component in your project, please run `idf.py add-dependency espressif/asio`

### Hosted Documentation

The documentation can be found on the link below:

- [ASIO documentation \(English\)](#)

### 2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (`esp-modbus`) supports Modbus communication in the networks based on RS485, Wi-Fi, Ethernet interfaces. The ESP-IDF component *freemodbus* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [ESP-Modbus component on GitHub](#)

### Hosted Documentation

The documentation can be found on the link below:

- [ESP-Modbus documentation \(English\)](#)

### Application Example

The examples below demonstrate the ESP-Modbus library of serial, TCP ports for slave and master implementations accordingly.

- [protocols/modbus/serial/mb\\_slave](#)
- [protocols/modbus/serial/mb\\_master](#)
- [protocols/modbus/tcp/mb\\_tcp\\_slave](#)
- [protocols/modbus/tcp/mb\\_tcp\\_master](#)

Please refer to the specific example README.md for details.

### Protocol References

- <https://modbus.org/specs.php>: Modbus Organization with protocol specifications.

## 2.2.3 ESP-MQTT

### Overview

ESP-MQTT is an implementation of [MQTT](#) protocol client, which is a lightweight publish/subscribe messaging protocol. Now ESP-MQTT supports [MQTT v5.0](#).

### Features

- Support MQTT over TCP, SSL with Mbed TLS, MQTT over WebSocket, and MQTT over WebSocket Secure
- Easy to setup with URI
- Multiple instances (multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings, and all 3 Quality of Service (QoS) levels (it should be a fully functional client)

### Application Examples

- [protocols/mqtt/tcp](#): MQTT over TCP, default port 1883
- [protocols/mqtt/ssl](#): MQTT over TLS, default port 8883
- [protocols/mqtt/ssl\\_ds](#): MQTT over TLS using digital signature peripheral for authentication, default port 8883
- [protocols/mqtt/ssl\\_mutual\\_auth](#): MQTT over TLS using certificates for authentication, default port 8883
- [protocols/mqtt/ssl\\_psk](#): MQTT over TLS using pre-shared keys for authentication, default port 8883
- [protocols/mqtt/ws](#): MQTT over WebSocket, default port 80
- [protocols/mqtt/wss](#): MQTT over WebSocket Secure, default port 443
- [protocols/mqtt5](#): Uses ESP-MQTT library to connect to broker with MQTT v5.0

## MQTT Message Retransmission

A new MQTT message is created by calling `esp_mqtt_client_publish` or its non blocking counterpart `esp_mqtt_client_enqueue`.

Messages with QoS 0 will be sent only once. QoS 1 and 2 have different behaviors since the protocol requires extra steps to complete the process.

The ESP-MQTT library opts to always retransmit unacknowledged QoS 1 and 2 publish messages to avoid losses in faulty connections, even though the MQTT specification requires the re-transmission only on reconnect with Clean Session flag been set to 0 (set `disable_clean_session` to true for this behavior).

QoS 1 and 2 messages that may need retransmission are always enqueued, but first transmission try occurs immediately if `esp_mqtt_client_publish` is used. A transmission retry for unacknowledged messages will occur after `message_retransmit_timeout`. After `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS` messages will expire and be deleted. If `CONFIG_MQTT_REPORT_DELETED_MESSAGES` is set, an event will be sent to notify the user.

## Configuration

The configuration is made by setting fields in `esp_mqtt_client_config_t` struct. The configuration struct has the following sub structs to configure different aspects of the client operation.

- `esp_mqtt_client_config_t::broker_t` - Allow to set address and security verification.
- `esp_mqtt_client_config_t::credentials_t` - Client credentials for authentication.
- `esp_mqtt_client_config_t::session_t` - Configuration for MQTT session aspects.
- `esp_mqtt_client_config_t::network_t` - Networking related configuration.
- `esp_mqtt_client_config_t::task_t` - Allow to configure FreeRTOS task.
- `esp_mqtt_client_config_t::buffer_t` - Buffer size for input and output.

In the following sections, the most common aspects are detailed.

## Broker

**Address** Broker address can be set by usage of `address` struct. The configuration can be made by usage of `uri` field or the combination of `hostname`, `transport` and `port`. Optionally, `path` could be set, this field is useful in WebSocket connections.

The `uri` field is used in the format `scheme://hostname:port/path`.

- Curently support `mqtt`, `mqttps`, `ws`, `wss` schemes
- MQTT over TCP samples:
  - `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883
  - `mqtt://mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884
  - `mqtt://username:password@mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - `mqttps://mqtt.eclipseprojects.io`: MQTT over SSL, port 8883
  - `mqttps://mqtt.eclipseprojects.io:8884`: MQTT over SSL, port 8884
- MQTT over WebSocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over WebSocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
```

(continues on next page)

(continued from previous page)

```
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler, ↵
↵client);
esp_mqtt_client_start(client);
```

**Note:** By default MQTT client uses event loop library to post related MQTT events (connected, subscribed, published, etc.).

**Verification** For secure connections with TLS used, and to guarantee Broker's identity, the *verification* struct must be set. The broker certificate may be set in PEM or DER format. To select DER, the equivalent *certificate\_len* field must be set. Otherwise, a null-terminated string in PEM format should be provided to *certificate* field.

- Get certificate from server, example: `mqtt.eclipseprojects.io`

```
openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 < /dev/
↵null \
2> /dev/null | openssl x509 -outform PEM > mqtt_eclipse_org.pem
```

- Check the sample application: [protocols/mqtt/ssl](#)
- Configuration:

```
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker = {
        .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
        .verification.certificate = (const char *)mqtt_eclipse_org_pem_start,
    },
};
```

For details about other fields, please check the [API Reference](#) and [TLS Server verification](#).

**Client Credentials** All client related credentials are under the *credentials* field.

- *username*: pointer to the username used for connecting to the broker, can also be set by URI
- *client\_id*: pointer to the client ID, defaults to ESP32\_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format

**Authentication** It's possible to set authentication parameters through the *authentication* field. The client supports the following authentication methods:

- *password*: use a password by setting
- *certificate* and *key*: mutual authentication with TLS, and both can be provided in PEM or DER format
- *use\_secure\_element*: use secure element available in ESP32-WROOM-32SE
- *ds\_data*: use Digital Signature Peripheral available in some Espressif devices

**Session** For MQTT session related configurations, *session* fields should be used.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the *last\_will* struct.

- *topic*: pointer to the LWT message topic
- *msg*: pointer to the LWT message
- *msg\_len*: length of the LWT message, required if *msg* is not null-terminated
- *qos*: quality of service for the LWT message
- *retain*: specifies the retain flag of the LWT message

**Change Settings in Project Configuration Menu** The settings for MQTT can be found using `idf.py menu-config`, under Component `config>ESP-MQTT Configuration`.

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: enable 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL` and `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: enable specific MQTT transport layer, such as SSL, WEBSOCKET, and WEBSOCKET\_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: disable default implementation of `mqtt_outbox`, so a specific implementation can be supplied

## Events

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client's subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client's unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client's publish message. This will only be posted for QoS level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer, multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. The field `error_handle` in the event data contains `error_type` that can be used to identify the error. The type of error will determine which parts of the `error_handle` struct is filled.

## API Reference

### Header File

- `components/mqtt/esp-mqtt/include/mqtt_client.h`

### Functions

`esp_mqtt_client_handle_t esp_mqtt_client_init` (const `esp_mqtt_client_config_t` \*config)

Creates *MQTT* client handle based on the configuration.

**Parameters** `config` -- *MQTT* configuration structure

**Returns** `mqtt_client_handle` if successfully created, NULL on error

`esp_err_t esp_mqtt_client_set_uri` (`esp_mqtt_client_handle_t` client, const char \*uri)

Sets *MQTT* connection URI. This API is usually used to overrides the URI configured in `esp_mqtt_client_init`.

**Parameters**

- `client` -- *MQTT* client handle
- `uri` --

**Returns** `ESP_FAIL` if URI parse error, `ESP_OK` on success

`esp_err_t esp_mqtt_client_start` (`esp_mqtt_client_handle_t` client)

Starts *MQTT* client with already created client handle.

**Parameters** `client` -- *MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL on other error

*esp\_err\_t* **esp\_mqtt\_client\_reconnect** (*esp\_mqtt\_client\_handle\_t* client)

This api is typically used to force reconnection upon a specific event.

**Parameters** **client** -- *MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL if client is in invalid state

*esp\_err\_t* **esp\_mqtt\_client\_disconnect** (*esp\_mqtt\_client\_handle\_t* client)

This api is typically used to force disconnection from the broker.

**Parameters** **client** -- *MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization

*esp\_err\_t* **esp\_mqtt\_client\_stop** (*esp\_mqtt\_client\_handle\_t* client)

Stops *MQTT* client tasks.

- Notes:
- Cannot be called from the *MQTT* event handler

**Parameters** **client** -- *MQTT* client handle

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_FAIL if client is in invalid state

int **esp\_mqtt\_client\_subscribe\_single** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, int qos)

Subscribe the client to defined topic with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a *MQTT* event callback i.e. internal *MQTT* task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- `esp_mqtt_client_subscribe` could be used to call this function.

**Parameters**

- **client** -- *MQTT* client handle
- **topic** -- topic filter to subscribe
- **qos** -- Max qos level of the subscription

**Returns** message\_id of the subscribe message on success -1 on failure -2 in case of full outbox.

int **esp\_mqtt\_client\_subscribe\_multiple** (*esp\_mqtt\_client\_handle\_t* client, const *esp\_mqtt\_topic\_t* \*topic\_list, int size)

Subscribe the client to a list of defined topics with defined qos.

Notes:

- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a *MQTT* event callback i.e. internal *MQTT* task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- `esp_mqtt_client_subscribe` could be used to call this function.

**Parameters**

- **client** -- *MQTT* client handle
- **topic\_list** -- List of topics to subscribe
- **size** -- size of topic\_list

**Returns** message\_id of the subscribe message on success -1 on failure -2 in case of full outbox.

int **esp\_mqtt\_client\_unsubscribe** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic)

Unsubscribe the client from defined topic.

Notes:

- Client must be connected to send unsubscribe message
- It is thread safe, please refer to `esp_mqtt_client_subscribe_single` for details

#### Parameters

- **client** -- *MQTT* client handle
- **topic** --

**Returns** message\_id of the subscribe message on success -1 on failure

int **esp\_mqtt\_client\_publish** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn't have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If `MQTT_SKIP_PUBLISH_IF_DISCONNECTED` is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to `esp_mqtt_client_subscribe` for details

#### Parameters

- **client** -- *MQTT* client handle
- **topic** -- topic string
- **data** -- payload string (set to NULL, sending empty payload message)
- **len** -- data length, if set to 0, length is calculated from payload string
- **qos** -- QoS of publish message
- **retain** -- retain flag

**Returns** message\_id of the publish message (for QoS 0 message\_id will always be zero) on success. -1 on failure, -2 in case of full outbox.

int **esp\_mqtt\_client\_enqueue** (*esp\_mqtt\_client\_handle\_t* client, const char \*topic, const char \*data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the `esp_mqtt_client_publish()` which sends the publish message immediately in the user task's context). Thus, it could be used as a non blocking version of `esp_mqtt_client_publish()`.

#### Parameters

- **client** -- *MQTT* client handle
- **topic** -- topic string
- **data** -- payload string (set to NULL, sending empty payload message)
- **len** -- data length, if set to 0, length is calculated from payload string
- **qos** -- QoS of publish message
- **retain** -- retain flag
- **store** -- if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

**Returns** message\_id if queued successfully, -1 on failure, -2 in case of full outbox.

*esp\_err\_t* **esp\_mqtt\_client\_destroy** (*esp\_mqtt\_client\_handle\_t* client)

Destroys the client handle.

Notes:

- Cannot be called from the *MQTT* event handler

**Parameters** `client` -- *MQTT* client handle

**Returns** ESP\_OK ESP\_ERR\_INVALID\_ARG on wrong initialization

`esp_err_t esp_mqtt_set_config(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)`

Set configuration structure, typically used when updating the config (i.e. on "before\_connect" event).

Notes:

- When calling this function make sure to have all the intended configurations set, otherwise default values are set.

#### Parameters

- `client` -- *MQTT* client handle
- `config` -- *MQTT* configuration structure

**Returns** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG if conflicts on transport configuration. ESP\_OK on success

`esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)`

Registers *MQTT* event.

#### Parameters

- `client` -- *MQTT* client handle
- `event` -- event type
- `event_handler` -- handler callback
- `event_handler_arg` -- handlers context

**Returns** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG on wrong initialization ESP\_OK on success

`esp_err_t esp_mqtt_client_unregister_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler)`

Unregisters mqtt event.

#### Parameters

- `client` -- mqtt client handle
- `event` -- event ID
- `event_handler` -- handler to unregister

**Returns** ESP\_ERR\_NO\_MEM if failed to allocate ESP\_ERR\_INVALID\_ARG on invalid event ID ESP\_OK on success

`int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)`

Get outbox size.

**Parameters** `client` -- *MQTT* client handle

**Returns** outbox size 0 on wrong initialization

`esp_err_t esp_mqtt_dispatch_custom_event(esp_mqtt_client_handle_t client, esp_mqtt_event_t *event)`

Dispatch user event to the mqtt internal event loop.

#### Parameters

- `client` -- *MQTT* client handle
- `event` -- *MQTT* event handle structure

**Returns** ESP\_OK on success ESP\_ERR\_TIMEOUT if the event couldn't be queued (ref also CONFIG\_MQTT\_EVENT\_QUEUE\_SIZE)

## Structures

struct **esp\_mqtt\_error\_codes**

*MQTT* error code structure to be passed as a contextual information into ERROR event

Important: This structure extends *esp\_tls\_last\_error* error structure and is backward compatible with it (so might be down-casted and treated as *esp\_tls\_last\_error* error, but recommended to update applications if used this way previously)

Use this structure directly checking *error\_type* first and then appropriate error code depending on the source of the error:

| *error\_type* | related member variables | note | | MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT | *esp\_tls\_last\_esp\_err*, *esp\_tls\_stack\_err*, *esp\_tls\_cert\_verify\_flags*, *sock\_errno* | Error reported from tcp\_transport/esp-tls | | MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED | *connect\_return\_code* | Internal error reported from *MQTT* broker on connection |

### Public Members

*esp\_err\_t* **esp\_tls\_last\_esp\_err**

last *esp\_err* code reported from esp-tls component

int **esp\_tls\_stack\_err**

tls specific error code reported from underlying tls stack

int **esp\_tls\_cert\_verify\_flags**

tls flags reported from underlying tls stack during certificate verification

*esp\_mqtt\_error\_type\_t* **error\_type**

error type referring to the source of the error

*esp\_mqtt\_connect\_return\_code\_t* **connect\_return\_code**

connection refused error code reported from MQTT\* broker on connection

int **esp\_transport\_sock\_errno**

errno from the underlying socket

struct **esp\_mqtt\_event\_t**

*MQTT* event configuration structure

### Public Members

*esp\_mqtt\_event\_id\_t* **event\_id**

*MQTT* event type

*esp\_mqtt\_client\_handle\_t* **client**

*MQTT* client handle for this event

char \***data**

Data associated with this event

int **data\_len**

Length of the data for this event

int **total\_data\_len**

Total length of the data (longer data are supplied with multiple events)

int **current\_data\_offset**

Actual offset for the data associated with this event

char \***topic**

Topic associated with this event

int **topic\_len**

Length of the topic for this event associated with this event

int **msg\_id**

*MQTT* message id of message

int **session\_present**

*MQTT* session\_present flag for connection event

*esp\_mqtt\_error\_codes\_t* \***error\_handle**

esp-mqtt error handle including esp-tls errors as well as internal *MQTT* errors

bool **retain**

Retained flag of the message associated with this event

int **qos**

QoS of the messages associated with this event

bool **dup**

dup flag of the message associated with this event

*esp\_mqtt\_protocol\_ver\_t* **protocol\_ver**

MQTT protocol version used for connection, defaults to value from menuconfig

struct **esp\_mqtt\_client\_config\_t**

*MQTT* client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

### Public Members

struct *esp\_mqtt\_client\_config\_t::broker\_t* **broker**

Broker address and security verification

struct *esp\_mqtt\_client\_config\_t::credentials\_t* **credentials**

User credentials for broker

struct *esp\_mqtt\_client\_config\_t::session\_t* **session**

*MQTT* session configuration.

struct *esp\_mqtt\_client\_config\_t::network\_t* **network**

Network configuration

struct *esp\_mqtt\_client\_config\_t::task\_t* **task**

FreeRTOS task configuration.

struct *esp\_mqtt\_client\_config\_t::buffer\_t* **buffer**

Buffer size configuration.

struct *esp\_mqtt\_client\_config\_t::outbox\_config\_t* **outbox**

Outbox configuration.

struct **broker\_t**

Broker related configuration

### Public Members

struct *esp\_mqtt\_client\_config\_t::broker\_t::address\_t* **address**

Broker address configuration

struct *esp\_mqtt\_client\_config\_t::broker\_t::verification\_t* **verification**

Security verification of the broker

struct **address\_t**

Broker address

- uri have precedence over other fields
- If uri isn't set at least hostname, transport and port should.

### Public Members

const char \***uri**

Complete *MQTT* broker URI

const char \***hostname**

Hostname, to set ipv4 pass it as string)

*esp\_mqtt\_transport\_t* **transport**

Selects transport

const char \***path**

Path in the URI

uint32\_t **port**

*MQTT* server port

struct **verification\_t**

Broker identity verification

If fields are not set broker's identity isn't verified. it's recommended to set the options in this struct for security reasons.

### Public Members

bool **use\_global\_ca\_store**

Use a global ca\_store, look esp-tls documentation for details.

*esp\_err\_t* (**\*crt\_bundle\_attach**)(void \*conf)

Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles. Client only attach the bundle, the clean up must be done by the user.

const char \***certificate**

Certificate data, default is NULL. It's not copied nor freed by the client, user needs to clean up.

size\_t **certificate\_len**

Length of the buffer pointed to by certificate.

const struct *psk\_key\_hint* \***psk\_hint\_key**

Pointer to PSK struct defined in esp\_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker. It's not copied nor freed by the client, user needs to clean up.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field, this reduces the security of TLS and makes the *MQTT* client susceptible to MITM attacks

const char \*\***alpn\_protos**

NULL-terminated list of supported application protocols to be used for ALPN.

const char \***common\_name**

Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname. This is ignored if skip\_cert\_common\_name\_check=true. It's not copied nor freed by the client, user needs to clean up.

struct **buffer\_t**

Client buffer size configuration

Client have two buffers for input and output respectively.

### Public Members

int **size**

size of *MQTT* send/receive buffer

int **out\_size**

size of *MQTT* output buffer. If not defined, defaults to the size defined by `buffer_size`

struct **credentials\_t**

Client related credentials for authentication.

### Public Members

const char \***username**

*MQTT* username

const char \***client\_id**

Set *MQTT* client identifier. Ignored if `set_null_client_id == true` If NULL set the default client id. Default client id is `ESP32_CHIPID%` where `CHIPID%` are last 3 bytes of MAC address in hex format

bool **set\_null\_client\_id**

Selects a NULL client id

struct *esp\_mqtt\_client\_config\_t::credentials\_t::authentication\_t* **authentication**

Client authentication

struct **authentication\_t**

Client authentication

Fields related to client authentication by broker

For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.

### Public Members

const char \***password**

*MQTT* password

const char \***certificate**

Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with `key`. It's not copied nor freed by the client, user needs to clean up.

size\_t **certificate\_len**

Length of the buffer pointed to by certificate.

const char \***key**

Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also `certificate` has to be provided. It's not copied nor freed by the client, user needs to clean up.

size\_t **key\_len**

Length of the buffer pointed to by key.

const char \***key\_password**

Client key decryption password, not PEM nor DER, if provided `key_password_len` must be correctly set.

int **key\_password\_len**

Length of the password pointed to by `key_password`

bool **use\_secure\_element**

Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void \***ds\_data**

Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices. It's not copied nor freed by the client, user needs to clean up.

struct **network\_t**

Network related configuration

### Public Members

int **reconnect\_timeout\_ms**

Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

int **timeout\_ms**

Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int **refresh\_connection\_after\_ms**

Refresh connection after this value (in milliseconds)

bool **disable\_auto\_reconnect**

Client will reconnect to server (when errors/disconnect). Set `disable_auto_reconnect=true` to disable

esp\_transport\_handle\_t **transport**

Custom transport handle to use. Warning: The transport should be valid during the client lifetime and is destroyed when `esp_mqtt_client_destroy` is called.

struct ifreq \***if\_name**

The name of interface for data to go through. Use the default interface without setting

struct **outbox\_config\_t**

Client outbox configuration options.

### Public Members

uint64\_t **limit**

Size limit for the outbox in bytes.

struct **session\_t**

*MQTT* Session related configuration

### Public Members

struct *esp\_mqtt\_client\_config\_t::session\_t::last\_will\_t* **last\_will**

Last will configuration

bool **disable\_clean\_session**

*MQTT* clean session, default clean\_session is true

int **keepalive**

*MQTT* keepalive, default is 120 seconds When configuring this value, keep in mind that the client attempts to communicate with the broker at half the interval that is actually set. This conservative approach allows for more attempts before the broker's timeout occurs

bool **disable\_keepalive**

Set `disable_keepalive=true` to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value `keepalive` to 0 doesn't disable keepalive feature, but uses a default keepalive period

*esp\_mqtt\_protocol\_ver\_t* **protocol\_ver**

*MQTT* protocol version used for connection.

int **message\_retransmit\_timeout**

timeout for retransmitting of failed packet

struct **last\_will\_t**

Last Will and Testament message configuration.

### Public Members

const char \***topic**

LWT (Last Will and Testament) message topic

const char \***msg**

LWT message, may be NULL terminated

int **msg\_len**

LWT message length, if msg isn't NULL terminated must have the correct length

int **qos**

LWT message QoS

int **retain**  
LWT retained message flag

struct **task\_t**  
Client task configuration

### Public Members

int **priority**  
*MQTT* task priority

int **stack\_size**  
*MQTT* task stack size

struct **topic\_t**  
Topic definition struct

### Public Members

const char \***filter**  
Topic filter to subscribe

int **qos**  
Max QoS level of the subscription

### Macros

#### **MQTT\_ERROR\_TYPE\_ESP\_TLS**

**MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT** error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from **MQTT\_ERROR\_TYPE\_ESP\_TLS** layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

**esp\_mqtt\_client\_subscribe** (client\_handle, topic\_type, qos\_or\_size)

Convenience macro to select subscribe function to use.

Notes:

- Usage of `esp_mqtt_client_subscribe_single` is the same as previous `esp_mqtt_client_subscribe`, refer to it for details.

#### Parameters

- **client\_handle** -- *MQTT* client handle
- **topic\_type** -- Needs to be char\* for single subscription or `esp_mqtt_topic_t` for multiple topics
- **qos\_or\_size** -- It's either a qos when subscribing to a single topic or the size of the subscription array when subscribing to multiple topics.

**Returns** message\_id of the subscribe message on success -1 on failure -2 in case of full outbox.

### Type Definitions

typedef struct esp\_mqtt\_client \***esp\_mqtt\_client\_handle\_t**

typedef enum *esp\_mqtt\_event\_id\_t* **esp\_mqtt\_event\_id\_t**

*MQTT* event types.

User event handler receives context data in *esp\_mqtt\_event\_t* structure with

- client - *MQTT* client handle
- various other data depending on event type

typedef enum *esp\_mqtt\_connect\_return\_code\_t* **esp\_mqtt\_connect\_return\_code\_t**

*MQTT* connection error codes propagated via ERROR event

typedef enum *esp\_mqtt\_error\_type\_t* **esp\_mqtt\_error\_type\_t**

*MQTT* connection error codes propagated via ERROR event

typedef enum *esp\_mqtt\_transport\_t* **esp\_mqtt\_transport\_t**

typedef enum *esp\_mqtt\_protocol\_ver\_t* **esp\_mqtt\_protocol\_ver\_t**

*MQTT* protocol version used for connection

typedef struct *esp\_mqtt\_error\_codes* **esp\_mqtt\_error\_codes\_t**

*MQTT* error code structure to be passed as a contextual information into ERROR event

Important: This structure extends *esp\_tls\_last\_error* error structure and is backward compatible with it (so might be down-casted and treated as *esp\_tls\_last\_error* error, but recommended to update applications if used this way previously)

Use this structure directly checking *error\_type* first and then appropriate error code depending on the source of the error:

| *error\_type* | related member variables | note | | **MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT** | *esp\_tls\_last\_esp\_err*, *esp\_tls\_stack\_err*, *esp\_tls\_cert\_verify\_flags*, *sock\_errno* | Error reported from *tcp\_transport/esp-tls* | | **MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED** | *connect\_return\_code* | Internal error reported from *MQTT* broker on connection |

typedef struct *esp\_mqtt\_event\_t* **esp\_mqtt\_event\_t**

*MQTT* event configuration structure

typedef *esp\_mqtt\_event\_t* \***esp\_mqtt\_event\_handle\_t**

typedef struct *esp\_mqtt\_client\_config\_t* **esp\_mqtt\_client\_config\_t**

*MQTT* client configuration structure

- Default values can be set via *menuconfig*
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related *len* field set to 0. DER format requires a related *len* field set to the correct length.

typedef struct *topic\_t* **esp\_mqtt\_topic\_t**

Topic definition struct

## Enumerations

enum **esp\_mqtt\_event\_id\_t**

*MQTT* event types.

User event handler receives context data in *esp\_mqtt\_event\_t* structure with

- client - *MQTT* client handle
- various other data depending on event type

*Values:*

enumerator **MQTT\_EVENT\_ANY**

enumerator **MQTT\_EVENT\_ERROR**

on error event, additional context: connection return code, error handle from esp\_tls (if supported)

enumerator **MQTT\_EVENT\_CONNECTED**

connected event, additional context: session\_present flag

enumerator **MQTT\_EVENT\_DISCONNECTED**

disconnected event

enumerator **MQTT\_EVENT\_SUBSCRIBED**

subscribed event, additional context:

- msg\_id message id
- error\_handle error\_type in case subscribing failed
- data pointer to broker response, check for errors.
- data\_len length of the data for this event

enumerator **MQTT\_EVENT\_UNSUBSCRIBED**

unsubscribed event, additional context: msg\_id

enumerator **MQTT\_EVENT\_PUBLISHED**

published event, additional context: msg\_id

enumerator **MQTT\_EVENT\_DATA**

data event, additional context:

- msg\_id message id
- topic pointer to the received topic
- topic\_len length of the topic
- data pointer to the received data
- data\_len length of the data for this event
- current\_data\_offset offset of the current data for this event
- total\_data\_len total length of the data received
- retain retain flag of the message
- qos QoS level of the message
- dup dup flag of the message Note: Multiple MQTT\_EVENT\_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator **MQTT\_EVENT\_BEFORE\_CONNECT**

The event occurs before connecting

**enumerator MQTT\_EVENT\_DELETED**

Notification on delete of one message from the internal outbox, if the message couldn't have been sent and acknowledged before expiring defined in `OUTBOX_EXPIRED_TIMEOUT_MS`. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if `MQTT_REPORT_DELETED_MESSAGES==1`
- Additional context: `msg_id` (id of the deleted message).

**enumerator MQTT\_USER\_EVENT**

Custom event used to queue tasks into mqtt event handler All fields from the `esp_mqtt_event_t` type could be used to pass an additional context data to the handler.

**enum esp\_mqtt\_connect\_return\_code\_t**

*MQTT* connection error codes propagated via ERROR event

*Values:*

**enumerator MQTT\_CONNECTION\_ACCEPTED**

Connection accepted

**enumerator MQTT\_CONNECTION\_REFUSE\_PROTOCOL**

*MQTT* connection refused reason: Wrong protocol

**enumerator MQTT\_CONNECTION\_REFUSE\_ID\_REJECTED**

*MQTT* connection refused reason: ID rejected

**enumerator MQTT\_CONNECTION\_REFUSE\_SERVER\_UNAVAILABLE**

*MQTT* connection refused reason: Server unavailable

**enumerator MQTT\_CONNECTION\_REFUSE\_BAD\_USERNAME**

*MQTT* connection refused reason: Wrong user

**enumerator MQTT\_CONNECTION\_REFUSE\_NOT\_AUTHORIZED**

*MQTT* connection refused reason: Wrong username or password

**enum esp\_mqtt\_error\_type\_t**

*MQTT* connection error codes propagated via ERROR event

*Values:*

**enumerator MQTT\_ERROR\_TYPE\_NONE****enumerator MQTT\_ERROR\_TYPE\_TCP\_TRANSPORT****enumerator MQTT\_ERROR\_TYPE\_CONNECTION\_REFUSED****enumerator MQTT\_ERROR\_TYPE\_SUBSCRIBE\_FAILED****enum esp\_mqtt\_transport\_t**

*Values:*

enumerator **MQTT\_TRANSPORT\_UNKNOWN**

enumerator **MQTT\_TRANSPORT\_OVER\_TCP**

*MQTT* over TCP, using scheme: `MQTT`

enumerator **MQTT\_TRANSPORT\_OVER\_SSL**

*MQTT* over SSL, using scheme: `MQTTS`

enumerator **MQTT\_TRANSPORT\_OVER\_WS**

*MQTT* over WebSocket, using scheme: `ws`

enumerator **MQTT\_TRANSPORT\_OVER\_WSS**

*MQTT* over WebSocket Secure, using scheme: `wss`

enum **esp\_mqtt\_protocol\_ver\_t**

*MQTT* protocol version used for connection

*Values:*

enumerator **MQTT\_PROTOCOL\_UNDEFINED**

enumerator **MQTT\_PROTOCOL\_V\_3\_1**

enumerator **MQTT\_PROTOCOL\_V\_3\_1\_1**

enumerator **MQTT\_PROTOCOL\_V\_5**

## 2.2.4 ESP-TLS

### Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the `esp_tls_cfg_t` data structure. Once done, TLS communication can be conducted using the following APIs:

- `esp_tls_init()`: for initializing the TLS connection handle.
- `esp_tls_conn_new_sync()`: for opening a new blocking TLS connection.
- `esp_tls_conn_new_async()`: for opening a new non-blocking TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

### Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https\\_request](#).

### Tree structure for ESP-TLS component

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between `mbedtls` and `wolfssl` for its operation. API specific to `mbedtls` are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to `wolfssl` are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

### TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer's server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

- **ca\_cert\_buf** and **ca\_cert\_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
  - `ca_cert_buf` - pointer to the buffer which contains the CA cert.
  - `ca_cert_bytes` - size of the CA certificate in bytes.
- **use\_global\_ca\_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.
- **cert\_bundle\_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](#)
- **psk\_hint\_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.
- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. *WARNING:Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca\_store etc.*

### ESP-TLS Server cert selection hook

The ESP-TLS component provides an option to set the server cert selection hook when using the `mbedtls` stack. This provides an ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (`alpn`, `sni`, etc). To enable this feature, please enable `CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK` in the ESP-TLS menuconfig. The certificate selection callback can be configured in the `esp_tls_cfg_t` structure as follows:

```

int cert_selection_callback(mbedtls_ssl_context *ssl)
{
    /* Code that the callback should execute */
    return 0;
}

```

(continues on next page)

(continued from previous page)

```

}
esp_tls_cfg_t cfg = {
    cert_select_cb = cert_section_callback,
};

```

### Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at <https://github.com/espressif/esp-wolfssl>. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

---

**Note:** *As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.*

---

### How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

- 1) Directly add wolfssl as a component in your project with following three commands.:

```

(First change directory (cd) to your project directory)
mkdir components
cd components
git clone https://github.com/espressif/esp-wolfssl.git

```

- 2) Add wolfssl as an extra component in your project.

- Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

- Include esp-wolfssl in ESP-IDF with setting EXTRA\_COMPONENT\_DIRS in CMakeLists.txt of your project as done in [wolfssl/examples](#). For reference see Optional Project variables in [build-system](#).

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

### Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when [protocols/https\\_request](#) example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN\_CONTENT length and OUT\_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

Property	Wolfssl	Mbedtls
Total Heap Consumed	~19 Kb	~37 Kb
Task Stack Used	~2.2 Kb	~3.6 Kb
Bin size	~858 Kb	~736 Kb

---

**Note:** *These values are subject to change with change in configuration options and version of respective libraries.*

---

## API Reference

### Header File

- `components/esp-tls/esp_tls.h`

### Functions

`esp_tls_t *esp_tls_init` (void)

Create TLS connection.

This function allocates and initializes esp-tls structure handle.

**Returns** `tls` Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

`esp_tls_t *esp_tls_conn_http_new` (const char \*url, const `esp_tls_cfg_t` \*cfg)

Create a new blocking TLS/SSL connection with a given "HTTP" url.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_http_new_sync` (and its asynchronous version `esp_tls_conn_http_new_async`)

#### Parameters

- **url** -- **[in]** url of host.
- **cfg** -- **[in]** TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to 'esp\_tls\_cfg\_t'. At a minimum, this structure should be zero-initialized.

**Returns** pointer to `esp_tls_t`, or NULL if connection couldn't be opened.

int `esp_tls_conn_new_sync` (const char \*hostname, int hostlen, int port, const `esp_tls_cfg_t` \*cfg, `esp_tls_t` \*tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

#### Parameters

- **hostname** -- **[in]** Hostname of the host.
- **hostlen** -- **[in]** Length of hostname.
- **port** -- **[in]** Port number of the host.
- **cfg** -- **[in]** TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t`. At a minimum, this structure should be zero-initialized.
- **tls** -- **[in]** Pointer to esp-tls as esp-tls handle.

#### Returns

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int `esp_tls_conn_http_new_sync` (const char \*url, const `esp_tls_cfg_t` \*cfg, `esp_tls_t` \*tls)

Create a new blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as `esp_tls_conn_new_sync()` API. However this API accepts host's url.

#### Parameters

- **url** -- **[in]** url of host.
- **cfg** -- **[in]** TLS configuration as `esp_tls_cfg_t`. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to 'esp\_tls\_cfg\_t'. At a minimum, this structure should be zero-initialized.
- **tls** -- **[in]** Pointer to esp-tls as esp-tls handle.

**Returns**

- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

int **esp\_tls\_conn\_new\_async** (const char \*hostname, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn't wait for the connection to get established.

**Parameters**

- **hostname** -- **[in]** Hostname of the host.
- **hostlen** -- **[in]** Length of hostname.
- **port** -- **[in]** Port number of the host.
- **cfg** -- **[in]** TLS configuration as *esp\_tls\_cfg\_t*. `non_block` member of this structure should be set to be true.
- **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

**Returns**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

int **esp\_tls\_conn\_http\_new\_async** (const char \*url, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_t* \*tls)

Create a new non-blocking TLS/SSL connection with a given "HTTP" url.

The behaviour is same as `esp_tls_conn_new_async()` API. However this API accepts host's url.

**Parameters**

- **url** -- **[in]** url of host.
- **cfg** -- **[in]** TLS configuration as *esp\_tls\_cfg\_t*.
- **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

**Returns**

- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

ssize\_t **esp\_tls\_conn\_write** (*esp\_tls\_t* \*tls, const void \*data, size\_t datalen)

Write from buffer 'data' into specified tls connection.

**Parameters**

- **tls** -- **[in]** pointer to esp-tls as esp-tls handle.
- **data** -- **[in]** Buffer from which data will be written.
- **datalen** -- **[in]** Length of data buffer.

**Returns**

- $\geq 0$  if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- $< 0$  if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- `ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE`. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

ssize\_t **esp\_tls\_conn\_read** (*esp\_tls\_t* \*tls, void \*data, size\_t datalen)

Read from specified tls connection into the buffer 'data'.

**Parameters**

- **tls** -- **[in]** pointer to esp-tls as esp-tls handle.
- **data** -- **[in]** Buffer to hold read data.
- **datalen** -- **[in]** Length of data buffer.

**Returns**

- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

int **esp\_tls\_conn\_destroy** (*esp\_tls\_t* \*tls)

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_conn_new_sync()` (or `esp_tls_conn_http_new_sync()`) and `esp_tls_conn_new_async()` (or `esp_tls_conn_http_new_async()`) APIs.

**Parameters** **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

**Returns** - 0 on success

- -1 if socket error or an invalid argument

ssize\_t **esp\_tls\_get\_bytes\_avail** (*esp\_tls\_t* \*tls)

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls's `mbedtls_ssl_get_bytes_avail()` API.

**Parameters** **tls** -- **[in]** pointer to esp-tls as esp-tls handle.

**Returns**

- -1 in case of invalid arg
- bytes available in the application data record read buffer

*esp\_err\_t* **esp\_tls\_get\_conn\_sockfd** (*esp\_tls\_t* \*tls, int \*sockfd)

Returns the connection socket file descriptor from esp\_tls session.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **sockfd** -- **[out]** int pointer to sockfd value.

**Returns** - ESP\_OK on success and value of sockfd will be updated with socket file descriptor for connection

- ESP\_ERR\_INVALID\_ARG if (tls == NULL || sockfd == NULL)

*esp\_err\_t* **esp\_tls\_set\_conn\_sockfd** (*esp\_tls\_t* \*tls, int sockfd)

Sets the connection socket file descriptor for the esp\_tls session.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **sockfd** -- **[in]** sockfd value to set.

**Returns** - ESP\_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP\_ERR\_INVALID\_ARG if (tls == NULL || sockfd < 0)

*esp\_err\_t* **esp\_tls\_get\_conn\_state** (*esp\_tls\_t* \*tls, *esp\_tls\_conn\_state\_t* \*conn\_state)

Gets the connection state for the esp\_tls session.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **conn\_state** -- **[out]** pointer to the connection state value.

**Returns** - ESP\_OK on success and value of sockfd for the tls connection shall updated with the provided value

- ESP\_ERR\_INVALID\_ARG (Invalid arguments)

*esp\_err\_t* **esp\_tls\_set\_conn\_state** (*esp\_tls\_t* \*tls, *esp\_tls\_conn\_state\_t* conn\_state)

Sets the connection state for the esp\_tls session.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **conn\_state** -- **[in]** connection state value to set.

**Returns** - ESP\_OK on success and value of sockfd for the tls connection shall updated with the provided value

- `ESP_ERR_INVALID_ARG` (Invalid arguments)

void `*esp_tls_get_ssl_context` (`esp_tls_t *tls`)

Returns the ssl context.

**Parameters** `tls` -- [in] handle to `esp_tls` context

**Returns** - `ssl_ctx` pointer to ssl context of underlying TLS layer on success

- `NULL` in case of error

`esp_err_t esp_tls_init_global_ca_store` (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling `esp_tls_set_global_ca_store()`. To be effective, this function must be called before any call to `esp_tls_set_global_ca_store()`.

**Returns**

- `ESP_OK` if creating global CA store was successful.
- `ESP_ERR_NO_MEM` if an error occurred when allocating the mbedTLS resources.

`esp_err_t esp_tls_set_global_ca_store` (const unsigned char \*`cacert_pem_buf`, const unsigned int `cacert_pem_bytes`)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls `esp_tls_init_global_ca_store()` if it has not already been called. The application must call this function before calling `esp_tls_conn_new()`.

**Parameters**

- `cacert_pem_buf` -- [in] Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.
- `cacert_pem_bytes` -- [in] Length of the buffer.

**Returns**

- `ESP_OK` if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void `esp_tls_free_global_ca_store` (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

`esp_err_t esp_tls_get_and_clear_last_error` (`esp_tls_error_handle_t h`, int \*`esp_tls_code`, int \*`esp_tls_flags`)

Returns last error in `esp_tls` with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Parameters**

- `h` -- [in] `esp-tls` error handle.
- `esp_tls_code` -- [out] last error code returned from mbedtls api (set to zero if none) This pointer could be `NULL` if caller does not care about `esp_tls_code`
- `esp_tls_flags` -- [out] last certification verification flags (set to zero if none) This pointer could be `NULL` if caller does not care about `esp_tls_code`

**Returns**

- `ESP_ERR_INVALID_STATE` if invalid parameters
- `ESP_OK` (0) if no error occurred
- specific error code (based on `ESP_ERR_ESP_TLS_BASE`) otherwise

`esp_err_t esp_tls_get_and_clear_error_type` (`esp_tls_error_handle_t h`, `esp_tls_error_type_t err_type`, int \*`error_code`)

Returns the last error captured in `esp_tls` of a specific type The error information is cleared internally upon return.

**Parameters**

- **h** -- **[in]** esp-tls error handle.
- **err\_type** -- **[in]** specific error type
- **error\_code** -- **[out]** last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp\_tls\_code

**Returns**

- ESP\_ERR\_INVALID\_STATE if invalid parameters
- ESP\_OK if a valid error returned and was cleared

*esp\_err\_t* **esp\_tls\_get\_error\_handle** (*esp\_tls\_t* \*tls, *esp\_tls\_error\_handle\_t* \*error\_handle)

Returns the ESP-TLS error\_handle.

**Parameters**

- **tls** -- **[in]** handle to esp\_tls context
- **error\_handle** -- **[out]** pointer to the error handle.

**Returns**

- ESP\_OK on success and error\_handle will be updated with the ESP-TLS error handle.
- ESP\_ERR\_INVALID\_ARG if (tls == NULL || error\_handle == NULL)

mbedtls\_x509\_crt \***esp\_tls\_get\_global\_ca\_store** (void)

Get the pointer to the global CA store currently being used.

The application must first call esp\_tls\_set\_global\_ca\_store(). Then the same CA store could be used by the application for APIs other than esp\_tls.

---

**Note:** Modifying the pointer might cause a failure in verifying the certificates.

---

**Returns**

- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

*esp\_err\_t* **esp\_tls\_plain\_tcp\_connect** (const char \*host, int hostlen, int port, const *esp\_tls\_cfg\_t* \*cfg, *esp\_tls\_error\_handle\_t* error\_handle, int \*sockfd)

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

**Parameters**

- **host** -- **[in]** Hostname of the host.
- **hostlen** -- **[in]** Length of hostname.
- **port** -- **[in]** Port number of the host.
- **cfg** -- **[in]** ESP-TLS configuration as esp\_tls\_cfg\_t.
- **error\_handle** -- **[out]** ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** -- **[out]** Socket descriptor if successfully connected on TCP layer

**Returns** ESP\_OK on success ESP\_ERR\_INVALID\_ARG if invalid output parameters ESP-TLS based error codes on failure

**Structures**

struct **psk\_key\_hint**

ESP-TLS preshared key and hint structure.

**Public Members**

const uint8\_t \***key**

key in PSK authentication mode in binary format

const size\_t **key\_size**

length of the key

const char \***hint**

hint in PSK authentication mode in string format

struct **tls\_keep\_alive\_cfg**

esp-tls client session ticket ctx

Keep alive parameters structure

### Public Members

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time (second)

int **keep\_alive\_interval**

Keep-alive interval time (second)

int **keep\_alive\_count**

Keep-alive packet retry send count

struct **esp\_tls\_cfg**

ESP-TLS configuration parameters.

---

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
  - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.
- 

### Public Members

const char \*\***alpn\_protos**

Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char \*\*alpn\_protos = { "h2", NULL };

- where 'h2' is the protocol name

const unsigned char \***cacert\_buf**

Certificate Authority's certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support  
This buffer should be NULL terminated in case of PEM

const unsigned char \***cacert\_pem\_buf**

CA certificate buffer legacy name

unsigned int **cacert\_bytes**

Size of Certificate Authority certificate pointed to by cacert\_buf (including NULL-terminator in case of PEM format)

unsigned int **cacert\_pem\_bytes**

Size of Certificate Authority certificate legacy name

const unsigned char \***clientcert\_buf**

Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char \***clientcert\_pem\_buf**

Client certificate legacy name

unsigned int **clientcert\_bytes**

Size of client certificate pointed to by clientcert\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientcert\_pem\_bytes**

Size of client certificate legacy name

const unsigned char \***clientkey\_buf**

Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char \***clientkey\_pem\_buf**

Client key legacy name

unsigned int **clientkey\_bytes**

Size of client key pointed to by clientkey\_pem\_buf (including NULL-terminator in case of PEM format)

unsigned int **clientkey\_pem\_bytes**

Size of client key legacy name

const unsigned char \***clientkey\_password**

Client key decryption password string

unsigned int **clientkey\_password\_len**

String length of the password pointed to by clientkey\_password

bool **use\_ecdsa\_peripheral**

Use the ECDSA peripheral for the private key operations

uint8\_t **ecdsa\_key\_efuse\_blk**

The efuse block where the ECDSA key is stored

bool **non\_block**

Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool **use\_secure\_element**

Enable this option to use secure element or atec608a chip ( Integrated with ESP32-WROOM-32SE )

int **timeout\_ms**

Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32\_MAX

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

const char \***common\_name**

If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool **skip\_common\_name**

Skip any validation of server certificate CN field

*tls\_keep\_alive\_cfg\_t* \***keep\_alive\_cfg**

Enable TCP keep-alive timeout for SSL connection

const *psk\_hint\_key\_t* \***psk\_hint\_key**

Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

*esp\_err\_t* (\***crt\_bundle\_attach**)(void \*conf)

Function pointer to esp\_cert\_bundle\_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void \***ds\_data**

Pointer for digital signature peripheral context

bool **is\_plain\_tcp**

Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather than TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp\_tls\_plain\_tcp\_connect() API

struct ifreq \***if\_name**

The name of interface for data to go through. Use the default interface without setting

*esp\_tls\_addr\_family\_t* **addr\_family**

The address family to use when connecting to a host.

*esp\_tls\_proto\_ver\_t* **tls\_version**

TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

### Type Definitions

typedef enum *esp\_tls\_conn\_state* **esp\_tls\_conn\_state\_t**

ESP-TLS Connection State.

typedef enum *esp\_tls\_role* **esp\_tls\_role\_t**

typedef struct *psk\_key\_hint* **psk\_hint\_key\_t**

ESP-TLS preshared key and hint structure.

typedef struct *tls\_keep\_alive\_cfg* **tls\_keep\_alive\_cfg\_t**

esp-tls client session ticket ctx

Keep alive parameters structure

typedef enum *esp\_tls\_addr\_family* **esp\_tls\_addr\_family\_t**

typedef struct *esp\_tls\_cfg* **esp\_tls\_cfg\_t**

ESP-TLS configuration parameters.

---

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
  - Certificate Authority's certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
  - Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy \*\_pem\_buf and \*\_pem\_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert\_buf and cacert\_bytes.
- 

typedef struct esp\_tls **esp\_tls\_t**

### Enumerations

enum **esp\_tls\_conn\_state**

ESP-TLS Connection State.

*Values:*

enumerator **ESP\_TLS\_INIT**

enumerator **ESP\_TLS\_CONNECTING**

enumerator **ESP\_TLS\_HANDSHAKE**

enumerator **ESP\_TLS\_FAIL**

enumerator **ESP\_TLS\_DONE**

enum **esp\_tls\_role**

*Values:*

enumerator **ESP\_TLS\_CLIENT**

enumerator **ESP\_TLS\_SERVER**

enum **esp\_tls\_addr\_family**

*Values:*

enumerator **ESP\_TLS\_AF\_UNSPEC**

Unspecified address family.

enumerator **ESP\_TLS\_AF\_INET**

IPv4 address family.

enumerator **ESP\_TLS\_AF\_INET6**

IPv6 address family.

enum **esp\_tls\_proto\_ver\_t**

*Values:*

enumerator **ESP\_TLS\_VER\_ANY**

enumerator **ESP\_TLS\_VER\_TLS\_1\_2**

enumerator **ESP\_TLS\_VER\_TLS\_1\_3**

enumerator **ESP\_TLS\_VER\_TLS\_MAX**

### Header File

- [components/esp-tls/esp\\_tls\\_errors.h](#)

### Structures

struct **esp\_tls\_last\_error**

Error structure containing relevant errors in case tls error occurred.

### Public Members

*esp\_err\_t* **last\_error**

error code (based on **ESP\_ERR\_ESP\_TLS\_BASE**) of the last occurred error

int **esp\_tls\_error\_code**

esp\_tls error code from last esp\_tls failed api

int **esp\_tls\_flags**

last certification verification flags

## Macros

### **ESP\_ERR\_ESP\_TLS\_BASE**

Starting number of ESP-TLS error codes

### **ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME**

Error if hostname couldn't be resolved upon tls connection

### **ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET**

Failed to create socket

### **ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY**

Unsupported protocol family

### **ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST**

Failed to connect to host

### **ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED**

failed to set/get socket option

### **ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT**

new connection in esp\_tls\_low\_level\_conn connection timeouted

### **ESP\_ERR\_ESP\_TLS\_SE\_FAILED**

### **ESP\_ERR\_ESP\_TLS\_TCP\_CLOSED\_FIN**

### **ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK**

mbedtls parse certificates was partly successful

### **ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED**

mbedtls api returned error

### **ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED**

mbedtls api returned error

### **ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED**

mbedtls api returned error

### **ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

mbedtls api returned error

### **ESP\_ERR\_MBEDTLS\_X509\_CRT\_PARSE\_FAILED**

mbedtls api returned error

### **ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED**

mbedtls api returned error

### **ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED**

mbedtls api returned error

**ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_MBEDTLS\_SSL\_TICKET\_SETUP\_FAILED**

mbedtls api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_SET\_HOSTNAME\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_CERT\_VERIFY\_SETUP\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_KEY\_VERIFY\_SETUP\_FAILED**

wolfSSL api returned error

**ESP\_ERR\_WOLFSSL\_SSL\_HANDSHAKE\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_CTX\_SETUP\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_SETUP\_FAILED**

wolfSSL api returned failed

**ESP\_ERR\_WOLFSSL\_SSL\_WRITE\_FAILED**

wolfSSL api returned failed

**ESP\_TLS\_ERR\_SSL\_WANT\_READ**

Definition of errors reported from IO API (potentially non-blocking) in case of error:

- esp\_tls\_conn\_read()
- esp\_tls\_conn\_write()

**ESP\_TLS\_ERR\_SSL\_WANT\_WRITE**

**ESP\_TLS\_ERR\_SSL\_TIMEOUT**

## Type Definitions

typedef struct *esp\_tls\_last\_error* \***esp\_tls\_error\_handle\_t**

typedef struct *esp\_tls\_last\_error* **esp\_tls\_last\_error\_t**

Error structure containing relevant errors in case tls error occurred.

## Enumerations

enum **esp\_tls\_error\_type\_t**

Definition of different types/sources of error codes reported from different components

*Values:*

enumerator **ESP\_TLS\_ERR\_TYPE\_UNKNOWN**

enumerator **ESP\_TLS\_ERR\_TYPE\_SYSTEM**

System error &#8212; errno

enumerator **ESP\_TLS\_ERR\_TYPE\_MBEDTLS**

Error code from mbedTLS library

enumerator **ESP\_TLS\_ERR\_TYPE\_MBEDTLS\_CERT\_FLAGS**

Certificate flags defined in mbedTLS

enumerator **ESP\_TLS\_ERR\_TYPE\_ESP**

ESP-IDF error type &#8212; esp\_err\_t

enumerator **ESP\_TLS\_ERR\_TYPE\_WOLFSSL**

Error code from wolfSSL library

enumerator **ESP\_TLS\_ERR\_TYPE\_WOLFSSL\_CERT\_FLAGS**

Certificate flags defined in wolfSSL

enumerator **ESP\_TLS\_ERR\_TYPE\_MAX**

Last err type &#8212; invalid entry

## 2.2.5 ESP HTTP Client

### Overview

`esp_http_client` component provides a set of APIs for making HTTP/S requests from ESP-IDF applications. The steps to use these APIs are as follows:

- `esp_http_client_init()`: Creates an `esp_http_client_handle_t` instance, i.e., an HTTP client handle based on the given `esp_http_client_config_t` configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.

- `esp_http_client_perform()`: Performs all operations of the `esp_http_client` - opening the connection, exchanging data, and closing the connection (as required), while blocking the current task before its completion. All related events will be invoked through the event handler (as specified in `esp_http_client_config_t`).
- `esp_http_client_cleanup()`: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

### Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests can be found at [protocols/esp\\_http\\_client](#).

### Basic HTTP Request

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

### Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance. Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

### HTTPS Request

ESP HTTP client supports SSL connections using **mbedTLS**, with the `url` configuration starting with `https` scheme or `transport_type` set to `HTTP_TRANSPORT_OVER_SSL`. HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS` (enabled by default).

---

**Note:** While making HTTPS requests, if server verification is needed, an additional root certificate (in PEM format) needs to be provided to the `cert_pem` member in the `esp_http_client_config_t` configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the `crt_bundle_attach` member of the `esp_http_client_config_t` configuration.

---

Check out the example functions `https_with_url` and `https_with_hostname_path` in the application example for implementation details of the above note.

### HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- `esp_http_client_init()`: Create a HTTP client handle.
- `esp_http_client_set_*` or `esp_http_client_delete_*`: Modify the HTTP connection parameters (optional).
- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection.
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`.

- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream.
- `esp_http_client_close()`: Close the connection.
- `esp_http_client_cleanup()`: Release allocated resources.

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

## HTTP Authentication

### ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only one `perform` operation to pass the authentication process.
- If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes two `perform` operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.

### Examples of Authentication Configuration

- Authentication with URI

```
esp_http_client_config_t config = {
    .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- Authentication with username and password entry

```
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

## Event Handling

ESP HTTP Client supports event handling by triggering an event handler corresponding to the event which takes place. `esp_http_client_event_id_t` contains all the events which could occur while performing an HTTP request using the ESP HTTP Client.

To enable event handling, you just need to set a callback function using the `esp_http_client_config_t::event_handler` member.

### ESP HTTP Client Diagnostic Information

Diagnostic information could be helpful to gain insights into a problem. In the case of ESP HTTP Client, the diagnostic information can be collected by registering an event handler with *the Event Loop library*. This feature has been added by keeping in mind the *ESP Insights* framework which collects the diagnostic information. However, this

feature can also be used without any dependency on the ESP Insights framework for the diagnostic purpose. Event handler can be registered to the event loop using the `esp_event_handler_register()` function.

Expected data types for different HTTP Client events in the event loop are as follows:

- `HTTP_EVENT_ERROR`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_CONNECTED`: `esp_http_client_handle_t`
- `HTTP_EVENT_HEADERS_SENT`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_HEADER`: `esp_http_client_handle_t`
- `HTTP_EVENT_ON_DATA`: `esp_http_client_on_data_t`
- `HTTP_EVENT_ON_FINISH`: `esp_http_client_handle_t`
- `HTTP_EVENT_DISCONNECTED`: `esp_http_client_handle_t`
- `HTTP_EVENT_REDIRECT`: `esp_http_client_redirect_event_data_t`

The `esp_http_client_handle_t` received along with the event data will be valid until `HTTP_EVENT_DISCONNECTED` is not received. This handle has been sent primarily to differentiate between different client connections and must not be used for any other purpose, as it may change based on client connection state.

## API Reference

### Header File

- `components/esp_http_client/include/esp_http_client.h`

### Functions

`esp_http_client_handle_t esp_http_client_init` (const `esp_http_client_config_t` \*config)

Start a HTTP session This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

**Parameters** `config` -- [in] The configurations, see `http_client_config_t`

**Returns**

- `esp_http_client_handle_t`
- NULL if any errors

`esp_err_t esp_http_client_perform` (`esp_http_client_handle_t` client)

Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to reuse the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use `esp_http_client_set_*` between the invokes to set options for the following `esp_http_client_perform`.

---

**Note:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open` -> `esp_http_client_write` -> `esp_http_client_fetch_headers` -> `esp_http_client_read` (and option) `esp_http_client_close`.

---

**Parameters** **client** -- The esp\_http\_client handle

**Returns**

- ESP\_OK on successful
- ESP\_FAIL on error

*esp\_err\_t* **esp\_http\_client\_cancel\_request** (*esp\_http\_client\_handle\_t* client)

Cancel an ongoing HTTP request. This API closes the current socket and opens a new socket with the same esp\_http\_client context.

**Parameters** **client** -- The esp\_http\_client handle

**Returns**

- ESP\_OK on successful
- ESP\_FAIL on error
- ESP\_ERR\_INVALID\_ARG
- ESP\_ERR\_INVALID\_STATE

*esp\_err\_t* **esp\_http\_client\_set\_url** (*esp\_http\_client\_handle\_t* client, const char \*url)

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **url** -- [in] The url

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_set\_post\_field** (*esp\_http\_client\_handle\_t* client, const char \*data, int len)

Set post data, this function must be called before esp\_http\_client\_perform. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **data** -- [in] post data pointer
- **len** -- [in] post length

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_http\_client\_get\_post\_field** (*esp\_http\_client\_handle\_t* client, char \*\*data)

Get current post field information.

**Parameters**

- **client** -- [in] The client
- **data** -- [out] Point to post data pointer

**Returns** Size of post data

*esp\_err\_t* **esp\_http\_client\_set\_header** (*esp\_http\_client\_handle\_t* client, const char \*key, const char \*value)

Set http request header, this function must be called after esp\_http\_client\_init and before any perform function.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **key** -- [in] The header key
- **value** -- [in] The header value

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_header** (*esp\_http\_client\_handle\_t* client, const char \*key, char \*\*value)

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp\_http\_client\_init.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **key** -- [in] The header key
- **value** -- [out] The header value

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_username** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **value** -- [out] The username value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_username** (*esp\_http\_client\_handle\_t* client, const char \*username)

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **username** -- [in] The username value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_get\_password** (*esp\_http\_client\_handle\_t* client, char \*\*value)

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **value** -- [out] The password value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_password** (*esp\_http\_client\_handle\_t* client, const char \*password)

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **password** -- [in] The password value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_auth\_type** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_auth\_type\_t* auth\_type)

Set http request auth\_type.

**Parameters**

- **client** -- [in] The esp\_http\_client handle
- **auth\_type** -- [in] The esp\_http\_client auth type

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_get\_user\_data** (*esp\_http\_client\_handle\_t* client, void \*\*data)

Get http request user\_data. The value stored from the *esp\_http\_client\_config\_t* will be written to the address passed into data.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **data** -- **[out]** A pointer to the pointer that will be set to user\_data.

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_user\_data** (*esp\_http\_client\_handle\_t* client, void \*data)

Set http request user\_data. The value passed in +data+ will be available during event callbacks. No memory management will be performed on the user's behalf.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **data** -- **[in]** The pointer to the user data

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

int **esp\_http\_client\_get\_errno** (*esp\_http\_client\_handle\_t* client)

Get HTTP client session errno.

**Parameters** **client** -- **[in]** The esp\_http\_client handle

**Returns**

- (-1) if invalid argument
- errno

*esp\_err\_t* **esp\_http\_client\_set\_method** (*esp\_http\_client\_handle\_t* client, *esp\_http\_client\_method\_t* method)

Set http request method.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **method** -- **[in]** The method

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_set\_timeout\_ms** (*esp\_http\_client\_handle\_t* client, int timeout\_ms)

Set http request timeout.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **timeout\_ms** -- **[in]** The timeout value

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

*esp\_err\_t* **esp\_http\_client\_delete\_header** (*esp\_http\_client\_handle\_t* client, const char \*key)

Delete http request header.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **key** -- **[in]** The key

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_open** (*esp\_http\_client\_handle\_t* client, int write\_len)

This function will be open the connection, write all header strings and return.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **write\_len** -- **[in]** HTTP Content length need to write to the server

**Returns**

- ESP\_OK
- ESP\_FAIL

int **esp\_http\_client\_write** (*esp\_http\_client\_handle\_t* client, const char \*buffer, int len)

This function will write data to the HTTP connection previously opened by esp\_http\_client\_open()

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **buffer** -- The buffer
- **len** -- **[in]** This value must not be larger than the write\_len parameter provided to esp\_http\_client\_open()

**Returns**

- (-1) if any errors
- Length of data written

int64\_t **esp\_http\_client\_fetch\_headers** (*esp\_http\_client\_handle\_t* client)

This function need to call after esp\_http\_client\_open, it will read from http stream, process all receive headers.

**Parameters** **client** -- **[in]** The esp\_http\_client handle

**Returns**

- (0) if stream doesn't contain content-length header, or chunked encoding (checked by esp\_http\_client\_is\_chunked response)
- (-1: ESP\_FAIL) if any errors
- (-ESP\_ERR\_HTTP\_EAGAIN = -0x7007) if call is timed-out before any data was ready
- Download data length defined by content-length header

bool **esp\_http\_client\_is\_chunked\_response** (*esp\_http\_client\_handle\_t* client)

Check response data is chunked.

**Parameters** **client** -- **[in]** The esp\_http\_client handle

**Returns** true or false

int **esp\_http\_client\_read** (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Read data from http stream.

---

**Note:** (-ESP\_ERR\_HTTP\_EAGAIN = -0x7007) is returned when call is timed-out before any data was ready

---

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **buffer** -- The buffer
- **len** -- **[in]** The length

**Returns**

- (-1) if any errors
- Length of data was read

int **esp\_http\_client\_get\_status\_code** (*esp\_http\_client\_handle\_t* client)

Get http response status code, the valid value if this function invoke after esp\_http\_client\_perform

**Parameters** **client** -- **[in]** The esp\_http\_client handle

**Returns** Status code

`int64_t esp_http_client_get_content_length (esp_http_client_handle_t client)`

Get http response content length (from header Content-Length) the valid value if this function invoke after `esp_http_client_perform`

**Parameters** `client` -- [in] The `esp_http_client` handle

**Returns**

- (-1) Chunked transfer
- Content-Length value as bytes

`esp_err_t esp_http_client_close (esp_http_client_handle_t client)`

Close http connection, still kept all http request resources.

**Parameters** `client` -- [in] The `esp_http_client` handle

**Returns**

- ESP\_OK
- ESP\_FAIL

`esp_err_t esp_http_client_cleanup (esp_http_client_handle_t client)`

This function must be the last function to call for an session. It is the opposite of the `esp_http_client_init` function and must be called with the same handle as input that a `esp_http_client_init` call returned. This might close all connections this handle has used and possibly has kept open until now. Don't call this function if you intend to transfer more files, re-using handles is a key to good performance with `esp_http_client`.

**Parameters** `client` -- [in] The `esp_http_client` handle

**Returns**

- ESP\_OK
- ESP\_FAIL

`esp_http_client_transport_t esp_http_client_get_transport_type (esp_http_client_handle_t client)`

Get transport type.

**Parameters** `client` -- [in] The `esp_http_client` handle

**Returns**

- HTTP\_TRANSPORT\_UNKNOWN
- HTTP\_TRANSPORT\_OVER\_TCP
- HTTP\_TRANSPORT\_OVER\_SSL

`esp_err_t esp_http_client_set_redirection (esp_http_client_handle_t client)`

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request. When `disable_auto_redirect` is set, the client will not call this function but the event `HTTP_EVENT_REDIRECT` will be dispatched giving the user control over the redirection event.

**Parameters** `client` -- [in] The `esp_http_client` handle

**Returns**

- ESP\_OK
- ESP\_FAIL

`esp_err_t esp_http_client_reset_redirect_counter (esp_http_client_handle_t client)`

Reset the redirection counter. This is useful to reset redirect counter in cases where the same handle is used for multiple requests.

**Parameters** `client` -- [in] The `esp_http_client` handle

**Returns**

- ESP\_OK
- ESP\_ERR\_INVALID\_ARG

void `esp_http_client_add_auth (esp_http_client_handle_t client)`

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

---

**Note:** There is a possibility of receiving body message with redirection status codes, thus make sure to flush

off body data after calling this API.

---

**Parameters** **client** -- **[in]** The esp\_http\_client handle

bool **esp\_http\_client\_is\_complete\_data\_received** (*esp\_http\_client\_handle\_t* client)

Checks if entire data in the response has been read without any error.

**Parameters** **client** -- **[in]** The esp\_http\_client handle

**Returns**

- true
- false

int **esp\_http\_client\_read\_response** (*esp\_http\_client\_handle\_t* client, char \*buffer, int len)

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **buffer** -- The buffer
- **len** -- **[in]** The buffer length

**Returns**

- Length of data was read

*esp\_err\_t* **esp\_http\_client\_flush\_response** (*esp\_http\_client\_handle\_t* client, int \*len)

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **len** -- Length of data discarded

**Returns**

- ESP\_OK If successful, len will have discarded length
- ESP\_FAIL If failed to read response
- ESP\_ERR\_INVALID\_ARG If the client is NULL

*esp\_err\_t* **esp\_http\_client\_get\_url** (*esp\_http\_client\_handle\_t* client, char \*url, const int len)

Get URL from client.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **url** -- **[inout]** The buffer to store URL
- **len** -- **[in]** The buffer length

**Returns**

- ESP\_OK
- ESP\_FAIL

*esp\_err\_t* **esp\_http\_client\_get\_chunk\_length** (*esp\_http\_client\_handle\_t* client, int \*len)

Get Chunk-Length from client.

**Parameters**

- **client** -- **[in]** The esp\_http\_client handle
- **len** -- **[out]** Variable to store length

**Returns**

- ESP\_OK If successful, len will have length of current chunk
- ESP\_FAIL If the server is not a chunked server
- ESP\_ERR\_INVALID\_ARG If the client or len are NULL

## Structures

struct **esp\_http\_client\_event**

HTTP Client events data.

### Public Members

*esp\_http\_client\_event\_id\_t* **event\_id**

event\_id, to know the cause of the event

*esp\_http\_client\_handle\_t* **client**

esp\_http\_client\_handle\_t context

void \***data**

data of the event

int **data\_len**

data length of data

void \***user\_data**

user\_data context, from *esp\_http\_client\_config\_t* user\_data

char \***header\_key**

For HTTP\_EVENT\_ON\_HEADER event\_id, it's store current http header key

char \***header\_value**

For HTTP\_EVENT\_ON\_HEADER event\_id, it's store current http header value

struct **esp\_http\_client\_on\_data**

Argument structure for HTTP\_EVENT\_ON\_DATA event.

### Public Members

*esp\_http\_client\_handle\_t* **client**

Client handle

int64\_t **data\_process**

Total data processed

struct **esp\_http\_client\_redirect\_event\_data**

Argument structure for HTTP\_EVENT\_REDIRECT event.

### Public Members

*esp\_http\_client\_handle\_t* **client**

Client handle

int **status\_code**

Status Code

struct **esp\_http\_client\_config\_t**

HTTP configuration.

### Public Members

const char \***url**

HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

const char \***host**

Domain or IP as string

int **port**

Port to connect, default depend on esp\_http\_client\_transport\_t (80 or 443)

const char \***username**

Using for Http authentication

const char \***password**

Using for Http authentication

[\*esp\\_http\\_client\\_auth\\_type\\_t\*](#) **auth\_type**

Http authentication type, see esp\_http\_client\_auth\_type\_t

const char \***path**

HTTP Path, if not set, default is /

const char \***query**

HTTP query

const char \***cert\_pem**

SSL server certification, PEM format as string, if the client requires to verify server

size\_t **cert\_len**

Length of the buffer pointed to by cert\_pem. May be 0 for null-terminated pem

const char \***client\_cert\_pem**

SSL client certification, PEM format as string, if the server requires to verify client

size\_t **client\_cert\_len**

Length of the buffer pointed to by client\_cert\_pem. May be 0 for null-terminated pem

const char \***client\_key\_pem**

SSL client key, PEM format as string, if the server requires to verify client

size\_t **client\_key\_len**

Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

const char \***client\_key\_password**

Client key decryption password string

size\_t **client\_key\_password\_len**

String length of the password pointed to by `client_key_password`

*esp\_http\_client\_proto\_ver\_t* **tls\_version**

TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

const char \***user\_agent**

The User Agent string to send with HTTP requests

*esp\_http\_client\_method\_t* **method**

HTTP Method

int **timeout\_ms**

Network timeout in milliseconds

bool **disable\_auto\_redirect**

Disable HTTP automatic redirects

int **max\_redirection\_count**

Max number of redirections on receiving HTTP redirect status code, using default value if zero

int **max\_authorization\_retries**

Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

*http\_event\_handle\_cb* **event\_handler**

HTTP Event Handle

*esp\_http\_client\_transport\_t* **transport\_type**

HTTP transport type, see `esp_http_client_transport_t`

int **buffer\_size**

HTTP receive buffer size

int **buffer\_size\_tx**

HTTP transmit buffer size

void \***user\_data**

HTTP `user_data` context

bool **is\_async**

Set asynchronous mode, only supported with HTTPS for now

bool **use\_global\_ca\_store**

Use a global ca\_store for all the connections in which this bool is set.

bool **skip\_cert\_common\_name\_check**

Skip any validation of server certificate CN field

const char \***common\_name**

Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname.

*esp\_err\_t* (\***crt\_bundle\_attach**)(void \*conf)

Function pointer to esp\_cert\_bundle\_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool **keep\_alive\_enable**

Enable keep-alive timeout

int **keep\_alive\_idle**

Keep-alive idle time. Default is 5 (second)

int **keep\_alive\_interval**

Keep-alive interval time. Default is 5 (second)

int **keep\_alive\_count**

Keep-alive packet retry send count. Default is 3 counts

struct ifreq \***if\_name**

The name of interface for data to go through. Use the default interface without setting

## Macros

**DEFAULT\_HTTP\_BUF\_SIZE**

**ESP\_ERR\_HTTP\_BASE**

Starting number of HTTP error codes

**ESP\_ERR\_HTTP\_MAX\_REDIRECT**

The error exceeds the number of HTTP redirects

**ESP\_ERR\_HTTP\_CONNECT**

Error open the HTTP connection

**ESP\_ERR\_HTTP\_WRITE\_DATA**

Error write HTTP data

**ESP\_ERR\_HTTP\_FETCH\_HEADER**

Error read HTTP header from server

**ESP\_ERR\_HTTP\_INVALID\_TRANSPORT**

There are no transport support for the input scheme

**ESP\_ERR\_HTTP\_CONNECTING**

HTTP connection hasn't been established yet

**ESP\_ERR\_HTTP\_EAGAIN**

Mapping of errno EAGAIN to esp\_err\_t

**ESP\_ERR\_HTTP\_CONNECTION\_CLOSED**

Read FIN from peer and the connection closed

**Type Definitions**

```
typedef struct esp_http_client *esp_http_client_handle_t
```

```
typedef struct esp_http_client_event *esp_http_client_event_handle_t
```

```
typedef struct esp_http_client_event esp_http_client_event_t
```

HTTP Client events data.

```
typedef struct esp_http_client_on_data esp_http_client_on_data_t
```

Argument structure for HTTP\_EVENT\_ON\_DATA event.

```
typedef struct esp_http_client_redirect_event_data esp_http_client_redirect_event_data_t
```

Argument structure for HTTP\_EVENT\_REDIRECT event.

```
typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)
```

**Enumerations**

```
enum esp_http_client_event_id_t
```

HTTP Client events id.

*Values:*

```
enumerator HTTP_EVENT_ERROR
```

This event occurs when there are any errors during execution

```
enumerator HTTP_EVENT_ON_CONNECTED
```

Once the HTTP has been connected to the server, no data exchange has been performed

```
enumerator HTTP_EVENT_HEADERS_SENT
```

After sending all the headers to the server

```
enumerator HTTP_EVENT_HEADER_SENT
```

This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

```
enumerator HTTP_EVENT_ON_HEADER
```

Occurs when receiving each header sent from the server

```
enumerator HTTP_EVENT_ON_DATA
```

Occurs when receiving data from the server, possibly multiple portions of the packet

enumerator **HTTP\_EVENT\_ON\_FINISH**

Occurs when finish a HTTP session

enumerator **HTTP\_EVENT\_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP\_EVENT\_REDIRECT**

Intercepting HTTP redirects to handle them manually

enum **esp\_http\_client\_transport\_t**

HTTP Client transport.

*Values:*

enumerator **HTTP\_TRANSPORT\_UNKNOWN**

Unknown

enumerator **HTTP\_TRANSPORT\_OVER\_TCP**

Transport over tcp

enumerator **HTTP\_TRANSPORT\_OVER\_SSL**

Transport over ssl

enum **esp\_http\_client\_proto\_ver\_t**

*Values:*

enumerator **ESP\_HTTP\_CLIENT\_TLS\_VER\_ANY**

enumerator **ESP\_HTTP\_CLIENT\_TLS\_VER\_TLS\_1\_2**

enumerator **ESP\_HTTP\_CLIENT\_TLS\_VER\_TLS\_1\_3**

enumerator **ESP\_HTTP\_CLIENT\_TLS\_VER\_MAX**

enum **esp\_http\_client\_method\_t**

HTTP method.

*Values:*

enumerator **HTTP\_METHOD\_GET**

HTTP GET Method

enumerator **HTTP\_METHOD\_POST**

HTTP POST Method

enumerator **HTTP\_METHOD\_PUT**

HTTP PUT Method

enumerator **HTTP\_METHOD\_PATCH**

HTTP PATCH Method

enumerator **HTTP\_METHOD\_DELETE**

HTTP DELETE Method

enumerator **HTTP\_METHOD\_HEAD**

HTTP HEAD Method

enumerator **HTTP\_METHOD\_NOTIFY**

HTTP NOTIFY Method

enumerator **HTTP\_METHOD\_SUBSCRIBE**

HTTP SUBSCRIBE Method

enumerator **HTTP\_METHOD\_UNSUBSCRIBE**

HTTP UNSUBSCRIBE Method

enumerator **HTTP\_METHOD\_OPTIONS**

HTTP OPTIONS Method

enumerator **HTTP\_METHOD\_COPY**

HTTP COPY Method

enumerator **HTTP\_METHOD\_MOVE**

HTTP MOVE Method

enumerator **HTTP\_METHOD\_LOCK**

HTTP LOCK Method

enumerator **HTTP\_METHOD\_UNLOCK**

HTTP UNLOCK Method

enumerator **HTTP\_METHOD\_PROPFIND**

HTTP PROPFIND Method

enumerator **HTTP\_METHOD\_PROPPATCH**

HTTP PROPPATCH Method

enumerator **HTTP\_METHOD\_MKCOL**

HTTP MKCOL Method

enumerator **HTTP\_METHOD\_MAX**

enum **esp\_http\_client\_auth\_type\_t**

HTTP Authentication type.

*Values:*

enumerator **HTTP\_AUTH\_TYPE\_NONE**

No authentication

enumerator **HTTP\_AUTH\_TYPE\_BASIC**

HTTP Basic authentication

enumerator **HTTP\_AUTH\_TYPE\_DIGEST**

HTTP Digest authentication

enum **HttpStatus\_Code**

Enum for the HTTP status codes.

*Values:*

enumerator **HttpStatus\_Ok**

enumerator **HttpStatus\_MultipleChoices**

enumerator **HttpStatus\_MovedPermanently**

enumerator **HttpStatus\_Found**

enumerator **HttpStatus\_SeeOther**

enumerator **HttpStatus\_TemporaryRedirect**

enumerator **HttpStatus\_PermanentRedirect**

enumerator **HttpStatus\_BadRequest**

enumerator **HttpStatus\_Unauthorized**

enumerator **HttpStatus\_Forbidden**

enumerator **HttpStatus\_NotFound**

enumerator **HttpStatus\_InternalError**

## 2.2.6 ESP Local Control

### Overview

ESP Local Control (**esp\_local\_ctrl**) component in ESP-IDF provides capability to control an ESP device over HTTPS or BLE. It provides access to application defined **properties** that are available for reading / writing via a set of configurable handlers.

Initialization of the **esp\_local\_ctrl** service over BLE transport is performed as follows:

```
esp_local_ctrl_config_t config = {  
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,  
    .transport_config = {  
        .ble = & (protocomm_ble_config_t) {
```

(continues on next page)

(continued from previous page)

```

        .device_name = SERVICE_NAME,
        .service_uuid = {
            /* LSB <-----
            * -----> MSB */
            0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
            0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
        }
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    },
    .handlers = {
        /* User defined handler functions */
        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

Similarly for HTTPS transport:

```

/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_
↪start");
extern const unsigned char servercert_end[] asm("_binary_servercert_pem_
↪end");
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_
↪start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_
↪end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
    .transport_config = {
        .httpd = &https_conf
    },
    .proto_sec = {
        .version = PROTOCOM_SEC0,
        .custom_handle = NULL,
        .sec_params = NULL,
    },
    .handlers = {
        /* User defined handler functions */

```

(continues on next page)

(continued from previous page)

```

        .get_prop_values = get_property_values,
        .set_prop_values = set_property_values,
        .usr_ctx         = NULL,
        .usr_ctx_free_fn = NULL
    },
    /* Maximum number of properties that may be set */
    .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

```

You may set security for transport in ESP local control using following options:

1. *PROTOCOLCOM\_SEC2*: specifies that SRP6a based key exchange and end to end encryption based on AES-GCM is used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol i.e. SRP6a.
2. *PROTOCOLCOM\_SEC1*: specifies that Curve25519 based key exchange and end to end encryption based on AES-CTR is used.
3. *PROTOCOLCOM\_SEC0*: specifies that data will be exchanged as a plain text (no security).
4. *PROTOCOLCOM\_SEC\_CUSTOM*: you can define your own security requirement. Please note that you will also have to provide *custom\_handle* of type *protocomm\_security\_t* \* in this context.

---

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocol security version section in *Protocol Communication* for more details.

---

### Creating a property

Now that we know how to start the **esp\_local\_ctrl** service, let's add a property to it. Each property must have a unique *name* (string), a *type* (e.g. enum), *flags* (bit fields) and *size*.

The *size* is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the *size* field to the right value, helps **esp\_local\_ctrl** to perform internal checks on arguments received with write requests.

The interpretation of *type* and *flags* fields is totally upto the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use *type* values to classify properties, while *flags* to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines *TYPE\_TIMESTAMP* and *READONLY*, which are used for setting the *type* and *flags* fields here.

```

/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name         = "timestamp",
    .type         = TYPE_TIMESTAMP,
    .size         = sizeof(int32_t),
    .flags        = READONLY,
    .ctx          = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);

```

Also notice that there is a *ctx* field, which is set to point to some custom *func\_get\_time()*. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of *get\_prop\_values()* handler, which is used for retrieving the timestamp.

```

static esp_err_t get_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     esp_local_ctrl_prop_val_t *prop_
→values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;

            /* Use static variable for saving the value.
             * This is essential because the value has to be
             * valid even after this function returns.
             * Alternative is to use dynamic allocation
             * and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}

```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```

static esp_err_t set_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     const esp_local_ctrl_prop_val_t
→*prop_values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s",
→props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);

            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                     prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}

```

For complete example see [protocols/esp\\_local\\_ctrl](#)

### Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:

1. `get_prop_count` : This should simply return the total number of properties supported by the service
2. `get_prop_values` : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices

3. *set\_prop\_values* : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call *get\_prop\_count* and then *get\_prop\_values*, hence form an index to name mapping for all properties. Now when calling *set\_prop\_values* for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by **esp\_local\_ctrl** are listed below:

Table 1: Endpoints provided by ESP Local Control

Endpoint Name (BLE + GATT Server)	URI (HTTPS + mDNS)	Description
<code>esp_local_ctrl_version</code>	<code>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</code>	Endpoint used for retrieving version string
<code>esp_local_ctrl_ctrl</code>	<code>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</code>	Endpoint used for sending / receiving control messages

## API Reference

### Header File

- [components/esp\\_local\\_ctrl/include/esp\\_local\\_ctrl.h](#)

### Functions

`const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble` (void)

Function for obtaining BLE transport mode.

`const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd` (void)

Function for obtaining HTTPD transport mode.

`esp_err_t esp_local_ctrl_start` (const `esp_local_ctrl_config_t` \*config)

Start local control service.

**Parameters** `config` -- [in] Pointer to configuration structure

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

`esp_err_t esp_local_ctrl_stop` (void)

Stop local control service.

`esp_err_t esp_local_ctrl_add_property` (const `esp_local_ctrl_prop_t` \*prop)

Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

**Parameters** `prop` -- [in] Property description structure

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

*esp\_err\_t* **esp\_local\_ctrl\_remove\_property** (const char \*name)

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

**Parameters** **name** -- [in] Name of the property to remove

**Returns**

- ESP\_OK : Success
- ESP\_ERR\_NOT\_FOUND : Failure

const *esp\_local\_ctrl\_prop\_t* \***esp\_local\_ctrl\_get\_property** (const char \*name)

Get property description structure by name.

This API may be used to get a property's context structure *esp\_local\_ctrl\_prop\_t* when its name is known

**Parameters** **name** -- [in] Name of the property to find

**Returns**

- Pointer to property
- NULL if not found

*esp\_err\_t* **esp\_local\_ctrl\_set\_handler** (const char \*ep\_name, *protocomm\_req\_handler\_t* handler, void \*user\_ctx)

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

---

**Note:** In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the *protocomm\_ble\_config\_t* structure set in *esp\_local\_ctrl\_config\_t*, and passed to *esp\_local\_ctrl\_start()*.

---

**Parameters**

- **ep\_name** -- [in] Name of the endpoint
- **handler** -- [in] Endpoint handler function
- **user\_ctx** -- [in] User data

**Returns**

- ESP\_OK : Success
- ESP\_FAIL : Failure

## Unions

union **esp\_local\_ctrl\_transport\_config\_t**

*#include <esp\_local\_ctrl.h>* Transport mode (BLE / HTTPD) configuration.

### Public Members

*esp\_local\_ctrl\_transport\_config\_ble\_t* \***ble**

This is same as *protocomm\_ble\_config\_t*. See *protocomm\_ble.h* for available configuration parameters.

*esp\_local\_ctrl\_transport\_config\_httpd\_t* \***httpd**

This is same as *httpd\_ssl\_config\_t*. See *esp\_https\_server.h* for available configuration parameters.

## Structures

### struct **esp\_local\_ctrl\_prop**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

#### Public Members

char \***name**

Unique name of property

uint32\_t **type**

Type of property. This may be set to application defined enums

size\_t **size**

Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

uint32\_t **flags**

Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void \***ctx**

Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values` and `set_prop_values` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

void (\***ctx\_free\_fn**)(void \*ctx)

Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

### struct **esp\_local\_ctrl\_prop\_val**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

#### Public Members

void \***data**

Pointer to memory holding property value

size\_t **size**

Size of property value

```
void (*free_fn)(void *data)
```

This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

```
struct esp_local_ctrl_handlers
```

Handlers for receiving and responding to local control commands for getting and setting properties.

### Public Members

```
esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[],  
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
```

Handler function to be implemented for retrieving current values of properties.

---

**Note:** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set

---

**Param props\_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the current values for which have been requested by the client

**Param prop\_values [out]** Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

**Param usr\_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

```
esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const  
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
```

Handler function to be implemented for changing values of properties.

---

**Note:** If any of the properties have variable sizes, the size field of the corresponding element in `prop_values` must be checked explicitly before making any assumptions on the size.

---

**Param props\_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the values for which the client requests to change

**Param prop\_values [in]** Array of property values, the elements of which need to be used for updating those properties specified by props argument

**Param usr\_ctx [in]** This provides value of the `usr_ctx` field of `esp_local_ctrl_handlers_t` structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client :

- ESP\_OK : Success
- ESP\_ERR\_INVALID\_ARG : InvalidArgument
- ESP\_ERR\_INVALID\_STATE : InvalidProto
- All other error codes : InternalError

void **\*usr\_ctx**

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the `esp_local_ctrl` service, and freed only when the service is stopped.

void (**\*usr\_ctx\_free\_fn**)(void \*usr\_ctx)

Pointer to function which will be internally invoked on `usr_ctx` for freeing the context resources when `esp_local_ctrl_stop()` is called.

struct **esp\_local\_ctrl\_proto\_sec\_cfg**

Protocom security configs

### Public Members

*esp\_local\_ctrl\_proto\_sec\_t* **version**

This sets protocom security version, `sec0/sec1` or `custom`. If `custom`, user must provide handle via `proto_sec_custom_handle` below

void **\*custom\_handle**

Custom security handle if security is set `custom` via `proto_sec` above. This handle must follow `protocomm_security_t` signature

const void **\*pop**

Proof of possession to be used for local control. Could be `NULL`.

const void **\*sec\_params**

Pointer to security params (`NULL` if not needed). This is not needed for `protocomm` security 0. This pointer should hold the struct of type `esp_local_ctrl_security1_params_t` for `protocomm` security 1 and `esp_local_ctrl_security2_params_t` for `protocomm` security 2 respectively. Could be `NULL`.

struct **esp\_local\_ctrl\_config**

Configuration structure to pass to `esp_local_ctrl_start()`

### Public Members

const *esp\_local\_ctrl\_transport\_t* **\*transport**

Transport layer over which service will be provided

*esp\_local\_ctrl\_transport\_config\_t* **transport\_config**

Transport layer over which service will be provided

*esp\_local\_ctrl\_proto\_sec\_cfg\_t* **proto\_sec**

Security version and POP

*esp\_local\_ctrl\_handlers\_t* **handlers**

Register handlers for responding to get/set requests on properties

size\_t **max\_properties**

This limits the number of properties that are available at a time

## Macros

**ESP\_LOCAL\_CTRL\_TRANSPORT\_BLE**

**ESP\_LOCAL\_CTRL\_TRANSPORT\_HTTPD**

## Type Definitions

typedef struct *esp\_local\_ctrl\_prop* **esp\_local\_ctrl\_prop\_t**

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

typedef struct *esp\_local\_ctrl\_prop\_val* **esp\_local\_ctrl\_prop\_val\_t**

Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

typedef struct *esp\_local\_ctrl\_handlers* **esp\_local\_ctrl\_handlers\_t**

Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct *esp\_local\_ctrl\_transport* **esp\_local\_ctrl\_transport\_t**

Transport mode (BLE / HTTPD) over which the service will be provided.

This is forward declaration of a private structure, implemented internally by `esp_local_ctrl`.

typedef struct *protocomm\_ble\_config* **esp\_local\_ctrl\_transport\_config\_ble\_t**

Configuration for transport mode BLE.

This is a forward declaration for `protocomm_ble_config_t`. To use this, application must set `CONFIG_BT_BLUEDROID_ENABLED` and include `protocomm_ble.h`.

typedef struct *httpd\_config* **esp\_local\_ctrl\_transport\_config\_httpd\_t**

Configuration for transport mode HTTPD.

This is a forward declaration for `httpd_ssl_config_t` (for HTTPS) or `httpd_config_t` (for HTTP)

typedef enum *esp\_local\_ctrl\_proto\_sec* **esp\_local\_ctrl\_proto\_sec\_t**

Security types for `esp_local_control`.

typedef *protocomm\_security1\_params\_t* **esp\_local\_ctrl\_security1\_params\_t**

typedef *protocomm\_security2\_params\_t* **esp\_local\_ctrl\_security2\_params\_t**

typedef struct *esp\_local\_ctrl\_proto\_sec\_cfg* **esp\_local\_ctrl\_proto\_sec\_cfg\_t**

Protocom security configs

typedef struct *esp\_local\_ctrl\_config* **esp\_local\_ctrl\_config\_t**

Configuration structure to pass to `esp_local_ctrl_start()`

## Enumerations

enum **esp\_local\_ctrl\_proto\_sec**

Security types for esp\_local\_control.

*Values:*

enumerator **PROTOCOLCOM\_SEC0**

enumerator **PROTOCOLCOM\_SEC1**

enumerator **PROTOCOLCOM\_SEC2**

enumerator **PROTOCOLCOM\_SEC\_CUSTOM**

## 2.2.7 ESP Serial Slave Link

### Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The *esp\_serial\_slave\_link* component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an *esp\_serial\_slave\_link* device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

### Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

### ESP SPI Slave HD (Half Duplex) Mode Protocol

#### SPI Slave Capabilities of Espressif chips

	ESP32	ESP32-S2	ESP32-C3	ESP32-S3	ESP32-C2	ESP32-C6	ESP32-H2
SPI Slave HD	N	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)	Y (v2)
Tohost intr		N	N	N	N	N	N
Frhost intr		2 *	2 *	2 *	2 *	2 *	2 *
TX DMA		Y	Y	Y	Y	Y	Y
RX DMA		Y	Y	Y	Y	Y	Y
Shared registers		72	64	64	64	64	64

**Introduction** In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- Command: 8-bit, master to slave  
This phase determines the rest phases of the transactions. See *Supported Commands*.
- Address: 8-bit, master to slave, optional  
For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.
- Dummy: 8-bit, floating, optional

This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.

- **Data:** variable length, the direction is also determined by the command.  
This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The *direction* means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

**Data IO Modes** In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.

Mode	command WN	address WN	dummy cycles	data WN
1-bit	1	1	1	1
DOUT	1	1	4	2
DIO	1	2	4	2
QOUT	1	1	4	4
QIO	1	4	4	4
QPI	4	4	4	4

Normally, which mode is used is determined by the command sent by the master (See [Supported Commands](#)), except the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it's not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

### Supported Commands

---

**Note:** The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

---

Name	Description	Command	Address	Data
WRBUF	Write buffer	0x01	Buf addr	master to slave, no longer than buffer size
RDBUF	Read buffer	0x02	Buf addr	slave to master, no longer than buffer size
WRDMA	Write DMA	0x03	8 bits	master to slave, no longer than length provided by slave
RDDMA	Read DMA	0x04	8 bits	slave to master, no longer than length provided by slave
SEG_DONE	Segments done	0x05	.	.
ENQPI	Enter QPI mode	0x06	.	.
WR_DONE	Write segments done	0x07	.	.
CMD8	Interrupt	0x08	.	.
CMD9	Interrupt	0x09	.	.
CMDA	Interrupt	0x0A	.	.
EXQPI	Exit QPI mode	0xDD	.	.

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

Mode	Mask
1-bit	0x00
DOUT	0x10
DIO	0x50
QOUT	0x20
QIO	0xA0
QPI	0xA0

**Segment Transaction Mode** Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn't have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR\_DONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here's an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave

3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

### Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the *esp\_serial\_slave\_link* component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.  
The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

### Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.  
The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.  
The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave's model. See *SPI Slave Capabilities of Espressif chips* for more details.

### Initialization of ESP Serial Slave Link

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the *sdmmc* component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a *sdmmc* card (see `:doc:` Document of SDMMC driver </api-reference/storage/sdmmc>``) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.

4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

### ESP SPI Slave

**Note:** If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

---

Hasn't been supported yet.

### APIs

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

#### Tohost Interrupts (optional)

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

#### Frhost Interrupts

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

#### TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

#### RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_dat_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset counters (Optional)** Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

### Application Example

The example below shows how ESP32-C2 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

[peripherals/sdio](#).

Please refer to the specific example README.md for details.

## API Reference

### Header File

- `components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h`

### Functions

`esp_err_t` **essl\_init** (*essl\_handle\_t* handle, uint32\_t wait\_ms)

Initialize the slave.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: If success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

`esp_err_t` **essl\_wait\_for\_ready** (*essl\_handle\_t* handle, uint32\_t wait\_ms)

Wait for interrupt of an ESSL slave device.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: If success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_get\_tx\_buffer\_num** (*essl\_handle\_t* handle, uint32\_t \*out\_tx\_num, uint32\_t wait\_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

#### Parameters

- **handle** -- Handle of a ESSL device.
- **out\_tx\_num** -- Output of buffer num that host can send data to ESSL slave.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl\_get\_rx\_data\_size** (*essl\_handle\_t* handle, uint32\_t \*out\_rx\_size, uint32\_t wait\_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send

#### Parameters

- **handle** -- Handle of an ESSL device.
- **out\_rx\_size** -- Output of data size to read from slave, in bytes
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl\_reset\_cnt** (*essl\_handle\_t* handle)

Reset the counters of this component. Usually you don't need to do this unless you know the slave is reset.

**Parameters** **handle** -- Handle of an ESSL device.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: This API is not supported in this mode
- ESP\_ERR\_INVALID\_ARG: Invalid argument, handle is not init.

*esp\_err\_t* **essl\_send\_packet** (*essl\_handle\_t* handle, const void \*start, size\_t length, uint32\_t wait\_ms)

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

#### Parameters

- **handle** -- Handle of an ESSL device.
- **start** -- Start address of the packet to send
- **length** -- Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG`: Invalid argument, handle is not init or other argument is not valid.
- `ESP_ERR_TIMEOUT`: No buffer to use, or error from SDMMC host controller.
- `ESP_ERR_NOT_FOUND`: Slave is not ready for receiving.
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_get\_packet** (*essl\_handle\_t* handle, void \*out\_data, size\_t size, size\_t \*out\_length, uint32\_t wait\_ms)

Get a packet from ESSL slave.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **out\_data** -- [out] Data output address
- **size** -- The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns `ESP_ERR_NOT_FINISHED`
- **out\_length** -- [out] Output of length the data actually received from slave.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK` Success: All the data has been read from the slave.
- `ESP_ERR_INVALID_ARG`: Invalid argument, The handle is not initialized or the other arguments are invalid.
- `ESP_ERR_NOT_FINISHED`: Read was successful, but there is still data remaining.
- `ESP_ERR_NOT_FOUND`: Slave is not ready to send data.
- `ESP_ERR_NOT_SUPPORTED`: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

*esp\_err\_t* **essl\_write\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t value, uint8\_t \*value\_o, uint32\_t wait\_ms)

Write general purpose R/W registers (8-bit) of ESSL slave.

---

**Note:** sdio 28-31 are reserved, the lower API helps to skip.

---

#### Parameters

- **handle** -- Handle of an ESSL device.
- **addr** -- Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- **value** -- Value to write to the register.
- **value\_o** -- Output of the returned written value.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- `ESP_OK` Success
- One of the error codes from SDMMC/SPI host controller

*esp\_err\_t* **essl\_read\_reg** (*essl\_handle\_t* handle, uint8\_t addr, uint8\_t \*value\_o, uint32\_t wait\_ms)

Read general purpose R/W registers (8-bit) of ESSL slave.

**Parameters**

- **handle** -- Handle of a `essl` device.
- **add** -- Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- **value\_o** -- Output value read from the register.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- `ESP_OK` Success
- One of the error codes from SDMMC/SPI host controller

`esp_err_t` **essl\_wait\_int** (`essl_handle_t` handle, `uint32_t` wait\_ms)

wait for an interrupt of the slave

**Parameters**

- **handle** -- Handle of an ESSL device.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- `ESP_OK`: If interrupt is triggered.
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- `ESP_ERR_TIMEOUT`: No interrupts before timeout.

`esp_err_t` **essl\_clear\_intr** (`essl_handle_t` handle, `uint32_t` intr\_mask, `uint32_t` wait\_ms)

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

**Parameters**

- **handle** -- Handle of an ESSL device.
- **intr\_mask** -- Mask of interrupt bits to clear.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_get\_intr** (`essl_handle_t` handle, `uint32_t` \*intr\_raw, `uint32_t` \*intr\_st, `uint32_t` wait\_ms)

Get interrupt bits of ESSL slave.

**Parameters**

- **handle** -- Handle of an ESSL device.
- **intr\_raw** -- Output of the raw interrupt bits. Set to `NULL` if only masked bits are read.
- **intr\_st** -- Output of the masked interrupt bits. set to `NULL` if only raw bits are read.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- `ESP_OK`: Success
- `ESP_INVALID_ARG`: If both `intr_raw` and `intr_st` are `NULL`.
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

`esp_err_t` **essl\_set\_intr\_ena** (`essl_handle_t` handle, `uint32_t` ena\_mask, `uint32_t` wait\_ms)

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Parameters**

- **handle** -- Handle of an ESSL device.
- **ena\_mask** -- Mask of the interrupt bits to enable.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- `ESP_OK`: Success
- `ESP_ERR_NOT_SUPPORTED`: Current device does not support this function.
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_get\_intr\_ena** (*essl\_handle\_t* handle, uint32\_t \*ena\_mask\_o, uint32\_t wait\_ms)

Get interrupt enable bits of ESSL slave.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **ena\_mask\_o** -- Output of interrupt bit enable mask.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK Success
- One of the error codes from SDMMC host controller

*esp\_err\_t* **essl\_send\_slave\_intr** (*essl\_handle\_t* handle, uint32\_t intr\_mask, uint32\_t wait\_ms)

Send interrupts to slave. Each bit of the interrupt will be triggered.

#### Parameters

- **handle** -- Handle of an ESSL device.
- **intr\_mask** -- Mask of interrupt bits to send to slave.
- **wait\_ms** -- Millisecond to wait before timeout, will not wait at all if set to 0-9.

#### Returns

- ESP\_OK: Success
- ESP\_ERR\_NOT\_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

## Type Definitions

```
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

## Header File

- [components/driver/test\\_apps/components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl\\_sdio.h](#)

## Functions

*esp\_err\_t* **essl\_sdio\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_sdio\_config\_t* \*config)

Initialize the ESSL SDIO device and get its handle.

#### Parameters

- **out\_handle** -- Output of the handle.
- **config** -- Configuration for the ESSL SDIO device.

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_NO\_MEM: memory exhausted.

*esp\_err\_t* **essl\_sdio\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize and free the space used by the ESSL SDIO device.

**Parameters** **handle** -- Handle of the ESSL SDIO device to deinit.

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: wrong handle passed

## Structures

```
struct essl_sdio_config_t
```

Configuration for the ESSL SDIO device.

## Public Members

*sdmmc\_card\_t* \***card**

The initialized sdmmc card pointer of the slave.

int **recv\_buffer\_size**

The pre-negotiated recv buffer size used by both the host and the slave.

## Header File

- [components/driver/test\\_apps/components/esp\\_serial\\_slave\\_link/include/esp\\_serial\\_slave\\_link/essl\\_spi.h](#)

## Functions

*esp\_err\_t* **essl\_spi\_init\_dev** (*essl\_handle\_t* \*out\_handle, const *essl\_spi\_config\_t* \*init\_config)

Initialize the ESSL SPI device function list and get its handle.

### Parameters

- **out\_handle** -- [out] Output of the handle
- **init\_config** -- Configuration for the ESSL SPI device

### Returns

- ESP\_OK: On success
- ESP\_ERR\_NO\_MEM: Memory exhausted
- ESP\_ERR\_INVALID\_STATE: SPI driver is not initialized
- ESP\_ERR\_INVALID\_ARG: Wrong register ID

*esp\_err\_t* **essl\_spi\_deinit\_dev** (*essl\_handle\_t* handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

**Parameters** **handle** -- Handle of the ESSL SPI device

### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI is not in use

*esp\_err\_t* **essl\_spi\_read\_reg** (void \*arg, uint8\_t addr, uint8\_t \*out\_value, uint32\_t wait\_ms)

Read from the shared registers.

---

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `rx_sync_reg` in `essl_spi_config_t`)

---

### Parameters

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** -- Address of the shared registers. (Valid: 0 ~ SOC\_SPI\_MAXIMUM\_BUFFER\_SIZE, registers for M/S sync are reserved, see note1).
- **out\_value** -- [out] Read buffer for the shared registers.
- **wait\_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

### Returns

- ESP\_OK: success
- ESP\_ERR\_INVALID\_STATE: ESSL SPI has not been initialized.
- ESP\_ERR\_INVALID\_ARG: The address argument is not valid. See note 1.
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_get\_packet** (void \*arg, void \*out\_data, size\_t size, uint32\_t wait\_ms)

Get a packet from Slave.

**Parameters**

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **out\_data** -- **[out]** Output data address
- **size** -- The size of the output data.
- **wait\_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: On Success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The output data address is neither DMA capable nor 4 byte-aligned
- `ESP_ERR_INVALID_SIZE`: Master requires `size` bytes of data but Slave did not load enough bytes.

`esp_err_t` **essl\_spi\_write\_reg** (void \*arg, uint8\_t addr, uint8\_t value, uint8\_t \*out\_value, uint32\_t wait\_ms)

Write to the shared registers.

---

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

---

---

**Note:** Feature of checking the actual written value (`out_value`) is not supported.

---

**Parameters**

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **addr** -- Address of the shared registers. (Valid: 0 ~ `SOC_SPI_MAXIMUM_BUFFER_SIZE`, registers for M/S sync are reserved, see note1)
- **value** -- Buffer for data to send, should be align to 4.
- **out\_value** -- **[out]** Not supported, should be set to `NULL`.
- **wait\_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The address argument is not valid. See note 1.
- `ESP_ERR_NOT_SUPPORTED`: Should set `out_value` to `NULL`. See note 2.
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` **essl\_spi\_send\_packet** (void \*arg, const void \*data, size\_t size, uint32\_t wait\_ms)

Send a packet to Slave.

**Parameters**

- **arg** -- Context of the component. (Member `arg` from `essl_handle_t`)
- **data** -- Address of the data to send
- **size** -- Size of the data to send.
- **wait\_ms** -- Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**

- `ESP_OK`: On success
- `ESP_ERR_INVALID_STATE`: ESSL SPI has not been initialized.
- `ESP_ERR_INVALID_ARG`: The data address is not DMA capable
- `ESP_ERR_INVALID_SIZE`: Master will send `size` bytes of data but Slave did not load enough RX buffer

void **essl\_spi\_reset\_cnt** (void \*arg)

Reset the counter in Master context.

---

**Note:** Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

---

**Parameters** **arg** -- Context of the component. (Member **arg** from **essl\_handle\_t**)

*esp\_err\_t* **essl\_spi\_rdbuf** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in ISR way.

---

**Note:** The slave's HW doesn't guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

---

---

**Note:** **out\_data** should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the **len** is shorter than a word.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **out\_data** -- [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** -- Address of the slave shared buffer
- **len** -- Length to read
- **flags** -- SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: on success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_rdbuf\_polling** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int addr, int len, uint32\_t flags)

Read the shared buffer from the slave in polling way.

---

**Note:** **out\_data** should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the **len** is shorter than a word.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **out\_data** -- [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr** -- Address of the slave shared buffer
- **len** -- Length to read
- **flags** -- SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

#### Returns

- ESP\_OK: on success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_wrbuf** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in ISR way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **addr** -- Address of the slave shared buffer,
- **len** -- Length to write
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

`esp_err_t` `essl_spi_wrbuf_polling` (`spi_device_handle_t` spi, const uint8\_t \*data, int addr, int len, uint32\_t flags)

Write the shared buffer of the slave in polling way.

---

**Note:** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the `len` is shorter than a word.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **addr** -- Address of the slave shared buffer,
- **len** -- Length to write
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_polling_transmit`.

`esp_err_t` `essl_spi_rddma` (`spi_device_handle_t` spi, uint8\_t \*out\_data, int len, int seg\_len, uint32\_t flags)

Receive long buffer in segments from the slave through its DMA.

---

**Note:** This function combines several `:cpp:func:essl_spi_rddma_seg` and one `:cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **out\_data** -- [out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** -- Total length of data to receive.
- **seg\_len** -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `rddma_done` will still be sent.)
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_rddma\_seg** (*spi\_device\_handle\_t* spi, uint8\_t \*out\_data, int seg\_len, uint32\_t flags)

Read one data segment from the slave through its DMA.

---

**Note:** To read long buffer, call `:cpp:func:essl_spi_rddma` instead.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **out\_data** -- [out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- **seg\_len** -- Length of this segment
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_rddma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the `rddma_done` command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

---

**Note:** This is required only when the slave is working in segment mode.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrdma** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int len, int seg\_len, uint32\_t flags)

Send long buffer in segments to the slave through its DMA.

---

**Note:** This function combines several `:cpp:func:essl_spi_wrdma_seg` and one `:cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

---

#### Parameters

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **len** -- Total length of data to send.
- **seg\_len** -- Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `wrdma_done` will still be sent.)
- **flags** -- `SPI_TRANS_*` flags to control the transaction mode of the transaction to send.

#### Returns

- `ESP_OK`: success
- or other return value from `:cpp:func:spi_device_transmit`.

*esp\_err\_t* **essl\_spi\_wrdma\_seg** (*spi\_device\_handle\_t* spi, const uint8\_t \*data, int seg\_len, uint32\_t flags)

Send one data segment to the slave through its DMA.

---

**Note:** To send long buffer, call `:cpp:func:essl_spi_wrdma` instead.

---

**Parameters**

- **spi** -- SPI device handle representing the slave
- **data** -- Buffer for data to send, strongly suggested to be in the DRAM
- **seg\_len** -- Length of this segment
- **flags** -- SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

*esp\_err\_t* **essl\_spi\_wrdma\_done** (*spi\_device\_handle\_t* spi, uint32\_t flags)

Send the wrdma\_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

---

**Note:** This is required only when the slave is working in segment mode.

---

**Parameters**

- **spi** -- SPI device handle representing the slave
- **flags** -- SPI\_TRANS\_\* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP\_OK: success
- or other return value from :cpp:func:spi\_device\_transmit.

**Structures**

struct **essl\_spi\_config\_t**

Configuration of ESSL SPI device.

**Public Members**

*spi\_device\_handle\_t* \***spi**

Pointer to SPI device handle.

uint32\_t **tx\_buf\_size**

The pre-negotiated Master TX buffer size used by both the host and the slave.

uint8\_t **tx\_sync\_reg**

The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8\_t **rx\_sync\_reg**

The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

## 2.2.8 ESP x509 Certificate Bundle

**Overview**

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

---

**Note:** The bundle is currently not available when using WolfSSL.

---

The bundle comes with the complete list of root certificates from Mozilla's NSS root certificate store. Using the `gen_cert_bundle.py` python utility the certificates' subject name and public key are stored in a file and embedded in the ESP32-C2 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Jan 10 04:12:06 2023 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 41 while still having around 90% absolute usage coverage and 99% market share coverage according to SSL certificate authorities statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

---

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from `cacrt_all.pem`.

---

## Configuration

Most configuration is done through `menuconfig`. CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```
esp_tls_cfg_t cfg = {
    .cert_bundle_attach = esp_cert_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);

esp_cert_bundle_attach(&conf);
```

## Generating the List of Root Certificates

The list of root certificates comes from Mozilla's NSS root certificate store, which can be found [here](#). The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of `curl`. Another alternative would be to download the finished list directly from the curl website: [CA certificates extracted from Mozilla](#)

The common certificates bundle were made by selecting the authorities with a market share of more than 1 % from w3tech's [SSL Survey](#). These authorities were then used to pick the names of the certificates for the filter list, `cmn_cert_authorities.csv`, from [this list](#) provided by Mozilla.

## Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in [Generating the List of Root Certificates](#).

## Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: [protocols/https\\_x509\\_bundle](#).

HTTPS example that uses ESP-TLS and the default bundle: [protocols/https\\_request](#).

HTTPS example that uses mbedTLS and the default bundle: [protocols/https\\_mbedtls](#).

## API Reference

### Header File

- [components/mbedtls/esp\\_cert\\_bundle/include/esp\\_cert\\_bundle.h](#)

### Functions

*esp\_err\_t* **esp\_cert\_bundle\_attach** (void \*conf)

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_cert_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

**Parameters** **conf** -- **[in]** The config struct for the SSL connection.

**Returns**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

void **esp\_cert\_bundle\_detach** (mbedtls\_ssl\_config \*conf)

Disable and deallocate the certification bundle.

Removes the certificate verification callback and deallocates used resources

**Parameters** **conf** -- **[in]** The config struct for the SSL connection.

*esp\_err\_t* **esp\_cert\_bundle\_set** (const uint8\_t \*x509\_bundle, size\_t bundle\_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

**Parameters**

- **x509\_bundle** -- **[in]** A pointer to the certificate bundle.
- **bundle\_size** -- **[in]** Size of the certificate bundle in bytes.

**Returns**

- ESP\_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

## 2.2.9 HTTP Server

## Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-C2. Following are detailed steps to use the API exposed by HTTP Server:

- `httpd_start()`: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing `httpd_config_t` structure to `httpd_start()`. TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.
- `httpd_stop()`: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.
- `httpd_register_uri_handler()`: A URI handler is registered by passing object of type `httpd_uri_t` structure which has members including `uri name`, `method type` (eg. `HTTPD_GET/HTTPD_POST/HTTPD_PUT` etc.), `function pointer of type esp_err_t *handler (httpd_req_t *req)` and `user_ctx` pointer to user context data.

## Application Example

```

/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
     * httpd_req_rcv() accepts char* only, but content could
     * as well be any binary data (needs type casting).
     * In case of string data, null termination will be absent, and
     * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t rcv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_rcv(req, content, rcv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling
             * httpd_req_rcv(), but to keep it simple, here we
             * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will
         * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }

    /* Send a simple response */

```

(continues on next page)

(continued from previous page)

```
const char resp[] = "URI POST Response";
httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri      = "/uri",
    .method   = HTTP_GET,
    .handler  = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri      = "/uri",
    .method   = HTTP_POST,
    .handler  = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}
```

**Simple HTTP Server Example** Check HTTP server example under [protocols/http\\_server/simple](#) where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

### Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

## Persistent Connections Example

```

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*!< Pointer to context_
↳data */
        req->free_ctx = free_ctx_func; /*!< Function to free_
↳context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *) req->sess_ctx;

    /* Respond */
    .....
    .....
    .....

    return ESP_OK;
}

```

Check the example under [protocols/http\\_server/persistent\\_sockets](#).

## WebSocket Server

The HTTP server component provides websocket support. The websocket feature can be enabled in menuconfig using the `CONFIG_HTTPD_WS_SUPPORT` option. Please refer to the [protocols/http\\_server/ws\\_echo\\_server](#) example which demonstrates usage of the websocket feature.

## Event Handling

ESP HTTP server has various events for which a handler can be triggered by *the Event Loop library* when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps in event handling for ESP HTTP server.

`esp_http_server_event_id_t` has all the events which can happen for ESP HTTP server.

Expected data type for different ESP HTTP server events in event loop:

- `HTTP_SERVER_EVENT_ERROR`: `httpd_err_code_t`
- `HTTP_SERVER_EVENT_START`: `NULL`
- `HTTP_SERVER_EVENT_ON_CONNECTED`: `int`
- `HTTP_SERVER_EVENT_ON_HEADER`: `int`
- `HTTP_SERVER_EVENT_HEADERS_SENT`: `int`
- `HTTP_SERVER_EVENT_ON_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_SENT_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_DISCONNECTED`: `int`
- `HTTP_SERVER_EVENT_STOP`: `NULL`

## API Reference

### Header File

- `components/esp_http_server/include/esp_http_server.h`

### Functions

`esp_err_t httpd_register_uri_handler` (`httpd_handle_t` handle, const `httpd_uri_t` \*uri\_handler)

Registers a URI handler.

Example usage:

```
esp_err_t my_uri_handler(httpd_req_t* req)
{
    // Recv , Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}

// URI handler structure
httpd_uri_t my_uri {
    .uri      = "/my_uri/path/xyz",
    .method   = HTTPD_GET,
    .handler  = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

---

**Note:** URI handlers can be registered in real time as long as the server handle is valid.

---

#### Parameters

- **handle** -- **[in]** handle to HTTPD server instance
- **uri\_handler** -- **[in]** pointer to handler that needs to be registered

#### Returns

- `ESP_OK` : On successfully registering the handler
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_HANDLERS_FULL` : If no slots left for new handler
- `ESP_ERR_HTTPD_HANDLER_EXISTS` : If handler with same URI and method is already registered

`esp_err_t httpd_unregister_uri_handler` (`httpd_handle_t` handle, const char \*uri, `httpd_method_t` method)

Unregister a URI handler.

**Parameters**

- **handle** -- **[in]** handle to HTTPD server instance
- **uri** -- **[in]** URI string
- **method** -- **[in]** HTTP method

**Returns**

- ESP\_OK : On successfully deregistering the handler
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_FOUND : Handler with specified URI and method not found

*esp\_err\_t* **httpd\_unregister\_uri** (*httpd\_handle\_t* handle, const char \*uri)

Unregister all URI handlers with the specified uri string.

**Parameters**

- **handle** -- **[in]** handle to HTTPD server instance
- **uri** -- **[in]** uri string specifying all handlers that need to be deregisterd

**Returns**

- ESP\_OK : On successfully deregistering all such handlers
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_NOT\_FOUND : No handler registered with specified uri string

*esp\_err\_t* **httpd\_sess\_set\_recv\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_recv\_func\_t* recv\_func)

Override web server's receive function (by session FD)

This function overrides the web server's receive function. This same function is used to read HTTP request packets.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()
- 

**Parameters**

- **hd** -- **[in]** HTTPD instance handle
- **sockfd** -- **[in]** Session socket FD
- **recv\_func** -- **[in]** The receive function to be set for this session

**Returns**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_sess\_set\_send\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_send\_func\_t* send\_func)

Override web server's send function (by session FD)

This function overrides the web server's send function. This same function is used to send out any response to any HTTP request.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()
- 

**Parameters**

- **hd** -- **[in]** HTTPD instance handle
- **sockfd** -- **[in]** Session socket FD
- **send\_func** -- **[in]** The send function to be set for this session

**Returns**

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

*esp\_err\_t* **httpd\_sess\_set\_pending\_override** (*httpd\_handle\_t* hd, int sockfd, *httpd\_pending\_func\_t* pending\_func)

Override web server's pending function (by session FD)

This function overrides the web server's pending function. This function is used to test for pending bytes in a socket.

---

**Note:** This API is supposed to be called either from the context of

- an http session APIs where sockfd is a valid parameter
  - a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()
- 

#### Parameters

- **hd** -- **[in]** HTTPD instance handle
- **sockfd** -- **[in]** Session socket FD
- **pending\_func** -- **[in]** The receive function to be set for this session

#### Returns

- ESP\_OK : On successfully registering override
- ESP\_ERR\_INVALID\_ARG : Null arguments

int **httpd\_req\_to\_sockfd** (*httpd\_req\_t* \*r)

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : httpd\_sess\_get\_ctx(), httpd\_sess\_trigger\_close(), httpd\_sess\_update\_lru\_counter().

---

**Note:** This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid.

---

**Parameters** **r** -- **[in]** The request whose socket descriptor should be found

#### Returns

- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

int **httpd\_req\_recv** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content\_len provided in httpd\_req\_t structure to know the length of data to be fetched. If content\_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf\_len' number of bytes, while the pointer to content data is incremented internally by the same number.

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where httpd\_req\_t\* request pointer is valid.
  - If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
  - Presently Chunked Encoding is not supported
- 

#### Parameters

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Pointer to a buffer that the data will be read into
- **buf\_len** -- **[in]** Length of the buffer

**Returns**

- Bytes : Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

size\_t **httpd\_req\_get\_hdr\_value\_len** (*httpd\_req\_t* \*r, const char \*field)

Search for a field in request headers and return the string length of it's value.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - Once *httpd\_resp\_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters**

- **r** -- [in] The request being responded to
- **field** -- [in] The header field to be searched in the request

**Returns**

- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

*esp\_err\_t* **httpd\_req\_get\_hdr\_value\_str** (*httpd\_req\_t* \*r, const char \*field, char \*val, size\_t val\_size)

Get the value string of a field from the request headers.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - Once *httpd\_resp\_send()* API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
  - Use *httpd\_req\_get\_hdr\_value\_len()* to know the right buffer length
- 

**Parameters**

- **r** -- [in] The request being responded to
- **field** -- [in] The field to be searched in the header
- **val** -- [out] Pointer to the buffer into which the value will be copied if the field is found
- **val\_size** -- [in] Size of the user buffer "val"

**Returns**

- ESP\_OK : Field found in the request header and value string copied
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid HTTP request pointer
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated

size\_t **httpd\_req\_get\_url\_query\_len** (*httpd\_req\_t* \*r)

Get Query string length from the request URL.

---

**Note:** This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid

---

**Parameters** **r** -- **[in]** The request being responded to

**Returns**

- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

*esp\_err\_t* **httpd\_req\_get\_url\_query\_str** (*httpd\_req\_t* \*r, char \*buf, size\_t buf\_len)

Get Query string from the request URL.

---

**Note:**

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the 'Content-Type' (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
  - This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
  - If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
  - Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **buf** -- **[out]** Pointer to the buffer into which the query string will be copied (if found)
- **buf\_len** -- **[in]** Length of output buffer

**Returns**

- `ESP_OK` : Query is found in the request URL and copied to buffer
- `ESP_ERR_NOT_FOUND` : Query not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid HTTP request pointer
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Query string truncated

*esp\_err\_t* **httpd\_query\_key\_value** (const char \*qry, const char \*key, char \*val, size\_t val\_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

---

**Note:**

- The components of URL query string (keys and values) are not URLdecoded. The user must check for 'Content-Type' field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
  - If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.
- 

**Parameters**

- **qry** -- **[in]** Pointer to query string
- **key** -- **[in]** The key to be searched in the query string
- **val** -- **[out]** Pointer to the buffer into which the value will be copied if the key is found
- **val\_size** -- **[in]** Size of the user buffer "val"

**Returns**

- `ESP_OK` : Key is found in the URL query string and copied to buffer
- `ESP_ERR_NOT_FOUND` : Key not found
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESULT_TRUNC` : Value string truncated

*esp\_err\_t* **httpd\_req\_get\_cookie\_val** (*httpd\_req\_t* \*req, const char \*cookie\_name, char \*val, size\_t \*val\_size)

Get the value string of a cookie value from the "Cookie" request headers by cookie name.

#### Parameters

- **req** -- [in] Pointer to the HTTP request
- **cookie\_name** -- [in] The cookie name to be searched in the request
- **val** -- [out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- **val\_size** -- [inout] Pointer to size of the user buffer "val". This variable will contain cookie length if ESP\_OK is returned and required buffer length incase ESP\_ERR\_HTTPD\_RESULT\_TRUNC is returned.

#### Returns

- ESP\_OK : Key is found in the cookie string and copied to buffer
- ESP\_ERR\_NOT\_FOUND : Key not found
- ESP\_ERR\_INVALID\_ARG : Null arguments
- ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated
- ESP\_ERR\_NO\_MEM : Memory allocation failure

bool **httpd\_uri\_match\_wildcard** (const char \*uri\_template, const char \*uri\_to\_match, size\_t match\_upto)

Test if a URI matches the given wildcard template.

Template may end with "?" to make the previous character optional (typically a slash), "\*" for a wildcard match, and "?\*" to make the previous character optional, and if present, allow anything to follow.

Example:

- \* matches everything
- /foo/? matches /foo and /foo/
- /foo/\* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?\* or /foo/\*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters "?" and "\*" anywhere else in the template will be taken literally.

#### Parameters

- **uri\_template** -- [in] URI template (pattern)
- **uri\_to\_match** -- [in] URI to be matched
- **match\_upto** -- [in] how many characters of the URI buffer to test (there may be trailing query string etc.)

**Returns** true if a match was found

*esp\_err\_t* **httpd\_resp\_send** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers : `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Parameters**

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Buffer from where the content is to be fetched
- **buf\_len** -- **[in]** Length of the buffer, HTTPD\_RESP\_USE\_STRLEN to use strlen()

**Returns**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request

*esp\_err\_t* **httpd\_resp\_send\_chunk** (*httpd\_req\_t* \*r, const char \*buf, ssize\_t buf\_len)

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Pointer to a buffer that stores the data
- **buf\_len** -- **[in]** Length of the buffer, HTTPD\_RESP\_USE\_STRLEN to use strlen()

**Returns**

- ESP\_OK : On successfully sending the response packet chunk
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request pointer

static inline *esp\_err\_t* **httpd\_resp\_sendstr** (*httpd\_req\_t* \*r, const char \*str)

API to send a complete string as HTTP response.

This API simply calls `httpd_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

**Parameters**

- **r** -- **[in]** The request being responded to
- **str** -- **[in]** String to be sent as response body

**Returns**

- ESP\_OK : On successfully sending the response packet
- ESP\_ERR\_INVALID\_ARG : Null request pointer
- ESP\_ERR\_HTTPD\_RESP\_HDR : Essential headers are too large for internal buffer
- ESP\_ERR\_HTTPD\_RESP\_SEND : Error in raw send
- ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid request

static inline [esp\\_err\\_t httpd\\_resp\\_sendstr\\_chunk](#) ([httpd\\_req\\_t](#) \*r, const char \*str)

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

#### Parameters

- **r** -- **[in]** The request being responded to
- **str** -- **[in]** String to be sent as response body (NULL to finish response packet)

#### Returns

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null request pointer
- `ESP_ERR_HTTPD_RESP_HDR` : Essential headers are too large for internal buffer
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request

[esp\\_err\\_t httpd\\_resp\\_set\\_status](#) ([httpd\\_req\\_t](#) \*r, const char \*status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the '200 OK' response is sent as the response.

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - This API only sets the status to this value. The status isn't sent out until any of the send APIs is executed.
  - Make sure that the lifetime of the status string is valid till send function is called.
- 

#### Parameters

- **r** -- **[in]** The request being responded to
- **status** -- **[in]** The HTTP status code of this response

#### Returns

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

[esp\\_err\\_t httpd\\_resp\\_set\\_type](#) ([httpd\\_req\\_t](#) \*r, const char \*type)

API to set the HTTP content type.

This API sets the 'Content Type' field of the response. The default content type is 'text/html'.

---

#### Note:

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - This API only sets the content type to this value. The type isn't sent out until any of the send APIs is executed.
  - Make sure that the lifetime of the type string is valid till send function is called.
- 

#### Parameters

- **r** -- **[in]** The request being responded to
- **type** -- **[in]** The Content Type of the response

#### Returns

- `ESP_OK` : On success
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_set\_hdr** (*httpd\_req\_t* \*r, const char \*field, const char \*value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - The header isn't sent out until any of the send APIs is executed.
  - The maximum allowed number of additional headers is limited to value of `max_resp_headers` in config structure.
  - Make sure that the lifetime of the field value strings are valid till send function is called.
- 

**Parameters**

- **r** -- [in] The request being responded to
- **field** -- [in] The field name of the HTTP header
- **value** -- [in] The value of this HTTP header

**Returns**

- `ESP_OK` : On successfully appending new header
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_HDR` : Total additional headers exceed max allowed
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

*esp\_err\_t* **httpd\_resp\_send\_err** (*httpd\_req\_t* \*req, *httpd\_err\_code\_t* error, const char \*msg)

For sending out error code in response to HTTP request.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  - If you wish to send additional data in the body of the response, please use the lower-level functions directly.
- 

**Parameters**

- **req** -- [in] Pointer to the HTTP request for which the response needs to be sent
- **error** -- [in] Error type to send
- **msg** -- [in] Error message string (pass NULL for default message)

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline *esp\_err\_t* **httpd\_resp\_send\_404** (*httpd\_req\_t* \*r)

Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where *httpd\_req\_t*\* request pointer is valid.

- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters** `r` -- **[in]** The request being responded to

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline `esp_err_t httpd_resp_send_408` (`httpd_req_t` \*r)

Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters** `r` -- **[in]** The request being responded to

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

static inline `esp_err_t httpd_resp_send_500` (`httpd_req_t` \*r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
- 

**Parameters** `r` -- **[in]** The request being responded to

**Returns**

- `ESP_OK` : On successfully sending the response packet
- `ESP_ERR_INVALID_ARG` : Null arguments
- `ESP_ERR_HTTPD_RESP_SEND` : Error in raw send
- `ESP_ERR_HTTPD_INVALID_REQ` : Invalid request pointer

int `httpd_send` (`httpd_req_t` \*r, const char \*buf, size\_t buf\_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually,

and HTTP delimiters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

---

**Note:**

- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.
  - Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn't have to call this API, but you would rather use either of : `httpd_resp_send()`, `httpd_resp_send_chunk()`
- 

**Parameters**

- **r** -- **[in]** The request being responded to
- **buf** -- **[in]** Buffer from where the fully constructed packet is to be read
- **buf\_len** -- **[in]** Length of the buffer

**Returns**

- Bytes : Number of bytes that were sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

int `httpd_socket_send` (*httpd\_handle\_t* hd, int sockfd, const char \*buf, size\_t buf\_len, int flags)

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by `httpd_sess_set_send_override()`.

---

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

---

**Parameters**

- **hd** -- **[in]** server instance
- **sockfd** -- **[in]** session socket file descriptor
- **buf** -- **[in]** buffer with bytes to send
- **buf\_len** -- **[in]** data size
- **flags** -- **[in]** flags for the send() function

**Returns**

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket send()
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket send()

int `httpd_socket_recv` (*httpd\_handle\_t* hd, int sockfd, char \*buf, size\_t buf\_len, int flags)

A low level API to receive data from a given socket

This internally calls the default recv function, or the function registered by `httpd_sess_set_recv_override()`.

---

**Note:** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

---

**Parameters**

- **hd** -- **[in]** server instance
- **sockfd** -- **[in]** session socket file descriptor
- **buf** -- **[in]** buffer with bytes to send
- **buf\_len** -- **[in]** data size
- **flags** -- **[in]** flags for the send() function

**Returns**

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

*esp\_err\_t* **httpd\_register\_err\_handler** (*httpd\_handle\_t* handle, *httpd\_err\_code\_t* error, *httpd\_err\_handler\_func\_t* handler\_fn)

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by *httpd\_err\_code\_t*. See prototype *httpd\_err\_handler\_func\_t* above for details.

**Parameters**

- **handle** -- **[in]** HTTP server handle
- **error** -- **[in]** Error type
- **handler\_fn** -- **[in]** User implemented handler function (Pass NULL to unset any previously set handler)

**Returns**

- ESP\_OK : handler registered successfully
- ESP\_ERR\_INVALID\_ARG : invalid error code or server handle

*esp\_err\_t* **httpd\_start** (*httpd\_handle\_t* \*handle, const *httpd\_config\_t* \*config)

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```
//Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

**Parameters**

- **config** -- **[in]** Configuration for new instance of the server
- **handle** -- **[out]** Handle to newly created instance of the server. NULL on error

**Returns**

- ESP\_OK : Instance created successfully
- ESP\_ERR\_INVALID\_ARG : Null argument(s)

- ESP\_ERR\_HTTPD\_ALLOC\_MEM : Failed to allocate memory for instance
- ESP\_ERR\_HTTPD\_TASK : Failed to launch server task

*esp\_err\_t* **httpd\_stop** (*httpd\_handle\_t* handle)

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

**Parameters** **handle** -- **[in]** Handle to server returned by httpd\_start

**Returns**

- ESP\_OK : Server stopped successfully
- ESP\_ERR\_INVALID\_ARG : Handle argument is Null

*esp\_err\_t* **httpd\_queue\_work** (*httpd\_handle\_t* handle, *httpd\_work\_fn\_t* work, void \*arg)

Queue execution of a function in HTTPD's context.

This API queues a work function for asynchronous execution

---

**Note:** Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

---

**Parameters**

- **handle** -- **[in]** Handle to server returned by httpd\_start
- **work** -- **[in]** Pointer to the function to be executed in the HTTPD's context
- **arg** -- **[in]** Pointer to the arguments that should be passed to this function

**Returns**

- ESP\_OK : On successfully queueing the work
- ESP\_FAIL : Failure in ctrl socket
- ESP\_ERR\_INVALID\_ARG : Null arguments

void \***httpd\_sess\_get\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd\_req\_t structure. But, there are cases where the web server's send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

**Parameters**

- **handle** -- **[in]** Handle to server returned by httpd\_start
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.

**Returns**

- void\* : Pointer to the context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd\_sess\_set\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session context by socket descriptor.

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.
- **ctx** -- **[in]** Context object to assign to the session
- **free\_fn** -- **[in]** Function that should be called to free the context

void \***httpd\_sess\_get\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd)

Get session 'transport' context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

**See also:**

`httpd_sess_get_ctx()`

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.

**Returns**

- void\* : Pointer to the transport context associated with this session
- NULL : Empty context / Invalid handle / Invalid socket fd

void **httpd\_sess\_set\_transport\_ctx** (*httpd\_handle\_t* handle, int sockfd, void \*ctx, *httpd\_free\_ctx\_fn\_t* free\_fn)

Set session 'transport' context by socket descriptor.

**See also:**

`httpd_sess_set_ctx()`

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor for which the context should be extracted.
- **ctx** -- **[in]** Transport context object to assign to the session
- **free\_fn** -- **[in]** Function that should be called to free the transport context

void \***httpd\_get\_global\_user\_ctx** (*httpd\_handle\_t* handle)

Get HTTPD global user context (it was set in the server config struct)

**Parameters** **handle** -- **[in]** Handle to server returned by `httpd_start`

**Returns** global user context

void \***httpd\_get\_global\_transport\_ctx** (*httpd\_handle\_t* handle)

Get HTTPD global transport context (it was set in the server config struct)

**Parameters** **handle** -- **[in]** Handle to server returned by `httpd_start`

**Returns** global transport context

*esp\_err\_t* **httpd\_sess\_trigger\_close** (*httpd\_handle\_t* handle, int sockfd)

Trigger an httpd session close externally.

---

**Note:** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

---

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor of the session to be closed

**Returns**

- `ESP_OK` : On successfully initiating closure
- `ESP_FAIL` : Failure to queue work
- `ESP_ERR_NOT_FOUND` : Socket fd not found
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **httpd\_sess\_update\_lru\_counter** (*httpd\_handle\_t* handle, int sockfd)

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

---

**Note:** Calling this API is only necessary if the LRU Purge Enable option is enabled.

---

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **sockfd** -- **[in]** The socket descriptor of the session for which LRU counter is to be updated

**Returns**

- `ESP_OK` : Socket found and LRU counter updated
- `ESP_ERR_NOT_FOUND` : Socket not found
- `ESP_ERR_INVALID_ARG` : Null arguments

*esp\_err\_t* **httpd\_get\_client\_list** (*httpd\_handle\_t* handle, size\_t \*fds, int \*client\_fds)

Returns list of current socket descriptors of active sessions.

---

**Note:** Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with `max_open_sockets` field in `httpd_config_t` structure.

---

**Parameters**

- **handle** -- **[in]** Handle to server returned by `httpd_start`
- **fds** -- **[inout]** In: Size of provided `client_fds` array Out: Number of valid client fds returned in `client_fds`,
- **client\_fds** -- **[out]** Array of client fds

**Returns**

- `ESP_OK` : Successfully retrieved session list
- `ESP_ERR_INVALID_ARG` : Wrong arguments or list is longer than provided array

**Structures**

struct **esp\_http\_server\_event\_data**

Argument structure for `HTTP_SERVER_EVENT_ON_DATA` and `HTTP_SERVER_EVENT_SENT_DATA` event

**Public Members**

int **fd**

Session socket file descriptor

int **data\_len**

Data length

struct **httpd\_config**

HTTP Server Configuration Structure.

---

**Note:** Use HTTPD\_DEFAULT\_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

### Public Members

unsigned **task\_priority**

Priority of FreeRTOS task which runs the server

size\_t **stack\_size**

The maximum stack size allowed for the server task

BaseType\_t **core\_id**

The core the HTTP server task will run on

uint16\_t **server\_port**

TCP Port number for receiving and transmitting HTTP traffic

uint16\_t **ctrl\_port**

UDP Port number for asynchronously exchanging control signals between various components of the server

uint16\_t **max\_open\_sockets**

Max number of sockets/clients connected at any time (3 sockets are reserved for internal working of the HTTP server)

uint16\_t **max\_uri\_handlers**

Maximum allowed uri handlers

uint16\_t **max\_resp\_headers**

Maximum allowed additional headers in HTTP response

uint16\_t **backlog\_conn**

Number of backlog connections

bool **lru\_purge\_enable**

Purge "Least Recently Used" connection

uint16\_t **recv\_wait\_timeout**

Timeout for recv function (in seconds)

`uint16_t send_wait_timeout`

Timeout for send function (in seconds)

`void *global_user_ctx`

Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the `httpd_req_t` struct.

When shutting down, the server frees up the user context by calling `free()` on the `global_user_ctx` field. If you wish to use a custom function for freeing the global user context, please specify that here.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) `global_user_ctx_free_fn`

Free function for global user context

`void *global_transport_ctx`

Global transport context.

Similar to `global_user_ctx`, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using `free()`, unless `global_transport_ctx_free_fn` is specified.

[\*httpd\\_free\\_ctx\\_fn\\_t\*](#) `global_transport_ctx_free_fn`

Free function for global transport context

`bool enable_so_linger`

bool to enable/disable linger

`int linger_timeout`

linger timeout (in seconds)

`bool keep_alive_enable`

Enable keep-alive timeout

`int keep_alive_idle`

Keep-alive idle time. Default is 5 (second)

`int keep_alive_interval`

Keep-alive interval time. Default is 5 (second)

`int keep_alive_count`

Keep-alive packet retry send count. Default is 3 counts

[\*httpd\\_open\\_func\\_t\*](#) `open_fn`

Custom session opening callback.

Called on a new session socket just after `accept()`, but before reading any data.

This is an opportunity to set up e.g. SSL encryption using `global_transport_ctx` and the `send/recv/pending` session overrides.

If a context needs to be maintained between these functions, store it in the session using `httpd_sess_set_transport_ctx()` and retrieve it later with `httpd_sess_get_transport_ctx()`

Returning a value other than `ESP_OK` will immediately close the new socket.

***httpd\_close\_func\_t* close\_fn**

Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.

The server will only close the socket if no custom session closing callback is set. If a custom callback is used, `close(sockfd)` should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

***httpd\_uri\_match\_func\_t* uri\_match\_fn**

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) NULL : Internally do basic matching using `strcmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

**struct httpd\_req**

HTTP Request Data Structure.

**Public Members*****httpd\_handle\_t* handle**

Handle to server instance

**int method**

The type of HTTP request, -1 if unsupported method

**const char uri[HTTPD\_MAX\_URI\_LEN + 1]**

The URI of this request (1 byte extra for null termination)

**size\_t content\_len**

Length of the request body

**void \*aux**

Internally used members

**void \*user\_ctx**

User context pointer passed during URI registration.

**void \*sess\_ctx**

Session Context Pointer

A session context. Contexts are maintained across 'sessions' for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling `free()`, unless `free_ctx` function is set.

#### *httpd\_free\_ctx\_fn\_t* **free\_ctx**

Pointer to free context hook

Function to free session context

If the web server's socket closes, it frees up the session context by calling `free()` on the `sess_ctx` member. If you wish to use a custom function for freeing the session context, please specify that here.

#### bool **ignore\_sess\_ctx\_changes**

Flag indicating if Session Context changes should be ignored

By default, if you change the `sess_ctx` in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of `sess_ctx` yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling `free_ctx` or `free()`) only if the socket gets closed.

#### struct **httpd\_uri**

Structure for URI handler.

### Public Members

#### const char \***uri**

The URI to handle

#### *httpd\_method\_t* **method**

Method supported by the URI

#### *esp\_err\_t* (\***handler**)(*httpd\_req\_t* \*r)

Handler to call for supported request method. This must return `ESP_OK`, or else the underlying socket will be closed.

#### void \***user\_ctx**

Pointer to user context data which will be available to handler

### Macros

**HTTPD\_MAX\_REQ\_HDR\_LEN**

**HTTPD\_MAX\_URI\_LEN**

**HTTPD\_SOCK\_ERR\_FAIL**

**HTTPD\_SOCK\_ERR\_INVALID**

**HTTPD\_SOCK\_ERR\_TIMEOUT**

**HTTPD\_200**

HTTP Response 200

**HTTPD\_204**

HTTP Response 204

**HTTPD\_207**

HTTP Response 207

**HTTPD\_400**

HTTP Response 400

**HTTPD\_404**

HTTP Response 404

**HTTPD\_408**

HTTP Response 408

**HTTPD\_500**

HTTP Response 500

**HTTPD\_TYPE\_JSON**

HTTP Content type JSON

**HTTPD\_TYPE\_TEXT**

HTTP Content type text/HTML

**HTTPD\_TYPE\_OCTET**

HTTP Content type octext-stream

**ESP\_HTTPD\_DEF\_CTRL\_PORT**

HTTP Server control socket port

**HTTPD\_DEFAULT\_CONFIG ()**

**ESP\_ERR\_HTTPD\_BASE**

Starting number of HTTPD error codes

**ESP\_ERR\_HTTPD\_HANDLERS\_FULL**

All slots for registering URI handlers have been consumed

**ESP\_ERR\_HTTPD\_HANDLER\_EXISTS**

URI handler with same method and target URI already registered

**ESP\_ERR\_HTTPD\_INVALID\_REQ**

Invalid request pointer

**ESP\_ERR\_HTTPD\_RESULT\_TRUNC**

Result string truncated

**ESP\_ERR\_HTTPD\_RESP\_HDR**

Response header field larger than supported

**ESP\_ERR\_HTTPD\_RESP\_SEND**

Error occurred while sending response packet

**ESP\_ERR\_HTTPD\_ALLOC\_MEM**

Failed to dynamically allocate memory for resource

**ESP\_ERR\_HTTPD\_TASK**

Failed to launch server task/thread

**HTTPD\_RESP\_USE\_STRLEN****Type Definitions**

```
typedef struct httpd_req httpd_req_t
```

HTTP Request Data Structure.

```
typedef struct httpd_uri httpd_uri_t
```

Structure for URI handler.

```
typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level send function.

---

**Note:** User specified send function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_send()` function

---

**Param `hd` [in]** server instance

**Param `sockfd` [in]** session socket file descriptor

**Param `buf` [in]** buffer with bytes to send

**Param `buf_len` [in]** data size

**Param `flags` [in]** flags for the `send()` function

**Return**

- Bytes : The number of bytes sent successfully
- `HTTPD_SOCK_ERR_INVALID` : Invalid arguments
- `HTTPD_SOCK_ERR_TIMEOUT` : Timeout/interrupted while calling socket `send()`
- `HTTPD_SOCK_ERR_FAIL` : Unrecoverable error while calling socket `send()`

```
typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

Prototype for HTTPDs low-level `recv` function.

---

**Note:** User specified `recv` function must handle errors internally, depending upon the set value of `errno`, and return specific `HTTPD_SOCK_ERR_` codes, which will eventually be conveyed as return value of `httpd_req_recv()` function

---

**Param `hd` [in]** server instance

**Param `sockfd` [in]** session socket file descriptor

**Param `buf` [in]** buffer with bytes to send

**Param buf\_len [in]** data size

**Param flags [in]** flags for the send() function

**Return**

- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()

```
typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
```

Prototype for HTTPDs low-level "get pending bytes" function.

---

**Note:** User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD\_SOCK\_ERR\_ codes, which will be handled accordingly in the server task.

---

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

**Return**

- Bytes : The number of bytes waiting to be received
- HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
- HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket pending()
- HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket pending()

```
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

---

**Note:**

- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd\_resp\_send\_err() must be invoked inside this function if user wishes to generate HTTP error responses.
  - When invoked, the validity of uri, method, content\_len and user\_ctx fields of the httpd\_req\_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
  - The function must return ESP\_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD\_500\_INTERNAL\_SERVER\_ERROR and the socket closed anyway.
- 

**Param req [in]** HTTP request for which the error needs to be handled

**Param error [in]** Error type

**Return**

- ESP\_OK : error handled successful
- ESP\_FAIL : failure indicates that the underlying socket needs to be closed

```
typedef void *httpd_handle_t
```

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

typedef enum http\_method **httpd\_method\_t**

HTTP Method Type wrapper over "enum http\_method" available in "http\_parser" library.

typedef void (\***httpd\_free\_ctx\_fn\_t**)(void \*ctx)

Prototype for freeing context data (if any)

**Param ctx [in]** object to free

typedef *esp\_err\_t* (\***httpd\_open\_func\_t**)(*httpd\_handle\_t* hd, int sockfd)

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

**Return**

- ESP\_OK : On success
- Any value other than ESP\_OK will signal the server to close the socket immediately

typedef void (\***httpd\_close\_func\_t**)(*httpd\_handle\_t* hd, int sockfd)

Function prototype for closing a session.

---

**Note:** It's possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

---

**Param hd [in]** server instance

**Param sockfd [in]** session socket file descriptor

typedef bool (\***httpd\_uri\_match\_func\_t**)(const char \*reference\_uri, const char \*uri\_to\_match, size\_t match\_upto)

Function prototype for URI matching.

**Param reference\_uri [in]** URI/template with respect to which the other URI is matched

**Param uri\_to\_match [in]** URI/template being matched to the reference URI/template

**Param match\_upto [in]** For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

**Return** true on match

typedef struct *httpd\_config* **httpd\_config\_t**

HTTP Server Configuration Structure.

---

**Note:** Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

---

typedef void (\***httpd\_work\_fn\_t**)(void \*arg)

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

**Param arg [in]** The arguments for this work function

## Enumerations

enum **httpd\_err\_code\_t**

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

*Values:*

enumerator **HTTPD\_500\_INTERNAL\_SERVER\_ERROR**

enumerator **HTTPD\_501\_METHOD\_NOT\_IMPLEMENTED**

enumerator **HTTPD\_505\_VERSION\_NOT\_SUPPORTED**

enumerator **HTTPD\_400\_BAD\_REQUEST**

enumerator **HTTPD\_401\_UNAUTHORIZED**

enumerator **HTTPD\_403\_FORBIDDEN**

enumerator **HTTPD\_404\_NOT\_FOUND**

enumerator **HTTPD\_405\_METHOD\_NOT\_ALLOWED**

enumerator **HTTPD\_408\_REQ\_TIMEOUT**

enumerator **HTTPD\_411\_LENGTH\_REQUIRED**

enumerator **HTTPD\_414\_URI\_TOO\_LONG**

enumerator **HTTPD\_431\_REQ\_HDR\_FIELDS\_TOO\_LARGE**

enumerator **HTTPD\_ERR\_CODE\_MAX**

enum **esp\_http\_server\_event\_id\_t**

HTTP Server events id.

*Values:*

enumerator **HTTP\_SERVER\_EVENT\_ERROR**

This event occurs when there are any errors during execution

enumerator **HTTP\_SERVER\_EVENT\_START**

This event occurs when HTTP Server is started

enumerator **HTTP\_SERVER\_EVENT\_ON\_CONNECTED**

Once the HTTP Server has been connected to the client, no data exchange has been performed

enumerator **HTTP\_SERVER\_EVENT\_ON\_HEADER**

Occurs when receiving each header sent from the client

enumerator **HTTP\_SERVER\_EVENT\_HEADERS\_SENT**

After sending all the headers to the client

enumerator **HTTP\_SERVER\_EVENT\_ON\_DATA**

Occurs when receiving data from the client

enumerator **HTTP\_SERVER\_EVENT\_SENT\_DATA**

Occurs when an ESP HTTP server session is finished

enumerator **HTTP\_SERVER\_EVENT\_DISCONNECTED**

The connection has been disconnected

enumerator **HTTP\_SERVER\_EVENT\_STOP**

This event occurs when HTTP Server is stopped

## 2.2.10 HTTPS Server

### Overview

This component is built on top of *HTTP Server*. The HTTPS server takes advantage of hook registration functions in the regular HTTP server to provide callback function for SSL session.

All documentation for *HTTP Server* applies also to a server you create this way.

### Used APIs

The following APIs of *HTTP Server* should not be used with *HTTPS Server*, as they are used internally to handle secure sessions and to maintain internal state:

- "send", "receive" and "pending" callback registration functions - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_recv_override()`
  - `httpd_sess_set_pending_override()`
- "transport context" - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()` - returns the shared SSL context
  - `httpd_config::global_transport_ctx`
  - `httpd_config::global_transport_ctx_free_fn`
  - `httpd_config::open_fn` - used to set up secure sockets

Everything else can be used without limitations.

### Usage

Please see the example [protocols/https\\_server](#) to learn how to set up a secure server.

Basically, all you need is to generate a certificate, embed it into the firmware, and pass the init struct into the start function after the certificate address and lengths are correctly configured in the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config::transport_mode`. This could be used, e.g., for testing or in trusted environments where you prefer speed over security.

## Performance

The initial session setup can take about two seconds, or more with slower clock speed or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

## API Reference

### Header File

- `components/esp_https_server/include/esp_https_server.h`

### Functions

`esp_err_t httpd_ssl_start` (`httpd_handle_t *handle`, `httpd_ssl_config_t *config`)

Create a SSL capable HTTP server (secure mode may be disabled in config)

#### Parameters

- **config** -- [inout] - server config, must not be const. Does not have to stay valid after calling this function.
- **handle** -- [out] - storage for the server handle, must be a valid pointer

**Returns** success

`esp_err_t httpd_ssl_stop` (`httpd_handle_t handle`)

Stop the server. Blocks until the server is shut down.

**Parameters** `handle` -- [in]

#### Returns

- ESP\_OK: Server stopped successfully
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_FAIL: Failure to shut down server

### Structures

struct `esp_https_server_user_cb_arg`

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

### Public Members

`httpd_ssl_user_cb_state_t user_cb_state`

State of user callback

`esp_tls_t *tls`

ESP-TLS connection handle

struct `httpd_ssl_config`

HTTPS server config struct

Please use `HTTPD_SSL_CONFIG_DEFAULT()` to initialize it.

### Public Members

`httpd_config_t httpd`

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

`const uint8_t *servercert`  
Server certificate

`size_t servercert_len`  
Server certificate byte length

`const uint8_t *cacert_pem`  
CA certificate ((CA used to sign clients, or client cert itself)

`size_t cacert_len`  
CA certificate byte length

`const uint8_t *prvtkey_pem`  
Private key

`size_t prvtkey_len`  
Private key byte length

`bool use_ecdsa_peripheral`  
Use ECDSA peripheral to use private key

`uint8_t ecdsa_key_efuse_blk`  
The efuse block where ECDSA key is stored

`httpd_ssl_transport_mode_t transport_mode`  
Transport Mode (default secure)

`uint16_t port_secure`  
Port used when transport mode is secure (default 443)

`uint16_t port_insecure`  
Port used when transport mode is insecure (default 80)

`bool session_tickets`  
Enable tls session tickets

`bool use_secure_element`  
Enable secure element for server session

`esp_https_server_user_cb *user_cb`  
User callback for esp\_https\_server

`void *ssl_userdata`  
user data to add to the ssl context

`esp_tls_handshake_callback cert_select_cb`  
Certificate selection callback to use

```
const char **alpn_protos
```

Application protocols the server supports in order of preference. Used for negotiating during the TLS handshake, first one the client supports is selected. The data structure must live as long as the https server itself!

### Macros

```
HTTPD_SSL_CONFIG_DEFAULT ()
```

Default config struct init

(http\_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to 'transport\_mode'
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

### Type Definitions

```
typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t
```

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

```
typedef void esp_https_server_user_cb (esp_https_server_user_cb_arg_t *user_cb)
```

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

**Param user\_cb** Callback data struct

```
typedef struct httpd_ssl_config httpd_ssl_config_t
```

### Enumerations

```
enum httpd_ssl_transport_mode_t
```

Values:

enumerator **HTTPD\_SSL\_TRANSPORT\_SECURE**

enumerator **HTTPD\_SSL\_TRANSPORT\_INSECURE**

```
enum httpd_ssl_user_cb_state_t
```

Indicates the state at which the user callback is executed, i.e at session creation or session close.

Values:

enumerator **HTTPD\_SSL\_USER\_CB\_SESS\_CREATE**

enumerator **HTTPD\_SSL\_USER\_CB\_SESS\_CLOSE**

## 2.2.11 ICMP Echo

## Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a new ping session** To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_
    ↪time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
           recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_
    ↪addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4),
    ↪seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;

    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted,
    ↪sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
}
```

(continues on next page)

(continued from previous page)

```

    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_
↪time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, ↪
↪received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr;           // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE;    // ping in infinite mode, esp_
↪ping_stop can stop it

    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, ↪
↪can be NULL
    cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
}

```

**Start and Stop ping session** You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won't start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

**Delete a ping session** If a ping session won't be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

**Get runtime statistics** As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

## Application Example

ICMP echo example: [protocols/icmp\\_echo](#)

## API Reference

### Header File

- [components/lwip/include/apps/ping/ping\\_sock.h](#)

## Functions

*esp\_err\_t* **esp\_ping\_new\_session** (const *esp\_ping\_config\_t* \*config, const *esp\_ping\_callbacks\_t* \*cbs, *esp\_ping\_handle\_t* \*hdl\_out)

Create a ping session.

### Parameters

- **config** -- ping configuration
- **cbs** -- a bunch of callback functions invoked by internal ping task
- **hdl\_out** -- handle of ping session

### Returns

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. configuration is null, etc)
- ESP\_ERR\_NO\_MEM: out of memory
- ESP\_FAIL: other internal error (e.g. socket error)
- ESP\_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

*esp\_err\_t* **esp\_ping\_delete\_session** (*esp\_ping\_handle\_t* hdl)

Delete a ping session.

**Parameters** **hdl** -- handle of ping session

### Returns

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: delete ping session successfully

*esp\_err\_t* **esp\_ping\_start** (*esp\_ping\_handle\_t* hdl)

Start the ping session.

**Parameters** **hdl** -- handle of ping session

### Returns

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: start ping session successfully

*esp\_err\_t* **esp\_ping\_stop** (*esp\_ping\_handle\_t* hdl)

Stop the ping session.

**Parameters** **hdl** -- handle of ping session

### Returns

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_OK: stop ping session successfully

*esp\_err\_t* **esp\_ping\_get\_profile** (*esp\_ping\_handle\_t* hdl, *esp\_ping\_profile\_t* profile, void \*data, uint32\_t size)

Get runtime profile of ping session.

### Parameters

- **hdl** -- handle of ping session
- **profile** -- type of profile
- **data** -- profile data
- **size** -- profile data size

### Returns

- ESP\_ERR\_INVALID\_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP\_ERR\_INVALID\_SIZE: the actual profile data size doesn't match the "size" parameter
- ESP\_OK: get profile successfully

## Structures

struct **esp\_ping\_callbacks\_t**

Type of "ping" callback functions.

### Public Members

void **\*cb\_args**

arguments for callback functions

void (**\*on\_ping\_success**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when received ICMP echo reply packet.

void (**\*on\_ping\_timeout**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (**\*on\_ping\_end**)(*esp\_ping\_handle\_t* hdl, void \*args)

Invoked by internal ping thread when a ping session is finished.

struct **esp\_ping\_config\_t**

Type of "ping" configuration.

### Public Members

uint32\_t **count**

A "ping" session contains count procedures

uint32\_t **interval\_ms**

Milliseconds between each ping procedure

uint32\_t **timeout\_ms**

Timeout value (in milliseconds) of each ping procedure

uint32\_t **data\_size**

Size of the data next to ICMP packet header

int **tos**

Type of Service, a field specified in the IP header

int **ttl**

Time to Live, a field specified in the IP header

ip\_addr\_t **target\_addr**

Target IP address, either IPv4 or IPv6

uint32\_t **task\_stack\_size**

Stack size of internal ping task

uint32\_t **task\_prio**

Priority of internal ping task

uint32\_t **interface**

Netif index, interface=0 means NETIF\_NO\_INDEX

### Macros

**ESP\_PING\_DEFAULT\_CONFIG** ()

Default ping configuration.

**ESP\_PING\_COUNT\_INFINITE**

Set ping count to zero will ping target infinitely

### Type Definitions

typedef void \***esp\_ping\_handle\_t**

Type of "ping" session handle.

### Enumerations

enum **esp\_ping\_profile\_t**

Profile of ping session.

*Values:*

enumerator **ESP\_PING\_PROF\_SEQNO**

Sequence number of a ping procedure

enumerator **ESP\_PING\_PROF\_TOS**

Type of service of a ping procedure

enumerator **ESP\_PING\_PROF\_TTL**

Time to live of a ping procedure

enumerator **ESP\_PING\_PROF\_REQUEST**

Number of request packets sent out

enumerator **ESP\_PING\_PROF\_REPLY**

Number of reply packets received

enumerator **ESP\_PING\_PROF\_IPADDR**

IP address of replied target

enumerator **ESP\_PING\_PROF\_SIZE**

Size of received packet

enumerator **ESP\_PING\_PROF\_TIMEGAP**

Elapsed time between request and reply packet

enumerator **ESP\_PING\_PROF\_DURATION**

Elapsed time of the whole ping session

## 2.2.12 mDNS Service

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

The ESP-IDF component *mDNS* has been moved from ESP-IDF since version v5.0 to a separate repository:

- [mDNS component on GitHub](#)

To add mDNS component in your project, please run `idf.py add-dependency espressif/mdns`.

### Hosted Documentation

The documentation can be found on the link below:

- [mDNS documentation](#)

### 2.2.13 Mbed TLS

**Mbed TLS** is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

---

**Note:** ESP-IDF uses a [fork](#) of Mbed TLS which includes a few patches (related to hardware routines of certain modules like `bignum` (MPI) and ECC) over vanilla Mbed TLS.

---

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

---

**Note:** Mbed TLS is in the process of migrating all the documentation to a single place. In the meantime, users can find the documentation at the [old Mbed TLS site](#).

---

### Mbed TLS Support in ESP-IDF

Please find the information about the Mbed TLS versions present in different branches of ESP-IDF [here](#).

---

**Note:** Please refer the [ESP-IDF Migration Guide](#) to migrate from Mbed TLS version 2.x to version 3.0 or greater.

---

### Application Examples

Examples in ESP-IDF use [ESP-TLS](#) which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples [protocols/https\\_server/simple](#) (Simple HTTPS server) and [protocols/https\\_request](#) (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example [protocols/https\\_mbedtls](#).

### Alternatives

[ESP-TLS](#) acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at <https://github.com/espressif/esp-wolfSSL> with the upstream submodule pointer.

Please refer to [ESP-TLS: Underlying SSL/TLS Library Options](#) docs for more information on this and comparison of Mbed TLS and wolfSSL.

### Important Config Options

Following is a brief list of important config options accessible at `Component Config -> mbedTLS`. The full list of config options can be found [here](#).

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3
- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: Support for trusted root certificate bundle (more about this: [ESP x509 Certificate Bundle](#))
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Client session tickets
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Server session tickets
- `CONFIG_MBEDTLS_HARDWARE_SHA`: Support for hardware SHA acceleration
- `CONFIG_MBEDTLS_HARDWARE_ECC`: Support for hardware ECC acceleration

---

**Note:** Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1 and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out [here](#).

---

### Performance and Memory Tweaks

**Reducing Heap Usage** The following table shows typical memory usage with different configs when the [protocols/https\\_request](#) example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

Mbed TLS Test	Related Configs	Heap Usage (approx.)
Default	NA	42196 B
Enable SSL Variable Length	<a href="#">CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</a>	42120 B
Disable Keep Peer Certificate	<a href="#">CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</a>	38533 B
Enable Dynamic TX/RX Buffer	<a href="#">CONFIG_MBEDTLS_DYNAMIC_BUFFER</a> <a href="#">FIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</a> <a href="#">FIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</a>	<a href="#">CON-</a> <a href="#">CON-</a> 22013 B

---

**Note:** These values are subject to change with change in configuration options and versions of Mbed TLS.

---

**Reducing Binary Size** Under `Component Config -> mbedTLS`, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in [Minimizing Binary Size](#) docs.

Code examples for this API section are provided in the [protocols](#) directory of ESP-IDF examples.

## 2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in [Networking APIs](#).

## 2.3 Bluetooth API

### 2.3.1 BT COMMON

#### BT GENERIC DEFINES

##### API Reference

##### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_bt\\_defs.h](#)

##### Macros

**ESP\_BLUEDROID\_STATUS\_CHECK** (status)

**ESP\_BT\_STATUS\_BASE\_FOR\_HCI\_ERR**

**ESP\_BT\_OCTET16\_LEN**

**ESP\_BT\_OCTETS\_LEN**

**ESP\_DEFAULT\_GATT\_IF**

Default GATT interface id.

**ESP\_BLE\_PRIM\_ADV\_INT\_MIN**

Minimum advertising interval for undirected and low duty cycle directed advertising

**ESP\_BLE\_PRIM\_ADV\_INT\_MAX**

Maximum advertising interval for undirected and low duty cycle directed advertising

**ESP\_BLE\_CONN\_INT\_MIN**

relate to BTM\_BLE\_CONN\_INT\_MIN in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_INT\_MAX**

relate to BTM\_BLE\_CONN\_INT\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_LATENCY\_MAX**

relate to ESP\_BLE\_CONN\_LATENCY\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_SUP\_TOUT\_MIN**

relate to BTM\_BLE\_CONN\_SUP\_TOUT\_MIN in stack/btm\_ble\_api.h

**ESP\_BLE\_CONN\_SUP\_TOUT\_MAX**

relate to ESP\_BLE\_CONN\_SUP\_TOUT\_MAX in stack/btm\_ble\_api.h

**ESP\_BLE\_IS\_VALID\_PARAM** (x, min, max)

Check the param is valid or not.

**ESP\_UUID\_LEN\_16**

**ESP\_UUID\_LEN\_32**

**ESP\_UUID\_LEN\_128**

**ESP\_BD\_ADDR\_LEN**

Bluetooth address length.

**ESP\_PEER\_IRK\_LEN**

Bluetooth peer irk.

**ESP\_BLE\_ENC\_KEY\_MASK**

Used to exchange the encryption key in the init key & response key.

**ESP\_BLE\_ID\_KEY\_MASK**

Used to exchange the IRK key in the init key & response key.

**ESP\_BLE\_CSR\_KEY\_MASK**

Used to exchange the CSRK key in the init key & response key.

**ESP\_BLE\_LINK\_KEY\_MASK**

Used to exchange the link key(this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

**ESP\_APP\_ID\_MIN**

Minimum of the application id.

**ESP\_APP\_ID\_MAX**

Maximum of the application id.

**ESP\_BD\_ADDR\_STR****ESP\_BD\_ADDR\_HEX** (addr)**Type Definitions**

```

enumerator **ESP\_BT\_STATUS\_HCI\_CONN\_FAILED\_ESTABLISHMENT**

enumerator **ESP\_BT\_STATUS\_HCI\_MAC\_CONNECTION\_FAILED**

enum **esp\_bt\_dev\_type\_t**

Bluetooth device type.

*Values:*

enumerator **ESP\_BT\_DEVICE\_TYPE\_BREDR**

enumerator **ESP\_BT\_DEVICE\_TYPE\_BLE**

enumerator **ESP\_BT\_DEVICE\_TYPE\_DUMO**

enum **esp\_ble\_addr\_type\_t**

BLE device address type.

*Values:*

enumerator **BLE\_ADDR\_TYPE\_PUBLIC**

Public Device Address

enumerator **BLE\_ADDR\_TYPE\_RANDOM**

Random Device Address. To set this address, use the function `esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)`

enumerator **BLE\_ADDR\_TYPE\_RPA\_PUBLIC**

Resolvable Private Address (RPA) with public identity address

enumerator **BLE\_ADDR\_TYPE\_RPA\_RANDOM**

Resolvable Private Address (RPA) with random identity address. To set this address, use the function `esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)`

enum **esp\_ble\_wl\_addr\_type\_t**

white list address type

*Values:*

enumerator **BLE\_WL\_ADDR\_TYPE\_PUBLIC**

enumerator **BLE\_WL\_ADDR\_TYPE\_RANDOM**

## BT MAIN API

### API Reference

#### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_bt\\_main.h](#)

#### Functions

*esp\_bluedroid\_status\_t* **esp\_bluedroid\_get\_status** (void)

Get bluetooth stack status.

**Returns** Bluetooth stack status

*esp\_err\_t* **esp\_bluedroid\_enable** (void)

Enable bluetooth, must after esp\_bluedroid\_init().

**Returns**

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_disable** (void)

Disable bluetooth, must prior to esp\_bluedroid\_deinit().

**Returns**

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_init** (void)

Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

**Returns**

- ESP\_OK : Succeed
- Other : Failed

*esp\_err\_t* **esp\_bluedroid\_deinit** (void)

Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

**Returns**

- ESP\_OK : Succeed
- Other : Failed

#### Enumerations

enum **esp\_bluedroid\_status\_t**

Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

*Values:*

enumerator **ESP\_BLUEDROID\_STATUS\_UNINITIALIZED**

Bluetooth not initialized

enumerator **ESP\_BLUEDROID\_STATUS\_INITIALIZED**

Bluetooth initialized but not enabled

enumerator **ESP\_BLUEDROID\_STATUS\_ENABLED**

Bluetooth initialized and enabled

## BT DEVICE APIs

**Overview** Bluetooth device reference APIs.

### API Reference

#### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_bt\\_device.h](#)

#### Functions

const uint8\_t \***esp\_bt\_dev\_get\_address** (void)

Get bluetooth device address. Must use after "esp\_bluedroid\_enable".

**Returns** bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

*esp\_err\_t* **esp\_bt\_dev\_set\_device\_name** (const char \*name)

Set bluetooth device name. This function should be called after esp\_bluedroid\_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

**Parameters** **name** -- [in] : device name to be set

**Returns**

- ESP\_OK : Succeed
- ESP\_ERR\_INVALID\_ARG : if name is NULL pointer or empty, or string length out of limit
- ESP\_ERR\_INVALID\_STATE : if bluetooth stack is not yet enabled
- ESP\_FAIL : others

## 2.3.2 BT LE

### GAP API

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - [bluetooth/bluedroid/ble/gatt\\_security\\_client](#)
  - [GATT Security Client Example Walkthrough](#)
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - [bluetooth/bluedroid/ble/gatt\\_security\\_server](#)
  - [GATT Security Server Example Walkthrough](#)

## API Reference

### Header File

- components/bt/host/bluetooth/api/include/api/esp\_gap\_ble\_api.h

### Functions

*esp\_err\_t* **esp\_ble\_gap\_register\_callback** (*esp\_gap\_ble\_cb\_t* callback)

This function is called to occur gap event, such as scan result.

**Parameters** **callback** -- [in] callback function

**Returns**

- ESP\_OK : success
- other : failed

*esp\_gap\_ble\_cb\_t* **esp\_ble\_gap\_get\_callback** (void)

This function is called to get the current gap callback.

**Returns**

- esp\_gap\_ble\_cb\_t : callback function

*esp\_err\_t* **esp\_ble\_gap\_config\_adv\_data** (*esp\_ble\_adv\_data\_t* \*adv\_data)

This function is called to override the BTA default ADV parameters.

**Parameters** **adv\_data** -- [in] Pointer to User defined ADV data structure. This memory space can not be freed until callback of config\_adv\_data is received.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_scan\_params** (*esp\_ble\_scan\_params\_t* \*scan\_params)

This function is called to set scan parameters.

**Parameters** **scan\_params** -- [in] Pointer to User defined scan\_params data structure. This memory space can not be freed until callback of set\_scan\_params

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_start\_scanning** (uint32\_t duration)

This procedure keep the device scanning the peer device which advertising on the air.

**Parameters** **duration** -- [in] Keeping the scanning time, the unit is second.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_stop\_scanning** (void)

This function call to stop the device scanning the peer device which advertising on the air.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_start\_advertising** (*esp\_ble\_adv\_params\_t* \*adv\_params)

This function is called to start advertising.

**Parameters** **adv\_params** -- [in] pointer to User defined adv\_params data structure.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_stop\_advertising** (void)

This function is called to stop advertising.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_update\_conn\_params** (*esp\_ble\_conn\_update\_params\_t* \*params)

Update connection parameters, can only be used when connection is up.

**Parameters** **params** -- [in] - connection update parameters

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_pkt\_data\_len** (*esp\_bd\_addr\_t* remote\_device, uint16\_t tx\_data\_length)

This function is to set maximum LE data packet size.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_rand\_addr** (*esp\_bd\_addr\_t* rand\_addr)

This function allows configuring either a Non-Resolvable Private Address or a Static Random Address.

**Parameters** **rand\_addr** -- [in] The address to be configured. Refer to the table below for possible address subtypes:

address [47:46]	Address Type
0b00	Non-Resolvable Private Address
0b11	Static Random Address

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_resolvable\_private\_address\_timeout** (uint16\_t rpa\_timeout)

This function sets the length of time the Controller uses a Resolvable Private Address before generating and starting to use a new resolvable private address.

---

**Note:** Note: This function is currently not supported on the ESP32 but will be enabled in a future update.

---

**Parameters** **rpa\_timeout** -- [in] The timeout duration in seconds for how long a Resolvable Private Address is used before a new one is generated. The value must be within the range specified by the Bluetooth specification (0x0001 to 0x0E10), which corresponds to a time range of 1 second to 1 hour. The default value is 0x0384 (900 seconds or 15 minutes).

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_add\_device\_to\_resolving\_list** (*esp\_bd\_addr\_t* peer\_addr, uint8\_t addr\_type, uint8\_t \*peer\_irk)

This function adds a device to the resolving list used to generate and resolve Resolvable Private Addresses in the Controller.

---

**Note:** Note: This function shall not be used when address resolution is enabled in the Controller and:

- Advertising (other than periodic advertising) is enabled,
  - Scanning is enabled, or
  - an `HCI_LE_Create_Connection`, `HCI_LE_Extended_Create_Connection`, or `HCI_LE_Periodic_Advertising_Create_Sync` command is pending. This command may be used at any time when address resolution is disabled in the Controller. The added device shall be set to Network Privacy mode.
- 

**Parameters**

- **peer\_addr** -- **[in]** The peer identity address of the device to be added to the resolving list.
- **addr\_type** -- **[in]** The address type of the peer identity address (`BLE_ADDR_TYPE_PUBLIC` or `BLE_ADDR_TYPE_RANDOM`).
- **peer\_irk** -- **[in]** The Identity Resolving Key (IRK) of the device.

**Returns**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_clear\_rand\_addr** (void)

This function clears the random address for the application.

**Returns**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_local\_privacy** (bool privacy\_enable)

Enable/disable privacy (including address resolution) on the local device.

**Parameters** **privacy\_enable** -- **[in]** - enable/disable privacy on remote device.

**Returns**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_local\_icon** (uint16\_t icon)

set local gap appearance icon

**Parameters** **icon** -- **[in]** - External appearance value, these values are defined by the Bluetooth SIG, please refer to <https://www.bluetooth.com/specifications/assigned-numbers/>

**Returns**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_update\_whitelist** (bool add\_remove, *esp\_bd\_addr\_t* remote\_bda, *esp\_ble\_wl\_addr\_type\_t* wl\_addr\_type)

Add or remove device from white list.

**Parameters**

- **add\_remove** -- **[in]** the value is true if added the ble device to the white list, and false remove to the white list.
- **remote\_bda** -- **[in]** the remote device address add/remove from the white list.
- **wl\_addr\_type** -- **[in]** whitelist address type

**Returns**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_clear\_whitelist** (void)

Clear all white list.

**Returns**

- `ESP_OK` : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_get\_whitelist\_size** (uint16\_t \*length)

Get the whitelist size in the controller.

**Parameters** **length** -- [out] the white list length.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_prefer\_conn\_params** (*esp\_bd\_addr\_t* bd\_addr, uint16\_t min\_conn\_int, uint16\_t max\_conn\_int, uint16\_t slave\_latency, uint16\_t supervision\_tout)

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

**Parameters**

- **bd\_addr** -- [in] BD address of the peripheral
- **min\_conn\_int** -- [in] minimum preferred connection interval
- **max\_conn\_int** -- [in] maximum preferred connection interval
- **slave\_latency** -- [in] preferred slave latency
- **supervision\_tout** -- [in] preferred supervision timeout

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_device\_name** (const char \*name)

Set device name to the local device Note: This API don't affect the advertising data.

**Parameters** **name** -- [in] - device name.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_get\_device\_name** (void)

Get device name of the local device.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_get\_local\_used\_addr** (*esp\_bd\_addr\_t* local\_used\_addr, uint8\_t \*addr\_type)

This function is called to get local used address and address type. uint8\_t \*esp\_bt\_dev\_get\_address(void) get the public address.

**Parameters**

- **local\_used\_addr** -- [in] - current local used ble address (six bytes)
- **addr\_type** -- [in] - ble address type

**Returns** - ESP\_OK : success

- other : failed

uint8\_t \***esp\_ble\_resolve\_adv\_data** (uint8\_t \*adv\_data, uint8\_t type, uint8\_t \*length)

This function is called to get ADV data for a specific type.

**Parameters**

- **adv\_data** -- [in] - pointer of ADV data which to be resolved
- **type** -- [in] - finding ADV data type
- **length** -- [out] - return the length of ADV data not including type

**Returns** pointer of ADV data

*esp\_err\_t* **esp\_ble\_gap\_config\_adv\_data\_raw** (uint8\_t \*raw\_data, uint32\_t raw\_data\_len)

This function is called to set raw advertising data. User need to fill ADV data by self.

**Parameters**

- **raw\_data** -- **[in]** : raw advertising data with the format: [Length 1][Data Type 1][Data 1][Length 2][Data Type 2][Data 2] ...
- **raw\_data\_len** -- **[in]** : raw advertising data length , less than 31 bytes

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_scan\_rsp\_data\_raw** (uint8\_t \*raw\_data, uint32\_t raw\_data\_len)

This function is called to set raw scan response data. User need to fill scan response data by self.

**Parameters**

- **raw\_data** -- **[in]** : raw scan response data
- **raw\_data\_len** -- **[in]** : raw scan response data length , less than 31 bytes

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_read\_rssi** (*esp\_bd\_addr\_t* remote\_addr)

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT event.

**Parameters** **remote\_addr** -- **[in]** : The remote connection device address.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_add\_duplicate\_scan\_exceptional\_device** (*esp\_ble\_duplicate\_exceptional\_info\_type\_t* type, *esp\_duplicate\_info\_t* device\_info)

This function is called to add a device info into the duplicate scan exceptional list.

**Parameters**

- **type** -- **[in]** device info type, it is defined in *esp\_ble\_duplicate\_exceptional\_info\_type\_t* when type is MESH\_BEACON\_TYPE, MESH\_PROV\_SRV\_ADV or MESH\_PROXY\_SRV\_ADV , device\_info is invalid.
- **device\_info** -- **[in]** the device information.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_remove\_duplicate\_scan\_exceptional\_device** (*esp\_ble\_duplicate\_exceptional\_info\_type\_t* type, *esp\_duplicate\_info\_t* device\_info)

This function is called to remove a device info from the duplicate scan exceptional list.

**Parameters**

- **type** -- **[in]** device info type, it is defined in *esp\_ble\_duplicate\_exceptional\_info\_type\_t* when type is MESH\_BEACON\_TYPE, MESH\_PROV\_SRV\_ADV or MESH\_PROXY\_SRV\_ADV , device\_info is invalid.
- **device\_info** -- **[in]** the device information.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_clean\_duplicate\_scan\_exceptional\_list** (*esp\_duplicate\_scan\_exceptional\_list\_type\_t* list\_type)

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**Parameters** **list\_type** -- **[in]** duplicate scan exceptional list type, the value can be one or more of *esp\_duplicate\_scan\_exceptional\_list\_type\_t*.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_security\_param** (*esp\_ble\_sm\_param\_t* param\_type, void \*value, uint8\_t len)

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like 'Impersonation in the Pin Pairing Protocol' (CVE-2020-26555) and 'Authentication of the LE Legacy Pairing Protocol'.

To accept only `secure connection mode`, it is necessary do as following:

1. Set bit `ESP\_LE\_AUTH\_REQ\_SC\_ONLY` (`param\_type` is `ESP\_BLE\_SM\_AUTHEN\_REQ\_MODE`), bit `ESP\_LE\_AUTH\_BOND` and bit `ESP\_LE\_AUTH\_REQ\_MITM` is optional as required.
2. Set to `ESP\_BLE\_ONLY\_ACCEPT\_SPECIFIED\_AUTH\_ENABLE` (`param\_type` is `ESP\_BLE\_SM\_ONLY\_ACCEPT\_SPECIFIED\_SEC\_AUTH`).

**Parameters**

- **param\_type** -- [in] : the type of the param which to be set
- **value** -- [in] : the param value
- **len** -- [in] : the length of the param value

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_security\_rsp** (*esp\_bd\_addr\_t* bd\_addr, bool accept)

Grant security request access.

**Parameters**

- **bd\_addr** -- [in] : BD address of the peer
- **accept** -- [in] : accept the security request or not

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_set\_encryption** (*esp\_bd\_addr\_t* bd\_addr, *esp\_ble\_sec\_act\_t* sec\_act)

Set a gap parameter value. Use this function to change the default GAP parameter values.

**Parameters**

- **bd\_addr** -- [in] : the address of the peer device need to encryption
- **sec\_act** -- [in] : This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_passkey\_reply** (*esp\_bd\_addr\_t* bd\_addr, bool accept, uint32\_t passkey)

Reply the key value to the peer device in the legacy connection stage.

**Parameters**

- **bd\_addr** -- [in] : BD address of the peer
- **accept** -- [in] : passkey entry successful or declined.
- **passkey** -- [in] : passkey value, must be a 6 digit number, can be lead by 0.

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_confirm\_reply** (*esp\_bd\_addr\_t* bd\_addr, bool accept)

Reply the confirm value to the peer device in the secure connection stage.

**Parameters**

- **bd\_addr** -- **[in]** : BD address of the peer device
- **accept** -- **[in]** : numbers to compare are the same or different.

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_remove\_bond\_device** (*esp\_bd\_addr\_t* bd\_addr)

Removes a device from the security database list of peer device. It manages unpairing event while connected.

**Parameters** **bd\_addr** -- **[in]** : BD address of the peer device

**Returns** - ESP\_OK : success

- other : failed

int **esp\_ble\_get\_bond\_device\_num** (void)

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

**Returns** - >= 0 : bonded devices number.

- ESP\_FAIL : failed

*esp\_err\_t* **esp\_ble\_get\_bond\_device\_list** (int \*dev\_num, *esp\_ble\_bond\_dev\_t* \*dev\_list)

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Parameters**

- **dev\_num** -- **[inout]** Indicate the dev\_list array(buffer) size as input. If dev\_num is large enough, it means the actual number as output. Suggest that dev\_num value equal to esp\_ble\_get\_bond\_device\_num().
- **dev\_list** -- **[out]** an array(buffer) of *esp\_ble\_bond\_dev\_t* type. Use for storing the bonded devices address. The dev\_list should be allocated by who call this API.

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_oob\_req\_reply** (*esp\_bd\_addr\_t* bd\_addr, uint8\_t \*TK, uint8\_t len)

This function is called to provide the OOB data for SMP in response to ESP\_GAP\_BLE\_OOB\_REQ\_EVT.

**Parameters**

- **bd\_addr** -- **[in]** BD address of the peer device.
- **TK** -- **[in]** Temporary Key value, the TK value shall be a 128-bit random number
- **len** -- **[in]** length of temporary key, should always be 128-bit

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_sc\_oob\_req\_reply** (*esp\_bd\_addr\_t* bd\_addr, uint8\_t p\_c[16], uint8\_t p\_r[16])

This function is called to provide the OOB data for SMP in response to ESP\_GAP\_BLE\_SC\_OOB\_REQ\_EVT.

**Parameters**

- **bd\_addr** -- **[in]** BD address of the peer device.
- **p\_c** -- **[in]** Confirmation value, it shall be a 128-bit random number
- **p\_r** -- **[in]** Randomizer value, it should be a 128-bit random number

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_create\_sc\_oob\_data** (void)

This function is called to create the OOB data for SMP when secure connection.

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_disconnect** (*esp\_bd\_addr\_t* remote\_device)

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app\_id registered. `esp_ble_gattc_close` (`esp_gatt_if_t` gattc\_if, `uint16_t` conn\_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. `esp_ble_gap_disconnect`(`esp_bd_addr_t` remote\_device) disconnect the physical connection directly.

**Parameters** `remote_device` -- **[in]** : BD address of the peer device

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_get\_current\_conn\_params** (*esp\_bd\_addr\_t* bd\_addr, *esp\_gap\_conn\_params\_t* \*conn\_params)

This function is called to read the connection parameters information of the device.

**Parameters**

- `bd_addr` -- **[in]** BD address of the peer device.
- `conn_params` -- **[out]** the connection parameters information

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_gap\_ble\_set\_channels** (*esp\_gap\_ble\_channels\_t* channels)

BLE set channels.

**Parameters** `channels` -- **[in]** : The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

**Returns** - ESP\_OK : success

- ESP\_ERR\_INVALID\_STATE: if bluetooth stack is not yet enabled
- other : failed

*esp\_err\_t* **esp\_gap\_ble\_set\_authorization** (*esp\_bd\_addr\_t* bd\_addr, bool authorize)

This function is called to authorized a link after Authentication(MITM protection)

**Parameters**

- `bd_addr` -- **[in]** BD address of the peer device.
- `authorize` -- **[out]** Authorized the link or not.

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_read\_phy** (*esp\_bd\_addr\_t* bd\_addr)

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

**Parameters** `bd_addr` -- **[in]** : BD address of the peer device

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_preferred\_default\_phy** (*esp\_ble\_gap\_phy\_mask\_t* tx\_phy\_mask, *esp\_ble\_gap\_phy\_mask\_t* rx\_phy\_mask)

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

**Parameters**

- `tx_phy_mask` -- **[in]** : indicates the transmitter PHYs that the Host prefers the Controller to use
- `rx_phy_mask` -- **[in]** : indicates the receiver PHYs that the Host prefers the Controller to use

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_preferred\_phy** (*esp\_bd\_addr\_t* bd\_addr, *esp\_ble\_gap\_all\_phys\_t* all\_phys\_mask, *esp\_ble\_gap\_phy\_mask\_t* tx\_phy\_mask, *esp\_ble\_gap\_phy\_mask\_t* rx\_phy\_mask, *esp\_ble\_gap\_prefer\_phy\_options\_t* phy\_options)

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

**Parameters**

- **bd\_addr** -- **[in]** : remote address
- **all\_phys\_mask** -- **[in]** : a bit field that allows the Host to specify
- **tx\_phy\_mask** -- **[in]** : a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- **rx\_phy\_mask** -- **[in]** : a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- **phy\_options** -- **[in]** : a bit field that allows the Host to specify options for PHYs

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_set\_rand\_addr** (uint8\_t instance, *esp\_bd\_addr\_t* rand\_addr)

This function is used by the Host to set the random device address specified by the Random\_Address parameter.

**Parameters**

- **instance** -- **[in]** : Used to identify an advertising set
- **rand\_addr** -- **[in]** : Random Device Address

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_set\_params** (uint8\_t instance, const *esp\_ble\_gap\_ext\_adv\_params\_t* \*params)

This function is used by the Host to set the advertising parameters.

**Parameters**

- **instance** -- **[in]** : identifies the advertising set whose parameters are being configured.
- **params** -- **[in]** : advertising parameters

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_ext\_adv\_data\_raw** (uint8\_t instance, uint16\_t length, const uint8\_t \*data)

This function is used to set the data used in advertising PDUs that have a data field.

**Parameters**

- **instance** -- **[in]** : identifies the advertising set whose data are being configured
- **length** -- **[in]** : data length
- **data** -- **[in]** : data information

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_ext\_scan\_rsp\_data\_raw** (uint8\_t instance, uint16\_t length, const uint8\_t \*scan\_rsp\_data)

This function is used to provide scan response data used in scanning response PDUs.

**Parameters**

- **instance** -- **[in]** : identifies the advertising set whose response data are being configured.
- **length** -- **[in]** : responsedata length
- **scan\_rsp\_data** -- **[in]** : response data information

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_start** (uint8\_t num\_adv, const *esp\_ble\_gap\_ext\_adv\_t* \*ext\_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

**Parameters**

- **num\_adv** -- **[in]** : Number of advertising sets to enable or disable
- **ext\_adv** -- **[in]** : adv parameters

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_stop** (uint8\_t num\_adv, const uint8\_t \*ext\_adv\_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

**Parameters**

- **num\_adv** -- **[in]** : Number of advertising sets to enable or disable
- **ext\_adv\_inst** -- **[in]** : ext adv instance

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_set\_remove** (uint8\_t instance)

This function is used to remove an advertising set from the Controller.

**Parameters** **instance** -- **[in]** : Used to identify an advertising set

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_ext\_adv\_set\_clear** (void)

This function is used to remove all existing advertising sets from the Controller.

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_set\_params** (uint8\_t instance, const *esp\_ble\_gap\_periodic\_adv\_params\_t* \*params)

This function is used by the Host to set the parameters for periodic advertising.

**Parameters**

- **instance** -- **[in]** : identifies the advertising set whose periodic advertising parameters are being configured.
- **params** -- **[in]** : periodic adv parameters

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_config\_periodic\_adv\_data\_raw** (uint8\_t instance, uint16\_t length, const uint8\_t \*data)

This function is used to set the data used in periodic advertising PDUs.

**Parameters**

- **instance** -- **[in]** : identifies the advertising set whose periodic advertising parameters are being configured.
- **length** -- **[in]** : the length of periodic data
- **data** -- **[in]** : periodic data information

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_start** (uint8\_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

**Parameters** **instance** -- **[in]** : Used to identify an advertising set

**Returns** - ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_stop** (uint8\_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

**Parameters** **instance** -- **[in]** : Used to identify an advertising set

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_ext\_scan\_params** (const *esp\_ble\_ext\_scan\_params\_t* \*params)

This function is used to set the extended scan parameters to be used on the advertising channels.

**Parameters** **params** -- **[in]** : scan parameters

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_start\_ext\_scan** (uint32\_t duration, uint16\_t period)

This function is used to enable scanning.

**Parameters**

- **duration** -- **[in]** Scan duration time, where Time = N \* 10 ms. Range: 0x0001 to 0xFFFF.
- **period** -- **[in]** Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration. Time = N \* 1.28 sec. Range: 0x0001 to 0xFFFF.

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_stop\_ext\_scan** (void)

This function is used to disable scanning.

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_create\_sync** (const *esp\_ble\_gap\_periodic\_adv\_sync\_params\_t* \*params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

**Parameters** **params** -- **[in]** : sync parameters

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_sync\_cancel** (void)

This function is used to cancel the LE\_Periodic\_Advertising\_Create\_Sync command while it is pending.

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_sync\_terminate** (uint16\_t sync\_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

**Parameters** **sync\_handle** -- **[in]** : identify the periodic advertiser

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_add\_dev\_to\_list** (*esp\_ble\_addr\_type\_t* addr\_type, *esp\_bd\_addr\_t* addr, uint8\_t sid)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

**Parameters**

- **addr\_type** -- **[in]** : address type
- **addr** -- **[in]** : Device Address
- **sid** -- **[in]** : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_remove\_dev\_from\_list** (*esp\_ble\_addr\_type\_t* addr\_type, *esp\_bd\_addr\_t* addr, uint8\_t sid)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

**Parameters**

- **addr\_type** -- [in] : address type
- **addr** -- [in] : Device Address
- **sid** -- [in] : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_clear\_dev** (void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_prefer\_ext\_connect\_params\_set** (*esp\_bd\_addr\_t* addr, *esp\_ble\_gap\_phy\_mask\_t* phy\_mask, const *esp\_ble\_gap\_conn\_params\_t* \*phy\_1m\_conn\_params, const *esp\_ble\_gap\_conn\_params\_t* \*phy\_2m\_conn\_params, const *esp\_ble\_gap\_conn\_params\_t* \*phy\_coded\_conn\_params)

This function is used to set aux connection parameters.

**Parameters**

- **addr** -- [in] : device address
- **phy\_mask** -- [in] : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
- **phy\_1m\_conn\_params** -- [in] : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
- **phy\_2m\_conn\_params** -- [in] : Connection parameters for the LE 2M PHY are provided.
- **phy\_coded\_conn\_params** -- [in] : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_rcv\_enable** (uint16\_t sync\_handle, uint8\_t enable)

This function is used to set periodic advertising receive enable.

**Parameters**

- **sync\_handle** -- [in] : Handle of periodic advertising sync
- **enable** -- [in] : Determines whether reporting and duplicate filtering are enabled or disabled

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_sync\_trans** (*esp\_bd\_addr\_t* addr, uint16\_t service\_data, uint16\_t sync\_handle)

This function is used to transfer periodic advertising sync.

**Parameters**

- **addr** -- [in] : Peer device address
- **service\_data** -- [in] : Service data used by Host
- **sync\_handle** -- [in] : Handle of periodic advertising sync

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_periodic\_adv\_set\_info\_trans** (*esp\_bd\_addr\_t* addr, uint16\_t service\_data, uint8\_t adv\_handle)

This function is used to transfer periodic advertising set info.

**Parameters**

- **addr** -- [in] : Peer device address
- **service\_data** -- [in] : Service data used by Host
- **adv\_handle** -- [in] : Handle of advertising set

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_periodic\_adv\_sync\_trans\_params** (*esp\_bd\_addr\_t* addr, const *esp\_ble\_gap\_past\_params\_t* \*params)

This function is used to set periodic advertising sync transfer params.

**Parameters**

- **addr** -- [in] : Peer device address
- **params** -- [in] : Params of periodic advertising sync transfer

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_dtm\_tx\_start** (const *esp\_ble\_dtm\_tx\_t* \*tx\_params)

This function is used to start a test where the DUT generates reference packets at a fixed interval.

**Parameters** **tx\_params** -- [in] : DTM Transmitter parameters

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_dtm\_rx\_start** (const *esp\_ble\_dtm\_rx\_t* \*rx\_params)

This function is used to start a test where the DUT receives test reference packets at a fixed interval.

**Parameters** **rx\_params** -- [in] : DTM Receiver parameters

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_dtm\_enh\_tx\_start** (const *esp\_ble\_dtm\_enh\_tx\_t* \*tx\_params)

This function is used to start a test where the DUT generates reference packets at a fixed interval.

**Parameters** **tx\_params** -- [in] : DTM Transmitter parameters

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_dtm\_enh\_rx\_start** (const *esp\_ble\_dtm\_enh\_rx\_t* \*rx\_params)

This function is used to start a test where the DUT receives test reference packets at a fixed interval.

**Parameters** **rx\_params** -- [in] : DTM Receiver parameters

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_dtm\_stop** (void)

This function is used to stop any test which is in progress.

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_clear\_advertising** (void)

This function is used to clear legacy advertising.

**Returns** - ESP\_OK : success  
• other : failed

*esp\_err\_t* **esp\_ble\_gap\_vendor\_command\_send** (*esp\_ble\_vendor\_cmd\_params\_t* \*vendor\_cmd\_param)

This function is called to send vendor hci command.

**Parameters** **vendor\_cmd\_param** -- [in] vendor hci command parameters

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gap\_set\_privacy\_mode** (*esp\_ble\_addr\_type\_t* addr\_type, *esp\_bd\_addr\_t* addr, *esp\_ble\_privacy\_mode\_t* mode)

This function set the privacy mode of the device in resolving list.

---

**Note:** This feature is not supported on ESP32.

---

**Parameters**

- **addr\_type** -- [in] The address type of the peer identity address (BLE\_ADDR\_TYPE\_PUBLIC or BLE\_ADDR\_TYPE\_RANDOM).
- **addr** -- [in] The peer identity address of the device.
- **mode** -- [in] The privacy mode of the device.

**Returns**

- ESP\_OK : success
- other : failed

### Public Members

*esp\_bt\_status\_t* **status**  
Set periodic advertising sync transfer params status

*esp\_bd\_addr\_t* **bda**  
The remote device address

```
struct ble_set_perf_def_phy_cmpl_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERRED_DEFAULT_PHY_COMPLETE_EVT.
```

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate perf default phy set status

```
struct ble_set_perf_phy_cmpl_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERRED_PHY_COMPLETE_EVT.
```

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate perf phy set status

```
struct ble_set_privacy_mode_cmpl_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PRIVACY_MODE_COMPLETE_EVT.
```

### Public Members

*esp\_bt\_status\_t* **status**  
Indicate privacy mode set operation success status

```
struct ble_set_rand_cmpl_evt_param  
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.
```

### Public Members

#### *esp\_bt\_status\_t* status

Indicate set static rand address operation success status

struct **ble\_update\_conn\_params\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_UPDATE\_CONN\_PARAMS\_EVT.

### Public Members

#### *esp\_bt\_status\_t* status

Indicate update connection parameters success status

#### *esp\_bd\_addr\_t* bda

Bluetooth device address

#### uint16\_t min\_int

Min connection interval

#### uint16\_t max\_int

Max connection interval

#### uint16\_t latency

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

#### uint16\_t conn\_int

Current connection interval

#### uint16\_t timeout

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N \* 10 msec

struct **ble\_update\_duplicate\_exceptional\_list\_cmpl\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_UPDATE\_DUPLICATE\_EXCEPTIONAL\_LIST\_COMPLETE\_EVT.

### Public Members

#### *esp\_bt\_status\_t* status

Indicate update duplicate scan exceptional list operation success status

#### uint8\_t subcode

Define in *esp\_bt\_duplicate\_exceptional\_subcode\_type\_t*

#### uint16\_t length

The length of *device\_info*

***esp\_duplicate\_info\_t* device\_info**

device information, when subcode is ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_CLEAN, the value is invalid

struct **ble\_update\_whitelist\_cmpl\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_UPDATE\_WHITELIST\_COMPLETE\_EVT.

**Public Members*****esp\_bt\_status\_t* status**

Indicate the add or remove whitelist operation success status

***esp\_ble\_wl\_operation\_t* wl\_operation**

The value is ESP\_BLE\_WHITELIST\_ADD if add address to whitelist operation success, ESP\_BLE\_WHITELIST\_REMOVE if remove address from the whitelist operation success

struct **vendor\_cmd\_cmpl\_evt\_param**

*#include <esp\_gap\_ble\_api.h>* ESP\_GAP\_BLE\_VENDOR\_CMD\_COMPLETE\_EVT.

**Public Members****uint16\_t opcode**

vendor hci command opcode

**uint16\_t param\_len**

The length of parameter buffer

**uint8\_t \*p\_param\_buf**

The point of parameter buffer

**Structures**

struct **esp\_ble\_vendor\_cmd\_params\_t**

Vendor HCI command parameters.

**Public Members****uint16\_t opcode**

vendor hci command opcode

**uint8\_t param\_len**

the length of parameter

**uint8\_t \*p\_param\_buf**

the point of parameter buffer

struct **esp\_ble\_dtm\_tx\_t**

DTM TX parameters.

### Public Members

uint8\_t **tx\_channel**

channel for sending test data, tx\_channel = (Frequency - 2402)/2, tx\_channel range: 0x00-0x27, Frequency range: 2402 MHz to 2480 MHz

uint8\_t **len\_of\_data**

length in bytes of payload data in each packet

*esp\_ble\_dtm\_pkt\_payload\_t* **pkt\_payload**

packet payload type. value range: 0x00-0x07

struct **esp\_ble\_dtm\_rx\_t**

DTM RX parameters.

### Public Members

uint8\_t **rx\_channel**

channel for test data reception, rx\_channel = (Frequency - 2402)/2, tx\_channel range: 0x00-0x27, Frequency range: 2402 MHz to 2480 MHz

struct **esp\_ble\_adv\_params\_t**

Advertising parameters.

### Public Members

uint16\_t **adv\_int\_min**

Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N \* 0.625 msec Time Range: 20 ms to 10.24 sec

uint16\_t **adv\_int\_max**

Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N \* 0.625 msec Time Range: 20 ms to 10.24 sec  
Advertising max interval

*esp\_ble\_adv\_type\_t* **adv\_type**

Advertising type

*esp\_ble\_addr\_type\_t* **own\_addr\_type**

Owner bluetooth device address type

*esp\_bd\_addr\_t* **peer\_addr**

Peer device bluetooth device address

*esp\_ble\_addr\_type\_t* **peer\_addr\_type**

Peer device bluetooth device address type, only support public address type and random address type

*esp\_ble\_adv\_channel\_t* **channel\_map**

Advertising channel map

*esp\_ble\_adv\_filter\_t* **adv\_filter\_policy**

Advertising filter policy

struct **esp\_ble\_adv\_data\_t**

Advertising data content, according to "Supplement to the Bluetooth Core Specification".

### Public Members

bool **set\_scan\_rsp**

Set this advertising data as scan response or not

bool **include\_name**

Advertising data include device name or not

bool **include\_txpower**

Advertising data include TX power

int **min\_interval**

Advertising data show slave preferred connection min interval. The connection interval in the following manner:  $\text{connIntervalmin} = \text{Conn\_Interval\_Min} * 1.25 \text{ ms}$  Conn\_Interval\_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int **max\_interval**

Advertising data show slave preferred connection max interval. The connection interval in the following manner:  $\text{connIntervalmax} = \text{Conn\_Interval\_Max} * 1.25 \text{ ms}$  Conn\_Interval\_Max range: 0x0006 to 0x0C80 Conn\_Interval\_Max shall be equal to or greater than the Conn\_Interval\_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int **appearance**

External appearance of device

uint16\_t **manufacturer\_len**

Manufacturer data length

uint8\_t \***p\_manufacturer\_data**

Manufacturer data point

uint16\_t **service\_data\_len**

Service data length

uint8\_t \***p\_service\_data**

Service data point

uint16\_t **service\_uuid\_len**

Service uuid length

uint8\_t \***p\_service\_uuid**

Service uuid array point

uint8\_t **flag**

Advertising flag of discovery mode, see BLE\_ADV\_DATA\_FLAG detail

struct **esp\_ble\_scan\_params\_t**

Ble scan parameters.

### Public Members

*esp\_ble\_scan\_type\_t* **scan\_type**

Scan type

*esp\_ble\_addr\_type\_t* **own\_addr\_type**

Owner address type

*esp\_ble\_scan\_filter\_t* **scan\_filter\_policy**

Scan filter policy

uint16\_t **scan\_interval**

Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N \* 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16\_t **scan\_window**

Scan window. The duration of the LE scan. LE\_Scan\_Window shall be less than or equal to LE\_Scan\_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N \* 0.625 msec Time Range: 2.5 msec to 10240 msec

*esp\_ble\_scan\_duplicate\_t* **scan\_duplicate**

The Scan\_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE\_SCAN\_DUPLICATE\_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct **esp\_gap\_conn\_params\_t**

connection parameters information

### Public Members

uint16\_t **interval**

connection interval

uint16\_t **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

**uint16\_t timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80  
Time = N \* 10 msec Time Range: 100 msec to 32 seconds

struct **esp\_ble\_conn\_update\_params\_t**

Connection update parameters.

**Public Members***esp\_bd\_addr\_t* **bda**

Bluetooth device address

**uint16\_t min\_int**

Min connection interval

**uint16\_t max\_int**

Max connection interval

**uint16\_t latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

**uint16\_t timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80  
Time = N \* 10 msec Time Range: 100 msec to 32 seconds

struct **esp\_ble\_pkt\_data\_length\_params\_t**

BLE pkt data length keys.

**Public Members****uint16\_t rx\_len**

pkt rx data length value

**uint16\_t tx\_len**

pkt tx data length value

struct **esp\_ble\_penc\_keys\_t**

BLE encryption keys.

**Public Members***esp\_bt\_octet16\_t* **ltk**

The long term key

*esp\_bt\_octet8\_t* **rand**

The random number

uint16\_t **ediv**

The ediv value

uint8\_t **sec\_level**

The security level of the security link

uint8\_t **key\_size**

The key size(7~16) of the security link

struct **esp\_ble\_pcsrkeys\_t**

BLE CSRK keys.

### **Public Members**

uint32\_t **counter**

The counter

*esp\_bt\_octet16\_t* **csrkey**

The csrkey

uint8\_t **sec\_level**

The security level

struct **esp\_ble\_pidkeys\_t**

BLE pid keys.

### **Public Members**

*esp\_bt\_octet16\_t* **irk**

The irk value

*esp\_ble\_addr\_type\_t* **addr\_type**

The address type

*esp\_bd\_addr\_t* **static\_addr**

The static address

struct **esp\_ble\_lenckeys\_t**

BLE Encryption reproduction keys.

### **Public Members**

*esp\_bt\_octet16\_t* **ltk**

The long term key

uint16\_t **div**

The div value

uint8\_t **key\_size**

The key size of the security link

uint8\_t **sec\_level**

The security level of the security link

struct **esp\_ble\_lcsrk\_keys**

BLE SRK keys.

### Public Members

uint32\_t **counter**

The counter value

uint16\_t **div**

The div value

uint8\_t **sec\_level**

The security level of the security link

*esp\_bt\_octet16\_t* **csrk**

The csrk key value

struct **esp\_ble\_sec\_key\_notif\_t**

Structure associated with ESP\_KEY\_NOTIF\_EVT.

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**

peer address

uint32\_t **passkey**

the numeric value for comparison. If just\_works, do not show this number to UI

struct **esp\_ble\_sec\_req\_t**

Structure of the security request.

### Public Members

*esp\_bd\_addr\_t* **bd\_addr**

peer address

struct **esp\_ble\_bond\_key\_info\_t**

struct type of the bond key information value

**Public Members**

*esp\_ble\_key\_mask\_t* **key\_mask**

the key mask to indicate witch key is present

*esp\_ble\_penc\_keys\_t* **penc\_key**

received peer encryption key

*esp\_ble\_pcsrkeys\_t* **pcsrk\_key**

received peer device SRK

*esp\_ble\_pid\_keys\_t* **pid\_key**

peer device ID key

struct **esp\_ble\_bond\_dev\_t**

struct type of the bond device value

**Public Members**

*esp\_bd\_addr\_t* **bd\_addr**

peer address

*esp\_ble\_bond\_key\_info\_t* **bond\_key**

the bond key information

struct **esp\_ble\_key\_t**

union type of the security key value

**Public Members**

*esp\_bd\_addr\_t* **bd\_addr**

peer address

*esp\_ble\_key\_type\_t* **key\_type**

key type of the security link

*esp\_ble\_key\_value\_t* **p\_key\_value**

the pointer to the key value

struct **esp\_ble\_local\_id\_keys\_t**

structure type of the ble local id keys value

**Public Members**

*esp\_bt\_octet16\_t* **ir**

the 16 bits of the ir value

*esp\_bt\_octet16\_t* **irk**

the 16 bits of the ir key value

*esp\_bt\_octet16\_t* **dhk**

the 16 bits of the dh key value

struct **esp\_ble\_local\_oob\_data\_t**

structure type of the ble local oob data value

### **Public Members**

*esp\_bt\_octet16\_t* **oob\_c**

the 128 bits of confirmation value

*esp\_bt\_octet16\_t* **oob\_r**

the 128 bits of randomizer value

struct **esp\_ble\_auth\_cmpl\_t**

Structure associated with ESP\_AUTH\_CMPL\_EVT.

### **Public Members**

*esp\_bd\_addr\_t* **bd\_addr**

BD address peer device.

bool **key\_present**

Valid link key value in key element

*esp\_link\_key* **key**

Link key associated with peer device.

uint8\_t **key\_type**

The type of Link Key

bool **success**

TRUE of authentication succeeded, FALSE if failed.

uint8\_t **fail\_reason**

The HCI reason/error code for when success=FALSE

*esp\_ble\_addr\_type\_t* **addr\_type**

Peer device address type

*esp\_bt\_dev\_type\_t* **dev\_type**

Device type

*esp\_ble\_auth\_req\_t* **auth\_mode**

authentication mode

struct **esp\_ble\_gap\_ext\_adv\_params\_t**

ext adv parameters

### **Public Members**

*esp\_ble\_ext\_adv\_type\_mask\_t* **type**

ext adv type

uint32\_t **interval\_min**

ext adv minimum interval

uint32\_t **interval\_max**

ext adv maximum interval

*esp\_ble\_adv\_channel\_t* **channel\_map**

ext adv channel map

*esp\_ble\_addr\_type\_t* **own\_addr\_type**

ext adv own address type

*esp\_ble\_addr\_type\_t* **peer\_addr\_type**

ext adv peer address type

*esp\_bd\_addr\_t* **peer\_addr**

ext adv peer address

*esp\_ble\_adv\_filter\_t* **filter\_policy**

ext adv filter policy

int8\_t **tx\_power**

ext adv tx power

*esp\_ble\_gap\_pri\_phy\_t* **primary\_phy**

ext adv primary phy

uint8\_t **max\_skip**

ext adv maximum skip

*esp\_ble\_gap\_phy\_t* **secondary\_phy**

ext adv secondary phy

uint8\_t **sid**

ext adv sid

bool **scan\_req\_notif**  
ext adv scan request event notify

struct **esp\_ble\_ext\_scan\_cfg\_t**  
ext scan config

### Public Members

*esp\_ble\_scan\_type\_t* **scan\_type**  
ext scan type

uint16\_t **scan\_interval**  
ext scan interval

uint16\_t **scan\_window**  
ext scan window

struct **esp\_ble\_ext\_scan\_params\_t**  
ext scan parameters

### Public Members

*esp\_ble\_addr\_type\_t* **own\_addr\_type**  
ext scan own address type

*esp\_ble\_scan\_filter\_t* **filter\_policy**  
ext scan filter policy

*esp\_ble\_scan\_duplicate\_t* **scan\_duplicate**  
ext scan duplicate scan

*esp\_ble\_ext\_scan\_cfg\_mask\_t* **cfg\_mask**  
ext scan config mask

*esp\_ble\_ext\_scan\_cfg\_t* **uncoded\_cfg**  
ext scan uncoded config parameters

*esp\_ble\_ext\_scan\_cfg\_t* **coded\_cfg**  
ext scan coded config parameters

struct **esp\_ble\_gap\_conn\_params\_t**  
create extend connection parameters

### Public Members

uint16\_t **scan\_interval**

init scan interval

uint16\_t **scan\_window**

init scan window

uint16\_t **interval\_min**

minimum interval

uint16\_t **interval\_max**

maximum interval

uint16\_t **latency**

ext scan type

uint16\_t **supervision\_timeout**

connection supervision timeout

uint16\_t **min\_ce\_len**

minimum ce length

uint16\_t **max\_ce\_len**

maximum ce length

struct **esp\_ble\_gap\_ext\_adv\_t**

extend adv enable parameters

### Public Members

uint8\_t **instance**

advertising handle

int **duration**

advertising duration

int **max\_events**

maximum number of extended advertising events

struct **esp\_ble\_gap\_periodic\_adv\_params\_t**

periodic adv parameters

### Public Members

uint16\_t **interval\_min**

periodic advertising minimum interval

`uint16_t interval_max`  
periodic advertising maximum interval

`uint8_t properties`  
periodic advertising properties

struct `esp_ble_gap_periodic_adv_sync_params_t`  
periodic adv sync parameters

### Public Members

*esp\_ble\_gap\_sync\_t* `filter_policy`

Configures the filter policy for periodic advertising sync: 0: Use Advertising SID, Advertiser Address Type, and Advertiser Address parameters to determine the advertiser to listen to. 1: Use the Periodic Advertiser List to determine the advertiser to listen to.

`uint8_t sid`  
SID of the periodic advertising

*esp\_ble\_addr\_type\_t* `addr_type`  
Address type of the periodic advertising

*esp\_bd\_addr\_t* `addr`  
Address of the periodic advertising

`uint16_t skip`  
Maximum number of periodic advertising events that can be skipped

`uint16_t sync_timeout`  
Synchronization timeout

struct `esp_ble_gap_ext_adv_report_t`  
extend adv report parameters

### Public Members

*esp\_ble\_gap\_adv\_type\_t* `event_type`  
extend advertising type

`uint8_t addr_type`  
extend advertising address type

*esp\_bd\_addr\_t* `addr`  
extend advertising address

*esp\_ble\_gap\_pri\_phy\_t* `primary_phy`  
extend advertising primary phy

*esp\_ble\_gap\_phy\_t* **secondly\_phy**

extend advertising secondary phy

uint8\_t **sid**

extend advertising sid

uint8\_t **tx\_power**

extend advertising tx power

int8\_t **rss\_i**

extend advertising rssi

uint16\_t **per\_adv\_interval**

periodic advertising interval

uint8\_t **dir\_addr\_type**

direct address type

*esp\_bd\_addr\_t* **dir\_addr**

direct address

*esp\_ble\_gap\_ext\_adv\_data\_status\_t* **data\_status**

data type

uint8\_t **adv\_data\_len**

extend advertising data length

uint8\_t **adv\_data**[251]

extend advertising data

struct **esp\_ble\_gap\_periodic\_adv\_report\_t**

periodic adv report parameters

### Public Members

uint16\_t **sync\_handle**

periodic advertising train handle

uint8\_t **tx\_power**

periodic advertising tx power

int8\_t **rss\_i**

periodic advertising rssi

*esp\_ble\_gap\_ext\_adv\_data\_status\_t* **data\_status**

periodic advertising data type

`uint8_t data_length`  
periodic advertising data length

`uint8_t data[251]`  
periodic advertising data

struct `esp_ble_gap_periodic_adv_sync_estab_t`  
periodic adv sync establish parameters

### Public Members

`uint8_t status`  
periodic advertising sync status

`uint16_t sync_handle`  
periodic advertising train handle

`uint8_t sid`  
periodic advertising sid

`esp_ble_addr_type_t addr_type`  
periodic advertising address type

`esp_bd_addr_t adv_addr`  
periodic advertising address

`esp_ble_gap_phy_t adv_phy`  
periodic advertising adv phy type

`uint16_t period_adv_interval`  
periodic advertising interval

`uint8_t adv_clk_accuracy`  
periodic advertising clock accuracy

struct `esp_ble_dtm_enh_tx_t`  
DTM TX parameters.

### Public Members

`uint8_t tx_channel`  
channel for sending test data,  $tx\_channel = (Frequency - 2402) / 2$ , `tx_channel` range: 0x00-0x27, Frequency range: 2402 MHz to 2480 MHz

`uint8_t len_of_data`  
length in bytes of payload data in each packet

*esp\_ble\_dtm\_pkt\_payload\_t* **pkt\_payload**

packet payload type. value range: 0x00-0x07

*esp\_ble\_gap\_phy\_t* **phy**

the phy type used by the transmitter, coded phy with S=2:0x04

struct **esp\_ble\_dtm\_enh\_rx\_t**

DTM RX parameters.

### Public Members

uint8\_t **rx\_channel**

channel for test data reception, rx\_channel = (Frequency -2402)/2, tx\_channel range:0x00-0x27, Frequency range: 2402 MHz to 2480 MHz

*esp\_ble\_gap\_phy\_t* **phy**

the phy type used by the receiver, 1M phy: 0x01, 2M phy:0x02, coded phy:0x03

uint8\_t **modulation\_idx**

modulation index, 0x00:standard modulation index, 0x01:stable modulation index

struct **esp\_ble\_gap\_past\_params\_t**

periodic adv sync transfer parameters

### Public Members

*esp\_ble\_gap\_past\_mode\_t* **mode**

periodic advertising sync transfer mode

uint16\_t **skip**

the number of periodic advertising packets that can be skipped

uint16\_t **sync\_timeout**

synchronization timeout for the periodic advertising train

uint8\_t **cte\_type**

periodic advertising sync transfer CET type

### Macros

**ESP\_BLE\_ADV\_FLAG\_LIMIT\_DISC**

BLE\_ADV\_DATA\_FLAG data flag bit definition used for advertising data flag.

**ESP\_BLE\_ADV\_FLAG\_GEN\_DISC**

**ESP\_BLE\_ADV\_FLAG\_BREDR\_NOT\_SPT**

**ESP\_BLE\_ADV\_FLAG\_DMT\_CONTROLLER\_SPT**

**ESP\_BLE\_ADV\_FLAG\_DMT\_HOST\_SPT**

**ESP\_BLE\_ADV\_FLAG\_NON\_LIMIT\_DISC**

**ESP\_LE\_KEY\_NONE**

relate to BTM\_LE\_KEY\_XXX in stack/btm\_api.h

No encryption key

**ESP\_LE\_KEY\_PENC**

encryption key, encryption information of peer device

**ESP\_LE\_KEY\_PID**

identity key of the peer device

**ESP\_LE\_KEY\_PCSRK**

peer SRK

**ESP\_LE\_KEY\_PLK**

Link key

**ESP\_LE\_KEY\_LLK**

peer link key

**ESP\_LE\_KEY\_LENC**

master role security information:div

**ESP\_LE\_KEY\_LID**

master device ID key

**ESP\_LE\_KEY\_LCSRK**

local CSRK has been deliver to peer

**ESP\_LE\_AUTH\_NO\_BOND**

relate to BTM\_LE\_AUTH\_XXX in stack/btm\_api.h

0 no bondingv

**ESP\_LE\_AUTH\_BOND**

1 << 0 device in the bonding with peer

**ESP\_LE\_AUTH\_REQ\_MITM**

1 << 2 man in the middle attack

**ESP\_LE\_AUTH\_REQ\_BOND\_MITM**

0101 banding with man in the middle attack

**ESP\_LE\_AUTH\_REQ\_SC\_ONLY**

1 << 3 secure connection

**ESP\_LE\_AUTH\_REQ\_SC\_BOND**

1001 secure connection with bond

**ESP\_LE\_AUTH\_REQ\_SC\_MITM**

1100 secure conn with MITM

**ESP\_LE\_AUTH\_REQ\_SC\_MITM\_BOND**

1101 SC with MITM and Bonding

**ESP\_BLE\_ONLY\_ACCEPT\_SPECIFIED\_AUTH\_DISABLE**

authentication disable

**ESP\_BLE\_ONLY\_ACCEPT\_SPECIFIED\_AUTH\_ENABLE**

authentication enable

**ESP\_BLE\_OOB\_DISABLE**

disbale the out of bond

**ESP\_BLE\_OOB\_ENABLE**

enable the out of bond

**ESP\_IO\_CAP\_OUT**

relate to BTM\_IO\_CAP\_xxx in stack/btm\_api.h

DisplayOnly

**ESP\_IO\_CAP\_IO**

DisplayYesNo

**ESP\_IO\_CAP\_IN**

KeyboardOnly

**ESP\_IO\_CAP\_NONE**

NoInputNoOutput

**ESP\_IO\_CAP\_KBDISP**

Keyboard display

**ESP\_BLE\_APPEARANCE\_UNKNOWN**

relate to BTM\_BLE\_APPEARANCE\_UNKNOWN in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_PHONE**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_PHONE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_COMPUTER**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_COMPUTER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_WATCH**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_WATCH in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_SPORTS\_WATCH**

relate to BTM\_BLE\_APPEARANCE\_SPORTS\_WATCH in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_CLOCK**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_CLOCK in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_DISPLAY**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_DISPLAY in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_REMOTE**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_REMOTE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_EYEGLASSES**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_EYEGLASSES in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_TAG**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_TAG in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_KEYRING**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_KEYRING in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_MEDIA\_PLAYER**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_MEDIA\_PLAYER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_BARCODE\_SCANNER**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_BARCODE\_SCANNER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_THERMOMETER**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_THERMOMETER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_THERMOMETER\_EAR**

relate to BTM\_BLE\_APPEARANCE\_THERMOMETER\_EAR in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_HEART\_RATE**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_HEART\_RATE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_HEART\_RATE\_BELT**

relate to BTM\_BLE\_APPEARANCE\_HEART\_RATE\_BELT in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_BLOOD\_PRESSURE**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_BLOOD\_PRESSURE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_BLOOD\_PRESSURE\_ARM**

relate to BTM\_BLE\_APPEARANCE\_BLOOD\_PRESSURE\_ARM in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_BLOOD\_PRESSURE\_WRIST**

relate to BTM\_BLE\_APPEARANCE\_BLOOD\_PRESSURE\_WRIST in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_HID**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_HID in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_HID\_KEYBOARD**

relate to BTM\_BLE\_APPEARANCE\_HID\_KEYBOARD in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_HID\_MOUSE**

relate to BTM\_BLE\_APPEARANCE\_HID\_MOUSE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_HID\_JOYSTICK**

relate to BTM\_BLE\_APPEARANCE\_HID\_JOYSTICK in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_HID\_GAMEPAD**

relate to BTM\_BLE\_APPEARANCE\_HID\_GAMEPAD in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_HID\_DIGITIZER\_TABLET**

relate to BTM\_BLE\_APPEARANCE\_HID\_DIGITIZER\_TABLET in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_HID\_CARD\_READER**

relate to BTM\_BLE\_APPEARANCE\_HID\_CARD\_READER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_HID\_DIGITAL\_PEN**

relate to BTM\_BLE\_APPEARANCE\_HID\_DIGITAL\_PEN in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_HID\_BARCODE\_SCANNER**

relate to BTM\_BLE\_APPEARANCE\_HID\_BARCODE\_SCANNER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_GLUCOSE**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_GLUCOSE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_WALKING**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_WALKING in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_WALKING\_IN\_SHOE**

relate to BTM\_BLE\_APPEARANCE\_WALKING\_IN\_SHOE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_WALKING\_ON\_SHOE**

relate to BTM\_BLE\_APPEARANCE\_WALKING\_ON\_SHOE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_WALKING\_ON\_HIP**

relate to BTM\_BLE\_APPEARANCE\_WALKING\_ON\_HIP in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_CYCLING**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_CYCLING in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_CYCLING\_COMPUTER**

relate to BTM\_BLE\_APPEARANCE\_CYCLING\_COMPUTER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_CYCLING\_SPEED**

relate to BTM\_BLE\_APPEARANCE\_CYCLING\_SPEED in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_CYCLING\_CADENCE**

relate to BTM\_BLE\_APPEARANCE\_CYCLING\_CADENCE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_CYCLING\_POWER**

relate to BTM\_BLE\_APPEARANCE\_CYCLING\_POWER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_CYCLING\_SPEED\_CADENCE**

relate to BTM\_BLE\_APPEARANCE\_CYCLING\_SPEED\_CADENCE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_STANDALONE\_SPEAKER**

relate to BTM\_BLE\_APPEARANCE\_STANDALONE\_SPEAKER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_PULSE\_OXIMETER**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_PULSE\_OXIMETER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_PULSE\_OXIMETER\_FINGERTIP**

relate to BTM\_BLE\_APPEARANCE\_PULSE\_OXIMETER\_FINGERTIP in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_PULSE\_OXIMETER\_WRIST**

relate to BTM\_BLE\_APPEARANCE\_PULSE\_OXIMETER\_WRIST in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_WEIGHT**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_WEIGHT in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_PERSONAL\_MOBILITY\_DEVICE**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_PERSONAL\_MOBILITY\_DEVICE in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_POWERED\_WHEELCHAIR**

relate to BTM\_BLE\_APPEARANCE\_POWERED\_WHEELCHAIR in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_MOBILITY\_SCOOTER**

relate to BTM\_BLE\_APPEARANCE\_MOBILITY\_SCOOTER in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_CONTINUOUS\_GLUCOSE\_MONITOR**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_CONTINUOUS\_GLUCOSE\_MONITOR in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_INSULIN\_PUMP**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_INSULIN\_PUMP in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_INSULIN\_PUMP\_DURABLE\_PUMP**

relate to BTM\_BLE\_APPEARANCE\_INSULIN\_PUMP\_DURABLE\_PUMP in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_INSULIN\_PUMP\_PATCH\_PUMP**

relate to BTM\_BLE\_APPEARANCE\_INSULIN\_PUMP\_PATCH\_PUMP in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_INSULIN\_PEN**

relate to BTM\_BLE\_APPEARANCE\_INSULIN\_PEN in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_MEDICATION\_DELIVERY**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_MEDICATION\_DELIVERY in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_GENERIC\_OUTDOOR\_SPORTS**

relate to BTM\_BLE\_APPEARANCE\_GENERIC\_OUTDOOR\_SPORTS in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION**

relate to BTM\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_AND\_NAV**

relate to BTM\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_AND\_NAV in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_POD**

relate to BTM\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_POD in stack/btm\_ble\_api.h

**ESP\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_POD\_AND\_NAV**

relate to BTM\_BLE\_APPEARANCE\_OUTDOOR\_SPORTS\_LOCATION\_POD\_AND\_NAV in stack/btm\_ble\_api.h

**BLE\_DTM\_PKT\_PAYLOAD\_0x00**

PRBS9 sequence '1111111100000111101...' (in transmission order) as described in [Vol 6] Part F, Section 4.1.5

**BLE\_DTM\_PKT\_PAYLOAD\_0x01**

Repeated '11110000' (in transmission order) sequence as described in [Vol 6] Part F, Section 4.1.5

**BLE\_DTM\_PKT\_PAYLOAD\_0x02**

Repeated '10101010' (in transmission order) sequence as described in [Vol 6] Part F, Section 4.1.5

**BLE\_DTM\_PKT\_PAYLOAD\_0x03**

PRBS15 sequence as described in [Vol 6] Part F, Section 4.1.5

**BLE\_DTM\_PKT\_PAYLOAD\_0x04**

Repeated '11111111' (in transmission order) sequence

**BLE\_DTM\_PKT\_PAYLOAD\_0x05**

Repeated '00000000' (in transmission order) sequence

**BLE\_DTM\_PKT\_PAYLOAD\_0x06**

Repeated '00001111' (in transmission order) sequence

**BLE\_DTM\_PKT\_PAYLOAD\_0x07**

Repeated '01010101' (in transmission order) sequence

**BLE\_DTM\_PKT\_PAYLOAD\_MAX**

0x08 ~ 0xFF, Reserved for future use

**ESP\_GAP\_BLE\_CHANNELS\_LEN**

channel length

**ESP\_GAP\_BLE\_ADD\_WHITELIST\_COMPLETE\_EVT**

This is the old name, just for backwards compatibility.

**ESP\_BLE\_ADV\_DATA\_LEN\_MAX**

Advertising data maximum length.

**ESP\_BLE\_SCAN\_RSP\_DATA\_LEN\_MAX**

Scan response data maximum length.

**VENDOR\_HCI\_CMD\_MASK**

**BLE\_BIT** (n)

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_NONCONN\_NONSCANNABLE\_UNDIRECTED**

Non-Connectable and Non-Scannable Undirected advertising

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_CONNECTABLE**

Connectable advertising

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_SCANNABLE**

Scannable advertising

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_DIRECTED**

Directed advertising

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_HD\_DIRECTED**

High Duty Cycle Directed Connectable advertising ( $\leq 3.75$  ms Advertising Interval)

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_LEGACY**

Use legacy advertising PDUs

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_ANON\_ADV**

Omit advertiser's address from all PDUs ("anonymous advertising")

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_INCLUDE\_TX\_PWR**

Include TxPower in the extended header of the advertising PDU

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_MASK**

Reserved for future use If extended advertising PDU types are being used (bit 4 = 0) then: The advertisement shall not be both connectable and scannable. High duty cycle directed connectable advertising ( $\leq 3.75$  ms advertising interval) shall not be used (bit 3 = 0) ADV\_IND

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_LEGACY\_IND**

ADV\_DIRECT\_IND (low duty cycle)

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_LEGACY\_LD\_DIR**

ADV\_DIRECT\_IND (high duty cycle)

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_LEGACY\_HD\_DIR**

ADV\_SCAN\_IND

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_LEGACY\_SCAN**

ADV\_NONCONN\_IND

**ESP\_BLE\_GAP\_SET\_EXT\_ADV\_PROP\_LEGACY\_NONCONN**

**ESP\_BLE\_GAP\_PHY\_1M**

Secondary Advertisement PHY is LE1M

**ESP\_BLE\_GAP\_PHY\_2M**

Secondary Advertisement PHY is LE2M

**ESP\_BLE\_GAP\_PHY\_CODED**

Secondary Advertisement PHY is LE Coded

**ESP\_BLE\_GAP\_NO\_PREFER\_TRANSMIT\_PHY**

No Prefer TX PHY supported by controller

**ESP\_BLE\_GAP\_NO\_PREFER\_RECEIVE\_PHY**

No Prefer RX PHY supported by controller

**ESP\_BLE\_GAP\_PRI\_PHY\_1M**

Primary phy only support 1M and LE coded phy.

Primary Phy is LE1M

**ESP\_BLE\_GAP\_PRI\_PHY\_CODED**

Primary Phy is LE CODED

**ESP\_BLE\_GAP\_PHY\_1M\_PREF\_MASK**

The Host prefers use the LE1M transmitter or receiver PHY

**ESP\_BLE\_GAP\_PHY\_2M\_PREF\_MASK**

The Host prefers use the LE2M transmitter or receiver PHY

**ESP\_BLE\_GAP\_PHY\_CODED\_PREF\_MASK**

The Host prefers use the LE CODED transmitter or receiver PHY

**ESP\_BLE\_GAP\_PHY\_OPTIONS\_NO\_PREF**

The Host has no preferred coding when transmitting on the LE Coded PHY

**ESP\_BLE\_GAP\_PHY\_OPTIONS\_PREF\_S2\_CODING**

The Host prefers that S=2 coding be used when transmitting on the LE Coded PHY

**ESP\_BLE\_GAP\_PHY\_OPTIONS\_PREF\_S8\_CODING**

The Host prefers that S=8 coding be used when transmitting on the LE Coded PHY

**ESP\_BLE\_GAP\_EXT\_SCAN\_CFG\_UNCODE\_MASK**

Scan Advertisements on the LE1M PHY

**ESP\_BLE\_GAP\_EXT\_SCAN\_CFG\_CODE\_MASK**

Scan advertisements on the LE coded PHY

**ESP\_BLE\_GAP\_EXT\_ADV\_DATA\_COMPLETE**

Advertising data.

extended advertising data complete

**ESP\_BLE\_GAP\_EXT\_ADV\_DATA\_INCOMPLETE**

extended advertising data incomplete

**ESP\_BLE\_GAP\_EXT\_ADV\_DATA\_TRUNCATED**

extended advertising data truncated mode

**ESP\_BLE\_GAP\_SYNC\_POLICY\_BY\_ADV\_INFO**

Advertising SYNC policy.

sync policy by advertising info

**ESP\_BLE\_GAP\_SYNC\_POLICY\_BY\_PERIODIC\_LIST**

periodic advertising sync policy

**ESP\_BLE\_ADV\_REPORT\_EXT\_ADV\_IND**

Advertising report.

advertising report with extended advertising indication type

**ESP\_BLE\_ADV\_REPORT\_EXT\_SCAN\_IND**

advertising report with extended scan indication type

**ESP\_BLE\_ADV\_REPORT\_EXT\_DIRECT\_ADV**

advertising report with extended direct advertising indication type

**ESP\_BLE\_ADV\_REPORT\_EXT\_SCAN\_RSP**

advertising report with extended scan response indication type Bluetooth 5.0, Vol 2, Part E, 7.7.65.13

**ESP\_BLE\_LEGACY\_ADV\_TYPE\_IND**

advertising report with legacy advertising indication type

**ESP\_BLE\_LEGACY\_ADV\_TYPE\_DIRECT\_IND**

advertising report with legacy direct indication type

**ESP\_BLE\_LEGACY\_ADV\_TYPE\_SCAN\_IND**

advertising report with legacy scan indication type

**ESP\_BLE\_LEGACY\_ADV\_TYPE\_NONCON\_IND**

advertising report with legacy non connectable indication type

**ESP\_BLE\_LEGACY\_ADV\_TYPE\_SCAN\_RSP\_TO\_ADV\_IND**

advertising report with legacy scan response indication type

**ESP\_BLE\_LEGACY\_ADV\_TYPE\_SCAN\_RSP\_TO\_ADV\_SCAN\_IND**

advertising report with legacy advertising with scan response indication type

**EXT\_ADV\_TX\_PWR\_NO\_PREFERENCE**

Extend advertising tx power, range: [-127, +126] dBm.

host has no preference for tx power

**ESP\_BLE\_GAP\_PAST\_MODE\_NO\_SYNC\_EVT**

Periodic advertising sync trans mode.

No attempt is made to sync and no periodic adv sync transfer received event

**ESP\_BLE\_GAP\_PAST\_MODE\_NO\_REPORT\_EVT**

An periodic adv sync transfer received event and no periodic adv report events

**ESP\_BLE\_GAP\_PAST\_MODE\_DUP\_FILTER\_DISABLED**

Periodic adv report events will be enabled with duplicate filtering disabled

**ESP\_BLE\_GAP\_PAST\_MODE\_DUP\_FILTER\_ENABLED**

Periodic adv report events will be enabled with duplicate filtering enabled

## Type Definitions

```
typedef uint8_t esp_ble_key_type_t
```

```
typedef uint8_t esp_ble_auth_req_t  
    combination of the above bit pattern
```

```
typedef uint8_t esp_ble_io_cap_t  
    combination of the io capability
```

```
typedef uint8_t esp_ble_dtm_pkt_payload_t
```

```
typedef uint8_t esp_gap_ble_channels[ESP_GAP_BLE_CHANNELS_LEN]
```

```
typedef uint8_t esp_duplicate_info_t[ESP_BD_ADDR_LEN]
```

```
typedef uint16_t esp_ble_ext_adv_type_mask_t
```

```
typedef uint8_t esp_ble_gap_phy_t
```

```
typedef uint8_t esp_ble_gap_all_phys_t
```

```
typedef uint8_t esp_ble_gap_pri_phy_t
```

```
typedef uint8_t esp_ble_gap_phy_mask_t
```

```
typedef uint16_t esp_ble_gap_prefer_phy_options_t
```

```
typedef uint8_t esp_ble_ext_scan_cfg_mask_t
```

```
typedef uint8_t esp_ble_gap_ext_adv_data_status_t
```

```
typedef uint8_t esp_ble_gap_sync_t
```

```
typedef uint8_t esp_ble_gap_adv_type_t
```

```
typedef uint8_t esp_ble_gap_past_mode_t
```

```
typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)
```

GAP callback function type.

**Param event** : Event type

**Param param** : Point to callback parameter, currently is union type

## Enumerations

```
enum esp_gap_ble_cb_event_t
```

GAP BLE callback event type.

*Values:*

enumerator **ESP\_GAP\_BLE\_ADV\_DATA\_SET\_COMPLETE\_EVT**

When advertising data set complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_RSP\_DATA\_SET\_COMPLETE\_EVT**

When scan response data set complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_PARAM\_SET\_COMPLETE\_EVT**

When scan parameters set complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT**

When one scan result ready, the event comes each time

enumerator **ESP\_GAP\_BLE\_ADV\_DATA\_RAW\_SET\_COMPLETE\_EVT**

When raw advertising data set complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_RSP\_DATA\_RAW\_SET\_COMPLETE\_EVT**

When raw scan response data set complete, the event comes

enumerator **ESP\_GAP\_BLE\_ADV\_START\_COMPLETE\_EVT**

When start advertising complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_START\_COMPLETE\_EVT**

When start scan complete, the event comes

enumerator **ESP\_GAP\_BLE\_AUTH\_CMPL\_EVT**

Authentication complete indication.

enumerator **ESP\_GAP\_BLE\_KEY\_EVT**

BLE key event for peer device keys

enumerator **ESP\_GAP\_BLE\_SEC\_REQ\_EVT**

BLE security request

enumerator **ESP\_GAP\_BLE\_PASSKEY\_NOTIF\_EVT**

passkey notification event

enumerator **ESP\_GAP\_BLE\_PASSKEY\_REQ\_EVT**

passkey request event

enumerator **ESP\_GAP\_BLE\_OOB\_REQ\_EVT**

OOB request event

enumerator **ESP\_GAP\_BLE\_LOCAL\_IR\_EVT**

BLE local IR (identity Root 128-bit random static value used to generate Long Term Key) event

enumerator **ESP\_GAP\_BLE\_LOCAL\_ER\_EVT**

BLE local ER (Encryption Root value used to generate identity resolving key) event

enumerator **ESP\_GAP\_BLE\_NC\_REQ\_EVT**

Numeric Comparison request event

enumerator **ESP\_GAP\_BLE\_ADV\_STOP\_COMPLETE\_EVT**

When stop adv complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_STOP\_COMPLETE\_EVT**

When stop scan complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_STATIC\_RAND\_ADDR\_EVT**

When set the static rand address complete, the event comes

enumerator **ESP\_GAP\_BLE\_UPDATE\_CONN\_PARAMS\_EVT**

When update connection parameters complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_PKT\_LENGTH\_COMPLETE\_EVT**

When set pkt length complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_LOCAL\_PRIVACY\_COMPLETE\_EVT**

When Enable/disable privacy on the local device complete, the event comes

enumerator **ESP\_GAP\_BLE\_REMOVE\_BOND\_DEV\_COMPLETE\_EVT**

When remove the bond device complete, the event comes

enumerator **ESP\_GAP\_BLE\_CLEAR\_BOND\_DEV\_COMPLETE\_EVT**

When clear the bond device clear complete, the event comes

enumerator **ESP\_GAP\_BLE\_GET\_BOND\_DEV\_COMPLETE\_EVT**

When get the bond device list complete, the event comes

enumerator **ESP\_GAP\_BLE\_READ\_RSSI\_COMPLETE\_EVT**

When read the rssi complete, the event comes

enumerator **ESP\_GAP\_BLE\_UPDATE\_WHITELIST\_COMPLETE\_EVT**

When add or remove whitelist complete, the event comes

enumerator **ESP\_GAP\_BLE\_UPDATE\_DUPLICATE\_EXCEPTIONAL\_LIST\_COMPLETE\_EVT**

When update duplicate exceptional list complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_CHANNELS\_EVT**

When setting BLE channels complete, the event comes

enumerator **ESP\_GAP\_BLE\_READ\_PHY\_COMPLETE\_EVT**

when reading phy complete, this event comes

enumerator **ESP\_GAP\_BLE\_SET\_PREFERRED\_DEFAULT\_PHY\_COMPLETE\_EVT**

when preferred default phy complete, this event comes

enumerator **ESP\_GAP\_BLE\_SET\_PREFERRED\_PHY\_COMPLETE\_EVT**

when preferred phy complete , this event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_SET\_RAND\_ADDR\_COMPLETE\_EVT**

when extended set random address complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_SET\_PARAMS\_COMPLETE\_EVT**

when extended advertising parameter complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_DATA\_SET\_COMPLETE\_EVT**

when extended advertising data complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_SCAN\_RSP\_DATA\_SET\_COMPLETE\_EVT**

when extended scan response data complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_START\_COMPLETE\_EVT**

when extended advertising start complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_STOP\_COMPLETE\_EVT**

when extended advertising stop complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_SET\_REMOVE\_COMPLETE\_EVT**

when extended advertising set remove complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_SET\_CLEAR\_COMPLETE\_EVT**

when extended advertising set clear complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SET\_PARAMS\_COMPLETE\_EVT**

when periodic advertising parameter complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_DATA\_SET\_COMPLETE\_EVT**

when periodic advertising data complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_START\_COMPLETE\_EVT**

when periodic advertising start complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_STOP\_COMPLETE\_EVT**

when periodic advertising stop complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_CREATE\_SYNC\_COMPLETE\_EVT**

when periodic advertising create sync complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_CANCEL\_COMPLETE\_EVT**

when extended advertising sync cancel complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_TERMINATE\_COMPLETE\_EVT**

when extended advertising sync terminate complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_ADD\_DEV\_COMPLETE\_EVT**

when extended advertising add device complete , the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_REMOVE\_DEV\_COMPLETE\_EVT**

when extended advertising remove device complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_CLEAR\_DEV\_COMPLETE\_EVT**

when extended advertising clear device, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_EXT\_SCAN\_PARAMS\_COMPLETE\_EVT**

when extended scan parameter complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_SCAN\_START\_COMPLETE\_EVT**

when extended scan start complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_SCAN\_STOP\_COMPLETE\_EVT**

when extended scan stop complete, the event comes

enumerator **ESP\_GAP\_BLE\_PREFER\_EXT\_CONN\_PARAMS\_SET\_COMPLETE\_EVT**

when extended prefer connection parameter set complete, the event comes

enumerator **ESP\_GAP\_BLE\_PHY\_UPDATE\_COMPLETE\_EVT**

when ble phy update complete, the event comes

enumerator **ESP\_GAP\_BLE\_EXT\_ADV\_REPORT\_EVT**

when extended advertising report complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_TIMEOUT\_EVT**

when scan timeout complete, the event comes

enumerator **ESP\_GAP\_BLE\_ADV\_TERMINATED\_EVT**

when advertising terminate data complete, the event comes

enumerator **ESP\_GAP\_BLE\_SCAN\_REQ\_RECEIVED\_EVT**

when scan req received complete, the event comes

enumerator **ESP\_GAP\_BLE\_CHANNEL\_SELECT\_ALGORITHM\_EVT**

when channel select algorithm complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_REPORT\_EVT**

when periodic report advertising complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_LOST\_EVT**

when periodic advertising sync lost complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_ESTAB\_EVT**

when periodic advertising sync establish complete, the event comes

enumerator **ESP\_GAP\_BLE\_SC\_OOB\_REQ\_EVT**

Secure Connection OOB request event

enumerator **ESP\_GAP\_BLE\_SC\_CR\_LOC\_OOB\_EVT**

Secure Connection create OOB data complete event

enumerator **ESP\_GAP\_BLE\_GET\_DEV\_NAME\_COMPLETE\_EVT**

When getting BT device name complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_RECV\_ENABLE\_COMPLETE\_EVT**

when set periodic advertising receive enable complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_TRANS\_COMPLETE\_EVT**

when periodic advertising sync transfer complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SET\_INFO\_TRANS\_COMPLETE\_EVT**

when periodic advertising set info transfer complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_PAST\_PARAMS\_COMPLETE\_EVT**

when set periodic advertising sync transfer params complete, the event comes

enumerator **ESP\_GAP\_BLE\_PERIODIC\_ADV\_SYNC\_TRANS\_RECV\_EVT**

when periodic advertising sync transfer received, the event comes

enumerator **ESP\_GAP\_BLE\_DTM\_TEST\_UPDATE\_EVT**

when direct test mode state changes, the event comes

enumerator **ESP\_GAP\_BLE\_ADV\_CLEAR\_COMPLETE\_EVT**

When clear advertising complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_RPA\_TIMEOUT\_COMPLETE\_EVT**

When set the Resolvable Private Address (RPA) timeout completes, the event comes

enumerator **ESP\_GAP\_BLE\_ADD\_DEV\_TO\_RESOLVING\_LIST\_COMPLETE\_EVT**

when add a device to the resolving list completes, the event comes

enumerator **ESP\_GAP\_BLE\_VENDOR\_CMD\_COMPLETE\_EVT**

When vendor hci command complete, the event comes

enumerator **ESP\_GAP\_BLE\_SET\_PRIVACY\_MODE\_COMPLETE\_EVT**

When set privacy mode complete, the event comes

enumerator **ESP\_GAP\_BLE\_EVT\_MAX**

when maximum advertising event complete, the event comes

enum **esp\_ble\_adv\_data\_type**

The type of advertising data(not adv\_type)

*Values:*

enumerator **ESP\_BLE\_AD\_TYPE\_FLAG**

enumerator **ESP\_BLE\_AD\_TYPE\_16SRV\_PART**

enumerator **ESP\_BLE\_AD\_TYPE\_16SRV\_CMPL**

enumerator **ESP\_BLE\_AD\_TYPE\_32SRV\_PART**

enumerator **ESP\_BLE\_AD\_TYPE\_32SRV\_CMPL**

enumerator **ESP\_BLE\_AD\_TYPE\_128SRV\_PART**

enumerator **ESP\_BLE\_AD\_TYPE\_128SRV\_CMPL**

enumerator **ESP\_BLE\_AD\_TYPE\_NAME\_SHORT**

enumerator **ESP\_BLE\_AD\_TYPE\_NAME\_CMPL**

enumerator **ESP\_BLE\_AD\_TYPE\_TX\_PWR**

enumerator **ESP\_BLE\_AD\_TYPE\_DEV\_CLASS**

enumerator **ESP\_BLE\_AD\_TYPE\_SM\_TK**

enumerator **ESP\_BLE\_AD\_TYPE\_SM\_OOB\_FLAG**

enumerator **ESP\_BLE\_AD\_TYPE\_TRANS\_DISC\_DATA**

enumerator **ESP\_BLE\_AD\_TYPE\_LE\_SUPPORT\_FEATURE**

enumerator **ESP\_BLE\_AD\_TYPE\_CHAN\_MAP\_UPDATE**

enumerator **ESP\_BLE\_AD\_MANUFACTURER\_SPECIFIC\_TYPE**

enum **esp\_ble\_adv\_type\_t**

Advertising mode.

*Values:*

enumerator **ADV\_TYPE\_IND**

enumerator **ADV\_TYPE\_DIRECT\_IND\_HIGH**

enumerator **ADV\_TYPE\_SCAN\_IND**

enumerator **ADV\_TYPE\_NONCONN\_IND**

enumerator **ADV\_TYPE\_DIRECT\_IND\_LOW**

enum **esp\_ble\_adv\_channel\_t**

Advertising channel mask.

*Values:*

enumerator **ADV\_CHNL\_37**

enumerator **ADV\_CHNL\_38**

enumerator **ADV\_CHNL\_39**

enumerator **ADV\_CHNL\_ALL**

enum **esp\_ble\_adv\_filter\_t**

*Values:*

enumerator **ADV\_FILTER\_ALLOW\_SCAN\_ANY\_CON\_ANY**

Allow both scan and connection requests from anyone.

enumerator **ADV\_FILTER\_ALLOW\_SCAN\_WLST\_CON\_ANY**

Allow both scan req from White List devices only and connection req from anyone.

enumerator **ADV\_FILTER\_ALLOW\_SCAN\_ANY\_CON\_WLST**

Allow both scan req from anyone and connection req from White List devices only.

enumerator **ADV\_FILTER\_ALLOW\_SCAN\_WLST\_CON\_WLST**

Allow scan and connection requests from White List devices only.

enum **esp\_ble\_sec\_act\_t**

*Values:*

enumerator **ESP\_BLE\_SEC\_ENCRYPT**

relate to **BTA\_DM\_BLE\_SEC\_ENCRYPT** in `bta/bta_api.h`. If the device has already bonded, the stack will use Long Term Key (LTK) to encrypt with the remote device directly. Else if the device hasn't bonded, the stack will use the default authentication request used in the `esp_ble_gap_set_security_param` function set by the user.

enumerator **ESP\_BLE\_SEC\_ENCRYPT\_NO\_MITM**

relate to **BTA\_DM\_BLE\_SEC\_ENCRYPT\_NO\_MITM** in `bta/bta_api.h`. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn't been bonded, the stack will use NO MITM authentication request in the current link instead of using the `authreq` in the `esp_ble_gap_set_security_param` function set by the user.

enumerator **ESP\_BLE\_SEC\_ENCRYPT\_MITM**

relate to **BTA\_DM\_BLE\_SEC\_ENCRYPT\_MITM** in `bta/bta_api.h`. If the device has been already bonded, the stack will check the LTK (Long Term Key) whether the authentication request has been met, and if met, use the LTK to encrypt with the remote device directly, else re-pair with the remote device. Else if the device hasn't been bonded, the stack will use MITM authentication request in the current link instead of using the `authreq` in the `esp_ble_gap_set_security_param` function set by the user.

enum **esp\_ble\_sm\_param\_t**

*Values:*

enumerator **ESP\_BLE\_SM\_PASSKEY**

Authentication requirements of local device

enumerator **ESP\_BLE\_SM\_AUTHEN\_REQ\_MODE**

The IO capability of local device

enumerator **ESP\_BLE\_SM\_IOCAP\_MODE**

Initiator Key Distribution/Generation

enumerator **ESP\_BLE\_SM\_SET\_INIT\_KEY**

Responder Key Distribution/Generation

enumerator **ESP\_BLE\_SM\_SET\_RSP\_KEY**

Maximum Encryption key size to support

enumerator **ESP\_BLE\_SM\_MAX\_KEY\_SIZE**

Minimum Encryption key size requirement from Peer

enumerator **ESP\_BLE\_SM\_MIN\_KEY\_SIZE**

Set static Passkey

enumerator **ESP\_BLE\_SM\_SET\_STATIC\_PASSKEY**

Reset static Passkey

enumerator **ESP\_BLE\_SM\_CLEAR\_STATIC\_PASSKEY**

Accept only specified SMP Authentication requirement

enumerator **ESP\_BLE\_SM\_ONLY\_ACCEPT\_SPECIFIED\_SEC\_AUTH**

Enable/Disable OOB support

enumerator **ESP\_BLE\_SM\_OOB\_SUPPORT**

Appl encryption key size

enumerator **ESP\_BLE\_APP\_ENC\_KEY\_SIZE**

authentication max param

enumerator **ESP\_BLE\_SM\_MAX\_PARAM**

enum **esp\_ble\_dtm\_update\_evt\_t**

*Values:*

enumerator **DTM\_TX\_START\_EVT**

DTM TX start event.

enumerator **DTM\_RX\_START\_EVT**

DTM RX start event.

enumerator **DTM\_TEST\_STOP\_EVT**

DTM test end event.

enum **esp\_ble\_scan\_type\_t**

Ble scan type.

*Values:*

enumerator **BLE\_SCAN\_TYPE\_PASSIVE**

Passive scan

enumerator **BLE\_SCAN\_TYPE\_ACTIVE**

Active scan

enum **esp\_ble\_scan\_filter\_t**

Ble scan filter type.

*Values:*

enumerator **BLE\_SCAN\_FILTER\_ALLOW\_ALL**

Accept all :

- i. advertisement packets except directed advertising packets not addressed to this device (default).

enumerator **BLE\_SCAN\_FILTER\_ALLOW\_ONLY\_WLST**

Accept only :

- i. advertisement packets from devices where the advertiser' s address is in the White list.
- ii. Directed advertising packets which are not addressed for this device shall be ignored.

enumerator **BLE\_SCAN\_FILTER\_ALLOW\_UND\_RPA\_DIR**

Accept all :

- i. undirected advertisement packets, and
- ii. directed advertising packets where the initiator address is a resolvable private address, and
- iii. directed advertising packets addressed to this device.

enumerator **BLE\_SCAN\_FILTER\_ALLOW\_WLIST\_RPA\_DIR**

Accept all :

- i. advertisement packets from devices where the advertiser' s address is in the White list, and
- ii. directed advertising packets where the initiator address is a resolvable private address, and
- iii. directed advertising packets addressed to this device.

enum **esp\_ble\_scan\_duplicate\_t**

Ble scan duplicate type.

*Values:*

enumerator **BLE\_SCAN\_DUPLICATE\_DISABLE**

the Link Layer should generate advertising reports to the host for each packet received

enumerator **BLE\_SCAN\_DUPLICATE\_ENABLE**

the Link Layer should filter out duplicate advertising reports to the Host

enumerator **BLE\_SCAN\_DUPLICATE\_ENABLE\_RESET**

Duplicate filtering enabled, reset for each scan period, only supported in BLE 5.0.

enumerator **BLE\_SCAN\_DUPLICATE\_MAX**

Reserved for future use.

enum **esp\_gap\_search\_evt\_t**

Sub Event of ESP\_GAP\_BLE\_SCAN\_RESULT\_EVT.

*Values:*

enumerator **ESP\_GAP\_SEARCH\_INQ\_RES\_EVT**

Inquiry result for a peer device.

enumerator **ESP\_GAP\_SEARCH\_INQ\_CMPL\_EVT**

Inquiry complete.

enumerator **ESP\_GAP\_SEARCH\_DISC\_RES\_EVT**

Discovery result for a peer device.

enumerator **ESP\_GAP\_SEARCH\_DISC\_BLE\_RES\_EVT**

Discovery result for BLE GATT based service on a peer device.

enumerator **ESP\_GAP\_SEARCH\_DISC\_CMPL\_EVT**

Discovery complete.

enumerator **ESP\_GAP\_SEARCH\_DI\_DISC\_CMPL\_EVT**

Discovery complete.

enumerator **ESP\_GAP\_SEARCH\_SEARCH\_CANCEL\_CMPL\_EVT**

Search cancelled

enumerator **ESP\_GAP\_SEARCH\_INQ\_DISCARD\_NUM\_EVT**

The number of pkt discarded by flow control

enum **esp\_ble\_evt\_type\_t**

Ble scan result event type, to indicate the result is scan response or advertising data or other.

*Values:*

enumerator **ESP\_BLE\_EVT\_CONN\_ADV**

Connectable undirected advertising (ADV\_IND)

enumerator **ESP\_BLE\_EVT\_CONN\_DIR\_ADV**

Connectable directed advertising (ADV\_DIRECT\_IND)

enumerator **ESP\_BLE\_EVT\_DISC\_ADV**

Scannable undirected advertising (ADV\_SCAN\_IND)

enumerator **ESP\_BLE\_EVT\_NON\_CONN\_ADV**

Non connectable undirected advertising (ADV\_NONCONN\_IND)

enumerator **ESP\_BLE\_EVT\_SCAN\_RSP**

Scan Response (SCAN\_RSP)

enum **esp\_ble\_wl\_operation\_t**

*Values:*

enumerator **ESP\_BLE\_WHITELIST\_REMOVE**

remove mac from whitelist

enumerator **ESP\_BLE\_WHITELIST\_ADD**

add address to whitelist

enumerator **ESP\_BLE\_WHITELIST\_CLEAR**

clear all device in whitelist

enum **esp\_bt\_duplicate\_exceptional\_subcode\_type\_t**

*Values:*

enumerator **ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_ADD**

Add device info into duplicate scan exceptional list

enumerator **ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_REMOVE**

Remove device info from duplicate scan exceptional list

enumerator **ESP\_BLE\_DUPLICATE\_EXCEPTIONAL\_LIST\_CLEAN**

Clean duplicate scan exceptional list

enum **esp\_ble\_duplicate\_exceptional\_info\_type\_t**

*Values:*

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_ADV\_ADDR**

BLE advertising address , device info will be added into ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ADDR\_LIST

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_LINK\_ID**

BLE mesh link ID, it is for BLE mesh, device info will be added into ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_LINK\_ID\_LIST

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_BEACON\_TYPE**

BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROV\_SRV\_ADV**

BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | .... |

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROXY\_SRV\_ADV**

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | .... |

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_PROXY\_SOLIC\_ADV**

BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1859 | .... |

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_INFO\_MESH\_URI\_ADV**

BLE mesh URI adv, the format is ...| Len | 0x24 | data |...

enum **esp\_duplicate\_scan\_exceptional\_list\_type\_t**

*Values:*

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ADDR\_LIST**

duplicate scan exceptional addr list

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_LINK\_ID\_LIST**

duplicate scan exceptional mesh link ID list

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_BEACON\_TYPE\_LIST**

duplicate scan exceptional mesh beacon type list

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROV\_SRV\_ADV\_LIST**

duplicate scan exceptional mesh adv with provisioning service uuid

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROXY\_SRV\_ADV\_LIST**  
duplicate scan exceptional mesh adv with proxy service uuid

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_PROXY\_SOLIC\_ADV\_LIST**  
duplicate scan exceptional mesh adv with proxy solicitation PDU uuid

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_MESH\_URI\_ADV\_LIST**  
duplicate scan exceptional URI list

enumerator **ESP\_BLE\_DUPLICATE\_SCAN\_EXCEPTIONAL\_ALL\_LIST**  
duplicate scan exceptional all list

enum **esp\_ble\_privacy\_mode\_t**

*Values:*

enumerator **ESP\_BLE\_NETWORK\_PRIVACY\_MODE**  
Network Privacy Mode for peer device (default)

enumerator **ESP\_BLE\_DEVICE\_PRIVACY\_MODE**  
Device Privacy Mode for peer device

## GATT DEFINES

### API Reference

#### Header File

- [components/bt/host/bluedroid/api/include/api/esp\\_gatt\\_defs.h](#)

#### Unions

union **esp\_gatt\_rsp\_t**

*#include <esp\_gatt\_defs.h>* Represents the response type for a GATT remote read request.

#### Public Members

*esp\_gatt\_value\_t attr\_value*

The GATT attribute value, including its data, handle, and metadata.

uint16\_t **handle**

Only the handle of the GATT attribute, when that's the only required information.

#### Structures

struct **esp\_gatt\_id\_t**

Represents a GATT identifier.

**Public Members***esp\_bt\_uuid\_t* **uuid**

The UUID component of the GATT ID.

**uint8\_t inst\_id**

The instance ID component of the GATT ID, providing further differentiation of the GATT ID.

struct **esp\_gatt\_srvc\_id\_t**

Represents a GATT service identifier.

**Public Members***esp\_gatt\_id\_t* **id**

Encapsulates the UUID and instance ID of the GATT service.

**bool is\_primary**

Indicates if the service is primary. A value of true means it is a primary service, false indicates a secondary service.

struct **esp\_attr\_desc\_t**

Defines an attribute's description.

This structure is used to describe an attribute in the GATT database. It includes details such as the UUID of the attribute, its permissions, and its value.

**Public Members****uint16\_t uuid\_length**

Length of the UUID in bytes.

**uint8\_t \*uuid\_p**

Pointer to the UUID value.

**uint16\_t perm**

Attribute permissions, defined by `esp_gatt_perm_t`.

**uint16\_t max\_length**

Maximum length of the attribute's value.

**uint16\_t length**

Current length of the attribute's value.

**uint8\_t \*value**

Pointer to the attribute's value array.

struct **esp\_attr\_control\_t**

Defines the auto response setting for attribute operations.

This structure is used to control whether the GATT stack or the application will handle responses to Read/Write operations.

### Public Members

uint8\_t **auto\_rsp**

Controls who handles the response to Read/Write operations.

- If set to `ESP_GATT_RSP_BY_APP`, the application is responsible for generating the response.
- If set to `ESP_GATT_AUTO_RSP`, the GATT stack will automatically generate the response.

struct **esp\_gatts\_attr\_db\_t**

attribute type added to the GATT server database

### Public Members

*esp\_attr\_control\_t* **attr\_control**

The attribute control type

*esp\_attr\_desc\_t* **att\_desc**

The attribute type

struct **esp\_attr\_value\_t**

set the attribute value type

### Public Members

uint16\_t **attr\_max\_len**

attribute max value length

uint16\_t **attr\_len**

attribute current value length

uint8\_t \***attr\_value**

the pointer to attribute value

struct **esp\_gatts\_incl\_svc\_desc\_t**

Gatt include service entry element.

### Public Members

uint16\_t **start\_hdl**

Gatt start handle value of included service

uint16\_t **end\_hdl**

Gatt end handle value of included service

uint16\_t **uuid**

Gatt attribute value UUID of included service

struct **esp\_gatts\_incl128\_svc\_desc\_t**  
Gatt include 128 bit service entry element.

### Public Members

uint16\_t **start\_hdl**  
Gatt start handle value of included 128 bit service

uint16\_t **end\_hdl**  
Gatt end handle value of included 128 bit service

struct **esp\_gatt\_value\_t**  
Represents a GATT attribute's value.

### Public Members

uint8\_t **value**[ESP\_GATT\_MAX\_ATTR\_LEN]  
Array holding the value of the GATT attribute.

uint16\_t **handle**  
Unique identifier (handle) of the GATT attribute.

uint16\_t **offset**  
Offset within the attribute's value, for partial updates.

uint16\_t **len**  
Current length of the data in the value array.

uint8\_t **auth\_req**  
Authentication requirements for accessing this attribute.

struct **esp\_gatt\_conn\_params\_t**  
Connection parameters for GATT.

### Public Members

uint16\_t **interval**  
Connection interval.

uint16\_t **latency**  
Slave latency for the connection in number of connection events.

uint16\_t **timeout**  
Supervision timeout for the LE Link.

struct **esp\_gattc\_multi\_t**  
Represents multiple attributes for reading.

**Public Members****uint8\_t num\_attr**

Number of attributes.

**uint16\_t handles**[ESP\_GATT\_MAX\_READ\_MULTI\_HANDLES]

List of attribute handles.

struct **esp\_gattc\_db\_elem\_t**

GATT database attribute element.

**Public Members***esp\_gatt\_db\_attr\_type\_t* **type**

Attribute type.

**uint16\_t attribute\_handle**

Attribute handle.

**uint16\_t start\_handle**

Service start handle.

**uint16\_t end\_handle**

Service end handle.

*esp\_gatt\_char\_prop\_t* **properties**

Characteristic properties.

*esp\_bt\_uuid\_t* **uuid**

Attribute UUID.

struct **esp\_gattc\_service\_elem\_t**

Represents a GATT service element.

**Public Members****bool is\_primary**

Indicates if the service is primary.

**uint16\_t start\_handle**

Service start handle.

**uint16\_t end\_handle**

Service end handle.

*esp\_bt\_uuid\_t* **uuid**

Service UUID.

struct **esp\_gattc\_char\_elem\_t**

Represents a GATT characteristic element.

### Public Members

uint16\_t **char\_handle**

Characteristic handle.

*esp\_gatt\_char\_prop\_t* **properties**

Characteristic properties.

*esp\_bt\_uuid\_t* **uuid**

Characteristic UUID.

struct **esp\_gattc\_descr\_elem\_t**

Represents a GATT descriptor element.

### Public Members

uint16\_t **handle**

Descriptor handle.

*esp\_bt\_uuid\_t* **uuid**

Descriptor UUID.

struct **esp\_gattc\_incl\_svc\_elem\_t**

Represents an included GATT service element.

### Public Members

uint16\_t **handle**

Current attribute handle of the included service.

uint16\_t **incl\_srvc\_s\_handle**

Start handle of the included service.

uint16\_t **incl\_srvc\_e\_handle**

End handle of the included service.

*esp\_bt\_uuid\_t* **uuid**

Included service UUID.

### Macros

**ESP\_GATT\_ILLEGAL\_UUID**

GATT INVALID UUID.

**ESP\_GATT\_ILLEGAL\_HANDLE**

GATT INVALID HANDLE.

**ESP\_GATT\_ATTR\_HANDLE\_MAX**

GATT attribute max handle.

**ESP\_GATT\_MAX\_READ\_MULTI\_HANDLES**

Maximum number of attributes to read in one request.

**ESP\_GATT\_UUID\_IMMEDIATE\_ALERT\_SVC**

Immediate Alert Service UUID.

**ESP\_GATT\_UUID\_LINK\_LOSS\_SVC**

Link Loss Service UUID.

**ESP\_GATT\_UUID\_TX\_POWER\_SVC**

TX Power Service UUID.

**ESP\_GATT\_UUID\_CURRENT\_TIME\_SVC**

Current Time Service UUID.

**ESP\_GATT\_UUID\_REF\_TIME\_UPDATE\_SVC**

Reference Time Update Service UUID.

**ESP\_GATT\_UUID\_NEXT\_DST\_CHANGE\_SVC**

Next DST Change Service UUID.

**ESP\_GATT\_UUID\_GLUCOSE\_SVC**

Glucose Service UUID.

**ESP\_GATT\_UUID\_HEALTH\_THERMOM\_SVC**

Health Thermometer Service UUID.

**ESP\_GATT\_UUID\_DEVICE\_INFO\_SVC**

Device Information Service UUID.

**ESP\_GATT\_UUID\_HEART\_RATE\_SVC**

Heart Rate Service UUID.

**ESP\_GATT\_UUID\_PHONE\_ALERT\_STATUS\_SVC**

Phone Alert Status Service UUID.

**ESP\_GATT\_UUID\_BATTERY\_SERVICE\_SVC**

Battery Service UUID.

**ESP\_GATT\_UUID\_BLOOD\_PRESSURE\_SVC**

Blood Pressure Service UUID.

**ESP\_GATT\_UUID\_ALERT\_NTF\_SVC**

Alert Notification Service UUID.

**ESP\_GATT\_UUID\_HID\_SVC**

HID Service UUID.

**ESP\_GATT\_UUID\_SCAN\_PARAMETERS\_SVC**

Scan Parameters Service UUID.

**ESP\_GATT\_UUID\_RUNNING\_SPEED\_CADENCE\_SVC**

Running Speed and Cadence Service UUID.

**ESP\_GATT\_UUID\_Automation\_IO\_SVC**

Automation IO Service UUID.

**ESP\_GATT\_UUID\_CYCLING\_SPEED\_CADENCE\_SVC**

Cycling Speed and Cadence Service UUID.

**ESP\_GATT\_UUID\_CYCLING\_POWER\_SVC**

Cycling Power Service UUID.

**ESP\_GATT\_UUID\_LOCATION\_AND\_NAVIGATION\_SVC**

Location and Navigation Service UUID.

**ESP\_GATT\_UUID\_ENVIRONMENTAL\_SENSING\_SVC**

Environmental Sensing Service UUID.

**ESP\_GATT\_UUID\_BODY\_COMPOSITION**

Body Composition Service UUID.

**ESP\_GATT\_UUID\_USER\_DATA\_SVC**

User Data Service UUID.

**ESP\_GATT\_UUID\_WEIGHT\_SCALE\_SVC**

Weight Scale Service UUID.

**ESP\_GATT\_UUID\_BOND\_MANAGEMENT\_SVC**

Bond Management Service UUID.

**ESP\_GATT\_UUID\_CONT\_GLUCOSE\_MONITOR\_SVC**

Continuous Glucose Monitoring Service UUID.

**ESP\_GATT\_UUID\_PRI\_SERVICE**

Primary Service UUID.

**ESP\_GATT\_UUID\_SEC\_SERVICE**

Secondary Service UUID.

**ESP\_GATT\_UUID\_INCLUDE\_SERVICE**

Include Service UUID.

**ESP\_GATT\_UUID\_CHAR\_DECLARE**

Characteristic Declaration UUID.

**ESP\_GATT\_UUID\_CHAR\_EXT\_PROP**

Characteristic Extended Properties UUID.

**ESP\_GATT\_UUID\_CHAR\_DESCRIPTION**

Characteristic User Description UUID.

**ESP\_GATT\_UUID\_CHAR\_CLIENT\_CONFIG**

Client Characteristic Configuration UUID.

**ESP\_GATT\_UUID\_CHAR\_SRVR\_CONFIG**

Server Characteristic Configuration UUID.

**ESP\_GATT\_UUID\_CHAR\_PRESENT\_FORMAT**

Characteristic Presentation Format UUID.

**ESP\_GATT\_UUID\_CHAR\_AGG\_FORMAT**

Characteristic Aggregate Format UUID.

**ESP\_GATT\_UUID\_CHAR\_VALID\_RANGE**

Characteristic Valid Range UUID.

**ESP\_GATT\_UUID\_EXT\_RPT\_REF\_DESCR**

External Report Reference Descriptor UUID.

**ESP\_GATT\_UUID\_RPT\_REF\_DESCR**

Report Reference Descriptor UUID.

**ESP\_GATT\_UUID\_NUM\_DIGITALS\_DESCR**

Number of Digitals Descriptor UUID.

**ESP\_GATT\_UUID\_VALUE\_TRIGGER\_DESCR**

Value Trigger Setting Descriptor UUID.

**ESP\_GATT\_UUID\_ENV\_SENSING\_CONFIG\_DESCR**

Environmental Sensing Configuration Descriptor UUID.

**ESP\_GATT\_UUID\_ENV\_SENSING\_MEASUREMENT\_DESCR**

Environmental Sensing Measurement Descriptor UUID.

**ESP\_GATT\_UUID\_ENV\_SENSING\_TRIGGER\_DESCR**

Environmental Sensing Trigger Setting Descriptor UUID.

**ESP\_GATT\_UUID\_TIME\_TRIGGER\_DESCR**

Time Trigger Setting Descriptor UUID.

**ESP\_GATT\_UUID\_GAP\_DEVICE\_NAME**

GAP Device Name UUID.

**ESP\_GATT\_UUID\_GAP\_ICON**

GAP Icon UUID.

**ESP\_GATT\_UUID\_GAP\_PREF\_CONN\_PARAM**

GAP Preferred Connection Parameters UUID.

**ESP\_GATT\_UUID\_GAP\_CENTRAL\_ADDR\_RESOL**

GAP Central Address Resolution UUID.

**ESP\_GATT\_UUID\_GATT\_SRV\_CHGD**

GATT Service Changed UUID.

**ESP\_GATT\_UUID\_ALERT\_LEVEL**

Alert Level UUID.

**ESP\_GATT\_UUID\_TX\_POWER\_LEVEL**

TX Power Level UUID.

**ESP\_GATT\_UUID\_CURRENT\_TIME**

Current Time UUID.

**ESP\_GATT\_UUID\_LOCAL\_TIME\_INFO**

Local Time Info UUID.

**ESP\_GATT\_UUID\_REF\_TIME\_INFO**

Reference Time Information UUID.

**ESP\_GATT\_UUID\_NW\_STATUS**

Network Availability Status UUID.

**ESP\_GATT\_UUID\_NW\_TRIGGER**

Network Availability Trigger UUID.

**ESP\_GATT\_UUID\_ALERT\_STATUS**

Alert Status UUID.

**ESP\_GATT\_UUID\_RINGER\_CP**

Ringer Control Point UUID.

**ESP\_GATT\_UUID\_RINGER\_SETTING**

Ringer Setting UUID.

**ESP\_GATT\_UUID\_GM\_MEASUREMENT**

Glucose Measurement Characteristic UUID.

**ESP\_GATT\_UUID\_GM\_CONTEXT**

Glucose Measurement Context Characteristic UUID.

**ESP\_GATT\_UUID\_GM\_CONTROL\_POINT**

Glucose Control Point Characteristic UUID.

**ESP\_GATT\_UUID\_GM\_FEATURE**

Glucose Feature Characteristic UUID.

**ESP\_GATT\_UUID\_SYSTEM\_ID**

System ID Characteristic UUID.

**ESP\_GATT\_UUID\_MODEL\_NUMBER\_STR**

Model Number String Characteristic UUID.

**ESP\_GATT\_UUID\_SERIAL\_NUMBER\_STR**

Serial Number String Characteristic UUID.

**ESP\_GATT\_UUID\_FW\_VERSION\_STR**

Firmware Revision String Characteristic UUID.

**ESP\_GATT\_UUID\_HW\_VERSION\_STR**

Hardware Revision String Characteristic UUID.

**ESP\_GATT\_UUID\_SW\_VERSION\_STR**

Software Revision String Characteristic UUID.

**ESP\_GATT\_UUID\_MANU\_NAME**

Manufacturer Name String Characteristic UUID.

**ESP\_GATT\_UUID\_IEEE\_DATA**

IEEE 11073-20601 Regulatory Certification Data List Characteristic UUID.

**ESP\_GATT\_UUID\_PNP\_ID**

PnP ID Characteristic UUID.

**ESP\_GATT\_UUID\_HID\_INFORMATION**

HID Information Characteristic UUID.

**ESP\_GATT\_UUID\_HID\_REPORT\_MAP**

HID Report Map Characteristic UUID.

**ESP\_GATT\_UUID\_HID\_CONTROL\_POINT**

HID Control Point Characteristic UUID.

**ESP\_GATT\_UUID\_HID\_REPORT**

HID Report Characteristic UUID.

**ESP\_GATT\_UUID\_HID\_PROTO\_MODE**

HID Protocol Mode Characteristic UUID.

**ESP\_GATT\_UUID\_HID\_BT\_KB\_INPUT**

HID Bluetooth Keyboard Input Characteristic UUID.

**ESP\_GATT\_UUID\_HID\_BT\_KB\_OUTPUT**

HID Bluetooth Keyboard Output Characteristic UUID.

**ESP\_GATT\_UUID\_HID\_BT\_MOUSE\_INPUT**

HID Bluetooth Mouse Input Characteristic UUID.

**ESP\_GATT\_HEART\_RATE\_MEAS**

Heart Rate Measurement Characteristic UUID.

**ESP\_GATT\_BODY\_SENSOR\_LOCATION**

Body Sensor Location Characteristic UUID.

**ESP\_GATT\_HEART\_RATE\_CNTL\_POINT**

Heart Rate Control Point Characteristic UUID.

**ESP\_GATT\_UUID\_BATTERY\_LEVEL**

Battery Level Characteristic UUID.

**ESP\_GATT\_UUID\_SC\_CONTROL\_POINT**

Sensor Control Point Characteristic UUID.

**ESP\_GATT\_UUID\_SENSOR\_LOCATION**

Sensor Location Characteristic UUID.

**ESP\_GATT\_UUID\_RSC\_MEASUREMENT**

RSC Measurement Characteristic UUID.

**ESP\_GATT\_UUID\_RSC\_FEATURE**

RSC Feature Characteristic UUID.

**ESP\_GATT\_UUID\_CSC\_MEASUREMENT**

CSC Measurement Characteristic UUID.

**ESP\_GATT\_UUID\_CSC\_FEATURE**

CSC Feature Characteristic UUID.

**ESP\_GATT\_UUID\_SCAN\_INT\_WINDOW**

Scan Interval Window Characteristic UUID.

**ESP\_GATT\_UUID\_SCAN\_REFRESH**

Scan Refresh UUID.

**ESP\_GATT\_PERM\_READ**

Permission to read the attribute. Corresponds to BTA\_GATT\_PERM\_READ.

**ESP\_GATT\_PERM\_READ\_ENCRYPTED**

Permission to read the attribute with encryption. Corresponds to BTA\_GATT\_PERM\_READ\_ENCRYPTED.

**ESP\_GATT\_PERM\_READ\_ENC\_MITM**

Permission to read the attribute with encrypted MITM (Man In The Middle) protection. Corresponds to BTA\_GATT\_PERM\_READ\_ENC\_MITM.

**ESP\_GATT\_PERM\_WRITE**

Permission to write to the attribute. Corresponds to BTA\_GATT\_PERM\_WRITE.

**ESP\_GATT\_PERM\_WRITE\_ENCRYPTED**

Permission to write to the attribute with encryption. Corresponds to BTA\_GATT\_PERM\_WRITE\_ENCRYPTED.

**ESP\_GATT\_PERM\_WRITE\_ENC\_MITM**

Permission to write to the attribute with encrypted MITM protection. Corresponds to BTA\_GATT\_PERM\_WRITE\_ENC\_MITM.

**ESP\_GATT\_PERM\_WRITE\_SIGNED**

Permission for signed writes to the attribute. Corresponds to BTA\_GATT\_PERM\_WRITE\_SIGNED.

**ESP\_GATT\_PERM\_WRITE\_SIGNED\_MITM**

Permission for signed writes to the attribute with MITM protection. Corresponds to BTA\_GATT\_PERM\_WRITE\_SIGNED\_MITM.

**ESP\_GATT\_PERM\_READ\_AUTHORIZATION**

Permission to read the attribute with authorization.

**ESP\_GATT\_PERM\_WRITE\_AUTHORIZATION**

Permission to write to the attribute with authorization.

**ESP\_GATT\_PERM\_ENCRYPT\_KEY\_SIZE** (keysize)

Macro to specify minimum encryption key size.

**Parameters**

- **keysize** -- The minimum size of the encryption key, in bytes.

**ESP\_GATT\_CHAR\_PROP\_BIT\_BROADCAST**

Ability to broadcast. Corresponds to BTA\_GATT\_CHAR\_PROP\_BIT\_BROADCAST.

**ESP\_GATT\_CHAR\_PROP\_BIT\_READ**

Ability to read. Corresponds to BTA\_GATT\_CHAR\_PROP\_BIT\_READ.

**ESP\_GATT\_CHAR\_PROP\_BIT\_WRITE\_NR**

Ability to write without response. Corresponds to BTA\_GATT\_CHAR\_PROP\_BIT\_WRITE\_NR.

**ESP\_GATT\_CHAR\_PROP\_BIT\_WRITE**

Ability to write. Corresponds to BTA\_GATT\_CHAR\_PROP\_BIT\_WRITE.

**ESP\_GATT\_CHAR\_PROP\_BIT\_NOTIFY**

Ability to notify. Corresponds to BTA\_GATT\_CHAR\_PROP\_BIT\_NOTIFY.

**ESP\_GATT\_CHAR\_PROP\_BIT\_INDICATE**

Ability to indicate. Corresponds to BTA\_GATT\_CHAR\_PROP\_BIT\_INDICATE.

**ESP\_GATT\_CHAR\_PROP\_BIT\_AUTH**

Ability to authenticate. Corresponds to BTA\_GATT\_CHAR\_PROP\_BIT\_AUTH.

**ESP\_GATT\_CHAR\_PROP\_BIT\_EXT\_PROP**

Has extended properties. Corresponds to BTA\_GATT\_CHAR\_PROP\_BIT\_EXT\_PROP.

**ESP\_GATT\_MAX\_ATTR\_LEN**

Defines the maximum length of a GATT attribute.

This definition specifies the maximum number of bytes that a GATT attribute can hold. As same as GATT\_MAX\_ATTR\_LEN.

**ESP\_GATT\_RSP\_BY\_APP**

Defines attribute control for GATT operations.

This module provides definitions for controlling attribute auto responses in GATT operations.

Response to Write/Read operations should be handled by the application.

**ESP\_GATT\_AUTO\_RSP**

Response to Write/Read operations should be automatically handled by the GATT stack.

**ESP\_GATT\_IF\_NONE**

Macro indicating no specific GATT interface.

No specific application GATT interface.

**Type Definitions**

```
typedef uint16_t esp_gatt_perm_t
```

Type to represent GATT attribute permissions.

```
typedef uint8_t esp_gatt_char_prop_t
```

Type for characteristic properties bitmask.

```
typedef uint8_t esp_gatt_if_t
```

GATT interface type for client applications.

## Enumerations

### enum **esp\_gatt\_prep\_write\_type**

Defines the attribute write operation types from the client.

These values are used to specify the type of write operation in a prepare write sequence. relate to BTA\_GATT\_PREP\_WRITE\_XXX in bta/bta\_gatt\_api.h.

*Values:*

enumerator **ESP\_GATT\_PREP\_WRITE\_CANCEL**

Prepare write cancel. Corresponds to BTA\_GATT\_PREP\_WRITE\_CANCEL.

enumerator **ESP\_GATT\_PREP\_WRITE\_EXEC**

Prepare write execute. Corresponds to BTA\_GATT\_PREP\_WRITE\_EXEC.

### enum **esp\_gatt\_status\_t**

GATT operation status codes.

These status codes are used to indicate the result of various GATT operations. relate to BTA\_GATT\_XXX in bta/bta\_gatt\_api.h .

*Values:*

enumerator **ESP\_GATT\_OK**

0x0, Operation successful. Corresponds to BTA\_GATT\_OK.

enumerator **ESP\_GATT\_INVALID\_HANDLE**

0x01, Invalid handle. Corresponds to BTA\_GATT\_INVALID\_HANDLE.

enumerator **ESP\_GATT\_READ\_NOT\_PERMIT**

0x02, Read operation not permitted. Corresponds to BTA\_GATT\_READ\_NOT\_PERMIT.

enumerator **ESP\_GATT\_WRITE\_NOT\_PERMIT**

0x03, Write operation not permitted. Corresponds to BTA\_GATT\_WRITE\_NOT\_PERMIT.

enumerator **ESP\_GATT\_INVALID\_PDU**

0x04, Invalid PDU. Corresponds to BTA\_GATT\_INVALID\_PDU.

enumerator **ESP\_GATT\_INSUF\_AUTHENTICATION**

0x05, Insufficient authentication. Corresponds to BTA\_GATT\_INSUF\_AUTHENTICATION.

enumerator **ESP\_GATT\_REQ\_NOT\_SUPPORTED**

0x06, Request not supported. Corresponds to BTA\_GATT\_REQ\_NOT\_SUPPORTED.

enumerator **ESP\_GATT\_INVALID\_OFFSET**

0x07, Invalid offset. Corresponds to BTA\_GATT\_INVALID\_OFFSET.

enumerator **ESP\_GATT\_INSUF\_AUTHORIZATION**

0x08, Insufficient authorization. Corresponds to BTA\_GATT\_INSUF\_AUTHORIZATION.

enumerator **ESP\_GATT\_PREPARE\_Q\_FULL**

0x09, Prepare queue full. Corresponds to BTA\_GATT\_PREPARE\_Q\_FULL.

enumerator **ESP\_GATT\_NOT\_FOUND**

0x0a, Not found. Corresponds to BTA\_GATT\_NOT\_FOUND.

enumerator **ESP\_GATT\_NOT\_LONG**

0x0b, Not long. Corresponds to BTA\_GATT\_NOT\_LONG.

enumerator **ESP\_GATT\_INSUF\_KEY\_SIZE**

0x0c, Insufficient key size. Corresponds to BTA\_GATT\_INSUF\_KEY\_SIZE.

enumerator **ESP\_GATT\_INVALID\_ATTR\_LEN**

0x0d, Invalid attribute length. Corresponds to BTA\_GATT\_INVALID\_ATTR\_LEN.

enumerator **ESP\_GATT\_ERR\_UNLIKELY**

0x0e, Unlikely error. Corresponds to BTA\_GATT\_ERR\_UNLIKELY.

enumerator **ESP\_GATT\_INSUF\_ENCRYPTION**

0x0f, Insufficient encryption. Corresponds to BTA\_GATT\_INSUF\_ENCRYPTION.

enumerator **ESP\_GATT\_UN SUPPORT\_GRP\_TYPE**

0x10, Unsupported group type. Corresponds to BTA\_GATT\_UN SUPPORT\_GRP\_TYPE.

enumerator **ESP\_GATT\_INSUF\_RESOURCE**

0x11, Insufficient resource. Corresponds to BTA\_GATT\_INSUF\_RESOURCE.

enumerator **ESP\_GATT\_NO\_RESOURCES**

0x80, No resources. Corresponds to BTA\_GATT\_NO\_RESOURCES.

enumerator **ESP\_GATT\_INTERNAL\_ERROR**

0x81, Internal error. Corresponds to BTA\_GATT\_INTERNAL\_ERROR.

enumerator **ESP\_GATT\_WRONG\_STATE**

0x82, Wrong state. Corresponds to BTA\_GATT\_WRONG\_STATE.

enumerator **ESP\_GATT\_DB\_FULL**

0x83, Database full. Corresponds to BTA\_GATT\_DB\_FULL.

enumerator **ESP\_GATT\_BUSY**

0x84, Busy. Corresponds to BTA\_GATT\_BUSY.

enumerator **ESP\_GATT\_ERROR**

0x85, Generic error. Corresponds to BTA\_GATT\_ERROR.

enumerator **ESP\_GATT\_CMD\_STARTED**

0x86, Command started. Corresponds to BTA\_GATT\_CMD\_STARTED.

enumerator **ESP\_GATT\_ILLEGAL\_PARAMETER**

0x87, Illegal parameter. Corresponds to BTA\_GATT\_ILLEGAL\_PARAMETER.

enumerator **ESP\_GATT\_PENDING**

0x88, Operation pending. Corresponds to BTA\_GATT\_PENDING.

enumerator **ESP\_GATT\_AUTH\_FAIL**

0x89, Authentication failed. Corresponds to BTA\_GATT\_AUTH\_FAIL.

enumerator **ESP\_GATT\_MORE**

0x8a, More data available. Corresponds to BTA\_GATT\_MORE.

enumerator **ESP\_GATT\_INVALID\_CFG**

0x8b, Invalid configuration. Corresponds to BTA\_GATT\_INVALID\_CFG.

enumerator **ESP\_GATT\_SERVICE\_STARTED**

0x8c, Service started. Corresponds to BTA\_GATT\_SERVICE\_STARTED.

enumerator **ESP\_GATT\_ENCRYPTED\_MITM**

0x0, Encrypted, with MITM protection. Corresponds to BTA\_GATT\_ENCRYPTED\_MITM.

enumerator **ESP\_GATT\_ENCRYPTED\_NO\_MITM**

0x8d, Encrypted, without MITM protection. Corresponds to BTA\_GATT\_ENCRYPTED\_NO\_MITM.

enumerator **ESP\_GATT\_NOT\_ENCRYPTED**

0x8e, Not encrypted. Corresponds to BTA\_GATT\_NOT\_ENCRYPTED.

enumerator **ESP\_GATT\_CONGESTED**

0x8f, Congested. Corresponds to BTA\_GATT\_CONGESTED.

enumerator **ESP\_GATT\_DUP\_REG**

0x90, Duplicate registration. Corresponds to BTA\_GATT\_DUP\_REG.

enumerator **ESP\_GATT\_ALREADY\_OPEN**

0x91, Already open. Corresponds to BTA\_GATT\_ALREADY\_OPEN.

enumerator **ESP\_GATT\_CANCEL**

0x92, Operation cancelled. Corresponds to BTA\_GATT\_CANCEL.

enumerator **ESP\_GATT\_STACK\_RSP**

0xe0, Stack response. Corresponds to BTA\_GATT\_STACK\_RSP.

enumerator **ESP\_GATT\_APP\_RSP**

0xe1, Application response. Corresponds to BTA\_GATT\_APP\_RSP.

enumerator **ESP\_GATT\_UNKNOWN\_ERROR**

0xef, Unknown error. Corresponds to BTA\_GATT\_UNKNOWN\_ERROR.

enumerator **ESP\_GATT\_CCC\_CFG\_ERR**

0xfd, Client Characteristic Configuration Descriptor improperly configured. Corresponds to BTA\_GATT\_CCC\_CFG\_ERR.

enumerator **ESP\_GATT\_PRC\_IN\_PROGRESS**

0xfe, Procedure already in progress. Corresponds to BTA\_GATT\_PRC\_IN\_PROGRESS.

enumerator **ESP\_GATT\_OUT\_OF\_RANGE**

0xff, Attribute value out of range. Corresponds to BTA\_GATT\_OUT\_OF\_RANGE.

enum **esp\_gatt\_conn\_reason\_t**

Enumerates reasons for GATT connection.

*Values:*

enumerator **ESP\_GATT\_CONN\_UNKNOWN**

Unknown connection reason. Corresponds to BTA\_GATT\_CONN\_UNKNOWN in bta/bta\_gatt\_api.h

enumerator **ESP\_GATT\_CONN\_L2C\_FAILURE**

General L2CAP failure. Corresponds to BTA\_GATT\_CONN\_L2C\_FAILURE in bta/bta\_gatt\_api.h

enumerator **ESP\_GATT\_CONN\_TIMEOUT**

Connection timeout. Corresponds to BTA\_GATT\_CONN\_TIMEOUT in bta/bta\_gatt\_api.h

enumerator **ESP\_GATT\_CONN\_TERMINATE\_PEER\_USER**

Connection terminated by peer user. Corresponds to BTA\_GATT\_CONN\_TERMINATE\_PEER\_USER in bta/bta\_gatt\_api.h

enumerator **ESP\_GATT\_CONN\_TERMINATE\_LOCAL\_HOST**

Connection terminated by local host. Corresponds to BTA\_GATT\_CONN\_TERMINATE\_LOCAL\_HOST in bta/bta\_gatt\_api.h

enumerator **ESP\_GATT\_CONN\_FAIL\_ESTABLISH**

Failure to establish connection. Corresponds to BTA\_GATT\_CONN\_FAIL\_ESTABLISH in bta/bta\_gatt\_api.h

enumerator **ESP\_GATT\_CONN\_LMP\_TIMEOUT**

Connection failed due to LMP response timeout. Corresponds to BTA\_GATT\_CONN\_LMP\_TIMEOUT in bta/bta\_gatt\_api.h

enumerator **ESP\_GATT\_CONN\_CONN\_CANCEL**

L2CAP connection cancelled. Corresponds to BTA\_GATT\_CONN\_CONN\_CANCEL in bta/bta\_gatt\_api.h

enumerator **ESP\_GATT\_CONN\_NONE**

No connection to cancel. Corresponds to BTA\_GATT\_CONN\_NONE in bta/bta\_gatt\_api.h

enum **esp\_gatt\_auth\_req\_t**

Defines the GATT authentication request types.

This enumeration lists the types of authentication requests that can be made. It corresponds to the BTA\_GATT\_AUTH\_REQ\_XXX values defined in bta/bta\_gatt\_api.h. The types include options for no authentication, unauthenticated encryption, authenticated encryption, and both signed versions with and without MITM (Man-In-The-Middle) protection.

*Values:*

enumerator **ESP\_GATT\_AUTH\_REQ\_NONE**

No authentication required. Corresponds to BTA\_GATT\_AUTH\_REQ\_NONE.

enumerator **ESP\_GATT\_AUTH\_REQ\_NO\_MITM**

Unauthenticated encryption. Corresponds to BTA\_GATT\_AUTH\_REQ\_NO\_MITM.

enumerator **ESP\_GATT\_AUTH\_REQ\_MITM**

Authenticated encryption (MITM protection). Corresponds to BTA\_GATT\_AUTH\_REQ\_MITM.

enumerator **ESP\_GATT\_AUTH\_REQ\_SIGNED\_NO\_MITM**

Signed data, no MITM protection. Corresponds to BTA\_GATT\_AUTH\_REQ\_SIGNED\_NO\_MITM.

enumerator **ESP\_GATT\_AUTH\_REQ\_SIGNED\_MITM**

Signed data with MITM protection. Corresponds to BTA\_GATT\_AUTH\_REQ\_SIGNED\_MITM.

enum **esp\_service\_source\_t**

Enumerates the possible sources of a GATT service discovery.

This enumeration identifies the source of a GATT service discovery process, indicating whether the service information was obtained from a remote device, from NVS (Non-Volatile Storage) flash, or the source is unknown.

*Values:*

enumerator **ESP\_GATT\_SERVICE\_FROM\_REMOTE\_DEVICE**

Service information from a remote device. Relates to BTA\_GATTC\_SERVICE\_INFO\_FROM\_REMOTE\_DEVICE.

enumerator **ESP\_GATT\_SERVICE\_FROM\_NVS\_FLASH**

Service information from NVS flash. Relates to BTA\_GATTC\_SERVICE\_INFO\_FROM\_NVS\_FLASH.

enumerator **ESP\_GATT\_SERVICE\_FROM\_UNKNOWN**

Service source is unknown. Relates to BTA\_GATTC\_SERVICE\_INFO\_FROM\_UNKNOWN.

enum **esp\_gatt\_write\_type\_t**

Defines the types of GATT write operations.

*Values:*

enumerator **ESP\_GATT\_WRITE\_TYPE\_NO\_RSP**

Write operation where no response is needed.

enumerator **ESP\_GATT\_WRITE\_TYPE\_RSP**

Write operation that requires a remote response.

enum **esp\_gatt\_db\_attr\_type\_t**

Enumerates types of GATT database attributes.

*Values:*

enumerator **ESP\_GATT\_DB\_PRIMARY\_SERVICE**

Primary service attribute.

enumerator **ESP\_GATT\_DB\_SECONDARY\_SERVICE**

Secondary service attribute.

enumerator **ESP\_GATT\_DB\_CHARACTERISTIC**

Characteristic attribute.

enumerator **ESP\_GATT\_DB\_DESCRIPTOR**

Descriptor attribute.

enumerator **ESP\_GATT\_DB\_INCLUDED\_SERVICE**

Included service attribute.

enumerator **ESP\_GATT\_DB\_ALL**

All attribute types.

## GATT SERVER API

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - [bluetooth/bluedroid/ble/gatt\\_server\\_service\\_table](#)
  - [GATT Server Service Table Example Walkthrough](#)
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - [bluetooth/bluedroid/ble/gatt\\_server](#)
  - [GATT Server Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - [bluetooth/bluedroid/ble/ble\\_spp\\_server](#)

## API Reference

### Header File

### Functions

*esp\_err\_t* **esp\_ble\_gatts\_register\_callback** (*esp\_gatts\_cb\_t* callback)

This function is called to register application callbacks with BTA GATTS module.

#### Returns

- ESP\_OK : success
- other : failed

*esp\_gatts\_cb\_t* **esp\_ble\_gatts\_get\_callback** (void)

This function is called to get the current application callbacks with BTA GATTS module.

#### Returns

- *esp\_gatts\_cb\_t* : current callback

*esp\_err\_t* **esp\_ble\_gatts\_app\_register** (uint16\_t app\_id)

This function is called to register application identifier.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_app\_unregister** (*esp\_gatt\_if\_t* gatts\_if)

unregister with GATT Server.

**Parameters** **gatts\_if** -- [in] GATT server access interface

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_create\_service** (*esp\_gatt\_if\_t* gatts\_if, *esp\_gatt\_srvc\_id\_t* \*service\_id, uint16\_t num\_handle)

Create a service. When service creation is done, a callback event ESP\_GATTS\_CREATE\_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

**Parameters**

- **gatts\_if** -- [in] GATT server access interface
- **service\_id** -- [in] service ID.
- **num\_handle** -- [in] number of handle requested for this service.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_create\_attr\_tab** (const *esp\_gatts\_attr\_db\_t* \*gatts\_attr\_db, *esp\_gatt\_if\_t* gatts\_if, uint16\_t max\_nb\_attr, uint8\_t srvc\_inst\_id)

Create a service attribute tab.

**Parameters**

- **gatts\_attr\_db** -- [in] the pointer to the service attr tab
- **gatts\_if** -- [in] GATT server access interface
- **max\_nb\_attr** -- [in] the number of attribute to be added to the service database.
- **srvc\_inst\_id** -- [in] the instance id of the service

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_add\_included\_service** (uint16\_t service\_handle, uint16\_t included\_service\_handle)

This function is called to add an included service. This function have to be called between 'esp\_ble\_gatts\_create\_service' and 'esp\_ble\_gatts\_add\_char'. After included service is included, a callback event ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT is reported the included service ID.

**Parameters**

- **service\_handle** -- [in] service handle to which this included service is to be added.
- **included\_service\_handle** -- [in] the service ID to be included.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_add\_char** (uint16\_t service\_handle, *esp\_bt\_uuid\_t* \*char\_uuid, *esp\_gatt\_perm\_t* perm, *esp\_gatt\_char\_prop\_t* property, *esp\_attr\_value\_t* \*char\_val, *esp\_attr\_control\_t* \*control)

This function is called to add a characteristic into a service.

**Parameters**

- **service\_handle** -- [in] service handle to which this included service is to be added.

- **char\_uuid** -- **[in]** : Characteristic UUID.
- **perm** -- **[in]** : Characteristic value declaration attribute permission.
- **property** -- **[in]** : Characteristic Properties
- **char\_val** -- **[in]** : Characteristic value
- **control** -- **[in]** : attribute response control byte

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_add\_char\_descr** (uint16\_t service\_handle, *esp\_bt\_uuid\_t* \*descr\_uuid, *esp\_gatt\_perm\_t* perm, *esp\_attr\_value\_t* \*char\_descr\_val, *esp\_attr\_control\_t* \*control)

This function is called to add characteristic descriptor. When it's done, a callback event ESP\_GATTS\_ADD\_DESCR\_EVT is called to report the status and an ID number for this descriptor.

**Parameters**

- **service\_handle** -- **[in]** service handle to which this characteristic descriptor is to be added.
- **perm** -- **[in]** descriptor access permission.
- **descr\_uuid** -- **[in]** descriptor UUID.
- **char\_descr\_val** -- **[in]** : Characteristic descriptor value
- **control** -- **[in]** : attribute response control byte

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_delete\_service** (uint16\_t service\_handle)

This function is called to delete a service. When this is done, a callback event ESP\_GATTS\_DELETE\_EVT is report with the status.

**Parameters** **service\_handle** -- **[in]** service\_handle to be deleted.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_start\_service** (uint16\_t service\_handle)

This function is called to start a service.

**Parameters** **service\_handle** -- **[in]** the service handle to be started.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_stop\_service** (uint16\_t service\_handle)

This function is called to stop a service.

**Parameters** **service\_handle** -- **[in]** - service to be topped.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_send\_indicate** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id, uint16\_t attr\_handle, uint16\_t value\_len, uint8\_t \*value, bool need\_confirm)

Send indicate or notify to GATT client. Set param need\_confirm as false will send notification, otherwise indication. Note: the size of indicate or notify data need less than MTU size, see "esp\_ble\_gattc\_send\_mtu\_req".

**Parameters**

- **gatts\_if** -- **[in]** GATT server access interface
- **conn\_id** -- **[in]** - connection id to indicate.
- **attr\_handle** -- **[in]** - attribute handle to indicate.
- **value\_len** -- **[in]** - indicate value length.
- **value** -- **[in]** value to indicate.

- **need\_confirm** -- **[in]** - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_send\_response** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id, uint32\_t trans\_id, *esp\_gatt\_status\_t* status, *esp\_gatt\_rsp\_t* \*rsp)

This function is called to send a response to a request.

**Parameters**

- **gatts\_if** -- **[in]** GATT server access interface
- **conn\_id** -- **[in]** - connection identifier.
- **trans\_id** -- **[in]** - transfer id
- **status** -- **[in]** - response status
- **rsp** -- **[in]** - response data.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_set\_attr\_value** (uint16\_t attr\_handle, uint16\_t length, const uint8\_t \*value)

This function is called to set the attribute value by the application.

**Parameters**

- **attr\_handle** -- **[in]** the attribute handle which to be set
- **length** -- **[in]** the value length
- **value** -- **[in]** the pointer to the attribute value

**Returns**

- ESP\_OK : success
- other : failed

*esp\_gatt\_status\_t* **esp\_ble\_gatts\_get\_attr\_value** (uint16\_t attr\_handle, uint16\_t \*length, const uint8\_t \*\*value)

Retrieve attribute value.

**Parameters**

- **attr\_handle** -- **[in]** Attribute handle.
- **length** -- **[out]** pointer to the attribute value length
- **value** -- **[out]** Pointer to attribute value payload, the value cannot be modified by user

**Returns**

- ESP\_GATT\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_open** (*esp\_gatt\_if\_t* gatts\_if, *esp\_bd\_addr\_t* remote\_bda, bool is\_direct)

Open a direct open connection or add a background auto connection.

**Parameters**

- **gatts\_if** -- **[in]** GATT server access interface
- **remote\_bda** -- **[in]** remote device bluetooth device address.
- **is\_direct** -- **[in]** direct connection or background auto connection

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_close** (*esp\_gatt\_if\_t* gatts\_if, uint16\_t conn\_id)

Close a connection a remote device.

**Parameters**

- **gatts\_if** -- **[in]** GATT server access interface
- **conn\_id** -- **[in]** connection ID to be closed.

**Returns**

- ESP\_OK : success

- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_send\_service\_change\_indication** (*esp\_gatt\_if\_t* gatts\_if,  
*esp\_bd\_addr\_t* remote\_bda)

Send service change indication.

#### Parameters

- **gatts\_if** -- [in] GATT server access interface
- **remote\_bda** -- [in] remote device bluetooth device address. If remote\_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

#### Returns

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_gatts\_show\_local\_database** (void)

Print local database (GATT service table)

#### Returns

- ESP\_OK : success
- other : failed

## Unions

union **esp\_ble\_gatts\_cb\_param\_t**

*#include <esp\_gatts\_api.h>* Gatt server callback parameters union.

## Public Members

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_reg\_evt\_param* **reg**

Gatt server callback param of ESP\_GATTS\_REG\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_read\_evt\_param* **read**

Gatt server callback param of ESP\_GATTS\_READ\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_write\_evt\_param* **write**

Gatt server callback param of ESP\_GATTS\_WRITE\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_exec\_write\_evt\_param* **exec\_write**

Gatt server callback param of ESP\_GATTS\_EXEC\_WRITE\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_mtu\_evt\_param* **mtu**

Gatt server callback param of ESP\_GATTS\_MTU\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_conf\_evt\_param* **conf**

Gatt server callback param of ESP\_GATTS\_CONF\_EVT (confirm)

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_create\_evt\_param* **create**

Gatt server callback param of ESP\_GATTS\_CREATE\_EVT

struct *esp\_ble\_gatts\_cb\_param\_t::gatts\_add\_incl\_srvc\_evt\_param* **add\_incl\_srvc**

Gatt server callback param of ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT

```
struct esp_ble_gatts_cb_param_t::gatts_add_char_evt_param add_char
    Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param add_char_descr
    Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct esp_ble_gatts_cb_param_t::gatts_delete_evt_param del
    Gatt server callback param of ESP_GATTS_DELETE_EVT

struct esp_ble_gatts_cb_param_t::gatts_start_evt_param start
    Gatt server callback param of ESP_GATTS_START_EVT

struct esp_ble_gatts_cb_param_t::gatts_stop_evt_param stop
    Gatt server callback param of ESP_GATTS_STOP_EVT

struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect
    Gatt server callback param of ESP_GATTS_CONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_disconnect_evt_param disconnect
    Gatt server callback param of ESP_GATTS_DISCONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_open_evt_param open
    Gatt server callback param of ESP_GATTS_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_cancel_open_evt_param cancel_open
    Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_close_evt_param close
    Gatt server callback param of ESP_GATTS_CLOSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_congest_evt_param congest
    Gatt server callback param of ESP_GATTS_CONGEST_EVT

struct esp_ble_gatts_cb_param_t::gatts_rsp_evt_param rsp
    Gatt server callback param of ESP_GATTS_RESPONSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab
    Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT

struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val
    Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT

struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change
    Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT

struct gatts_add_attr_tab_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_CREAT_ATTR_TAB_EVT.

`uint16_t handle`  
attribute handle

`uint16_t len`  
The indication or notification value length, len is valid when send notification or indication failed

`uint8_t *value`  
The indication or notification value , value is valid when send notification or indication failed

```
struct gatts_congest_evt_param  
#include <esp_gatts_api.h> ESP_GATTS_LISTEN_EVT.  
ESP_GATTS_CONGEST_EVT
```

### Public Members

`uint16_t conn_id`  
Connection id

`bool congested`  
Congested or not

```
struct gatts_connect_evt_param  
#include <esp_gatts_api.h> ESP_GATTS_CONNECT_EVT.
```

### Public Members

`uint16_t conn_id`  
Connection id

`uint8_t link_role`  
Link role : master role = 0 ; slave role = 1

`esp_bd_addr_t remote_bda`  
Remote bluetooth device address

`esp_gatt_conn_params_t conn_params`  
current Connection parameters

`esp_ble_addr_type_t ble_addr_type`  
Remote BLE device address type

`uint16_t conn_handle`  
HCI connection handle

```
struct gatts_create_evt_param  
#include <esp_gatts_api.h> ESP_GATTS_UNREG_EVT.  
ESP_GATTS_CREATE_EVT
```

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **service\_handle**

Service attribute handle

*esp\_gatt\_srvc\_id\_t* **service\_id**

Service id, include service uuid and other information

struct **gatts\_delete\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_DELETE\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **service\_handle**

Service attribute handle

struct **gatts\_disconnect\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_DISCONNECT\_EVT.

### Public Members

uint16\_t **conn\_id**

Connection id

*esp\_bd\_addr\_t* **remote\_bda**

Remote bluetooth device address

*esp\_gatt\_conn\_reason\_t* **reason**

Indicate the reason of disconnection

struct **gatts\_exec\_write\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_EXEC\_WRITE\_EVT.

### Public Members

uint16\_t **conn\_id**

Connection id

uint32\_t **trans\_id**

Transfer id

*esp\_bd\_addr\_t* **bda**

The bluetooth device address which been written

uint8\_t **exec\_write\_flag**

Execute write flag

struct **gatts\_mtu\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_MTU\_EVT.

### Public Members

uint16\_t **conn\_id**

Connection id

uint16\_t **mtu**

MTU size

struct **gatts\_open\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_OPEN\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

struct **gatts\_read\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_READ\_EVT.

### Public Members

uint16\_t **conn\_id**

Connection id

uint32\_t **trans\_id**

Transfer id

*esp\_bd\_addr\_t* **bda**

The bluetooth device address which been read

uint16\_t **handle**

The attribute handle

uint16\_t **offset**

Offset of the value, if the value is too long

bool **is\_long**  
The value is too long or not

bool **need\_rsp**  
The read operation need to do response

struct **gatts\_reg\_evt\_param**  
*#include <esp\_gatts\_api.h>* ESP\_GATTS\_REG\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**  
Operation status

uint16\_t **app\_id**  
Application id which input in register API

struct **gatts\_rsp\_evt\_param**  
*#include <esp\_gatts\_api.h>* ESP\_GATTS\_RESPONSE\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**  
Operation status

uint16\_t **handle**  
Attribute handle which send response

struct **gatts\_send\_service\_change\_evt\_param**  
*#include <esp\_gatts\_api.h>* ESP\_GATTS\_SEND\_SERVICE\_CHANGE\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**  
Operation status

struct **gatts\_set\_attr\_val\_evt\_param**  
*#include <esp\_gatts\_api.h>* ESP\_GATTS\_SET\_ATTR\_VAL\_EVT.

### Public Members

uint16\_t **srvc\_handle**  
The service handle

uint16\_t **attr\_handle**  
The attribute handle

*esp\_gatt\_status\_t* **status**

Operation status

struct **gatts\_start\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_START\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **service\_handle**

Service attribute handle

struct **gatts\_stop\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_STOP\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **service\_handle**

Service attribute handle

struct **gatts\_write\_evt\_param**

*#include <esp\_gatts\_api.h>* ESP\_GATTS\_WRITE\_EVT.

### Public Members

uint16\_t **conn\_id**

Connection id

uint32\_t **trans\_id**

Transfer id

*esp\_bd\_addr\_t* **bda**

The bluetooth device address which been written

uint16\_t **handle**

The attribute handle

uint16\_t **offset**

Offset of the value, if the value is too long

bool **need\_rsp**  
The write operation need to do response

bool **is\_prep**  
This write operation is prepare write

uint16\_t **len**  
The write attribute value length

uint8\_t \***value**  
The write attribute value

### Macros

**ESP\_GATT\_PREP\_WRITE\_CANCEL**  
Prepare write flag to indicate cancel prepare write

**ESP\_GATT\_PREP\_WRITE\_EXEC**  
Prepare write flag to indicate execute prepare write

### Type Definitions

typedef void (\***esp\_gatts\_cb\_t**)(*esp\_gatts\_cb\_event\_t* event, *esp\_gatt\_if\_t* gatts\_if, *esp\_ble\_gatts\_cb\_param\_t* \*param)

GATT Server callback function type.

**Param event** : Event type

**Param gatts\_if** : GATT server access interface, normally different gatts\_if correspond to different profile

**Param param** : Point to callback parameter, currently is union type

### Enumerations

enum **esp\_gatts\_cb\_event\_t**  
GATT Server callback function events.

*Values:*

enumerator **ESP\_GATTS\_REG\_EVT**  
When register application id, the event comes

enumerator **ESP\_GATTS\_READ\_EVT**  
When gatt client request read operation, the event comes

enumerator **ESP\_GATTS\_WRITE\_EVT**  
When gatt client request write operation, the event comes

enumerator **ESP\_GATTS\_EXEC\_WRITE\_EVT**  
When gatt client request execute write, the event comes

enumerator **ESP\_GATTS\_MTU\_EVT**  
When set mtu complete, the event comes

enumerator **ESP\_GATTS\_CONF\_EVT**

When receive confirm, the event comes

enumerator **ESP\_GATTS\_UNREG\_EVT**

When unregister application id, the event comes

enumerator **ESP\_GATTS\_CREATE\_EVT**

When create service complete, the event comes

enumerator **ESP\_GATTS\_ADD\_INCL\_SRVC\_EVT**

When add included service complete, the event comes

enumerator **ESP\_GATTS\_ADD\_CHAR\_EVT**

When add characteristic complete, the event comes

enumerator **ESP\_GATTS\_ADD\_CHAR\_DESCR\_EVT**

When add descriptor complete, the event comes

enumerator **ESP\_GATTS\_DELETE\_EVT**

When delete service complete, the event comes

enumerator **ESP\_GATTS\_START\_EVT**

When start service complete, the event comes

enumerator **ESP\_GATTS\_STOP\_EVT**

When stop service complete, the event comes

enumerator **ESP\_GATTS\_CONNECT\_EVT**

When gatt client connect, the event comes

enumerator **ESP\_GATTS\_DISCONNECT\_EVT**

When gatt client disconnect, the event comes

enumerator **ESP\_GATTS\_OPEN\_EVT**

When connect to peer, the event comes

enumerator **ESP\_GATTS\_CANCEL\_OPEN\_EVT**

When disconnect from peer, the event comes

enumerator **ESP\_GATTS\_CLOSE\_EVT**

When gatt server close, the event comes

enumerator **ESP\_GATTS\_LISTEN\_EVT**

When gatt listen to be connected the event comes

enumerator **ESP\_GATTS\_CONGEST\_EVT**

When congest happen, the event comes

enumerator **ESP\_GATTS\_RESPONSE\_EVT**

When gatt send response complete, the event comes

enumerator **ESP\_GATTS\_CREAT\_ATTR\_TAB\_EVT**

When gatt create table complete, the event comes

enumerator **ESP\_GATTS\_SET\_ATTR\_VAL\_EVT**

When gatt set attr value complete, the event comes

enumerator **ESP\_GATTS\_SEND\_SERVICE\_CHANGE\_EVT**

When gatt send service change indication complete, the event comes

## GATT CLIENT API

**Application Example** Check [bluetooth/bluedroid/ble](#) folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - [bluetooth/bluedroid/ble/gatt\\_client](#)
  - [GATT Client Example Walkthrough](#)
- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - [bluetooth/bluedroid/ble/gattc\\_multi\\_connect](#)
  - [GATT Client Multi-connection Example Walkthrough](#)
- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - [bluetooth/bluedroid/ble/ble\\_spp\\_client](#)

## API Reference

### Functions

*esp\_err\_t* **esp\_ble\_gattc\_register\_callback** (*esp\_gattc\_cb\_t* callback)

This function is called to register application callbacks with GATTC module.

**Parameters** **callback** -- [**in**] : pointer to the application callback function.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_gattc\_cb\_t* **esp\_ble\_gattc\_get\_callback** (void)

This function is called to get the current application callbacks with BTA GATTC module.

**Returns**

- *esp\_gattc\_cb\_t* : current callback

*esp\_err\_t* **esp\_ble\_gattc\_app\_register** (uint16\_t app\_id)

This function is called to register application callbacks with GATTC module.

**Parameters** **app\_id** -- [**in**] : Application Identify (UUID), for different application

**Returns**

- ESP\_OK: success

- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_app\_unregister** (*esp\_gatt\_if\_t* gattc\_if)

This function is called to unregister an application from GATT module.

**Parameters** **gattc\_if** -- **[in]** Gatt client access interface.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_open** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* remote\_bda, *esp\_ble\_addr\_type\_t* remote\_addr\_type, bool is\_direct)

Open a direct connection or add a background auto connection.

**Parameters**

- **gattc\_if** -- **[in]** Gatt client access interface.
- **remote\_bda** -- **[in]** remote device bluetooth device address.
- **remote\_addr\_type** -- **[in]** remote device bluetooth device the address type.
- **is\_direct** -- **[in]** direct connection or background auto connection (by now, background auto connection is not supported).

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_aux\_open** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* remote\_bda, *esp\_ble\_addr\_type\_t* remote\_addr\_type, bool is\_direct)

*esp\_err\_t* **esp\_ble\_gattc\_close** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id)

Close the virtual connection to the GATT server. `gattc` may have multiple virtual GATT server connections when multiple `app_id` registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use `esp_ble_gap_disconnect(esp_bd_addr_t remote_device)`.

**Parameters**

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** connection ID to be closed.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_send\_mtu\_req** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id)

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use `esp_ble_gatt_set_local_mtu()` to configure the local MTU size.

**Parameters**

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** connection ID.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_search\_service** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_bt\_uuid\_t* \*filter\_uuid)

This function is called to get service from local cache. This function report service search result by a call-back event, and followed by a service search complete event. Note: 128-bit base UUID will automatically be converted to a 16-bit UUID in the search results. Other types of UUID remain unchanged.

**Parameters**

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** connection ID.
- **filter\_uuid** -- **[in]** a UUID of the service application is interested in. If Null, discover for all services.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_service** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_bt\_uuid\_t* \*svc\_uuid, *esp\_gattc\_service\_elem\_t* \*result, uint16\_t \*count, uint16\_t offset)

Find all the service with the given service uuid in the gattc cache, if the svc\_uuid is NULL, find all the service. Note: It just get service from local cache, won't get from remote devices. If want to get it from remote device, need to used the esp\_ble\_gattc\_cache\_refresh, then call esp\_ble\_gattc\_get\_service again.

**Parameters**

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** connection ID which identify the server.
- **svc\_uuid** -- **[in]** the pointer to the service uuid.
- **result** -- **[out]** The pointer to the service which has been found in the gattc cache.
- **count** -- **[inout]** input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- **offset** -- **[in]** Offset of the service position to get.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_all\_char** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_gattc\_char\_elem\_t* \*result, uint16\_t \*count, uint16\_t offset)

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

**Parameters**

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** connection ID which identify the server.
- **start\_handle** -- **[in]** the attribute start handle.
- **end\_handle** -- **[in]** the attribute end handle
- **result** -- **[out]** The pointer to the characteristic in the service.
- **count** -- **[inout]** input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- **offset** -- **[in]** Offset of the characteristic position to get.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_all\_descr** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t char\_handle, *esp\_gattc\_descr\_elem\_t* \*result, uint16\_t \*count, uint16\_t offset)

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

**Parameters**

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** connection ID which identify the server.
- **char\_handle** -- **[in]** the given characteristic handle
- **result** -- **[out]** The pointer to the descriptor in the characteristic.
- **count** -- **[inout]** input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- **offset** -- **[in]** Offset of the descriptor position to get.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_char\_by\_uuid** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_bt\_uuid\_t* char\_uuid, *esp\_gattc\_char\_elem\_t* \*result, uint16\_t \*count)

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won't get from remote devices.

#### Parameters

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** connection ID which identify the server.
- **start\_handle** -- **[in]** the attribute start handle
- **end\_handle** -- **[in]** the attribute end handle
- **char\_uuid** -- **[in]** the characteristic uuid
- **result** -- **[out]** The pointer to the characteristic in the service.
- **count** -- **[inout]** input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

#### Returns

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_descr\_by\_uuid** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_bt\_uuid\_t* char\_uuid, *esp\_bt\_uuid\_t* descr\_uuid, *esp\_gattc\_descr\_elem\_t* \*result, uint16\_t \*count)

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

#### Parameters

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** connection ID which identify the server.
- **start\_handle** -- **[in]** the attribute start handle
- **end\_handle** -- **[in]** the attribute end handle
- **char\_uuid** -- **[in]** the characteristic uuid.
- **descr\_uuid** -- **[in]** the descriptor uuid.
- **result** -- **[out]** The pointer to the descriptor in the given characteristic.
- **count** -- **[inout]** input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

#### Returns

- ESP\_OK: success
- other: failed

*esp\_gatt\_status\_t* **esp\_ble\_gattc\_get\_descr\_by\_char\_handle** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t char\_handle, *esp\_bt\_uuid\_t* descr\_uuid, *esp\_gattc\_descr\_elem\_t* \*result, uint16\_t \*count)

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won't get from remote devices.

#### Parameters

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** connection ID which identify the server.
- **char\_handle** -- **[in]** the characteristic handle.
- **descr\_uuid** -- **[in]** the descriptor uuid.
- **result** -- **[out]** The pointer to the descriptor in the given characteristic.
- **count** -- **[inout]** input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

#### Returns

- ESP\_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_include_service (esp_gatt_if_t gattc_if, uint16_t conn_id,
                                                    uint16_t start_handle, uint16_t end_handle,
                                                    esp_bt_uuid_t *incl_uuid,
                                                    esp_gattc_incl_svc_elem_t *result, uint16_t
                                                    *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won't get from remote devices.

**Parameters**

- **gattc\_if** -- [in] Gatt client access interface.
- **conn\_id** -- [in] connection ID which identify the server.
- **start\_handle** -- [in] the attribute start handle
- **end\_handle** -- [in] the attribute end handle
- **incl\_uuid** -- [in] the include service uuid
- **result** -- [out] The pointer to the include service in the given service.
- **count** -- [inout] input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

**Returns**

- ESP\_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_attr_count (esp_gatt_if_t gattc_if, uint16_t conn_id,
                                                esp_gatt_db_attr_type_t type, uint16_t start_handle,
                                                uint16_t end_handle, uint16_t char_handle, uint16_t
                                                *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

**Parameters**

- **gattc\_if** -- [in] Gatt client access interface.
- **conn\_id** -- [in] connection ID which identify the server.
- **type** -- [in] the attribute type.
- **start\_handle** -- [in] the attribute start handle, if the type is ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore
- **end\_handle** -- [in] the attribute end handle, if the type is ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore
- **char\_handle** -- [in] the characteristic handle, this parameter valid when the type is ESP\_GATT\_DB\_DESCRIPTOR. If the type isn't ESP\_GATT\_DB\_DESCRIPTOR, this parameter should be ignore.
- **count** -- [out] output the number of attribute has been found in the gattc cache with the given attribute type.

**Returns**

- ESP\_OK: success
- other: failed

```
esp_gatt_status_t esp_ble_gattc_get_db (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle,
                                         uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)
```

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won't get from remote devices.

**Parameters**

- **gattc\_if** -- [in] Gatt client access interface.
- **start\_handle** -- [in] the attribute start handle
- **end\_handle** -- [in] the attribute end handle
- **conn\_id** -- [in] connection ID which identify the server.
- **db** -- [in] output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- **count** -- [in] number of elements in database.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_char** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read a service's characteristics of the given characteristic handle.

**Parameters**

- **gattc\_if** -- [in] Gatt client access interface.
- **conn\_id** -- [in] : connection ID.
- **handle** -- [in] : characteritic handle to read.
- **auth\_req** -- [in] : authenticate request type

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_by\_type** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t start\_handle, uint16\_t end\_handle, *esp\_bt\_uuid\_t* \*uuid, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read a service's characteristics of the given characteristic UUID.

**Parameters**

- **gattc\_if** -- [in] Gatt client access interface.
- **conn\_id** -- [in] : connection ID.
- **start\_handle** -- [in] : the attribute start handle.
- **end\_handle** -- [in] : the attribute end handle
- **uuid** -- [in] : The UUID of attribute which will be read.
- **auth\_req** -- [in] : authenticate request type

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_multiple** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_gattc\_multi\_t* \*read\_multi, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read multiple characteristic or characteristic descriptors.

**Parameters**

- **gattc\_if** -- [in] Gatt client access interface.
- **conn\_id** -- [in] : connection ID.
- **read\_multi** -- [in] : pointer to the read multiple parameter.
- **auth\_req** -- [in] : authenticate request type

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_multiple\_variable** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, *esp\_gattc\_multi\_t* \*read\_multi, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read multiple variable length characteristic or characteristic descriptors.

**Parameters**

- **gattc\_if** -- [in] Gatt client access interface.
- **conn\_id** -- [in] : connection ID.
- **read\_multi** -- [in] : pointer to the read multiple parameter.
- **auth\_req** -- [in] : authenticate request type

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_read\_char\_descr** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to read a characteristics descriptor.

**Parameters**

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** : connection ID.
- **handle** -- **[in]** : descriptor handle to read.
- **auth\_req** -- **[in]** : authenticate request type

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_write\_char** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_write\_type\_t* write\_type, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to write characteristic value.

**Parameters**

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** : connection ID.
- **handle** -- **[in]** : characteristic handle to write.
- **value\_len** -- **[in]** length of the value to be written.
- **value** -- **[in]** : the value to be written.
- **write\_type** -- **[in]** : the type of attribute write operation.
- **auth\_req** -- **[in]** : authentication request.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_write\_char\_descr** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_write\_type\_t* write\_type, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to write characteristic descriptor value.

**Parameters**

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** : connection ID
- **handle** -- **[in]** : descriptor handle to write.
- **value\_len** -- **[in]** length of the value to be written.
- **value** -- **[in]** : the value to be written.
- **write\_type** -- **[in]** : the type of attribute write operation.
- **auth\_req** -- **[in]** : authentication request.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_prepare\_write** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t offset, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to prepare write a characteristic value.

**Parameters**

- **gattc\_if** -- **[in]** Gatt client access interface.
- **conn\_id** -- **[in]** : connection ID.
- **handle** -- **[in]** : characteristic handle to prepare write.
- **offset** -- **[in]** : offset of the write value.
- **value\_len** -- **[in]** length of the value to be written.
- **value** -- **[in]** : the value to be written.
- **auth\_req** -- **[in]** : authentication request.

**Returns**

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_prepare\_write\_char\_descr** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, uint16\_t handle, uint16\_t offset, uint16\_t value\_len, uint8\_t \*value, *esp\_gatt\_auth\_req\_t* auth\_req)

This function is called to prepare write a characteristic descriptor value.

#### Parameters

- **gattc\_if** -- [in] Gatt client access interface.
- **conn\_id** -- [in] : connection ID.
- **handle** -- [in] : characteristic descriptor handle to prepare write.
- **offset** -- [in] : offset of the write value.
- **value\_len** -- [in] length of the value to be written.
- **value** -- [in] : the value to be written.
- **auth\_req** -- [in] : authentication request.

#### Returns

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_execute\_write** (*esp\_gatt\_if\_t* gattc\_if, uint16\_t conn\_id, bool is\_execute)

This function is called to execute write a prepare write sequence.

#### Parameters

- **gattc\_if** -- [in] Gatt client access interface.
- **conn\_id** -- [in] : connection ID.
- **is\_execute** -- [in] : execute or cancel.

#### Returns

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_register\_for\_notify** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* server\_bda, uint16\_t handle)

This function is called to register for notification of a service.

#### Parameters

- **gattc\_if** -- [in] Gatt client access interface.
- **server\_bda** -- [in] : target GATT server.
- **handle** -- [in] : GATT characteristic handle.

#### Returns

- ESP\_OK: registration succeeds
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_unregister\_for\_notify** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* server\_bda, uint16\_t handle)

This function is called to de-register for notification of a service.

#### Parameters

- **gattc\_if** -- [in] Gatt client access interface.
- **server\_bda** -- [in] : target GATT server.
- **handle** -- [in] : GATT characteristic handle.

#### Returns

- ESP\_OK: unregister succeeds
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_cache\_refresh** (*esp\_bd\_addr\_t* remote\_bda)

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Parameters** **remote\_bda** -- [in] remote device BD address.

#### Returns

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_cache\_assoc** (*esp\_gatt\_if\_t* gattc\_if, *esp\_bd\_addr\_t* src\_addr, *esp\_bd\_addr\_t* assoc\_addr, bool is\_assoc)

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device's attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address means that device want to use the database has stored in the local cache. The source address means that device want to share the database to the associated address device.

#### Parameters

- **gattc\_if** -- **[in]** Gatt client access interface.
- **src\_addr** -- **[in]** the source address which provide the attribute table.
- **assoc\_addr** -- **[in]** the associated device address which went to share the attribute table with the source address.
- **is\_assoc** -- **[in]** true add the associated device address, false remove the associated device address.

#### Returns

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_cache\_get\_addr\_list** (*esp\_gatt\_if\_t* gattc\_if)

Get the address list which has store the attribute table in the gattc cache. There will callback ESP\_GATTC\_GET\_ADDR\_LIST\_EVT event when get address list complete.

**Parameters** **gattc\_if** -- **[in]** Gatt client access interface.

#### Returns

- ESP\_OK: success
- other: failed

*esp\_err\_t* **esp\_ble\_gattc\_cache\_clean** (*esp\_bd\_addr\_t* remote\_bda)

Clean the service cache of this device in the gattc stack,.

**Parameters** **remote\_bda** -- **[in]** remote device BD address.

#### Returns

- ESP\_OK: success
- other: failed

## Unions

union **esp\_ble\_gattc\_cb\_param\_t**

*#include <esp\_gattc\_api.h>* Gatt client callback parameters union.

### Public Members

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_reg\_evt\_param* **reg**  
Gatt client callback param of ESP\_GATTC\_REG\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_open\_evt\_param* **open**  
Gatt client callback param of ESP\_GATTC\_OPEN\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_close\_evt\_param* **close**  
Gatt client callback param of ESP\_GATTC\_CLOSE\_EVT

struct *esp\_ble\_gattc\_cb\_param\_t::gattc\_cfg\_mtu\_evt\_param* **cfg\_mtu**  
Gatt client callback param of ESP\_GATTC\_CFG\_MTU\_EVT

```
struct esp_ble_gattc_cb_param_t::gattc_search_cmpl_evt_param search_cmpl
    Gatt client callback param of ESP_GATTC_SEARCH_CMPL_EVT

struct esp_ble_gattc_cb_param_t::gattc_search_res_evt_param search_res
    Gatt client callback param of ESP_GATTC_SEARCH_RES_EVT

struct esp_ble_gattc_cb_param_t::gattc_read_char_evt_param read
    Gatt client callback param of ESP_GATTC_READ_CHAR_EVT

struct esp_ble_gattc_cb_param_t::gattc_write_evt_param write
    Gatt client callback param of ESP_GATTC_WRITE_DESCR_EVT

struct esp_ble_gattc_cb_param_t::gattc_exec_cmpl_evt_param exec_cmpl
    Gatt client callback param of ESP_GATTC_EXEC_EVT

struct esp_ble_gattc_cb_param_t::gattc_notify_evt_param notify
    Gatt client callback param of ESP_GATTC_NOTIFY_EVT

struct esp_ble_gattc_cb_param_t::gattc_srvc_chg_evt_param srvc_chg
    Gatt client callback param of ESP_GATTC_SRVC_CHG_EVT

struct esp_ble_gattc_cb_param_t::gattc_congest_evt_param congest
    Gatt client callback param of ESP_GATTC_CONGEST_EVT

ESP\_GATTC\_WRITE\_DESCR\_EVT.

### Public Members

*esp\_gatt\_status\_t* **status**

Operation status

uint16\_t **conn\_id**

Connection id

uint16\_t **handle**

The Characteristic or descriptor handle

uint16\_t **offset**

The prepare write offset, this value is valid only when prepare write

### Type Definitions

```
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if, esp_ble_gattc_cb_param_t *param)
```

GATT Client callback function type.

**Param event** : Event type

**Param gattc\_if** : GATT client access interface, normally different gattc\_if correspond to different profile

**Param param** : Point to callback parameter, currently is union type

### Enumerations

```
enum esp_gattc_cb_event_t
```

GATT Client callback function events.

*Values:*

enumerator **ESP\_GATTC\_REG\_EVT**

When GATT client is registered, the event comes

enumerator **ESP\_GATTC\_UNREG\_EVT**

When GATT client is unregistered, the event comes

enumerator **ESP\_GATTC\_OPEN\_EVT**

When GATT virtual connection is set up, the event comes

enumerator **ESP\_GATTC\_READ\_CHAR\_EVT**

When GATT characteristic is read, the event comes

enumerator **ESP\_GATTC\_WRITE\_CHAR\_EVT**

When GATT characteristic write operation completes, the event comes

enumerator **ESP\_GATTC\_CLOSE\_EVT**

When GATT virtual connection is closed, the event comes

enumerator **ESP\_GATTC\_SEARCH\_CMPL\_EVT**

When GATT service discovery is completed, the event comes

enumerator **ESP\_GATTC\_SEARCH\_RES\_EVT**

When GATT service discovery result is got, the event comes

enumerator **ESP\_GATTC\_READ\_DESCR\_EVT**

When GATT characteristic descriptor read completes, the event comes

enumerator **ESP\_GATTC\_WRITE\_DESCR\_EVT**

When GATT characteristic descriptor write completes, the event comes

enumerator **ESP\_GATTC\_NOTIFY\_EVT**

When GATT notification or indication arrives, the event comes

enumerator **ESP\_GATTC\_PREP\_WRITE\_EVT**

When GATT prepare-write operation completes, the event comes

enumerator **ESP\_GATTC\_EXEC\_EVT**

When write execution completes, the event comes

enumerator **ESP\_GATTC\_ACL\_EVT**

When ACL connection is up, the event comes

enumerator **ESP\_GATTC\_CANCEL\_OPEN\_EVT**

When GATT client ongoing connection is cancelled, the event comes

enumerator **ESP\_GATTC\_SRVC\_CHG\_EVT**

When "service changed" occurs, the event comes

enumerator **ESP\_GATTC\_ENC\_CMPL\_CB\_EVT**

When encryption procedure completes, the event comes

enumerator **ESP\_GATTC\_CFG\_MTU\_EVT**

When configuration of MTU completes, the event comes

enumerator **ESP\_GATTC\_ADV\_DATA\_EVT**

When advertising of data, the event comes

enumerator **ESP\_GATTC\_MULT\_ADV\_ENB\_EVT**

When multi-advertising is enabled, the event comes

enumerator **ESP\_GATTC\_MULT\_ADV\_UPD\_EVT**

When multi-advertising parameters are updated, the event comes

enumerator **ESP\_GATTC\_MULT\_ADV\_DATA\_EVT**

When multi-advertising data arrives, the event comes

enumerator **ESP\_GATTC\_MULT\_ADV\_DIS\_EVT**

When multi-advertising is disabled, the event comes

enumerator **ESP\_GATTC\_CONGEST\_EVT**

When GATT connection congestion comes, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_ENB\_EVT**

When batch scan is enabled, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_CFG\_EVT**

When batch scan storage is configured, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_RD\_EVT**

When Batch scan read event is reported, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_THR\_EVT**

When Batch scan threshold is set, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_PARAM\_EVT**

When Batch scan parameters are set, the event comes

enumerator **ESP\_GATTC\_BTH\_SCAN\_DIS\_EVT**

When Batch scan is disabled, the event comes

enumerator **ESP\_GATTC\_SCAN\_FLT\_CFG\_EVT**

When Scan filter configuration completes, the event comes

enumerator **ESP\_GATTC\_SCAN\_FLT\_PARAM\_EVT**

When Scan filter parameters are set, the event comes

enumerator **ESP\_GATTC\_SCAN\_FLT\_STATUS\_EVT**

When Scan filter status is reported, the event comes

enumerator **ESP\_GATTC\_ADV\_VSC\_EVT**

When advertising vendor spec content event is reported, the event comes

enumerator **ESP\_GATTC\_REG\_FOR\_NOTIFY\_EVT**

When register for notification of a service completes, the event comes

enumerator **ESP\_GATTC\_UNREG\_FOR\_NOTIFY\_EVT**

When unregister for notification of a service completes, the event comes

enumerator **ESP\_GATTC\_CONNECT\_EVT**

When the ble physical connection is set up, the event comes

enumerator **ESP\_GATTC\_DISCONNECT\_EVT**

When the ble physical connection disconnected, the event comes

enumerator **ESP\_GATTC\_READ\_MULTIPLE\_EVT**

When the ble characteristic or descriptor multiple complete, the event comes

enumerator **ESP\_GATTC\_QUEUE\_FULL\_EVT**

When the gattc command queue full, the event comes

enumerator **ESP\_GATTC\_SET\_ASSOC\_EVT**

When the ble gattc set the associated address complete, the event comes

enumerator **ESP\_GATTC\_GET\_ADDR\_LIST\_EVT**

When the ble get gattc address list in cache finish, the event comes

enumerator **ESP\_GATTC\_DIS\_SRVC\_CMPL\_EVT**

When the ble discover service complete, the event comes

enumerator **ESP\_GATTC\_READ\_MULTI\_VAR\_EVT**

When read multiple variable characteristic complete, the event comes

## BLUFI API

**Overview** BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the "Key Exchange/Negotiation" procedure.

**Application Example** Check [bluetooth](#) folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32's wifi to softap/station/softap&station mode and config wifi connections - [bluetooth/blufi](#)

## API Reference

### Header File

- [components/bt/common/api/include/api/esp\\_blufi\\_api.h](#)

### Functions

*esp\_err\_t* **esp\_blufi\_register\_callbacks** (*esp\_blufi\_callbacks\_t* \*callbacks)

This function is called to receive blufi callback event.

**Parameters** **callbacks** -- [in] callback functions

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_profile\_init** (void)

This function is called to initialize blufi\_profile.

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_profile\_deinit** (void)

This function is called to de-initialize blufi\_profile.

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_send\_wifi\_conn\_report** (*wifi\_mode\_t* opmode, *esp\_blufi\_sta\_conn\_state\_t* sta\_conn\_state, *uint8\_t* softap\_conn\_num, *esp\_blufi\_extra\_info\_t* \*extra\_info)

This function is called to send wifi connection report.

**Parameters**

- **opmode** -- : wifi opmode

- **sta\_conn\_state** -- : station is already in connection or not
- **softap\_conn\_num** -- : softap connection number
- **extra\_info** -- : extra information, such as sta\_ssid, softap\_ssid and etc.

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_send\_wifi\_list** (uint16\_t apCount, *esp\_blufi\_ap\_record\_t* \*list)

This function is called to send wifi list.

**Parameters**

- **apCount** -- : wifi list count
- **list** -- : wifi list

**Returns** ESP\_OK - success, other - failed

uint16\_t **esp\_blufi\_get\_version** (void)

Get BLUFI profile version.

**Returns** Most 8bit significant is Great version, Least 8bit is Sub version

*esp\_err\_t* **esp\_blufi\_send\_error\_info** (*esp\_blufi\_error\_state\_t* state)

This function is called to send blufi error information.

**Parameters** **state** -- : error state

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_blufi\_send\_custom\_data** (uint8\_t \*data, uint32\_t data\_len)

This function is called to custom data.

**Parameters**

- **data** -- : custom data value
- **data\_len** -- : the length of custom data

**Returns** ESP\_OK - success, other - failed

## Unions

union **esp\_blufi\_cb\_param\_t**

#include <esp\_blufi\_api.h> BLUFI callback parameters union.

## Public Members

struct *esp\_blufi\_cb\_param\_t::blufi\_init\_finish\_evt\_param* **init\_finish**

Blufi callback param of ESP\_BLUFI\_EVENT\_INIT\_FINISH

struct *esp\_blufi\_cb\_param\_t::blufi\_deinit\_finish\_evt\_param* **deinit\_finish**

Blufi callback param of ESP\_BLUFI\_EVENT\_DEINIT\_FINISH

struct *esp\_blufi\_cb\_param\_t::blufi\_set\_wifi\_mode\_evt\_param* **wifi\_mode**

Blufi callback param of ESP\_BLUFI\_EVENT\_INIT\_FINISH

struct *esp\_blufi\_cb\_param\_t::blufi\_connect\_evt\_param* **connect**

Blufi callback param of ESP\_BLUFI\_EVENT\_CONNECT

struct *esp\_blufi\_cb\_param\_t::blufi\_disconnect\_evt\_param* **disconnect**

Blufi callback param of ESP\_BLUFI\_EVENT\_DISCONNECT

struct *esp\_blufi\_cb\_param\_t::blufi\_recv\_sta\_bssid\_evt\_param* **sta\_bssid**

Blufi callback param of ESP\_BLUFI\_EVENT\_RECV\_STA\_BSSID

```
struct esp_blufi_cb_param_t::blufi_rcv_sta_ssid_evt_param sta_ssid  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_SSID
```

```
struct esp_blufi_cb_param_t::blufi_rcv_sta_passwd_evt_param sta_passwd  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_STA_PASSWD
```

```
struct esp_blufi_cb_param_t::blufi_rcv_softap_ssid_evt_param softap_ssid  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_SSID
```

```
struct esp_blufi_cb_param_t::blufi_rcv_softap_passwd_evt_param softap_passwd  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD
```

```
struct esp_blufi_cb_param_t::blufi_rcv_softap_max_conn_num_evt_param softap_max_conn_num  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM
```

```
struct esp_blufi_cb_param_t::blufi_rcv_softap_auth_mode_evt_param softap_auth_mode  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE
```

```
struct esp_blufi_cb_param_t::blufi_rcv_softap_channel_evt_param softap_channel  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL
```

```
struct esp_blufi_cb_param_t::blufi_rcv_username_evt_param username  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_USERNAME
```

```
struct esp_blufi_cb_param_t::blufi_rcv_ca_evt_param ca  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CA_CERT
```

```
struct esp_blufi_cb_param_t::blufi_rcv_client_cert_evt_param client_cert  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_CERT
```

```
struct esp_blufi_cb_param_t::blufi_rcv_server_cert_evt_param server_cert  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_CERT
```

```
struct esp_blufi_cb_param_t::blufi_rcv_client_pkey_evt_param client_pkey  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CLIENT_PRIV_KEY
```

```
struct esp_blufi_cb_param_t::blufi_rcv_server_pkey_evt_param server_pkey  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SERVER_PRIV_KEY
```

```
struct esp_blufi_cb_param_t::blufi_get_error_evt_param report_error  
    Blufi callback param of ESP_BLUFI_EVENT_REPORT_ERROR
```

```
struct esp_blufi_cb_param_t::blufi_rcv_custom_data_evt_param custom_data  
    Blufi callback param of ESP_BLUFI_EVENT_RECV_CUSTOM_DATA
```

```
struct blufi_connect_evt_param  
    #include <esp_blufi_api.h> ESP_BLUFI_EVENT_CONNECT.
```

struct **esp\_blufi\_ap\_record\_t**

Description of an WiFi AP.

### Public Members

uint8\_t **ssid**[33]

SSID of AP

int8\_t **rss**

signal strength of AP

struct **esp\_blufi\_callbacks\_t**

BLUFI callback functions type.

### Public Members

*esp\_blufi\_event\_cb\_t* **event\_cb**

BLUFI event callback

*esp\_blufi\_negotiate\_data\_handler\_t* **negotiate\_data\_handler**

BLUFI negotiate data function for negotiate share key

*esp\_blufi\_encrypt\_func\_t* **encrypt\_func**

BLUFI encrypt data function with share key generated by negotiate\_data\_handler

*esp\_blufi\_decrypt\_func\_t* **decrypt\_func**

BLUFI decrypt data function with share key generated by negotiate\_data\_handler

*esp\_blufi\_checksum\_func\_t* **checksum\_func**

BLUFI check sum function (FCS)

### Macros

**ESP\_BLUFI\_BD\_ADDR\_LEN**

Bluetooth address length.

### Type Definitions

typedef uint8\_t **esp\_blufi\_bd\_addr\_t**[ESP\_BLUFI\_BD\_ADDR\_LEN]

Bluetooth device address.

typedef void (\***esp\_blufi\_event\_cb\_t**)(*esp\_blufi\_cb\_event\_t* event, *esp\_blufi\_cb\_param\_t* \*param)

BLUFI event callback function type.

**Param event** : Event type

**Param param** : Point to callback parameter, currently is union type

typedef void (\***esp\_blufi\_negotiate\_data\_handler\_t**)(uint8\_t \*data, int len, uint8\_t \*\*output\_data, int \*output\_len, bool \*need\_free)

BLUFI negotiate data handler.

**Param data** : data from phone

**Param len** : length of data from phone

**Param output\_data** : data want to send to phone

**Param output\_len** : length of data want to send to phone  
**Param need\_free** : output reporting if memory needs to be freed or not \*

typedef int (\***esp\_blufi\_encrypt\_func\_t**)(uint8\_t iv8, uint8\_t \*crypt\_data, int crypt\_len)

BLUFI encrypt the data after negotiate a share key.

**Param iv8** : initial vector(8bit), normally, blufi core will input packet sequence number  
**Param crypt\_data** : plain text and encrypted data, the encrypt function must support autochthonous encrypt  
**Param crypt\_len** : length of plain text  
**Return** Nonnegative number is encrypted length, if error, return negative number;

typedef int (\***esp\_blufi\_decrypt\_func\_t**)(uint8\_t iv8, uint8\_t \*crypt\_data, int crypt\_len)

BLUFI decrypt the data after negotiate a share key.

**Param iv8** : initial vector(8bit), normally, blufi core will input packet sequence number  
**Param crypt\_data** : encrypted data and plain text, the encrypt function must support autochthonous decrypt  
**Param crypt\_len** : length of encrypted text  
**Return** Nonnegative number is decrypted length, if error, return negative number;

typedef uint16\_t (\***esp\_blufi\_checksum\_func\_t**)(uint8\_t iv8, uint8\_t \*data, int len)

BLUFI checksum.

**Param iv8** : initial vector(8bit), normally, blufi core will input packet sequence number  
**Param data** : data need to checksum  
**Param len** : length of data

## Enumerations

## 2.3.3 Controller & VHCI

### Application Example

Check `bluetooth/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send Reset/ADV\_PARAM/ADV\_DATA/ADV\_ENABLE HCI command for BLE advertising - [bluetooth/hci/controller\\_vhci\\_ble\\_adv](#).

### API Reference

#### Header File

- `components/bt/include/esp32/include/esp_bt.h`

#### Functions

`esp_err_t esp_ble_tx_power_set` (`esp_ble_power_type_t` power\_type, `esp_power_level_t` power\_level)

Set BLE TX power Connection Tx power should only be set after connection created.

##### Parameters

- **power\_type** -- : The type of which tx power, could set Advertising/Connection/Default and etc
- **power\_level** -- Power level(index) corresponding to absolute value(dbm)

**Returns** ESP\_OK - success, other - failed

`esp_power_level_t esp_ble_tx_power_get` (`esp_ble_power_type_t` power\_type)

Get BLE TX power Connection Tx power should only be get after connection created.

**Parameters** **power\_type** -- : The type of which tx power, could set Advertising/Connection/Default and etc

**Returns** >= 0 - Power level, < 0 - Invalid

`esp_err_t esp_bredr_tx_power_set` (`esp_power_level_t` min\_power\_level, `esp_power_level_t` max\_power\_level)

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on. Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP\_PWR\_LVL\_N0, and maximum power level is ESP\_PWR\_LVL\_P3.

##### Parameters

- **min\_power\_level** -- The minimum power level
- **max\_power\_level** -- The maximum power level

**Returns** ESP\_OK - success, other - failed

`esp_err_t esp_bredr_tx_power_get` (`esp_power_level_t` \*min\_power\_level, `esp_power_level_t` \*max\_power\_level)

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

##### Parameters

- **min\_power\_level** -- The minimum power level
- **max\_power\_level** -- The maximum power level

**Returns** ESP\_OK - success, other - failed

`esp_err_t esp_bredr_sco_datapath_set` (`esp_sco_data_path_t` data\_path)

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

**Parameters** **data\_path** -- SCO data path

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_init** (*esp\_bt\_controller\_config\_t* \*cfg)

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

**Parameters** **cfg** -- Initial configuration of BT controller. Different from previous version, there's a mode and some connection configuration in "cfg" to configure controller work mode and allocate the resource which is needed.

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_deinit** (void)

De-initialize BT controller to free resource and delete task. You should stop advertising and scanning, as well as disconnect all existing connections before de-initializing BT controller.

This function should be called only once, after any other BT functions are called.

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_enable** (*esp\_bt\_mode\_t* mode)

Enable BT controller. Due to a known issue, you cannot call `esp_bt_controller_enable()` a second time to change the controller mode dynamically. To change controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.

**Parameters** **mode** -- : the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in "cfg" of `esp_bt_controller_init()`.

**Returns** ESP\_OK - success, other - failed

*esp\_err\_t* **esp\_bt\_controller\_disable** (void)

Disable BT controller.

**Returns** ESP\_OK - success, other - failed

*esp\_bt\_controller\_status\_t* **esp\_bt\_controller\_get\_status** (void)

Get BT controller is initialised/de-initialised/enabled/disabled.

**Returns** status value

bool **esp\_vhci\_host\_check\_send\_available** (void)

`esp_vhci_host_check_send_available` used for check actively if the host can send packet to controller or not.

**Returns** true for ready to send, false means cannot send packet

void **esp\_vhci\_host\_send\_packet** (uint8\_t \*data, uint16\_t len)

`esp_vhci_host_send_packet` host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

**Parameters**

- **data** -- the packet point
- **len** -- the packet length

*esp\_err\_t* **esp\_vhci\_host\_register\_callback** (const *esp\_vhci\_host\_callback\_t* \*callback)

`esp_vhci_host_register_callback` register the vhci reference callback struct defined by `vhci_host_callback` structure.

**Parameters** **callback** -- *esp\_vhci\_host\_callback* type variable

**Returns** ESP\_OK - success, ESP\_FAIL - failed

*esp\_err\_t* **esp\_bt\_controller\_mem\_release** (*esp\_bt\_mode\_t* mode)

`esp_bt_controller_mem_release` release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

`esp_bt_controller_mem_release(mode)` should be called only before `esp_bt_controller_init()` or after `esp_bt_controller_deinit()`.

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls `esp_bt_controller_enable(ESP_BT_MODE_BLE)` to use BLE only then it is safe to call `esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT)` at initialization time to free unused BT Classic memory.

If the mode is `ESP_BT_MODE_BTDM`, then it may be useful to call API `esp_bt_mem_release(ESP_BT_MODE_BTDM)` instead, which internally calls `esp_bt_controller_mem_release(ESP_BT_MODE_BTDM)` and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of `esp_bt_mem_release()` function

**Parameters** `mode` -- : the mode want to release memory

**Returns** `ESP_OK` - success, other - failed

*esp\_err\_t* **esp\_bt\_mem\_release** (*esp\_bt\_mode\_t* mode)

`esp_bt_mem_release` release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling `esp_bt_controller_mem_release()`. Additionally, if the mode is set to `ESP_BT_MODE_BTDM`, it also releases the BSS and data consumed by the BT/BLE host stack to heap

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call `esp_bt_mem_release(ESP_BT_MODE_BTDM)` before `esp_bt_controller_init` or after `esp_bt_controller_deinit`.

For example, if a user only uses bluetooth for setting the WiFi configuration, and does not use bluetooth in the rest of the product operation". In such cases, after receiving the WiFi configuration, you can disable/deinit bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```
esp_blueandroid_disable();
esp_blueandroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

**Note:** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to `ESP_BT_MODE_BTDM` as controller is dual mode.

**Parameters** `mode` -- : the mode whose memory is to be released

**Returns** `ESP_OK` - success, other - failed

*esp\_err\_t* **esp\_bt\_sleep\_enable** (void)

enable bluetooth to enter modem sleep

Note that this function shall not be invoked before `esp_bt_controller_enable()`

There are currently two options for bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if `CONFIG_CTRL_BTDM_MODEM_SLEEP` is set and "ORIG mode" is selected. In ORIG modem sleep mode,

bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function "esp\_bt\_controller\_wakeup\_request".

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_bt\_sleep\_disable** (void)

disable bluetooth modem sleep

Note that this function shall not be invoked before esp\_bt\_controller\_enable()

If esp\_bt\_sleep\_disable() is called, bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, bluetooth controller may not immediately wake up if it is dormant then. In this case, esp\_bt\_controller\_wakeup\_request() can be used to shorten the time for wakeup.

**Returns**

- ESP\_OK : success
- other : failed

*esp\_err\_t* **esp\_ble\_scan\_duplicate\_list\_flush** (void)

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

---

**Note:** This function name is incorrectly spelled, it will be fixed in release 5.x version.

---

**Returns**

- ESP\_OK : success
- other : failed

void **esp\_wifi\_bt\_power\_domain\_on** (void)

bt Wi-Fi power domain power on

void **esp\_wifi\_bt\_power\_domain\_off** (void)

bt Wi-Fi power domain power off

**Structures**

struct **esp\_bt\_controller\_config\_t**

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

**Public Members**

uint16\_t **controller\_task\_stack\_size**

Bluetooth controller task stack size

uint8\_t **controller\_task\_prio**

Bluetooth controller task priority

`uint8_t hci_uart_no`

If use UART1/2 as HCI IO interface, indicate UART number

`uint32_t hci_uart_baudrate`

If use UART1/2 as HCI IO interface, indicate UART baudrate

`uint8_t scan_duplicate_mode`

scan duplicate mode

`uint8_t scan_duplicate_type`

scan duplicate type

`uint16_t normal_adv_size`

Normal adv size for scan duplicate

`uint16_t mesh_adv_size`

Mesh adv size for scan duplicate

`uint16_t send_adv_reserved_size`

Controller minimum memory value

`uint32_t controller_debug_flag`

Controller debug log flag

`uint8_t mode`

Controller mode: BR/EDR, BLE or Dual Mode

`uint8_t ble_max_conn`

BLE maximum connection numbers

`uint8_t bt_max_acl_conn`

BR/EDR maximum ACL connection numbers

`uint8_t bt_sco_datapath`

SCO data path, i.e. HCI or PCM module

`bool auto_latency`

BLE auto latency, used to enhance classic BT performance

`bool bt_legacy_auth_vs_evt`

BR/EDR Legacy auth complete event required to protect from BIAS attack

`uint8_t bt_max_sync_conn`

BR/EDR maximum ACL connection numbers. Effective in menuconfig

`uint8_t ble_sca`

BLE low power crystal accuracy index

uint8\_t **pcm\_role**

PCM role (master & slave)

uint8\_t **pcm\_polar**

PCM polar trig (falling clk edge & rising clk edge)

bool **hli**

Using high level interrupt or not

uint16\_t **dup\_list\_refresh\_period**

Duplicate scan list refresh period

bool **ble\_scan\_backoff**

BLE scan backoff

uint32\_t **magic**

Magic number

struct **esp\_vhci\_host\_callback**

*esp\_vhci\_host\_callback* used for vhci call host function to notify what host need to do

### Public Members

void (\***notify\_host\_send\_available**)(void)

callback used to notify that the host can send packet to controller

int (\***notify\_host\_recv**)(uint8\_t \*data, uint16\_t len)

callback used to notify that the controller has a packet to send to the host

### Macros

**ESP\_BT\_CONTROLLER\_CONFIG\_MAGIC\_VAL**

**BT\_CONTROLLER\_INIT\_CONFIG\_DEFAULT** ()

### Type Definitions

typedef struct *esp\_vhci\_host\_callback* **esp\_vhci\_host\_callback\_t**

*esp\_vhci\_host\_callback* used for vhci call host function to notify what host need to do

### Enumerations

enum **esp\_bt\_mode\_t**

Bluetooth mode for controller enable/disable.

*Values:*

enumerator **ESP\_BT\_MODE\_IDLE**

Bluetooth is not running

enumerator **ESP\_BT\_MODE\_BLE**

Run BLE mode

enumerator **ESP\_BT\_MODE\_CLASSIC\_BT**

Run Classic BT mode

enumerator **ESP\_BT\_MODE\_BTDM**

Run dual mode

enum [**anonymous**]

BLE sleep clock accuracy(SCA), values for ble\_sca field in *esp\_bt\_controller\_config\_t*, currently only ESP\_BLE\_SCA\_500PPM and ESP\_BLE\_SCA\_250PPM are supported.

*Values:*

enumerator **ESP\_BLE\_SCA\_500PPM**

BLE SCA at 500ppm

enumerator **ESP\_BLE\_SCA\_250PPM**

BLE SCA at 250ppm

enumerator **ESP\_BLE\_SCA\_150PPM**

BLE SCA at 150ppm

enumerator **ESP\_BLE\_SCA\_100PPM**

BLE SCA at 100ppm

enumerator **ESP\_BLE\_SCA\_75PPM**

BLE SCA at 75ppm

enumerator **ESP\_BLE\_SCA\_50PPM**

BLE SCA at 50ppm

enumerator **ESP\_BLE\_SCA\_30PPM**

BLE SCA at 30ppm

enumerator **ESP\_BLE\_SCA\_20PPM**

BLE SCA at 20ppm

enum **esp\_bt\_controller\_status\_t**

Bluetooth controller enable/disable/initialised/de-initialised status.

*Values:*

enumerator **ESP\_BT\_CONTROLLER\_STATUS\_IDLE**

enumerator **ESP\_BT\_CONTROLLER\_STATUS\_INITED**

enumerator **ESP\_BT\_CONTROLLER\_STATUS\_ENABLED**

enumerator **ESP\_BT\_CONTROLLER\_STATUS\_NUM**

enum **esp\_ble\_power\_type\_t**

BLE tx power type **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL0-8**: for each connection, and only be set after connection completed. when disconnect, the correspond TX power is not effected. **ESP\_BLE\_PWR\_TYPE\_ADV** : for advertising/scan response. **ESP\_BLE\_PWR\_TYPE\_SCAN** : for scan. **ESP\_BLE\_PWR\_TYPE\_DEFAULT** : if each connection's TX power is not set, it will use this default value. if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use **ESP\_PWR\_LVL\_P3** as default for ADV/SCAN/CONN0-9.

*Values:*

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL0**

For connection handle 0

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL1**

For connection handle 1

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL2**

For connection handle 2

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL3**

For connection handle 3

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL4**

For connection handle 4

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL5**

For connection handle 5

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL6**

For connection handle 6

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL7**

For connection handle 7

enumerator **ESP\_BLE\_PWR\_TYPE\_CONN\_HDL8**

For connection handle 8

enumerator **ESP\_BLE\_PWR\_TYPE\_ADV**

For advertising

enumerator **ESP\_BLE\_PWR\_TYPE\_SCAN**

For scan

enumerator **ESP\_BLE\_PWR\_TYPE\_DEFAULT**

For default, if not set other, it will use default value

enumerator **ESP\_BLE\_PWR\_TYPE\_NUM**

TYPE numbers

enum **esp\_power\_level\_t**

Bluetooth TX power level(index), it's just a index corresponding to power(dbm).

*Values:*

enumerator **ESP\_PWR\_LVL\_N12**

Corresponding to -12dbm

enumerator **ESP\_PWR\_LVL\_N9**

Corresponding to -9dbm

enumerator **ESP\_PWR\_LVL\_N6**

Corresponding to -6dbm

enumerator **ESP\_PWR\_LVL\_N3**

Corresponding to -3dbm

enumerator **ESP\_PWR\_LVL\_N0**

Corresponding to 0dbm

enumerator **ESP\_PWR\_LVL\_P3**

Corresponding to +3dbm

enumerator **ESP\_PWR\_LVL\_P6**

Corresponding to +6dbm

enumerator **ESP\_PWR\_LVL\_P9**

Corresponding to +9dbm

enumerator **ESP\_PWR\_LVL\_N14**

Backward compatibility! Setting to -14dbm will actually result to -12dbm

enumerator **ESP\_PWR\_LVL\_N11**

Backward compatibility! Setting to -11dbm will actually result to -9dbm

enumerator **ESP\_PWR\_LVL\_N8**

Backward compatibility! Setting to -8dbm will actually result to -6dbm

enumerator **ESP\_PWR\_LVL\_N5**

Backward compatibility! Setting to -5dbm will actually result to -3dbm

enumerator **ESP\_PWR\_LVL\_N2**

Backward compatibility! Setting to -2dbm will actually result to 0dbm

enumerator **ESP\_PWR\_LVL\_P1**

Backward compatibility! Setting to +1dbm will actually result to +3dbm

enumerator **ESP\_PWR\_LVL\_P4**

Backward compatibility! Setting to +4dbm will actually result to +6dbm

enumerator **ESP\_PWR\_LVL\_P7**

Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum **esp\_sco\_data\_path\_t**

Bluetooth audio data transport path.

*Values:*

enumerator **ESP\_SCO\_DATA\_PATH\_HCI**

data over HCI transport

enumerator **ESP\_SCO\_DATA\_PATH\_PCM**

data over PCM interface

## 2.3.4 NimBLE-based host APIs

### Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Blueroid) providing VHCI interface. Refer to [NimBLE user guide](#) for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

### Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

Fig. 1: ESP NimBLE Stack

### Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

## Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig *choose NimBLE for the Bluetooth host*.

### Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Initialize the host and controller stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to [NimBLE tutorial](#) for more details on the programming sequence/NimBLE APIs for different scenarios.

## API Reference

### Header File

- `components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h`

### Functions

`esp_err_t esp_nimble_hci_init` (void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

#### Returns

- ESP\_OK if the initialization is successful
- Appropriate error code from `esp_err_t` in case of an error

`esp_err_t esp_nimble_hci_deinit` (void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

---

**Note:** This function should be called after the NimBLE host is deinitialized.

---

#### Returns

- ESP\_OK if the deinitialization is successful
- Appropriate error codes from `esp_err_t` in case of an error

### Macros

`BLE_HCI_UART_H4_NONE`

`BLE_HCI_UART_H4_CMD`

`BLE_HCI_UART_H4_ACL`

`BLE_HCI_UART_H4_SCO`

`BLE_HCI_UART_H4_EVT`

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

- For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used.

- For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

Code examples for this API section are provided in the [bluetooth/bluedroid](#) directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

- [GATT Client Example Walkthrough](#)
- [GATT Server Service Table Example Walkthrough](#)
- [GATT Server Example Walkthrough](#)
- [GATT Security Client Example Walkthrough](#)
- [GATT Security Server Example Walkthrough](#)
- [GATT Client Multi-connection Example Walkthrough](#)

## 2.4 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see [Error Handling](#).

*ESP\_FAIL* (-1): Generic esp\_err\_t code indicating failure

*ESP\_OK* (0): esp\_err\_t value indicating success (no error)

*ESP\_ERR\_NO\_MEM* (0x101): Out of memory

*ESP\_ERR\_INVALID\_ARG* (0x102): Invalid argument

*ESP\_ERR\_INVALID\_STATE* (0x103): Invalid state

*ESP\_ERR\_INVALID\_SIZE* (0x104): Invalid size

*ESP\_ERR\_NOT\_FOUND* (0x105): Requested resource not found

*ESP\_ERR\_NOT\_SUPPORTED* (0x106): Operation or feature not supported

*ESP\_ERR\_TIMEOUT* (0x107): Operation timed out

*ESP\_ERR\_INVALID\_RESPONSE* (0x108): Received response was invalid

*ESP\_ERR\_INVALID\_CRC* (0x109): CRC or checksum was invalid

*ESP\_ERR\_INVALID\_VERSION* (0x10a): Version was invalid

*ESP\_ERR\_INVALID\_MAC* (0x10b): MAC address was invalid

*ESP\_ERR\_NOT\_FINISHED* (0x10c): There are items remained to retrieve

*ESP\_ERR\_NOT\_ALLOWED* (0x10d): Operation is not allowed

*ESP\_ERR\_ROC\_IN\_PROGRESS* (0x10e): ROC Operation is in progress

*ESP\_ERR\_NVS\_BASE* (0x1100): Starting number of error codes

*ESP\_ERR\_NVS\_NOT\_INITIALIZED* (0x1101): The storage driver is not initialized

*ESP\_ERR\_NVS\_NOT\_FOUND* (0x1102): A requested entry couldn't be found or namespace doesn't exist yet and mode is NVS\_READONLY

*ESP\_ERR\_NVS\_TYPE\_MISMATCH* (0x1103): The type of set or get operation doesn't match the type of value stored in NVS

*ESP\_ERR\_NVS\_READ\_ONLY* (0x1104): Storage handle was opened as read only

*ESP\_ERR\_NVS\_NOT\_ENOUGH\_SPACE* (0x1105): There is not enough space in the underlying storage to save the value

*ESP\_ERR\_NVS\_INVALID\_NAME* (0x1106): Namespace name doesn't satisfy constraints

*ESP\_ERR\_NVS\_INVALID\_HANDLE* (0x1107): Handle has been closed or is NULL

*ESP\_ERR\_NVS\_REMOVE\_FAILED (0x1108)*: The value wasn't updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn't fail again.

*ESP\_ERR\_NVS\_KEY\_TOO\_LONG (0x1109)*: Key name is too long

*ESP\_ERR\_NVS\_PAGE\_FULL (0x110a)*: Internal error; never returned by nvs API functions

*ESP\_ERR\_NVS\_INVALID\_STATE (0x110b)*: NVS is in an inconsistent state due to a previous error. Call `nvs_flash_init` and `nvs_open` again, then retry.

*ESP\_ERR\_NVS\_INVALID\_LENGTH (0x110c)*: String or blob length is not sufficient to store data

*ESP\_ERR\_NVS\_NO\_FREE\_PAGES (0x110d)*: NVS partition doesn't contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call `nvs_flash_init` again.

*ESP\_ERR\_NVS\_VALUE\_TOO\_LONG (0x110e)*: Value doesn't fit into the entry or string or blob length is longer than supported by the implementation

*ESP\_ERR\_NVS\_PART\_NOT\_FOUND (0x110f)*: Partition with specified name is not found in the partition table

*ESP\_ERR\_NVS\_NEW\_VERSION\_FOUND (0x1110)*: NVS partition contains data in new format and cannot be recognized by this version of code

*ESP\_ERR\_NVS\_XTS\_ENCR\_FAILED (0x1111)*: XTS encryption failed while writing NVS entry

*ESP\_ERR\_NVS\_XTS\_DECR\_FAILED (0x1112)*: XTS decryption failed while reading NVS entry

*ESP\_ERR\_NVS\_XTS\_CFG\_FAILED (0x1113)*: XTS configuration setting failed

*ESP\_ERR\_NVS\_XTS\_CFG\_NOT\_FOUND (0x1114)*: XTS configuration not found

*ESP\_ERR\_NVS\_ENCR\_NOT\_SUPPORTED (0x1115)*: NVS encryption is not supported in this version

*ESP\_ERR\_NVS\_KEYS\_NOT\_INITIALIZED (0x1116)*: NVS key partition is uninitialized

*ESP\_ERR\_NVS\_CORRUPT\_KEY\_PART (0x1117)*: NVS key partition is corrupt

*ESP\_ERR\_NVS\_CONTENT\_DIFFERS (0x1118)*: Internal error; never returned by nvs API functions. NVS key is different in comparison

*ESP\_ERR\_NVS\_WRONG\_ENCRYPTION (0x1119)*: NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

*ESP\_ERR\_ULP\_BASE (0x1200)*: Offset for ULP-related error codes

*ESP\_ERR\_ULP\_SIZE\_TOO\_BIG (0x1201)*: Program doesn't fit into RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_INVALID\_LOAD\_ADDR (0x1202)*: Load address is outside of RTC memory reserved for the ULP

*ESP\_ERR\_ULP\_DUPLICATE\_LABEL (0x1203)*: More than one label with the same number was defined

*ESP\_ERR\_ULP\_UNDEFINED\_LABEL (0x1204)*: Branch instructions references an undefined label

*ESP\_ERR\_ULP\_BRANCH\_OUT\_OF\_RANGE (0x1205)*: Branch target is out of range of B instruction (try replacing with BX)

*ESP\_ERR\_OTA\_BASE (0x1500)*: Base error code for ota\_ops api

*ESP\_ERR\_OTA\_PARTITION\_CONFLICT (0x1501)*: Error if request was to write or erase the current running partition

*ESP\_ERR\_OTA\_SELECT\_INFO\_INVALID (0x1502)*: Error if OTA data partition contains invalid content

*ESP\_ERR\_OTA\_VALIDATE\_FAILED (0x1503)*: Error if OTA app image is invalid

*ESP\_ERR\_OTA\_SMALL\_SEC\_VER (0x1504)*: Error if the firmware has a secure version less than the running firmware.

*ESP\_ERR\_OTA\_ROLLBACK\_FAILED (0x1505)*: Error if flash does not have valid firmware in passive partition and hence rollback is not possible

*ESP\_ERR\_OTA\_ROLLBACK\_INVALID\_STATE (0x1506)*: Error if current active firmware is still marked in pending validation state (*ESP\_OTA\_IMG\_PENDING\_VERIFY*), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

*ESP\_ERR\_EFUSE (0x1600)*: Base error code for efuse api.

*ESP\_OK\_EFUSE\_CNT (0x1601)*: OK the required number of bits is set.

*ESP\_ERR\_EFUSE\_CNT\_IS\_FULL (0x1602)*: Error field is full.

*ESP\_ERR\_EFUSE\_REPEATED\_PROG (0x1603)*: Error repeated programming of programmed bits is strictly forbidden.

*ESP\_ERR\_CODING (0x1604)*: Error while a encoding operation.

*ESP\_ERR\_NOT\_ENOUGH\_UNUSED\_KEY\_BLOCKS (0x1605)*: Error not enough unused key blocks available

*ESP\_ERR\_DAMAGED\_READING (0x1606)*: Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

*ESP\_ERR\_IMAGE\_BASE (0x2000)*

*ESP\_ERR\_IMAGE\_FLASH\_FAIL (0x2001)*

*ESP\_ERR\_IMAGE\_INVALID (0x2002)*

*ESP\_ERR\_WIFI\_BASE (0x3000)*: Starting number of WiFi error codes

*ESP\_ERR\_WIFI\_NOT\_INIT (0x3001)*: WiFi driver was not installed by *esp\_wifi\_init*

*ESP\_ERR\_WIFI\_NOT\_STARTED (0x3002)*: WiFi driver was not started by *esp\_wifi\_start*

*ESP\_ERR\_WIFI\_NOT\_STOPPED (0x3003)*: WiFi driver was not stopped by *esp\_wifi\_stop*

*ESP\_ERR\_WIFI\_IF (0x3004)*: WiFi interface error

*ESP\_ERR\_WIFI\_MODE (0x3005)*: WiFi mode error

*ESP\_ERR\_WIFI\_STATE (0x3006)*: WiFi internal state error

*ESP\_ERR\_WIFI\_CONN (0x3007)*: WiFi internal control block of station or soft-AP error

*ESP\_ERR\_WIFI\_NVS (0x3008)*: WiFi internal NVS module error

*ESP\_ERR\_WIFI\_MAC (0x3009)*: MAC address is invalid

*ESP\_ERR\_WIFI\_SSID (0x300a)*: SSID is invalid

*ESP\_ERR\_WIFI\_PASSWORD (0x300b)*: Password is invalid

*ESP\_ERR\_WIFI\_TIMEOUT (0x300c)*: Timeout error

*ESP\_ERR\_WIFI\_WAKE\_FAIL (0x300d)*: WiFi is in sleep state(RF closed) and wakeup fail

*ESP\_ERR\_WIFI\_WOULD\_BLOCK (0x300e)*: The caller would block

*ESP\_ERR\_WIFI\_NOT\_CONNECT (0x300f)*: Station still in disconnect status

*ESP\_ERR\_WIFI\_POST (0x3012)*: Failed to post the event to WiFi task

*ESP\_ERR\_WIFI\_INIT\_STATE (0x3013)*: Invalid WiFi state when init/deinit is called

*ESP\_ERR\_WIFI\_STOP\_STATE (0x3014)*: Returned when WiFi is stopping

*ESP\_ERR\_WIFI\_NOT\_ASSOC (0x3015)*: The WiFi connection is not associated

*ESP\_ERR\_WIFI\_TX\_DISALLOW (0x3016)*: The WiFi TX is disallowed

*ESP\_ERR\_WIFI\_TWT\_FULL (0x3017)*: no available flow id

*ESP\_ERR\_WIFI\_TWT\_SETUP\_TIMEOUT (0x3018)*: Timeout of receiving twt setup response frame, timeout times can be set during twt setup

*ESP\_ERR\_WIFI\_TWT\_SETUP\_TXFAIL (0x3019)*: TWT setup frame tx failed

*ESP\_ERR\_WIFI\_TWT\_SETUP\_REJECT (0x301a)*: The twt setup request was rejected by the AP

*ESP\_ERR\_WIFI\_DISCARD* (**0x301b**): Discard frame

*ESP\_ERR\_WIFI\_REGISTRAR* (**0x3033**): WPS registrar is not supported

*ESP\_ERR\_WIFI\_WPS\_TYPE* (**0x3034**): WPS type error

*ESP\_ERR\_WIFI\_WPS\_SM* (**0x3035**): WPS state machine is not initialized

*ESP\_ERR\_ESPNOW\_BASE* (**0x3064**): ESPNOW error number base.

*ESP\_ERR\_ESPNOW\_NOT\_INIT* (**0x3065**): ESPNOW is not initialized.

*ESP\_ERR\_ESPNOW\_ARG* (**0x3066**): Invalid argument

*ESP\_ERR\_ESPNOW\_NO\_MEM* (**0x3067**): Out of memory

*ESP\_ERR\_ESPNOW\_FULL* (**0x3068**): ESPNOW peer list is full

*ESP\_ERR\_ESPNOW\_NOT\_FOUND* (**0x3069**): ESPNOW peer is not found

*ESP\_ERR\_ESPNOW\_INTERNAL* (**0x306a**): Internal error

*ESP\_ERR\_ESPNOW\_EXIST* (**0x306b**): ESPNOW peer has existed

*ESP\_ERR\_ESPNOW\_IF* (**0x306c**): Interface error

*ESP\_ERR\_DPP\_FAILURE* (**0x3097**): Generic failure during DPP Operation

*ESP\_ERR\_DPP\_TX\_FAILURE* (**0x3098**): DPP Frame Tx failed OR not Acked

*ESP\_ERR\_DPP\_INVALID\_ATTR* (**0x3099**): Encountered invalid DPP Attribute

*ESP\_ERR\_DPP\_AUTH\_TIMEOUT* (**0x309a**): DPP Auth response was not recieved in time

*ESP\_ERR\_MESH\_BASE* (**0x4000**): Starting number of MESH error codes

*ESP\_ERR\_MESH\_WIFI\_NOT\_START* (**0x4001**)

*ESP\_ERR\_MESH\_NOT\_INIT* (**0x4002**)

*ESP\_ERR\_MESH\_NOT\_CONFIG* (**0x4003**)

*ESP\_ERR\_MESH\_NOT\_START* (**0x4004**)

*ESP\_ERR\_MESH\_NOT\_SUPPORT* (**0x4005**)

*ESP\_ERR\_MESH\_NOT\_ALLOWED* (**0x4006**)

*ESP\_ERR\_MESH\_NO\_MEMORY* (**0x4007**)

*ESP\_ERR\_MESH\_ARGUMENT* (**0x4008**)

*ESP\_ERR\_MESH\_EXCEED\_MTU* (**0x4009**)

*ESP\_ERR\_MESH\_TIMEOUT* (**0x400a**)

*ESP\_ERR\_MESH\_DISCONNECTED* (**0x400b**)

*ESP\_ERR\_MESH\_QUEUE\_FAIL* (**0x400c**)

*ESP\_ERR\_MESH\_QUEUE\_FULL* (**0x400d**)

*ESP\_ERR\_MESH\_NO\_PARENT\_FOUND* (**0x400e**)

*ESP\_ERR\_MESH\_NO\_ROUTE\_FOUND* (**0x400f**)

*ESP\_ERR\_MESH\_OPTION\_NULL* (**0x4010**)

*ESP\_ERR\_MESH\_OPTION\_UNKNOWN* (**0x4011**)

*ESP\_ERR\_MESH\_XON\_NO\_WINDOW* (**0x4012**)

*ESP\_ERR\_MESH\_INTERFACE* (**0x4013**)

*ESP\_ERR\_MESH\_DISCARD\_DUPLICATE* (**0x4014**)

*ESP\_ERR\_MESH\_DISCARD* (**0x4015**)

*ESP\_ERR\_MESH\_VOTING* (**0x4016**)

*ESP\_ERR\_MESH\_XMIT* (**0x4017**)

*ESP\_ERR\_MESH\_QUEUE\_READ* (**0x4018**)

*ESP\_ERR\_MESH\_PS* (**0x4019**)

*ESP\_ERR\_MESH\_RECV\_RELEASE* (**0x401a**)

*ESP\_ERR\_ESP\_NETIF\_BASE* (**0x5000**)

*ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS* (**0x5001**)

*ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY* (**0x5002**)

*ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED* (**0x5003**)

*ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED* (**0x5004**)

*ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED* (**0x5005**)

*ESP\_ERR\_ESP\_NETIF\_NO\_MEM* (**0x5006**)

*ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED* (**0x5007**)

*ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED* (**0x5008**)

*ESP\_ERR\_ESP\_NETIF\_INIT\_FAILED* (**0x5009**)

*ESP\_ERR\_ESP\_NETIF\_DNS\_NOT\_CONFIGURED* (**0x500a**)

*ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED* (**0x500b**)

*ESP\_ERR\_ESP\_NETIF\_IP6\_ADDR\_FAILED* (**0x500c**)

*ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED* (**0x500d**)

*ESP\_ERR\_FLASH\_BASE* (**0x6000**): Starting number of flash error codes

*ESP\_ERR\_FLASH\_OP\_FAIL* (**0x6001**)

*ESP\_ERR\_FLASH\_OP\_TIMEOUT* (**0x6002**)

*ESP\_ERR\_FLASH\_NOT\_INITIALISED* (**0x6003**)

*ESP\_ERR\_FLASH\_UNSUPPORTED\_HOST* (**0x6004**)

*ESP\_ERR\_FLASH\_UNSUPPORTED\_CHIP* (**0x6005**)

*ESP\_ERR\_FLASH\_PROTECTED* (**0x6006**)

*ESP\_ERR\_HTTP\_BASE* (**0x7000**): Starting number of HTTP error codes

*ESP\_ERR\_HTTP\_MAX\_REDIRECT* (**0x7001**): The error exceeds the number of HTTP redirects

*ESP\_ERR\_HTTP\_CONNECT* (**0x7002**): Error open the HTTP connection

*ESP\_ERR\_HTTP\_WRITE\_DATA* (**0x7003**): Error write HTTP data

*ESP\_ERR\_HTTP\_FETCH\_HEADER* (**0x7004**): Error read HTTP header from server

*ESP\_ERR\_HTTP\_INVALID\_TRANSPORT* (**0x7005**): There are no transport support for the input scheme

*ESP\_ERR\_HTTP\_CONNECTING* (**0x7006**): HTTP connection hasn't been established yet

*ESP\_ERR\_HTTP\_EAGAIN* (**0x7007**): Mapping of errno EAGAIN to esp\_err\_t

*ESP\_ERR\_HTTP\_CONNECTION\_CLOSED* (**0x7008**): Read FIN from peer and the connection closed

*ESP\_ERR\_ESP\_TLS\_BASE* (**0x8000**): Starting number of ESP-TLS error codes

*ESP\_ERR\_ESP\_TLS\_CANNOT\_RESOLVE\_HOSTNAME* (**0x8001**): Error if hostname couldn't be resolved upon tls connection

*ESP\_ERR\_ESP\_TLS\_CANNOT\_CREATE\_SOCKET* (**0x8002**): Failed to create socket

*ESP\_ERR\_ESP\_TLS\_UNSUPPORTED\_PROTOCOL\_FAMILY* (**0x8003**): Unsupported protocol family

*ESP\_ERR\_ESP\_TLS\_FAILED\_CONNECT\_TO\_HOST* (**0x8004**): Failed to connect to host

*ESP\_ERR\_ESP\_TLS\_SOCKET\_SETOPT\_FAILED* (**0x8005**): failed to set/get socket option

*ESP\_ERR\_ESP\_TLS\_CONNECTION\_TIMEOUT* (**0x8006**): new connection in `esp_tls_low_level_conn` connection timedout

*ESP\_ERR\_ESP\_TLS\_SE\_FAILED* (**0x8007**)

*ESP\_ERR\_ESP\_TLS\_TCP\_CLOSED\_FIN* (**0x8008**)

*ESP\_ERR\_MBEDTLS\_CERT\_PARTLY\_OK* (**0x8010**): mbedtls parse certificates was partly successful

*ESP\_ERR\_MBEDTLS\_CTR\_DRBG\_SEED\_FAILED* (**0x8011**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_SET\_HOSTNAME\_FAILED* (**0x8012**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_CONFIG\_DEFAULTS\_FAILED* (**0x8013**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED* (**0x8014**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_X509\_CERT\_PARSE\_FAILED* (**0x8015**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_CONF\_OWN\_CERT\_FAILED* (**0x8016**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_SETUP\_FAILED* (**0x8017**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_SSL\_WRITE\_FAILED* (**0x8018**): mbedtls api returned error

*ESP\_ERR\_MBEDTLS\_PK\_PARSE\_KEY\_FAILED* (**0x8019**): mbedtls api returned failed

*ESP\_ERR\_MBEDTLS\_SSL\_HANDSHAKE\_FAILED* (**0x801a**): mbedtls api returned failed

*ESP\_ERR\_MBEDTLS\_SSL\_CONF\_PSK\_FAILED* (**0x801b**): mbedtls api returned failed

*ESP\_ERR\_MBEDTLS\_SSL\_TICKET\_SETUP\_FAILED* (**0x801c**): mbedtls api returned failed

*ESP\_ERR\_WOLFSSL\_SSL\_SET\_HOSTNAME\_FAILED* (**0x8031**): wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_SSL\_CONF\_ALPN\_PROTOCOLS\_FAILED* (**0x8032**): wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_CERT\_VERIFY\_SETUP\_FAILED* (**0x8033**): wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_KEY\_VERIFY\_SETUP\_FAILED* (**0x8034**): wolfSSL api returned error

*ESP\_ERR\_WOLFSSL\_SSL\_HANDSHAKE\_FAILED* (**0x8035**): wolfSSL api returned failed

*ESP\_ERR\_WOLFSSL\_CTX\_SETUP\_FAILED* (**0x8036**): wolfSSL api returned failed

*ESP\_ERR\_WOLFSSL\_SSL\_SETUP\_FAILED* (**0x8037**): wolfSSL api returned failed

*ESP\_ERR\_WOLFSSL\_SSL\_WRITE\_FAILED* (**0x8038**): wolfSSL api returned failed

*ESP\_ERR\_HTTPS\_OTA\_BASE* (**0x9000**)

*ESP\_ERR\_HTTPS\_OTA\_IN\_PROGRESS* (**0x9001**)

*ESP\_ERR\_PING\_BASE* (**0xa000**)

*ESP\_ERR\_PING\_INVALID\_PARAMS* (**0xa001**)

*ESP\_ERR\_PING\_NO\_MEM* (**0xa002**)

*ESP\_ERR\_HTTPD\_BASE* (**0xb000**): Starting number of HTTPD error codes

*ESP\_ERR\_HTTPD\_HANDLERS\_FULL* (**0xb001**): All slots for registering URI handlers have been consumed

*ESP\_ERR\_HTTPD\_HANDLER\_EXISTS* (**0xb002**): URI handler with same method and target URI already registered

*ESP\_ERR\_HTTPD\_INVALID\_REQ* (**0xb003**): Invalid request pointer

*ESP\_ERR\_HTTPD\_RESULT\_TRUNC* (**0xb004**): Result string truncated

*ESP\_ERR\_HTTPD\_RESP\_HDR* (**0xb005**): Response header field larger than supported

*ESP\_ERR\_HTTPD\_RESP\_SEND (0xb006)*: Error occurred while sending response packet

*ESP\_ERR\_HTTPD\_ALLOC\_MEM (0xb007)*: Failed to dynamically allocate memory for resource

*ESP\_ERR\_HTTPD\_TASK (0xb008)*: Failed to launch server task/thread

*ESP\_ERR\_HW\_CRYPTO\_BASE (0xc000)*: Starting number of HW cryptography module error codes

*ESP\_ERR\_HW\_CRYPTO\_DS\_HMAC\_FAIL (0xc001)*: HMAC peripheral problem

*ESP\_ERR\_HW\_CRYPTO\_DS\_INVALID\_KEY (0xc002)*

*ESP\_ERR\_HW\_CRYPTO\_DS\_INVALID\_DIGEST (0xc004)*

*ESP\_ERR\_HW\_CRYPTO\_DS\_INVALID\_PADDING (0xc005)*

*ESP\_ERR\_MEMPROT\_BASE (0xd000)*: Starting number of Memory Protection API error codes

*ESP\_ERR\_MEMPROT\_MEMORY\_TYPE\_INVALID (0xd001)*

*ESP\_ERR\_MEMPROT\_SPLIT\_ADDR\_INVALID (0xd002)*

*ESP\_ERR\_MEMPROT\_SPLIT\_ADDR\_OUT\_OF\_RANGE (0xd003)*

*ESP\_ERR\_MEMPROT\_SPLIT\_ADDR\_UNALIGNED (0xd004)*

*ESP\_ERR\_MEMPROT\_UNIMGMT\_BLOCK\_INVALID (0xd005)*

*ESP\_ERR\_MEMPROT\_WORLD\_INVALID (0xd006)*

*ESP\_ERR\_MEMPROT\_AREA\_INVALID (0xd007)*

*ESP\_ERR\_MEMPROT\_CPUID\_INVALID (0xd008)*

*ESP\_ERR\_TCP\_TRANSPORT\_BASE (0xe000)*: Starting number of TCP Transport error codes

*ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_TIMEOUT (0xe001)*: Connection has timed out

*ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_CLOSED\_BY\_FIN (0xe002)*: Read FIN from peer and the connection has closed (in a clean way)

*ESP\_ERR\_TCP\_TRANSPORT\_CONNECTION\_FAILED (0xe003)*: Failed to connect to the peer

*ESP\_ERR\_TCP\_TRANSPORT\_NO\_MEM (0xe004)*: Memory allocation failed

## 2.5 Networking APIs

### 2.5.1 Wi-Fi

#### ESP-NOW

**Overview** ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.

**Frame Format** ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

-----					
↔	MAC Header	Category Code	Organization Identifier	Random Values	Vendor_
↔	Specific Content	FCS			
-----					
↔	24 bytes	1 byte	3 bytes	4 bytes	7~
↔	257 bytes	4 bytes			

- **Category Code:** The Category Code field is set to the value(127) indicating the vendor-specific category.
- **Organization Identifier:** The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Random Value:** The Random Value field is used to prevent relay attacks.
- **Vendor Specific Content:** The Vendor Specific Content contains vendor-specific fields as follows:

-----												
	Element ID		Length		Organization Identifier		Type		Version		Body	
-----												
	1 byte		1 byte		3 bytes		1 byte		1 byte		0~250 bytes	

- **Element ID:** The Element ID field is set to the value (221), indicating the vendor-specific element.
- **Length:** The length is the total length of Organization Identifier, Type, Version and Body.
- **Organization Identifier:** The Organization Identifier contains a unique identifier(0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Type:** The Type field is set to the value (4) indicating ESP-NOW.
- **Version:** The Version field is set to the version of ESP-NOW.
- **Body:** The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff).

## Security

**ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame**

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

**Initialization and De-initialization** Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When `esp_now_deinit()` is called, all of the information of paired devices will be deleted.

**Add Paired Device** Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 4, the default is 2. If you want to change the number of paired encryption devices, set `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM` in the Wi-Fi component configuration menu.

A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

**Send ESP-NOW Data** Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb()` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn't exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data** Call `esp_now_register_recv_cb()` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Config ESP-NOW Rate** Call `esp_wifi_config_espnw_rate()` to config ESPNOW rate of specified interface. Make sure that the interface is enabled before config rate. This API should be called after `esp_wifi_start()`.

**Config ESP-NOW Power-saving Parameter** Sleep is supported only when ESP32-C2 is configured as station.

Call `esp_now_set_wake_window()` to configure Window for ESP-NOW RX at sleep. The default value is the maximum, which allowing RX all the time.

If Power-saving is needed for ESP-NOW, call `esp_wifi_connectionless_module_set_wake_interval()` to configure Interval as well.

Please refer to [connectionless module power save](#) to get more detail.

## Application Examples

- Example of sending and receiving ESP-NOW data between two devices: [wifi/espnw](#).
- For more application examples of how to use ESP-NOW, please visit [ESP-NOW repository](#).

## API Reference

### Header File

- [components/esp\\_wifi/include/esp\\_now.h](#)

### Functions

`esp_err_t esp_now_init` (void)

Initialize ESPNOW function.

#### Returns

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_INTERNAL` : Internal error

*esp\_err\_t* **esp\_now\_deinit** (void)

De-initialize ESPNOW function.

**Returns**

- ESP\_OK : succeed

*esp\_err\_t* **esp\_now\_get\_version** (uint32\_t \*version)

Get the version of ESPNOW.

**Parameters** *version* -- ESPNOW version

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

*esp\_err\_t* **esp\_now\_register\_recv\_cb** (*esp\_now\_recv\_cb\_t* cb)

Register callback function of receiving ESPNOW data.

**Parameters** *cb* -- callback function of receiving ESPNOW data

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

*esp\_err\_t* **esp\_now\_unregister\_recv\_cb** (void)

Unregister callback function of receiving ESPNOW data.

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_register\_send\_cb** (*esp\_now\_send\_cb\_t* cb)

Register callback function of sending ESPNOW data.

**Parameters** *cb* -- callback function of sending ESPNOW data

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_INTERNAL : internal error

*esp\_err\_t* **esp\_now\_unregister\_send\_cb** (void)

Unregister callback function of sending ESPNOW data.

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

*esp\_err\_t* **esp\_now\_send** (const uint8\_t \*peer\_addr, const uint8\_t \*data, size\_t len)

Send ESPNOW data.

**Attention** 1. If *peer\_addr* is not NULL, send data to the peer whose MAC address matches *peer\_addr*

**Attention** 2. If *peer\_addr* is NULL, send data to all of the peers that are added to the peer list

**Attention** 3. The maximum length of data must be less than ESP\_NOW\_MAX\_DATA\_LEN

**Attention** 4. The buffer pointed to by data argument does not need to be valid after *esp\_now\_send* returns

**Parameters**

- *peer\_addr* -- peer MAC address
- *data* -- data to send
- *len* -- length of data

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_INTERNAL` : internal error
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory, when this happens, you can delay a while before sending the next data
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found
- `ESP_ERR_ESPNOW_IF` : current WiFi interface doesn't match that of peer

`esp_err_t esp_now_add_peer` (const `esp_now_peer_info_t` \*peer)

Add a peer to peer list.

**Parameters** `peer` -- peer information

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full
- `ESP_ERR_ESPNOW_NO_MEM` : out of memory
- `ESP_ERR_ESPNOW_EXIST` : peer has existed

`esp_err_t esp_now_del_peer` (const `uint8_t` \*peer\_addr)

Delete a peer from peer list.

**Parameters** `peer_addr` -- peer MAC address

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

`esp_err_t esp_now_mod_peer` (const `esp_now_peer_info_t` \*peer)

Modify a peer.

**Parameters** `peer` -- peer information

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_FULL` : peer list is full

`esp_err_t esp_wifi_config_espnw_rate` (`wifi_interface_t` ifx, `wifi_phy_rate_t` rate)

Config ESPNOW rate of specified interface.

*Deprecated:*

please use `esp_now_set_peer_rate_config()` instead.

**Attention** 1. This API should be called after `esp_wifi_start()`.

**Attention** 2. This API only work when not use Wi-Fi 6 and `esp_now_set_peer_rate_config()` not called.

**Parameters**

- `ifx` -- Interface to be configured.
- `rate` -- Phy rate to be configured.

**Returns**

- `ESP_OK`: succeed
- others: failed

`esp_err_t esp_now_set_peer_rate_config` (const `uint8_t` \*peer\_addr, `esp_now_rate_config_t` \*config)

Set ESPNOW rate config for each peer.

**Attention** 1. This API should be called after `esp_wifi_start()` and `esp_now_init()`.

**Parameters**

- **peer\_addr** -- peer MAC address
- **config** -- rate config to be configured.

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_INTERNAL` : internal error

*esp\_err\_t* **esp\_now\_get\_peer** (const uint8\_t \*peer\_addr, *esp\_now\_peer\_info\_t* \*peer)

Get a peer whose MAC address matches peer\_addr from peer list.

**Parameters**

- **peer\_addr** -- peer MAC address
- **peer** -- peer information

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

*esp\_err\_t* **esp\_now\_fetch\_peer** (bool from\_head, *esp\_now\_peer\_info\_t* \*peer)

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Parameters**

- **from\_head** -- fetch from head of list or not
- **peer** -- peer information

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND` : peer is not found

bool **esp\_now\_is\_peer\_exist** (const uint8\_t \*peer\_addr)

Peer exists or not.

**Parameters** **peer\_addr** -- peer MAC address

**Returns**

- true : peer exists
- false : peer not exists

*esp\_err\_t* **esp\_now\_get\_peer\_num** (*esp\_now\_peer\_num\_t* \*num)

Get the number of peers.

**Parameters** **num** -- number of peers

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_ESPNOW_NOT_INIT` : ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG` : invalid argument

*esp\_err\_t* **esp\_now\_set\_pmk** (const uint8\_t \*pmk)

Set the primary master key.

**Attention** 1. primary master key is used to encrypt local master key

**Parameters** **pmk** -- primary master key

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized
- ESP\_ERR\_ESPNOW\_ARG : invalid argument

*esp\_err\_t* **esp\_now\_set\_wake\_window** (uint16\_t window)

Set wake window for esp\_now to wake up in interval unit.

**Attention 1.** This configuration could work at connected status. When ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE is enabled, this configuration could work at disconnected status.

**Attention 2.** Default value is the maximum.

**Parameters** **window** -- Milliseconds would the chip keep waked each interval, from 0 to 65535.

**Returns**

- ESP\_OK : succeed
- ESP\_ERR\_ESPNOW\_NOT\_INIT : ESPNOW is not initialized

**Structures**

struct **esp\_now\_peer\_info**

ESPNOW peer information parameters.

**Public Members**

uint8\_t **peer\_addr**[ESP\_NOW\_ETH\_ALEN]

ESPNOW peer MAC address that is also the MAC address of station or softap

uint8\_t **lmk**[ESP\_NOW\_KEY\_LEN]

ESPNOW peer local master key that is used to encrypt data

uint8\_t **channel**

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

*wifi\_interface\_t* **ifidx**

Wi-Fi interface that peer uses to send/receive ESPNOW data

bool **encrypt**

ESPNOW data that this peer sends/receives is encrypted or not

void \***priv**

ESPNOW peer private data

struct **esp\_now\_peer\_num**

Number of ESPNOW peers which exist currently.

**Public Members**

int **total\_num**

Total number of ESPNOW peers, maximum value is ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM

int **encrypt\_num**

Number of encrypted ESPNOW peers, maximum value is ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM

struct **esp\_now\_rcv\_info**

ESPNOW packet information.

### Public Members

uint8\_t \***src\_addr**

Source address of ESPNOW packet

uint8\_t \***des\_addr**

Destination address of ESPNOW packet

*wifi\_pkt\_rx\_ctrl\_t* \***rx\_ctrl**

Rx control info of ESPNOW packet

struct **esp\_now\_rate\_config**

ESPNOW rate config.

### Public Members

*wifi\_phy\_mode\_t* **phymode**

ESPNOW phymode of specified interface

*wifi\_phy\_rate\_t* **rate**

ESPNOW rate of specified interface

bool **ersu**

ESPNOW using ersu send frame

bool **dcm**

ESPNOW using dcm rate to send frame

### Macros

**ESP\_ERR\_ESPNOW\_BASE**

ESPNOW error number base.

**ESP\_ERR\_ESPNOW\_NOT\_INIT**

ESPNOW is not initialized.

**ESP\_ERR\_ESPNOW\_ARG**

Invalid argument

**ESP\_ERR\_ESPNOW\_NO\_MEM**

Out of memory

**ESP\_ERR\_ESPNOW\_FULL**

ESPNOW peer list is full

**ESP\_ERR\_ESPNOW\_NOT\_FOUND**

ESPNOW peer is not found

**ESP\_ERR\_ESPNOW\_INTERNAL**

Internal error

**ESP\_ERR\_ESPNOW\_EXIST**

ESPNOW peer has existed

**ESP\_ERR\_ESPNOW\_IF**

Interface error

**ESP\_NOW\_ETH\_ALEN**

Length of ESPNOW peer MAC address

**ESP\_NOW\_KEY\_LEN**

Length of ESPNOW peer local master key

**ESP\_NOW\_MAX\_TOTAL\_PEER\_NUM**

Maximum number of ESPNOW total peers

**ESP\_NOW\_MAX\_ENCRYPT\_PEER\_NUM**

Maximum number of ESPNOW encrypted peers

**ESP\_NOW\_MAX\_DATA\_LEN**

Maximum length of ESPNOW data which is sent very time

**Type Definitions**typedef struct *esp\_now\_peer\_info* **esp\_now\_peer\_info\_t**

ESPNOW peer information parameters.

typedef struct *esp\_now\_peer\_num* **esp\_now\_peer\_num\_t**

Number of ESPNOW peers which exist currently.

typedef struct *esp\_now\_recv\_info* **esp\_now\_recv\_info\_t**

ESPNOW packet information.

typedef struct *esp\_now\_rate\_config* **esp\_now\_rate\_config\_t**

ESPNOW rate config.

typedef void (\***esp\_now\_recv\_cb\_t**)(const *esp\_now\_recv\_info\_t* \*esp\_now\_info, const uint8\_t \*data, int data\_len)

Callback function of receiving ESPNOW data.

**Attention** `esp_now_info` is a local variable, it can only be used in the callback.

**Param `esp_now_info`** received ESPNOW packet information

**Param `data`** received data

**Param `data_len`** length of received data

```
typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
```

Callback function of sending ESPNOW data.

**Param `mac_addr`** peer MAC address

**Param `status`** status of sending ESPNOW data (succeed or fail)

### Enumerations

```
enum esp_now_send_status_t
```

Status of sending ESPNOW data .

*Values:*

enumerator **ESP\_NOW\_SEND\_SUCCESS**

Send ESPNOW data successfully

enumerator **ESP\_NOW\_SEND\_FAIL**

Send ESPNOW data fail

### SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-C2 devices, check [Provisioning API](#).

**Application Example** Connect ESP32-C2 to target AP using SmartConfig: [wifi/smart\\_config](#).

### API Reference

#### Header File

- [components/esp\\_wifi/include/esp\\_smartconfig.h](#)

#### Functions

```
const char *esp_smartconfig_get_version (void)
```

Get the version of SmartConfig.

#### Returns

- SmartConfig version const char.

*esp\_err\_t* **esp\_smartconfig\_start** (const *smartconfig\_start\_config\_t* \*config)

Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

**Attention** 1. This API can be called in station or softAP-station mode.

**Attention** 2. Can not call `esp_smartconfig_start` twice before it finish, please call `esp_smartconfig_stop` first.

**Parameters** `config` -- pointer to smartconfig start configure structure

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_stop** (void)

Stop SmartConfig, free the buffer taken by `esp_smartconfig_start`.

**Attention** Whether connect to AP succeed or not, this API should be called to free memory taken by `smartconfig_start`.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_esptouch\_set\_timeout** (uint8\_t time\_s)

Set timeout of SmartConfig process.

**Attention** Timing starts from SC\_STATUS\_FIND\_CHANNEL status. SmartConfig will restart if timeout.

**Parameters** `time_s` -- range 15s~255s, offset:45s.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_set\_type** (*smartconfig\_type\_t* type)

Set protocol type of SmartConfig.

**Attention** If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

**Parameters** `type` -- Choose from the `smartconfig_type_t`.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_smartconfig\_fast\_mode** (bool enable)

Set mode of SmartConfig. default normal mode.

**Attention** 1. Please call it before API `esp_smartconfig_start`.

**Attention** 2. Fast mode have corresponding APP(phone).

**Attention** 3. Two mode is compatible.

**Parameters** `enable` -- false-disable(default); true-enable;

**Returns**

- ESP\_OK: succeed

- others: fail

*esp\_err\_t* **esp\_smartconfig\_get\_rvd\_data** (uint8\_t \*rvd\_data, uint8\_t len)

Get reserved data of ESPTouch v2.

#### Parameters

- **rvd\_data** -- reserved data
- **len** -- length of reserved data

#### Returns

- ESP\_OK: succeed
- others: fail

## Structures

struct **smartconfig\_event\_got\_ssid\_pswd\_t**

Argument structure for SC\_EVENT\_GOT\_SSID\_PSWD event

### Public Members

uint8\_t **ssid**[32]

SSID of the AP. Null terminated string.

uint8\_t **password**[64]

Password of the AP. Null terminated string.

bool **bssid\_set**

whether set MAC address of target AP or not.

uint8\_t **bssid**[6]

MAC address of target AP.

*smartconfig\_type\_t* **type**

Type of smartconfig(ESPTouch or AirKiss).

uint8\_t **token**

Token from cellphone which is used to send ACK to cellphone.

uint8\_t **cellphone\_ip**[4]

IP address of cellphone.

struct **smartconfig\_start\_config\_t**

Configure structure for esp\_smartconfig\_start

### Public Members

bool **enable\_log**

Enable smartconfig logs.

bool **esp\_touch\_v2\_enable\_crypt**

Enable ESPTouch v2 crypt.

char **\*esp\_touch\_v2\_key**  
ESPTouch v2 crypt key, len should be 16.

### Macros

**SMARTCONFIG\_START\_CONFIG\_DEFAULT** ()

### Enumerations

enum **smartconfig\_type\_t**

*Values:*

enumerator **SC\_TYPE\_ESPTOUCH**  
protocol: ESPTouch

enumerator **SC\_TYPE\_AIRKISS**  
protocol: AirKiss

enumerator **SC\_TYPE\_ESPTOUCH\_AIRKISS**  
protocol: ESPTouch and AirKiss

enumerator **SC\_TYPE\_ESPTOUCH\_V2**  
protocol: ESPTouch v2

enum **smartconfig\_event\_t**

Smartconfig event declarations

*Values:*

enumerator **SC\_EVENT\_SCAN\_DONE**  
Station smartconfig has finished to scan for APs

enumerator **SC\_EVENT\_FOUND\_CHANNEL**  
Station smartconfig has found the channel of the target AP

enumerator **SC\_EVENT\_GOT\_SSID\_PSWD**  
Station smartconfig got the SSID and password

enumerator **SC\_EVENT\_SEND\_ACK\_DONE**  
Station smartconfig has sent ACK to cellphone

### Wi-Fi

**Introduction** The Wi-Fi libraries provide support for configuring and monitoring the ESP32-C2 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32-C2 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-C2.
- Station/AP-coexistence mode (ESP32-C2 is concurrently an access point and a station connected to another access point).

- Various security modes for the above (WPA, WPA2, WPA3, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

**Application Examples** Several application examples demonstrating the functionality of Wi-Fi library are provided in `wifi` directory of ESP-IDF repository. Please check the [README](#) for more details.

## API Reference

### Header File

- `components/esp_wifi/include/esp_wifi.h`

### Functions

`esp_err_t esp_wifi_init` (const `wifi_init_config_t` \*config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

**Attention** 1. This API must be called before all other WiFi API can be called

**Attention** 2. Always use `WIFI_INIT_CONFIG_DEFAULT` macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into `wifi_init_config_t` in future release. If you want to set your own initial values, overwrite the default values which are set by `WIFI_INIT_CONFIG_DEFAULT`. Please be notified that the field 'magic' of `wifi_init_config_t` should always be `WIFI_INIT_CONFIG_MAGIC`!

**Parameters** `config` -- pointer to WiFi initialized configuration structure; can point to a temporary variable.

#### Returns

- `ESP_OK`: succeed
- `ESP_ERR_NO_MEM`: out of memory
- others: refer to error code `esp_err.h`

`esp_err_t esp_wifi_deinit` (void)

Deinit WiFi Free all resource allocated in `esp_wifi_init` and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

#### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

`esp_err_t esp_wifi_set_mode` (`wifi_mode_t` mode)

Set the WiFi operating mode.

Set the WiFi operating mode `as` station, soft-AP, station+soft-AP **or** NAN.  
The default mode `is` station mode.

**Parameters** `mode` -- WiFi operating mode

#### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

- others: refer to error code in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_mode** (*wifi\_mode\_t* \*mode)

Get current operating mode of WiFi.

**Parameters** mode -- [out] store current WiFi mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_start** (void)

Start WiFi according to current configuration. If mode is WIFI\_MODE\_STA, it creates station control block and starts station. If mode is WIFI\_MODE\_AP, it creates soft-AP control block and starts soft-AP. If mode is WIFI\_MODE\_APSTA, it creates soft-AP and station control block and starts soft-AP and station. If mode is WIFI\_MODE\_NAN, it creates NAN control block and starts NAN.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP\_FAIL: other WiFi internal errors

*esp\_err\_t* **esp\_wifi\_stop** (void)

Stop WiFi. If mode is WIFI\_MODE\_STA, it stops station and frees station control block. If mode is WIFI\_MODE\_AP, it stops soft-AP and frees soft-AP control block. If mode is WIFI\_MODE\_APSTA, it stops station/soft-AP and frees station/soft-AP control block. If mode is WIFI\_MODE\_NAN, it stops NAN and frees NAN control block.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_restore** (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:

- esp\_wifi\_set\_bandwidth,
- esp\_wifi\_set\_protocol,
- esp\_wifi\_set\_config related
- esp\_wifi\_set\_mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_connect** (void)

Connect WiFi station to the AP.

**Attention** 1. This API only impact WIFI\_MODE\_STA or WIFI\_MODE\_APSTA mode

**Attention** 2. If station interface is connected to an AP, call esp\_wifi\_disconnect to disconnect.

**Attention** 3. The scanning triggered by esp\_wifi\_scan\_start() will not be effective until connection between device and the AP is established. If device is scanning and connecting at the same time, it will abort scanning and return a warning message and error number ESP\_ERR\_WIFI\_STATE.

**Attention** 4. This API attempts to connect to an Access Point (AP) only once. To enable reconnection in case of a connection failure, please use the 'failure\_retry\_cnt' feature in the '*wifi\_sta\_config\_t*'. Users are

suggested to implement reconnection logic in their application for scenarios where the specified AP does not exist, or reconnection is desired after the device has received a disconnect event.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP\_ERR\_WIFI\_SSID: SSID of AP which station connects is invalid

*esp\_err\_t* **esp\_wifi\_disconnect** (void)

Disconnect WiFi station from the AP.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi was not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_FAIL: other WiFi internal errors

*esp\_err\_t* **esp\_wifi\_clear\_fast\_connect** (void)

Currently this API is just an stub API.

**Returns**

- ESP\_OK: succeed
- others: fail

*esp\_err\_t* **esp\_wifi\_deauth\_sta** (uint16\_t aid)

deauthenticate all stations or associated id equals to aid

**Parameters** **aid** -- when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong

*esp\_err\_t* **esp\_wifi\_scan\_start** (const *wifi\_scan\_config\_t* \*config, bool block)

Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory. And then can be freed in esp\_wifi\_scan\_get\_ap\_records(), esp\_wifi\_scan\_get\_ap\_record() or esp\_wifi\_clear\_ap\_list(), so call any one to free the memory once the scan is done.

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

**Parameters**

- **config** -- configuration settings for scanning, if set to NULL default settings will be used of which default values are show\_hidden:false, scan\_type:active, scan\_time.active.min:0, scan\_time.active.max:120 miliseconds, scan\_time.passive:360 miliseconds
- **block** -- if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi was not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_TIMEOUT: blocking scan is timeout
- ESP\_ERR\_WIFI\_STATE: wifi still connecting when invoke esp\_wifi\_scan\_start

- others: refer to error code in esp\_err.h

*esp\_err\_t* **esp\_wifi\_scan\_stop** (void)

Stop the scan in process.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_num** (uint16\_t \*number)

Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Parameters** **number** -- [out] store number of APs found in last scan

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_records** (uint16\_t \*number, *wifi\_ap\_record\_t* \*ap\_records)

Get AP list found in last scan.

**Attention** This API will free all memory occupied by scanned AP list.

**Parameters**

- **number** -- [inout] As input param, it stores max AP number ap\_records can hold. As output param, it receives the actual AP number this API returns.
- **ap\_records** -- *wifi\_ap\_record\_t* array to hold the found APs

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NO\_MEM: out of memory

*esp\_err\_t* **esp\_wifi\_scan\_get\_ap\_record** (*wifi\_ap\_record\_t* \*ap\_record)

Get one AP record from the scanned AP list.

**Attention** Different from esp\_wifi\_scan\_get\_ap\_records(), this API only gets one AP record from the scanned AP list each time. This API will free the memory of one AP record, if the user doesn't get all records in the scanned AP list, then needs to call esp\_wifi\_clear\_ap\_list() to free the remaining memory.

**Parameters** **ap\_record** -- [out] pointer to one AP record

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_FAIL: scan APs is NULL, means all AP records fetched or no AP found

*esp\_err\_t* **esp\_wifi\_clear\_ap\_list** (void)

Clear AP list found in last scan.

**Attention** This API will free all memory occupied by scanned AP list. When the obtained AP list fails, AP records must be cleared, otherwise it may cause memory leakage.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_sta\_get\_ap\_info** (*wifi\_ap\_record\_t* \*ap\_info)

Get information of AP to which the device is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

**Parameters** **ap\_info** -- the *wifi\_ap\_record\_t* to hold AP information sta can get the connected ap's phy mode info through the struct member phy\_11b, phy\_11g, phy\_11n, phy\_lr in the *wifi\_ap\_record\_t* struct. For example, phy\_11b = 1 imply that ap support 802.11b mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_CONN: The station interface don't initialized
- ESP\_ERR\_WIFI\_NOT\_CONNECT: The station is in disconnect status

*esp\_err\_t* **esp\_wifi\_set\_ps** (*wifi\_ps\_type\_t* type)

Set current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

**Parameters** **type** -- power save type

**Returns** ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_get\_ps** (*wifi\_ps\_type\_t* \*type)

Get current WiFi power save type.

**Attention** Default power save type is WIFI\_PS\_MIN\_MODEM.

**Parameters** **type** -- [out] store current power save type

**Returns** ESP\_OK: succeed

*esp\_err\_t* **esp\_wifi\_set\_protocol** (*wifi\_interface\_t* ifx, uint8\_t protocol\_bitmap)

Set protocol type of specified interface The default protocol is (WIFI\_PROTOCOL\_11B|WIFI\_PROTOCOL\_11G|WIFI\_PROTOCOL\_11N) if CONFIG\_SOC\_WIFI\_HE\_SUPPORT, the default protocol is (WIFI\_PROTOCOL\_11B|WIFI\_PROTOCOL\_11G|WIFI\_PROTOCOL\_11N|WIFI\_PROTOCOL\_LR)

**Attention** Support 802.11b or 802.11g or 802.11bgn or 802.11bgnax or LR mode

**Parameters**

- **ifx** -- interfaces
- **protocol\_bitmap** -- WiFi protocol bitmap

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- others: refer to error codes in esp\_err.h

*esp\_err\_t* esp\_wifi\_get\_protocol (*wifi\_interface\_t* ifx, uint8\_t \*protocol\_bitmap)

Get the current protocol bitmap of the specified interface.

**Parameters**

- **ifx** -- interface
- **protocol\_bitmap** -- [out] store current WiFi protocol bitmap of interface ifx

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

*esp\_err\_t* esp\_wifi\_set\_bandwidth (*wifi\_interface\_t* ifx, *wifi\_bandwidth\_t* bw)

Set the bandwidth of specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled

**Attention** 2. WIFI\_BW\_HT40 is supported only when the interface support 11N

**Parameters**

- **ifx** -- interface to be configured
- **bw** -- bandwidth

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- others: refer to error codes in esp\_err.h

*esp\_err\_t* esp\_wifi\_get\_bandwidth (*wifi\_interface\_t* ifx, *wifi\_bandwidth\_t* \*bw)

Get the bandwidth of specified interface.

**Attention** 1. API return false if try to get a interface that is not enable

**Parameters**

- **ifx** -- interface to be configured
- **bw** -- [out] store bandwidth of interface ifx

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* esp\_wifi\_set\_channel (uint8\_t primary, *wifi\_second\_chan\_t* second)

Set primary/secondary channel of device.

**Attention** 1. This API should be called after esp\_wifi\_start() and before esp\_wifi\_stop()

**Attention** 2. When device is in STA mode, this API should not be called when STA is scanning or connecting to an external AP

**Attention** 3. When device is in softAP mode, this API should not be called when softAP has connected to external STAs

**Attention** 4. When device is in STA+softAP mode, this API should not be called when in the scenarios described above

**Attention** 5. The channel info set by this API will not be stored in NVS. So If you want to remember the channel used before wifi stop, you need to call this API again after wifi start, or you can call `esp_wifi_set_config()` to store the channel info in NVS.

#### Parameters

- **primary** -- for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second** -- for HT20, second is ignored, for HT40, second is the second channel

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by `esp_wifi_start`

`esp_err_t esp_wifi_get_channel` (uint8\_t \*primary, *wifi\_second\_chan\_t* \*second)

Get the primary/secondary channel of device.

**Attention** 1. API return false if try to get a interface that is not enable

#### Parameters

- **primary** -- store current primary channel
- **second** -- [out] store current second channel

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument

`esp_err_t esp_wifi_set_country` (const *wifi\_country\_t* \*country)

configure country info

**Attention** 1. It is discouraged to call this API since this doesn't validate the per-country rules, it's up to the user to fill in all fields according to local regulations. Please use `esp_wifi_set_country_code` instead.

**Attention** 2. The default country is "01" (world safe mode) {.cc="01", .schan=1, .nchan=11, .policy=WIFI\_COUNTRY\_POLICY\_AUTO}.

**Attention** 3. The third octet of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as ' '.

**Attention** 4. When the country policy is WIFI\_COUNTRY\_POLICY\_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc="US", .schan=1, .nchan=11} and the country info of the AP to which the station is connected is {.cc="JP", .schan=1, .nchan=14} then the country info that will be used is {.cc="JP", .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc="US", .schan=1, .nchan=11} in the example.

**Attention** 5. When the country policy is WIFI\_COUNTRY\_POLICY\_MANUAL, then the configured country info is used always.

**Attention** 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 7. The country configuration is stored into flash.

**Attention** 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Parameters** **country** -- the configured country info

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_get\_country** (*wifi\_country\_t* \*country)

get the current country info

**Parameters** **country** -- country info

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_mac** (*wifi\_interface\_t* ifx, const uint8\_t mac[6])

Set MAC address of WiFi station, soft-AP or NAN interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. Above mentioned interfaces have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of MAC address can not be 1. For example, the MAC address can set to be "1a:XX:XX:XX:XX:XX", but can not be "15:XX:XX:XX:XX:XX".

**Parameters**

- **ifx** -- interface
- **mac** -- the MAC address

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MAC: invalid mac address
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- others: refer to error codes in esp\_err.h

*esp\_err\_t* **esp\_wifi\_get\_mac** (*wifi\_interface\_t* ifx, uint8\_t mac[6])

Get mac of specified interface.

**Parameters**

- **ifx** -- interface
- **mac** -- [out] store mac of the interface ifx

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_rx\_cb** (*wifi\_promiscuous\_cb\_t* cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Parameters** **cb** -- callback

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_set\_promiscuous** (bool en)

Enable the promiscuous mode.

**Parameters** **en** -- false - disable, true - enable

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous** (bool \*en)

Get the promiscuous mode.

**Parameters** en -- [out] store the current status of promiscuous mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable the promiscuous mode packet type filter.

---

**Note:** The default filter is to filter all packets except WIFI\_PKT\_MISC

---

**Parameters** filter -- the packet type filtered in promiscuous mode.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the promiscuous filter.

**Parameters** filter -- [out] store the current status of promiscuous filter

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_promiscuous\_ctrl\_filter** (const *wifi\_promiscuous\_filter\_t* \*filter)

Enable subtype filter of the control packet in promiscuous mode.

---

**Note:** The default filter is to filter none control packet.

---

**Parameters** filter -- the subtype of the control packet filtered in promiscuous mode.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init

*esp\_err\_t* **esp\_wifi\_get\_promiscuous\_ctrl\_filter** (*wifi\_promiscuous\_filter\_t* \*filter)

Get the subtype filter of the control packet in promiscuous mode.

**Parameters** filter -- [out] store the current status of subtype filter of the control packet in promiscuous mode

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_set\_config** (*wifi\_interface\_t* interface, *wifi\_config\_t* \*conf)

Set the configuration of the STA, AP or NAN.

**Attention** 1. This API can be called only when specified interface is enabled, otherwise, API fail

**Attention** 2. For station configuration, `ssid_set` needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**Attention** 3. ESP devices are limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the station.

**Attention** 4. The configuration will be stored in NVS for station and soft-AP

#### Parameters

- **interface** -- interface
- **conf** -- station, soft-AP or NAN configuration

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface
- ESP\_ERR\_WIFI\_MODE: invalid mode
- ESP\_ERR\_WIFI\_PASSWORD: invalid password
- ESP\_ERR\_WIFI\_NVS: WiFi internal NVS error
- others: refer to the error code in `esp_err.h`

`esp_err_t esp_wifi_get_config (wifi_interface_t interface, wifi_config_t *conf)`

Get configuration of specified interface.

#### Parameters

- **interface** -- interface
- **conf** -- [out] station or soft-AP configuration

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_IF: invalid interface

`esp_err_t esp_wifi_ap_get_sta_list (wifi_sta_list_t *sta)`

Get STAs associated with soft-AP.

**Attention** SSC only API

**Parameters** **sta** -- [out] station list ap can get the connected sta's phy mode info through the struct member `phy_11b`, `phy_11g`, `phy_11n`, `phy_lr` in the `wifi_sta_info_t` struct. For example, `phy_11b = 1` imply that sta support 802.11b mode

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong
- ESP\_ERR\_WIFI\_CONN: WiFi internal error, the station/soft-AP control block is invalid

`esp_err_t esp_wifi_ap_get_sta_aid (const uint8_t mac[6], uint16_t *aid)`

Get AID of STA connected with soft-AP.

#### Parameters

- **mac** -- STA's mac address
- **aid** -- [out] Store the AID corresponding to STA mac

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NOT\_FOUND: Requested resource not found
- ESP\_ERR\_WIFI\_MODE: WiFi mode is wrong

- `ESP_ERR_WIFI_CONN`: WiFi internal error, the station/soft-AP control block is invalid

`esp_err_t esp_wifi_set_storage` (*wifi\_storage\_t* storage)

Set the WiFi API configuration storage type.

**Attention** 1. The default value is `WIFI_STORAGE_FLASH`

**Parameters** `storage` -- : storage type

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

`esp_err_t esp_wifi_set_vendor_ie` (bool enable, *wifi\_vendor\_ie\_type\_t* type, *wifi\_vendor\_ie\_id\_t* idx, const void \*vnd\_ie)

Set 802.11 Vendor-Specific Information Element.

**Parameters**

- **enable** -- If true, specified IE is enabled. If false, specified IE is removed.
- **type** -- Information Element type. Determines the frame type to associate with the IE.
- **idx** -- Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- **vnd\_ie** -- Pointer to vendor specific element data. First 6 bytes should be a header with fields matching *wifi\_vendor\_ie\_data\_t*. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init()`
- `ESP_ERR_INVALID_ARG`: Invalid argument, including if first byte of `vnd_ie` is not `WIFI_VENDOR_IE_ELEMENT_ID` (0xDD) or second byte is an invalid length.
- `ESP_ERR_NO_MEM`: Out of memory

`esp_err_t esp_wifi_set_vendor_ie_cb` (*esp\_vendor\_ie\_cb\_t* cb, void \*ctx)

Register Vendor-Specific Information Element monitoring callback.

**Parameters**

- **cb** -- Callback function
- **ctx** -- Context argument, passed to callback function.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

`esp_err_t esp_wifi_set_max_tx_power` (int8\_t power)

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.

**Attention** 2. The value set by this API will be mapped to the `max_tx_power` of the structure *wifi\_country\_t* variable.

**Attention** 3. Mapping Table {Power, max\_tx\_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.

**Attention** 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

**Attention** 5. Relationship between set value and actual value. As follows: {set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

**Parameters** `power` -- Maximum WiFi transmitting power.

**Returns**

- `ESP_OK`: succeed

- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument, e.g. parameter is out of range

*esp\_err\_t* `esp_wifi_get_max_tx_power` (`int8_t *power`)

Get maximum transmitting power after WiFi start.

**Parameters** `power` -- Maximum WiFi transmitting power, unit is 0.25dBm.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument

*esp\_err\_t* `esp_wifi_set_event_mask` (`uint32_t mask`)

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various `WIFI_EVENT_MASK_` constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention** 2. Default WiFi event mask is `WIFI_EVENT_MASK_AP_PROBEREQRCVED`.

**Attention** 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

**Parameters** `mask` -- WiFi event mask.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`

*esp\_err\_t* `esp_wifi_get_event_mask` (`uint32_t *mask`)

Get mask of WiFi events.

**Parameters** `mask` -- WiFi event mask.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

*esp\_err\_t* `esp_wifi_80211_tx` (`wifi_interface_t ifx`, `const void *buffer`, `int len`, `bool en_sys_seq`)

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Parameters**

- **ifx** -- interface if the Wi-Fi mode is Station, the ifx should be `WIFI_IF_STA`. If the Wi-Fi mode is SoftAP, the ifx should be `WIFI_IF_AP`. If the Wi-Fi mode is Station+SoftAP, the ifx should be `WIFI_IF_STA` or `WIFI_IF_AP`. If the ifx is wrong, the API returns `ESP_ERR_WIFI_IF`.
- **buffer** -- raw ieee80211 buffer
- **len** -- the length of raw buffer, the len must be  $\leq 1500$  Bytes and  $\geq 24$  Bytes
- **en\_sys\_seq** -- indicate whether use the internal sequence number. If `en_sys_seq` is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if `esp_wifi_80211_tx` is called before the Wi-Fi connection has been set up, both `en_sys_seq==true` and `en_sys_seq==false` are fine. However, if the API is called after the Wi-Fi connection has been set up, `en_sys_seq` must be true, otherwise `ESP_ERR_INVALID_ARG` is returned.

**Returns**

- ESP\_OK: success
- ESP\_ERR\_WIFI\_IF: Invalid interface
- ESP\_ERR\_INVALID\_ARG: Invalid parameter
- ESP\_ERR\_WIFI\_NO\_MEM: out of memory

*esp\_err\_t* **esp\_wifi\_set\_csi\_rx\_cb** (*wifi\_csi\_cb\_t* cb, void \*ctx)

Register the RX callback function of CSI data.

Each time a CSI data **is** received, the callback function will be called.

#### Parameters

- **cb** -- callback
- **ctx** -- context argument, passed to callback function

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`

*esp\_err\_t* **esp\_wifi\_set\_csi\_config** (const *wifi\_csi\_config\_t* \*config)

Set CSI data configuration.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters** **config** -- configuration

*esp\_err\_t* **esp\_wifi\_set\_csi** (bool en)

Enable or disable CSI.

return

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by `esp_wifi_start` or promiscuous mode is not enabled
- ESP\_ERR\_INVALID\_ARG: invalid argument

**Parameters** **en** -- true - enable, false - disable

*esp\_err\_t* **esp\_wifi\_set\_ant\_gpio** (const *wifi\_ant\_gpio\_config\_t* \*config)

Set antenna GPIO configuration.

**Parameters** **config** -- Antenna GPIO configuration.

#### Returns

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by `esp_wifi_init`
- ESP\_ERR\_INVALID\_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

`esp_err_t esp_wifi_get_ant_gpio (wifi_ant_gpio_config_t *config)`

Get current antenna GPIO configuration.

**Parameters** `config` -- Antenna GPIO configuration.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument, e.g. parameter is `NULL`

`esp_err_t esp_wifi_set_ant (const wifi_ant_config_t *config)`

Set antenna configuration.

**Parameters** `config` -- Antenna configuration.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: Invalid argument, e.g. parameter is `NULL`, invalid antenna mode or invalid GPIO number

`esp_err_t esp_wifi_get_ant (wifi_ant_config_t *config)`

Get current antenna configuration.

**Parameters** `config` -- Antenna configuration.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument, e.g. parameter is `NULL`

`int64_t esp_wifi_get_tsf_time (wifi_interface_t interface)`

Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn't receive at least one beacon after connected, will return 0.

**Attention** Enabling power save may cause the return value inaccurate, except WiFi modem sleep

**Parameters** `interface` -- The interface whose `tsf_time` is to be retrieved.

**Returns** 0 or the TSF time

`esp_err_t esp_wifi_set_inactive_time (wifi_interface_t ifx, uint16_t sec)`

Set the inactive time of the STA or AP.

**Attention** 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

**Attention** 2. For SoftAP, If the softAP doesn't receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

**Attention** 3. The inactive time configuration is not stored into flash

**Parameters**

- `ifx` -- interface to be configured.
- `sec` -- Inactive time. Unit seconds.

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`
- `ESP_ERR_INVALID_ARG`: invalid argument, For Station, if `sec` is less than 3. For SoftAP, if `sec` is less than 10.

*esp\_err\_t* **esp\_wifi\_get\_inactive\_time** (*wifi\_interface\_t* ifx, uint16\_t \*sec)

Get inactive time of specified interface.

**Parameters**

- **ifx** -- Interface to be configured.
- **sec** -- Inactive time. Unit seconds.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_WIFI\_NOT\_STARTED: WiFi is not started by esp\_wifi\_start
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_stats\_dump** (uint32\_t modules)

Dump WiFi statistics.

**Parameters** **modules** -- statistic modules to be dumped

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_set\_rssi\_threshold** (int32\_t rssi)

Set RSSI threshold, if average rssi gets lower than threshold, WiFi task will post event WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW.

**Attention** If the user wants to receive another WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW event after receiving one, this API needs to be called again with an updated/same RSSI threshold.

**Parameters** **rssi** -- threshold value in dbm between -100 to 10 Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_WIFI\_NOT\_INIT: WiFi is not initialized by esp\_wifi\_init
- ESP\_ERR\_INVALID\_ARG: invalid argument

*esp\_err\_t* **esp\_wifi\_ftm\_initiate\_session** (*wifi\_ftm\_initiator\_cfg\_t* \*cfg)

Start an FTM Initiator session by sending FTM request If successful, event WIFI\_EVENT\_FTM\_REPORT is generated with the result of the FTM procedure.

**Attention** 1. Use this API only in Station mode.

**Attention** 2. If FTM is initiated on a different channel than Station is connected in or internal SoftAP is started in, FTM defaults to a single burst in ASAP mode.

**Parameters** **cfg** -- FTM Initiator session configuration

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_ftm\_end\_session** (void)

End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_ftm\_resp\_set\_offset** (int16\_t offset\_cm)

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**Parameters** **offset\_cm** -- T1 Offset to be added in centimeters

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_ftm\_get\_report** (*wifi\_ftm\_report\_entry\_t* \*report, uint8\_t num\_entries)

Get FTM measurements report copied into a user provided buffer.

**Attention 1.** To get the FTM report, user first needs to allocate a buffer of size (sizeof(wifi\_ftm\_report\_entry\_t) \* num\_entries) where the API will fill up to num\_entries valid FTM measurements in the buffer. Total number of entries can be found in the event WIFI\_EVENT\_FTM\_REPORT as ftm\_report\_num\_entries

**Attention 2.** The internal FTM report is freed upon use of this API which means the API can only be used once after every FTM session initiated

**Attention 3.** Passing the buffer as NULL merely frees the FTM report

**Parameters**

- **report** -- Pointer to the buffer for receiving the FTM report
- **num\_entries** -- Number of FTM report entries to be filled in the report

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_config\_11b\_rate** (*wifi\_interface\_t* ifx, bool disable)

Enable or disable 11b rate of specified interface.

**Attention 1.** This API should be called after esp\_wifi\_init() and before esp\_wifi\_start().

**Attention 2.** Only when really need to disable 11b rate call this API otherwise don't call this.

**Parameters**

- **ifx** -- Interface to be configured.
- **disable** -- true means disable 11b rate while false means enable 11b rate.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_connectionless\_module\_set\_wake\_interval** (uint16\_t wake\_interval)

Set wake interval for connectionless modules to wake up periodically.

**Attention 1.** Only one wake interval for all connectionless modules.

**Attention 2.** This configuration could work at connected status. When ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE is enabled, this configuration could work at disconnected status.

**Attention 3.** Event WIFI\_EVENT\_CONNECTIONLESS\_MODULE\_WAKE\_INTERVAL\_START would be posted each time wake interval starts.

**Attention 4.** Recommend to configure interval in multiples of hundred. (e.g. 100ms)

**Attention** 5. Recommend to configure interval to `ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE` to get stable performance at coexistence mode.

**Parameters** `wake_interval` -- Milliseconds after would the chip wake up, from 1 to 65535.

*esp\_err\_t* `esp_wifi_force_wakeup_acquire` (void)

Request extra reference of Wi-Fi radio. Wi-Fi keep active state(RF opened) to be able to receive packets.

**Attention** Please pair the use of `esp_wifi_force_wakeup_acquire` with `esp_wifi_force_wakeup_release`.

#### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`

*esp\_err\_t* `esp_wifi_force_wakeup_release` (void)

Release extra reference of Wi-Fi radio. Wi-Fi go to sleep state(RF closed) if no more use of radio.

**Attention** Please pair the use of `esp_wifi_force_wakeup_acquire` with `esp_wifi_force_wakeup_release`.

#### Returns

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_WIFI_NOT_STARTED`: WiFi is not started by `esp_wifi_start`

*esp\_err\_t* `esp_wifi_set_country_code` (const char \*country, bool ieee80211d\_enabled)

configure country

**Attention** 1. When `ieee80211d_enabled`, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

**Attention** 2. When `ieee80211d_enabled` is disabled, then the configured country info is used always.

**Attention** 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 4. The country configuration is stored into flash.

**Attention** 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Attention** 6. Supported country codes are "01"(world safe mode) "AT","AU","BE","BG","BR", "CA","CH","CN","CY","CZ","DE","DK","EE","ES","FI","FR","GB","GR","HK","HR","HU", "IE","IN","IS","IT","JP","KR","LI","LT","LU","LV","MT","MX","NL","NO","NZ","PL","PT", "RO","SE","SI","SK","TW","US"

**Attention** 7. When country code "01" (world safe mode) is set, SoftAP mode won't contain country IE.

**Attention** 8. The default country is "01" (world safe mode) and `ieee80211d_enabled` is TRUE.

**Attention** 9. The third octet of country code string is one of the following: ' ', 'O', 'I', 'X', otherwise it is considered as ' '.

#### Parameters

- `country` -- the configured country ISO code
- `ieee80211d_enabled` -- 802.11d is enabled or not

#### Returns

- `ESP_OK`: succeed

- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

*esp\_err\_t* `esp_wifi_get_country_code` (char \*country)

get the current country code

**Parameters** `country` -- country code

**Returns**

- `ESP_OK`: succeed
- `ESP_ERR_WIFI_NOT_INIT`: WiFi is not initialized by `esp_wifi_init`
- `ESP_ERR_INVALID_ARG`: invalid argument

*esp\_err\_t* `esp_wifi_config_80211_tx_rate` (*wifi\_interface\_t* ifx, *wifi\_phy\_rate\_t* rate)

Config 80211 tx rate of specified interface.

**Attention** 1. This API should be called after `esp_wifi_init()` and before `esp_wifi_start()`.

**Parameters**

- `ifx` -- Interface to be configured.
- `rate` -- Phy rate to be configured.

**Returns**

- `ESP_OK`: succeed
- others: failed

*esp\_err\_t* `esp_wifi_disable_pmf_config` (*wifi\_interface\_t* ifx)

Disable PMF configuration for specified interface.

**Attention** This API should be called after `esp_wifi_set_config()` and before `esp_wifi_start()`.

**Parameters** `ifx` -- Interface to be configured.

**Returns**

- `ESP_OK`: succeed
- others: failed

*esp\_err\_t* `esp_wifi_sta_get_aid` (uint16\_t \*aid)

Get the Association id assigned to STA by AP.

**Attention** aid = 0 if station is not connected to AP.

**Parameters** `aid` -- [out] store the aid

**Returns**

- `ESP_OK`: succeed

*esp\_err\_t* `esp_wifi_sta_get_negotiated_phymode` (*wifi\_phy\_mode\_t* \*phymode)

Get the negotiated phymode after connection.

**Parameters** `phymode` -- [out] store the negotiated phymode.

**Returns**

- `ESP_OK`: succeed

*esp\_err\_t* `esp_wifi_set_dynamic_cs` (bool enabled)

Config dynamic carrier sense.

**Attention** This API should be called after `esp_wifi_start()`.

**Parameters** **enabled** -- Dynamic carrier sense is enabled or not.

**Returns**

- ESP\_OK: succeed
- others: failed

*esp\_err\_t* **esp\_wifi\_sta\_get\_rssi** (int \*rssi)

Get the rssi info after station connected to AP.

**Attention** This API should be called after station connected to AP.

**Parameters** **rssi** -- store the rssi info received from last beacon.

**Returns**

- ESP\_OK: succeed
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_FAIL: failed

## Structures

struct **wifi\_init\_config\_t**

WiFi stack configuration parameters passed to esp\_wifi\_init call.

### Public Members

wifi\_osi\_funcs\_t \***osi\_funcs**

WiFi OS functions

wpa\_crypto\_funcs\_t **wpa\_crypto\_funcs**

WiFi station crypto functions when connect

Nano option for printf/scan family enable flag
- int **rx\_ba\_win**  
WiFi Block Ack RX window size
- int **wifi\_task\_core\_id**  
WiFi Task Core ID
- int **beacon\_max\_len**  
WiFi softAP maximum length of the beacon
- int **mgmt\_sbuf\_num**  
WiFi management short buffer number, the minimum value is 6, the maximum value is 32
- uint64\_t **feature\_caps**  
Enables additional WiFi features and capabilities
- bool **sta\_disconnected\_pm**  
WiFi Power Management for station at disconnected status
- int **espnow\_max\_encrypt\_num**  
Maximum encrypt number of peers supported by espnow
- int **magic**  
WiFi init magic number, it should be the last field

## Macros

- ESP\_ERR\_WIFI\_NOT\_INIT**  
WiFi driver was not installed by esp\_wifi\_init

**ESP\_ERR\_WIFI\_NOT\_STARTED**

WiFi driver was not started by esp\_wifi\_start

**ESP\_ERR\_WIFI\_NOT\_STOPPED**

WiFi driver was not stopped by esp\_wifi\_stop

**ESP\_ERR\_WIFI\_IF**

WiFi interface error

**ESP\_ERR\_WIFI\_MODE**

WiFi mode error

**ESP\_ERR\_WIFI\_STATE**

WiFi internal state error

**ESP\_ERR\_WIFI\_CONN**

WiFi internal control block of station or soft-AP error

**ESP\_ERR\_WIFI\_NVS**

WiFi internal NVS module error

**ESP\_ERR\_WIFI\_MAC**

MAC address is invalid

**ESP\_ERR\_WIFI\_SSID**

SSID is invalid

**ESP\_ERR\_WIFI\_PASSWORD**

Password is invalid

**ESP\_ERR\_WIFI\_TIMEOUT**

Timeout error

**ESP\_ERR\_WIFI\_WAKE\_FAIL**

WiFi is in sleep state(RF closed) and wakeup fail

**ESP\_ERR\_WIFI\_WOULD\_BLOCK**

The caller would block

**ESP\_ERR\_WIFI\_NOT\_CONNECT**

Station still in disconnect status

**ESP\_ERR\_WIFI\_POST**

Failed to post the event to WiFi task

**ESP\_ERR\_WIFI\_INIT\_STATE**

Invalid WiFi state when init/deinit is called

**ESP\_ERR\_WIFI\_STOP\_STATE**

Returned when WiFi is stopping

**ESP\_ERR\_WIFI\_NOT\_ASSOC**

The WiFi connection is not associated

**ESP\_ERR\_WIFI\_TX\_DISALLOW**

The WiFi TX is disallowed

**ESP\_ERR\_WIFI\_TWT\_FULL**

no available flow id

**ESP\_ERR\_WIFI\_TWT\_SETUP\_TIMEOUT**

Timeout of receiving twt setup response frame, timeout times can be set during twt setup

**ESP\_ERR\_WIFI\_TWT\_SETUP\_TXFAIL**

TWT setup frame tx failed

**ESP\_ERR\_WIFI\_TWT\_SETUP\_REJECT**

The twt setup request was rejected by the AP

**ESP\_ERR\_WIFI\_DISCARD**

Discard frame

### Type Definitions

typedef void (\***wifi\_promiscuous\_cb\_t**)(void \*buf, *wifi\_promiscuous\_pkt\_type\_t* type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

**Param buf** Data received. Type of data in buffer (*wifi\_promiscuous\_pkt\_t* or *wifi\_pkt\_rx\_ctrl\_t*) indicated by 'type' parameter.

**Param type** promiscuous packet type.

typedef void (\***esp\_vendor\_ie\_cb\_t**)(void \*ctx, *wifi\_vendor\_ie\_type\_t* type, const uint8\_t sa[6], const *vendor\_ie\_data\_t* \*vnd\_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

**Param ctx** Context argument, as passed to `esp_wifi_set_vendor_ie_cb()` when registering callback.

**Param type** Information element type, based on frame type received.

**Param sa** Source 802.11 address.

**Param vnd\_ie** Pointer to the vendor specific element data received.

**Param rssi** Received signal strength indication.

```
typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)
```

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data **is** received, the callback function will be called.

**Param ctx** context argument, passed to `esp_wifi_set_csi_rx_cb()` when registering callback function.

**Param data** CSI data received. The memory that it points to will be deallocated after callback function returns.

### Header File

- `components/esp_wifi/include/esp_wifi_types.h`

### Unions

```
union wifi_config_t
```

`#include <esp_wifi_types.h>` Configuration data for device's AP or STA or NAN.

The usage of this union (for ap, sta or nan configuration) is determined by the accompanying interface argument passed to `esp_wifi_set_config()` or `esp_wifi_get_config()`

### Public Members

*wifi\_ap\_config\_t* **ap**

configuration of AP

*wifi\_sta\_config\_t* **sta**

configuration of STA

*wifi\_nan\_config\_t* **nan**

configuration of NAN

### Structures

```
struct wifi_country_t
```

Structure describing WiFi country-based regional restrictions.

### Public Members

char **cc**[3]

country code string

uint8\_t **schan**

start channel

uint8\_t **nchan**

total channel number

`int8_t max_tx_power`

This field is used for getting WiFi maximum transmitting power, call `esp_wifi_set_max_tx_power` to set the maximum transmitting power.

`wifi_country_policy_t policy`

country policy

struct `wifi_active_scan_time_t`

Range of active scan times per channel.

### Public Members

`uint32_t min`

minimum active scan time per channel, units: millisecond

`uint32_t max`

maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct `wifi_scan_time_t`

Aggregate of active & passive scan time per channel.

### Public Members

`wifi_active_scan_time_t active`

active scan time per channel, units: millisecond.

`uint32_t passive`

passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

struct `wifi_scan_config_t`

Parameters for an SSID scan.

### Public Members

`uint8_t *ssid`

SSID of AP

`uint8_t *bssid`

MAC address of AP

`uint8_t channel`

channel, scan the specific channel

`bool show_hidden`

enable to scan AP whose SSID is hidden

*wifi\_scan\_type\_t* **scan\_type**

scan type, active or passive

*wifi\_scan\_time\_t* **scan\_time**

scan time per channel

uint8\_t **home\_chan\_dwell\_time**

time spent at home channel between scanning consecutive channels.

struct **wifi\_he\_ap\_info\_t**

Description of a WiFi AP HE Info.

### Public Members

uint8\_t **bss\_color**

an unsigned integer whose value is the BSS Color of the BSS corresponding to the AP

uint8\_t **partial\_bss\_color**

indicate if an AID assignment rule based on the BSS color

uint8\_t **bss\_color\_disabled**

indicate if the use of BSS color is disabled

uint8\_t **bssid\_index**

in M-BSSID set, identifies the nontransmitted BSSID

struct **wifi\_ap\_record\_t**

Description of a WiFi AP.

### Public Members

uint8\_t **bssid**[6]

MAC address of AP

uint8\_t **ssid**[33]

SSID of AP

uint8\_t **primary**

channel of AP

*wifi\_second\_chan\_t* **second**

secondary channel of AP

int8\_t **rss\_i**

signal strength of AP. Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive

*wifi\_auth\_mode\_t* **authmode**

authmode of AP

*wifi\_cipher\_type\_t* **pairwise\_cipher**

pairwise cipher of AP

*wifi\_cipher\_type\_t* **group\_cipher**

group cipher of AP

*wifi\_ant\_t* **ant**

antenna used to receive beacon from AP

uint32\_t **phy\_11b**

bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g**

bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n**

bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_1r**

bit: 3 flag to identify if low rate is enabled or not

uint32\_t **phy\_11ax**

bit: 4 flag to identify if 11ax mode is enabled or not

uint32\_t **wps**

bit: 5 flag to identify if WPS is supported or not

uint32\_t **ftm\_responder**

bit: 6 flag to identify if FTM is supported in responder mode

uint32\_t **ftm\_initiator**

bit: 7 flag to identify if FTM is supported in initiator mode

uint32\_t **reserved**

bit: 8..31 reserved

*wifi\_country\_t* **country**

country information of AP

*wifi\_he\_ap\_info\_t* **he\_ap**

HE AP info

struct **wifi\_scan\_threshold\_t**

Structure describing parameters for a WiFi fast scan.

### Public Members

`int8_t rssi`

The minimum rssi to accept in the fast scan mode

`wifi_auth_mode_t authmode`

The weakest authmode to accept in the fast scan mode Note: In case this value is not set and password is set as per WPA2 standards (password len  $\geq$  8), it will be defaulted to WPA2 and device won't connect to deprecated WEP/WPA networks. Please set authmode threshold as WIFI\_AUTH\_WEP/WIFI\_AUTH\_WPA\_PSK to connect to WEP/WPA networks

struct `wifi_pmf_config_t`

Configuration structure for Protected Management Frame

### Public Members

bool `capable`

Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool `required`

Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct `wifi_ap_config_t`

Soft-AP configuration settings for the device.

### Public Members

`uint8_t ssid[32]`

SSID of soft-AP. If `ssid_len` field is 0, this must be a Null terminated string. Otherwise, length is set according to `ssid_len`.

`uint8_t password[64]`

Password of soft-AP.

`uint8_t ssid_len`

Optional length of SSID field.

`uint8_t channel`

Channel of soft-AP

`wifi_auth_mode_t authmode`

Auth mode of soft-AP. Do not support AUTH\_WEP, AUTH\_WAPI\_PSK and AUTH\_OWE in soft-AP mode. When the auth mode is set to WPA2\_PSK, WPA2\_WPA3\_PSK or WPA3\_PSK, the pairwise cipher will be overwritten with WIFI\_CIPHER\_TYPE\_CCMP.

`uint8_t ssid_hidden`

Broadcast SSID or not, default 0, broadcast the SSID

uint8\_t **max\_connection**

Max number of stations allowed to connect in

uint16\_t **beacon\_interval**

Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

*wifi\_cipher\_type\_t* **pairwise\_cipher**

Pairwise cipher of SoftAP, group cipher will be derived using this. Cipher values are valid starting from WIFI\_CIPHER\_TYPE\_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI\_CIPHER\_TYPE\_TKIP, WIFI\_CIPHER\_TYPE\_CCMP and WIFI\_CIPHER\_TYPE\_TKIP\_CCMP.

bool **ftm\_responder**

Enable FTM Responder mode

*wifi\_pmf\_config\_t* **pmf\_cfg**

Configuration for Protected Management Frame

*wifi\_sae\_pwe\_method\_t* **sae\_pwe\_h2e**

Configuration for SAE PWE derivation method

struct **wifi\_sta\_config\_t**

STA configuration settings for the device.

## Public Members

uint8\_t **ssid**[32]

SSID of target AP.

uint8\_t **password**[64]

Password of target AP.

*wifi\_scan\_method\_t* **scan\_method**

do all channel scan or fast scan

bool **bssid\_set**

whether set MAC address of target AP or not. Generally, station\_config.bssid\_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

uint8\_t **bssid**[6]

MAC address of target AP

uint8\_t **channel**

channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.

**uint16\_t listen\_interval**

Listen interval for ESP32 station to receive beacon when WIFI\_PS\_MAX\_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

**wifi\_sort\_method\_t sort\_method**

sort the connect AP in the list by rssi or security mode

**wifi\_scan\_threshold\_t threshold**

When scan\_threshold is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

**wifi\_pmf\_config\_t pmf\_cfg**

Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

**uint32\_t rm\_enabled**

Whether Radio Measurements are enabled for the connection

**uint32\_t btm\_enabled**

Whether BSS Transition Management is enabled for the connection

**uint32\_t mbo\_enabled**

Whether MBO is enabled for the connection

**uint32\_t ft\_enabled**

Whether FT is enabled for the connection

**uint32\_t owe\_enabled**

Whether OWE is enabled for the connection

**uint32\_t transition\_disable**

Whether to enable transition disable feature

**uint32\_t reserved**

Reserved for future feature set

**wifi\_sae\_pwe\_method\_t sae\_pwe\_h2e**

Configuration for SAE PWE derivation method

**wifi\_sae\_pk\_mode\_t sae\_pk\_mode**

Configuration for SAE-PK (Public Key) Authentication method

**uint8\_t failure\_retry\_cnt**

Number of connection retries station will do before moving to next AP. scan\_method should be set as WIFI\_ALL\_CHANNEL\_SCAN to use this config. Note: Enabling this may cause connection time to increase incase best AP doesn't behave properly.

**uint32\_t he\_dcm\_set**

Whether DCM max.constellation for transmission and reception is set.

**uint32\_t he\_dcm\_max\_constellation\_tx**

Indicate the max.constellation for DCM in TB PDU the STA supported. 0: not supported. 1: BPSK, 2: QPSK, 3: 16-QAM. The default value is 3.

**uint32\_t he\_dcm\_max\_constellation\_rx**

Indicate the max.constellation for DCM in both Data field and HE-SIG-B field the STA supported. 0: not supported. 1: BPSK, 2: QPSK, 3: 16-QAM. The default value is 3.

**uint32\_t he\_mcs9\_enabled**

Whether to support HE-MCS 0 to 9. The default value is 0.

**uint32\_t he\_su\_beamformee\_disabled**

Whether to disable support for operation as an SU beamformee.

**uint32\_t he\_trig\_su\_biforming\_feedback\_disabled**

Whether to disable support the transmission of SU feedback in an HE TB sounding sequence.

**uint32\_t he\_trig\_mu\_biforming\_partial\_feedback\_disabled**

Whether to disable support the transmission of partial-bandwidth MU feedback in an HE TB sounding sequence.

**uint32\_t he\_trig\_cqi\_feedback\_disabled**

Whether to disable support the transmission of CQI feedback in an HE TB sounding sequence.

**uint32\_t he\_reserved**

Reserved for future feature set

**uint8\_t sae\_h2e\_identifier[SAE\_H2E\_IDENTIFIER\_LEN]**

Password identifier for H2E. this needs to be null terminated string

**struct wifi\_nan\_config\_t**

NAN Discovery start configuration.

**Public Members****uint8\_t op\_channel**

NAN Discovery operating channel

**uint8\_t master\_pref**

Device's preference value to serve as NAN Master

**uint8\_t scan\_time**

Scan time in seconds while searching for a NAN cluster

**uint16\_t warm\_up\_sec**

Warm up time before assuming NAN Anchor Master role

**struct wifi\_sta\_info\_t**

Description of STA associated with AP.

**Public Members**

uint8\_t **mac**[6]

mac address

int8\_t **rss**

current average rssi of sta connected

uint32\_t **phy\_11b**

bit: 0 flag to identify if 11b mode is enabled or not

uint32\_t **phy\_11g**

bit: 1 flag to identify if 11g mode is enabled or not

uint32\_t **phy\_11n**

bit: 2 flag to identify if 11n mode is enabled or not

uint32\_t **phy\_1r**

bit: 3 flag to identify if low rate is enabled or not

uint32\_t **phy\_11ax**

bit: 4 flag to identify if 11ax mode is enabled or not

uint32\_t **is\_mesh\_child**

bit: 5 flag to identify mesh child

uint32\_t **reserved**

bit: 6..31 reserved

struct **wifi\_sta\_list\_t**

List of stations associated with the Soft-AP.

**Public Members**

*wifi\_sta\_info\_t* **sta**[ESP\_WIFI\_MAX\_CONN\_NUM]

station list

int **num**

number of stations in the list (other entries are invalid)

struct **vendor\_ie\_data\_t**

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

**Public Members**

uint8\_t **element\_id**

Should be set to WIFI\_VENDOR\_IE\_ELEMENT\_ID (0xDD)

uint8\_t **length**

Length of all bytes in the element data following this field. Minimum 4.

uint8\_t **vendor\_oui**[3]

Vendor identifier (OUI).

uint8\_t **vendor\_oui\_type**

Vendor-specific OUI type.

uint8\_t **payload**[0]

Payload. Length is equal to value in 'length' field, minus 4.

struct **wifi\_pkt\_rx\_ctrl\_t**

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

### Public Members

signed **rsi**

Received Signal Strength Indicator(RSSI) of packet. unit: dBm

unsigned **rate**

PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned **\_\_pad0\_\_**

reserved

unsigned **sig\_mode**

Protocol of the received packet, 0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned **\_\_pad1\_\_**

reserved

unsigned **mcs**

Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MCS0 ~ MCS76)

unsigned **cwb**

Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned **\_\_pad2\_\_**

reserved

unsigned **smoothing**

Set to 1 indicates that channel estimate smoothing is recommended. Set to 0 indicates that only per-carrier independent (unsmoothed) channel estimate is recommended.

unsigned **not\_sounding**

Set to 0 indicates that PPDU is a sounding PPDU. Set to 1 indicates that the PPDU is not a sounding PPDU. sounding PPDU is used for channel estimation by the request receiver

unsigned **\_\_pad3\_\_**

reserved

unsigned **aggregation**

Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned **stbc**

Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned **fec\_coding**

Forward Error Correction(FEC). Flag is set for 11n packets which are LDPC

unsigned **sgi**

Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned **\_\_pad4\_\_**

reserved

unsigned **ampdu\_cnt**

the number of subframes aggregated in AMPDU

unsigned **channel**

primary channel on which this packet is received

unsigned **secondary\_channel**

secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned **\_\_pad5\_\_**

reserved

unsigned **timestamp**

timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned **\_\_pad6\_\_**

reserved

signed **noise\_floor**

noise floor of Radio Frequency Module(RF). unit: dBm

unsigned **\_\_pad7\_\_**

reserved

unsigned **\_\_pad8\_\_**

reserved

unsigned **\_\_pad9\_\_**  
reserved

unsigned **ant**  
antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned **\_\_pad10\_\_**  
reserved

unsigned **\_\_pad11\_\_**  
reserved

unsigned **\_\_pad12\_\_**  
reserved

unsigned **sig\_len**  
length of packet including Frame Check Sequence(FCS)

unsigned **\_\_pad13\_\_**  
reserved

unsigned **rx\_state**  
state of the packet. 0: no error; others: error numbers which are not public

struct **wifi\_promiscuous\_pkt\_t**  
Payload passed to 'buf' parameter of promiscuous mode RX callback.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**  
metadata header

uint8\_t **payload[0]**  
Data or management payload. Length of payload is described by rx\_ctrl.sig\_len. Type of content determined by packet type argument of callback.

struct **wifi\_promiscuous\_filter\_t**  
Mask for filtering different packet types in promiscuous mode.

### Public Members

uint32\_t **filter\_mask**  
OR of one or more filter values WIFI\_PROMIS\_FILTER\_\*

struct **wifi\_csi\_config\_t**  
Channel state information(CSI) configuration type.

### Public Members

bool **lltf\_en**

enable to receive legacy long training field(lltf) data. Default enabled

bool **htltf\_en**

enable to receive HT long training field(htltf) data. Default enabled

bool **stbc\_htltf2\_en**

enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

bool **ltf\_merge\_en**

enable to generate htltf data by averaging lltf and ht\_ltf data when receiving HT packet. Otherwise, use ht\_ltf data directly. Default enabled

bool **channel\_filter\_en**

enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool **manu\_scale**

manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8\_t **shift**

manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

bool **dump\_ack\_en**

enable to dump 802.11 ACK frame, default disabled

struct **wifi\_csi\_info\_t**

CSI data type.

### Public Members

*wifi\_pkt\_rx\_ctrl\_t* **rx\_ctrl**

received packet radio metadata header of the CSI data

uint8\_t **mac**[6]

source MAC address of the CSI data

uint8\_t **dmac**[6]

destination MAC address of the CSI data

bool **first\_word\_invalid**

first four bytes of the CSI data is invalid or not, true indicates the first four bytes is invalid due to hardware limitation

int8\_t \***buf**

valid buffer of CSI data

`uint16_t len`

valid length of CSI data

`uint8_t *hdr`

header of the wifi packet

`uint8_t *payload`

payload of the wifi packet

`uint16_t payload_len`

payload len of the wifi packet

`uint16_t rx_seq`

rx sequence number of the wifi packet

struct `wifi_ant_gpio_t`

WiFi GPIO configuration for antenna selection.

### Public Members

`uint8_t gpio_select`

Whether this GPIO is connected to external antenna switch

`uint8_t gpio_num`

The GPIO number that connects to external antenna switch

struct `wifi_ant_gpio_config_t`

WiFi GPIOs configuration for antenna selection.

### Public Members

`wifi_ant_gpio_t gpio_cfg[4]`

The configurations of GPIOs that connect to external antenna switch

struct `wifi_ant_config_t`

WiFi antenna configuration.

### Public Members

`wifi_ant_mode_t rx_ant_mode`

WiFi antenna mode for receiving

`wifi_ant_t rx_ant_default`

Default antenna mode for receiving, it's ignored if `rx_ant_mode` is not `WIFI_ANT_MODE_AUTO`

**wifi\_ant\_mode\_t tx\_ant\_mode**

WiFi antenna mode for transmission, it can be set to WIFI\_ANT\_MODE\_AUTO only if rx\_ant\_mode is set to WIFI\_ANT\_MODE\_AUTO

**uint8\_t enabled\_ant0**

Index (in antenna GPIO configuration) of enabled WIFI\_ANT\_MODE\_ANT0

**uint8\_t enabled\_ant1**

Index (in antenna GPIO configuration) of enabled WIFI\_ANT\_MODE\_ANT1

**struct wifi\_action\_tx\_req\_t**

Action Frame Tx Request.

**Public Members****wifi\_interface\_t ifx**

WiFi interface to send request to

**uint8\_t dest\_mac[6]**

Destination MAC address

**bool no\_ack**

Indicates no ack required

**wifi\_action\_rx\_cb\_t rx\_cb**

Rx Callback to receive any response

**uint32\_t data\_len**

Length of the appended Data

**uint8\_t data[0]**

Appended Data payload

**struct wifi\_ftm\_initiator\_cfg\_t**

FTM Initiator configuration.

**Public Members****uint8\_t resp\_mac[6]**

MAC address of the FTM Responder

**uint8\_t channel**

Primary channel of the FTM Responder

**uint8\_t frm\_count**

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16\_t **burst\_period**

Requested period between FTM bursts in 100's of milliseconds (allowed values 0(No pref) - 100)

bool **use\_get\_report\_api**

True - Using `esp_wifi_ftm_get_report` to get FTM report, False - Using `ftm_report_data` from `WIFI_EVENT_FTM_REPORT` to get FTM report

struct **wifi\_beacon\_monitor\_config\_t**

WiFi beacon monitor parameter configuration.

### Public Members

bool **enable**

Enable or disable beacon monitor

uint8\_t **loss\_timeout**

Beacon lost timeout

uint8\_t **loss\_threshold**

Maximum number of consecutive lost beacons allowed

uint8\_t **delta\_intr\_early**

Delta early time for RF PHY on

uint8\_t **delta\_loss\_timeout**

Delta timeout time for RF PHY off

struct **wifi\_nan\_publish\_cfg\_t**

NAN Publish service configuration parameters.

### Public Members

char **service\_name**[ESP\_WIFI\_MAX\_SVC\_NAME\_LEN]

Service name identifier

*wifi\_nan\_service\_type\_t* **type**

Service type

char **matching\_filter**[ESP\_WIFI\_MAX\_FILTER\_LEN]

Comma separated filters for filtering services

char **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]

Service info shared in Publish frame

uint8\_t **single\_replied\_event**

Give single Replied event or every time

uint8\_t **datapath\_reqd**  
NAN Datapath required for the service

uint8\_t **reserved**  
Reserved

struct **wifi\_nan\_subscribe\_cfg\_t**  
NAN Subscribe service configuration parameters.

### Public Members

char **service\_name**[ESP\_WIFI\_MAX\_SVC\_NAME\_LEN]  
Service name identifier

*wifi\_nan\_service\_type\_t* **type**  
Service type

char **matching\_filter**[ESP\_WIFI\_MAX\_FILTER\_LEN]  
Comma separated filters for filtering services

char **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]  
Service info shared in Subscribe frame

uint8\_t **single\_match\_event**  
Give single Match event or every time

uint8\_t **reserved**  
Reserved

struct **wifi\_nan\_followup\_params\_t**  
NAN Follow-up parameters.

### Public Members

uint8\_t **inst\_id**  
Own service instance id

uint8\_t **peer\_inst\_id**  
Peer's service instance id

uint8\_t **peer\_mac**[6]  
Peer's MAC address

char **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]  
Service info(or message) to be shared

struct **wifi\_nan\_datapath\_req\_t**  
NAN Datapath Request parameters.

**Public Members****uint8\_t pub\_id**

Publisher's service instance id

**uint8\_t peer\_mac[6]**

Peer's MAC address

**bool confirm\_required**

NDP Confirm frame required

struct **wifi\_nan\_datapath\_resp\_t**

NAN Datapath Response parameters.

**Public Members****bool accept**

True - Accept incoming NDP, False - Reject it

**uint8\_t ndp\_id**

NAN Datapath Identifier

**uint8\_t peer\_mac[6]**

Peer's MAC address

struct **wifi\_nan\_datapath\_end\_req\_t**

NAN Datapath End parameters.

**Public Members****uint8\_t ndp\_id**

NAN Datapath Identifier

**uint8\_t peer\_mac[6]**

Peer's MAC address

struct **wifi\_event\_sta\_scan\_done\_t**

Argument structure for WIFI\_EVENT\_SCAN\_DONE event

**Public Members****uint32\_t status**

status of scanning APs: 0 — success, 1 - failure

**uint8\_t number**

number of scan results

`uint8_t scan_id`  
scan sequence number, used for block scan

struct `wifi_event_sta_connected_t`  
Argument structure for `WIFI_EVENT_STA_CONNECTED` event

### Public Members

`uint8_t ssid[32]`  
SSID of connected AP

`uint8_t ssid_len`  
SSID length of connected AP

`uint8_t bssid[6]`  
BSSID of connected AP

`uint8_t channel`  
channel of connected AP

`wifi_auth_mode_t authmode`  
authentication mode used by AP

`uint16_t aid`  
authentication id assigned by the connected AP

struct `wifi_event_sta_disconnected_t`  
Argument structure for `WIFI_EVENT_STA_DISCONNECTED` event

### Public Members

`uint8_t ssid[32]`  
SSID of disconnected AP

`uint8_t ssid_len`  
SSID length of disconnected AP

`uint8_t bssid[6]`  
BSSID of disconnected AP

`uint8_t reason`  
reason of disconnection

`int8_t rssi`  
rssi of disconnection

struct `wifi_event_sta_authmode_change_t`  
Argument structure for `WIFI_EVENT_STA_AUTHMODE_CHANGE` event

**Public Members**

*wifi\_auth\_mode\_t* **old\_mode**

the old auth mode of AP

*wifi\_auth\_mode\_t* **new\_mode**

the new auth mode of AP

struct **wifi\_event\_sta\_wps\_er\_pin\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_PIN event

**Public Members**

uint8\_t **pin\_code**[8]

PIN code of station in enrollee mode

struct **wifi\_event\_sta\_wps\_er\_success\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS event

**Public Members**

uint8\_t **ap\_cred\_cnt**

Number of AP credentials received

uint8\_t **ssid**[MAX\_SSID\_LEN]

SSID of AP

uint8\_t **passphrase**[MAX\_PASSPHRASE\_LEN]

Passphrase for the AP

struct *wifi\_event\_sta\_wps\_er\_success\_t*::[anonymous] **ap\_cred**[MAX\_WPS\_AP\_CRED]

All AP credentials received from WPS handshake

struct **wifi\_event\_ap\_staconnected\_t**

Argument structure for WIFI\_EVENT\_AP\_STACONNECTED event

**Public Members**

uint8\_t **mac**[6]

MAC address of the station connected to Soft-AP

uint8\_t **aid**

the aid that soft-AP gives to the station connected to

bool **is\_mesh\_child**

flag to identify mesh child

struct **wifi\_event\_ap\_stadisconnected\_t**

Argument structure for WIFI\_EVENT\_AP\_STADISCONNECTED event

### Public Members

uint8\_t **mac**[6]

MAC address of the station disconnects to soft-AP

uint8\_t **aid**

the aid that soft-AP gave to the station disconnects to

bool **is\_mesh\_child**

flag to identify mesh child

uint8\_t **reason**

reason of disconnection

struct **wifi\_event\_ap\_probe\_req\_rx\_t**

Argument structure for WIFI\_EVENT\_AP\_PROBEREQRECVED event

### Public Members

int **rss\_i**

Received probe request signal strength

uint8\_t **mac**[6]

MAC address of the station which send probe request

struct **wifi\_event\_bss\_rssi\_low\_t**

Argument structure for WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW event

### Public Members

int32\_t **rss\_i**

RSSI value of bss

struct **wifi\_ftm\_report\_entry\_t**

Argument structure for

### Public Members

uint8\_t **dlog\_token**

Dialog Token of the FTM frame

int8\_t **rss\_i**

RSSI of the FTM frame received

uint32\_t **rtt**

Round Trip Time in pSec with a peer

uint64\_t **t1**

Time of departure of FTM frame from FTM Responder in pSec

uint64\_t **t2**

Time of arrival of FTM frame at FTM Initiator in pSec

uint64\_t **t3**

Time of departure of ACK from FTM Initiator in pSec

uint64\_t **t4**

Time of arrival of ACK at FTM Responder in pSec

struct **wifi\_event\_ftm\_report\_t**

Argument structure for WIFI\_EVENT\_FTM\_REPORT event

### Public Members

uint8\_t **peer\_mac**[6]

MAC address of the FTM Peer

*wifi\_ftm\_status\_t* **status**

Status of the FTM operation

uint32\_t **rtt\_raw**

Raw average Round-Trip-Time with peer in Nano-Seconds

uint32\_t **rtt\_est**

Estimated Round-Trip-Time with peer in Nano-Seconds

uint32\_t **dist\_est**

Estimated one-way distance in Centi-Meters

*wifi\_ftm\_report\_entry\_t* \***ftm\_report\_data**

Pointer to FTM Report, should be freed after use. Note: Highly recommended to use API `esp_wifi_ftm_get_report` to get the report instead of using this

uint8\_t **ftm\_report\_num\_entries**

Number of entries in the FTM Report data

struct **wifi\_event\_action\_tx\_status\_t**

Argument structure for WIFI\_EVENT\_ACTION\_TX\_STATUS event

### Public Members

*wifi\_interface\_t* **ifx**

WiFi interface to send request to

uint32\_t **context**

Context to identify the request

uint8\_t **da**[6]

Destination MAC address

uint8\_t **status**

Status of the operation

struct **wifi\_event\_roc\_done\_t**

Argument structure for WIFI\_EVENT\_ROC\_DONE event

### **Public Members**

uint32\_t **context**

Context to identify the request

struct **wifi\_event\_ap\_wps\_rg\_pin\_t**

Argument structure for WIFI\_EVENT\_AP\_WPS\_RG\_PIN event

### **Public Members**

uint8\_t **pin\_code**[8]

PIN code of station in enrollee mode

struct **wifi\_event\_ap\_wps\_rg\_fail\_reason\_t**

Argument structure for WIFI\_EVENT\_AP\_WPS\_RG\_FAILED event

### **Public Members**

*wps\_fail\_reason\_t* **reason**

WPS failure reason wps\_fail\_reason\_t

uint8\_t **peer\_macaddr**[6]

Enrollee mac address

struct **wifi\_event\_ap\_wps\_rg\_success\_t**

Argument structure for WIFI\_EVENT\_AP\_WPS\_RG\_SUCCESS event

### **Public Members**

uint8\_t **peer\_macaddr**[6]

Enrollee mac address

struct **wifi\_event\_nan\_svc\_match\_t**

Argument structure for WIFI\_EVENT\_NAN\_SVC\_MATCH event

### Public Members

uint8\_t **subscribe\_id**

Subscribe Service Identifier

uint8\_t **publish\_id**

Publish Service Identifier

uint8\_t **pub\_if\_mac**[6]

NAN Interface MAC of the Publisher

bool **update\_pub\_id**

Indicates whether publisher's service ID needs to be updated

struct **wifi\_event\_nan\_replied\_t**

Argument structure for WIFI\_EVENT\_NAN\_REPLIED event

### Public Members

uint8\_t **publish\_id**

Publish Service Identifier

uint8\_t **subscribe\_id**

Subscribe Service Identifier

uint8\_t **sub\_if\_mac**[6]

NAN Interface MAC of the Subscriber

struct **wifi\_event\_nan\_receive\_t**

Argument structure for WIFI\_EVENT\_NAN\_RECEIVE event

### Public Members

uint8\_t **inst\_id**

Our Service Identifier

uint8\_t **peer\_inst\_id**

Peer's Service Identifier

uint8\_t **peer\_if\_mac**[6]

Peer's NAN Interface MAC

uint8\_t **peer\_svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]  
Peer Service Info

struct **wifi\_event\_ndp\_indication\_t**  
Argument structure for WIFI\_EVENT\_NDP\_INDICATION event

### Public Members

uint8\_t **publish\_id**  
Publish Id for NAN Service

uint8\_t **ndp\_id**  
NDP instance id

uint8\_t **peer\_nmi**[6]  
Peer's NAN Management Interface MAC

uint8\_t **peer\_ndi**[6]  
Peer's NAN Data Interface MAC

uint8\_t **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]  
Service Specific Info

struct **wifi\_event\_ndp\_confirm\_t**  
Argument structure for WIFI\_EVENT\_NDP\_CONFIRM event

### Public Members

uint8\_t **status**  
NDP status code

uint8\_t **ndp\_id**  
NDP instance id

uint8\_t **peer\_nmi**[6]  
Peer's NAN Management Interface MAC

uint8\_t **peer\_ndi**[6]  
Peer's NAN Data Interface MAC

uint8\_t **own\_ndi**[6]  
Own NAN Data Interface MAC

uint8\_t **svc\_info**[ESP\_WIFI\_MAX\_SVC\_INFO\_LEN]  
Service Specific Info

struct **wifi\_event\_ndp\_terminated\_t**  
Argument structure for WIFI\_EVENT\_NDP\_TERMINATED event

### Public Members

uint8\_t **reason**

Termination reason code

uint8\_t **ndp\_id**

NDP instance id

uint8\_t **init\_ndi**[6]

Initiator's NAN Data Interface MAC

### Macros

**WIFI\_OFFCHAN\_TX\_REQ**

**WIFI\_OFFCHAN\_TX\_CANCEL**

**WIFI\_ROC\_REQ**

**WIFI\_ROC\_CANCEL**

**WIFI\_PROTOCOL\_11B**

**WIFI\_PROTOCOL\_11G**

**WIFI\_PROTOCOL\_11N**

**WIFI\_PROTOCOL\_LR**

**WIFI\_PROTOCOL\_11AX**

**SAE\_H2E\_IDENTIFIER\_LEN**

**ESP\_WIFI\_MAX\_CONN\_NUM**

max number of stations which can connect to ESP32C2 soft-AP

**WIFI\_VENDOR\_IE\_ELEMENT\_ID**

**WIFI\_PROMIS\_FILTER\_MASK\_ALL**

filter all packets

**WIFI\_PROMIS\_FILTER\_MASK\_MGMT**

filter the packets with type of WIFI\_PKT\_MGMT

**WIFI\_PROMIS\_FILTER\_MASK\_CTRL**

filter the packets with type of WIFI\_PKT\_CTRL

**WIFI\_PROMIS\_FILTER\_MASK\_DATA**

filter the packets with type of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_MISC**

filter the packets with type of WIFI\_PKT\_MISC

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_MPDU**

filter the MPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_DATA\_AMPDU**

filter the AMPDU which is a kind of WIFI\_PKT\_DATA

**WIFI\_PROMIS\_FILTER\_MASK\_FCSFAIL**

filter the FCS failed packets, do not open it in general

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ALL**

filter all control packets

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_WRAPPER**

filter the control packets with subtype of Control Wrapper

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BAR**

filter the control packets with subtype of Block Ack Request

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_BA**

filter the control packets with subtype of Block Ack

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_PSPOLL**

filter the control packets with subtype of PS-Poll

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_RTS**

filter the control packets with subtype of RTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CTS**

filter the control packets with subtype of CTS

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_ACK**

filter the control packets with subtype of ACK

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFEND**

filter the control packets with subtype of CF-END

**WIFI\_PROMIS\_CTRL\_FILTER\_MASK\_CFENDACK**

filter the control packets with subtype of CF-END+CF-ACK

**WIFI\_EVENT\_MASK\_ALL**

mask all WiFi events

**WIFI\_EVENT\_MASK\_NONE**

mask none of the WiFi events

**WIFI\_EVENT\_MASK\_AP\_PROBEREQRECVED**

mask SYSTEM\_EVENT\_AP\_PROBEREQRECVED event

**ESP\_WIFI\_NAN\_MAX\_SVC\_SUPPORTED****ESP\_WIFI\_NAN\_DATAPATH\_MAX\_PEERS****ESP\_WIFI\_NDP\_ROLE\_INITIATOR****ESP\_WIFI\_NDP\_ROLE\_RESPONDER****ESP\_WIFI\_MAX\_SVC\_NAME\_LEN****ESP\_WIFI\_MAX\_FILTER\_LEN****ESP\_WIFI\_MAX\_SVC\_INFO\_LEN****MAX\_SSID\_LEN****MAX\_PASSPHRASE\_LEN****MAX\_WPS\_AP\_CRED****WIFI\_STATIS\_BUFFER****WIFI\_STATIS\_RXTX****WIFI\_STATIS\_HW****WIFI\_STATIS\_DIAG****WIFI\_STATIS\_PS****WIFI\_STATIS\_ALL**

### Type Definitions

```
typedef int (*wifi_action_rx_cb_t)(uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)
```

The Rx callback function of Action Tx operations.

**Param hdr** pointer to the IEEE 802.11 Header structure**Param payload** pointer to the Payload following 802.11 Header**Param len** length of the Payload**Param channel** channel number the frame is received on

## Enumerations

enum **wifi\_mode\_t**

*Values:*

enumerator **WIFI\_MODE\_NULL**  
null mode

enumerator **WIFI\_MODE\_STA**  
WiFi station mode

enumerator **WIFI\_MODE\_AP**  
WiFi soft-AP mode

enumerator **WIFI\_MODE\_APSTA**  
WiFi station + soft-AP mode

enumerator **WIFI\_MODE\_NAN**  
WiFi NAN mode

enumerator **WIFI\_MODE\_MAX**

enum **wifi\_interface\_t**

*Values:*

enumerator **WIFI\_IF\_STA**

enumerator **WIFI\_IF\_AP**

enumerator **WIFI\_IF\_MAX**

enum **wifi\_country\_policy\_t**

*Values:*

enumerator **WIFI\_COUNTRY\_POLICY\_AUTO**  
Country policy is auto, use the country info of AP to which the station is connected

enumerator **WIFI\_COUNTRY\_POLICY\_MANUAL**  
Country policy is manual, always use the configured country info

enum **wifi\_auth\_mode\_t**

*Values:*

enumerator **WIFI\_AUTH\_OPEN**  
authenticate mode : open

enumerator **WIFI\_AUTH\_WEP**  
authenticate mode : WEP

enumerator **WIFI\_AUTH\_WPA\_PSK**

authenticate mode : WPA\_PSK

enumerator **WIFI\_AUTH\_WPA2\_PSK**

authenticate mode : WPA2\_PSK

enumerator **WIFI\_AUTH\_WPA\_WPA2\_PSK**

authenticate mode : WPA\_WPA2\_PSK

enumerator **WIFI\_AUTH\_ENTERPRISE**

authenticate mode : WiFi EAP security

enumerator **WIFI\_AUTH\_WPA2\_ENTERPRISE**

authenticate mode : WiFi EAP security

enumerator **WIFI\_AUTH\_WPA3\_PSK**

authenticate mode : WPA3\_PSK

enumerator **WIFI\_AUTH\_WPA2\_WPA3\_PSK**

authenticate mode : WPA2\_WPA3\_PSK

enumerator **WIFI\_AUTH\_WAPI\_PSK**

authenticate mode : WAPI\_PSK

enumerator **WIFI\_AUTH\_OWE**

authenticate mode : OWE

enumerator **WIFI\_AUTH\_WPA3\_ENT\_192**

authenticate mode : WPA3\_ENT\_SUITE\_B\_192\_BIT

enumerator **WIFI\_AUTH\_MAX**

enum **wifi\_err\_reason\_t**

*Values:*

enumerator **WIFI\_REASON\_UNSPECIFIED**

enumerator **WIFI\_REASON\_AUTH\_EXPIRE**

enumerator **WIFI\_REASON\_AUTH\_LEAVE**

enumerator **WIFI\_REASON\_ASSOC\_EXPIRE**

enumerator **WIFI\_REASON\_ASSOC\_TOOMANY**

enumerator **WIFI\_REASON\_NOT\_AUTHED**

enumerator **WIFI\_REASON\_NOT\_ASSOCED**

enumerator **WIFI\_REASON\_ASSOC\_LEAVE**

enumerator **WIFI\_REASON\_ASSOC\_NOT\_AUTHED**

enumerator **WIFI\_REASON\_DISASSOC\_PWRCAP\_BAD**

enumerator **WIFI\_REASON\_DISASSOC\_SUPCHAN\_BAD**

enumerator **WIFI\_REASON\_BSS\_TRANSITION\_DISASSOC**

enumerator **WIFI\_REASON\_IE\_INVALID**

enumerator **WIFI\_REASON\_MIC\_FAILURE**

enumerator **WIFI\_REASON\_4WAY\_HANDSHAKE\_TIMEOUT**

enumerator **WIFI\_REASON\_GROUP\_KEY\_UPDATE\_TIMEOUT**

enumerator **WIFI\_REASON\_IE\_IN\_4WAY\_DIFFERS**

enumerator **WIFI\_REASON\_GROUP\_CIPHER\_INVALID**

enumerator **WIFI\_REASON\_PAIRWISE\_CIPHER\_INVALID**

enumerator **WIFI\_REASON\_AKMP\_INVALID**

enumerator **WIFI\_REASON\_UNSUPP\_RSN\_IE\_VERSION**

enumerator **WIFI\_REASON\_INVALID\_RSN\_IE\_CAP**

enumerator **WIFI\_REASON\_802\_1X\_AUTH\_FAILED**

enumerator **WIFI\_REASON\_CIPHER\_SUITE\_REJECTED**

enumerator **WIFI\_REASON\_TDLS\_PEER\_UNREACHABLE**

enumerator **WIFI\_REASON\_TDLS\_UNSPECIFIED**

enumerator **WIFI\_REASON\_SSP\_REQUESTED\_DISASSOC**

enumerator **WIFI\_REASON\_NO\_SSP\_ROAMING\_AGREEMENT**

enumerator **WIFI\_REASON\_BAD\_CIPHER\_OR\_AKM**

enumerator **WIFI\_REASON\_NOT\_AUTHORIZED\_THIS\_LOCATION**

enumerator **WIFI\_REASON\_SERVICE\_CHANGE\_PERCLUDES\_TS**

enumerator **WIFI\_REASON\_UNSPECIFIED\_QOS**

enumerator **WIFI\_REASON\_NOT\_ENOUGH\_BANDWIDTH**

enumerator **WIFI\_REASON\_MISSING\_ACKS**

enumerator **WIFI\_REASON\_EXCEEDED\_TXOP**

enumerator **WIFI\_REASON\_STA\_LEAVING**

enumerator **WIFI\_REASON\_END\_BA**

enumerator **WIFI\_REASON\_UNKNOWN\_BA**

enumerator **WIFI\_REASON\_TIMEOUT**

enumerator **WIFI\_REASON\_PEER\_INITIATED**

enumerator **WIFI\_REASON\_AP\_INITIATED**

enumerator **WIFI\_REASON\_INVALID\_FT\_ACTION\_FRAME\_COUNT**

enumerator **WIFI\_REASON\_INVALID\_PMKID**

enumerator **WIFI\_REASON\_INVALID\_MDE**

enumerator **WIFI\_REASON\_INVALID\_FTE**

enumerator **WIFI\_REASON\_TRANSMISSION\_LINK\_ESTABLISH\_FAILED**

enumerator **WIFI\_REASON\_ALTERATIVE\_CHANNEL\_OCCUPIED**

enumerator **WIFI\_REASON\_BEACON\_TIMEOUT**

enumerator **WIFI\_REASON\_NO\_AP\_FOUND**

enumerator **WIFI\_REASON\_AUTH\_FAIL**

enumerator **WIFI\_REASON\_ASSOC\_FAIL**

enumerator **WIFI\_REASON\_HANDSHAKE\_TIMEOUT**

enumerator **WIFI\_REASON\_CONNECTION\_FAIL**

enumerator **WIFI\_REASON\_AP\_TSF\_RESET**

enumerator **WIFI\_REASON\_ROAMING**

enumerator **WIFI\_REASON\_ASSOC\_COMEBACK\_TIME\_TOO\_LONG**

enumerator **WIFI\_REASON\_SA\_QUERY\_TIMEOUT**

enum **wifi\_second\_chan\_t**

*Values:*

enumerator **WIFI\_SECOND\_CHAN\_NONE**

the channel width is HT20

enumerator **WIFI\_SECOND\_CHAN\_ABOVE**

the channel width is HT40 and the secondary channel is above the primary channel

enumerator **WIFI\_SECOND\_CHAN\_BELOW**

the channel width is HT40 and the secondary channel is below the primary channel

enum **wifi\_scan\_type\_t**

*Values:*

enumerator **WIFI\_SCAN\_TYPE\_ACTIVE**

active scan

enumerator **WIFI\_SCAN\_TYPE\_PASSIVE**

passive scan

enum **wifi\_cipher\_type\_t**

*Values:*

enumerator **WIFI\_CIPHER\_TYPE\_NONE**

the cipher type is none

enumerator **WIFI\_CIPHER\_TYPE\_WEP40**

the cipher type is WEP40

enumerator **WIFI\_CIPHER\_TYPE\_WEP104**

the cipher type is WEP104

enumerator **WIFI\_CIPHER\_TYPE\_TKIP**

the cipher type is TKIP

enumerator **WIFI\_CIPHER\_TYPE\_CCMP**

the cipher type is CCMP

enumerator **WIFI\_CIPHER\_TYPE\_TKIP\_CCMP**

the cipher type is TKIP and CCMP

enumerator **WIFI\_CIPHER\_TYPE\_AES\_CMAC128**

the cipher type is AES-CMAC-128

enumerator **WIFI\_CIPHER\_TYPE\_SMS4**

the cipher type is SMS4

enumerator **WIFI\_CIPHER\_TYPE\_GCMP**

the cipher type is GCMP

enumerator **WIFI\_CIPHER\_TYPE\_GCMP256**

the cipher type is GCMP-256

enumerator **WIFI\_CIPHER\_TYPE\_AES\_GMAC128**

the cipher type is AES-GMAC-128

enumerator **WIFI\_CIPHER\_TYPE\_AES\_GMAC256**

the cipher type is AES-GMAC-256

enumerator **WIFI\_CIPHER\_TYPE\_UNKNOWN**

the cipher type is unknown

enum **wifi\_ant\_t**

WiFi antenna.

*Values:*

enumerator **WIFI\_ANT\_ANT0**

WiFi antenna 0

enumerator **WIFI\_ANT\_ANT1**

WiFi antenna 1

enumerator **WIFI\_ANT\_MAX**

Invalid WiFi antenna

enum **wifi\_scan\_method\_t**

*Values:*

enumerator **WIFI\_FAST\_SCAN**

Do fast scan, scan will end after find SSID match AP

enumerator **WIFI\_ALL\_CHANNEL\_SCAN**

All channel scan, scan will end after scan all the channel

enum **wifi\_sort\_method\_t**

*Values:*

enumerator **WIFI\_CONNECT\_AP\_BY\_SIGNAL**

Sort match AP in scan list by RSSI

enumerator **WIFI\_CONNECT\_AP\_BY\_SECURITY**

Sort match AP in scan list by security mode

enum **wifi\_ps\_type\_t**

*Values:*

enumerator **WIFI\_PS\_NONE**

No power save

enumerator **WIFI\_PS\_MIN\_MODEM**

Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

enumerator **WIFI\_PS\_MAX\_MODEM**

Maximum modem power saving. In this mode, interval to receive beacons is determined by the `listen_interval` parameter in [wifi\\_sta\\_config\\_t](#)

enum **wifi\_bandwidth\_t**

*Values:*

enumerator **WIFI\_BW\_HT20**

enumerator **WIFI\_BW\_HT40**

enum **wifi\_sae\_pwe\_method\_t**

Configuration for SAE PWE derivation

*Values:*

enumerator **WPA3\_SAE\_PWE\_UNSPECIFIED**

enumerator **WPA3\_SAE\_PWE\_HUNT\_AND\_PECK**

enumerator **WPA3\_SAE\_PWE\_HASH\_TO\_ELEMENT**

enumerator **WPA3\_SAE\_PWE\_BOTH**

enum **wifi\_sae\_pk\_mode\_t**

Configuration for SAE-PK

*Values:*

enumerator **WPA3\_SAE\_PK\_MODE\_AUTOMATIC**

enumerator **WPA3\_SAE\_PK\_MODE\_ONLY**

enumerator **WPA3\_SAE\_PK\_MODE\_DISABLED**

enum **wifi\_storage\_t**

*Values:*

enumerator **WIFI\_STORAGE\_FLASH**  
all configuration will store in both memory and flash

enumerator **WIFI\_STORAGE\_RAM**  
all configuration will only store in the memory

enum **wifi\_vendor\_ie\_type\_t**

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

*Values:*

enumerator **WIFI\_VND\_IE\_TYPE\_BEACON**

enumerator **WIFI\_VND\_IE\_TYPE\_PROBE\_REQ**

enumerator **WIFI\_VND\_IE\_TYPE\_PROBE\_RESP**

enumerator **WIFI\_VND\_IE\_TYPE\_ASSOC\_REQ**

enumerator **WIFI\_VND\_IE\_TYPE\_ASSOC\_RESP**

enum **wifi\_vendor\_ie\_id\_t**

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

*Values:*

enumerator **WIFI\_VND\_IE\_ID\_0**

enumerator **WIFI\_VND\_IE\_ID\_1**

enum **wifi\_phy\_mode\_t**

Operation Phymode.

*Values:*

enumerator **WIFI\_PHY\_MODE\_LR**  
PHY mode for Low Rate

enumerator **WIFI\_PHY\_MODE\_11B**  
PHY mode for 11b

enumerator **WIFI\_PHY\_MODE\_11G**  
PHY mode for 11g

enumerator **WIFI\_PHY\_MODE\_HT20**

PHY mode for Bandwidth HT20

enumerator **WIFI\_PHY\_MODE\_HT40**

PHY mode for Bandwidth HT40

enumerator **WIFI\_PHY\_MODE\_HE20**

PHY mode for Bandwidth HE20

enum **wifi\_promiscuous\_pkt\_type\_t**

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

*Values:*

enumerator **WIFI\_PKT\_MGMT**

Management frame, indicates 'buf' argument is *wifi\_promiscuous\_pkt\_t*

enumerator **WIFI\_PKT\_CTRL**

Control frame, indicates 'buf' argument is *wifi\_promiscuous\_pkt\_t*

enumerator **WIFI\_PKT\_DATA**

Data frame, indicates 'buf' argument is *wifi\_promiscuous\_pkt\_t*

enumerator **WIFI\_PKT\_MISC**

Other type, such as MIMO etc. 'buf' argument is *wifi\_promiscuous\_pkt\_t* but the payload is zero length.

enum **wifi\_ant\_mode\_t**

WiFi antenna mode.

*Values:*

enumerator **WIFI\_ANT\_MODE\_ANT0**

Enable WiFi antenna 0 only

enumerator **WIFI\_ANT\_MODE\_ANT1**

Enable WiFi antenna 1 only

enumerator **WIFI\_ANT\_MODE\_AUTO**

Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator **WIFI\_ANT\_MODE\_MAX**

Invalid WiFi enabled antenna

enum **wifi\_nan\_service\_type\_t**

NAN Services types.

*Values:*

enumerator **NAN\_PUBLISH\_SOLICITED**

Send unicast Publish frame to Subscribers that match the requirement

enumerator **NAN\_PUBLISH\_UNSOLICITED**

Send broadcast Publish frames in every Discovery Window(DW)

enumerator **NAN\_SUBSCRIBE\_ACTIVE**

Send broadcast Subscribe frames in every DW

enumerator **NAN\_SUBSCRIBE\_PASSIVE**

Passively listens to Publish frames

enum **wifi\_phy\_rate\_t**

WiFi PHY rate encodings.

*Values:*

enumerator **WIFI\_PHY\_RATE\_1M\_L**

1 Mbps with long preamble

enumerator **WIFI\_PHY\_RATE\_2M\_L**

2 Mbps with long preamble

enumerator **WIFI\_PHY\_RATE\_5M\_L**

5.5 Mbps with long preamble

enumerator **WIFI\_PHY\_RATE\_11M\_L**

11 Mbps with long preamble

enumerator **WIFI\_PHY\_RATE\_2M\_S**

2 Mbps with short preamble

enumerator **WIFI\_PHY\_RATE\_5M\_S**

5.5 Mbps with short preamble

enumerator **WIFI\_PHY\_RATE\_11M\_S**

11 Mbps with short preamble

enumerator **WIFI\_PHY\_RATE\_48M**

48 Mbps

enumerator **WIFI\_PHY\_RATE\_24M**

24 Mbps

enumerator **WIFI\_PHY\_RATE\_12M**

12 Mbps

enumerator **WIFI\_PHY\_RATE\_6M**

6 Mbps

enumerator **WIFI\_PHY\_RATE\_54M**

54 Mbps

enumerator **WIFI\_PHY\_RATE\_36M**

36 Mbps

enumerator **WIFI\_PHY\_RATE\_18M**

18 Mbps

enumerator **WIFI\_PHY\_RATE\_9M**

9 Mbps rate table and guard interval information for each MCS rate

enumerator **WIFI\_PHY\_RATE\_MCS0\_LGI**

MCS0 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS1\_LGI**

MCS1 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS2\_LGI**

MCS2 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS3\_LGI**

MCS3 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS4\_LGI**

MCS4 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS5\_LGI**

MCS5 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS6\_LGI**

MCS6 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS7\_LGI**

MCS7 with long GI

enumerator **WIFI\_PHY\_RATE\_MCS0\_SGI**

MCS0 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS1\_SGI**

MCS1 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS2\_SGI**

MCS2 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS3\_SGI**

MCS3 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS4\_SGI**

MCS4 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS5\_SGI**

MCS5 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS6\_SGI**

MCS6 with short GI

enumerator **WIFI\_PHY\_RATE\_MCS7\_SGI**

MCS7 with short GI

enumerator **WIFI\_PHY\_RATE\_LORA\_250K**

250 Kbps

enumerator **WIFI\_PHY\_RATE\_LORA\_500K**

500 Kbps

enumerator **WIFI\_PHY\_RATE\_MAX**

enum **wifi\_event\_t**

WiFi event declarations

*Values:*

enumerator **WIFI\_EVENT\_WIFI\_READY**

WiFi ready

enumerator **WIFI\_EVENT\_SCAN\_DONE**

Finished scanning AP

enumerator **WIFI\_EVENT\_STA\_START**

Station start

enumerator **WIFI\_EVENT\_STA\_STOP**

Station stop

enumerator **WIFI\_EVENT\_STA\_CONNECTED**

Station connected to AP

enumerator **WIFI\_EVENT\_STA\_DISCONNECTED**

Station disconnected from AP

enumerator **WIFI\_EVENT\_STA\_AUTHMODE\_CHANGE**

the auth mode of AP connected by device's station changed

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_SUCCESS**

Station wps succeeds in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_FAILED**

Station wps fails in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_TIMEOUT**

Station wps timeout in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_PIN**

Station wps pin code in enrollee mode

enumerator **WIFI\_EVENT\_STA\_WPS\_ER\_PBC\_OVERLAP**

Station wps overlap in enrollee mode

enumerator **WIFI\_EVENT\_AP\_START**

Soft-AP start

enumerator **WIFI\_EVENT\_AP\_STOP**

Soft-AP stop

enumerator **WIFI\_EVENT\_AP\_STACONNECTED**

a station connected to Soft-AP

enumerator **WIFI\_EVENT\_AP\_STADISCONNECTED**

a station disconnected from Soft-AP

enumerator **WIFI\_EVENT\_AP\_PROBEREQRCVD**

Receive probe request packet in soft-AP interface

enumerator **WIFI\_EVENT\_FTM\_REPORT**

Receive report of FTM procedure

enumerator **WIFI\_EVENT\_STA\_BSS\_RSSI\_LOW**

AP's RSSI crossed configured threshold

enumerator **WIFI\_EVENT\_ACTION\_TX\_STATUS**

Status indication of Action Tx operation

enumerator **WIFI\_EVENT\_ROC\_DONE**

Remain-on-Channel operation complete

enumerator **WIFI\_EVENT\_STA\_BEACON\_TIMEOUT**

Station beacon timeout

enumerator **WIFI\_EVENT\_CONNECTIONLESS\_MODULE\_WAKE\_INTERVAL\_START**

Connectionless module wake interval start

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_SUCCESS**

Soft-AP wps succeeds in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_FAILED**

Soft-AP wps fails in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_TIMEOUT**

Soft-AP wps timeout in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_PIN**

Soft-AP wps pin code in registrar mode

enumerator **WIFI\_EVENT\_AP\_WPS\_RG\_PBC\_OVERLAP**

Soft-AP wps overlap in registrar mode

enumerator **WIFI\_EVENT\_ITWT\_SETUP**

iTWT setup

enumerator **WIFI\_EVENT\_ITWT\_TEARDOWN**

iTWT teardown

enumerator **WIFI\_EVENT\_ITWT\_PROBE**

iTWT probe

enumerator **WIFI\_EVENT\_ITWT\_SUSPEND**

iTWT suspend

enumerator **WIFI\_EVENT\_TWT\_WAKEUP**

TWT wakeup

enumerator **WIFI\_EVENT\_NAN\_STARTED**

NAN Discovery has started

enumerator **WIFI\_EVENT\_NAN\_STOPPED**

NAN Discovery has stopped

enumerator **WIFI\_EVENT\_NAN\_SVC\_MATCH**

NAN Service Discovery match found

enumerator **WIFI\_EVENT\_NAN\_REPLIED**

Replied to a NAN peer with Service Discovery match

enumerator **WIFI\_EVENT\_NAN\_RECEIVE**

Received a Follow-up message

enumerator **WIFI\_EVENT\_NDP\_INDICATION**

Received NDP Request from a NAN Peer

enumerator **WIFI\_EVENT\_NDP\_CONFIRM**

NDP Confirm Indication

enumerator **WIFI\_EVENT\_NDP\_TERMINATED**

NAN Datapath terminated indication

enumerator **WIFI\_EVENT\_MAX**

Invalid WiFi event ID

enum **wifi\_event\_sta\_wps\_fail\_reason\_t**

Argument structure for WIFI\_EVENT\_STA\_WPS\_ER\_FAILED event

*Values:*

enumerator **WPS\_FAIL\_REASON\_NORMAL**

WPS normal fail reason

enumerator **WPS\_FAIL\_REASON\_RECV\_M2D**

WPS receive M2D frame

enumerator **WPS\_FAIL\_REASON\_MAX**

enum **wifi\_ftm\_status\_t**

FTM operation status types.

*Values:*

enumerator **FTM\_STATUS\_SUCCESS**

FTM exchange is successful

enumerator **FTM\_STATUS\_UNSUPPORTED**

Peer does not support FTM

enumerator **FTM\_STATUS\_CONF\_REJECTED**

Peer rejected FTM configuration in FTM Request

enumerator **FTM\_STATUS\_NO\_RESPONSE**

Peer did not respond to FTM Requests

enumerator **FTM\_STATUS\_FAIL**

Unknown error during FTM exchange

enumerator **FTM\_STATUS\_NO\_VALID\_MSMT**

FTM session did not result in any valid measurements

enumerator **FTM\_STATUS\_USER\_TERM**

User triggered termination

enum **wps\_fail\_reason\_t**

*Values:*

enumerator **WPS\_AP\_FAIL\_REASON\_NORMAL**

WPS normal fail reason

enumerator **WPS\_AP\_FAIL\_REASON\_CONFIG**

WPS failed due to incorrect config

enumerator **WPS\_AP\_FAIL\_REASON\_AUTH**

WPS failed during auth

enumerator **WPS\_AP\_FAIL\_REASON\_MAX**

## Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_eap\\_client.h](#)

## Functions

*esp\_err\_t* **esp\_wifi\_sta\_enterprise\_enable** (void)

Enable EAP authentication(WiFi Enterprise) for the station mode.

This function enables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is enabled, the ESP device will attempt to authenticate with the configured EAP credentials when connecting to a secure Wi-Fi network.

---

**Note:** Before calling this function, ensure that the Wi-Fi configuration and EAP credentials (such as username and password) have been properly set using the appropriate configuration APIs.

---

### Returns

- **ESP\_OK**: EAP authentication enabled successfully.
- **ESP\_ERR\_NO\_MEM**: Failed to enable EAP authentication due to memory allocation failure.

*esp\_err\_t* **esp\_wifi\_sta\_enterprise\_disable** (void)

Disable EAP authentication(WiFi Enterprise) for the station mode.

This function disables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is disabled, the ESP device will not attempt to authenticate using EAP credentials when connecting to a secure Wi-Fi network.

---

**Note:** Disabling EAP authentication may cause the device to connect to the Wi-Fi network using other available authentication methods, if configured using `esp_wifi_set_config()`.

---

### Returns

- **ESP\_OK**: EAP authentication disabled successfully.
- **ESP\_ERR\_INVALID\_STATE**: EAP client is in an invalid state for disabling.

*esp\_err\_t* **esp\_eap\_client\_set\_identity** (const unsigned char \*identity, int len)

Set identity for PEAP/TTLS authentication method.

This function sets the identity to be used during PEAP/TTLS authentication.

### Parameters

- **identity** -- **[in]** Pointer to the identity data.
- **len** -- **[in]** Length of the identity data (limited to 1~127 bytes).

### Returns

- **ESP\_OK**: The identity was set successfully.
- **ESP\_ERR\_INVALID\_ARG**: Invalid argument (len <= 0 or len >= 128).
- **ESP\_ERR\_NO\_MEM**: Memory allocation failure.

void **esp\_eap\_client\_clear\_identity** (void)

Clear the previously set identity for PEAP/TTLS authentication.

This function clears the identity that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured identity during the authentication process.

*esp\_err\_t* **esp\_eap\_client\_set\_username** (const unsigned char \*username, int len)

Set username for PEAP/TTLS authentication method.

This function sets the username to be used during PEAP/TTLS authentication.

#### Parameters

- **username** -- **[in]** Pointer to the username data.
- **len** -- **[in]** Length of the username data (limited to 1~127 bytes).

#### Returns

- ESP\_OK: The username was set successfully.
- ESP\_ERR\_INVALID\_ARG: Failed due to an invalid argument (len <= 0 or len >= 128).
- ESP\_ERR\_NO\_MEM: Failed due to memory allocation failure.

void **esp\_eap\_client\_clear\_username** (void)

Clear username for PEAP/TTLS method.

This function clears the previously set username for the EAP client.

*esp\_err\_t* **esp\_eap\_client\_set\_password** (const unsigned char \*password, int len)

Set password for PEAP/TTLS authentication method.

This function sets the password to be used during PEAP/TTLS authentication.

#### Parameters

- **password** -- **[in]** Pointer to the password data.
- **len** -- **[in]** Length of the password data (len > 0).

#### Returns

- ESP\_OK: The password was set successfully.
- ESP\_ERR\_INVALID\_ARG: Failed due to an invalid argument (len <= 0).
- ESP\_ERR\_NO\_MEM: Failed due to memory allocation failure.

void **esp\_eap\_client\_clear\_password** (void)

Clear password for PEAP/TTLS method.

This function clears the previously set password for the EAP client.

*esp\_err\_t* **esp\_eap\_client\_set\_new\_password** (const unsigned char \*new\_password, int len)

Set a new password for MSCHAPv2 authentication method.

This function sets the new password to be used during MSCHAPv2 authentication. The new password is used to substitute the old password when an eap-mschapv2 failure request message with error code ERROR\_PASSWD\_EXPIRED is received.

#### Parameters

- **new\_password** -- **[in]** Pointer to the new password data.
- **len** -- **[in]** Length of the new password data.

#### Returns

- ESP\_OK: The new password was set successfully.
- ESP\_ERR\_INVALID\_ARG: Failed due to an invalid argument (len <= 0).
- ESP\_ERR\_NO\_MEM: Failed due to memory allocation failure.

void **esp\_eap\_client\_clear\_new\_password** (void)

Clear new password for MSCHAPv2 method.

This function clears the previously set new password for the EAP client.

*esp\_err\_t* **esp\_eap\_client\_set\_ca\_cert** (const unsigned char \*ca\_cert, int ca\_cert\_len)

Set CA certificate for EAP authentication.

This function sets the Certificate Authority (CA) certificate to be used during EAP authentication. The CA certificate is passed to the EAP client module through a global pointer.

#### Parameters

- **ca\_cert** -- [in] Pointer to the CA certificate data.
- **ca\_cert\_len** -- [in] Length of the CA certificate data.

#### Returns

- ESP\_OK: The CA certificate was set successfully.

void **esp\_eap\_client\_clear\_ca\_cert** (void)

Clear the previously set Certificate Authority (CA) certificate for EAP authentication.

This function clears the CA certificate that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured CA certificate during the authentication process.

*esp\_err\_t* **esp\_eap\_client\_set\_certificate\_and\_key** (const unsigned char \*client\_cert, int client\_cert\_len, const unsigned char \*private\_key, int private\_key\_len, const unsigned char \*private\_key\_password, int private\_key\_passwd\_len)

Set client certificate and private key for EAP authentication.

This function sets the client certificate and private key to be used during authentication. Optionally, a private key password can be provided for encrypted private keys.

**Attention** 1. The client certificate, private key, and private key password are provided as pointers to the respective data arrays.

**Attention** 2. The client\_cert, private\_key, and private\_key\_password should be zero-terminated.

#### Parameters

- **client\_cert** -- [in] Pointer to the client certificate data.
- **client\_cert\_len** -- [in] Length of the client certificate data.
- **private\_key** -- [in] Pointer to the private key data.
- **private\_key\_len** -- [in] Length of the private key data (limited to 1~4096 bytes).
- **private\_key\_password** -- [in] Pointer to the private key password data (optional).
- **private\_key\_passwd\_len** -- [in] Length of the private key password data (can be 0 for no password).

#### Returns

- ESP\_OK: The certificate, private key, and password (if provided) were set successfully.

void **esp\_eap\_client\_clear\_certificate\_and\_key** (void)

Clear the previously set client certificate and private key for EAP authentication.

This function clears the client certificate and private key that were previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured certificate and private key during the authentication process.

*esp\_err\_t* **esp\_eap\_client\_set\_disable\_time\_check** (bool disable)

Set EAP client certificates time check (disable or not).

This function enables or disables the time check for EAP client certificates. When disabled, the certificates' expiration time will not be checked during the authentication process.

**Parameters** **disable** -- [in] True to disable EAP client certificates time check, false to enable it.

#### Returns

- ESP\_OK: The EAP client certificates time check setting was updated successfully.

*esp\_err\_t* **esp\_eap\_client\_get\_disable\_time\_check** (bool \*disable)

Get EAP client certificates time check status.

This function retrieves the current status of the EAP client certificates time check.

**Parameters** **disable** -- **[out]** Pointer to a boolean variable to store the disable status.

**Returns**

- ESP\_OK: The status of EAP client certificates time check was retrieved successfully.

*esp\_err\_t* **esp\_eap\_client\_set\_ttls\_phase2\_method** (*esp\_eap\_ttls\_phase2\_types* type)

Set EAP-TTLS phase 2 method.

This function sets the phase 2 method to be used during EAP-TTLS authentication.

**Parameters** **type** -- **[in]** The type of phase 2 method to be used (e.g., EAP, MSCHAPv2, MSCHAP, PAP, CHAP).

**Returns**

- ESP\_OK: The EAP-TTLS phase 2 method was set successfully.

*esp\_err\_t* **esp\_eap\_client\_set\_suiteb\_192bit\_certification** (bool enable)

Enable or disable Suite-B 192-bit certification checks.

This function enables or disables the 192-bit Suite-B certification checks during EAP-TLS authentication. Suite-B is a set of cryptographic algorithms which generally are considered more secure.

**Parameters** **enable** -- **[in]** True to enable 192-bit Suite-B certification checks, false to disable it.

**Returns**

- ESP\_OK: The 192-bit Suite-B certification checks were set successfully.

*esp\_err\_t* **esp\_eap\_client\_set\_pac\_file** (const unsigned char \*pac\_file, int pac\_file\_len)

Set the PAC (Protected Access Credential) file for EAP-FAST authentication.

EAP-FAST requires a PAC file that contains the client's credentials.

**Attention** 1. For files read from the file system, length has to be decremented by 1 byte.

**Attention** 2. Disabling the ESP\_WIFI\_MBEDTLS\_TLS\_CLIENT config is required to use EAP-FAST.

**Parameters**

- **pac\_file** -- **[in]** Pointer to the PAC file buffer.
- **pac\_file\_len** -- **[in]** Length of the PAC file buffer.

**Returns**

- ESP\_OK: The PAC file for EAP-FAST authentication was set successfully.

*esp\_err\_t* **esp\_eap\_client\_set\_fast\_params** (*esp\_eap\_fast\_config* config)

Set the parameters for EAP-FAST Phase 1 authentication.

EAP-FAST supports Fast Provisioning, where clients can be authenticated faster using precomputed keys (PAC). This function allows configuring parameters for Fast Provisioning.

**Attention** 1. Disabling the ESP\_WIFI\_MBEDTLS\_TLS\_CLIENT config is required to use EAP-FAST.

**Parameters** **config** -- **[in]** Configuration structure with Fast Provisioning parameters.

**Returns**

- ESP\_OK: The parameters for EAP-FAST Phase 1 authentication were set successfully.

*esp\_err\_t* **esp\_eap\_client\_use\_default\_cert\_bundle** (bool use\_default\_bundle)

Use the default certificate bundle for EAP authentication.

By default, the EAP client uses a built-in certificate bundle for server verification. Enabling this option allows the use of the default certificate bundle.

**Parameters** `use_default_bundle` -- [in] True to use the default certificate bundle, false to use a custom bundle.

**Returns**

- `ESP_OK`: The option to use the default certificate bundle was set successfully.

## Structures

struct `esp_eap_fast_config`

Configuration settings for EAP-FAST (Extensible Authentication Protocol - Flexible Authentication via Secure Tunneling).

This structure defines the configuration options that can be used to customize the behavior of the EAP-FAST authentication protocol, specifically for Fast Provisioning and PAC (Protected Access Credential) handling.

## Public Members

int `fast_provisioning`

Enable or disable Fast Provisioning in EAP-FAST (0 = disabled, 1 = enabled)

int `fast_max_pac_list_len`

Maximum length of the PAC (Protected Access Credential) list

bool `fast_pac_format_binary`

Set to true for binary format PAC, false for ASCII format PAC

## Enumerations

enum `esp_eap_ttls_phase2_types`

Enumeration of phase 2 authentication types for EAP-TTLS.

This enumeration defines the supported phase 2 authentication methods that can be used in the EAP-TTLS (Extensible Authentication Protocol - Tunneled Transport Layer Security) protocol for the second authentication phase.

*Values:*

enumerator `ESP_EAP_TTLS_PHASE2_EAP`

EAP (Extensible Authentication Protocol)

enumerator `ESP_EAP_TTLS_PHASE2_MSCHAPV2`

MS-CHAPv2 (Microsoft Challenge Handshake Authentication Protocol - Version 2)

enumerator `ESP_EAP_TTLS_PHASE2_MSCHAP`

MS-CHAP (Microsoft Challenge Handshake Authentication Protocol)

enumerator `ESP_EAP_TTLS_PHASE2_PAP`

PAP (Password Authentication Protocol)

enumerator `ESP_EAP_TTLS_PHASE2_CHAP`

CHAP (Challenge Handshake Authentication Protocol)

## Header File

- `components/wpa_supplicant/esp_supplicant/include/esp_wps.h`

## Functions

`esp_err_t esp_wifi_wps_enable` (const `esp_wps_config_t` \*config)

Enable Wi-Fi WPS function.

**Parameters** `config` -- : WPS config to be used in connection

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_TYPE` : wps type is invalid
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on
- `ESP_FAIL` : wps initialization fails

`esp_err_t esp_wifi_wps_disable` (void)

Disable Wi-Fi WPS function and release resource it taken.

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on

`esp_err_t esp_wifi_wps_start` (int timeout\_ms)

Start WPS session.

**Attention** WPS can only be used when station is enabled. WPS needs to be enabled first for using this API.

**Parameters** `timeout_ms` -- : deprecated: This argument's value will have not effect in functionality of API. The argument will be removed in future. The app should start WPS and register for WIFI events to get the status. WPS status is updated through WPS events. See `wifi_event_t` enum for more info.

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_TYPE` : wps type is invalid
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on
- `ESP_ERR_WIFI_WPS_SM` : wps state machine is not initialized
- `ESP_FAIL` : wps initialization fails

`esp_err_t esp_wifi_ap_wps_enable` (const `esp_wps_config_t` \*config)

Enable Wi-Fi AP WPS function.

**Attention** WPS can only be used when softAP is enabled.

**Parameters** `config` -- wps configuration to be used.

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_TYPE` : wps type is invalid
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on
- `ESP_FAIL` : wps initialization fails

`esp_err_t esp_wifi_ap_wps_disable` (void)

Disable Wi-Fi SoftAP WPS function and release resource it taken.

### Returns

- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on

*esp\_err\_t* **esp\_wifi\_ap\_wps\_start** (const unsigned char \*pin)

WPS starts to work.

**Attention** WPS can only be used when softAP is enabled.

**Parameters** **pin** -- : Pin to be used in case of WPS mode is pin. If Pin is not provided, device will use the pin generated/provided during *esp\_wifi\_ap\_wps\_enable()* and reported in `WIFI_EVENT_AP_WPS_RG_PIN`

**Returns**

- `ESP_OK` : succeed
- `ESP_ERR_WIFI_WPS_TYPE` : wps type is invalid
- `ESP_ERR_WIFI_WPS_MODE` : wifi is not in station mode or sniffer mode is on
- `ESP_ERR_WIFI_WPS_SM` : wps state machine is not initialized
- `ESP_FAIL` : wps initialization fails

## Structures

struct **wps\_factory\_information\_t**

Structure representing WPS factory information for ESP device.

This structure holds various strings representing factory information for a device, such as the manufacturer, model number, model name, and device name. Each string is a null-terminated character array. If any of the strings are empty, the default values are used.

### Public Members

char **manufacturer**[WPS\_MAX\_MANUFACTURER\_LEN]

Manufacturer of the device. If empty, the default manufacturer is used.

char **model\_number**[WPS\_MAX\_MODEL\_NUMBER\_LEN]

Model number of the device. If empty, the default model number is used.

char **model\_name**[WPS\_MAX\_MODEL\_NAME\_LEN]

Model name of the device. If empty, the default model name is used.

char **device\_name**[WPS\_MAX\_DEVICE\_NAME\_LEN]

Device name. If empty, the default device name is used.

struct **esp\_wps\_config\_t**

Structure representing configuration settings for WPS (Wi-Fi Protected Setup).

This structure encapsulates various configuration settings for WPS, including the WPS type (PBC or PIN), factory information that will be shown in the WPS Information Element (IE), and a PIN if the WPS type is set to PIN.

### Public Members

*wps\_type\_t* **wps\_type**

The type of WPS to be used (PBC or PIN).

***wps\_factory\_information\_t* factory\_info**

Factory information to be shown in the WPS Information Element (IE). Vendor can choose to display their own information.

char **pin**[PIN\_LEN]

WPS PIN (Personal Identification Number) used when `wps_type` is set to `WPS_TYPE_PIN`.

**Macros****ESP\_ERR\_WIFI\_REGISTRAR**

WPS registrar is not supported

**ESP\_ERR\_WIFI\_WPS\_TYPE**

WPS type error

**ESP\_ERR\_WIFI\_WPS\_SM**

WPS state machine is not initialized

**WPS\_MAX\_MANUFACTURER\_LEN**

Maximum length of the manufacturer name in WPS information

**WPS\_MAX\_MODEL\_NUMBER\_LEN**

Maximum length of the model number in WPS information

**WPS\_MAX\_MODEL\_NAME\_LEN**

Maximum length of the model name in WPS information

**WPS\_MAX\_DEVICE\_NAME\_LEN**

Maximum length of the device name in WPS information

**PIN\_LEN**

The length of the WPS PIN (Personal Identification Number).

**WPS\_CONFIG\_INIT\_DEFAULT** (type)

Initialize a default WPS configuration structure with specified WPS type.

This macro initializes a *esp\_wps\_config\_t* structure with default values for the specified WPS type. It sets the WPS type, factory information (including default manufacturer, model number, model name, and device name), and a default PIN value if applicable.

**Parameters**

- **type** -- The WPS type to be used (PBC or PIN).

**Returns** An initialized *esp\_wps\_config\_t* structure with the specified WPS type and default values.

**Type Definitions**

```
typedef enum wps_type wps_type_t
```

Enumeration of WPS (Wi-Fi Protected Setup) types.

## Enumerations

enum **wps\_type**

Enumeration of WPS (Wi-Fi Protected Setup) types.

*Values:*

enumerator **WPS\_TYPE\_DISABLE**

WPS is disabled

enumerator **WPS\_TYPE\_PBC**

WPS Push Button Configuration method

enumerator **WPS\_TYPE\_PIN**

WPS PIN (Personal Identification Number) method

enumerator **WPS\_TYPE\_MAX**

Maximum value for WPS type enumeration

## Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_rrm.h](#)

## Functions

int **esp\_rrm\_send\_neighbor\_rep\_request** (*neighbor\_rep\_request\_cb* cb, void \*cb\_ctx)

Send Radio measurement neighbor report request to connected AP.

### Parameters

- **cb** -- callback function for neighbor report
- **cb\_ctx** -- callback context

### Returns

- 0: success
- -1: AP does not support RRM
- -2: station not connected to AP

bool **esp\_rrm\_is\_rrm\_supported\_connection** (void)

Check RRM capability of connected AP.

### Returns

- true: AP supports RRM
- false: AP does not support RRM or station not connected to AP

## Type Definitions

typedef void (\***neighbor\_rep\_request\_cb**)(void \*ctx, const uint8\_t \*report, size\_t report\_len)

Callback function type to get neighbor report.

**Param ctx** neighbor report context

**Param report** neighbor report

**Param report\_len** neighbor report length

**Return**

- void

## Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_wnm.h](#)

## Functions

int **esp\_wmm\_send\_bss\_transition\_mgmt\_query** (enum *btm\_query\_reason* query\_reason, const char \*btm\_candidates, int cand\_list)

Send bss transition query to connected AP.

### Parameters

- **query\_reason** -- reason for sending query
- **btm\_candidates** -- btm candidates list if available
- **cand\_list** -- whether candidate list to be included from scan results available in supplicant's cache.

### Returns

- 0: success
- -1: AP does not support BTM
- -2: station not connected to AP

bool **esp\_wmm\_is\_btm\_supported\_connection** (void)

Check bss transition capability of connected AP.

### Returns

- true: AP supports BTM
- false: AP does not support BTM or station not connected to AP

## Enumerations

enum **btm\_query\_reason**

enum btm\_query\_reason: Reason code for sending btm query

*Values:*

enumerator **REASON\_UNSPECIFIED**

enumerator **REASON\_FRAME\_LOSS**

enumerator **REASON\_DELAY**

enumerator **REASON\_BANDWIDTH**

enumerator **REASON\_LOAD\_BALANCE**

enumerator **REASON\_RSSI**

enumerator **REASON\_RETRANSMISSIONS**

enumerator **REASON\_INTERFERENCE**

enumerator **REASON\_GRAY\_ZONE**

enumerator **REASON\_PREMIUM\_AP**

## Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_mbo.h](#)

## Functions

int **esp\_mbo\_update\_non\_pref\_chan** (struct *non\_pref\_chan\_s* \*non\_pref\_chan)

Update channel preference for MBO IE.

**Parameters** *non\_pref\_chan* -- Non preference channel list

**Returns**

- 0: success else failure

## Structures

struct **non\_pref\_chan**

Structure representing a non-preferred channel in a wireless network.

This structure encapsulates information about a non-preferred channel including the reason for its non-preference, the operating class, channel number, and preference level.

## Public Members

enum *non\_pref\_chan\_reason* **reason**

Reason for the channel being non-preferred

uint8\_t **oper\_class**

Operating class of the channel

uint8\_t **chan**

Channel number

uint8\_t **preference**

Preference level of the channel

struct **non\_pref\_chan\_s**

Structure representing a list of non-preferred channels in a wireless network.

This structure encapsulates information about a list of non-preferred channels including the number of non-preferred channels and an array of structures representing individual non-preferred channels.

## Public Members

size\_t **non\_pref\_chan\_num**

Number of non-preferred channels in the list

struct *non\_pref\_chan* **chan** []

Array of structures representing individual non-preferred channels

## Enumerations

enum **non\_pref\_chan\_reason**

Enumeration of reasons for a channel being non-preferred in a wireless network.

This enumeration defines various reasons why a specific channel might be considered non-preferred in a wireless network configuration.

*Values:*

enumerator **NON\_PREF\_CHAN\_REASON\_UNSPECIFIED**

Unspecified reason for non-preference

enumerator **NON\_PREF\_CHAN\_REASON\_RSSI**

Non-preferred due to low RSSI (Received Signal Strength Indication)

enumerator **NON\_PREF\_CHAN\_REASON\_EXT\_INTERFERENCE**

Non-preferred due to external interference

enumerator **NON\_PREF\_CHAN\_REASON\_INT\_INTERFERENCE**

Non-preferred due to internal interference

### Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance's official page on [Easy Connect](#) for more information.

ESP32-C2 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-C2 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32-C2 using a supported smartphone: [wifi/wifi\\_easy\\_connect/dpp-enrollee](#).

### API Reference

#### Header File

- [components/wpa\\_supplicant/esp\\_supplicant/include/esp\\_dpp.h](#)

#### Functions

`esp_err_t esp_supp_dpp_init(esp_supp_dpp_event_cb_t evt_cb)`

Initialize DPP Supplicant.

Starts DPP Supplicant **and** initializes related Data Structures.

return

- ESP\_OK: Success
- ESP\_FAIL: Failure

**Parameters** `evt_cb` -- Callback function to receive DPP related events

void `esp_supp_dpp_deinit` (void)

De-initialize DPP Supplicant.

Frees memory **from** DPP Supplicant Data Structures.

*esp\_err\_t* `esp_supp_dpp_bootstrap_gen` (const char \*chan\_list, *esp\_supp\_dpp\_bootstrap\_t* type, const char \*key, const char \*info)

Generates Bootstrap Information as an Enrollee.

Generates Out Of Band Bootstrap information **as** an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

**Parameters**

- **chan\_list** -- List of channels device will be available on for listening
- **type** -- Bootstrap method type, only QR Code method is supported for now.
- **key** -- (Optional) 32 byte Raw Private Key for generating a Bootstrapping Public Key
- **info** -- (Optional) Ancilliary Device Information like Serial Number

**Returns**

- ESP\_OK: Success
- ESP\_FAIL: Failure

*esp\_err\_t* `esp_supp_dpp_start_listen` (void)

Start listening on Channels provided during `esp_supp_dpp_bootstrap_gen`.

Listens on every Channel **from** Channel List **for** a pre-defined wait time.

**Returns**

- ESP\_OK: Success
- ESP\_FAIL: Generic Failure
- ESP\_ERR\_INVALID\_STATE: ROC attempted before WiFi is started
- ESP\_ERR\_NO\_MEM: Memory allocation failed while posting ROC request

void `esp_supp_dpp_stop_listen` (void)

Stop listening on Channels.

Stops listening on Channels **and** cancels ongoing listen operation.

**Macros**

**ESP\_DPP\_AUTH\_TIMEOUT\_SECS**

**ESP\_ERR\_DPP\_FAILURE**

Generic failure during DPP Operation

**ESP\_ERR\_DPP\_TX\_FAILURE**

DPP Frame Tx failed OR not Acked

**ESP\_ERR\_DPP\_INVALID\_ATTR**

Encountered invalid DPP Attribute

**ESP\_ERR\_DPP\_AUTH\_TIMEOUT**

DPP Auth response was not recieved in time

**Type Definitions**

```
typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t
```

Types of Bootstrap Methods for DPP.

```
typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t evt, void *data)
```

Callback function for receiving DPP Events from Supplicant.

Callback function will be called **with** DPP related information.

**Param evt** DPP event ID

**Param data** Event data payload

**Enumerations**

```
enum dpp_bootstrap_type
```

Types of Bootstrap Methods for DPP.

*Values:*

```
enumerator DPP_BOOTSTRAP_QR_CODE
```

QR Code Method

```
enumerator DPP_BOOTSTRAP_PKEX
```

Proof of Knowledge Method

```
enumerator DPP_BOOTSTRAP_NFC_URI
```

NFC URI record Method

```
enum esp_supp_dpp_event_t
```

Types of Callback Events received from DPP Supplicant.

*Values:*

```
enumerator ESP_SUPP_DPP_URI_READY
```

URI is ready through Bootstrapping

```
enumerator ESP_SUPP_DPP_CFG_RECVD
```

Config received via DPP Authentication

enumerator **ESP\_SUPP\_DPP\_FAIL**

DPP Authentication failure

Code examples for the Wi-Fi API are provided in the [wifi](#) directory of ESP-IDF examples.

## 2.5.2 Ethernet

### Ethernet

**Overview** ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. *Basic Ethernet Concepts*
2. *Configure MAC and PHY*
3. *Connect Driver to TCP/IP Stack*
4. *Misc Control of Ethernet Driver*

**Basic Ethernet Concepts** Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low-power applications. However, with ubiquitous deployment, internet connectivity, high data rates, and limitless-range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, a data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown below:

**Preamble and Start-of-Frame Delimiter** The preamble contains seven bytes of 55H. It allows the receiver to lock onto the stream of data before the actual frame arrives.

The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

**Destination Address** The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multicast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not.

Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multicast address, i.e. FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a unicast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or unicast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

Fig. 2: Ethernet Data Frame Format

**Source Address** The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. For more information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type/Length** The type/length field is a 2-byte field. If the value in this field is  $\leq 1500$  (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is  $\geq 1536$ , it represents the protocol the following packet data belongs to. The followings are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol's specification when transmitting packets.

**Payload** The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes.

This field contains the client data, such as an IP datagram.

**Padding and FCS** The padding field is a variable length field added to meet the IEEE 802.3 specification requirements when small data payloads are used.

The DA, SA, type, payload, and padding of an Ethernet packet must be no smaller than 60 bytes in total. If the required 4-byte FCS field is added, packets must be no smaller than 64 bytes. If the payload field is less than 46-byte long, a padding field is required.

The FCS field is a 4-byte field that contains an industry-standard 32-bit CRC calculated with the data from the DA, SA, type, payload, and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

---

**Note:** Besides the basic data frame described above, there're two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN-tagged frames. They're not supported in ESP-IDF.

---

**Configure MAC and PHY** The Ethernet driver is composed of two parts: MAC and PHY.

You need to set up the necessary parameters for MAC and PHY respectively based on your Ethernet board design, and then combine the two together to complete the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `eth_mac_config_t::sw_reset_timeout_ms`: software reset timeout value, in milliseconds. Typically, MAC reset should be finished within 100 ms.
- `eth_mac_config_t::rx_task_stack_size` and `eth_mac_config_t::rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets. These two parameters are used to set the stack size and priority of the task.
- `eth_mac_config_t::flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR'd with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when the cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

Configuration for PHY is described in `eth_phy_config_t`, including:

- `eth_phy_config_t::phy_addr`: multiple PHY devices can share the same SMI bus, so each PHY needs a unique address. Usually, this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- `eth_phy_config_t::reset_timeout_ms`: reset timeout value, in milliseconds. Typically, PHY reset should be finished within 100 ms.
- `eth_phy_config_t::autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. The Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `eth_phy_config_t::reset_gpio_num`: if your board also connects the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

**Create MAC and PHY Instance** The Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of the two.

**SPI-Ethernet Module**

```

eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG();           // apply default
↳common MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG();           // apply default PHY
↳configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR;                // alter the PHY
↳address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO;     // alter the GPIO
↳used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt-driven)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Configure SPI device
spi_device_interface_config_t spi_devcfg = {
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(CONFIG_EXAMPLE_ETH_
↳SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(&phy_config);

```

**Note:**

- When creating MAC and PHY instances for SPI-Ethernet modules (e.g. DM9051), the constructor function must have the same suffix (e.g. `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we don't have other choices but the integrated PHY.
- The SPI device configuration (i.e. `spi_device_interface_config_t`) may slightly differ for other Ethernet modules or to meet SPI timing on specific PCB. Please check out your module's specs and the examples in ESP-IDF.

**Install Driver** To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in `esp_eth_config_t`:

- `esp_eth_config_t::mac`: instance that created from MAC generator (e.g. `esp_eth_mac_new_esp32()`).
- `esp_eth_config_t::phy`: instance that created from PHY generator (e.g. `esp_eth_phy_new_ip101()`).
- `esp_eth_config_t::check_link_period_ms`: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- `esp_eth_config_t::stack_input`: In most Ethernet IoT applications, any Ethernet frame received by a driver should be passed to the upper layer (e.g. TCP/IP stack). This field is set to a function that is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- `esp_eth_config_t::on_lowlevel_init_done` and `esp_eth_config_t::on_lowlevel_deinit_done`: These two fields are used to specify the hooks which get invoked when low-level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver
↳configuration
esp_eth_handle_t eth_handle = NULL; // after the driver is installed, we will get
↳the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

The Ethernet driver also includes an event-driven model, which will send useful and important events to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to [ESP Event](#).

```
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base,
                             int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
        case ETHERNET_EVENT_CONNECTED:
            esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
            ESP_LOGI(TAG, "Ethernet Link Up");
            ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x",
                    mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
↳addr[4], mac_addr[5]);
            break;
        case ETHERNET_EVENT_DISCONNECTED:
            ESP_LOGI(TAG, "Ethernet Link Down");
            break;
        case ETHERNET_EVENT_START:
            ESP_LOGI(TAG, "Ethernet Started");
            break;
        case ETHERNET_EVENT_STOP:
            ESP_LOGI(TAG, "Ethernet Stopped");
            break;
        default:
            break;
    }
}

esp_event_loop_create_default(); // create a default event loop that runs in the
↳background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);
↳
↳// register Ethernet event handler (to deal with user-specific stuff when events
↳like link up/down happened)
```

**Start Ethernet Driver** After driver installation, we can start Ethernet immediately.

```
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Connect Driver to TCP/IP Stack** Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we're still on level 2 (i.e. Data Link Layer). While we can detect link up and down events and gain MAC address in user space, it's infeasible to obtain the IP address, let alone send an HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP. For more information about it, please refer to [LwIP](#).

To connect the Ethernet driver to TCP/IP stack, follow these three steps:

1. Create a network interface for the Ethernet driver
2. Attach the network interface to the Ethernet driver

### 3. Register IP event handlers

For more information about the network interface, please refer to [Network Interface](#).

```

/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
                                int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(&ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(&ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(&ip_info->gw));
    ESP_LOGI(TAG, "~~~~~");
}

esp_netif_init(); // Initialize TCP/IP network interface (should be called only
↳once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network
↳interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for
↳Ethernet driver

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach
↳Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler,
↳NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine

```

**Warning:** It is recommended to fully initialize the Ethernet driver and network interface before registering the user's Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior to starting the Ethernet driver. Such an approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface so the system is in the expected state when executing the user's handlers.

**Misc Control of Ethernet Driver** The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```

/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x",
          mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_
↳addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);

```

**Flow Control** Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer

end can accept it. The ethernet flow control mechanism allows the receiving node to signal the sender requesting the suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After the Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing that should be kept in mind is that the pause frame ability will be advertised to the peer end by PHY during auto-negotiation. The Ethernet driver sends a pause frame only when both sides of the link support it.

### Application Examples

- Ethernet basic example: [ethernet/basic](#)
- Ethernet iperf example: [ethernet/iperf](#)
- Ethernet to Wi-Fi AP "router": [ethernet/eth2ap](#)
- Most protocol examples should also work for Ethernet: [protocols](#)

### Advanced Topics

**Custom PHY Driver** There are multiple PHY manufacturers with wide portfolios of chips available. The ESP-IDF already supports several PHY chips however one can easily get to a point where none of them satisfies the user's actual needs due to price, features, stock availability, etc.

Luckily, a management interface between EMAC and PHY is standardized by IEEE 802.3 in Section 22.2.4 Management Functions. It defines provisions of the so-called "MII Management Interface" to control the PHY and gather status from the PHY. A set of management registers is defined to control chip behavior, link properties, auto-negotiation configuration, etc. This basic management functionality is addressed by [esp\\_eth/src/esp\\_eth\\_phy\\_802\\_3.c](#) in ESP-IDF and so it makes the creation of a new custom PHY chip driver quite a simple task.

---

**Note:** Always consult with PHY datasheet since some PHY chips may not comply with IEEE 802.3, Section 22.2.4. It does not mean you are not able to create a custom PHY driver, it will just require more effort. You will have to define all PHY management functions.

---

The majority of PHY management functionality required by the ESP-IDF Ethernet driver is covered by the [esp\\_eth/src/esp\\_eth\\_phy\\_802\\_3.c](#). However, the following may require developing chip-specific management functions:

- Link status which is almost always chip-specific
- Chip initialization, even though not strictly required, should be customized to at least ensure that the expected chip is used
- Chip-specific features configuration

#### Steps to create a custom PHY driver:

1. Define vendor-specific registry layout based on the PHY datasheet. See [esp\\_eth/src/esp\\_eth\\_phy\\_ip101.c](#) as an example.
2. Prepare derived PHY management object info structure which:
  - must contain at least parent IEEE 802.3 [phy\\_802\\_3\\_t](#) object
  - optionally contain additional variables needed to support non-IEEE 802.3 or customized functionality. See [esp\\_eth/src/esp\\_eth\\_phy\\_ksz80xx.c](#) as an example.
3. Define chip-specific management call-back functions.

4. Initialize parent IEEE 802.3 object and re-assign chip-specific management call-back functions.

Once you finish the new custom PHY driver implementation, consider sharing it among other users via [IDF Component Registry](#).

## API Reference

### Header File

- [components/esp\\_eth/include/esp\\_eth.h](#)

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_driver.h](#)

### Functions

*esp\_err\_t* **esp\_eth\_driver\_install** (const *esp\_eth\_config\_t* \*config, *esp\_eth\_handle\_t* \*out\_hdl)

Install Ethernet driver.

#### Parameters

- **config** -- **[in]** configuration of the Ethernet driver
- **out\_hdl** -- **[out]** handle of Ethernet driver

#### Returns

- ESP\_OK: install esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: install esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_NO\_MEM: install esp\_eth driver failed because there's no memory for driver
- ESP\_FAIL: install esp\_eth driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_driver\_uninstall** (*esp\_eth\_handle\_t* hdl)

Uninstall Ethernet driver.

---

**Note:** It's not recommended to uninstall Ethernet driver unless it won't get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

---

**Parameters** **hdl** -- **[in]** handle of Ethernet driver

#### Returns

- ESP\_OK: uninstall esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: uninstall esp\_eth driver failed because of some invalid argument
- ESP\_ERR\_INVALID\_STATE: uninstall esp\_eth driver failed because it has more than one reference
- ESP\_FAIL: uninstall esp\_eth driver failed because some other error occurred

*esp\_err\_t* **esp\_eth\_start** (*esp\_eth\_handle\_t* hdl)

Start Ethernet driver **ONLY** in standalone mode (i.e. without TCP/IP stack)

---

**Note:** This API will start driver state machine and internal software timer (for checking link status).

---

**Parameters** **hdl** -- **[in]** handle of Ethernet driver

#### Returns

- ESP\_OK: start esp\_eth driver successfully
- ESP\_ERR\_INVALID\_ARG: start esp\_eth driver failed because of some invalid argument

- `ESP_ERR_INVALID_STATE`: start `esp_eth` driver failed because driver has started already
- `ESP_FAIL`: start `esp_eth` driver failed because some other error occurred

`esp_err_t esp_eth_stop(esp_eth_handle_t hdl)`

Stop Ethernet driver.

---

**Note:** This function does the oppsite operation of `esp_eth_start`.

---

**Parameters** `hdl` -- [in] handle of Ethernet driver

**Returns**

- `ESP_OK`: stop `esp_eth` driver successfully
- `ESP_ERR_INVALID_ARG`: stop `esp_eth` driver failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: stop `esp_eth` driver failed because driver has not started yet
- `ESP_FAIL`: stop `esp_eth` driver failed because some other error occurred

`esp_err_t esp_eth_update_input_path(esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)`

Update Ethernet data input path (i.e. specify where to pass the input buffer)

---

**Note:** After install driver, Ethernet still don't know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

---

**Parameters**

- `hdl` -- [in] handle of Ethernet driver
- `stack_input` -- [in] function pointer, which does the actual process on incoming packets
- `priv` -- [in] private resource, which gets passed to `stack_input` callback without any modification

**Returns**

- `ESP_OK`: update input path successfully
- `ESP_ERR_INVALID_ARG`: update input path failed because of some invalid argument
- `ESP_FAIL`: update input path failed because some other error occurred

`esp_err_t esp_eth_transmit(esp_eth_handle_t hdl, void *buf, size_t length)`

General Transmit.

**Parameters**

- `hdl` -- [in] handle of Ethernet driver
- `buf` -- [in] buffer of the packet to transfer
- `length` -- [in] length of the buffer to transfer

**Returns**

- `ESP_OK`: transmit frame buffer successfully
- `ESP_ERR_INVALID_ARG`: transmit frame buffer failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: invalid driver state (e.i. driver is not started)
- `ESP_ERR_TIMEOUT`: transmit frame buffer failed because HW was not get available in predefined period
- `ESP_FAIL`: transmit frame buffer failed because some other error occurred

`esp_err_t esp_eth_transmit_vargs(esp_eth_handle_t hdl, uint32_t argc, ...)`

Special Transmit with variable number of arguments.

**Parameters**

- `hdl` -- [in] handle of Ethernet driver

- **argc** -- **[in]** number variable arguments
- . . . -- variable arguments

**Returns**

- ESP\_OK: transmit successfull
- ESP\_ERR\_INVALID\_STATE: invalid driver state (e.i. driver is not started)
- ESP\_ERR\_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP\_FAIL: transmit frame buffer failed because some other error occurred

*esp\_err\_t* **esp\_eth\_ioctl** (*esp\_eth\_handle\_t* hdl, *esp\_eth\_io\_cmd\_t* cmd, void \*data)

Misc IO function of Ethernet driver.

The following common IO control commands are supported:

- ETH\_CMD\_S\_MAC\_ADDR sets Ethernet interface MAC address. *data* argument is pointer to MAC address buffer with expected size of 6 bytes.
- ETH\_CMD\_G\_MAC\_ADDR gets Ethernet interface MAC address. *data* argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- ETH\_CMD\_S\_PHY\_ADDR sets PHY address in range of <0-31>. *data* argument is pointer to memory of *uint32\_t* datatype from where the configuration option is read.
- ETH\_CMD\_G\_PHY\_ADDR gets PHY address. *data* argument is pointer to memory of *uint32\_t* datatype to which the PHY address is to be stored.
- ETH\_CMD\_S\_AUTONEGO enables or disables Ethernet link speed and duplex mode autonegotiation. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- ETH\_CMD\_G\_AUTONEGO gets current configuration of the Ethernet link speed and duplex mode autonegotiation. *data* argument is pointer to memory of *bool* datatype to which the current configuration is to be stored.
- ETH\_CMD\_S\_SPEED sets the Ethernet link speed. *data* argument is pointer to memory of *eth\_speed\_t* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- ETH\_CMD\_G\_SPEED gets current Ethernet link speed. *data* argument is pointer to memory of *eth\_speed\_t* datatype to which the speed is to be stored.
- ETH\_CMD\_S\_PROMISCUOUS sets/resets Ethernet interface promiscuous mode. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.
- ETH\_CMD\_S\_FLOW\_CTRL sets/resets Ethernet interface flow control. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.
- ETH\_CMD\_S\_DUPLEX\_MODE sets the Ethernet duplex mode. *data* argument is pointer to memory of *eth\_duplex\_t* datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- ETH\_CMD\_G\_DUPLEX\_MODE gets current Ethernet link duplex mode. *data* argument is pointer to memory of *eth\_duplex\_t* datatype to which the duplex mode is to be stored.
- ETH\_CMD\_S\_PHY\_LOOPBACK sets/resets PHY to/from loopback mode. *data* argument is pointer to memory of *bool* datatype from which the configuration option is read.
- Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

**Parameters**

- **hdl** -- **[in]** handle of Ethernet driver
- **cmd** -- **[in]** IO control command
- **data** -- **[inout]** address of data for *set* command or address where to store the data when used with *get* command

**Returns**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred

- `ESP_ERR_NOT_SUPPORTED`: requested feature is not supported

*esp\_err\_t* **esp\_eth\_increase\_reference** (*esp\_eth\_handle\_t* hdl)

Increase Ethernet driver reference.

---

**Note:** Ethernet driver handle can be obtained by `os_timer`, `netif`, etc. It's dangerous when thread A is using Ethernet but thread B uninstalls the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won't be uninstalled during your using time.

---

**Parameters** `hdl` -- [in] handle of Ethernet driver

**Returns**

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

*esp\_err\_t* **esp\_eth\_decrease\_reference** (*esp\_eth\_handle\_t* hdl)

Decrease Ethernet driver reference.

**Parameters** `hdl` -- [in] handle of Ethernet driver

**Returns**

- `ESP_OK`: increase reference successfully
- `ESP_ERR_INVALID_ARG`: increase reference failed because of some invalid argument

## Structures

struct **esp\_eth\_config\_t**

Configuration of Ethernet driver.

## Public Members

*esp\_eth\_mac\_t* \***mac**

Ethernet MAC object.

*esp\_eth\_phy\_t* \***phy**

Ethernet PHY object.

uint32\_t **check\_link\_period\_ms**

Period time of checking Ethernet link status.

*esp\_err\_t* (**\*stack\_input**)(*esp\_eth\_handle\_t* eth\_handle, uint8\_t \*buffer, uint32\_t length, void \*priv)

Input frame buffer to user's stack.

**Param eth\_handle** [in] handle of Ethernet driver

**Param buffer** [in] frame buffer that will get input to upper stack

**Param length** [in] length of the frame buffer

**Return**

- `ESP_OK`: input frame buffer to upper stack successfully
- `ESP_FAIL`: error occurred when inputting buffer to upper stack

*esp\_err\_t* (**\*on\_lowlevel\_init\_done**)(*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel initialization is finished.

**Param eth\_handle** [in] handle of Ethernet driver

**Return**

- ESP\_OK: process extra lowlevel initialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel initialization

*esp\_err\_t* (\***on\_lowlevel\_deinit\_done**)(*esp\_eth\_handle\_t* eth\_handle)

Callback function invoked when lowlevel deinitialization is finished.

**Param eth\_handle [in]** handle of Ethernet driver

**Return**

- ESP\_OK: process extra lowlevel deinitialization successfully
- ESP\_FAIL: error occurred when processing extra lowlevel deinitialization

*esp\_err\_t* (\***read\_phy\_reg**)(*esp\_eth\_handle\_t* eth\_handle, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

---

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

---

**Param eth\_handle [in]** handle of Ethernet driver

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

*esp\_err\_t* (\***write\_phy\_reg**)(*esp\_eth\_handle\_t* eth\_handle, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

---

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC's SMI interface.

---

**Param eth\_handle [in]** handle of Ethernet driver

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout
- ESP\_FAIL: write PHY register failed because some other error occurred

struct **esp\_eth\_phy\_reg\_rw\_data\_t**

Data structure to Read/Write PHY register via ioctl API.

**Public Members**

uint32\_t **reg\_addr**

PHY register address

uint32\_t \***reg\_value\_p**

Pointer to a memory where the register value is read/written

### Macros

**ETH\_DEFAULT\_CONFIG** (emac, ephy)

Default configuration for Ethernet driver.

### Type Definitions

typedef void \***esp\_eth\_handle\_t**

Handle of Ethernet driver.

### Enumerations

enum **esp\_eth\_io\_cmd\_t**

Command list for ioctl API.

*Values:*

enumerator **ETH\_CMD\_G\_MAC\_ADDR**

Get MAC address

enumerator **ETH\_CMD\_S\_MAC\_ADDR**

Set MAC address

enumerator **ETH\_CMD\_G\_PHY\_ADDR**

Get PHY address

enumerator **ETH\_CMD\_S\_PHY\_ADDR**

Set PHY address

enumerator **ETH\_CMD\_G\_AUTONEGO**

Get PHY Auto Negotiation

enumerator **ETH\_CMD\_S\_AUTONEGO**

Set PHY Auto Negotiation

enumerator **ETH\_CMD\_G\_SPEED**

Get Speed

enumerator **ETH\_CMD\_S\_SPEED**

Set Speed

enumerator **ETH\_CMD\_S\_PROMISCUOUS**

Set promiscuous mode

- enumerator **ETH\_CMD\_S\_FLOW\_CTRL**  
Set flow control
- enumerator **ETH\_CMD\_G\_DUPLEX\_MODE**  
Get Duplex mode
- enumerator **ETH\_CMD\_S\_DUPLEX\_MODE**  
Set Duplex mode
- enumerator **ETH\_CMD\_S\_PHY\_LOOPBACK**  
Set PHY loopback
- enumerator **ETH\_CMD\_READ\_PHY\_REG**  
Read PHY register
- enumerator **ETH\_CMD\_WRITE\_PHY\_REG**  
Write PHY register
- enumerator **ETH\_CMD\_CUSTOM\_MAC\_CMDS**
- enumerator **ETH\_CMD\_CUSTOM\_PHY\_CMDS**

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_com.h](#)

### Structures

struct **esp\_eth\_mediator\_s**  
Ethernet mediator.

### Public Members

*esp\_err\_t* (**\*phy\_reg\_read**)(*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Param eth [in]** mediator of Ethernet driver  
**Param phy\_addr [in]** PHY Chip address (0~31)  
**Param phy\_reg [in]** PHY register index code  
**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_FAIL: read PHY register failed because some error occurred

*esp\_err\_t* (**\*phy\_reg\_write**)(*esp\_eth\_mediator\_t* \*eth, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Param eth [in]** mediator of Ethernet driver  
**Param phy\_addr [in]** PHY Chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_FAIL: write PHY register failed because some error occurred

*esp\_err\_t* (\***stack\_input**)(*esp\_eth\_mediator\_t* \*eth, uint8\_t \*buffer, uint32\_t length)

Deliver packet to upper stack.

**Param eth [in]** mediator of Ethernet driver

**Param buffer [in]** packet buffer

**Param length [in]** length of the packet

**Return**

- ESP\_OK: deliver packet to upper stack successfully
- ESP\_FAIL: deliver packet failed because some error occurred

*esp\_err\_t* (\***on\_state\_changed**)(*esp\_eth\_mediator\_t* \*eth, *esp\_eth\_state\_t* state, void \*args)

Callback on Ethernet state changed.

**Param eth [in]** mediator of Ethernet driver

**Param state [in]** new state

**Param args [in]** optional argument for the new state

**Return**

- ESP\_OK: process the new state successfully
- ESP\_FAIL: process the new state failed because some error occurred

## Type Definitions

typedef struct *esp\_eth\_mediator\_s* **esp\_eth\_mediator\_t**

Ethernet mediator.

## Enumerations

enum **esp\_eth\_state\_t**

Ethernet driver state.

*Values:*

enumerator **ETH\_STATE\_LLINIT**

Lowlevel init done

enumerator **ETH\_STATE\_DEINIT**

Deinit done

enumerator **ETH\_STATE\_LINK**

Link status changed

enumerator **ETH\_STATE\_SPEED**

Speed updated

enumerator **ETH\_STATE\_DUPLEX**

Duplex updated

enumerator **ETH\_STATE\_PAUSE**

Pause ability updated

enum **eth\_event\_t**

Ethernet event declarations.

*Values:*

enumerator **ETHERNET\_EVENT\_START**

Ethernet driver start

enumerator **ETHERNET\_EVENT\_STOP**

Ethernet driver stop

enumerator **ETHERNET\_EVENT\_CONNECTED**

Ethernet got a valid link

enumerator **ETHERNET\_EVENT\_DISCONNECTED**

Ethernet lost a valid link

### Header File

- [components/esp\\_eth/include/esp\\_eth\\_mac.h](#)

### Unions

union **eth\_mac\_clock\_config\_t**

*#include* <esp\_eth\_mac.h> Ethernet MAC Clock Configuration.

### Public Members

struct *eth\_mac\_clock\_config\_t*::[anonymous] **mii**

EMAC MII Clock Configuration

*emac\_rmii\_clock\_mode\_t* **clock\_mode**

RMII Clock Mode Configuration

*emac\_rmii\_clock\_gpio\_t* **clock\_gpio**

RMII Clock GPIO Configuration

struct *eth\_mac\_clock\_config\_t*::[anonymous] **rmii**

EMAC RMII Clock Configuration

### Structures

struct **esp\_eth\_mac\_s**

Ethernet MAC.

**Public Members**

*esp\_err\_t* (\***set\_mediator**)(*esp\_eth\_mac\_t* \*mac, *esp\_eth\_mediator\_t* \*eth)

Set mediator for Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Param eth [in]** Ethernet mediator

**Return**

- ESP\_OK: set mediator for Ethernet MAC successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet MAC failed because of invalid argument

*esp\_err\_t* (\***init**)(*esp\_eth\_mac\_t* \*mac)

Initialize Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: initialize Ethernet MAC successfully
- ESP\_ERR\_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP\_FAIL: initialize Ethernet MAC failed because some other error occurred

*esp\_err\_t* (\***deinit**)(*esp\_eth\_mac\_t* \*mac)

Deinitialize Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: deinitialize Ethernet MAC successfully
- ESP\_FAIL: deinitialize Ethernet MAC failed because some error occurred

*esp\_err\_t* (\***start**)(*esp\_eth\_mac\_t* \*mac)

Start Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: start Ethernet MAC successfully
- ESP\_FAIL: start Ethernet MAC failed because some other error occurred

*esp\_err\_t* (\***stop**)(*esp\_eth\_mac\_t* \*mac)

Stop Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: stop Ethernet MAC successfully
- ESP\_FAIL: stop Ethernet MAC failed because some error occurred

*esp\_err\_t* (\***transmit**)(*esp\_eth\_mac\_t* \*mac, *uint8\_t* \*buf, *uint32\_t* length)

Transmit packet from Ethernet MAC.

---

**Note:** Returned error codes may differ for each specific MAC chip.

---

**Param mac [in]** Ethernet MAC instance

**Param buf [in]** packet buffer to transmit

**Param length [in]** length of packet

**Return**

- ESP\_OK: transmit packet successfully

- ESP\_ERR\_INVALID\_SIZE: number of actually sent bytes differs to expected
- ESP\_FAIL: transmit packet failed because some other error occurred

*esp\_err\_t* (\***transmit\_vargs**)(*esp\_eth\_mac\_t* \*mac, uint32\_t argc, va\_list args)

Transmit packet from Ethernet MAC constructed with special parameters at Layer2.

---

**Note:** Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

---

---

**Note:** Returned error codes may differ for each specific MAC chip.

---

**Param mac [in]** Ethernet MAC instance

**Param argc [in]** number variable arguments

**Param args [in]** variable arguments

**Return**

- ESP\_OK: transmit packet successfully
- ESP\_ERR\_INVALID\_SIZE: number of actually sent bytes differs to expected
- ESP\_FAIL: transmit packet failed because some other error occurred

*esp\_err\_t* (\***receive**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*buf, uint32\_t \*length)

Receive packet from Ethernet MAC.

---

**Note:** Memory of buf is allocated in the Layer2, make sure it get free after process.

---

---

**Note:** Before this function got invoked, the value of "length" should set by user, equals the size of buffer. After the function returned, the value of "length" means the real length of received data.

---

**Param mac [in]** Ethernet MAC instance

**Param buf [out]** packet buffer which will preserve the received frame

**Param length [out]** length of the received packet

**Return**

- ESP\_OK: receive packet successfully
- ESP\_ERR\_INVALID\_ARG: receive packet failed because of invalid argument
- ESP\_ERR\_INVALID\_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned "length" indicates the real size of incoming data.
- ESP\_FAIL: receive packet failed because some other error occurred

*esp\_err\_t* (\***read\_phy\_reg**)(*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t \*reg\_value)

Read PHY register.

**Param mac [in]** Ethernet MAC instance

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [out]** PHY register value

**Return**

- ESP\_OK: read PHY register successfully
- ESP\_ERR\_INVALID\_ARG: read PHY register failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: read PHY register failed because of wrong state of MAC

- ESP\_ERR\_TIMEOUT: read PHY register failed because of timeout
- ESP\_FAIL: read PHY register failed because some other error occurred

*esp\_err\_t* (\***write\_phy\_reg**)(*esp\_eth\_mac\_t* \*mac, uint32\_t phy\_addr, uint32\_t phy\_reg, uint32\_t reg\_value)

Write PHY register.

**Param mac [in]** Ethernet MAC instance

**Param phy\_addr [in]** PHY chip address (0~31)

**Param phy\_reg [in]** PHY register index code

**Param reg\_value [in]** PHY register value

**Return**

- ESP\_OK: write PHY register successfully
- ESP\_ERR\_INVALID\_STATE: write PHY register failed because of wrong state of MAC
- ESP\_ERR\_TIMEOUT: write PHY register failed because of timeout
- ESP\_FAIL: write PHY register failed because some other error occurred

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Set MAC address.

**Param mac [in]** Ethernet MAC instance

**Param addr [in]** MAC address

**Return**

- ESP\_OK: set MAC address successfully
- ESP\_ERR\_INVALID\_ARG: set MAC address failed because of invalid argument
- ESP\_FAIL: set MAC address failed because some other error occurred

*esp\_err\_t* (\***get\_addr**)(*esp\_eth\_mac\_t* \*mac, uint8\_t \*addr)

Get MAC address.

**Param mac [in]** Ethernet MAC instance

**Param addr [out]** MAC address

**Return**

- ESP\_OK: get MAC address successfully
- ESP\_ERR\_INVALID\_ARG: get MAC address failed because of invalid argument
- ESP\_FAIL: get MAC address failed because some other error occurred

*esp\_err\_t* (\***set\_speed**)(*esp\_eth\_mac\_t* \*mac, eth\_speed\_t speed)

Set speed of MAC.

**Param ma:c [in]** Ethernet MAC instance

**Param speed [in]** MAC speed

**Return**

- ESP\_OK: set MAC speed successfully
- ESP\_ERR\_INVALID\_ARG: set MAC speed failed because of invalid argument
- ESP\_FAIL: set MAC speed failed because some other error occurred

*esp\_err\_t* (\***set\_duplex**)(*esp\_eth\_mac\_t* \*mac, eth\_duplex\_t duplex)

Set duplex mode of MAC.

**Param mac [in]** Ethernet MAC instance

**Param duplex [in]** MAC duplex

**Return**

- ESP\_OK: set MAC duplex mode successfully
- ESP\_ERR\_INVALID\_ARG: set MAC duplex failed because of invalid argument
- ESP\_FAIL: set MAC duplex failed because some other error occurred

*esp\_err\_t* (\***set\_link**)(*esp\_eth\_mac\_t* \*mac, eth\_link\_t link)

Set link status of MAC.

**Param mac [in]** Ethernet MAC instance

**Param link [in]** Link status

**Return**

- ESP\_OK: set link status successfully
- ESP\_ERR\_INVALID\_ARG: set link status failed because of invalid argument
- ESP\_FAIL: set link status failed because some other error occurred

*esp\_err\_t* (\***set\_promiscuous**)(*esp\_eth\_mac\_t* \*mac, bool enable)

Set promiscuous of MAC.

**Param mac [in]** Ethernet MAC instance

**Param enable [in]** set true to enable promiscuous mode; set false to disable promiscuous mode

**Return**

- ESP\_OK: set promiscuous mode successfully
- ESP\_FAIL: set promiscuous mode failed because some error occurred

*esp\_err\_t* (\***enable\_flow\_ctrl**)(*esp\_eth\_mac\_t* \*mac, bool enable)

Enable flow control on MAC layer or not.

**Param mac [in]** Ethernet MAC instance

**Param enable [in]** set true to enable flow control; set false to disable flow control

**Return**

- ESP\_OK: set flow control successfully
- ESP\_FAIL: set flow control failed because some error occurred

*esp\_err\_t* (\***set\_peer\_pause\_ability**)(*esp\_eth\_mac\_t* \*mac, uint32\_t ability)

Set the PAUSE ability of peer node.

**Param mac [in]** Ethernet MAC instance

**Param ability [in]** zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

**Return**

- ESP\_OK: set peer pause ability successfully
- ESP\_FAIL: set peer pause ability failed because some error occurred

*esp\_err\_t* (\***custom\_ioctl**)(*esp\_eth\_mac\_t* \*mac, uint32\_t cmd, void \*data)

Custom IO function of MAC driver. This function is intended to extend common options of `esp_eth_ioctl` to cover specifics of MAC chip.

---

**Note:** This function may not be assigned when the MAC chip supports only most common set of configuration options.

---

**Param mac [in]** Ethernet MAC instance

**Param cmd [in]** IO control command

**Param data [inout]** address of data for `set` command or address where to store the data when used with `get` command

**Return**

- ESP\_OK: process io command successfully
- ESP\_ERR\_INVALID\_ARG: process io command failed because of some invalid argument
- ESP\_FAIL: process io command failed because some other error occurred
- ESP\_ERR\_NOT\_SUPPORTED: requested feature is not supported

`esp_err_t (*del)(esp_eth_mac_t *mac)`

Free memory of Ethernet MAC.

**Param mac [in]** Ethernet MAC instance

**Return**

- ESP\_OK: free Ethernet MAC instance successfully
- ESP\_FAIL: free Ethernet MAC instance failed because some error occurred

struct **eth\_mac\_config\_t**

Configuration of Ethernet MAC object.

### Public Members

uint32\_t **sw\_reset\_timeout\_ms**

Software reset timeout value (Unit: ms)

uint32\_t **rx\_task\_stack\_size**

Stack size of the receive task

uint32\_t **rx\_task\_prio**

Priority of the receive task

uint32\_t **flags**

Flags that specify extra capability for mac driver

struct **eth\_spi\_custom\_driver\_config\_t**

Custom SPI Driver Configuration. This structure declares configuration and callback functions to access Ethernet SPI module via user's custom SPI driver.

### Public Members

void \***config**

Custom driver specific configuration data used by `init()` function.

---

**Note:** Type and its content is fully under user's control

---

void \*(\***init**)(const void \*spi\_config)

Custom driver SPI Initialization.

---

**Note:** return type and its content is fully under user's control

---

**Param spi\_config [in]** Custom driver specific configuration

**Return**

- spi\_ctx: when initialization is successful, a pointer to context structure holding all variables needed for subsequent SPI access operations (e.g. SPI bus identification, mutexes, etc.)
- NULL: driver initialization failed

*esp\_err\_t* (\***deinit**)(void \*spi\_ctx)

Custom driver De-initialization.

**Param spi\_ctx [in]** a pointer to driver specific context structure

**Return**

- ESP\_OK: driver de-initialization was successful
- ESP\_FAIL: driver de-initialization failed
- any other failure codes are allowed to be used to provide failure isolation

*esp\_err\_t* (\***read**)(void \*spi\_ctx, uint32\_t cmd, uint32\_t addr, void \*data, uint32\_t data\_len)

Custom driver SPI read.

---

**Note:** The read function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

---

**Param spi\_ctx [in]** a pointer to driver specific context structure

**Param cmd [in]** command

**Param addr [in]** register address

**Param data [out]** read data

**Param data\_len [in]** read data length in bytes

**Return**

- ESP\_OK: read was successful
- ESP\_FAIL: read failed
- any other failure codes are allowed to be used to provide failure isolation

*esp\_err\_t* (\***write**)(void \*spi\_ctx, uint32\_t cmd, uint32\_t addr, const void \*data, uint32\_t data\_len)

Custom driver SPI write.

---

**Note:** The write function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

---

**Param spi\_ctx [in]** a pointer to driver specific context structure

**Param cmd [in]** command

**Param addr [in]** register address

**Param data [in]** data to write

**Param data\_len [in]** length of data to write in bytes

**Return**

- ESP\_OK: write was successful
- ESP\_FAIL: write failed
- any other failure codes are allowed to be used to provide failure isolation

## Macros

**ETH\_MAC\_FLAG\_WORK\_WITH\_CACHE\_DISABLE**

MAC driver can work when cache is disabled

**ETH\_MAC\_FLAG\_PIN\_TO\_CORE**

Pin MAC task to the CPU core where driver installation happened

**ETH\_MAC\_DEFAULT\_CONFIG()**

Default configuration for Ethernet MAC object.

**ETH\_DEFAULT\_SPI**

Default configuration of the custom SPI driver. Internal ESP-IDF SPI Master driver is used by default.

**Type Definitions**

```
typedef struct esp_eth_mac_s esp_eth_mac_t
```

Ethernet MAC.

**Enumerations**

```
enum emac_rmii_clock_mode_t
```

RMII Clock Mode Options.

*Values:*

```
enumerator EMAC_CLK_DEFAULT
```

Default values configured using Kconfig are going to be used when "Default" selected.

```
enumerator EMAC_CLK_EXT_IN
```

Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

---

**Note:** MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

---

```
enumerator EMAC_CLK_OUT
```

Output RMII Clock from internal APPL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

```
enum emac_rmii_clock_gpio_t
```

RMII Clock GPIO number Options.

*Values:*

```
enumerator EMAC_CLK_IN_GPIO
```

MAC will get RMII clock from outside at this GPIO.

---

**Note:** ESP32 only supports GPIO0 to input the RMII clock.

---

```
enumerator EMAC_APPL_CLK_OUT_GPIO
```

Output RMII Clock from internal APPL Clock available at GPIO0.

---

**Note:** GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn't have directly relationship with EMAC peripheral. Sometimes this clock won't work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don't select GPIO0 output mode for stability.

---

enumerator **EMAC\_CLK\_OUT\_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC\_CLK\_OUT\_180\_GPIO**

Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

## Header File

- [components/esp\\_eth/include/esp\\_eth\\_phy.h](#)

## Functions

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_ip101** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of IP101.

**Parameters** *config* -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_rt18201** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of RTL8201.

**Parameters** *config* -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_lan87xx** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of LAN87xx.

**Parameters** *config* -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_dp83848** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of DP83848.

**Parameters** *config* -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp\_eth\_phy\_t* \***esp\_eth\_phy\_new\_ksz80xx** (const *eth\_phy\_config\_t* \*config)

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

**Parameters** *config* -- [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

## Structures

struct **esp\_eth\_phy\_s**

Ethernet PHY.

### Public Members

*esp\_err\_t* (**\*set\_mediator**)(*esp\_eth\_phy\_t* \*phy, *esp\_eth\_mediator\_t* \*mediator)

Set mediator for PHY.

**Param phy [in]** Ethernet PHY instance

**Param mediator [in]** mediator of Ethernet driver

**Return**

- ESP\_OK: set mediator for Ethernet PHY instance successfully
- ESP\_ERR\_INVALID\_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

*esp\_err\_t* (**\*reset**)(*esp\_eth\_phy\_t* \*phy)

Software Reset Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* (**\*reset\_hw**)(*esp\_eth\_phy\_t* \*phy)

Hardware Reset Ethernet PHY.

---

**Note:** Hardware reset is mostly done by pull down and up PHY's nRST pin

---

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: reset Ethernet PHY successfully
- ESP\_FAIL: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* (**\*init**)(*esp\_eth\_phy\_t* \*phy)

Initialize Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: initialize Ethernet PHY successfully
- ESP\_FAIL: initialize Ethernet PHY failed because some error occurred

*esp\_err\_t* (**\*deinit**)(*esp\_eth\_phy\_t* \*phy)

Deinitialize Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: deinitialize Ethernet PHY successfully
- ESP\_FAIL: deinitialize Ethernet PHY failed because some error occurred

*esp\_err\_t* (**\*autonego\_ctrl**)(*esp\_eth\_phy\_t* \*phy, *eth\_phy\_autoneg\_cmd\_t* cmd, bool \*autonego\_en\_stat)

Configure auto negotiation.

**Param phy [in]** Ethernet PHY instance

**Param cmd [in]** Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation

**Param autonego\_en\_stat [out]** Address where to store current status of auto negotiation configuration

**Return**

- ESP\_OK: restart auto negotiation successfully
- ESP\_FAIL: restart auto negotiation failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid command

*esp\_err\_t* (\***get\_link**)(*esp\_eth\_phy\_t* \*phy)

Get Ethernet PHY link status.

**Param phy [in]** Ethernet PHY instance

**Return**

- ESP\_OK: get Ethernet PHY link status successfully
- ESP\_FAIL: get Ethernet PHY link status failed because some error occurred

*esp\_err\_t* (\***set\_link**)(*esp\_eth\_phy\_t* \*phy, *eth\_link\_t* link)

Set Ethernet PHY link status.

**Param phy [in]** Ethernet PHY instance

**Param link [in]** new link status

**Return**

- ESP\_OK: set Ethernet PHY link status successfully
- ESP\_FAIL: set Ethernet PHY link status failed because some error occurred

*esp\_err\_t* (\***pwrcctl**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Power control of Ethernet PHY.

**Param phy [in]** Ethernet PHY instance

**Param enable [in]** set true to power on Ethernet PHY; ser false to power off Ethernet PHY

**Return**

- ESP\_OK: control Ethernet PHY power successfully
- ESP\_FAIL: control Ethernet PHY power failed because some error occurred

*esp\_err\_t* (\***set\_addr**)(*esp\_eth\_phy\_t* \*phy, *uint32\_t* addr)

Set PHY chip address.

**Param phy [in]** Ethernet PHY instance

**Param addr [in]** PHY chip address

**Return**

- ESP\_OK: set Ethernet PHY address successfully
- ESP\_FAIL: set Ethernet PHY address failed because some error occurred

*esp\_err\_t* (\***get\_addr**)(*esp\_eth\_phy\_t* \*phy, *uint32\_t* \*addr)

Get PHY chip address.

**Param phy [in]** Ethernet PHY instance

**Param addr [out]** PHY chip address

**Return**

- ESP\_OK: get Ethernet PHY address successfully
- ESP\_ERR\_INVALID\_ARG: get Ethernet PHY address failed because of invalid argument

*esp\_err\_t* (\***advertise\_pause\_ability**)(*esp\_eth\_phy\_t* \*phy, *uint32\_t* ability)

Advertise pause function supported by MAC layer.

**Param phy [in]** Ethernet PHY instance

**Param addr [out]** Pause ability

**Return**

- ESP\_OK: Advertise pause ability successfully
- ESP\_ERR\_INVALID\_ARG: Advertise pause ability failed because of invalid argument

*esp\_err\_t* (\***loopback**)(*esp\_eth\_phy\_t* \*phy, bool enable)

Sets the PHY to loopback mode.

**Param phy [in]** Ethernet PHY instance

**Param enable [in]** enables or disables PHY loopback

**Return**

- ESP\_OK: PHY instance loopback mode has been configured successfully
- ESP\_FAIL: PHY instance loopback configuration failed because some error occurred

*esp\_err\_t* (\***set\_speed**)(*esp\_eth\_phy\_t* \*phy, *eth\_speed\_t* speed)

Sets PHY speed mode.

---

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

---

**Param phy [in]** Ethernet PHY instance

**Param speed [in]** Speed mode to be set

**Return**

- ESP\_OK: PHY instance speed mode has been configured successfully
- ESP\_FAIL: PHY instance speed mode configuration failed because some error occurred

*esp\_err\_t* (\***set\_duplex**)(*esp\_eth\_phy\_t* \*phy, *eth\_duplex\_t* duplex)

Sets PHY duplex mode.

---

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

---

**Param phy [in]** Ethernet PHY instance

**Param duplex [in]** Duplex mode to be set

**Return**

- ESP\_OK: PHY instance duplex mode has been configured successfully
- ESP\_FAIL: PHY instance duplex mode configuration failed because some error occurred

*esp\_err\_t* (\***custom\_ioctl**)(*esp\_eth\_phy\_t* \*phy, *uint32\_t* cmd, void \*data)

Custom IO function of PHY driver. This function is intended to extend common options of *esp\_eth\_ioctl* to cover specifics of PHY chip.

---

**Note:** This function may not be assigned when the PHY chip supports only most common set of configuration options.

---

**Param phy [in]** Ethernet PHY instance

**Param cmd [in]** IO control command

**Param data [inout]** address of data for *set* command or address where to store the data when used with *get* command

**Return**

- **ESP\_OK**: process io command successfully
- **ESP\_ERR\_INVALID\_ARG**: process io command failed because of some invalid argument
- **ESP\_FAIL**: process io command failed because some other error occurred
- **ESP\_ERR\_NOT\_SUPPORTED**: requested feature is not supported

*esp\_err\_t* (**\*del**)(*esp\_eth\_phy\_t* \*phy)

Free memory of Ethernet PHY instance.

**Param phy [in]** Ethernet PHY instance

**Return**

- **ESP\_OK**: free PHY instance successfully
- **ESP\_FAIL**: free PHY instance failed because some error occurred

struct **eth\_phy\_config\_t**

Ethernet PHY configuration.

### Public Members

int32\_t **phy\_addr**

PHY address, set -1 to enable PHY address detection at initialization stage

uint32\_t **reset\_timeout\_ms**

Reset timeout value (Unit: ms)

uint32\_t **autonego\_timeout\_ms**

Auto-negotiation timeout value (Unit: ms)

int **reset\_gpio\_num**

Reset GPIO number, -1 means no hardware reset

### Macros

**ESP\_ETH\_PHY\_ADDR\_AUTO**

**ETH\_PHY\_DEFAULT\_CONFIG** ()

Default configuration for Ethernet PHY object.

### Type Definitions

typedef struct *esp\_eth\_phy\_s* **esp\_eth\_phy\_t**

Ethernet PHY.

### Enumerations

enum **eth\_phy\_autoneg\_cmd\_t**

Auto-negotiation controll commands.

*Values:*

enumerator **ESP\_ETH\_PHY\_AUTONEGO\_RESTART**

enumerator **ESP\_ETH\_PHY\_AUTONEGO\_EN**

enumerator **ESP\_ETH\_PHY\_AUTONEGO\_DIS**

enumerator **ESP\_ETH\_PHY\_AUTONEGO\_G\_STAT**

## Header File

- [components/esp\\_eth/include/esp\\_eth\\_phy\\_802\\_3.h](#)

## Functions

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_mediator** (*phy\_802\_3\_t* \*phy\_802\_3, *esp\_eth\_mediator\_t* \*eth)

Set Ethernet mediator.

### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **eth** -- Ethernet mediator pointer

### Returns

- **ESP\_OK**: Ethernet mediator set successfully
- **ESP\_ERR\_INVALID\_ARG**: if **eth** is **NULL**

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_reset** (*phy\_802\_3\_t* \*phy\_802\_3)

Reset PHY.

**Parameters** **phy\_802\_3** -- IEEE 802.3 PHY object infostructure

### Returns

- **ESP\_OK**: Ethernet PHY reset successfully
- **ESP\_FAIL**: reset Ethernet PHY failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_autonego\_ctrl** (*phy\_802\_3\_t* \*phy\_802\_3, *eth\_phy\_autoneg\_cmd\_t* cmd, *bool* \*autonego\_en\_stat)

Control autonegotiation mode of Ethernet PHY.

### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **cmd** -- autonegotiation command enumeration
- **autonego\_en\_stat** -- [**out**] autonegotiation enabled flag

### Returns

- **ESP\_OK**: Ethernet PHY autonegotiation configured successfully
- **ESP\_FAIL**: Ethernet PHY autonegotiation configuration fail because some error occurred
- **ESP\_ERR\_INVALID\_ARG**: invalid value of **cmd**

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_pwrctl** (*phy\_802\_3\_t* \*phy\_802\_3, *bool* enable)

Power control of Ethernet PHY.

### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **enable** -- set true to power ON Ethernet PHY; set false to power OFF Ethernet PHY

### Returns

- **ESP\_OK**: Ethernet PHY power down mode set successfully
- **ESP\_FAIL**: Ethernet PHY power up or power down failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_addr** (*phy\_802\_3\_t* \*phy\_802\_3, *uint32\_t* addr)

Set Ethernet PHY address.

### Parameters

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **addr** -- new PHY address

### Returns

- **ESP\_OK**: Ethernet PHY address set

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_get\_addr** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t \*addr)

Get Ethernet PHY address.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **addr** -- [out] Ethernet PHY address

**Returns**

- **ESP\_OK**: Ethernet PHY address read successfully
- **ESP\_ERR\_INVALID\_ARG**: addr pointer is NULL

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_advertise\_pause\_ability** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t ability)

Advertise pause function ability.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **ability** -- enable or disable pause ability

**Returns**

- **ESP\_OK**: pause ability set successfully
- **ESP\_FAIL**: Advertise pause function ability failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_loopback** (*phy\_802\_3\_t* \*phy\_802\_3, bool enable)

Set Ethernet PHY loopback mode.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **enable** -- set true to enable loopback; set false to disable loopback

**Returns**

- **ESP\_OK**: Ethernet PHY loopback mode set successfully
- **ESP\_FAIL**: Ethernet PHY loopback configuration failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_speed** (*phy\_802\_3\_t* \*phy\_802\_3, eth\_speed\_t speed)

Set Ethernet PHY speed.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **speed** -- new speed of Ethernet PHY link

**Returns**

- **ESP\_OK**: Ethernet PHY speed set successfully
- **ESP\_FAIL**: Set Ethernet PHY speed failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_duplex** (*phy\_802\_3\_t* \*phy\_802\_3, eth\_duplex\_t duplex)

Set Ethernet PHY duplex mode.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **duplex** -- new duplex mode for Ethernet PHY link

**Returns**

- **ESP\_OK**: Ethernet PHY duplex mode set successfully
- **ESP\_ERR\_INVALID\_STATE**: unable to set duplex mode to Half if loopback is enabled
- **ESP\_FAIL**: Set Ethernet PHY duplex mode failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_set\_link** (*phy\_802\_3\_t* \*phy\_802\_3, eth\_link\_t link)

Set Ethernet PHY link status.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **link** -- new link status

**Returns**

- **ESP\_OK**: Ethernet PHY link set successfully

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_init** (*phy\_802\_3\_t* \*phy\_802\_3)

Initialize Ethernet PHY.

**Parameters** *phy\_802\_3* -- IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: Ethernet PHY initialized successfully

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_deinit** (*phy\_802\_3\_t* \*phy\_802\_3)

Power off Ethernet PHY.

**Parameters** *phy\_802\_3* -- IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: Ethernet PHY powered off successfully

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_del** (*phy\_802\_3\_t* \*phy\_802\_3)

Delete Ethernet PHY infostructure.

**Parameters** *phy\_802\_3* -- IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: Ethernet PHY infostructure deleted

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_reset\_hw** (*phy\_802\_3\_t* \*phy\_802\_3, uint32\_t reset\_assert\_us)

Performs hardware reset with specific reset pin assertion time.

**Parameters**

- *phy\_802\_3* -- IEEE 802.3 PHY object infostructure
- *reset\_assert\_us* -- Hardware reset pin assertion time

**Returns**

- ESP\_OK: reset Ethernet PHY successfully

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_detect\_phy\_addr** (*esp\_eth\_mediator\_t* \*eth, int \*detected\_addr)

Detect PHY address.

**Parameters**

- *eth* -- Mediator of Ethernet driver
- *detected\_addr* -- [out] a valid address after detection

**Returns**

- ESP\_OK: detect phy address successfully
- ESP\_ERR\_INVALID\_ARG: invalid parameter
- ESP\_ERR\_NOT\_FOUND: can't detect any PHY device
- ESP\_FAIL: detect phy address failed because some error occurred

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_basic\_phy\_init** (*phy\_802\_3\_t* \*phy\_802\_3)

Performs basic PHY chip initialization.

---

**Note:** It should be called as the first function in PHY specific driver instance

---

**Parameters** *phy\_802\_3* -- IEEE 802.3 PHY object infostructure

**Returns**

- ESP\_OK: initialized Ethernet PHY successfully
- ESP\_FAIL: initialization of Ethernet PHY failed because some error occurred
- ESP\_ERR\_INVALID\_ARG: invalid argument
- ESP\_ERR\_NOT\_FOUND: PHY device not detected
- ESP\_ERR\_TIMEOUT: MII Management read/write operation timeout
- ESP\_ERR\_INVALID\_STATE: PHY is in invalid state to perform requested operation

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_basic\_phy\_deinit** (*phy\_802\_3\_t* \*phy\_802\_3)

Performs basic PHY chip de-initialization.

---

**Note:** It should be called as the last function in PHY specific driver instance

---

**Parameters** `phy_802_3` -- IEEE 802.3 PHY object infostructure

**Returns**

- `ESP_OK`: de-initialized Ethernet PHY successfully
- `ESP_FAIL`: de-initialization of Ethernet PHY failed because some error occurred
- `ESP_ERR_TIMEOUT`: MII Management read/write operation timeout
- `ESP_ERR_INVALID_STATE`: PHY is in invalid state to perform requested operation

*esp\_err\_t* `esp_eth_phy_802_3_read_oui` (*phy\_802\_3\_t* \*`phy_802_3`, *uint32\_t* \*`oui`)

Reads raw content of OUI field.

**Parameters**

- `phy_802_3` -- IEEE 802.3 PHY object infostructure
- `oui` -- **[out]** OUI value

**Returns**

- `ESP_OK`: OUI field read successfully
- `ESP_FAIL`: OUI field read failed because some error occurred
- `ESP_ERR_INVALID_ARG`: invalid `oui` argument
- `ESP_ERR_TIMEOUT`: MII Management read/write operation timeout
- `ESP_ERR_INVALID_STATE`: PHY is in invalid state to perform requested operation

*esp\_err\_t* `esp_eth_phy_802_3_read_manufac_info` (*phy\_802\_3\_t* \*`phy_802_3`, *uint8\_t* \*`model`, *uint8\_t* \*`rev`)

Reads manufacturer's model and revision number.

**Parameters**

- `phy_802_3` -- IEEE 802.3 PHY object infostructure
- `model` -- **[out]** Manufacturer's model number (can be NULL when not required)
- `rev` -- **[out]** Manufacturer's revision number (can be NULL when not required)

**Returns**

- `ESP_OK`: Manufacturer's info read successfully
- `ESP_FAIL`: Manufacturer's info read failed because some error occurred
- `ESP_ERR_TIMEOUT`: MII Management read/write operation timeout
- `ESP_ERR_INVALID_STATE`: PHY is in invalid state to perform requested operation

*esp\_err\_t* `esp_eth_phy_802_3_get_mmd_addr` (*phy\_802\_3\_t* \*`phy_802_3`, *uint8\_t* `devaddr`, *uint16\_t* \*`mmd_addr`)

Reads MDIO device's internal address register.

**Parameters**

- `phy_802_3` -- IEEE 802.3 PHY object infostructure
- `devaddr` -- Address of MDIO device
- `mmd_addr` -- **[out]** Current address stored in device's register

**Returns**

- `ESP_OK`: Address register read successfully
- `ESP_FAIL`: Address register read failed because of some error occurred
- `ESP_ERR_INVALID_ARG`: Device address provided is out of range (hardware limits device address to 5 bits)

*esp\_err\_t* `esp_eth_phy_802_3_set_mmd_addr` (*phy\_802\_3\_t* \*`phy_802_3`, *uint8\_t* `devaddr`, *uint16\_t* `mmd_addr`)

Write to MDIO device's internal address register.

**Parameters**

- `phy_802_3` -- IEEE 802.3 PHY object infostructure
- `devaddr` -- Address of MDIO device
- `mmd_addr` -- **[out]** New value of MDIO device's address register value

**Returns**

- ESP\_OK: Address register written to successfully
- ESP\_FAIL: Address register write failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_mmd\_data** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, *esp\_eth\_phy\_802\_3\_mmd\_func\_t* function, uint32\_t \*data)

Read data of MDIO device's memory at address register.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **function** -- MMD function
- **data** -- [out] Data read from the device's memory

**Returns**

- ESP\_OK: Memory read successfully
- ESP\_FAIL: Memory read failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits) or MMD access function is invalid

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_write\_mmd\_data** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, *esp\_eth\_phy\_802\_3\_mmd\_func\_t* function, uint32\_t data)

Write data to MDIO device's memory at address register.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **function** -- MMD function
- **data** -- [out] Data to write to the device's memory

**Returns**

- ESP\_OK: Memory written successfully
- ESP\_FAIL: Memory write failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits) or MMD access function is invalid

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_read\_mmd\_register** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, uint16\_t mmd\_addr, uint32\_t \*data)

Set MMD address to mmd\_addr with function MMD\_FUNC\_NOINCR and read contents to \*data.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **mmd\_addr** -- Address of MDIO device register
- **data** -- [out] Data read from the device's memory

**Returns**

- ESP\_OK: Memory read successfully
- ESP\_FAIL: Memory read failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

*esp\_err\_t* **esp\_eth\_phy\_802\_3\_write\_mmd\_register** (*phy\_802\_3\_t* \*phy\_802\_3, uint8\_t devaddr, uint16\_t mmd\_addr, uint32\_t data)

Set MMD address to mmd\_addr with function MMD\_FUNC\_NOINCR and write data.

**Parameters**

- **phy\_802\_3** -- IEEE 802.3 PHY object infostructure
- **devaddr** -- Address of MDIO device
- **mmd\_addr** -- Address of MDIO device register

- **data** -- [out] Data to write to the device's memory

**Returns**

- ESP\_OK: Memory written to successfully
- ESP\_FAIL: Memory write failed because of some error occurred
- ESP\_ERR\_INVALID\_ARG: Device address provided is out of range (hardware limits device address to 5 bits)

inline [phy\\_802\\_3\\_t](#) \***esp\_eth\_phy\_into\_phy\_802\_3** ([esp\\_eth\\_phy\\_t](#) \*phy)

Returns address to parent IEEE 802.3 PHY object infostructure.

**Parameters** **phy** -- Ethernet PHY instance

**Returns** [phy\\_802\\_3\\_t](#)\*

- address to parent IEEE 802.3 PHY object infostructure

[esp\\_err\\_t](#) **esp\_eth\_phy\_802\_3\_obj\_config\_init** ([phy\\_802\\_3\\_t](#) \*phy\_802\_3, const [eth\\_phy\\_config\\_t](#) \*config)

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

**Parameters**

- **phy\_802\_3** -- Address to IEEE 802.3 PHY object infostructure
- **config** -- Configuration of the IEEE 802.3 PHY object

**Returns**

- ESP\_OK: configuration initialized successfully
- ESP\_ERR\_INVALID\_ARG: invalid `config` argument

**Structures**

struct **phy\_802\_3\_t**

IEEE 802.3 PHY object infostructure.

**Public Members**

[esp\\_eth\\_phy\\_t](#) **parent**

Parent Ethernet PHY instance

[esp\\_eth\\_mediator\\_t](#) \***eth**

Mediator of Ethernet driver

int **addr**

PHY address

uint32\_t **reset\_timeout\_ms**

Reset timeout value (Unit: ms)

uint32\_t **autonego\_timeout\_ms**

Auto-negotiation timeout value (Unit: ms)

[eth\\_link\\_t](#) **link\_status**

Current Link status

int **reset\_gpio\_num**

Reset GPIO number, -1 means no hardware reset

## Enumerations

enum **esp\_eth\_phy\_802\_3\_mmd\_func\_t**

IEEE 802.3 MMD modes enumeration.

*Values:*

enumerator **MMD\_FUNC\_ADDRESS**

enumerator **MMD\_FUNC\_DATA\_NOINCR**

enumerator **MMD\_FUNC\_DATA\_RWINCR**

enumerator **MMD\_FUNC\_DATA\_WINCR**

## Header File

- [components/esp\\_eth/include/esp\\_eth\\_netif\\_glue.h](#)

## Functions

*esp\_eth\_netif\_glue\_handle\_t* **esp\_eth\_new\_netif\_glue** (*esp\_eth\_handle\_t* eth\_hdl)

Create a netif glue for Ethernet driver.

---

**Note:** netif glue is used to attach io driver to TCP/IP netif

---

**Parameters** **eth\_hdl** -- Ethernet driver handle

**Returns** glue object, which inherits esp\_netif\_driver\_base\_t

*esp\_err\_t* **esp\_eth\_del\_netif\_glue** (*esp\_eth\_netif\_glue\_handle\_t* eth\_netif\_glue)

Delete netif glue of Ethernet driver.

**Parameters** **eth\_netif\_glue** -- netif glue

**Returns** -ESP\_OK: delete netif glue successfully

## Type Definitions

typedef struct esp\_eth\_netif\_glue\_t \***esp\_eth\_netif\_glue\_handle\_t**

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the [ethernet](#) directory of ESP-IDF examples.

## 2.5.3 Thread

### Thread

**Introduction** [Thread](#) is a IP-based mesh networking protocol. It's based on the 802.15.4 physical and MAC layer.

**Application Examples** The [openthread](#) directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell [openthread/ot\\_cli](#).
- The Thread border router [openthread/ot\\_br](#).
- The Thread radio co-processor [openthread/ot\\_rcp](#).

**API Reference** For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](#).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

### Header File

- [components/openthread/include/esp\\_openthread.h](#)

### Functions

*esp\_err\_t* **esp\_openthread\_init** (const *esp\_openthread\_platform\_config\_t* \*init\_config)

Initializes the full OpenThread stack.

---

**Note:** The OpenThread instance will also be initialized in this function.

---

**Parameters** *init\_config* -- [in] The initialization configuration.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_ERR\_INVALID\_ARG if radio or host connection mode not supported
- ESP\_ERR\_INVALID\_STATE if already initialized

*esp\_err\_t* **esp\_openthread\_auto\_start** (otOperationalDatasetTlvs \*datasetTlvs)

Starts the Thread protocol operation and attaches to a Thread network.

**Parameters** *datasetTlvs* -- [in] The operational dataset (TLV encoded), if it's NULL, the function will generate the dataset based on the configurations from kconfig.

#### Returns

- ESP\_OK on success
- ESP\_FAIL on failures

*esp\_err\_t* **esp\_openthread\_launch\_mainloop** (void)

Launches the OpenThread main loop.

---

**Note:** This function will not return unless error happens when running the OpenThread stack.

---

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_FAIL on other failures

*esp\_err\_t* **esp\_openthread\_deinit** (void)

This function performs OpenThread stack and platform driver deinitialization.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not initialized

otInstance \***esp\_openthread\_get\_instance** (void)

This function acquires the underlying OpenThread instance.

---

**Note:** This function can be called on other tasks without lock.

---

**Returns** The OpenThread instance pointer

### Header File

- [components/openthread/include/esp\\_openthread\\_types.h](#)

### Structures

struct **esp\_openthread\_role\_changed\_event\_t**

OpenThread role changed event data.

#### Public Members

otDeviceRole **previous\_role**

Previous Thread role

otDeviceRole **current\_role**

Current Thread role

struct **esp\_openthread\_mainloop\_context\_t**

This structure represents a context for a select() based mainloop.

#### Public Members

fd\_set **read\_fds**

The read file descriptors

fd\_set **write\_fds**

The write file descriptors

fd\_set **error\_fds**

The error file descriptors

int **max\_fd**

The max file descriptor

struct timeval **timeout**

The timeout

struct **esp\_openthread\_uart\_config\_t**

The uart port config for OpenThread.

#### Public Members

*uart\_port\_t* **port**

UART port number

*uart\_config\_t* **uart\_config**

UART configuration, see *uart\_config\_t* docs

*gpio\_num\_t* **rx\_pin**

UART RX pin

*gpio\_num\_t* **tx\_pin**

UART TX pin

struct **esp\_openthread\_spi\_host\_config\_t**

The spi port config for OpenThread.

### Public Members

*spi\_host\_device\_t* **host\_device**

SPI host device

*spi\_dma\_chan\_t* **dma\_channel**

DMA channel

*spi\_bus\_config\_t* **spi\_interface**

SPI bus

*spi\_device\_interface\_config\_t* **spi\_device**

SPI peripheral device

*gpio\_num\_t* **intr\_pin**

SPI interrupt pin

struct **esp\_openthread\_spi\_slave\_config\_t**

The spi slave config for OpenThread.

### Public Members

*spi\_host\_device\_t* **host\_device**

SPI host device

*spi\_bus\_config\_t* **bus\_config**

SPI bus config

*spi\_slave\_interface\_config\_t* **slave\_config**

SPI slave config

*gpio\_num\_t* **intr\_pin**

SPI interrupt pin

struct **esp\_openthread\_radio\_config\_t**

The OpenThread radio configuration.

**Public Members**

*esp\_openthread\_radio\_mode\_t* **radio\_mode**

The radio mode

*esp\_openthread\_uart\_config\_t* **radio\_uart\_config**

The uart configuration to RCP

*esp\_openthread\_spi\_host\_config\_t* **radio\_spi\_config**

The spi configuration to RCP

struct **esp\_openthread\_host\_connection\_config\_t**

The OpenThread host connection configuration.

**Public Members**

*esp\_openthread\_host\_connection\_mode\_t* **host\_connection\_mode**

The host connection mode

*esp\_openthread\_uart\_config\_t* **host\_uart\_config**

The uart configuration to host

*usb\_serial\_jtag\_driver\_config\_t* **host\_usb\_config**

The usb configuration to host

*esp\_openthread\_spi\_slave\_config\_t* **spi\_slave\_config**

The spi configuration to host

struct **esp\_openthread\_port\_config\_t**

The OpenThread port specific configuration.

**Public Members**

const char \***storage\_partition\_name**

The partition for storing OpenThread dataset

uint8\_t **netif\_queue\_size**

The packet queue size for the network interface

uint8\_t **task\_queue\_size**

The task queue size

struct **esp\_openthread\_platform\_config\_t**

The OpenThread platform configuration.

## Public Members

*esp\_openthread\_radio\_config\_t* **radio\_config**

The radio configuration

*esp\_openthread\_host\_connection\_config\_t* **host\_config**

The host connection configuration

*esp\_openthread\_port\_config\_t* **port\_config**

The port configuration

## Type Definitions

```
typedef void (*esp_openthread_rcp_failure_handler)(void)
```

## Enumerations

```
enum esp_openthread_event_t
```

OpenThread event declarations.

*Values:*

```
enumerator OPENTHREAD_EVENT_START
```

OpenThread stack start

```
enumerator OPENTHREAD_EVENT_STOP
```

OpenThread stack stop

```
enumerator OPENTHREAD_EVENT_DETACHED
```

OpenThread detached

```
enumerator OPENTHREAD_EVENT_ATTACHED
```

OpenThread attached

```
enumerator OPENTHREAD_EVENT_ROLE_CHANGED
```

OpenThread role changed

```
enumerator OPENTHREAD_EVENT_IF_UP
```

OpenThread network interface up

```
enumerator OPENTHREAD_EVENT_IF_DOWN
```

OpenThread network interface down

```
enumerator OPENTHREAD_EVENT_GOT_IP6
```

OpenThread stack added IPv6 address

```
enumerator OPENTHREAD_EVENT_LOST_IP6
```

OpenThread stack removed IPv6 address

enumerator **OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_JOIN**

OpenThread stack joined IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_LEAVE**

OpenThread stack left IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_TREL\_ADD\_IP6**

OpenThread stack added TREL IPv6 address

enumerator **OPENTHREAD\_EVENT\_TREL\_REMOVE\_IP6**

OpenThread stack removed TREL IPv6 address

enumerator **OPENTHREAD\_EVENT\_TREL\_MULTICAST\_GROUP\_JOIN**

OpenThread stack joined TREL IPv6 multicast group

enumerator **OPENTHREAD\_EVENT\_SET\_DNS\_SERVER**

OpenThread stack set DNS server >

enumerator **OPENTHREAD\_EVENT\_PUBLISH\_MESHCOPE**

OpenThread stack start to publish meshcop-e service >

enumerator **OPENTHREAD\_EVENT\_REMOVE\_MESHCOPE**

OpenThread stack start to remove meshcop-e service >

enum **esp\_openthread\_radio\_mode\_t**

The radio mode of OpenThread.

*Values:*

enumerator **RADIO\_MODE\_NATIVE**

Use the native 15.4 radio

enumerator **RADIO\_MODE\_UART\_RCP**

UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO\_MODE\_SPI\_RCP**

SPI connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO\_MODE\_MAX**

Using for parameter check

enum **esp\_openthread\_host\_connection\_mode\_t**

How OpenThread connects to the host.

*Values:*

enumerator **HOST\_CONNECTION\_MODE\_NONE**

Disable host connection

enumerator **HOST\_CONNECTION\_MODE\_CLI\_UART**

CLI UART connection to the host

enumerator **HOST\_CONNECTION\_MODE\_CLI\_USB**

CLI USB connection to the host

enumerator **HOST\_CONNECTION\_MODE\_RCP\_UART**

RCP UART connection to the host

enumerator **HOST\_CONNECTION\_MODE\_RCP\_SPI**

RCP SPI connection to the host

enumerator **HOST\_CONNECTION\_MODE\_MAX**

Using for parameter check

### Header File

- [components/openthread/include/esp\\_openthread\\_lock.h](#)

### Functions

*esp\_err\_t* **esp\_openthread\_lock\_init** (void)

This function initializes the OpenThread API lock.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if allocation has failed
- ESP\_ERR\_INVALID\_STATE if already initialized

void **esp\_openthread\_lock\_deinit** (void)

This function deinitializes the OpenThread API lock.

bool **esp\_openthread\_lock\_acquire** (TickType\_t block\_ticks)

This function acquires the OpenThread API lock.

---

**Note:** Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

---

**Parameters** **block\_ticks** -- [in] The maximum number of RTOS ticks to wait for the lock.

#### Returns

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp\_openthread\_lock\_release** (void)

This function releases the OpenThread API lock.

bool **esp\_openthread\_task\_switching\_lock\_acquire** (TickType\_t block\_ticks)

This function acquires the OpenThread API task switching lock.

---

**Note:** In OpenThread API context, it waits for some actions to be done in other tasks (like lwip), after task switching, it needs to call OpenThread API again. Normally it's not allowed, since the previous OpenThread API lock is not released yet. This task\_switching lock allows the OpenThread API can be called in this case.

---

---

**Note:** Please use esp\_openthread\_lock\_acquire() for normal cases.

---

**Parameters** **block\_ticks** -- [in] The maximum number of RTOS ticks to wait for the lock.

**Returns**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp\_openthread\_task\_switching\_lock\_release** (void)

This function releases the OpenThread API task switching lock.

**Header File**

- [components/openthread/include/esp\\_openthread\\_netif\\_glue.h](#)

**Functions**

void \***esp\_openthread\_netif\_glue\_init** (const *esp\_openthread\_platform\_config\_t* \*config)

This function initializes the OpenThread network interface glue.

**Parameters** **config** -- [in] The platform configuration.

**Returns**

- glue pointer on success
- NULL on failure

void **esp\_openthread\_netif\_glue\_deinit** (void)

This function deinitializes the OpenThread network interface glue.

*esp\_netif\_t* \***esp\_openthread\_get\_netif** (void)

This function acquires the OpenThread netif.

**Returns** The OpenThread netif or NULL if not initialized.

void **esp\_openthread\_register\_meshcop\_e\_handler** (*esp\_event\_handler\_t* handler, bool for\_publish)

This function register a handler for meshcop-e service publish event and remove event.

**Parameters**

- **handler** -- [in] The handler.
- **for\_publish** -- [in] The usage of handler, true for publish event and false for remove event.

**Macros**

**ESP\_NETIF\_INHERENT\_DEFAULT\_OPENTHREAD** ()

Default configuration reference of OpenThread esp-netif.

**ESP\_NETIF\_DEFAULT\_OPENTHREAD** ()

**Header File**

- [components/openthread/include/esp\\_openthread\\_border\\_router.h](#)

**Functions**

void **esp\_openthread\_set\_backbone\_netif** (*esp\_netif\_t* \*backbone\_netif)

Sets the backbone interface used for border routing.

---

**Note:** This function must be called before `esp_openthread_init`

---

**Parameters** **backbone\_netif** -- [in] The backbone network interface (WiFi or ethernet)

*esp\_err\_t* **esp\_openthread\_border\_router\_init** (void)

Initializes the border router features of OpenThread.

---

**Note:** Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG\_OPENTHREAD\_BORDER\_ROUTER is required.

---

**Returns**

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if feature not supported
- ESP\_ERR\_INVALID\_STATE if already initialized
- ESP\_FAIL on other failures

*esp\_err\_t* **esp\_openthread\_border\_router\_deinit** (void)

Deinitializes the border router features of OpenThread.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if not initialized
- ESP\_FAIL on other failures

*esp\_netif\_t* \***esp\_openthread\_get\_backbone\_netif** (void)

Gets the backbone interface of OpenThread border router.

**Returns** The backbone interface or NULL if border router not initialized.

void **esp\_openthread\_register\_rcp\_failure\_handler** (*esp\_openthread\_rcp\_failure\_handler* handler)

Registers the callback for RCP failure.

*esp\_err\_t* **esp\_openthread\_rcp\_deinit** (void)

Deinitializes the connection to RCP.

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if fail to deinitialize RCP

*esp\_err\_t* **esp\_openthread\_rcp\_init** (void)

Initializes the connection to RCP.

**Returns**

- ESP\_OK on success
- ESP\_FAIL if fail to initialize RCP

*esp\_err\_t* **esp\_openthread\_set\_meshcop\_instance\_name** (const char \*instance\_name)

Sets the meshcop(e) instance name.

---

**Note:** This function can only be called before `esp_openthread_border_router_init`. If `instance_name` is NULL, then the service will use the hostname as instance name.

---

**Parameters** `instance_name` -- [in] The instance name, can be NULL.

**Returns**

- ESP\_OK on success
- ESP\_FAIL if fail to initialize RCP

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in the `openthread` directory of ESP-IDF examples.

### 2.5.4 ESP-NETIF

#### ESP-NETIF

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

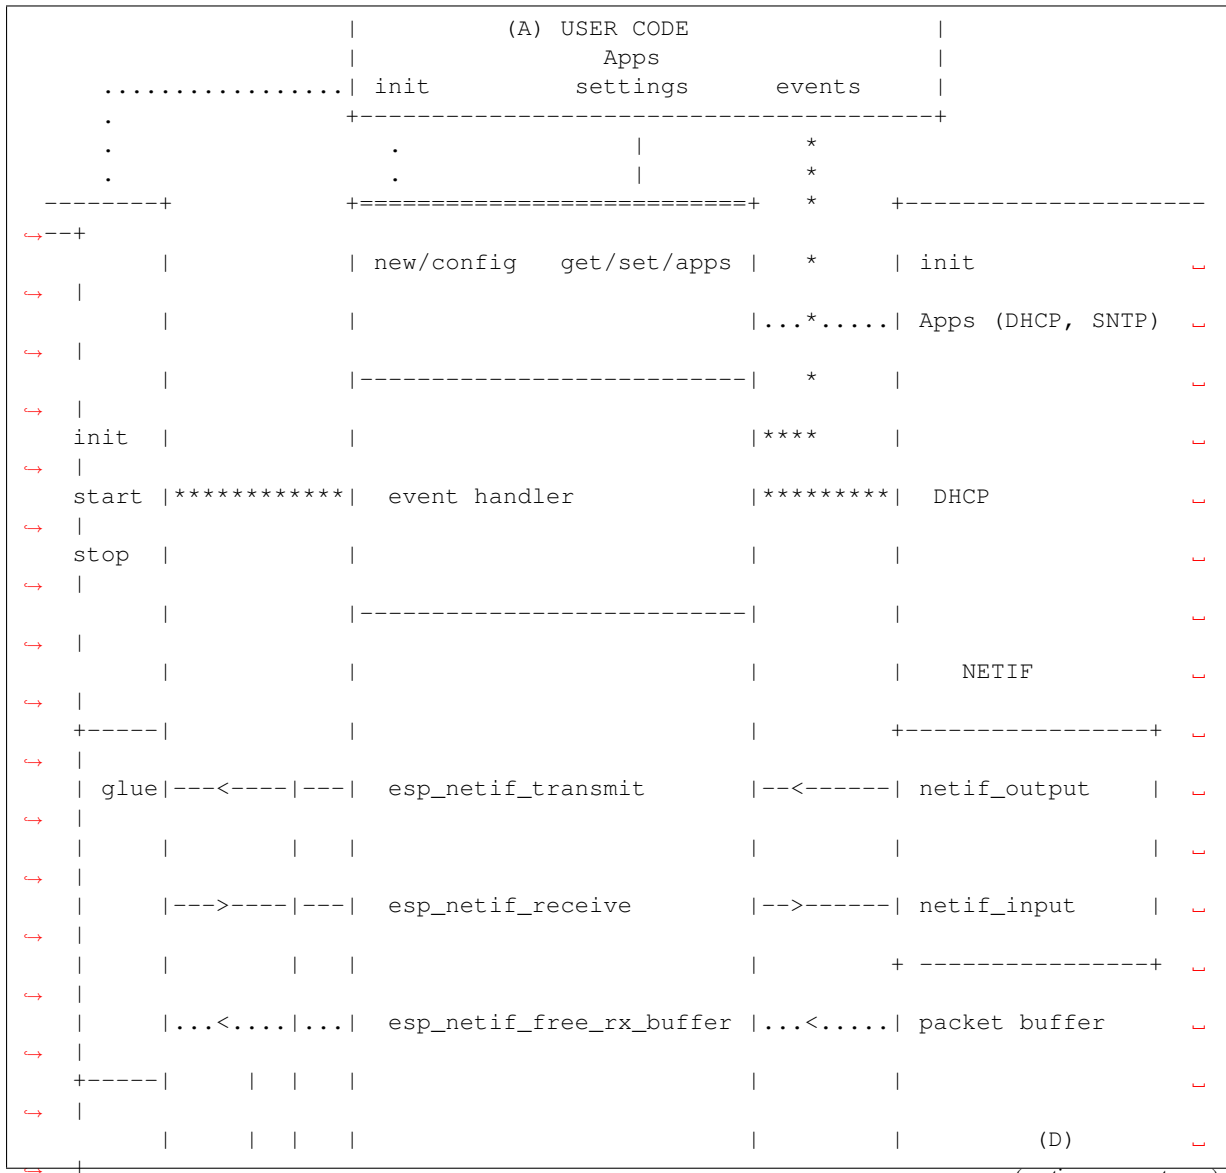

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

It is also possible to use a custom TCP/IP stack with ESP-IDF, provided it implements BSD API. For more information on building ESP-IDF without lwIP, please refer to [components/esp\\_netif\\_stack/README.md](#).

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

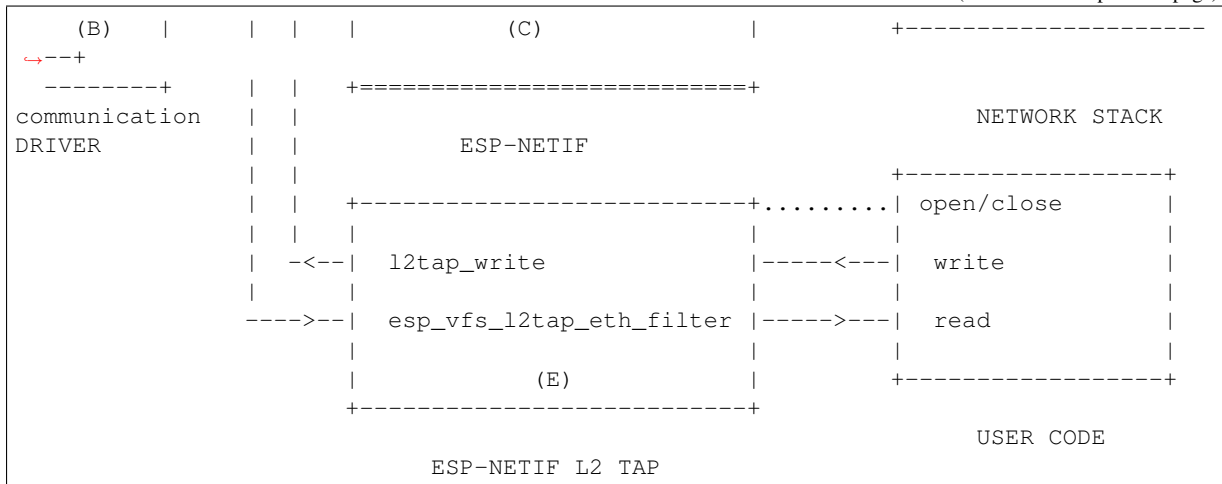

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

#### ESP-NETIF architecture

(continues on next page)

(continued from previous page)

### Data and event flow in the diagram

- ..... Initialization line from user code to ESP-NETIF and communication driver
- ---<--->--- Data packets going from communication media to TCP/IP stack and back
- \*\*\*\*\* Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

### ESP-NETIF interaction

**A) User code, boiler plate** Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

#### A) Initialization code

- 1) Initializes IO driver
- 2) Creates a new instance of ESP-NETIF and configure with
  - ESP-NETIF specific options (flags, behaviour, name)
  - Network stack options (netif init and input functions, not publicly available)
  - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
- 3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
- 4) Configures event handlers
  - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
  - register handlers for app related events (such as IP lost/acquired)

#### B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
- Controlling application lifecycle (set interface up/down)

**B) Communication driver, IO driver, media driver** Communication driver plays these two important roles in relation with ESP-NETIF:

- 1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
- 2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
  - Installs driver\_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver

- Calls `esp_netif_receive()` to pass incoming data to network stack

**C) ESP-NETIF** ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

- 1) Initialization APIs (to create and configure ESP-NETIF instance)
- 2) Input/Output API (for passing data between IO driver and network stack)
- 3) Event or Action API
  - Used for network interface lifecycle management
  - ESP-NETIF provides building blocks for designing event handlers
- 4) Setters and Getters for basic network interface properties
- 5) Network stack abstraction: enabling user interaction with TCP/IP stack
  - Set interface up or down
  - DHCP server and client API
  - DNS API
  - [SNTP API](#)
- 6) Driver conversion utilities

**D) Network stack** Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

**E) ESP-NETIF L2 TAP Interface** The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). Refer to [Virtual filesystem component](#) to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to Layer 2 infrastructure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by `if_key` (e.g. `ETH_DEF`) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user's application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

### ESP-NETIF L2 TAP Interface Usage Manual

**Initialization** To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by `CONFIG_ESP_NETIF_L2_TAP` first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

**open()** Once the ESP-NETIF L2 TAP is registered, it can be opened at path name `"/dev/net/tap"`. The same path name can be opened multiple times up to `CONFIG_ESP_NETIF_L2_TAP_MAX_FDS` and multiple file descriptors with with different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with `O_NONBLOCK` file status flag to the `read()` does not block. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned and `errno` is set to indicate the error.

**ioctl()** The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- `L2TAP_S_INTF_DEVICE` - bounds the file descriptor to specific Network Interface which is identified by its `if_key`. ESP-NETIF Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`'s used in ESP-IDF can be found in [esp\\_netif/include/esp\\_netif\\_defaults.h](#).
- `L2TAP_S_DEVICE_DRV_HNDL` - is other way how to bound the file descriptor to specific Network Interface. In this case the Network interface is identified directly by IO Driver handle (e.g. `esp_eth_handle_t` in case of Ethernet). The IO Driver handle is passed to `ioctl()` as the third parameter.
- `L2TAP_S_RCV_FILTER` - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to `0x05DC`, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval `<0, 0x05DC>` at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user's application. In case the filter value is set greater than `0x05DC`, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All above set configuration options have getter counterpart option to read the current settings.

**Warning:** The file descriptor needs to be firstly bounded to specific Network Interface by `L2TAP_S_INTF_DEVICE` or `L2TAP_S_DEVICE_DRV_HNDL` to be `L2TAP_S_RCV_FILTER` option available.

---

**Note:** VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. `0x8100` or `0x88A8`) and process the VLAN tagged frames in user application.

---

---

**Note:** `L2TAP_S_DEVICE_DRV_HNDL` is particularly useful when user's application does not require usage of IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

---

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EACCES** - option change is denied in this state (e.g. file descriptor has not be bounded to Network interface yet).

**EINVAL** - invalid configuration argument. Ethernet type filter is already used by other file descriptor on that same Network interface.

**ENODEV** - no such Network Interface which is tried to be assigned to the file descriptor exists.

**ENOSYS** - unsupported operation, passed configuration option does not exists.

**fcntl()** `fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with file descriptor:

- `F_GETFD` - the function returns the file descriptor flags, the third argument is ignored.

- `F_SETFD` - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**ENOSYS** - unsupported command.

**read()** Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EAGAIN** - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

**write()** A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User's application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user's application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EBADMSG** - Ethernet type of the frame is different then file descriptor configured filter.

**EIO** - Network interface not available or busy.

**close()** Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first's task read operation then ends with error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.  
**EBADF** - not a valid file descriptor.

**select()** Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to be the `select()` function available.

**SNTP API** You can find a brief introduction to SNTP in general, its initialization code and basic modes in *SNTP Time Synchronization* section in the *System Time Document*.

This section provides more details about specific use cases of SNTP service, with statically configured servers, or using DHCP provided servers, or both. The workflow is usually very simple:

- 1) Initialize and configure the service using `esp_netif_sntp_init()`. This operations can only be called once (unless the SNTP service has been destroyed by `esp_netif_sntp_deinit()`)
- 2) Start the service via `esp_netif_sntp_start()`. This step is not needed if we auto-started the service in the previous step (default). It is useful to start the service explicitly after connecting if we want to use the DHCP-obtained NTP servers. Please note, this option needs to be enabled before connecting, but the SNTP service should be started after.
- 3) Wait for the system time to synchronize using `esp_netif_sntp_sync_wait()` (only if needed).
- 4) Stop and destroy the service using `esp_netif_sntp_deinit()`.

**Basic mode with statically defined server(s)** Initialize the module with the default configuration after connecting to network. Note that it's possible to provide multiple NTP servers in the configuration struct:

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(2,  
                        ESP_SNTP_SERVER_LIST("time.windows.com", "pool.ntp.org"  
↪) );  
esp_netif_sntp_init(&config);
```

---

**Note:** If we want to configure multiple SNTP servers, we have to update lwIP configuration `CONFIG_LWIP_SNTP_MAX_SERVERS`.

---

**Use DHCP obtained SNTP server(s)** First of all, we have to enable lwIP configuration option `CONFIG_LWIP_DHCP_GET_NTP_SRV`. Then we have to initialize the SNTP module with the DHCP option and no NTP server:

```
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(0, {});  
config.start = false; // start SNTP service explicitly  
config.server_from_dhcp = true; // accept NTP offer from DHCP server  
esp_netif_sntp_init(&config);
```

Then, once we're connected, we could start the service using:

```
esp_netif_sntp_start();
```

---

**Note:** It's also possible to start the service during initialization (default `config.start=true`). This would likely cause the initial SNTP request to fail (since we are not connected yet) and thus some backoff time for subsequent requests.

---

**Use both static and dynamic servers** Very similar to the scenario above (DHCP provided SNTP server), but in this configuration we need to make sure that the static server configuration is refreshed when obtaining NTP servers by DHCP. The underlying lwIP code cleans up the rest of the list of NTP servers when DHCP provided information

gets accepted. Thus the ESP-NETIF SNTP module saves the statically configured server(s) and reconfigures them after obtaining DHCP lease.

The typical configuration now looks as per below, providing the specific `IP_EVENT` to update the config and index of the first server to reconfigure (for example setting `config.index_of_first_server=1` would keep DHCP provided server at index 0, and the statically configured server at index 1).

```
esp_sntp_config_t config = ESP_NETIF_Sntp_DEFAULT_CONFIG("pool.ntp.org");
config.start = false; // start SNTP service explicitly
↳(after connecting)
config.server_from_dhcp = true; // accept NTP offers from DHCP server
config.renew_servers_after_new_IP = true; // let esp-netif update configured
↳SNTP server(s) after receiving DHCP lease
config.index_of_first_server = 1; // updates from server num 1, leaving
↳server 0 (from DHCP) intact
config.ip_event_to_renew = IP_EVENT_STA_GOT_IP; // IP event on which we refresh
↳the configuration
```

Then we start the service normally with `esp_netif_sntp_start()`.

**ESP-NETIF programmer's manual** Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: [wifi/getting\\_started/station/main/station\\_example\\_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet\\_example\\_main.c](#)
- L2 TAP: [protocols/l2tap/main/l2tap\\_main.c](#)
- WiFi Access Point: [wifi/getting\\_started/softAP/main/softap\\_example\\_main.c](#)

For more specific cases please consult this guide: [ESP-NETIF Custom I/O Driver](#).

**WiFi default initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`
- `esp_netif_create_default_wifi_ap()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These *default* interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

## API Reference

### Header File

- [components/esp\\_netif/include/esp\\_netif.h](#)

### Functions

`esp_err_t esp_netif_init` (void)

Initialize the underlying TCP/IP stack.

---

**Note:** This function should be called exactly once from application code, when the application starts up.

---

**Returns**

- ESP\_OK on success
- ESP\_FAIL if initializing failed

*esp\_err\_t* **esp\_netif\_deinit** (void)

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

Note: Deinitialization **is not** supported yet

**Returns**

- ESP\_ERR\_INVALID\_STATE if esp\_netif not initialized
- ESP\_ERR\_NOT\_SUPPORTED otherwise

*esp\_netif\_t* \***esp\_netif\_new** (const *esp\_netif\_config\_t* \*esp\_netif\_config)

Creates an instance of new esp-netif object based on provided config.

**Parameters** *esp\_netif\_config* -- pointer esp-netif configuration

**Returns**

- pointer to esp-netif object on success
- NULL otherwise

void **esp\_netif\_destroy** (*esp\_netif\_t* \*esp\_netif)

Destroys the esp\_netif object.

**Parameters** *esp\_netif* -- [in] pointer to the object to be deleted

*esp\_err\_t* **esp\_netif\_set\_driver\_config** (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_driver\_ifconfig\_t* \*driver\_config)

Configures driver related options of esp\_netif object.

**Parameters**

- *esp\_netif* -- [inout] pointer to the object to be configured
- *driver\_config* -- [in] pointer esp-netif io driver related configuration

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS if invalid parameters provided

*esp\_err\_t* **esp\_netif\_attach** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_io\_driver\_handle* driver\_handle)

Attaches esp\_netif instance to the io driver handle.

Calling this function enables connecting specific esp\_netif object with already initialized io driver to update esp\_netif object with driver specific configuration (i.e. calls post\_attach callback, which typically sets io driver callbacks to esp\_netif instance and starts the driver)

**Parameters**

- *esp\_netif* -- [inout] pointer to esp\_netif object to be attached
- *driver\_handle* -- [in] pointer to the driver handle

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_DRIVER\_ATTACH\_FAILED if driver's pot\_attach callback failed

*esp\_err\_t* **esp\_netif\_receive** (*esp\_netif\_t* \*esp\_netif, void \*buffer, size\_t len, void \*eb)

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Parameters**

- *esp\_netif* -- [in] Handle to esp-netif instance
- *buffer* -- [in] Received data

- **len** -- **[in]** Length of the data frame
- **eb** -- **[in]** Pointer to internal buffer (used in Wi-Fi driver)

**Returns**

- ESP\_OK

void **esp\_netif\_action\_start** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver start event Creates network interface, if AUTOUP enabled turns the interface on, if DHCP enabled starts dhcp server.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** --
- **event\_id** --
- **data** --

void **esp\_netif\_action\_stop** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver stop event.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** --
- **event\_id** --
- **data** --

void **esp\_netif\_action\_connected** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver connected event.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** --
- **event\_id** --
- **data** --

void **esp\_netif\_action\_disconnected** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IO driver disconnected event.

---

**Note:** This API can be directly used as event handler

---

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **base** --
- **event\_id** --
- **data** --

void **esp\_netif\_action\_got\_ip** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)  
Default building block for network interface action upon network got IP event.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **base** --
- **event\_id** --
- **data** --

void **esp\_netif\_action\_join\_ip6\_multicast\_group** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 multicast group join.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **base** --
- **event\_id** --
- **data** --

void **esp\_netif\_action\_leave\_ip6\_multicast\_group** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 multicast group leave.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **base** --
- **event\_id** --
- **data** --

void **esp\_netif\_action\_add\_ip6\_address** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 address added by the underlying stack.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **base** --
- **event\_id** --
- **data** --

void **esp\_netif\_action\_remove\_ip6\_address** (void \*esp\_netif, esp\_event\_base\_t base, int32\_t event\_id, void \*data)

Default building block for network interface action upon IPv6 address removed by the underlying stack.

---

**Note:** This API can be directly used as event handler

---

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **base** --
- **event\_id** --
- **data** --

*esp\_err\_t* **esp\_netif\_set\_default\_netif** (*esp\_netif\_t* \*esp\_netif)

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route\_prio. If the selected netif is set default using this API, no other interface could be set-default disregarding its route\_prio number (unless the selected netif gets destroyed).

**Parameters** **esp\_netif** -- [in] Handle to esp-netif instance

**Returns** ESP\_OK on success

*esp\_netif\_t* \***esp\_netif\_get\_default\_netif** (void)

Getter function of the default netif.

This API returns the selected default netif.

**Returns** Handle to esp-netif instance of the default netif.

*esp\_err\_t* **esp\_netif\_join\_ip6\_multicast\_group** (*esp\_netif\_t* \*esp\_netif, const *esp\_ip6\_addr\_t* \*addr)

Cause the TCP/IP stack to join a IPv6 multicast group.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **addr** -- [in] The multicast group to join

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED
- ESP\_ERR\_NO\_MEM

*esp\_err\_t* **esp\_netif\_leave\_ip6\_multicast\_group** (*esp\_netif\_t* \*esp\_netif, const *esp\_ip6\_addr\_t* \*addr)

Cause the TCP/IP stack to leave a IPv6 multicast group.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **addr** -- [in] The multicast group to leave

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_MLD6\_FAILED
- ESP\_ERR\_NO\_MEM

*esp\_err\_t* **esp\_netif\_set\_mac** (*esp\_netif\_t* \*esp\_netif, uint8\_t mac[])

Set the mac address for the interface instance.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **mac** -- [in] Desired mac address for the related network interface

#### Returns

- ESP\_OK - success
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY - interface status error

- `ESP_ERR_NOT_SUPPORTED` - mac not supported on this interface

`esp_err_t esp_netif_get_mac (esp_netif_t *esp_netif, uint8_t mac[])`

Get the mac address for the interface instance.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **mac** -- [out] Resultant mac address for the related network interface

#### Returns

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_NOT_SUPPORTED` - mac not supported on this interface

`esp_err_t esp_netif_set_hostname (esp_netif_t *esp_netif, const char *hostname)`

Set the hostname of an interface.

The configured hostname overrides the default configuration value `CONFIG_LWIP_LOCAL_HOSTNAME`. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **hostname** -- [in] New hostname for the interface. Maximum length 32 bytes.

#### Returns

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` - parameter error

`esp_err_t esp_netif_get_hostname (esp_netif_t *esp_netif, const char **hostname)`

Get interface hostname.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **hostname** -- [out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

#### Returns

- `ESP_OK` - success
- `ESP_ERR_ESP_NETIF_IF_NOT_READY` - interface status error
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS` - parameter error

`bool esp_netif_is_netif_up (esp_netif_t *esp_netif)`

Test if supplied interface is up or down.

**Parameters** **esp\_netif** -- [in] Handle to esp-netif instance

#### Returns

- true - Interface is up
- false - Interface is down

`esp_err_t esp_netif_get_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)`

Get interface's IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **ip\_info** -- [out] If successful, IP information will be returned in this argument.

#### Returns

- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

*esp\_err\_t esp\_netif\_get\_old\_ip\_info* (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_ip\_info\_t* \*ip\_info)

Get interface's old IP information.

Returns an "old" IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **ip\_info** -- [out] If successful, IP information will be returned in this argument.

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t esp\_netif\_set\_ip\_info* (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_ip\_info\_t* \*ip\_info)

Set interface's IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

---

**Note:** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

---

---

**Note:** Calling this interface for may generate a SYSTEM\_EVENT\_STA\_GOT\_IP or SYSTEM\_EVENT\_ETH\_GOT\_IP event.

---

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **ip\_info** -- [in] IP information to set on the specified interface

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_NOT\_STOPPED If DHCP server or client is still running

*esp\_err\_t esp\_netif\_set\_old\_ip\_info* (*esp\_netif\_t* \*esp\_netif, const *esp\_netif\_ip\_info\_t* \*ip\_info)

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the "IP lost timer" will expire (after the configured interval) and set the old IP information to zero.

#### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **ip\_info** -- [in] Store the old IP information for the specified interface

#### Returns

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

`int esp_netif_get_netif_impl_index (esp_netif_t *esp_netif)`

Get net interface index from network stack implementation.

---

**Note:** This index could be used in `setsockopt ()` to bind socket with multicast interface

---

**Parameters** `esp_netif` -- **[in]** Handle to esp-netif instance

**Returns** implementation specific index of interface represented with supplied `esp_netif`

`esp_err_t esp_netif_get_netif_impl_name (esp_netif_t *esp_netif, char *name)`

Get net interface name from network stack implementation.

---

**Note:** This name could be used in `setsockopt ()` to bind socket with appropriate interface

---

**Parameters**

- `esp_netif` -- **[in]** Handle to esp-netif instance
- `name` -- **[out]** Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

`esp_err_t esp_netif_napt_enable (esp_netif_t *esp_netif)`

Enable NAPT on an interface.

---

**Note:** Enable operation can be performed only on one interface at a time. NAPT cannot be enabled on multiple interfaces according to this implementation.

---

**Parameters** `esp_netif` -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_NOT\_SUPPORTED

`esp_err_t esp_netif_napt_disable (esp_netif_t *esp_netif)`

Disable NAPT on an interface.

**Parameters** `esp_netif` -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_FAIL
- ESP\_ERR\_NOT\_SUPPORTED

`esp_err_t esp_netif_dhcps_option (esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)`

Set or Get DHCP server option.

**Parameters**

- `esp_netif` -- **[in]** Handle to esp-netif instance
- `opt_op` -- **[in]** ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- `opt_id` -- **[in]** Option index to get or set, must be one of the supported enum values.
- `opt_val` -- **[inout]** Pointer to the option parameter.
- `opt_len` -- **[in]** Length of the option parameter.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcpc\_option** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_option\_mode\_t* opt\_op, *esp\_netif\_dhcp\_option\_id\_t* opt\_id, void \*opt\_val, uint32\_t opt\_len)

Set or Get DHCP client option.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **opt\_op** -- **[in]** ESP\_NETIF\_OP\_SET to set an option, ESP\_NETIF\_OP\_GET to get an option.
- **opt\_id** -- **[in]** Option index to get or set, must be one of the supported enum values.
- **opt\_val** -- **[inout]** Pointer to the option parameter.
- **opt\_len** -- **[in]** Length of the option parameter.

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcpc\_start** (*esp\_netif\_t* \*esp\_netif)

Start DHCP client (only if enabled in interface object)

---

**Note:** The default event handlers for the SYSTEM\_EVENT\_STA\_CONNECTED and SYSTEM\_EVENT\_ETH\_CONNECTED events call this function.

---

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED
- ESP\_ERR\_ESP\_NETIF\_DHCPC\_START\_FAILED

*esp\_err\_t* **esp\_netif\_dhcpc\_stop** (*esp\_netif\_t* \*esp\_netif)

Stop DHCP client (only if enabled in interface object)

---

**Note:** Calling action\_netif\_stop() will also stop the DHCP Client if it is running.

---

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

*esp\_err\_t* **esp\_netif\_dhcpc\_get\_status** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_status\_t* \*status)

Get DHCP client status.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **status** -- **[out]** If successful, the status of DHCP client will be returned in this argument.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_netif\_dhcps\_get\_status** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dhcp\_status\_t* \*status)

Get DHCP Server status.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **status** -- **[out]** If successful, the status of the DHCP server will be returned in this argument.

**Returns**

- ESP\_OK

*esp\_err\_t* **esp\_netif\_dhcps\_start** (*esp\_netif\_t* \*esp\_netif)

Start DHCP server (only if enabled in interface object)

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STARTED

*esp\_err\_t* **esp\_netif\_dhcps\_stop** (*esp\_netif\_t* \*esp\_netif)

Stop DHCP server (only if enabled in interface object)

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS
- ESP\_ERR\_ESP\_NETIF\_DHCP\_ALREADY\_STOPPED
- ESP\_ERR\_ESP\_NETIF\_IF\_NOT\_READY

*esp\_err\_t* **esp\_netif\_dhcps\_get\_clients\_by\_mac** (*esp\_netif\_t* \*esp\_netif, int num, *esp\_netif\_pair\_mac\_ip\_t* \*mac\_ip\_pair)

Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **num** -- **[in]** Number of clients with specified MAC addresses in the array of pairs
- **mac\_ip\_pair** -- **[inout]** Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS on invalid params
- ESP\_ERR\_NOT\_SUPPORTED if DHCP server not enabled

*esp\_err\_t* **esp\_netif\_set\_dns\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dns\_type\_t* type, *esp\_netif\_dns\_info\_t* \*dns)

Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP\_NETIF\_DNS\_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance

- **type** -- **[in]** Type of DNS Server to set: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- **dns** -- **[in]** DNS Server address to set

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

*esp\_err\_t* **esp\_netif\_get\_dns\_info** (*esp\_netif\_t* \*esp\_netif, *esp\_netif\_dns\_type\_t* type, *esp\_netif\_dns\_info\_t* \*dns)

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to *esp\_netif\_set\_dns\_info()*. If the interface's DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **type** -- **[in]** Type of DNS Server to get: ESP\_NETIF\_DNS\_MAIN, ESP\_NETIF\_DNS\_BACKUP, ESP\_NETIF\_DNS\_FALLBACK
- **dns** -- **[out]** DNS Server result is written here on success

**Returns**

- ESP\_OK on success
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS invalid params

*esp\_err\_t* **esp\_netif\_create\_ip6\_linklocal** (*esp\_netif\_t* \*esp\_netif)

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM\_EVENT\_GOT\_IP6 event will be sent.

**Parameters** **esp\_netif** -- **[in]** Handle to esp-netif instance

**Returns**

- ESP\_OK
- ESP\_ERR\_ESP\_NETIF\_INVALID\_PARAMS

*esp\_err\_t* **esp\_netif\_get\_ip6\_linklocal** (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* \*if\_ip6)

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **if\_ip6** -- **[out]** IPv6 information will be returned in this argument if successful.

**Returns**

- ESP\_OK
- ESP\_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

*esp\_err\_t* **esp\_netif\_get\_ip6\_global** (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* \*if\_ip6)

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **if\_ip6** -- **[out]** IPv6 information will be returned in this argument if successful.

**Returns**

- ESP\_OK

- **ESP\_FAIL** If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

int **esp\_netif\_get\_all\_ip6** (*esp\_netif\_t* \*esp\_netif, *esp\_ip6\_addr\_t* if\_ip6[])

Get all IPv6 addresses of the specified interface.

**Parameters**

- **esp\_netif** -- **[in]** Handle to esp-netif instance
- **if\_ip6** -- **[out]** Array of IPv6 addresses will be copied to the argument

**Returns** number of returned IPv6 addresses

void **esp\_netif\_set\_ip4\_addr** (*esp\_ip4\_addr\_t* \*addr, uint8\_t a, uint8\_t b, uint8\_t c, uint8\_t d)

Sets IPv4 address to the specified octets.

**Parameters**

- **addr** -- **[out]** IP address to be set
- **a** -- the first octet (127 for IP 127.0.0.1)
- **b** --
- **c** --
- **d** --

char \***esp\_ip4addr\_ntoa** (const *esp\_ip4\_addr\_t* \*addr, char \*buf, int buflen)

Converts numeric IP address into decimal dotted ASCII representation.

**Parameters**

- **addr** -- ip address in network order to convert
- **buf** -- target buffer where the string is stored
- **buflen** -- length of buf

**Returns** either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

uint32\_t **esp\_ip4addr\_aton** (const char \*addr)

Ascii internet address interpretation routine The value returned is in network order.

**Parameters** **addr** -- IP address in ascii representation (e.g. "127.0.0.1")

**Returns** ip address in network order

*esp\_err\_t* **esp\_netif\_str\_to\_ip4** (const char \*src, *esp\_ip4\_addr\_t* \*dst)

Converts Ascii internet IPv4 address into esp\_ip4\_addr\_t.

**Parameters**

- **src** -- **[in]** IPv4 address in ascii representation (e.g. "127.0.0.1")
- **dst** -- **[out]** Address of the target esp\_ip4\_addr\_t structure to receive converted address

**Returns**

- **ESP\_OK** on success
- **ESP\_FAIL** if conversion failed
- **ESP\_ERR\_INVALID\_ARG** if invalid parameter is passed into

*esp\_err\_t* **esp\_netif\_str\_to\_ip6** (const char \*src, *esp\_ip6\_addr\_t* \*dst)

Converts Ascii internet IPv6 address into esp\_ip4\_addr\_t Zeros in the IP address can be stripped or completely omitted: "2001:db8:85a3:0:0:0:2:1" or "2001:db8::2:1")

**Parameters**

- **src** -- **[in]** IPv6 address in ascii representation (e.g. ""2001:0db8:85a3:0000:0000:0000:0002:0001")
- **dst** -- **[out]** Address of the target esp\_ip6\_addr\_t structure to receive converted address

**Returns**

- **ESP\_OK** on success
- **ESP\_FAIL** if conversion failed
- **ESP\_ERR\_INVALID\_ARG** if invalid parameter is passed into

*esp\_netif\_io\_driver\_handle* **esp\_netif\_get\_io\_driver** (*esp\_netif\_t* \*esp\_netif)

Gets media driver handle for this esp-netif instance.

**Parameters** `esp_netif` -- **[in]** Handle to esp-netif instance

**Returns** opaque pointer of related IO driver

`esp_netif_t *esp_netif_get_handle_from_ifkey` (const char \*if\_key)

Searches over a list of created objects to find an instance with supplied if key.

**Parameters** `if_key` -- Textual description of network interface

**Returns** Handle to esp-netif instance

`esp_netif_flags_t esp_netif_get_flags` (`esp_netif_t *esp_netif`)

Returns configured flags for this interface.

**Parameters** `esp_netif` -- **[in]** Handle to esp-netif instance

**Returns** Configuration flags

const char \*`esp_netif_get_ifkey` (`esp_netif_t *esp_netif`)

Returns configured interface key for this esp-netif instance.

**Parameters** `esp_netif` -- **[in]** Handle to esp-netif instance

**Returns** Textual description of related interface

const char \*`esp_netif_get_desc` (`esp_netif_t *esp_netif`)

Returns configured interface type for this esp-netif instance.

**Parameters** `esp_netif` -- **[in]** Handle to esp-netif instance

**Returns** Enumerated type of this interface, such as station, AP, ethernet

int `esp_netif_get_route_prio` (`esp_netif_t *esp_netif`)

Returns configured routing priority number.

**Parameters** `esp_netif` -- **[in]** Handle to esp-netif instance

**Returns** Integer representing the instance's route-prio, or -1 if invalid paramters

int32\_t `esp_netif_get_event_id` (`esp_netif_t *esp_netif`, `esp_netif_ip_event_type_t event_type`)

Returns configured event for this esp-netif instance and supplied event type.

**Parameters**

- `esp_netif` -- **[in]** Handle to esp-netif instance
- `event_type` -- (either get or lost IP)

**Returns** specific event id which is configured to be raised if the interface lost or acquired IP address  
-1 if supplied event\_type is not known

`esp_netif_t *esp_netif_next` (`esp_netif_t *esp_netif`)

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

You can use `esp_netif_next_unsafe()` directly if all the system interfaces are under your control and you can safely iterate over them. Otherwise, iterate over interfaces using `esp_netif_tcpip_exec()`, or use `esp_netif_find_if()` to search in the list of netifs with defined predicate.

---

**Note:** This API doesn't lock the list, nor the TCPIP context, as this it's usually required to get atomic access between iteration steps rather than within a single iteration. Therefore it is recommended to iterate over the interfaces inside `esp_netif_tcpip_exec()`

---

**Parameters** `esp_netif` -- **[in]** Handle to esp-netif instance

**Returns** First netif from the list if supplied parameter is NULL, next one otherwise

`esp_netif_t *esp_netif_next_unsafe` (`esp_netif_t *esp_netif`)

Iterates over list of interfaces without list locking. Returns first netif if NULL given as parameter.

Used for bulk search loops within TCPIP context, e.g. using `esp_netif_tcpip_exec()`, or if we're sure that the iteration is safe from our application perspective (e.g. no interface is removed between iterations)

**Parameters** `esp_netif` -- [in] Handle to esp-netif instance

**Returns** First netif from the list if supplied parameter is NULL, next one otherwise

`esp_netif_t *esp_netif_find_if(esp_netif_find_predicate_t fn, void *ctx)`

Return a netif pointer for the first interface that meets criteria defined by the callback.

**Parameters**

- `fn` -- Predicate function returning true for the desired interface
- `ctx` -- Context pointer passed to the predicate, typically a descriptor to compare with

**Returns** valid netif pointer if found, NULL if not

`size_t esp_netif_get_nr_of_ifs(void)`

Returns number of registered esp\_netif objects.

**Returns** Number of esp\_netifs

`void esp_netif_netstack_buf_ref(void *netstack_buf)`

increase the reference counter of net stack buffer

**Parameters** `netstack_buf` -- [in] the net stack buffer

`void esp_netif_netstack_buf_free(void *netstack_buf)`

free the netstack buffer

**Parameters** `netstack_buf` -- [in] the net stack buffer

`esp_err_t esp_netif_tcpip_exec(esp_netif_callback_fn fn, void *ctx)`

Utility to execute the supplied callback in TCP/IP context.

**Parameters**

- `fn` -- Pointer to the callback
- `ctx` -- Parameter to the callback

**Returns** The error code (`esp_err_t`) returned by the callback

## Type Definitions

`typedef bool (*esp_netif_find_predicate_t)(esp_netif_t *netif, void *ctx)`

Predicate callback for `esp_netif_find_if()` used to find interface which meets defined criteria.

`typedef esp_err_t (*esp_netif_callback_fn)(void *ctx)`

TCPIP thread safe callback used with `esp_netif_tcpip_exec()`

## Header File

- `components/esp_netif/include/esp_netif_sntp.h`

## Functions

`esp_err_t esp_netif_sntp_init(const esp_sntp_config_t *config)`

Initialize SNTP with supplied config struct.

**Parameters** `config` -- Config struct

**Returns** ESP\_OK on success

`esp_err_t esp_netif_sntp_start(void)`

Start SNTP service if it wasn't started during init (`config.start = false`) or restart it if already started.

**Returns** ESP\_OK on success

`void esp_netif_sntp_deinit(void)`

Deinitialize esp\_netif SNTP module.

*esp\_err\_t* **esp\_netif\_sntp\_sync\_wait** (TickType\_t tout)

Wait for time sync event.

**Parameters** tout -- Specified timeout in RTOS ticks

**Returns** ESP\_TIMEOUT if sync event didn't come within the timeout  
ESP\_ERR\_NOT\_FINISHED if the sync event came, but we're in smooth update mode  
and still in progress (SNTP\_SYNC\_STATUS\_IN\_PROGRESS) ESP\_OK if time sync'ed

*esp\_err\_t* **esp\_netif\_sntp\_reachability** (unsigned int index, unsigned int \*reachability)

Returns SNTP server's reachability shift register as described in RFC 5905.

**Parameters**

- **index** -- Index of the SERVER
- **reachability** -- reachability shift register

**Returns** ESP\_OK on success, ESP\_ERR\_INVALID\_STATE if SNTP not initialized  
ESP\_ERR\_INVALID\_ARG if invalid arguments

## Structures

struct **esp\_sntp\_config**

SNTP configuration struct.

### Public Members

bool **smooth\_sync**

set to true if smooth sync required

bool **server\_from\_dhcp**

set to true to request NTP server config from DHCP

bool **wait\_for\_sync**

if true, we create a semaphore to signal time sync event

bool **start**

set to true to automatically start the SNTP service

*esp\_sntp\_time\_cb\_t* **sync\_cb**

optionally sets callback function on time sync event

bool **renew\_servers\_after\_new\_IP**

this is used to refresh server list if NTP provided by DHCP (which cleans other pre-configured servers)

*ip\_event\_t* **ip\_event\_to\_renew**

set the IP event id on which we refresh server list (if renew\_servers\_after\_new\_IP=true)

size\_t **index\_of\_first\_server**

refresh server list after this server (if renew\_servers\_after\_new\_IP=true)

size\_t **num\_of\_servers**

number of preconfigured NTP servers

const char \***servers**[1]

list of servers

## Macros

**ESP\_SNTP\_SERVER\_LIST** (...)

Utility macro for providing multiple servers in parentheses.

**ESP\_NETIF\_SNTP\_DEFAULT\_CONFIG\_MULTIPLE** (servers\_in\_list, list\_of\_servers)

Default configuration to init SNTP with multiple servers.

### Parameters

- **servers\_in\_list** -- Number of servers in the list
- **list\_of\_servers** -- List of servers (use [ESP\\_SNTP\\_SERVER\\_LIST\(...\)](#))

**ESP\_NETIF\_SNTP\_DEFAULT\_CONFIG** (server)

Default configuration with a single server.

## Type Definitions

typedef void (\***esp\_sntp\_time\_cb\_t**)(struct timeval \*tv)

Time sync notification function.

typedef struct *esp\_sntp\_config* **esp\_sntp\_config\_t**

SNTP configuration struct.

## Header File

- [components/esp\\_netif/include/esp\\_netif\\_types.h](#)

## Structures

struct **esp\_netif\_dns\_info\_t**

DNS server info.

### Public Members

*esp\_ip\_addr\_t* **ip**

IPV4 address of DNS server

struct **esp\_netif\_ip\_info\_t**

Event structure for IP\_EVENT\_STA\_GOT\_IP, IP\_EVENT\_ETH\_GOT\_IP events

### Public Members

*esp\_ip4\_addr\_t* **ip**

Interface IPV4 address

*esp\_ip4\_addr\_t* **netmask**

Interface IPV4 netmask

*esp\_ip4\_addr\_t* **gw**

Interface IPV4 gateway address

struct **esp\_netif\_ip6\_info\_t**

IPV6 IP address information.

**Public Members***esp\_ip6\_addr\_t* **ip**

Interface IPV6 address

struct **ip\_event\_got\_ip\_t**

Event structure for IP\_EVENT\_GOT\_IP event.

**Public Members***esp\_netif\_t* \***esp\_netif**

Pointer to corresponding esp-netif object

*esp\_netif\_ip\_info\_t* **ip\_info**

IP address, netmask, gateway IP address

bool **ip\_changed**

Whether the assigned IP has changed or not

struct **ip\_event\_got\_ip6\_t**

Event structure for IP\_EVENT\_GOT\_IP6 event

**Public Members***esp\_netif\_t* \***esp\_netif**

Pointer to corresponding esp-netif object

*esp\_netif\_ip6\_info\_t* **ip6\_info**

IPv6 address of the interface

int **ip\_index**

IPv6 address index

struct **ip\_event\_add\_ip6\_t**

Event structure for ADD\_IP6 event

**Public Members***esp\_ip6\_addr\_t* **addr**

The address to be added to the interface

bool **preferred**

The default preference of the address

struct **ip\_event\_ap\_staipassigned\_t**

Event structure for IP\_EVENT\_AP\_STAIPASSIGNED event

**Public Members**

*esp\_netif\_t* \***esp\_netif**

Pointer to the associated netif handle

*esp\_ip4\_addr\_t* **ip**

IP address which was assigned to the station

uint8\_t **mac**[6]

MAC address of the connected client

struct **bridgeif\_config**

LwIP bridge configuration

**Public Members**

uint16\_t **max\_fdb\_dyn\_entries**

maximum number of entries in dynamic forwarding database

uint16\_t **max\_fdb\_sta\_entries**

maximum number of entries in static forwarding database

uint8\_t **max\_ports**

maximum number of ports the bridge can consist of

struct **esp\_netif\_inherent\_config**

ESP-netif inherent config parameters.

**Public Members**

*esp\_netif\_flags\_t* **flags**

flags that define esp-netif behavior

uint8\_t **mac**[6]

initial mac address for this interface

const *esp\_netif\_ip\_info\_t* \***ip\_info**

initial ip address for this interface

uint32\_t **get\_ip\_event**

event id to be raised when interface gets an IP

uint32\_t **lost\_ip\_event**

event id to be raised when interface loses its IP

const char \***if\_key**

string identifier of the interface

const char **\*if\_desc**  
textual description of the interface

int **route\_prio**  
numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of route\_prio indicates a higher priority

*bridgeif\_config\_t* **\*bridge\_info**  
LwIP bridge configuration

struct **esp\_netif\_driver\_base\_s**  
ESP-netif driver base handle.

### Public Members

*esp\_err\_t* (**\*post\_attach**)(*esp\_netif\_t* \*netif, *esp\_netif\_iodriver\_handle* h)  
post attach function pointer

*esp\_netif\_t* **\*netif**  
netif handle

struct **esp\_netif\_driver\_ifconfig**  
Specific IO driver configuration.

### Public Members

*esp\_netif\_iodriver\_handle* **handle**  
io-driver handle

*esp\_err\_t* (**\*transmit**)(void \*h, void \*buffer, size\_t len)  
transmit function pointer

*esp\_err\_t* (**\*transmit\_wrap**)(void \*h, void \*buffer, size\_t len, void \*netstack\_buffer)  
transmit wrap function pointer

void (**\*driver\_free\_rx\_buffer**)(void \*h, void \*buffer)  
free rx buffer function pointer

struct **esp\_netif\_config**  
Generic esp\_netif configuration.

### Public Members

const *esp\_netif\_inherent\_config\_t* **\*base**  
base config

```
const esp_netif_driver_ifconfig_t *driver
```

driver config

```
const esp_netif_netstack_config_t *stack
```

stack config

```
struct esp_netif_pair_mac_ip_t
```

DHCP client's addr info (pair of MAC and IP address)

### Public Members

```
uint8_t mac[6]
```

Clients MAC address

```
esp_ip4_addr_t ip
```

Clients IP address

### Macros

```
ESP_ERR_ESP_NETIF_BASE
```

Definition of ESP-NETIF based errors.

```
ESP_ERR_ESP_NETIF_INVALID_PARAMS
```

```
ESP_ERR_ESP_NETIF_IF_NOT_READY
```

```

```

```
ESP_ERR_ESP_NETIF_IP6_ADDR_FAILED
```

**ESP\_ERR\_ESP\_NETIF\_DHCP\_START\_FAILED**

**ESP\_NETIF\_BR\_FLOOD**

Definition of ESP-NETIF bridge controll.

**ESP\_NETIF\_BR\_DROP**

**ESP\_NETIF\_BR\_FDW\_CPU**

### Type Definitions

typedef struct esp\_netif\_obj **esp\_netif\_t**

typedef enum *esp\_netif\_flags* **esp\_netif\_flags\_t**

typedef enum *esp\_netif\_ip\_event\_type* **esp\_netif\_ip\_event\_type\_t**

typedef struct *bridgeif\_config* **bridgeif\_config\_t**

LwIP bridge configuration

typedef struct *esp\_netif\_inherent\_config* **esp\_netif\_inherent\_config\_t**

ESP-netif inherent config parameters.

typedef struct *esp\_netif\_config* **esp\_netif\_config\_t**

typedef void \***esp\_netif\_iodriver\_handle**

IO driver handle type.

typedef struct *esp\_netif\_driver\_base\_s* **esp\_netif\_driver\_base\_t**

ESP-netif driver base handle.

typedef struct *esp\_netif\_driver\_ifconfig* **esp\_netif\_driver\_ifconfig\_t**

typedef struct esp\_netif\_netstack\_config **esp\_netif\_netstack\_config\_t**

Specific L3 network stack configuration.

typedef *esp\_err\_t* (\***esp\_netif\_receive\_t**)(*esp\_netif\_t* \*esp\_netif, void \*buffer, size\_t len, void \*eb)

ESP-NETIF Receive function type.

### Enumerations

enum **esp\_netif\_dns\_type\_t**

Type of DNS server.

*Values:*

enumerator **ESP\_NETIF\_DNS\_MAIN**

DNS main server address

enumerator **ESP\_NETIF\_DNS\_BACKUP**

DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator **ESP\_NETIF\_DNS\_FALLBACK**

DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator **ESP\_NETIF\_DNS\_MAX**

enum **esp\_netif\_dhcp\_status\_t**

Status of DHCP client or DHCP server.

*Values:*

enumerator **ESP\_NETIF\_DHCP\_INIT**

DHCP client/server is in initial state (not yet started)

enumerator **ESP\_NETIF\_DHCP\_STARTED**

DHCP client/server has been started

enumerator **ESP\_NETIF\_DHCP\_STOPPED**

DHCP client/server has been stopped

enumerator **ESP\_NETIF\_DHCP\_STATUS\_MAX**

enum **esp\_netif\_dhcp\_option\_mode\_t**

Mode for DHCP client or DHCP server option functions.

*Values:*

enumerator **ESP\_NETIF\_OP\_START**

enumerator **ESP\_NETIF\_OP\_SET**

Set option

enumerator **ESP\_NETIF\_OP\_GET**

Get option

enumerator **ESP\_NETIF\_OP\_MAX**

enum **esp\_netif\_dhcp\_option\_id\_t**

Supported options for DHCP client or DHCP server.

*Values:*

enumerator **ESP\_NETIF\_SUBNET\_MASK**

Network mask

enumerator **ESP\_NETIF\_DOMAIN\_NAME\_SERVER**

Domain name server

enumerator **ESP\_NETIF\_ROUTER\_SOLICITATION\_ADDRESS**

Solicitation router address

enumerator **ESP\_NETIF\_REQUESTED\_IP\_ADDRESS**

Request specific IP address

enumerator **ESP\_NETIF\_IP\_ADDRESS\_LEASE\_TIME**

Request IP address lease time

enumerator **ESP\_NETIF\_IP\_REQUEST\_RETRY\_TIME**

Request IP address retry counter

enumerator **ESP\_NETIF\_VENDOR\_CLASS\_IDENTIFIER**

Vendor Class Identifier of a DHCP client

enumerator **ESP\_NETIF\_VENDOR\_SPECIFIC\_INFO**

Vendor Specific Information of a DHCP server

enum **ip\_event\_t**

IP event declarations

*Values:*

enumerator **IP\_EVENT\_STA\_GOT\_IP**

station got IP from connected AP

enumerator **IP\_EVENT\_STA\_LOST\_IP**

station lost IP and the IP is reset to 0

enumerator **IP\_EVENT\_AP\_STAIPASSIGNED**

soft-AP assign an IP to a connected station

enumerator **IP\_EVENT\_GOT\_IP6**

station or ap or ethernet interface v6IP addr is preferred

enumerator **IP\_EVENT\_ETH\_GOT\_IP**

ethernet got IP from connected AP

enumerator **IP\_EVENT\_ETH\_LOST\_IP**

ethernet lost IP and the IP is reset to 0

enumerator **IP\_EVENT\_PPP\_GOT\_IP**

PPP interface got IP

enumerator **IP\_EVENT\_PPP\_LOST\_IP**

PPP interface lost IP

enum **esp\_netif\_flags**

*Values:*

enumerator **ESP\_NETIF\_DHCP\_CLIENT**

enumerator **ESP\_NETIF\_DHCP\_SERVER**

enumerator **ESP\_NETIF\_FLAG\_AUTOUP**

enumerator **ESP\_NETIF\_FLAG\_GARP**

enumerator **ESP\_NETIF\_FLAG\_EVENT\_IP\_MODIFIED**

enumerator **ESP\_NETIF\_FLAG\_IS\_PPP**

enumerator **ESP\_NETIF\_FLAG\_IS\_BRIDGE**

enumerator **ESP\_NETIF\_FLAG\_MLDV6\_REPORT**

enum **esp\_netif\_ip\_event\_type**

*Values:*

enumerator **ESP\_NETIF\_IP\_EVENT\_GOT\_IP**

enumerator **ESP\_NETIF\_IP\_EVENT\_LOST\_IP**

### Functions

*esp\_ip6\_addr\_type\_t* **esp\_netif\_ip6\_get\_addr\_type** (*esp\_ip6\_addr\_t* \*ip6\_addr)

Get the IPv6 address type.

**Parameters** **ip6\_addr** -- [in] IPv6 type

**Returns** IPv6 type in form of enum *esp\_ip6\_addr\_type\_t*

static inline void **esp\_netif\_ip\_addr\_copy** (*esp\_ip\_addr\_t* \*dest, const *esp\_ip\_addr\_t* \*src)

Copy IP addresses.

**Parameters**

- **dest** -- [out] destination IP
- **src** -- [in] source IP

### Structures

struct **esp\_ip6\_addr**

IPv6 address.

### Public Members

uint32\_t **addr**[4]

IPv6 address

## Functions

*esp\_err\_t* **esp\_vfs\_l2tap\_intf\_register** (*l2tap\_vfs\_config\_t* \*config)

Add L2 TAP virtual filesystem driver.

This function must be called prior usage of ESP-NETIF L2 TAP Interface

**Parameters** **config** -- L2 TAP virtual filesystem driver configuration. Default base path /dev/net/tap is used when this parameter is NULL.

**Returns** *esp\_err\_t*

- ESP\_OK on success

*esp\_err\_t* **esp\_vfs\_l2tap\_intf\_unregister** (const char \*base\_path)

Removes L2 TAP virtual filesystem driver.

**Parameters** **base\_path** -- Base path to the L2 TAP virtual filesystem driver. Default path /dev/net/tap is used when this parameter is NULL.

**Returns** *esp\_err\_t*

- ESP\_OK on success

*esp\_err\_t* **esp\_vfs\_l2tap\_eth\_filter** (*l2tap\_iodriver\_handle* driver\_handle, void \*buff, *size\_t* \*size)

Filters received Ethernet L2 frames into L2 TAP infrastructure.

**Parameters**

- **driver\_handle** -- handle of driver at which the frame was received
- **buff** -- received L2 frame
- **size** -- input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP

**Returns** *esp\_err\_t*

- ESP\_OK is always returned

## Structures

struct **l2tap\_vfs\_config\_t**

L2Tap VFS config parameters.

## Public Members

const char \***base\_path**

vfs base path

## Macros

**L2TAP\_VFS\_DEFAULT\_PATH**

## WiFi default API reference

### Header File

- [components/esp\\_wifi/include/esp\\_wifi\\_default.h](#)

### Functions

*esp\_err\_t* **esp\_netif\_attach\_wifi\_station** (*esp\_netif\_t* \*esp\_netif)

Attaches wifi station interface to supplied netif.

**Parameters** **esp\_netif** -- instance to attach the wifi station to

**Returns**

- ESP\_OK on success
- ESP\_FAIL if attach failed

*esp\_err\_t* **esp\_netif\_attach\_wifi\_ap** (*esp\_netif\_t* \*esp\_netif)

Attaches wifi soft AP interface to supplied netif.

**Parameters** **esp\_netif** -- instance to attach the wifi AP to

**Returns**

- ESP\_OK on success
- ESP\_FAIL if attach failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_sta\_handlers** (void)

Sets default wifi event handlers for STA interface.

**Returns**

- ESP\_OK on success, error returned from esp\_event\_handler\_register if failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_ap\_handlers** (void)

Sets default wifi event handlers for AP interface.

**Returns**

- ESP\_OK on success, error returned from esp\_event\_handler\_register if failed

*esp\_err\_t* **esp\_wifi\_set\_default\_wifi\_nan\_handlers** (void)

Sets default wifi event handlers for NAN interface.

**Returns**

- ESP\_OK on success, error returned from esp\_event\_handler\_register if failed

*esp\_err\_t* **esp\_wifi\_clear\_default\_wifi\_driver\_and\_handlers** (void \*esp\_netif)

Clears default wifi event handlers for supplied network interface.

**Parameters** *esp\_netif* -- instance of corresponding if object

**Returns**

- ESP\_OK on success, error returned from esp\_event\_handler\_register if failed

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_ap** (void)

Creates default WIFI AP. In case of any init error this API aborts.

---

**Note:** The API creates esp\_netif object with default WiFi access point config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses assert() to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

---

**Returns** pointer to esp-netif instance

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_sta** (void)

Creates default WIFI STA. In case of any init error this API aborts.

---

**Note:** The API creates esp\_netif object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses assert() to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

---

**Returns** pointer to esp-netif instance

*esp\_netif\_t* \***esp\_netif\_create\_default\_wifi\_nan** (void)

Creates default WIFI NAN. In case of any init error this API aborts.

---

**Note:** The API creates esp\_netif object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. (Note that the default event loop needs to be created prior to calling this API)

---

**Returns** pointer to esp-netif instance

void **esp\_netif\_destroy\_default\_wifi** (void \*esp\_netif)

Destroys default WIFI netif created with esp\_netif\_create\_default\_wifi\_...() API.

---

**Note:** This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp\_netif is NULL)

---

**Parameters** *esp\_netif* -- [in] object to detach from WiFi and destroy

```
esp_netif_t *esp_netif_create_wifi (wifi_interface_t wifi_if, const esp_netif_inherent_config_t
                                     *esp_netif_config)
```

Creates esp\_netif WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

#### Parameters

- **wifi\_if** -- [in] type of wifi interface
- **esp\_netif\_config** -- inherent esp-netif configuration pointer

**Returns** pointer to esp-netif instance

```
esp_err_t esp_netif_create_default_wifi_mesh_netifs (esp_netif_t **p_netif_sta, esp_netif_t
                                                       **p_netif_ap)
```

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

#### Parameters

- **p\_netif\_sta** -- [out] pointer where the resultant STA interface is saved (if non NULL)
- **p\_netif\_ap** -- [out] pointer where the resultant AP interface is saved (if non NULL)

**Returns** ESP\_OK on success

## 2.5.5 IP Network Layer

### ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver's lifecycle transitions.

**Packet input/output** As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- *esp\_netif\_transmit()*
- *esp\_netif\_free\_rx\_buffer()*
- *esp\_netif\_receive()*

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver's code simply calls *esp\_netif\_receive()* on a new data received event.

**Post attach callback** A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t
                             ↪driver_handle);
```

It is assumed that the *esp\_netif\_iodriver\_handle* is a pointer to driver's object, a struct derived from struct *esp\_netif\_driver\_base\_s*, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;           /*!< base structure reserved as_
↪esp-netif driver */
    driver_impl             *h;           /*!< handle of driver_
↪implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver's code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default handlers** I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example *driver start* → *network start*, etc. An example of such a default handler is provided below:

```
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_
↪netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_
↪EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_
↪EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

**Network stack connection** The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer.

Note, that IDF provides several network stack configurations for the most common network interfaces, such as for the WiFi station or Ethernet. These configurations are defined in `esp_netif/include/esp_netif_defaults.h` and should be sufficient for most network drivers. (In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set)

The following API reference outlines these network stack interaction with the esp-netif:

### Header File

- [components/esp\\_netif/include/esp\\_netif\\_net\\_stack.h](#)

## Functions

*esp\_netif\_t* \***esp\_netif\_get\_handle\_from\_netif\_impl** (void \*dev)

Returns esp-netif handle.

**Parameters** *dev* -- [in] opaque ptr to network interface of specific TCP/IP stack

**Returns** handle to related esp-netif instance

void \***esp\_netif\_get\_netif\_impl** (*esp\_netif\_t* \*esp\_netif)

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp\_netif instances configured to PPP mode

**Parameters** *esp\_netif* -- [in] Handle to esp-netif instance

**Returns** handle to related network stack netif handle

*esp\_err\_t* **esp\_netif\_set\_link\_speed** (*esp\_netif\_t* \*esp\_netif, uint32\_t speed)

Set link-speed for the specified network interface.

### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **speed** -- [in] Link speed in bit/s

**Returns** ESP\_OK on success

*esp\_err\_t* **esp\_netif\_transmit** (*esp\_netif\_t* \*esp\_netif, void \*data, size\_t len)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **data** -- [in] Data to be transmitted
- **len** -- [in] Length of the data frame

**Returns** ESP\_OK on success, an error passed from the I/O driver otherwise

*esp\_err\_t* **esp\_netif\_transmit\_wrap** (*esp\_netif\_t* \*esp\_netif, void \*data, size\_t len, void \*netstack\_buf)

Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **data** -- [in] Data to be transmitted
- **len** -- [in] Length of the data frame
- **netstack\_buf** -- [in] net stack buffer

**Returns** ESP\_OK on success, an error passed from the I/O driver otherwise

void **esp\_netif\_free\_rx\_buffer** (void \*esp\_netif, void \*buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

### Parameters

- **esp\_netif** -- [in] Handle to esp-netif instance
- **buffer** -- [in] Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the [protocols/sockets](#) directory of ESP-IDF examples.

## 2.5.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in [Application Protocols](#).

## 2.6 Peripherals API

### 2.6.1 Analog to Digital Converter (ADC) Oneshot Mode Driver

#### Introduction

The Analog to Digital Converter is integrated on the chip and is capable of measuring analog signals from specific analog IO pins.

ESP32-C2 has one ADC unit(s), which can be used in scenario(s) like:

- Generate one-shot ADC conversion result

This guide introduces ADC oneshot mode conversion.

#### Functional Overview

The following sections of this document cover the typical steps to install and operate an ADC:

- [Resource Allocation](#) - covers which parameters should be set up to get an ADC handle and how to recycle the resources when ADC finishes working.
- [Unit Configuration](#) - covers the parameters that should be set up to configure the ADC unit, so as to get ADC conversion raw result.
- [Read Conversion Result](#) - covers how to get ADC conversion raw result.
- [Hardware Limitations](#) - describes the ADC-related hardware limitations.
- [Power Management](#) - covers power management-related information.
- [IRAM Safe](#) - describes tips on how to read ADC conversion raw results when the cache is disabled.
- [Thread Safety](#) - lists which APIs are guaranteed to be thread-safe by the driver.
- [Kconfig Options](#) - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** The ADC oneshot mode driver is implemented based on ESP32-C2 SAR ADC module. Different ESP chips might have different numbers of independent ADCs. From the oneshot mode driver's point of view, an ADC instance is represented by [adc\\_oneshot\\_unit\\_handle\\_t](#).

To install an ADC instance, set up the required initial configuration structure [adc\\_oneshot\\_unit\\_init\\_cfg\\_t](#):

- [adc\\_oneshot\\_unit\\_init\\_cfg\\_t::unit\\_id](#) selects the ADC. Please refer to the [datasheet](#) to know dedicated analog IOs for this ADC.
- [adc\\_oneshot\\_unit\\_init\\_cfg\\_t::clk\\_src](#) selects the source clock of the ADC. If set to 0, the driver will fall back to using a default clock source, see [adc\\_oneshot\\_clk\\_src\\_t](#) to know the details.
- [adc\\_oneshot\\_unit\\_init\\_cfg\\_t::ulp\\_mode](#) sets if the ADC will be working under ULP mode.

After setting up the initial configurations for the ADC, call [adc\\_oneshot\\_new\\_unit\(\)](#) with the prepared [adc\\_oneshot\\_unit\\_init\\_cfg\\_t](#). This function will return an ADC unit handle if the allocation is successful.

This function may fail due to various errors such as invalid arguments, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return [ESP\\_ERR\\_NOT\\_FOUND](#) error. Number of available ADC(s) is recorded by [SOC\\_ADC\\_PERIPH\\_NUM](#).

If a previously created ADC instance is no longer required, you should recycle the ADC instance by calling [adc\\_oneshot\\_del\\_unit\(\)](#), related hardware and software resources will be recycled as well.

### Create an ADC Unit Handle Under Normal Oneshot Mode

```
adc_oneshot_unit_handle_t adc1_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adc1_handle));
```

### Recycle the ADC Unit

```
ESP_ERROR_CHECK(adc_oneshot_del_unit(adc1_handle));
```

**Unit Configuration** After an ADC instance is created, set up the `adc_oneshot_chan_cfg_t` to configure ADC IOs to measure analog signal:

- `adc_oneshot_chan_cfg_t::atten`, ADC attenuation. Refer to [TRM](#) > On-Chip Sensor and Analog Signal Processing.
- `adc_oneshot_chan_cfg_t::bitwidth`, the bitwidth of the raw conversion result.

**Note:** For the IO corresponding ADC channel number, check [datasheet](#) to know the ADC IOs.

Additionally, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call `adc_oneshot_config_channel()` with the above configuration structure. You should specify an ADC channel to be configured as well. Function `adc_oneshot_config_channel()` can be called multiple times to configure different ADC channels. The Driver will save each of these channel configurations internally.

### Configure Two ADC Channels

```
adc_oneshot_chan_cfg_t config = {
    .bitwidth = ADC_BITWIDTH_DEFAULT,
    .atten = ADC_ATTEN_DB_12,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN0, &
↪config));
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN1, &
↪config));
```

**Read Conversion Result** After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call `adc_oneshot_read()` to get the conversion raw result of an ADC channel.

- `adc_oneshot_read()` is safe to use. ADC(s) are shared by some other drivers/peripherals, see [Hardware Limitations](#). This function uses mutexes to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers/peripherals, and return `ESP_ERR_TIMEOUT`. Under this condition, the ADC raw result is invalid.

This function will fail due to invalid arguments.

The ADC conversion results read from this function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

$$V_{out} = D_{out} * V_{max} / D_{max} \quad (1)$$

where:

Vout	Digital output result, standing for the voltage.
Dout	ADC raw digital reading result.
Vmax	Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to <a href="#">TRM</a> > On-Chip Sensor and Analog Signal Processing.
Dmax	Maximum of the output ADC raw digital reading result, which is $2^{\text{bitwidth}}$ , where bitwidth is the <code>:cpp:member::adc_oneshot_chan_cfg_t:bitwidth</code> configured before.

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc [Analog to Digital Converter \(ADC\) Calibration Driver](#).

### Read Raw Result

```
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN0,
↪ adc_raw[0][0]);

ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + 1, EXAMPLE_ADC1_CHAN1,
↪ adc_raw[0][1]);
```

### Hardware Limitations

- Random Number Generator (RNG) uses ADC as an input source. When ADC `adc_oneshot_read()` works, the random number generated from RNG will be less random.

**Power Management** When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the `adc_oneshot_read()` will poll the CPU until the function returns. During this period of time, the task in which ADC oneshot mode driver resides will not be blocked. Therefore the clock frequency is stable when reading.

**IRAM Safe** By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled. Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc. If these APIs execute when the Cache is disabled, you will probably see errors like `Illegal Instruction` or `Load/Store Prohibited`.

### Thread Safety

- `adc_oneshot_new_unit()`
- `adc_oneshot_config_channel()`
- `adc_oneshot_read()`

Above functions are guaranteed to be thread-safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- `adc_oneshot_del_unit()` is not thread-safe. Besides, concurrently calling this function may result in failures of the above thread-safe APIs.

### Kconfig Options

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` controls where to place the ADC fast read function (IRAM or Flash), see [IRAM Safe](#) for more details.

### Application Examples

- ADC oneshot mode example: [peripherals/adc/oneshot\\_read](#).

## API Reference

### Header File

- [components/hal/include/hal/adc\\_types.h](#)

### Structures

struct **adc\_digi\_pattern\_config\_t**  
ADC digital controller pattern configuration.

#### Public Members

uint8\_t **atten**  
Attenuation of this ADC channel.

uint8\_t **channel**  
ADC channel.

uint8\_t **unit**  
ADC unit.

uint8\_t **bit\_width**  
ADC output bit width.

struct **adc\_digi\_output\_data\_t**  
ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

#### Public Members

uint32\_t **data**  
ADC real output data info. Resolution: 12 bit.

uint32\_t **reserved12**  
Reserved12.

uint32\_t **channel**  
ADC channel index info. If (channel < ADC\_CHANNEL\_MAX), The data is valid. If (channel > ADC\_CHANNEL\_MAX), The data is invalid.

uint32\_t **unit**  
ADC unit index info. 0: ADC1; 1: ADC2.

uint32\_t **reserved17\_31**  
Reserved17.

struct *adc\_digi\_output\_data\_t*::[anonymous]::[anonymous] **type2**  
When the configured output format is 12bit.

uint32\_t **val**  
Raw data value

## Type Definitions

typedef *soc\_periph\_adc\_digi\_clk\_src\_t* **adc\_oneshot\_clk\_src\_t**

Clock source type of oneshot mode which uses digital controller.

typedef *soc\_periph\_adc\_digi\_clk\_src\_t* **adc\_continuous\_clk\_src\_t**

Clock source type of continuous mode which uses digital controller.

## Enumerations

enum **adc\_unit\_t**

ADC unit.

*Values:*

enumerator **ADC\_UNIT\_1**

SAR ADC 1.

enumerator **ADC\_UNIT\_2**

SAR ADC 2.

enum **adc\_channel\_t**

ADC channels.

*Values:*

enumerator **ADC\_CHANNEL\_0**

ADC channel.

enumerator **ADC\_CHANNEL\_1**

ADC channel.

enumerator **ADC\_CHANNEL\_2**

ADC channel.

enumerator **ADC\_CHANNEL\_3**

ADC channel.

enumerator **ADC\_CHANNEL\_4**

ADC channel.

enumerator **ADC\_CHANNEL\_5**

ADC channel.

enumerator **ADC\_CHANNEL\_6**

ADC channel.

enumerator **ADC\_CHANNEL\_7**

ADC channel.

enumerator **ADC\_CHANNEL\_8**

ADC channel.

enumerator **ADC\_CHANNEL\_9**

ADC channel.

enum **adc\_atten\_t**

ADC attenuation parameter. Different parameters determine the range of the ADC.

*Values:*

enumerator **ADC\_ATTEN\_DB\_0**

No input attenuation, ADC can measure up to approx.

enumerator **ADC\_ATTEN\_DB\_2\_5**

The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB.

enumerator **ADC\_ATTEN\_DB\_6**

The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB.

enumerator **ADC\_ATTEN\_DB\_12**

The input voltage of ADC will be attenuated extending the range of measurement by about 12 dB.

enumerator **ADC\_ATTEN\_DB\_11**

This is deprecated, it behaves the same as **ADC\_ATTEN\_DB\_12**

enum **adc\_bitwidth\_t**

*Values:*

enumerator **ADC\_BITWIDTH\_DEFAULT**

Default ADC output bits, max supported width will be selected.

enumerator **ADC\_BITWIDTH\_9**

ADC output width is 9Bit.

enumerator **ADC\_BITWIDTH\_10**

ADC output width is 10Bit.

enumerator **ADC\_BITWIDTH\_11**

ADC output width is 11Bit.

enumerator **ADC\_BITWIDTH\_12**

ADC output width is 12Bit.

enumerator **ADC\_BITWIDTH\_13**

ADC output width is 13Bit.

enum **adc\_ulp\_mode\_t**

*Values:*

enumerator **ADC\_ULP\_MODE\_DISABLE**

ADC ULP mode is disabled.

enumerator **ADC\_ULP\_MODE\_FSM**

ADC is controlled by ULP FSM.

enumerator **ADC\_ULP\_MODE\_RISCV**

ADC is controlled by ULP RISCV.

enum **adc\_digi\_convert\_mode\_t**

ADC digital controller (DMA mode) work mode.

*Values:*

enumerator **ADC\_CONV\_SINGLE\_UNIT\_1**

Only use ADC1 for conversion.

enumerator **ADC\_CONV\_SINGLE\_UNIT\_2**

Only use ADC2 for conversion.

enumerator **ADC\_CONV\_BOTH\_UNIT**

Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC\_CONV\_ALTER\_UNIT**

Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 .....

enum **adc\_digi\_output\_format\_t**

ADC digital controller (DMA mode) output data format option.

*Values:*

enumerator **ADC\_DIGI\_OUTPUT\_FORMAT\_TYPE1**

See `adc_digi_output_data_t.type1`

enumerator **ADC\_DIGI\_OUTPUT\_FORMAT\_TYPE2**

See `adc_digi_output_data_t.type2`

enum **adc\_digi\_iir\_filter\_t**

ADC IIR Filter ID.

*Values:*

enumerator **ADC\_DIGI\_IIR\_FILTER\_0**

Filter 0.

enumerator **ADC\_DIGI\_IIR\_FILTER\_1**

Filter 1.

enum **adc\_digi\_iir\_filter\_coeff\_t**

IIR Filter Coefficient.

*Values:*

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_2**

The filter coefficient is 2.

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_4**

The filter coefficient is 4.

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_8**

The filter coefficient is 8.

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_16**

The filter coefficient is 16.

enumerator **ADC\_DIGI\_IIR\_FILTER\_COEFF\_64**

The filter coefficient is 64.

### Header File

- [components/esp\\_adc/include/esp\\_adc/adc\\_oneshot.h](#)

### Functions

*esp\_err\_t* **adc\_oneshot\_new\_unit** (const *adc\_oneshot\_unit\_init\_cfg\_t* \*init\_config,  
*adc\_oneshot\_unit\_handle\_t* \*ret\_unit)

Create a handle to a specific ADC unit.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

#### Parameters

- **init\_config** -- **[in]** Driver initial configurations
- **ret\_unit** -- **[out]** ADC unit handle

#### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_NO\_MEM: No memory
- ESP\_ERR\_NOT\_FOUND: The ADC peripheral to be claimed is already in use
- ESP\_FAIL: Clock source isn't initialised correctly

*esp\_err\_t* **adc\_oneshot\_config\_channel** (*adc\_oneshot\_unit\_handle\_t* handle, *adc\_channel\_t* channel,  
const *adc\_oneshot\_chan\_cfg\_t* \*config)

Set ADC oneshot mode required configurations.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

#### Parameters

- **handle** -- **[in]** ADC handle
- **channel** -- **[in]** ADC channel to be configured
- **config** -- **[in]** ADC configurations

#### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments

*esp\_err\_t* **adc\_oneshot\_read** (*adc\_oneshot\_unit\_handle\_t* handle, *adc\_channel\_t* chan, int \*out\_raw)

Get one ADC conversion raw result.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

---

**Note:** This API should NOT be called in an ISR context

---

#### Parameters

- **handle** -- **[in]** ADC handle
- **chan** -- **[in]** ADC channel
- **out\_raw** -- **[out]** ADC conversion raw result

#### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_TIMEOUT: Timeout, the ADC result is invalid

*esp\_err\_t* **adc\_oneshot\_del\_unit** (*adc\_oneshot\_unit\_handle\_t* handle)

Delete the ADC unit handle.

---

**Note:** This API is thread-safe. For more details, see ADC programming guide

---

**Parameters** **handle** -- **[in]** ADC handle

#### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid arguments
- ESP\_ERR\_NOT\_FOUND: The ADC peripheral to be disclaimed isn't in use

*esp\_err\_t* **adc\_oneshot\_io\_to\_channel** (int io\_num, *adc\_unit\_t* \*unit\_id, *adc\_channel\_t* \*channel)

Get ADC channel from the given GPIO number.

#### Parameters

- **io\_num** -- **[in]** GPIO number
- **unit\_id** -- **[out]** ADC unit
- **channel** -- **[out]** ADC channel

#### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_NOT\_FOUND: The IO is not a valid ADC pad

*esp\_err\_t* **adc\_oneshot\_channel\_to\_io** (*adc\_unit\_t* unit\_id, *adc\_channel\_t* channel, int \*io\_num)

Get GPIO number from the given ADC channel.

#### Parameters

- **unit\_id** -- **[in]** ADC unit
- **channel** -- **[in]** ADC channel
- **io\_num** -- **[out]** GPIO number
- -- ESP\_OK: On success
- -- ESP\_ERR\_INVALID\_ARG: Invalid argument

*esp\_err\_t* **adc\_oneshot\_get\_calibrated\_result** (*adc\_oneshot\_unit\_handle\_t* handle, *adc\_cali\_handle\_t* cali\_handle, *adc\_channel\_t* chan, int \*cali\_result)

Convenience function to get ADC calibrated result.

This is an all-in-one function which does:

- oneshot read ADC raw result
- calibrate the raw result and convert it into calibrated result (in mV)

**Parameters**

- **handle** -- [in] ADC oneshot handle, you should call `adc_oneshot_new_unit()` to get this handle
- **cali\_handle** -- [in] ADC calibration handle, you should call `adc_cali_create_scheme_x()` in `adc_cali_scheme.h` to create a handle
- **chan** -- [in] ADC channel
- **cali\_result** -- [out] Calibrated ADC result (in mV)

**Returns**

- `ESP_OK` Other return errors from `adc_oneshot_read()` and `adc_cali_raw_to_voltage()`

**Structures**

struct **adc\_oneshot\_unit\_init\_cfg\_t**  
ADC oneshot driver initial configurations.

**Public Members**

*adc\_unit\_t* **unit\_id**

ADC unit.

*adc\_oneshot\_clk\_src\_t* **clk\_src**

Clock source.

*adc\_ulp\_mode\_t* **ulp\_mode**

ADC controlled by ULP, see `adc_ulp_mode_t`

struct **adc\_oneshot\_chan\_cfg\_t**  
ADC channel configurations.

**Public Members**

*adc\_atten\_t* **atten**

ADC attenuation.

*adc\_bitwidth\_t* **bitwidth**

ADC conversion result bits.

**Type Definitions**

typedef struct `adc_oneshot_unit_ctx_t` \***adc\_oneshot\_unit\_handle\_t**  
Type of ADC unit handle for oneshot mode.

**2.6.2 Analog to Digital Converter (ADC) Calibration Driver**

## Introduction

In ESP32-C2, the digital-to-analog converter (ADC) compares the input analog voltage to the reference, and determines each bit of the output digital result. By design, the ADC reference voltage for ESP32-C2 is 1100 mV. However, the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide introduces the ADC calibration driver to minimize the effect of different reference voltages, and get more accurate output results.

## Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

- *Calibration Scheme Creation* - covers how to create a calibration scheme handle and delete the calibration scheme handle.
- *Result Conversion* - covers how to convert ADC raw result to calibrated result.
- *Thread Safety* - lists which APIs are guaranteed to be thread-safe by the driver.
- *Minimize Noise* - describes a general way to minimize the noise.

**Calibration Scheme Creation** The ADC calibration driver provides ADC calibration scheme(s). From the calibration driver's point of view, an ADC calibration scheme is created for an ADC calibration handle `adc_cali_handle_t`.

`adc_cali_check_scheme()` can be used to know which calibration scheme is supported on the chip. If you already know the supported schemes, this step can be skipped. Just call the corresponding function to create the scheme handle.

If you use your custom ADC calibration schemes, you could either modify this function `adc_cali_check_scheme()`, or just skip this step and call your custom creation function.

**ADC Calibration Line Fitting Scheme** ESP32-C2 supports `ADC_CALI_SCHEME_VER_LINE_FITTING` scheme. To create this scheme, set up `adc_cali_line_fitting_config_t` first.

- `adc_cali_line_fitting_config_t::unit_id`, the ADC that your ADC raw results are from.
- `adc_cali_line_fitting_config_t::atten`, ADC attenuation that your ADC raw results use.
- `adc_cali_line_fitting_config_t::bitwidth`, bit width of ADC raw result.

After setting up the configuration structure, call `adc_cali_create_scheme_line_fitting()` to create a Line Fitting calibration scheme handle.

```
ESP_LOGI(TAG, "calibration scheme version is %s", "Line Fitting");
adc_cali_line_fitting_config_t cali_config = {
    .unit_id = unit,
    .atten = atten,
    .bitwidth = ADC_BITWIDTH_DEFAULT,
};
ESP_ERROR_CHECK(adc_cali_create_scheme_line_fitting(&cali_config, &handle));
```

When the ADC calibration is no longer used, please delete the calibration scheme handle by calling `adc_cali_delete_scheme_line_fitting()`.

## Delete Line Fitting Scheme

```
ESP_LOGI(TAG, "delete %s calibration scheme", "Line Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_line_fitting(handle));
```

---

**Note:** If you want to use your custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table `adc_cali_scheme_t` in `components/esp_adc/interface/adc_cali_interface.h` to know the ESP ADC calibration interface.

---

**Result Conversion** After setting up the calibration characteristics, you can call `adc_cali_raw_to_voltage()` to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to an invalid argument. Especially, if this function returns `ESP_ERR_INVALID_STATE`, this means the calibration scheme is not created. You need to create a calibration scheme handle, use `adc_cali_check_scheme()` to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

---

**Note:** ADC calibration is only supported under `ADC_ATTEN_DB_0` and `ADC_ATTEN_DB_12`. Under `ADC_ATTEN_DB_0`, the attenuation of ADC is set to 0 dB, and input voltage higher than 950 mV is not supported. Under `ADC_ATTEN_DB_12`, the attenuation of ADC is set to 11 dB, and input voltage higher than 2800 mV is not supported.

---

### Get Voltage

```
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &
↳voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_
↳ADC1_CHAN0, voltage[0][0]);
```

**Thread Safety** The factory function `esp_adc_cali_new_scheme()` is guaranteed to be thread-safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks.

Other functions that take the `adc_cali_handle_t` as the first positional parameter are not thread-safe, you should avoid calling them from multiple tasks.

**Minimize Noise** The ESP32-C2 ADC is sensitive to noise, leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g., a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

## API Reference

### Header File

- `components/esp_adc/include/esp_adc/adc_cali.h`

### Functions

`esp_err_t adc_cali_check_scheme(adc_cali_scheme_ver_t *scheme_mask)`

Check the supported ADC calibration scheme.

**Parameters** `scheme_mask` -- [out] Supported ADC calibration scheme(s)

#### Returns

- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Invalid argument
- `ESP_ERR_NOT_SUPPORTED`: No supported calibration scheme

*esp\_err\_t* **adc\_cali\_raw\_to\_voltage** (*adc\_cali\_handle\_t* handle, int raw, int \*voltage)

Convert ADC raw data to calibrated voltage.

#### Parameters

- **handle** -- [in] ADC calibration handle
- **raw** -- [in] ADC raw data
- **voltage** -- [out] Calibrated ADC voltage (in mV)

#### Returns

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument
- ESP\_ERR\_INVALID\_STATE: Invalid state, scheme didn't registered

### Type Definitions

```
typedef struct adc_cali_scheme_t *adc_cali_handle_t
    ADC calibration handle.
```

### Enumerations

```
enum adc_cali_scheme_ver_t
```

ADC calibration scheme.

*Values:*

```
enumerator ADC_CALI_SCHEME_VER_LINE_FITTING
```

Line fitting scheme.

```
enumerator ADC_CALI_SCHEME_VER_CURVE_FITTING
```

Curve fitting scheme.

### Header File

## 2.6.3 Clock Tree

The clock subsystem of ESP32-C2 is used to source and distribute system/module clocks from a range of root clocks. The clock tree driver maintains the basic functionality of the system clock and the intricate relationship among module clocks.

This document starts with the introduction to root and module clocks. Then it covers the clock tree APIs that can be called to monitor the status of the module clocks at runtime.

### Introduction

This section lists definitions of ESP32-C2's supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help select a proper source clock for the peripheral.

**Root Clocks** Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), Wi-Fi, Bluetooth, the RTC, and the peripherals.

ESP32-C2's root clocks are listed in *soc\_root\_clk\_t*:

- **Internal 17.5 MHz RC Oscillator (RC\_FAST)**  
This RC oscillator generates a about 17.5 MHz clock signal output as the `RC_FAST_CLK`.  
The about 17.5 MHz signal output is also passed into a configurable divider, which by default divides the input clock frequency by 256, to generate a `RC_FAST_D256_CLK`.  
The exact frequency of `RC_FAST_CLK` can be computed in runtime through calibration on the `RC_FAST_D256_CLK`.
- **External 40/26 MHz Crystal (XTAL)**
- **Internal 136 kHz RC Oscillator (RC\_SLOW)**  
This RC oscillator generates a about 136kHz clock signal output as the `RC_SLOW_CLK`.  
The exact frequency of this clock can be computed in runtime through calibration.
- **External Slow Clock - optional (OSC\_SLOW)**  
A clock signal generated by an external circuit can be connected to `pin0` (when its frequency is no more than 136 kHz) to be the clock source for the `RTC_SLOW_CLK`. This clock can also be calibrated to get its exact frequency.

Typically, the frequency of the signal generated from an RC oscillator circuit is less accurate and more sensitive to the environment compared to the signal generated from a crystal. ESP32-C2 provides several clock source options for the `RTC_SLOW_CLK`, and it is possible to make the choice based on the requirements for system time accuracy and power consumption. For more details, please refer to *RTC Timer Clock Sources*.

**Module Clocks** ESP32-C2's available module clocks are listed in `soc_module_clk_t`. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.

### API Usage

The clock tree driver provides an all-in-one API to get the frequency of the module clocks, `esp_clk_tree_src_get_freq_hz()`. This function allows you to obtain the clock frequency at any time by providing the clock name `soc_module_clk_t` and specifying the desired precision level for the returned frequency value `esp_clk_tree_src_freq_precision_t`.

### API Reference

#### Header File

- `components/soc/esp32c2/include/soc/clk_tree_defs.h`

#### Macros

##### **SOC\_CLK\_RC\_FAST\_FREQ\_APPROX**

Approximate `RC_FAST_CLK` frequency in Hz

##### **SOC\_CLK\_RC\_SLOW\_FREQ\_APPROX**

Approximate `RC_SLOW_CLK` frequency in Hz

##### **SOC\_CLK\_RC\_FAST\_D256\_FREQ\_APPROX**

Approximate `RC_FAST_D256_CLK` frequency in Hz

##### **SOC\_CLK\_OSC\_SLOW\_FREQ\_APPROX**

Approximate `OSC_SLOW_CLK` (external slow clock) frequency in Hz

**SOC\_GPTIMER\_CLKS**

Array initializer for all supported clock sources of GPTimer.

The following code can be used to iterate all possible clocks:

```
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_
↪t)SOC_GPTIMER_CLKS;
for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock `clk`
}
```

**SOC\_TEMP\_SENSOR\_CLKS**

Array initializer for all supported clock sources of Temperature Sensor.

**SOC\_SPI\_CLKS**

Array initializer for all supported clock sources of SPI.

**SOC\_I2C\_CLKS**

Array initializer for all supported clock sources of I2C.

**SOC\_ADC\_DIGI\_CLKS**

Array initializer for all supported clock sources of ADC digital controller.

**SOC\_GLITCH\_FILTER\_CLKS**

Array initializer for all supported clock sources of Glitch Filter.

**SOC\_MWDT\_CLKS**

Array initializer for all supported clock sources of MWDT.

**SOC\_LEDC\_CLKS**

Array initializer for all supported clock sources of LEDC.

**Enumerations**

enum **soc\_root\_clk\_t**

Root clock.

*Values:*

enumerator **SOC\_ROOT\_CLK\_INT\_RC\_FAST**

Internal 17.5MHz RC oscillator

enumerator **SOC\_ROOT\_CLK\_INT\_RC\_SLOW**

Internal 136kHz RC oscillator

enumerator **SOC\_ROOT\_CLK\_EXT\_XTAL**

External 26/40MHz crystal

enumerator **SOC\_ROOT\_CLK\_EXT\_OSC\_SLOW**

External slow clock signal at pin0, only support 32.768 KHz currently

enum **soc\_cpu\_clk\_src\_t**

CPU\_CLK mux inputs, which are the supported clock sources for the CPU\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_CPU\_CLK\_SRC\_XTAL**

Select XTAL\_CLK as CPU\_CLK source

enumerator **SOC\_CPU\_CLK\_SRC\_PLL**

Select PLL\_CLK as CPU\_CLK source (PLL\_CLK is the output of 26/40MHz crystal oscillator frequency multiplier, 480MHz)

enumerator **SOC\_CPU\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST\_CLK as CPU\_CLK source

enumerator **SOC\_CPU\_CLK\_SRC\_INVALID**

Invalid CPU\_CLK source

enum **soc\_rtc\_slow\_clk\_src\_t**

RTC\_SLOW\_CLK mux inputs, which are the supported clock sources for the RTC\_SLOW\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_RC\_SLOW**

Select RC\_SLOW\_CLK as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_OSC\_SLOW**

Select OSC\_SLOW\_CLK (external slow clock) as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_RC\_FAST\_D256**

Select RC\_FAST\_D256\_CLK (referred as FOSC\_DIV or 8m\_d256/8md256 in TRM and reg. description) as RTC\_SLOW\_CLK source

enumerator **SOC\_RTC\_SLOW\_CLK\_SRC\_INVALID**

Invalid RTC\_SLOW\_CLK source

enum **soc\_rtc\_fast\_clk\_src\_t**

RTC\_FAST\_CLK mux inputs, which are the supported clock sources for the RTC\_FAST\_CLK.

---

**Note:** Enum values are matched with the register field values on purpose

---

*Values:*

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_D2**

Select XTAL\_D2\_CLK (may referred as XTAL\_CLK\_DIV\_2) as RTC\_FAST\_CLK source

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_DIV**

Alias name for SOC\_RTC\_FAST\_CLK\_SRC\_XTAL\_D2

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST\_CLK as RTC\_FAST\_CLK source

enumerator **SOC\_RTC\_FAST\_CLK\_SRC\_INVALID**

Invalid RTC\_FAST\_CLK source

enum **soc\_module\_clk\_t**

Supported clock sources for modules (CPU, peripherals, RTC, etc.)

---

**Note:** enum starts from 1, to save 0 for special purpose

---

*Values:*

enumerator **SOC\_MOD\_CLK\_CPU**

CPU\_CLK can be sourced from XTAL, PLL, or RC\_FAST by configuring soc\_cpu\_clk\_src\_t

enumerator **SOC\_MOD\_CLK\_RTC\_FAST**

RTC\_FAST\_CLK can be sourced from XTAL\_D2 or RC\_FAST by configuring soc\_rtc\_fast\_clk\_src\_t

enumerator **SOC\_MOD\_CLK\_RTC\_SLOW**

RTC\_SLOW\_CLK can be sourced from RC\_SLOW, XTAL32K, or RC\_FAST\_D256 by configuring soc\_rtc\_slow\_clk\_src\_t

enumerator **SOC\_MOD\_CLK\_APB**

APB\_CLK is always 40MHz no matter it derives from XTAL or PLL

enumerator **SOC\_MOD\_CLK\_PLL\_F40M**

PLL\_F40M\_CLK is derived from PLL, and has a fixed frequency of 40MHz

enumerator **SOC\_MOD\_CLK\_PLL\_F60M**

PLL\_F60M\_CLK is derived from PLL, and has a fixed frequency of 60MHz

enumerator **SOC\_MOD\_CLK\_PLL\_F80M**

PLL\_F80M\_CLK is derived from PLL, and has a fixed frequency of 80MHz

enumerator **SOC\_MOD\_CLK\_OSC\_SLOW**

OSC\_SLOW\_CLK comes from an external slow clock signal, passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_RC\_FAST**

RC\_FAST\_CLK comes from the internal 20MHz rc oscillator, passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_RC\_FAST\_D256**

RC\_FAST\_D256\_CLK comes from the internal 20MHz rc oscillator, divided by 256, and passing a clock gating to the peripherals

enumerator **SOC\_MOD\_CLK\_XTAL**

XTAL\_CLK comes from the external 26/40MHz crystal

enumerator **SOC\_MOD\_CLK\_INVALID**

Indication of the end of the available module clock sources

enum **soc\_periph\_systimer\_clk\_src\_t**

Type of SYSTIMER clock source.

*Values:*

enumerator **SYSTIMER\_CLK\_SRC\_XTAL**

SYSTIMER source clock is XTAL

enumerator **SYSTIMER\_CLK\_SRC\_DEFAULT**

SYSTIMER source clock default choice is XTAL

enum **soc\_periph\_gptimer\_clk\_src\_t**

Type of GPTimer clock source.

*Values:*

enumerator **GPTIMER\_CLK\_SRC\_PLL\_F40M**

Select PLL\_F40M as the source clock

enumerator **GPTIMER\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **GPTIMER\_CLK\_SRC\_DEFAULT**

Select PLL\_F40M as the default choice

enum **soc\_periph\_tg\_clk\_src\_legacy\_t**

Type of Timer Group clock source, reserved for the legacy timer group driver.

*Values:*

enumerator **TIMER\_SRC\_CLK\_PLL\_F40M**

Timer group clock source is PLL\_F40M

enumerator **TIMER\_SRC\_CLK\_XTAL**

Timer group clock source is XTAL

enumerator **TIMER\_SRC\_CLK\_DEFAULT**

Timer group clock source default choice is PLL\_F40M

enum **soc\_periph\_temperature\_sensor\_clk\_src\_t**

Type of Temp Sensor clock source.

*Values:*

enumerator **TEMPERATURE\_SENSOR\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **TEMPERATURE\_SENSOR\_CLK\_SRC\_RC\_FAST**

Select RC\_FAST as the source clock

enumerator **TEMPERATURE\_SENSOR\_CLK\_SRC\_DEFAULT**

Select XTAL as the default choice

enum **soc\_periph\_uart\_clk\_src\_legacy\_t**

Type of UART clock source, reserved for the legacy UART driver.

*Values:*

enumerator **UART\_SCLK\_PLL\_F40M**

UART source clock is PLL\_F40M CLK

enumerator **UART\_SCLK\_RTC**

UART source clock is RC\_FAST

enumerator **UART\_SCLK\_XTAL**

UART source clock is XTAL

enumerator **UART\_SCLK\_DEFAULT**

UART source clock default choice is PLL\_F40M

enum **soc\_periph\_spi\_clk\_src\_t**

Type of SPI clock source.

*Values:*

enumerator **SPI\_CLK\_SRC\_DEFAULT**

Select PLL\_40M as SPI source clock

enumerator **SPI\_CLK\_SRC\_PLL\_F40M**

Select PLL\_40M as SPI source clock

enumerator **SPI\_CLK\_SRC\_XTAL**

Select XTAL as SPI source clock

enum **soc\_periph\_i2c\_clk\_src\_t**

Type of I2C clock source.

*Values:*

enumerator **I2C\_CLK\_SRC\_XTAL**

Select XTAL as the source clock

enumerator **I2C\_CLK\_SRC\_RC\_FAST**  
Select RC\_FAST as the source clock

enumerator **I2C\_CLK\_SRC\_DEFAULT**  
Select XTAL as the default clock choice

enum **soc\_periph\_adc\_digi\_clk\_src\_t**  
ADC digital controller clock source.

*Values:*

enumerator **ADC\_DIGI\_CLK\_SRC\_XTAL**  
Select XTAL as the source clock

enumerator **ADC\_DIGI\_CLK\_SRC\_PLL\_F80M**  
Select PLL\_F80M as the source clock

enumerator **ADC\_DIGI\_CLK\_SRC\_DEFAULT**  
Select PLL\_F80M as the default clock choice

enum **soc\_periph\_glitch\_filter\_clk\_src\_t**  
Glitch filter clock source.

*Values:*

enumerator **GLITCH\_FILTER\_CLK\_SRC\_APB**  
Select APB clock as the source clock

enumerator **GLITCH\_FILTER\_CLK\_SRC\_DEFAULT**  
Select APB clock as the default clock choice

enum **soc\_periph\_mwdt\_clk\_src\_t**  
MWDT clock source.

*Values:*

enumerator **MWDT\_CLK\_SRC\_XTAL**  
Select XTAL as the source clock

enumerator **MWDT\_CLK\_SRC\_PLL\_F40M**  
Select PLL 40 Mhz as the source clock

enumerator **MWDT\_CLK\_SRC\_DEFAULT**  
Select PLL 40 Mhz as the default clock choice

enum **soc\_periph\_ledc\_clk\_src\_legacy\_t**  
Type of LEDC clock source, reserved for the legacy LEDC driver.

*Values:*

enumerator **LEDC\_AUTO\_CLK**

LEDC source clock will be automatically selected based on the giving resolution and duty parameter when init the timer

enumerator **LEDC\_USE\_PLL\_DIV\_CLK**

Select PLL\_F60M as the source clock

enumerator **LEDC\_USE\_RC\_FAST\_CLK**

Select RC\_FAST as the source clock

enumerator **LEDC\_USE\_XTAL\_CLK**

Select XTAL as the source clock

enumerator **LEDC\_USE\_RTC8M\_CLK**

Alias of 'LEDC\_USE\_RC\_FAST\_CLK'

## Header File

- [components/esp\\_hw\\_support/include/esp\\_clk\\_tree.h](#)

## Functions

*esp\_err\_t* **esp\_clk\_tree\_src\_get\_freq\_hz** (*soc\_module\_clk\_t* clk\_src, *esp\_clk\_tree\_src\_freq\_precision\_t* precision, *uint32\_t* \*freq\_value)

Get frequency of module clock source.

### Parameters

- **clk\_src** -- **[in]** Clock source available to modules, in *soc\_module\_clk\_t*
- **precision** -- **[in]** Degree of precision, one of *esp\_clk\_tree\_src\_freq\_precision\_t* values This arg only applies to the clock sources that their frequencies can vary: *SOC\_MOD\_CLK\_RTC\_FAST*, *SOC\_MOD\_CLK\_RTC\_SLOW*, *SOC\_MOD\_CLK\_RC\_FAST*, *SOC\_MOD\_CLK\_RC\_FAST\_D256*, *SOC\_MOD\_CLK\_XTAL32K* For other clock sources, this field is ignored.
- **freq\_value** -- **[out]** Frequency of the clock source, in Hz

### Returns

- *ESP\_OK* Success
- *ESP\_ERR\_INVALID\_ARG* Parameter error
- *ESP\_FAIL* Calibration failed

## Enumerations

enum **esp\_clk\_tree\_src\_freq\_precision\_t**

Degree of precision of frequency value to be returned by *esp\_clk\_tree\_src\_get\_freq\_hz()*

Values:

enumerator **ESP\_CLK\_TREE\_SRC\_FREQ\_PRECISION\_CACHED**

enumerator **ESP\_CLK\_TREE\_SRC\_FREQ\_PRECISION\_APPROX**

enumerator **ESP\_CLK\_TREE\_SRC\_FREQ\_PRECISION\_EXACT**

enumerator **ESP\_CLK\_TREE\_SRC\_FREQ\_PRECISION\_INVALID**

## 2.6.4 GPIO & RTC GPIO

### GPIO Summary

The ESP32-C2 chip features 21 physical GPIO pins (GPIO0 ~ GPIO20). For chip variants with an SiP flash built in, GPIO11 ~ GPIO17 are dedicated to connecting the SiP flash; therefore, only 14 GPIO pins are available.

Each pin can be used as a general-purpose I/O, or to be connected to an internal peripheral signal. Through GPIO matrix and IO MUX, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see *ESP32-C2 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO\_MUX)* [PDF].

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

GPIO	Analog Function	Comments
GPIO0	ADC1_CH0	RTC
GPIO1	ADC1_CH1	RTC
GPIO2	ADC1_CH2	RTC
GPIO3	ADC1_CH3	RTC
GPIO4	ADC1_CH4	RTC
GPIO5		RTC
GPIO6		
GPIO7		
GPIO8		Strapping pin
GPIO9		Strapping pin
GPIO10		
GPIO11		
GPIO12		SPI0/1
GPIO13		SPI0/1
GPIO14		SPI0/1
GPIO15		SPI0/1
GPIO16		SPI0/1
GPIO17		SPI0/1
GPIO18		
GPIO19		
GPIO20		

#### Note:

- Strapping pin: GPIO8 and GPIO9 are strapping pins. For more information, please refer to [ESP8684 datasheet](#).
- SPI0/1: GPIO12-17 are usually used for SPI flash and not recommended for other uses.
- RTC: GPIO0-5 can be used when in Deep-sleep mode.

GPIO driver offers a dump function `gpio_dump_io_configuration()` to show the configurations of the IOs at the moment, such as pull-up / pull-down, input / output enable, pin mapping etc. Below is an example dump:

```
=====IO DUMP Start=====
IO[4] -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigIn ID: (simple GPIO input)
  SleepSelEn: 1
```

(continues on next page)

```

IO[18] -
  Pullup: 0, Pulldown: 0, DriveCap: 2
  InputEn: 0, OutputEn: 1, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigOut ID: 256 (simple GPIO output)
  SleepSelEn: 1

IO[26] **RESERVED** -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 0 (IOMUX)
  SleepSelEn: 1

=====IO DUMP End=====

```

If an IO pin is routed to a peripheral signal through the GPIO matrix, the signal ID printed in the dump information is defined in the `soc/gpio_sig_map.h` file. The word **\*\*RESERVED\*\*** indicates the IO is occupied by either FLASH or PSRAM. It is strongly not recommended to reconfigure them for other application purposes.

### GPIO Glitch Filter

The ESP32-C2 chip features hardware filters to remove unwanted glitch pulses from the input GPIO, which can help reduce false triggering of the interrupt and prevent a noise being routed to the peripheral side.

Each GPIO can be configured with a glitch filter, which can be used to filter out pulses shorter than **two** sample clock cycles. The duration of the filter is not configurable. The sample clock is the clock source of the IO\_MUX. In the driver, we call this kind of filter as `pin glitch filter`. You can create the filter handle by calling `gpio_new_pin_glitch_filter()`. All the configurations for a pin glitch filter are listed in the `gpio_pin_glitch_filter_config_t` structure.

- `gpio_pin_glitch_filter_config_t::gpio_num` sets the GPIO number to enable the glitch filter.

The glitch filter is disabled by default, and can be enabled by calling `gpio_glitch_filter_enable()`. To recycle the filter, you can call `gpio_del_glitch_filter()`. Please note, before deleting the filter, you should disable it first by calling `gpio_glitch_filter_disable()`.

### Application Example

- GPIO output and input interrupt example: [peripherals/gpio/generic\\_gpio](#).

### API Reference - Normal GPIO

#### Header File

- `components/driver/gpio/include/driver/gpio.h`

#### Functions

`esp_err_t gpio_config` (const `gpio_config_t` \*pGPIOConfig)  
GPIO common configuration.

Configure GPIO's `Mode`, `pull-up`, `PullDown`, `IntrType`

**Parameters** `pGPIOConfig` -- Pointer to GPIO configure struct

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* `gpio_reset_pin` (*gpio\_num\_t* gpio\_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

---

**Note:** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

---

**Parameters** `gpio_num` -- GPIO number.

**Returns** Always return ESP\_OK.

*esp\_err\_t* `gpio_set_intr_type` (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)

GPIO set interrupt trigger type.

**Parameters**

- `gpio_num` -- GPIO number. If you want to set the trigger type of e.g. of GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `intr_type` -- Interrupt type, select from `gpio_int_type_t`

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* `gpio_intr_enable` (*gpio\_num\_t* gpio\_num)

Enable GPIO module interrupt signal.

---

**Note:** ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of `adc1_get_raw`. Please refer to Section 3.11 of [ESP32 ECO and Workarounds for Bugs](#) for the description of this issue.

---

**Parameters** `gpio_num` -- GPIO number. If you want to enable an interrupt on e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* `gpio_intr_disable` (*gpio\_num\_t* gpio\_num)

Disable GPIO module interrupt signal.

---

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

---

**Parameters** `gpio_num` -- GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

**Returns**

- ESP\_OK success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_set\_level** (*gpio\_num\_t* gpio\_num, uint32\_t level)

GPIO set output level.

---

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling CONFIG\_GPIO\_CTRL\_FUNC\_IN\_IRAM

---

#### Parameters

- **gpio\_num** -- GPIO number. If you want to set the output level of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **level** -- Output level. 0: low ; 1: high

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO number error

int **gpio\_get\_level** (*gpio\_num\_t* gpio\_num)

GPIO get input level.

**Warning:** If the pad is not configured for input (or input and output) the returned value is always 0.

**Parameters** **gpio\_num** -- GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);

#### Returns

- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

*esp\_err\_t* **gpio\_set\_direction** (*gpio\_num\_t* gpio\_num, *gpio\_mode\_t* mode)

GPIO set direction.

Configure GPIO direction,such as output\_only,input\_only,output\_and\_input

#### Parameters

- **gpio\_num** -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **mode** -- GPIO direction

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

*esp\_err\_t* **gpio\_set\_pull\_mode** (*gpio\_num\_t* gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors.

---

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

#### Parameters

- **gpio\_num** -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **pull** -- GPIO pull up/down mode.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

*esp\_err\_t* **gpio\_wakeup\_enable** (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)

Enable GPIO wake-up function.

**Parameters**

- **gpio\_num** -- GPIO number.
- **intr\_type** -- GPIO wake-up type. Only GPIO\_INTR\_LOW\_LEVEL or GPIO\_INTR\_HIGH\_LEVEL can be used.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_wakeup\_disable** (*gpio\_num\_t* gpio\_num)

Disable GPIO wake-up function.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *gpio\_isr\_handle\_t* \*handle)

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the *interrupt allocation functions*.

**Parameters**

- **fn** -- Interrupt handler function.
- **arg** -- Parameter for handler function
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.
- **handle** -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- ESP\_OK Success ;
- ESP\_ERR\_INVALID\_ARG GPIO error
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags

*esp\_err\_t* **gpio\_pullup\_en** (*gpio\_num\_t* gpio\_num)

Enable pull-up on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_pullup\_dis** (*gpio\_num\_t* gpio\_num)

Disable pull-up on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_pulldown\_en** (*gpio\_num\_t* gpio\_num)

Enable pull-down on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_pulldown\_dis** (*gpio\_num\_t* gpio\_num)

Disable pull-down on GPIO.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_install\_isr\_service** (int intr\_alloc\_flags)

Install the GPIO driver's ETS\_GPIO\_INTR\_SOURCE ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Parameters** **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See `esp_intr_alloc.h` for more info.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_NO\_MEM No memory to install this service
- ESP\_ERR\_INVALID\_STATE ISR service already installed.
- ESP\_ERR\_NOT\_FOUND No free interrupt found with the specified flags
- ESP\_ERR\_INVALID\_ARG GPIO error

void **gpio\_uninstall\_isr\_service** (void)

Uninstall the driver's GPIO ISR service, freeing related resources.

*esp\_err\_t* **gpio\_isr\_handler\_add** (*gpio\_num\_t* gpio\_num, *gpio\_isr\_t* isr\_handler, void \*args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver's GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with `IRAM_ATTR`, unless you pass the `ESP_INTR_FLAG_IRAM` flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as "ISR stack size" in `menuconfig`). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Parameters**

- **gpio\_num** -- GPIO number
- **isr\_handler** -- ISR handler function for the corresponding GPIO number.
- **args** -- parameter for ISR handler.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Wrong state, the ISR service has not been initialized.
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_isr\_handler\_remove** (*gpio\_num\_t* gpio\_num)

Remove ISR handler for the corresponding GPIO pin.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Wrong state, the ISR service has not been initialized.
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_set\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* strength)

Set GPIO pad drive capability.

**Parameters**

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_get\_drive\_capability** (*gpio\_num\_t* gpio\_num, *gpio\_drive\_cap\_t* \*strength)

Get GPIO pad drive capability.

**Parameters**

- **gpio\_num** -- GPIO number, only support output GPIOs
- **strength** -- Pointer to accept drive capability of the pad

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_hold\_en** (*gpio\_num\_t* gpio\_num)

Enable gpio pad hold function.

When a GPIO is set to hold, its state is latched at that moment and will not change when the internal signal or the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). This function can be used to retain the state of GPIOs when the power domain of where GPIO/IOMUX belongs to becomes off. For example, chip or system is reset (e.g. watchdog time-out, deep-sleep events are triggered), or peripheral power-down in light-sleep.

This function works in both input and output modes, and only applicable to output-capable GPIOs. If this function is enabled: in output mode: the output level of the GPIO will be locked and can not be changed. in input mode: the input read value can still reflect the changes of the input signal.

However, on ESP32/S2/C3/S3/C2, this function cannot be used to hold the state of a digital GPIO during Deep-sleep. Even if this function is enabled, the digital GPIO will be reset to its default state when the chip wakes up from Deep-sleep. If you want to hold the state of a digital GPIO during Deep-sleep, please call `gpio_deep_sleep_hold_en`.

Power down or call `gpio_hold_dis` will disable this function.

**Parameters** **gpio\_num** -- GPIO number, only support output-capable GPIOs

**Returns**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

*esp\_err\_t* **gpio\_hold\_dis** (*gpio\_num\_t* gpio\_num)

Disable gpio pad hold function.

When the chip is woken up from peripheral power-down sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don't want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level(because gpio18 is input mode by default). If you don't want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

**Parameters** **gpio\_num** -- GPIO number, only support output-capable GPIOs

**Returns**

- ESP\_OK Success
- ESP\_ERR\_NOT\_SUPPORTED Not support pad hold function

void **gpio\_deep\_sleep\_hold\_en** (void)

Enable all digital gpio pads hold function during Deep-sleep.

Enabling this feature makes all digital gpio pads be at the holding state during Deep-sleep. The state of each pad holds is its active configuration (not pad's sleep configuration!).

Note that this pad hold feature only works when the chip is in Deep-sleep mode. When the chip is in active mode, the digital gpio state can be changed freely even you have called this function.

After this API is being called, the digital gpio Deep-sleep hold feature will work during every sleep process. You should call `gpio_deep_sleep_hold_dis` to disable this feature.

void **gpio\_deep\_sleep\_hold\_dis** (void)

Disable all digital gpio pads hold function during Deep-sleep.

void **gpio\_iomux\_in** (uint32\_t gpio\_num, uint32\_t signal\_idx)

SOC\_GPIO\_SUPPORT\_HOLD\_SINGLE\_IO\_IN\_DSLP.

Set pad input to a peripheral signal through the IOMUX.

**Parameters**

- **gpio\_num** -- GPIO number of the pad.
- **signal\_idx** -- Peripheral signal id to input. One of the \*\_IN\_IDX signals in soc/gpio\_sig\_map.h.

void **gpio\_iomux\_out** (uint8\_t gpio\_num, int func, bool oen\_inv)

Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**

- **gpio\_num** -- gpio\_num GPIO number of the pad.
- **func** -- The function number of the peripheral pin to output pin. One of the FUNC\_X\_\* of specified pin (X) in soc/io\_mux\_reg.h.
- **oen\_inv** -- True if the output enable needs to be inverted, otherwise False.

*esp\_err\_t* **gpio\_force\_hold\_all** (void)

Force hold all digital and rtc gpio pads.

GPIO force hold, no matter the chip in active mode or sleep modes.

This function will immediately cause all pads to latch the current values of input enable, output enable, output value, function, and drive strength values.

**Warning:**

- This function will hold flash and UART pins as well. Therefore, this function, and all code run afterwards (till calling `gpio_force_unhold_all` to disable this feature), **MUST** be placed in internal RAM as holding the flash pins will halt SPI flash operation, and holding the UART pins will halt any UART logging.
- The hold state of all pads will be cancelled during ROM boot, so it is not recommended to use this API to hold the pads state during deepsleep and reset.

*esp\_err\_t* **gpio\_force\_unhold\_all** (void)

Unhold all digital and rtc gpio pads.

---

**Note:** The global hold signal and the hold signal of each IO act on the PAD through 'or' logic, so if a pad has already been configured to hold by `gpio_hold_en`, this API can't release its hold state.

---

*esp\_err\_t* **gpio\_sleep\_sel\_en** (*gpio\_num\_t* gpio\_num)

Enable SLP\_SEL to change GPIO status automatically in lightsleep.

**Parameters** **gpio\_num** -- GPIO number of the pad.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **gpio\_sleep\_sel\_dis** (*gpio\_num\_t* gpio\_num)

Disable SLP\_SEL to change GPIO status automatically in lightsleep.

**Parameters** **gpio\_num** -- GPIO number of the pad.

**Returns**

- ESP\_OK Success

*esp\_err\_t* **gpio\_sleep\_set\_direction** (*gpio\_num\_t* gpio\_num, *gpio\_mode\_t* mode)

GPIO set direction at sleep.

Configure GPIO direction,such as output\_only,input\_only,output\_and\_input

**Parameters**

- **gpio\_num** -- Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **mode** -- GPIO direction

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG GPIO error

*esp\_err\_t* **gpio\_sleep\_set\_pull\_mode** (*gpio\_num\_t* gpio\_num, *gpio\_pull\_mode\_t* pull)

Configure GPIO pull-up/pull-down resistors at sleep.

---

**Note:** ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

---

**Parameters**

- **gpio\_num** -- GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio\_num should be GPIO\_NUM\_16 (16);
- **pull** -- GPIO pull up/down mode.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG : Parameter error

*esp\_err\_t* **gpio\_deep\_sleep\_wakeup\_enable** (*gpio\_num\_t* gpio\_num, *gpio\_int\_type\_t* intr\_type)

Enable GPIO deep-sleep wake-up function.

---

**Note:** Called by the SDK. User shouldn't call this directly in the APP.

---

**Parameters**

- **gpio\_num** -- GPIO number.
- **intr\_type** -- GPIO wake-up type. Only GPIO\_INTR\_LOW\_LEVEL or GPIO\_INTR\_HIGH\_LEVEL can be used.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_deep\_sleep\_wakeup\_disable** (*gpio\_num\_t* gpio\_num)

Disable GPIO deep-sleep wake-up function.

**Parameters** **gpio\_num** -- GPIO number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **gpio\_dump\_io\_configuration** (FILE \*out\_stream, uint64\_t io\_bit\_mask)

Dump IO configuration information to console.

**Parameters**

- **out\_stream** -- IO stream (e.g. stdout)
- **io\_bit\_mask** -- IO pin bit mask, each bit maps to an IO

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

## Structures

struct **gpio\_config\_t**

Configuration parameters of GPIO pad for `gpio_config` function.

### Public Members

uint64\_t **pin\_bit\_mask**

GPIO pin: set with bit mask, each bit maps to a GPIO

*gpio\_mode\_t* **mode**

GPIO mode: set input/output mode

*gpio\_pullup\_t* **pull\_up\_en**

GPIO pull-up

*gpio\_pulldown\_t* **pull\_down\_en**

GPIO pull-down

*gpio\_int\_type\_t* **intr\_type**

GPIO interrupt type

## Macros

**GPIO\_PIN\_COUNT**

**GPIO\_IS\_VALID\_GPIO** (gpio\_num)

Check whether it is a valid GPIO number.

**GPIO\_IS\_VALID\_OUTPUT\_GPIO** (gpio\_num)

Check whether it can be a valid GPIO number of output mode.

**GPIO\_IS\_VALID\_DIGITAL\_IO\_PAD** (gpio\_num)

Check whether it can be a valid digital I/O pad.

**GPIO\_IS\_DEEP\_SLEEP\_WAKEUP\_VALID\_GPIO** (gpio\_num)

## Type Definitions

typedef *intr\_handle\_t* **gpio\_isr\_handle\_t**

typedef void (\***gpio\_isr\_t**)(void \*arg)

GPIO interrupt handler.

**Param arg** User registered data

*Values:*

enumerator **GPIO\_PULLUP\_DISABLE**  
Disable GPIO pull-up resistor

enumerator **GPIO\_PULLUP\_ENABLE**  
Enable GPIO pull-up resistor

enum **gpiopulldown\_t**

*Values:*

enumerator **GPIO\_PULLDOWN\_DISABLE**  
Disable GPIO pull-down resistor

enumerator **GPIO\_PULLDOWN\_ENABLE**  
Enable GPIO pull-down resistor

enum **gpio\_pull\_mode\_t**

*Values:*

enumerator **GPIO\_PULLUP\_ONLY**

Pad pull up

enumerator **GPIO\_PULLDOWN\_ONLY**

Pad pull down

enumerator **GPIO\_PULLUP\_PULLDOWN**

Pad pull up + pull down

enumerator **GPIO\_FLOATING**

Pad floating

enum **gpio\_drive\_cap\_t**

*Values:*

enumerator **GPIO\_DRIVE\_CAP\_0**

Pad drive capability: weak

enumerator **GPIO\_DRIVE\_CAP\_1**

Pad drive capability: stronger

enumerator **GPIO\_DRIVE\_CAP\_2**

Pad drive capability: medium

enumerator **GPIO\_DRIVE\_CAP\_DEFAULT**

Pad drive capability: medium

enumerator **GPIO\_DRIVE\_CAP\_3**

Pad drive capability: strongest

enumerator **GPIO\_DRIVE\_CAP\_MAX**

enum **gpio\_hys\_ctrl\_mode\_t**

Available option for configuring hysteresis feature of GPIOs.

*Values:*

enumerator **GPIO\_HYS\_CTRL\_EFUSE**

Pad input hysteresis ctrl by efuse

enumerator **GPIO\_HYS\_SOFT\_ENABLE**

Pad input hysteresis enable by software

enumerator **GPIO\_HYS\_SOFT\_DISABLE**

Pad input hysteresis disable by software

## API Reference - GPIO Glitch Filter

### Header File

- `components/driver/gpio/include/driver/gpio_filter.h`

### Functions

*esp\_err\_t* **gpio\_new\_pin\_glitch\_filter** (const *gpio\_pin\_glitch\_filter\_config\_t* \*config,  
*gpio\_glitch\_filter\_handle\_t* \*ret\_filter)

Create a pin glitch filter.

---

**Note:** Pin glitch filter parameters are fixed, pulses shorter than two sample clocks (IO-MUX's source clock) will be filtered out. It's independent with "flex" glitch filter. See also `gpio_new_flex_glitch_filter`.

---

---

**Note:** The created filter handle can later be deleted by `gpio_del_glitch_filter`.

---

#### Parameters

- **config** -- **[in]** Glitch filter configuration
- **ret\_filter** -- **[out]** Returned glitch filter handle

#### Returns

- `ESP_OK`: Create a pin glitch filter successfully
- `ESP_ERR_INVALID_ARG`: Create a pin glitch filter failed because of invalid arguments (e.g. wrong GPIO number)
- `ESP_ERR_NO_MEM`: Create a pin glitch filter failed because of out of memory
- `ESP_FAIL`: Create a pin glitch filter failed because of other error

*esp\_err\_t* **gpio\_new\_flex\_glitch\_filter** (const *gpio\_flex\_glitch\_filter\_config\_t* \*config,  
*gpio\_glitch\_filter\_handle\_t* \*ret\_filter)

Allocate a flex glitch filter.

---

**Note:** "flex" means the filter parameters (window, threshold) are adjustable. It's independent with pin glitch filter. See also `gpio_new_pin_glitch_filter`.

---

---

**Note:** The created filter handle can later be deleted by `gpio_del_glitch_filter`.

---

#### Parameters

- **config** -- **[in]** Glitch filter configuration
- **ret\_filter** -- **[out]** Returned glitch filter handle

#### Returns

- `ESP_OK`: Allocate a flex glitch filter successfully
- `ESP_ERR_INVALID_ARG`: Allocate a flex glitch filter failed because of invalid arguments (e.g. wrong GPIO number, filter parameters out of range)
- `ESP_ERR_NO_MEM`: Allocate a flex glitch filter failed because of out of memory
- `ESP_ERR_NOT_FOUND`: Allocate a flex glitch filter failed because the underlying hardware resources are used up
- `ESP_FAIL`: Allocate a flex glitch filter failed because of other error

*esp\_err\_t* **gpio\_del\_glitch\_filter** (*gpio\_glitch\_filter\_handle\_t* filter)

Delete a glitch filter.

**Parameters** **filter** -- **[in]** Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

**Returns**

- ESP\_OK: Delete glitch filter successfully
- ESP\_ERR\_INVALID\_ARG: Delete glitch filter failed because of invalid arguments
- ESP\_ERR\_INVALID\_STATE: Delete glitch filter failed because the glitch filter is still in working
- ESP\_FAIL: Delete glitch filter failed because of other error

*esp\_err\_t* **gpio\_glitch\_filter\_enable** (*gpio\_glitch\_filter\_handle\_t* filter)

Enable a glitch filter.

**Parameters** **filter** -- [in] Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

**Returns**

- ESP\_OK: Enable glitch filter successfully
- ESP\_ERR\_INVALID\_ARG: Enable glitch filter failed because of invalid arguments
- ESP\_ERR\_INVALID\_STATE: Enable glitch filter failed because the glitch filter is already enabled
- ESP\_FAIL: Enable glitch filter failed because of other error

*esp\_err\_t* **gpio\_glitch\_filter\_disable** (*gpio\_glitch\_filter\_handle\_t* filter)

Disable a glitch filter.

**Parameters** **filter** -- [in] Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

**Returns**

- ESP\_OK: Disable glitch filter successfully
- ESP\_ERR\_INVALID\_ARG: Disable glitch filter failed because of invalid arguments
- ESP\_ERR\_INVALID\_STATE: Disable glitch filter failed because the glitch filter is not enabled yet
- ESP\_FAIL: Disable glitch filter failed because of other error

**Structures**

struct **gpio\_pin\_glitch\_filter\_config\_t**

Configuration of GPIO pin glitch filter.

**Public Members**

*glitch\_filter\_clock\_source\_t* **clk\_src**

Clock source for the glitch filter

*gpio\_num\_t* **gpio\_num**

GPIO number

struct **gpio\_flex\_glitch\_filter\_config\_t**

Configuration of GPIO flex glitch filter.

**Public Members**

*glitch\_filter\_clock\_source\_t* **clk\_src**

Clock source for the glitch filter

*gpio\_num\_t* **gpio\_num**

GPIO number

uint32\_t **window\_width\_ns**

Sample window width (in ns)

uint32\_t **window\_thres\_ns**

Sample window threshold (in ns), during the `window_width_ns` sample window, any pulse whose width < `window_thres_ns` will be discarded.

### Type Definitions

typedef struct gpio\_glitch\_filter\_t \***gpio\_glitch\_filter\_handle\_t**

Typedef of GPIO glitch filter handle.

## 2.6.5 General Purpose Timer (GPTimer)

### Introduction

GPTimer (General Purpose Timer) is the driver of ESP32-C2 Timer Group peripheral. The hardware timer features high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution timestamp at any time and any places
- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time

### Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

- *Resource Allocation* - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- *Set and Get Count Value* - covers how to force the timer counting from a start point and how to get the count value at anytime.
- *Set up Alarm Action* - covers the parameters that should be set up to enable the alarm event.
- *Register Event Callbacks* - covers how to hook user specific code to the alarm event callback function.
- *Enable and Disable Timer* - covers how to enable and disable the timer.
- *Start and Stop Timer* - shows some typical use cases that start the timer with different alarm behavior.
- *Power Management* - describes how different source clock selections can affect power consumption.
- *IRAM Safe* - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
- *Thread Safety* - lists which APIs are guaranteed to be thread safe by the driver.
- *Kconfig Options* - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.<sup>1</sup>

A GPTimer instance is represented by `gptimer_handle_t`. The driver behind will manage all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

---

<sup>1</sup> Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to *ESP32-C2 Technical Reference Manual* > Chapter *Timer Group (TIMG)* [PDF]. The driver will not forbid you from applying for more timers, but it will return error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g. `gptimer_new_timer()`).

To install a timer instance, there is a configuration structure that needs to be given in advance: `gptimer_config_t`:

- `gptimer_config_t::clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Section *Power Management*.
- `gptimer_config_t::direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `gptimer_config_t::resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to  $1 / \text{resolution\_hz}$  seconds.
- `gptimer_config_t::intr_priority` sets the priority of the timer interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- Optional `gptimer_config_t::intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to *Interrupt Handling*.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e. all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value will depend on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This will allow the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, please disable it by `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

### Creating a GPTimer Handle with Resolution of 1 MHz

```
gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

**Set and Get Count Value** When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

**Set up Alarm Action** For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of `gptimer_alarm_config_t` based on how you make use of the alarm event:

- `gptimer_alarm_config_t::alarm_count` sets the target count value that will trigger the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `gptimer_alarm_config_t::alarm_count` and `gptimer_alarm_config_t::reload_count` cannot be set to the same value when `gptimer_alarm_config_t::auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- `gptimer_alarm_config_t::reload_count` sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `gptimer_alarm_config_t::auto_reload_on_alarm` is set to true.

- `gptimer_alarm_config_t::auto_reload_on_alarm` flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `gptimer_alarm_config_t::reload_count` into counter immediately when an alarm event happens.

To make the alarm configurations take effect, you should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to NULL, the alarm function will be disabled.

---

**Note:** If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

---

**Register Event Callbacks** After the timer starts up, it can generate a specific event (e.g. the "Alarm Event") dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in `gptimer_event_callbacks_t`:

- `gptimer_event_callbacks_t::on_alarm` sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`.

You can save your own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback function.

This function will lazy install the interrupt service for the timer but not enable it. So please call this function before `gptimer_enable()`, otherwise the `ESP_ERR_INVALID_STATE` error will be returned. See Section [Enable and Disable Timer](#) for more information.

**Enable and Disable Timer** Before doing IO control to the timer, you need to enable the timer first, by calling `gptimer_enable()`. This function will:

- Switch the timer driver state from **init** to **enable**.
- Enable the interrupt service if it has been lazy installed by `gptimer_register_event_callbacks()`.
- Acquire a proper power management lock if a specific clock source (e.g. APB clock) is selected. See Section [Power Management](#) for more information.

Calling `gptimer_disable()` will do the opposite, that is, put the timer driver back to the **init** state, disable the interrupt service and release the power management lock.

**Start and Stop Timer** The basic IO operation of a timer is to start and stop. Calling `gptimer_start()` can make the internal counter work, while calling `gptimer_stop()` can make the counter stop working. The following illustrates how to start a timer with or without an alarm event. Calling `gptimer_start()` will transit the driver state from **enable** to **run**, and vice versa. You need to make sure the start and stop functions are used in pairs, otherwise, the functions may return `ESP_ERR_INVALID_STATE`. Most of the time, this error means that the timer is already stopped or in the "start protection" state (i.e. `gptimer_start()` is called but not finished).

### Start Timer as a Wall Clock

```
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

### Trigger Period Events

```
typedef struct {
    uint64_t event_count;
} example_queue_element_t;
```

(continues on next page)

(continued from previous page)

```

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    // Do not introduce complex logics in callbacks
    // Suggest dealing with event data in the main loop, instead of in this
↳callback
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

### Trigger One-Shot Event

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↳event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

```

(continues on next page)

(continued from previous page)

```

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));

```

**Dynamic Alarm Update** Alarm value can be updated dynamically inside the ISR handler callback, by changing `gptimer_alarm_event_data_t::alarm_value`. Then the alarm value will be updated after the callback function returns.

```

typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
↪event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // reconfigure alarm value
    gptimer_alarm_config_t alarm_config = {
        .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
    };
    gptimer_set_alarm_action(timer, &alarm_config);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1000000, // initial alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer, &alarm_config));

```

**Power Management** There're some power management strategies, which might turn off or change the frequency of GPTimer's source clock to save power consumption. For example, during DFS, APB clock will be scaled down. If light-sleep is also enabled, PLL and XTAL clocks will be powered off. Both of them can result in an inaccurate time keeping.

The driver can prevent the above situation from happening by creating different power management lock according to different clock source. The driver will increase the reference count of that power management lock in the `gptimer_enable()` and decrease it in the `gptimer_disable()`. So we can ensure the clock source is stable between `gptimer_enable()` and `gptimer_disable()`.

**IRAM Safe** By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that will:

- Enable the interrupt being serviced even when the cache is disabled
- Place all functions that used by the ISR into IRAM<sup>2</sup>
- Place driver object into DRAM (in case it is mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled, but will come at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

**Thread Safety** All the APIs provided by the driver are guaranteed to be thread safe, which means you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context.

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_get_captured_count()`
- `gptimer_set_alarm_action()`

### Kconfig Options

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM or flash).
- `CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM` controls where to place the GPTimer ISR handler (IRAM or flash).
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler should be masked when the cache is disabled, see Section *IRAM Safe* for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option will increase the firmware binary size.

### Application Examples

- Typical use cases of GPTimer are listed in the example [peripherals/timer\\_group/gptimer](#).

### API Reference

#### Header File

- `components/driver/gptimer/include/driver/gptimer.h`

---

<sup>2</sup> `gptimer_event_callbacks_t::on_alarm` callback and the functions invoked by the callback should also be placed in IRAM, please take care of them by yourself.

## Functions

*esp\_err\_t* **gptimer\_new\_timer** (const *gptimer\_config\_t* \*config, *gptimer\_handle\_t* \*ret\_timer)

Create a new General Purpose Timer, and return the handle.

---

**Note:** The newly created timer is put in the "init" state.

---

### Parameters

- **config** -- [in] GPTimer configuration
- **ret\_timer** -- [out] Returned timer handle

### Returns

- ESP\_OK: Create GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Create GPTimer failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create GPTimer failed because out of memory
- ESP\_ERR\_NOT\_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP\_FAIL: Create GPTimer failed because of other error

*esp\_err\_t* **gptimer\_del\_timer** (*gptimer\_handle\_t* timer)

Delete the GPTimer handle.

---

**Note:** A timer must be in the "init" state before it can be deleted.

---

**Parameters** **timer** -- [in] Timer handle created by `gptimer_new_timer`

### Returns

- ESP\_OK: Delete GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Delete GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Delete GPTimer failed because the timer is not in init state
- ESP\_FAIL: Delete GPTimer failed because of other error

*esp\_err\_t* **gptimer\_set\_raw\_count** (*gptimer\_handle\_t* timer, uint64\_t value)

Set GPTimer raw count value.

---

**Note:** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

---

**Note:** This function is allowed to run within ISR context

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [in] Count value to be set

### Returns

- ESP\_OK: Set GPTimer raw count value successfully
- ESP\_ERR\_INVALID\_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP\_FAIL: Set GPTimer raw count value failed because of other error

*esp\_err\_t* **gptimer\_get\_raw\_count** (*gptimer\_handle\_t* timer, uint64\_t \*value)

Get GPTimer raw count value.

---

**Note:** This function will trigger a software capture event and then return the captured count value.

---

---

**Note:** With the raw count value and the resolution returned from `gptimer_get_resolution`, you can convert the count value into seconds.

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

#### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [out] Returned GPTimer count value

#### Returns

- `ESP_OK`: Get GPTimer raw count value successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer raw count value failed because of invalid argument
- `ESP_FAIL`: Get GPTimer raw count value failed because of other error

*esp\_err\_t* **gptimer\_get\_resolution** (*gptimer\_handle\_t* timer, uint32\_t \*out\_resolution)

Return the real resolution of the timer.

---

**Note:** usually the timer resolution is same as what you configured in the `gptimer_config_t::resolution_hz`, but some unstable clock source (e.g. `RC_FAST`) will do a calibration, the real resolution can be different from the configured one.

---

#### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **out\_resolution** -- [out] Returned timer resolution, in Hz

#### Returns

- `ESP_OK`: Get GPTimer resolution successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer resolution failed because of invalid argument
- `ESP_FAIL`: Get GPTimer resolution failed because of other error

*esp\_err\_t* **gptimer\_get\_captured\_count** (*gptimer\_handle\_t* timer, uint64\_t \*value)

Get GPTimer captured count value.

---

**Note:** The capture action can be issued either by ETM event or by software (see also `gptimer_get_raw_count`).

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters**

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **value** -- [out] Returned captured count value

**Returns**

- `ESP_OK`: Get GPTimer captured count value successfully
- `ESP_ERR_INVALID_ARG`: Get GPTimer captured count value failed because of invalid argument
- `ESP_FAIL`: Get GPTimer captured count value failed because of other error

*esp\_err\_t* `gptimer_register_event_callbacks` (*gptimer\_handle\_t* timer, const *gptimer\_event\_callbacks\_t* \*cbs, void \*user\_data)

Set callbacks for GPTimer.

---

**Note:** User registered callbacks are expected to be runnable within ISR context

---

---

**Note:** The first call to this function needs to be before the call to `gptimer_enable`

---

---

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to `NULL`.

---

**Parameters**

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **cbs** -- [in] Group of callback functions
- **user\_data** -- [in] User data, which will be passed to callback functions directly

**Returns**

- `ESP_OK`: Set event callbacks successfully
- `ESP_ERR_INVALID_ARG`: Set event callbacks failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Set event callbacks failed because the timer is not in init state
- `ESP_FAIL`: Set event callbacks failed because of other error

*esp\_err\_t* `gptimer_set_alarm_action` (*gptimer\_handle\_t* timer, const *gptimer\_alarm\_config\_t* \*config)

Set alarm event actions for GPTimer.

---

**Note:** This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters**

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] Alarm configuration, especially, set `config` to `NULL` means disabling the alarm function

**Returns**

- ESP\_OK: Set alarm action for GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP\_FAIL: Set alarm action for GPTimer failed because of other error

*esp\_err\_t* **gptimer\_enable** (*gptimer\_handle\_t* timer)

Enable GPTimer.

---

**Note:** This function will transit the timer state from "init" to "enable".

---

---

**Note:** This function will enable the interrupt service, if it's lazy installed in `gptimer_register_event_callbacks`.

---

---

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while `CONFIG_PM_ENABLE` is enabled.

---

---

**Note:** Enable a timer doesn't mean to start it. See also `gptimer_start` for how to make the timer start counting.

---

**Parameters** `timer` -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- ESP\_OK: Enable GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Enable GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Enable GPTimer failed because the timer is already enabled
- ESP\_FAIL: Enable GPTimer failed because of other error

*esp\_err\_t* **gptimer\_disable** (*gptimer\_handle\_t* timer)

Disable GPTimer.

---

**Note:** This function will transit the timer state from "enable" to "init".

---

---

**Note:** This function will disable the interrupt service if it's installed.

---

---

**Note:** This function will release the PM lock if it's acquired in the `gptimer_enable`.

---

---

**Note:** Disable a timer doesn't mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

---

**Parameters** `timer` -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- ESP\_OK: Disable GPTimer successfully
- ESP\_ERR\_INVALID\_ARG: Disable GPTimer failed because of invalid argument
- ESP\_ERR\_INVALID\_STATE: Disable GPTimer failed because the timer is not enabled yet
- ESP\_FAIL: Disable GPTimer failed because of other error

*esp\_err\_t* **gptimer\_start** (*gptimer\_handle\_t* timer)

Start GPTimer (internal counter starts counting)

---

**Note:** This function will transit the timer state from "enable" to "run".

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters** **timer** -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- `ESP_OK`: Start GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Start GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Start GPTimer failed because the timer is not enabled or is already in running
- `ESP_FAIL`: Start GPTimer failed because of other error

*esp\_err\_t* **gptimer\_stop** (*gptimer\_handle\_t* timer)

Stop GPTimer (internal counter stops counting)

---

**Note:** This function will transit the timer state from "run" to "enable".

---

---

**Note:** This function is allowed to run within ISR context

---

---

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

---

**Parameters** **timer** -- [in] Timer handle created by `gptimer_new_timer`

**Returns**

- `ESP_OK`: Stop GPTimer successfully
- `ESP_ERR_INVALID_ARG`: Stop GPTimer failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Stop GPTimer failed because the timer is not in running.
- `ESP_FAIL`: Stop GPTimer failed because of other error

## Structures

struct **gptimer\_config\_t**

General Purpose Timer configuration.

## Public Members

*gptimer\_clock\_source\_t* **clk\_src**

GPTimer clock source

*gptimer\_count\_direction\_t* **direction**

Count direction

uint32\_t **resolution\_hz**

Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution\_hz) seconds

int **intr\_priority**

GPTimer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32\_t **intr\_shared**

Set true, the timer interrupt number can be shared with other peripherals

struct *gptimer\_config\_t*::[anonymous] **flags**

GPTimer config flags

struct **gptimer\_event\_callbacks\_t**

Group of supported GPTimer callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

---

**Note:** When CONFIG\_GPTIMER\_ISR\_IRAM\_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

---

## Public Members

*gptimer\_alarm\_cb\_t* **on\_alarm**

Timer alarm callback

struct **gptimer\_alarm\_config\_t**

General Purpose Timer alarm configuration.

## Public Members

uint64\_t **alarm\_count**

Alarm target count value

uint64\_t **reload\_count**

Alarm reload count value, effect only when `auto_reload_on_alarm` is set to true

uint32\_t **auto\_reload\_on\_alarm**

Reload the count value by hardware, immediately at the alarm event

struct *gptimer\_alarm\_config\_t*::[anonymous] **flags**

Alarm config flags

## Header File

- `components/driver/gptimer/include/driver/gptimer_etm.h`

## Functions

`esp_err_t gptimer_new_etm_event` (*gptimer\_handle\_t* timer, const *gptimer\_etm\_event\_config\_t* \*config, *esp\_etm\_event\_handle\_t* \*out\_event)

Get the ETM event for GPTimer.

---

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`

---

### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] GPTimer ETM event configuration
- **out\_event** -- [out] Returned ETM event handle

### Returns

- `ESP_OK`: Get ETM event successfully
- `ESP_ERR_INVALID_ARG`: Get ETM event failed because of invalid argument
- `ESP_FAIL`: Get ETM event failed because of other error

`esp_err_t gptimer_new_etm_task` (*gptimer\_handle\_t* timer, const *gptimer\_etm\_task\_config\_t* \*config, *esp\_etm\_task\_handle\_t* \*out\_task)

Get the ETM task for GPTimer.

---

**Note:** The created ETM task object can be deleted later by calling `esp_etm_del_task`

---

### Parameters

- **timer** -- [in] Timer handle created by `gptimer_new_timer`
- **config** -- [in] GPTimer ETM task configuration
- **out\_task** -- [out] Returned ETM task handle

### Returns

- `ESP_OK`: Get ETM task successfully
- `ESP_ERR_INVALID_ARG`: Get ETM task failed because of invalid argument
- `ESP_FAIL`: Get ETM task failed because of other error

## Structures

struct `gptimer_etm_event_config_t`

GPTimer ETM event configuration.

## Public Members

*gptimer\_etm\_event\_type\_t* `event_type`

GPTimer ETM event type

struct `gptimer_etm_task_config_t`

GPTimer ETM task configuration.

## Public Members

*gptimer\_etm\_task\_type\_t* **task\_type**

GPTimer ETM task type

### Header File

- [components/driver/gptimer/include/driver/gptimer\\_types.h](#)

### Structures

struct **gptimer\_alarm\_event\_data\_t**

GPTimer alarm event data.

### Public Members

uint64\_t **count\_value**

Current count value

uint64\_t **alarm\_value**

Current alarm value

### Type Definitions

typedef struct gptimer\_t \***gptimer\_handle\_t**

Type of General Purpose Timer handle.

typedef bool (\***gptimer\_alarm\_cb\_t**)(*gptimer\_handle\_t* timer, const *gptimer\_alarm\_event\_data\_t* \*edata, void \*user\_ctx)

Timer alarm callback prototype.

**Param timer [in]** Timer handle created by `gptimer_new_timer`

**Param edata [in]** Alarm event data, fed by driver

**Param user\_ctx [in]** User data, passed from `gptimer_register_event_callbacks`

**Return** Whether a high priority task has been waken up by this function

### Header File

- [components/hal/include/hal/timer\\_types.h](#)

### Type Definitions

typedef *soc\_periph\_gptimer\_clk\_src\_t* **gptimer\_clock\_source\_t**

GPTimer clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

---

### Enumerations

enum **gptimer\_count\_direction\_t**

GPTimer count direction.

*Values:*

enumerator **GPTIMER\_COUNT\_DOWN**

Decrease count value

enumerator **GPTIMER\_COUNT\_UP**

Increase count value

enum **gptimer\_etm\_task\_type\_t**

GPTimer specific tasks that supported by the ETM module.

*Values:*

enumerator **GPTIMER\_ETM\_TASK\_START\_COUNT**

Start the counter

enumerator **GPTIMER\_ETM\_TASK\_STOP\_COUNT**

Stop the counter

enumerator **GPTIMER\_ETM\_TASK\_EN\_ALARM**

Enable the alarm

enumerator **GPTIMER\_ETM\_TASK\_RELOAD**

Reload preset value into counter

enumerator **GPTIMER\_ETM\_TASK\_CAPTURE**

Capture current count value into specific register

enumerator **GPTIMER\_ETM\_TASK\_MAX**

Maximum number of tasks

enum **gptimer\_etm\_event\_type\_t**

GPTimer specific events that supported by the ETM module.

*Values:*

enumerator **GPTIMER\_ETM\_EVENT\_ALARM\_MATCH**

Count value matches the alarm target value

enumerator **GPTIMER\_ETM\_EVENT\_MAX**

Maximum number of events

## 2.6.6 Dedicated GPIO

### Overview

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as "dedicated" can be access by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this "CPU Dedicated" way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

## Create/Destroy GPIO Bundle

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What's more, the GPIO bundle has a strong relevance to the CPU which it derives from. **Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to.** Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

---

**Note:** Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It's highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it's impossible to control GPIOA.

---

To install a GPIO bundle, one needs to call `dedic_gpio_new_bundle()` to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in `dedic_gpio_bundle_config_t` structure:

- `gpio_array`: An array that contains GPIO number.
- `array_size`: Element number of `gpio_array`.
- `flags`: Extra flags to control the behavior of GPIO Bundle.
  - `in_en` and `out_en` are used to select whether to enable the input and output function (note, they can be enabled together).
  - `in_invert` and `out_invert` are used to select whether to invert the GPIO signal.

The following code shows how to install a output only GPIO bundle:

```
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
    gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
    .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
    .flags = {
        .out_en = 1,
    },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));
```

To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

---

**Note:** `dedic_gpio_new_bundle()` doesn't cover any GPIO pad configuration (e.g. pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g. `gpio_config()`). For more information about GPIO driver, please refer to [GPIO API Reference](#).

---

## GPIO Bundle Operations

Operations	Functions
Write to GPIOs in the bundle by mask	<code>dedic_gpio_bundle_write()</code>
Read the value that output from the given GPIO bundle	<code>dedic_gpio_bundle_read_out()</code>
Read the value that input to the given GPIO bundle	<code>dedic_gpio_bundle_read_in()</code>

**Note:** Using the above functions might not get a high GPIO flip speed because of the overhead of function calls and the bit operations involved inside. Users can try *Manipulate GPIOs by Writing Assembly Code* instead to reduce the overhead but should take care of the thread safety by themselves.

## Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:

1. Allocate a GPIO bundle: `dedic_gpio_new_bundle()`
2. Query the mask occupied by that bundle: `dedic_gpio_get_out_mask()` or/and `dedic_gpio_get_in_mask()`
3. Call CPU LL apis (e.g. `dedic_gpio_cpu_ll_write_mask`) or write assembly code with that mask
4. The fasted way of toggling IO is to use the dedicated "set/clear" instructions:
  - Set bits of GPIO: `csrrsi rd, csr, imm[4:0]`
  - Clear bits of GPIO: `csrrci rd, csr, imm[4:0]`
  - Note: Can only control the lowest 4 GPIO channels

Code examples for manipulating dedicated GPIOs from assembly are provided in the [peripherals/dedicated\\_gpio](#) directory of ESP-IDF examples. These examples show how to emulate a UART, an I2C and an SPI bus in assembly thanks to dedicated GPIOs.

For details of supported dedicated GPIO instructions, please refer to *ESP32-C2 Technical Reference Manual > ESP-RISC-V CPU* [PDF].

Some of the dedicated CPU instructions are also wrapped inside `hal/dedic_gpio_cpu_ll.h` as helper inline functions.

**Note:** Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.

## API Reference

### Header File

- `components/driver/gpio/include/driver/dedic_gpio.h`

### Functions

`esp_err_t dedic_gpio_get_out_mask(dedic_gpio_bundle_handle_t bundle, uint32_t *mask)`

Get allocated channel mask.

**Note:** Each bundle should have at least one mask (in or/and out), based on bundle configuration.

---

**Note:** With the returned mask, user can directly invoke LL function like "dedic\_gpio\_cpu\_ll\_write\_mask" or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

---

**Parameters**

- **bundle** -- [in] Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"
- **mask** -- [out] Returned mask value for on specific direction (in or out)

**Returns**

- ESP\_OK: Get channel mask successfully
- ESP\_ERR\_INVALID\_ARG: Get channel mask failed because of invalid argument
- ESP\_FAIL: Get channel mask failed because of other error

*esp\_err\_t* **dedic\_gpio\_get\_in\_mask** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t \*mask)

*esp\_err\_t* **dedic\_gpio\_get\_out\_offset** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t \*offset)

Get the channel offset of the GPIO bundle.

A GPIO bundle maps the GPIOs of a particular direction to a consecutive set of channels within a particular GPIO bank of a particular CPU. This function returns the offset to the bundle's first channel of a particular direction within the bank.

**Parameters**

- **bundle** -- [in] Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"
- **offset** -- [out] Offset value to the first channel of a specific direction (in or out)

**Returns**

- ESP\_OK: Get channel offset successfully
- ESP\_ERR\_INVALID\_ARG: Get channel offset failed because of invalid argument
- ESP\_FAIL: Get channel offset failed because of other error

*esp\_err\_t* **dedic\_gpio\_get\_in\_offset** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t \*offset)

*esp\_err\_t* **dedic\_gpio\_new\_bundle** (const *dedic\_gpio\_bundle\_config\_t* \*config, *dedic\_gpio\_bundle\_handle\_t* \*ret\_bundle)

Create GPIO bundle and return the handle.

---

**Note:** One has to enable at least input or output mode in "config" parameter.

---

**Parameters**

- **config** -- [in] Configuration of GPIO bundle
- **ret\_bundle** -- [out] Returned handle of the new created GPIO bundle

**Returns**

- ESP\_OK: Create GPIO bundle successfully
- ESP\_ERR\_INVALID\_ARG: Create GPIO bundle failed because of invalid argument
- ESP\_ERR\_NO\_MEM: Create GPIO bundle failed because of no capable memory
- ESP\_ERR\_NOT\_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP\_FAIL: Create GPIO bundle failed because of other error

*esp\_err\_t* **dedic\_gpio\_del\_bundle** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Destroy GPIO bundle.

**Parameters** **bundle** -- [in] Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"

**Returns**

- ESP\_OK: Destroy GPIO bundle successfully
- ESP\_ERR\_INVALID\_ARG: Destroy GPIO bundle failed because of invalid argument
- ESP\_FAIL: Destroy GPIO bundle failed because of other error

void **dedic\_gpio\_bundle\_write** (*dedic\_gpio\_bundle\_handle\_t* bundle, uint32\_t mask, uint32\_t value)

Write value to GPIO bundle.

---

**Note:** The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

---

---

**Note:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

#### Parameters

- **bundle** -- **[in]** Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"
- **mask** -- **[in]** Mask of the GPIOs to be written in the given bundle
- **value** -- **[in]** Value to write to given GPIO bundle, low bit represents low member in the bundle

uint32\_t **dedic\_gpio\_bundle\_read\_out** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Read the value that output from the given GPIO bundle.

---

**Note:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**Parameters** **bundle** -- **[in]** Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"

**Returns** Value that output from the GPIO bundle, low bit represents low member in the bundle

uint32\_t **dedic\_gpio\_bundle\_read\_in** (*dedic\_gpio\_bundle\_handle\_t* bundle)

Read the value that input to the given GPIO bundle.

---

**Note:** For performance reasons, this function doesn't check the validity of any parameters, and is placed in IRAM.

---

**Parameters** **bundle** -- **[in]** Handle of GPIO bundle that returned from "dedic\_gpio\_new\_bundle"

**Returns** Value that input to the GPIO bundle, low bit represents low member in the bundle

## Structures

struct **dedic\_gpio\_bundle\_config\_t**

Type of Dedicated GPIO bundle configuration.

## Public Members

const int \***gpio\_array**

Array of GPIO numbers, gpio\_array[0] ~ gpio\_array[size-1] <=> low\_dedic\_channel\_num ~ high\_dedic\_channel\_num

size\_t **array\_size**

Number of GPIOs in gpio\_array

unsigned int **in\_en**

Enable input

unsigned int **in\_invert**

Invert input signal

unsigned int **out\_en**

Enable output

unsigned int **out\_invert**

Invert output signal

struct *dedic\_gpio\_bundle\_config\_t*::[anonymous] **flags**

Flags to control specific behaviour of GPIO bundle

### Type Definitions

```
typedef struct dedic_gpio_bundle_t *dedic_gpio_bundle_handle_t
```

Type of Dedicated GPIO bundle.

## 2.6.7 Inter-Integrated Circuit (I2C)

### Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32-C2 has 1 I2C controller (also referred to as port), responsible for handling communications on the I2C bus. A single I2C controller can operate as master or slave.

### Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Reading and writing to registers which are in turn read/written by the master

### Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. *Configuration* - set the initialization parameters (master mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. *Install Driver*- activate the driver on one of the two I2C controllers as a master
3. Depending on whether you configure the driver for a master, choose the appropriate item
  - a) *Communication as Master* - handle communications (master)
4. *Interrupt Handling* - configure and service I2C interrupts

5. *Customized Configuration* - adjust default I2C communication parameters (timings, bit order, etc.)
6. *Error Handling* - how to recognize and handle driver configuration and communication errors
7. *Delete Driver* - release resources used by the I2C driver when communication ends

**Configuration** To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C **mode of operation** - master from `i2c_mode_t`
- Configure **communication pins**
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32-C2's internal pull-ups
- (Master only) Set I2C **clock speed**

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,           // select SDA GPIO specific to your_
↪project
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_io_num = I2C_MASTER_SCL_IO,           // select SCL GPIO specific to your_
↪project
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = I2C_MASTER_FREQ_HZ,    // select frequency specific to your_
↪project
    .clk_flags = 0,                             // optional; you can use I2C_SCLK_SRC_
↪FLAG_* flags to choose i2c source clock here
};
```

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see *Customized Configuration*.

**Source Clock Configuration** **Clock sources allocator** is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

---

**Note:** A clock is not a valid option, if it doesn't meet the requested capabilities, i.e. any bit of requested capabilities (`clk_flags`) is 0 in the clock's capabilities.

---

Explanations for `i2c_config_t::clk_flags` are as follows:

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`: Clock's baud rate will not change while APB clock is changing.
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`: It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32-C2, reading technical reference manual before using it.

---

**Note:** The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

---

**Note:** The clock frequency of SCL will be influenced by the pull-up resistors and wire capacitance (or might slave capacitance) together. Therefore, users need to choose correct pull-up resistors by themselves to make the frequency accurate. It is recommended by I2C protocol that the pull-up resistors commonly range from 1KOhms to 10KOhms, but different frequencies need different resistors.

Generally speaking, the higher frequency is selected, the smaller resistor should be used (but not less than 1KOhms). This is because high resistor will decline the current, which will lengthen the rising time and reduce the frequency. Usually, range 2KOhms to 5KOhms is what we recommend, but users also might need to make some adjustment depends on their reality.

**Install Driver** After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- master, selected from `i2c_mode_t`
- Flags for allocating the interrupt (see `ESP_INTR_FLAG_*` values in `esp_hw_support/include/esp_intr_alloc.h`)

**Communication as Master** After installing the I2C driver, ESP32-C2 is ready to communicate with other I2C devices.

ESP32-C2's I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a "command link", that should be populated with a sequence of commands and then passed to the I2C controller for execution.

**Master Write** The example below shows how to build a command link for an I2C master to send  $n$  bytes to a slave.

Fig. 3: I2C command link - master write example

The following describes how a command link for a "master write" is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.  
Then, populate it with the series of data to be sent to the slave:
  - a) **Start bit** - `i2c_master_start()`

- b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
- c) **Data** - One or more bytes as an argument of `i2c_master_write()`
- d) **Stop bit** - `i2c_master_stop()`

Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.

2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.
3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read** The example below shows how to build a command link for an I2C master to read  $n$  bytes from a slave.

Fig. 4: I2C command link - master read example

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write...` functions but with `i2c_master_read_byte()` and/or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read** After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave's address.

For this reason, the command link sent by the master to write data to the slave contains the address  $(ESP\_SLAVE\_ADDR \ll 1) | I2C\_MASTER\_WRITE$  and looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Interrupt Handling** During driver installation, an interrupt handler is installed by default.

**Customized Configuration** As mentioned at the end of Section [Configuration](#), when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the I2C specification. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles.

Table 2: Other Configurable I2C Communication Parameters

Parameters to Change	Function
High time and low time for SCL pulses	<a href="#"><code>i2c_set_period()</code></a>
SCL and SDA signal timing used during generation of <b>start</b> signals	<a href="#"><code>i2c_set_start_timing()</code></a>
SCL and SDA signal timing used during generation of <b>stop</b> signals	<a href="#"><code>i2c_set_stop_timing()</code></a>
Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles	<a href="#"><code>i2c_set_data_timing()</code></a>
I2C timeout	<a href="#"><code>i2c_set_timeout()</code></a>
Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <a href="#"><code>i2c_trans_mode_t</code></a>	<a href="#"><code>i2c_set_data_mode()</code></a>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the I2C timeout value, call [`i2c\_get\_timeout\(\)`](#).

To check the default parameter values which are set during the driver configuration process, please refer to the file [driver/i2c/i2c.c](#) and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function [`i2c\_set\_pin\(\)`](#). If you want to modify already entered values, use the function [`i2c\_param\_config\(\)`](#).

---

**Note:** ESP32-C2's internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the I2C specification. For help with calculating the resistor values see [TI Application Note](#)

---

**Error Handling** The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file [driver/i2c/i2c.c](#) and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see [Interrupt Handling](#).

In case of a communication failure, you can reset the internal hardware buffers by calling the functions [`i2c\_reset\_tx\_fifo\(\)`](#) and [`i2c\_reset\_rx\_fifo\(\)`](#) for the send and receive buffers respectively.

**Delete Driver** When the I2C communication is established with the function [`i2c\_driver\_install\(\)`](#) and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling [`i2c\_driver\_delete\(\)`](#).

Before calling [`i2c\_driver\_delete\(\)`](#) to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

## Application Example

I2C examples: [peripherals/i2c](#).

## API Reference

### Header File

- [components/driver/i2c/include/driver/i2c.h](#)

## Functions

*esp\_err\_t* **i2c\_driver\_install** (*i2c\_port\_t* i2c\_num, *i2c\_mode\_t* mode, size\_t slv\_rx\_buf\_len, size\_t slv\_tx\_buf\_len, int intr\_alloc\_flags)

Install an I2C driver.

---

**Note:** Not all Espressif chips can support slave mode (e.g. ESP32C2)

---

---

**Note:** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, `ESP_INTR_FLAG_IRAM` is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we can not access the psram (if psram is enabled) in interrupt handle function when cache is disabled.

---

### Parameters

- **i2c\_num** -- I2C port number
- **mode** -- I2C mode (either master or slave).
- **slv\_rx\_buf\_len** -- Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
- **slv\_tx\_buf\_len** -- Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Driver installation error

*esp\_err\_t* **i2c\_driver\_delete** (*i2c\_port\_t* i2c\_num)

Delete I2C driver.

---

**Note:** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

---

**Parameters** **i2c\_num** -- I2C port to delete

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **i2c\_param\_config** (*i2c\_port\_t* i2c\_num, const *i2c\_config\_t* \*i2c\_conf)

Configure an I2C bus with the given configuration.

### Parameters

- **i2c\_num** -- I2C port to configure
- **i2c\_conf** -- Pointer to the I2C configuration

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **i2c\_reset\_tx\_fifo** (*i2c\_port\_t* i2c\_num)

reset I2C tx hardware fifo

**Parameters** **i2c\_num** -- I2C port number

### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **i2c\_reset\_rx\_fifo** (*i2c\_port\_t* i2c\_num)

reset I2C rx fifo

**Parameters** **i2c\_num** -- I2C port number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_pin** (*i2c\_port\_t* i2c\_num, int sda\_io\_num, int scl\_io\_num, bool sda\_pullup\_en, bool scl\_pullup\_en, *i2c\_mode\_t* mode)

Configure GPIO pins for I2C SCK and SDA signals.

**Parameters**

- **i2c\_num** -- I2C port number
- **sda\_io\_num** -- GPIO number for I2C SDA signal
- **scl\_io\_num** -- GPIO number for I2C SCL signal
- **sda\_pullup\_en** -- Enable the internal pullup for SDA pin
- **scl\_pullup\_en** -- Enable the internal pullup for SCL pin
- **mode** -- I2C mode

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_master\_write\_to\_device** (*i2c\_port\_t* i2c\_num, uint8\_t device\_address, const uint8\_t \*write\_buffer, size\_t write\_size, TickType\_t ticks\_to\_wait)

Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.

**Parameters**

- **i2c\_num** -- I2C port number to perform the transfer on
- **device\_address** -- I2C device's 7-bit address
- **write\_buffer** -- Bytes to send on the bus
- **write\_size** -- Size, in bytes, of the write buffer
- **ticks\_to\_wait** -- Maximum ticks to wait before issuing a timeout.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

*esp\_err\_t* **i2c\_master\_read\_from\_device** (*i2c\_port\_t* i2c\_num, uint8\_t device\_address, uint8\_t \*read\_buffer, size\_t read\_size, TickType\_t ticks\_to\_wait)

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.

**Parameters**

- **i2c\_num** -- I2C port number to perform the transfer on
- **device\_address** -- I2C device's 7-bit address
- **read\_buffer** -- Buffer to store the bytes received on the bus
- **read\_size** -- Size, in bytes, of the read buffer
- **ticks\_to\_wait** -- Maximum ticks to wait before issuing a timeout.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

*esp\_err\_t* **i2c\_master\_write\_read\_device** (*i2c\_port\_t* i2c\_num, uint8\_t device\_address, const uint8\_t \*write\_buffer, size\_t write\_size, uint8\_t \*read\_buffer, size\_t read\_size, TickType\_t ticks\_to\_wait)

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc... It shall only be called in I2C master mode.

#### Parameters

- **i2c\_num** -- I2C port number to perform the transfer on
- **device\_address** -- I2C device's 7-bit address
- **write\_buffer** -- Bytes to send on the bus
- **write\_size** -- Size, in bytes, of the write buffer
- **read\_buffer** -- Buffer to store the bytes received on the bus
- **read\_size** -- Size, in bytes, of the read buffer
- **ticks\_to\_wait** -- Maximum ticks to wait before issuing a timeout.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

*i2c\_cmd\_handle\_t* **i2c\_cmd\_link\_create\_static** (uint8\_t \*buffer, uint32\_t size)

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete_static()`.

---

**Note:** It is **highly** advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro `I2C_LINK_RECOMMENDED_SIZE` would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with `malloc`).

---

#### Parameters

- **buffer** -- Buffer to use for commands allocations
- **size** -- Size in bytes of the buffer

**Returns** Handle to the I2C command link or NULL if the buffer provided is too small, please use `I2C_LINK_RECOMMENDED_SIZE` macro to get the recommended size for the buffer.

*i2c\_cmd\_handle\_t* **i2c\_cmd\_link\_create** (void)

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call `i2c_cmd_link_delete()` to release and return the resources. The required bytes will be dynamically allocated.

**Returns** Handle to the I2C command link or NULL in case of insufficient dynamic memory.

void **i2c\_cmd\_link\_delete\_static** (*i2c\_cmd\_handle\_t* cmd\_handle)

Free the I2C commands list allocated statically with `i2c_cmd_link_create_static`.

**Parameters** **cmd\_handle** -- I2C commands list allocated statically. This handle should be created thanks to `i2c_cmd_link_create_static()` function

void **i2c\_cmd\_link\_delete** (*i2c\_cmd\_handle\_t* cmd\_handle)

Free the I2C commands list.

**Parameters** **cmd\_handle** -- I2C commands list. This handle should be created thanks to `i2c_cmd_link_create()` function

*esp\_err\_t* **i2c\_master\_start** (*i2c\_cmd\_handle\_t* cmd\_handle)

Queue a "START signal" to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**Parameters** **cmd\_handle** -- I2C commands list

**Returns**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_ERR\_NO\_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP\_FAIL** No more memory left on the heap

*esp\_err\_t* **i2c\_master\_write\_byte** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t data, bool ack\_en)

Queue a "write byte" command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**

- **cmd\_handle** -- I2C commands list
- **data** -- Byte to send on the port
- **ack\_en** -- Enable ACK signal

**Returns**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_ERR\_NO\_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP\_FAIL** No more memory left on the heap

*esp\_err\_t* **i2c\_master\_write** (*i2c\_cmd\_handle\_t* cmd\_handle, const uint8\_t \*data, size\_t data\_len, bool ack\_en)

Queue a "write (multiple) bytes" command to the commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**

- **cmd\_handle** -- I2C commands list
- **data** -- Bytes to send. This buffer shall remain **valid** until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to `ESP_INTR_FLAG_IRAM`, `data` should be allocated from internal RAM.
- **data\_len** -- Length, in bytes, of the data buffer
- **ack\_en** -- Enable ACK signal

**Returns**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_ERR\_NO\_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP\_FAIL** No more memory left on the heap

*esp\_err\_t* **i2c\_master\_read\_byte** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t \*data, *i2c\_ack\_type\_t* ack)

Queue a "read byte" command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Parameters**

- **cmd\_handle** -- I2C commands list
- **data** -- Pointer where the received byte will be stored. This buffer shall remain **valid** until the transaction is finished.
- **ack** -- ACK signal

**Returns**

- **ESP\_OK** Success
- **ESP\_ERR\_INVALID\_ARG** Parameter error
- **ESP\_ERR\_NO\_MEM** The static buffer used to create `cmd_handler` is too small
- **ESP\_FAIL** No more memory left on the heap

*esp\_err\_t* **i2c\_master\_read** (*i2c\_cmd\_handle\_t* cmd\_handle, uint8\_t \*data, size\_t data\_len, *i2c\_ack\_type\_t* ack)

Queue a "read (multiple) bytes" command to the commands list. Multiple bytes will be read on the I2C bus.

This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

#### Parameters

- **cmd\_handle** -- I2C commands list
- **data** -- Pointer where the received bytes will be stored. This buffer shall remain **valid** until the transaction is finished.
- **data\_len** -- Size, in bytes, of the data buffer
- **ack** -- ACK signal

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM The static buffer used to create `cmd_handler` is too small
- ESP\_FAIL No more memory left on the heap

*esp\_err\_t* `i2c_master_stop` (*i2c\_cmd\_handle\_t* cmd\_handle)

Queue a "STOP signal" to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**Parameters** **cmd\_handle** -- I2C commands list

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NO\_MEM The static buffer used to create `cmd_handler` is too small
- ESP\_FAIL No more memory left on the heap

*esp\_err\_t* `i2c_master_cmd_begin` (*i2c\_port\_t* i2c\_num, *i2c\_cmd\_handle\_t* cmd\_handle, TickType\_t ticks\_to\_wait)

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C port is protected by mutex, so this function is thread-safe. This function shall only be called in I2C master mode.

#### Parameters

- **i2c\_num** -- I2C port number
- **cmd\_handle** -- I2C commands list
- **ticks\_to\_wait** -- Maximum ticks to wait before issuing a timeout.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Sending command error, slave hasn't ACK the transfer.
- ESP\_ERR\_INVALID\_STATE I2C driver not installed or not in master mode.
- ESP\_ERR\_TIMEOUT Operation timeout because the bus is busy.

*esp\_err\_t* `i2c_set_period` (*i2c\_port\_t* i2c\_num, int high\_period, int low\_period)

Set I2C master clock period.

#### Parameters

- **i2c\_num** -- I2C port number
- **high\_period** -- Clock cycle number during SCL is high level, `high_period` is a 14 bit value
- **low\_period** -- Clock cycle number during SCL is low level, `low_period` is a 14 bit value

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* `i2c_get_period` (*i2c\_port\_t* i2c\_num, int \*high\_period, int \*low\_period)

Get I2C master clock period.

#### Parameters

- **i2c\_num** -- I2C port number
- **high\_period** -- pointer to get clock cycle number during SCL is high level, will get a 14 bit value

- **low\_period** -- pointer to get clock cycle number during SCL is low level, will get a 14 bit value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_filter\_enable** (*i2c\_port\_t* i2c\_num, uint8\_t cyc\_num)

Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise(about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

---

**Note:** Enable filter will slow down the SCL clock.

---

**Parameters**

- **i2c\_num** -- I2C port number to filter
- **cyc\_num** -- the APB cycles need to be filtered ( $0 \leq \text{cyc\_num} \leq 7$ ). When the period of a pulse is less than  $\text{cyc\_num} * \text{APB\_cycle}$ , the I2C controller will ignore this pulse.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_filter\_disable** (*i2c\_port\_t* i2c\_num)

Disable filter on I2C bus.

**Parameters** **i2c\_num** -- I2C port number

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_start\_timing** (*i2c\_port\_t* i2c\_num, int setup\_time, int hold\_time)

set I2C master start signal timing

**Parameters**

- **i2c\_num** -- I2C port number
- **setup\_time** -- clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it's a 10-bit value.
- **hold\_time** -- clock num between the falling-edge of SDA and falling-edge of SCL for start mark, it's a 10-bit value.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_start\_timing** (*i2c\_port\_t* i2c\_num, int \*setup\_time, int \*hold\_time)

get I2C master start signal timing

**Parameters**

- **i2c\_num** -- I2C port number
- **setup\_time** -- pointer to get setup time
- **hold\_time** -- pointer to get hold time

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_stop\_timing** (*i2c\_port\_t* i2c\_num, int setup\_time, int hold\_time)

set I2C master stop signal timing

**Parameters**

- **i2c\_num** -- I2C port number
- **setup\_time** -- clock num between the rising-edge of SCL and the rising-edge of SDA, it's a 10-bit value.

- **hold\_time** -- clock number after the STOP bit's rising-edge, it's a 14-bit value.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_stop\_timing** (*i2c\_port\_t* i2c\_num, int \*setup\_time, int \*hold\_time)

get I2C master stop signal timing

**Parameters**

- **i2c\_num** -- I2C port number
- **setup\_time** -- pointer to get setup time.
- **hold\_time** -- pointer to get hold time.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_data\_timing** (*i2c\_port\_t* i2c\_num, int sample\_time, int hold\_time)

set I2C data signal timing

**Parameters**

- **i2c\_num** -- I2C port number
- **sample\_time** -- clock number I2C used to sample data on SDA after the rising-edge of SCL, it's a 10-bit value
- **hold\_time** -- clock number I2C used to hold the data after the falling-edge of SCL, it's a 10-bit value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_data\_timing** (*i2c\_port\_t* i2c\_num, int \*sample\_time, int \*hold\_time)

get I2C data signal timing

**Parameters**

- **i2c\_num** -- I2C port number
- **sample\_time** -- pointer to get sample time
- **hold\_time** -- pointer to get hold time

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_timeout** (*i2c\_port\_t* i2c\_num, int timeout)

set I2C timeout value

**Parameters**

- **i2c\_num** -- I2C port number
- **timeout** -- timeout value for I2C bus (unit: APB 80Mhz clock cycle)

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_timeout** (*i2c\_port\_t* i2c\_num, int \*timeout)

get I2C timeout value

**Parameters**

- **i2c\_num** -- I2C port number
- **timeout** -- pointer to get timeout value

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_set\_data\_mode** (*i2c\_port\_t* i2c\_num, *i2c\_trans\_mode\_t* tx\_trans\_mode, *i2c\_trans\_mode\_t* rx\_trans\_mode)

set I2C data transfer mode

#### Parameters

- **i2c\_num** -- I2C port number
- **tx\_trans\_mode** -- I2C sending data mode
- **rx\_trans\_mode** -- I2C receiving data mode

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **i2c\_get\_data\_mode** (*i2c\_port\_t* i2c\_num, *i2c\_trans\_mode\_t* \*tx\_trans\_mode, *i2c\_trans\_mode\_t* \*rx\_trans\_mode)

get I2C data transfer mode

#### Parameters

- **i2c\_num** -- I2C port number
- **tx\_trans\_mode** -- pointer to get I2C sending data mode
- **rx\_trans\_mode** -- pointer to get I2C receiving data mode

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

## Structures

struct **i2c\_config\_t**

I2C initialization parameters.

### Public Members

*i2c\_mode\_t* **mode**

I2C mode

int **sda\_io\_num**

GPIO number for I2C sda signal

int **scl\_io\_num**

GPIO number for I2C scl signal

bool **sda\_pullup\_en**

Internal GPIO pull mode for I2C sda signal

bool **scl\_pullup\_en**

Internal GPIO pull mode for I2C scl signal

uint32\_t **clk\_speed**

I2C clock frequency for master mode, (no higher than 1MHz for now)

struct *i2c\_config\_t*::[anonymous]::[anonymous] **master**

I2C master config

uint32\_t **clk\_flags**

Bitwise of I2C\_SCLK\_SRC\_FLAG\_\*\*FOR\_DFS\*\* for clk source choice

## Macros

### **I2C\_SCLK\_SRC\_FLAG\_FOR\_NOMAL**

Any one clock source that is available for the specified frequency may be choosen

### **I2C\_SCLK\_SRC\_FLAG\_AWARE\_DFS**

For REF tick clock, it won't change with APB.

### **I2C\_SCLK\_SRC\_FLAG\_LIGHT\_SLEEP**

For light sleep mode.

### **I2C\_INTERNAL\_STRUCT\_SIZE**

Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

### **I2C\_LINK\_RECOMMENDED\_SIZE** (TRANSACTIONS)

The following macro is used to determine the recommended size of the buffer to pass to `i2c_cmd_link_create_static()` function. It requires one parameter, `TRANSACTIONS`, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, `TRANSACTIONS` must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as "(repeated) start", "stop", "nack", "ack" shall not be counted.

## Type Definitions

```
typedef void *i2c_cmd_handle_t
```

I2C command handle

## Header File

- [components/hal/include/hal/i2c\\_types.h](#)

## Structures

```
struct i2c_hal_clk_config_t
```

Data structure for calculating I2C bus timing.

### Public Members

```
uint16_t clkm_div
```

I2C core clock divider

```
uint16_t scl_low
```

I2C scl low period

```
uint16_t scl_high
```

I2C scl high period

uint16\_t **scl\_wait\_high**  
I2C scl wait\_high period

uint16\_t **sda\_hold**  
I2C scl low period

uint16\_t **sda\_sample**  
I2C sda sample time

uint16\_t **setup**  
I2C start and stop condition setup period

uint16\_t **hold**  
I2C start and stop condition hold period

uint16\_t **tout**  
I2C bus timeout period

struct **i2c\_hal\_timing\_config\_t**  
Timing configuration structure. Used for I2C reset internally.

### Public Members

int **high\_period**  
high\_period time

int **low\_period**  
low\_period time

int **wait\_high\_period**  
wait\_high\_period time

int **rstart\_setup**  
restart setup

int **start\_hold**  
start hold time

int **stop\_setup**  
stop setup

int **stop\_hold**  
stop hold time

int **sda\_sample**  
high\_period time

int **sda\_hold**  
sda hold time

int **timeout**  
timeout value

### Type Definitions

typedef *soc\_periph\_i2c\_clk\_src\_t* **i2c\_clock\_source\_t**  
I2C group clock source.

### Enumerations

enum **i2c\_port\_t**  
I2C port number, can be I2C\_NUM\_0 ~ (I2C\_NUM\_MAX-1).

*Values:*

enumerator **I2C\_NUM\_0**  
I2C port 0

enumerator **I2C\_NUM\_MAX**  
I2C port max

enum **i2c\_mode\_t**

*Values:*

enumerator **I2C\_MODE\_MASTER**  
I2C master mode

enumerator **I2C\_MODE\_MAX**

enum **i2c\_rw\_t**

*Values:*

enumerator **I2C\_MASTER\_WRITE**  
I2C write data

enumerator **I2C\_MASTER\_READ**  
I2C read data

enum **i2c\_trans\_mode\_t**

*Values:*

enumerator **I2C\_DATA\_MODE\_MSB\_FIRST**  
I2C data msb first

enumerator **I2C\_DATA\_MODE\_LSB\_FIRST**  
I2C data lsb first

enumerator **I2C\_DATA\_MODE\_MAX**

enum `i2c_addr_mode_t`

*Values:*

enumerator `I2C_ADDR_BIT_7`  
I2C 7bit address for slave mode

enumerator `I2C_ADDR_BIT_10`  
I2C 10bit address for slave mode

enumerator `I2C_ADDR_BIT_MAX`

enum `i2c_ack_type_t`

*Values:*

enumerator `I2C_MASTER_ACK`  
I2C ack for each byte read

enumerator `I2C_MASTER_NACK`  
I2C nack for each byte read

enumerator `I2C_MASTER_LAST_NACK`  
I2C nack for the last byte

enumerator `I2C_MASTER_ACK_MAX`

## 2.6.8 LCD

### Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/SRGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

### Functional Overview

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer and the hardware connection interface, the LCD panel drivers are mainly grouped into the following categories:

- Controller based LCD driver involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install. The frame buffer is located in the controller's internal GRAM (Graphical RAM). ESP-IDF provides only a limited number of LCD controller drivers out of the box (e.g., ST7789, SSD1306), *More Controller Based LCD Drivers* are maintained in the [Espressif Component Registry](#).
- *SPI Interfaced LCD* describes the steps to install the SPI LCD IO driver and then get the panel handle.
- *I2C Interfaced LCD* describes the steps to install the I2C LCD IO driver and then get the panel handle.
- *LCD Panel IO Operations* - provides a set of APIs to operate the LCD panel, like turning on/off the display, setting the orientation, etc. These operations are common for either controller-based LCD panel driver or RGB LCD panel driver.

## SPI Interfaced LCD

1. Create an SPI bus. Please refer to *SPI Master API doc* for more details.

```
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1, // Quad SPI LCD driver is not yet supported
    .quadhd_io_num = -1, // Quad SPI LCD driver is not yet supported
    .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), //
    ↪transfer 80 lines of pixels (assume pixel is RGB565) at most in one
    ↪SPI transaction
};
ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_
    ↪AUTO)); // Enable the DMA feature
```

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:

- `esp_lcd_panel_io_spi_config_t::dc_gpio_num`: Sets the gpio number for the DC signal line (some LCD calls this RS line). The LCD driver will use this GPIO to switch between sending command and sending data.
- `esp_lcd_panel_io_spi_config_t::cs_gpio_num`: Sets the gpio number for the CS signal line. The LCD driver will use this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e. this LCD), you can set the gpio number to -1 to occupy the bus exclusively.
- `esp_lcd_panel_io_spi_config_t::pclk_hz` sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.
- `esp_lcd_panel_io_spi_config_t::spi_mode` sets the SPI mode. The LCD driver will use this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the *SPI Master API doc*.
- `esp_lcd_panel_io_spi_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_spi_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
- `esp_lcd_panel_io_spi_config_t::trans_queue_depth` sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
    .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
    .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
    .spi_mode = 0,
    .trans_queue_depth = 10,
};
// Attach the LCD to the SPI bus
ESP_ERROR_CHECK(esp_lcd_new_panel_io_spi((esp_lcd_spi_bus_handle_t)LCD_
    ↪HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the SPI IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the R-G-B element order of each color data.
- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.

- `esp_lcd_panel_dev_config_t::data_endian` specifies the data endian to be transmitted to the screen. No need to specify for color data within 1 byte, like RGB232. For drivers that do not support specifying data endian, this field would be ignored.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_BGR,
    .bits_per_pixel = 16,
};
// Create LCD panel handle for ST7789, with the SPI IO device handle
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &
↪panel_handle));
```

## I2C Interfaced LCD

1. Create I2C bus. Please refer to *I2C API doc* for more details.

```
i2c_config_t i2c_conf = {
    .mode = I2C_MODE_MASTER, // I2C LCD is a master node
    .sda_io_num = EXAMPLE_PIN_NUM_SDA,
    .scl_io_num = EXAMPLE_PIN_NUM_SCL,
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
};
ESP_ERROR_CHECK(i2c_param_config(I2C_HOST, &i2c_conf));
ESP_ERROR_CHECK(i2c_driver_install(I2C_HOST, I2C_MODE_MASTER, 0, 0, ↪
↪0));
```

2. Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:
  - `esp_lcd_panel_io_i2c_config_t::dev_addr` sets the I2C device address of the LCD controller chip. The LCD driver will use this address to communicate with the LCD controller chip.
  - `esp_lcd_panel_io_i2c_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i2c_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i2c_config_t io_config = {
    .dev_addr = EXAMPLE_I2C_HW_ADDR,
    .control_phase_bytes = 1, // refer to LCD spec
    .dc_bit_offset = 6, // refer to LCD spec
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_CMD_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i2c((esp_lcd_i2c_bus_handle_t) I2C_
↪HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:
  - `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD's hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
  - `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver will use this value to calculate the number of bytes to send to the LCD controller chip.

```
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
```

(continues on next page)

(continued from previous page)

```
.bits_per_pixel = 1,  
.reset_gpio_num = EXAMPLE_PIN_NUM_RST,  
};  
ESP_ERROR_CHECK(esp_lcd_new_panel_ssd1306(io_handle, &panel_config, &  
↪panel_handle));
```

### More Controller Based LCD Drivers

More LCD panel drivers and touch drivers are available in [IDF Component Registry](#). The list of available and planned drivers with links is in this [table](#).

### LCD Panel IO Operations

- `esp_lcd_panel_reset()` can reset the LCD panel.
- Use `esp_lcd_panel_swap_xy()` and `esp_lcd_panel_mirror()`, you can rotate the LCD screen.
- `esp_lcd_panel_disp_on_off()` can turn on or off the LCD screen (different from LCD backlight).
- `esp_lcd_panel_draw_bitmap()` is the most significant function, that will do the magic to draw the user provided color buffer to the LCD screen, where the draw window is also configurable.

### Application Example

LCD examples are located under: [peripherals/lcd](#):

- Universal SPI LCD example with SPI touch - [peripherals/lcd/spi\\_lcd\\_touch](#)
- Jpeg decoding and LCD display - [peripherals/lcd/tjpgd](#)
- I2C interfaced OLED display scrolling text - [peripherals/lcd/i2c\\_oled](#)

### API Reference

#### Header File

- [components/hal/include/hal/lcd\\_types.h](#)

#### Macros

`LCD_RGB_ENDIAN_RGB`

`LCD_RGB_ENDIAN_BGR`

#### Type Definitions

typedef `lcd_rgb_element_order_t` `lcd_color_rgb_endian_t`  
for backward compatible

#### Enumerations

enum `lcd_rgb_element_order_t`

RGB color endian.

*Values:*

enumerator **LCD\_RGB\_ELEMENT\_ORDER\_RGB**

RGB element order: RGB

enumerator **LCD\_RGB\_ELEMENT\_ORDER\_BGR**

RGB element order: BGR

enum **lcd\_rgb\_data\_endian\_t**

RGB data endian.

*Values:*

enumerator **LCD\_RGB\_DATA\_ENDIAN\_BIG**

RGB data endian: MSB first

enumerator **LCD\_RGB\_DATA\_ENDIAN\_LITTLE**

RGB data endian: LSB first

enum **lcd\_color\_space\_t**

LCD color space.

*Values:*

enumerator **LCD\_COLOR\_SPACE\_RGB**

Color space: RGB

enumerator **LCD\_COLOR\_SPACE\_YUV**

Color space: YUV

enum **lcd\_color\_range\_t**

LCD color range.

*Values:*

enumerator **LCD\_COLOR\_RANGE\_LIMIT**

Limited color range

enumerator **LCD\_COLOR\_RANGE\_FULL**

Full color range

enum **lcd\_yuv\_sample\_t**

YUV sampling method.

*Values:*

enumerator **LCD\_YUV\_SAMPLE\_422**

YUV 4:2:2 sampling

enumerator **LCD\_YUV\_SAMPLE\_420**

YUV 4:2:0 sampling

enumerator **LCD\_YUV\_SAMPLE\_411**

YUV 4:1:1 sampling

enum **lcd\_yuv\_conv\_std\_t**

The standard used for conversion between RGB and YUV.

*Values:*

enumerator **LCD\_YUV\_CONV\_STD\_BT601**

YUV<->RGB conversion standard: BT.601

enumerator **LCD\_YUV\_CONV\_STD\_BT709**

YUV<->RGB conversion standard: BT.709

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_types.h](#)

### Type Definitions

typedef struct esp\_lcd\_panel\_io\_t \***esp\_lcd\_panel\_io\_handle\_t**

Type of LCD panel IO handle

typedef struct esp\_lcd\_panel\_t \***esp\_lcd\_panel\_handle\_t**

Type of LCD panel handle

### Header File

- [components/esp\\_lcd/include/esp\\_lcd\\_panel\\_io.h](#)

### Functions

*esp\_err\_t* **esp\_lcd\_panel\_io\_rx\_param** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, void \*param, size\_t param\_size)

Transmit LCD command and receive corresponding parameters.

---

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

#### Parameters

- **io** -- [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- [in] The specific LCD command, set to -1 if no command needed
- **param** -- [out] Buffer for the command data
- **param\_size** -- [in] Size of param buffer

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if read is not supported by transport
- `ESP_OK` on success

*esp\_err\_t* **esp\_lcd\_panel\_io\_tx\_param** (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, const void \*param, size\_t param\_size)

Transmit LCD command and corresponding parameters.

---

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

---

#### Parameters

- **io** -- [in] LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- [in] The specific LCD command, set to -1 if no command needed
- **param** -- [in] Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param\_size** -- [in] Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* `esp_lcd_panel_io_tx_color` (*esp\_lcd\_panel\_io\_handle\_t* io, int lcd\_cmd, const void \*color, size\_t color\_size)

Transmit LCD RGB data.

---

**Note:** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

---

#### Parameters

- **io** -- [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **lcd\_cmd** -- [in] The specific LCD command, set to -1 if no command needed
- **color** -- [in] Buffer that holds the RGB color data
- **color\_size** -- [in] Size of `color` in memory, in bytes

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* `esp_lcd_panel_io_del` (*esp\_lcd\_panel\_io\_handle\_t* io)

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Parameters** **io** -- [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* `esp_lcd_panel_io_register_event_callbacks` (*esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_io\_callbacks\_t* \*cbs, void \*user\_ctx)

Register LCD panel IO callbacks.

#### Parameters

- **io** -- [in] LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- **cbs** -- [in] structure with all LCD panel IO callbacks
- **user\_ctx** -- [in] User private data, passed directly to callback's `user_ctx`

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_spi** (*esp\_lcd\_spi\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_spi\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for SPI interface.

#### Parameters

- **bus** -- [in] SPI bus handle
- **io\_config** -- [in] IO configuration, for SPI interface
- **ret\_io** -- [out] Returned IO handle

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_io\_i2c** (*esp\_lcd\_i2c\_bus\_handle\_t* bus, const *esp\_lcd\_panel\_io\_i2c\_config\_t* \*io\_config, *esp\_lcd\_panel\_io\_handle\_t* \*ret\_io)

Create LCD panel IO handle, for I2C interface.

#### Parameters

- **bus** -- [in] I2C bus handle
- **io\_config** -- [in] IO configuration, for I2C interface
- **ret\_io** -- [out] Returned IO handle

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

## Structures

struct **esp\_lcd\_panel\_io\_event\_data\_t**

Type of LCD panel IO event data.

struct **esp\_lcd\_panel\_io\_callbacks\_t**

Type of LCD panel IO callbacks.

## Public Members

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

struct **esp\_lcd\_panel\_io\_spi\_config\_t**

Panel IO configuration structure, for SPI interface.

## Public Members

int **cs\_gpio\_num**

GPIO used for CS line

int **dc\_gpio\_num**

GPIO used to select the D/C line, set this to -1 if the D/C line is not used

int **spi\_mode**

Traditional SPI mode (0~3)

unsigned int **pclk\_hz**

Frequency of pixel clock

size\_t **trans\_queue\_depth**

Size of internal transaction queue

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void **\*user\_ctx**

User private data, passed directly to *on\_color\_trans\_done*'s *user\_ctx*

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_high\_on\_cmd**

If enabled, DC level = 1 indicates command transfer

unsigned int **dc\_low\_on\_data**

If enabled, DC level = 0 indicates color data transfer

unsigned int **dc\_low\_on\_param**

If enabled, DC level = 0 indicates parameter transfer

unsigned int **octal\_mode**

transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int **quad\_mode**

transmit with quad mode (4 data lines), this mode is useful when transmitting LCD parameters (Only use one line for command)

unsigned int **sio\_mode**

Read and write through a single data line (MOSI)

unsigned int **lsb\_first**

transmit LSB bit first

unsigned int **cs\_high\_active**

CS line is high active

struct *esp\_lcd\_panel\_io\_spi\_config\_t*::[anonymous] **flags**

Extra flags to fine-tune the SPI device

struct **esp\_lcd\_panel\_io\_i2c\_config\_t**

Panel IO configuration structure, for I2C interface.

### Public Members

uint32\_t **dev\_addr**

I2C device address

*esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t* **on\_color\_trans\_done**

Callback invoked when color data transfer has finished

void \***user\_ctx**

User private data, passed directly to *on\_color\_trans\_done*'s *user\_ctx*

size\_t **control\_phase\_bytes**

I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc\_bit\_offset**

Offset of the D/C selection bit in control phase

int **lcd\_cmd\_bits**

Bit-width of LCD command

int **lcd\_param\_bits**

Bit-width of LCD parameter

unsigned int **dc\_low\_on\_data**

If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable\_control\_phase**

If this flag is enabled, the control phase isn't used

struct *esp\_lcd\_panel\_io\_i2c\_config\_t*::[anonymous] **flags**

Extra flags to fine-tune the I2C device

### Type Definitions

typedef void \***esp\_lcd\_spi\_bus\_handle\_t**

Type of LCD SPI bus handle

typedef void \***esp\_lcd\_i2c\_bus\_handle\_t**

Type of LCD I2C bus handle

typedef struct esp\_lcd\_i80\_bus\_t \***esp\_lcd\_i80\_bus\_handle\_t**

Type of LCD intel 8080 bus handle

typedef bool (\***esp\_lcd\_panel\_io\_color\_trans\_done\_cb\_t**)(*esp\_lcd\_panel\_io\_handle\_t* panel\_io, *esp\_lcd\_panel\_io\_event\_data\_t* \*edata, void \*user\_ctx)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

**Param panel\_io [in]** LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`  
**Param edata [in]** Panel IO event data, fed by driver  
**Param user\_ctx [in]** User data, passed from `esp_lcd_panel_io_XXX_config_t`  
**Return** Whether a high priority task has been waken up by this function

### Header File

- `components/esp_lcd/include/esp_lcd_panel_ops.h`

### Functions

*esp\_err\_t* **esp\_lcd\_panel\_reset** (*esp\_lcd\_panel\_handle\_t* panel)

Reset LCD panel.

---

**Note:** Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

---

**Parameters panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

#### Returns

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_init** (*esp\_lcd\_panel\_handle\_t* panel)

Initialize LCD panel.

---

**Note:** Before calling this function, make sure the LCD panel has finished the reset stage by `esp_lcd_panel_reset()`.

---

**Parameters panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

#### Returns

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_del** (*esp\_lcd\_panel\_handle\_t* panel)

Deinitialize the LCD panel.

**Parameters panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

#### Returns

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_draw\_bitmap** (*esp\_lcd\_panel\_handle\_t* panel, int x\_start, int y\_start, int x\_end, int y\_end, const void \*color\_data)

Draw bitmap on LCD panel.

#### Parameters

- **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_start** -- **[in]** Start index on x-axis (x\_start included)
- **y\_start** -- **[in]** Start index on y-axis (y\_start included)
- **x\_end** -- **[in]** End index on x-axis (x\_end not included)
- **y\_end** -- **[in]** End index on y-axis (y\_end not included)
- **color\_data** -- **[in]** RGB color data that will be dumped to the specific window range

#### Returns

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_mirror** (*esp\_lcd\_panel\_handle\_t* panel, bool mirror\_x, bool mirror\_y)

Mirror the LCD panel on specific axis.

---

**Note:** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

---

#### Parameters

- **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **mirror\_x** -- **[in]** Whether the panel will be mirrored about the x axis
- **mirror\_y** -- **[in]** Whether the panel will be mirrored about the y axis

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_swap\_xy** (*esp\_lcd\_panel\_handle\_t* panel, bool swap\_axes)

Swap/Exchange x and y axis.

---

**Note:** Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

---

#### Parameters

- **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap\_axes** -- **[in]** Whether to swap the x and y axis

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_set\_gap** (*esp\_lcd\_panel\_handle\_t* panel, int x\_gap, int y\_gap)

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

---

**Note:** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

---

#### Parameters

- **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x\_gap** -- **[in]** Extra gap on x axis, in pixels
- **y\_gap** -- **[in]** Extra gap on y axis, in pixels

#### Returns

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_invert\_color** (*esp\_lcd\_panel\_handle\_t* panel, bool invert\_color\_data)

Invert the color (bit-wise invert the color data line)

#### Parameters

- **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert\_color\_data** -- **[in]** Whether to invert the color data

#### Returns

- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_panel\_disp\_on\_off** (*esp\_lcd\_panel\_handle\_t* panel, bool on\_off)

Turn on or off the display.

#### Parameters

- **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on\_off** -- **[in]** True to turns on display, False to turns off display

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

*esp\_err\_t* **esp\_lcd\_panel\_disp\_off** (*esp\_lcd\_panel\_handle\_t* panel, bool off)

Turn off the display.

#### Parameters

- **panel** -- **[in]** LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** -- **[in]** Whether to turn off the screen

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NOT\_SUPPORTED if this function is not supported by the panel

### Header File

- `components/esp_lcd/include/esp_lcd_panel_rgb.h`

### Header File

- `components/esp_lcd/include/esp_lcd_panel_vendor.h`

### Functions

*esp\_err\_t* **esp\_lcd\_new\_panel\_st7789** (const *esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_dev\_config\_t* \*panel\_dev\_config, *esp\_lcd\_panel\_handle\_t* \*ret\_panel)

Create LCD panel for model ST7789.

#### Parameters

- **io** -- **[in]** LCD panel IO handle
- **panel\_dev\_config** -- **[in]** general panel device configuration
- **ret\_panel** -- **[out]** Returned LCD panel handle

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

*esp\_err\_t* **esp\_lcd\_new\_panel\_nt35510** (const *esp\_lcd\_panel\_io\_handle\_t* io, const *esp\_lcd\_panel\_dev\_config\_t* \*panel\_dev\_config, *esp\_lcd\_panel\_handle\_t* \*ret\_panel)

Create LCD panel for model NT35510.

#### Parameters

- **io** -- **[in]** LCD panel IO handle
- **panel\_dev\_config** -- **[in]** general panel device configuration
- **ret\_panel** -- **[out]** Returned LCD panel handle

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

```
esp_err_t esp_lcd_new_panel_ssd1306 (const esp_lcd_panel_io_handle_t io, const  
                                     esp_lcd_panel_dev_config_t *panel_dev_config,  
                                     esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model SSD1306.

#### Parameters

- **io** -- [in] LCD panel IO handle
- **panel\_dev\_config** -- [in] general panel device configuration
- **ret\_panel** -- [out] Returned LCD panel handle

#### Returns

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NO\_MEM if out of memory
- ESP\_OK on success

## Structures

```
struct esp_lcd_panel_dev_config_t
```

Configuration structure for panel device.

### Public Members

```
int reset_gpio_num
```

GPIO used to reset the LCD panel, set to -1 if it's not used

```
lcd_rgb_element_order_t color_space
```

*Deprecated:*

Set RGB color space, please use `rgb_ele_order` instead

```
lcd_rgb_element_order_t rgb_endian
```

*Deprecated:*

Set RGB data endian, please use `rgb_ele_order` instead

```
lcd_rgb_element_order_t rgb_ele_order
```

Set RGB element order, RGB or BGR

```
lcd_rgb_data_endian_t data_endian
```

Set the data endian for color data larger than 1 byte

```
unsigned int bits_per_pixel
```

Color depth, in bpp

```
unsigned int reset_active_high
```

Setting this if the panel reset is high level active

```
struct esp_lcd_panel_dev_config_t::[anonymous] flags
```

LCD panel config flags

```
void *vendor_config
```

vendor specific configuration, optional, left as NULL if not used

## 2.6.9 LED Control (LEDC)

### Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 6 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

### Functionality Overview

Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-C2 only supports configuring channels in "low speed" mode.

1. *Timer Configuration* by specifying the PWM signal's frequency and duty cycle resolution.
2. *Channel Configuration* by associating it with the timer and GPIO to output the PWM signal.
3. *Change PWM Signal* that drives the output in order to change LED's intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

Fig. 5: Key Settings of LED PWM Controller's API

**Note:** For an initial setup, it is recommended to configure for the timers first (by calling `ledc_timer_config()`), and then for the channels (by calling `ledc_channel_config()`). This ensures the PWM frequency is at the desired value since the appearance of the PWM signal from the IO pad.

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)

- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section [Supported Range of Frequency and Duty Resolutions](#).

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

Table 3: Characteristics of ESP32-C2 LEDC source clocks

Clock name	Clock freq	Clock capabilities
PLL_60M_CLK	60 MHz	/
RC_FAST_CLK	~20 MHz	Dynamic Frequency Scaling compatible, Light sleep compatible
XTAL_CLK	40 MHz	Dynamic Frequency Scaling compatible

**Note:**

1. On ESP32-C2, if RC\_FAST\_CLK is chosen as the LEDC clock source, an internal calibration will be performed to get the exact frequency of the clock. This ensures the accuracy of output PWM signal frequency.
2. For ESP32-C2, all timers share one clock source. In other words, it is impossible to use different clock sources for different timers.

**Channel Configuration** When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel's configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal** Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal's frequency can also be changed; it is covered in Section [Change PWM Frequency](#).

**Note:** All the timers and channels in the ESP32-C2's LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).

**Change PWM Duty Cycle Using Software** To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section [Channel Configuration](#).

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to  $(2 ** \text{duty\_resolution})$ . For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1024. This provides the resolution of ~ 0.1%.

**Warning:** On ESP32-C2, when channel's binded timer selects its maximum duty resolution, the duty cycle value cannot be set to  $(2 ** \text{duty\_resolution})$ . Otherwise, the internal duty counter in the hardware will overflow and be messed up.

**Change PWM Duty Cycle using Hardware** The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes or is stopped. `ledc_fade_stop()` has to be called to stop a fade that is in progress.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed. The fade end callback prototype is defined in `ledc_cb_t`, where you should return a boolean value from the callback function, indicating whether a high priority task is woken up by this callback function. It is worth mentioning, the callback and the function invoked by itself should be placed in IRAM, as the interrupt service routine is in IRAM. `ledc_cb_register()` will print a warning message if it finds the addresses of callback and user context are incorrect.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency "on the fly":

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel's timer by calling `ledc_channel_config()`.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called "behind the scenes" by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

## Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of  $\sim 0.012\%$  ( $2^{13} = 8192$  discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see [timer configuration](#) and the *ESP32-C2 Technical Reference Manual > LED PWM Controller (LEDC)* [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC's hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_
↳increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

## Application Example

The LEDC basic example: [peripherals/ledc/ledc\\_basic](#).

The LEDC change duty cycle and fading control example: [peripherals/ledc/ledc\\_fade](#).

## API Reference

### Header File

- `components/driver/ledc/include/driver/ledc.h`

### Functions

`esp_err_t ledc_channel_config` (const `ledc_channel_config_t` \*ledc\_conf)

LEDC channel configuration Configure LEDC channel with the given channel/output gpio\_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

**Parameters** `ledc_conf` -- Pointer of LEDC channel configure struct

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`esp_err_t ledc_timer_config` (const `ledc_timer_config_t` \*timer\_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty\_resolution.

**Parameters** `timer_conf` -- Pointer of LEDC timer configure struct

**Returns**

- ESP\_OK Success

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Can not find a proper pre-divider number base on the given frequency and the current `duty_resolution`.

*esp\_err\_t* **ledc\_update\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC update channel parameters.

---

**Note:** Call this function to activate the LEDC updated parameters. After `ledc_set_duty`, we need to call this function to update the settings. And the new LEDC parameters don't take effect until the next PWM cycle.

---

---

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **ledc\_set\_pin** (int gpio\_num, *ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* ledc\_channel)

Set LEDC output gpio.

---

**Note:** This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use `ledc_channel_config()` instead to fully configure a LEDC channel.

---

#### Parameters

- **gpio\_num** -- The LEDC output gpio
- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc\_channel** -- LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **ledc\_stop** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t idle\_level)

LEDC stop. Disable LEDC output, and set idle level.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- **idle\_level** -- Set output idle level after LEDC stops.

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error

*esp\_err\_t* **ledc\_set\_freq** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num, uint32\_t freq\_hz)

LEDC set channel frequency (Hz)

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** -- LEDC timer index (0-3), select from `ledc_timer_t`
- **freq\_hz** -- Set the LEDC frequency

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Can not find a proper pre-divider number base on the given frequency and the current `duty_resolution`.

`uint32_t ledc_get_freq` (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_num)

LEDC get channel frequency (Hz)

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_num** -- LEDC timer index (0-3), select from `ledc_timer_t`

**Returns**

- 0 error
- Others Current LEDC frequency

*esp\_err\_t* `ledc_set_duty_with_hpoint` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, `uint32_t` duty, `uint32_t` hpoint)

LEDC set duty and hpoint value Only after calling `ledc_update_duty` will the duty update.

---

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **hpoint** -- Set the LEDC hpoint value, the range is [0, (2\*\*duty\_resolution)-1]

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

`int ledc_get_hpoint` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get hpoint value, the counter value when the output is set high level.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`

**Returns**

- LEDC\_ERR\_VAL if parameter error
- Others Current hpoint value of LEDC channel

*esp\_err\_t* **ledc\_set\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc\_set\_duty\_with\_hpoint. only after calling ledc\_update\_duty will the duty update.

---

**Note:** ledc\_set\_duty, ledc\_set\_duty\_with\_hpoint and ledc\_update\_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc\_set\_duty\_and\_update.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from ledc\_channel\_t
- **duty** -- Set the LEDC duty, the range of duty setting is [0, (2\*\*duty\_resolution)]

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

uint32\_t **ledc\_get\_duty** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn't expect the function to return the new duty in the same cycle of calling ledc\_update\_duty, because duty update doesn't take effect until the next cycle.

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from ledc\_channel\_t

#### Returns

- LEDC\_ERR\_DUTY if parameter error
- Others Current LEDC duty

*esp\_err\_t* **ledc\_set\_fade** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t duty, *ledc\_duty\_direction\_t* fade\_direction, uint32\_t step\_num, uint32\_t duty\_cycle\_num, uint32\_t duty\_scale)

LEDC set gradient Set LEDC gradient, After the function calls the ledc\_update\_duty function, the function can take effect.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - LEDC\_CHANNEL\_MAX-1), select from ledc\_channel\_t
- **duty** -- Set the start of the gradient duty, the range of duty setting is [0, (2\*\*duty\_resolution)]
- **fade\_direction** -- Set the direction of the gradient
- **step\_num** -- Set the number of the gradient
- **duty\_cycle\_num** -- Set how many LEDC tick each time the gradient lasts

- **duty\_scale** -- Set gradient change amplitude

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **ledc\_isr\_register** (void (\*fn)(void\*), void \*arg, int intr\_alloc\_flags, *ledc\_isr\_handle\_t* \*handle)

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**

- **fn** -- Interrupt handler function.
- **arg** -- User-supplied argument passed to the handler function.
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info.
- **handle** -- Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_NOT\_FOUND Failed to find available interrupt source

*esp\_err\_t* **ledc\_timer\_set** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel, uint32\_t clock\_divider, uint32\_t duty\_resolution, *ledc\_clk\_src\_t* clk\_src)

Configure LEDC settings.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- Timer index (0-3), there are 4 timers in LEDC module
- **clock\_divider** -- Timer clock divide value, the timer clock is divided from the selected clock source
- **duty\_resolution** -- Resolution of duty setting in number of bits. The range is [1, SOC\_LEDC\_TIMER\_BIT\_WIDTH]
- **clk\_src** -- Select LEDC source clock.

**Returns**

- (-1) Parameter error
- Other Current LEDC duty

*esp\_err\_t* **ledc\_timer\_rst** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Reset LEDC timer.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- LEDC timer index (0-3), select from ledc\_timer\_t

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_timer\_pause** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Pause LEDC timer counter.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- LEDC timer index (0-3), select from ledc\_timer\_t

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_timer\_resume** (*ledc\_mode\_t* speed\_mode, *ledc\_timer\_t* timer\_sel)

Resume LEDC timer.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer\_sel** -- LEDC timer index (0-3), select from *ledc\_timer\_t*

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_bind\_channel\_timer** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_timer\_t* timer\_sel)

Bind LEDC channel with the selected timer.

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*
- **timer\_sel** -- LEDC timer index (0-3), select from *ledc\_timer\_t*

**Returns**

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

*esp\_err\_t* **ledc\_set\_fade\_with\_step** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num)

Set LEDC fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from *ledc\_channel\_t*
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle\_num** -- increase or decrease the duty every cycle\_num cycles

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_set\_fade\_with\_time** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, int max\_fade\_time\_ms)

Set LEDC fade function, with a limited time.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

---

---

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **max\_fade\_time\_ms** -- The maximum time of the fading ( ms ).

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* `ledc_fade_func_install` (int intr\_alloc\_flags)

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Parameters** `intr_alloc_flags` -- Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

#### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Intr flag error
- ESP\_ERR\_NOT\_FOUND Failed to find available interrupt source
- ESP\_ERR\_INVALID\_STATE Fade function already installed

void `ledc_fade_func_uninstall` (void)

Uninstall LEDC fade function.

*esp\_err\_t* `ledc_fade_start` (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, *ledc\_fade\_mode\_t* fade\_mode)

Start LEDC fading.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

---

---

**Note:** Starting fade operation with this API is not thread-safe, use with care.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress

---

on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel number
- **fade\_mode** -- Whether to block until fading done. See `ledc_types.h` `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized or fade function not installed.
- `ESP_ERR_INVALID_ARG` Parameter error.

`esp_err_t ledc_fade_stop` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel)

Stop LEDC fading. The duty of the channel is guaranteed to be fixed at most one PWM cycle after the function returns.

---

**Note:** This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

---

**Note:** Call this API will abort the fading operation only if it was started by calling `ledc_fade_start` with `LEDC_FADE_NO_WAIT` mode.

---

**Note:** If a fade was started with `LEDC_FADE_WAIT_DONE` mode, calling this API afterwards HAS no use in stopping the fade. Fade will continue until it reaches the target duty.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel number

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_FAIL` Fade function init error

`esp_err_t ledc_set_duty_and_update` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `uint32_t` duty, `uint32_t` hpoint)

A thread-safe API to set duty for LEDC channel and return when duty updated.

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel (0 - `LEDC_CHANNEL_MAX-1`), select from `ledc_channel_t`
- **duty** -- Set the LEDC duty, the range of duty setting is `[0, (2**duty_resolution)]`
- **hpoint** -- Set the LEDC hpoint value, the range is `[0, (2**duty_resolution)-1]`

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_set\_fade\_time\_and\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t max\_fade\_time\_ms, *ledc\_fade\_mode\_t* fade\_mode)

A thread-safe API to set and start LEDC fade function, with a limited time.

---

**Note:** Call `ledc_fade_func_install()` once, before calling this function.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **max\_fade\_time\_ms** -- The maximum time of the fading ( ms ).
- **fade\_mode** -- choose blocking or non-blocking mode

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Channel not initialized
- ESP\_FAIL Fade function init error

*esp\_err\_t* **ledc\_set\_fade\_step\_and\_start** (*ledc\_mode\_t* speed\_mode, *ledc\_channel\_t* channel, uint32\_t target\_duty, uint32\_t scale, uint32\_t cycle\_num, *ledc\_fade\_mode\_t* fade\_mode)

A thread-safe API to set and start LEDC fade function.

---

**Note:** Call `ledc_fade_func_install()` once before calling this function.

---

---

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

---

**Parameters**

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **target\_duty** -- Target duty of fading [0, (2\*\*duty\_resolution)]
- **scale** -- Controls the increase or decrease step scale.
- **cycle\_num** -- increase or decrease the duty every cycle\_num cycles
- **fade\_mode** -- choose blocking or non-blocking mode

**Returns**

- ESP\_OK Success

- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_FAIL` Fade function init error

`esp_err_t ledc_cb_register` (`ledc_mode_t` speed\_mode, `ledc_channel_t` channel, `ledc_cbs_t` \*cbs, void \*user\_arg)

LEDC callback registration function.

---

**Note:** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

---

#### Parameters

- **speed\_mode** -- Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** -- LEDC channel index (0 - LEDC\_CHANNEL\_MAX-1), select from `ledc_channel_t`
- **cbs** -- Group of LEDC callback functions
- **user\_arg** -- user registered data for the callback function

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Parameter error
- `ESP_ERR_INVALID_STATE` Channel not initialized
- `ESP_FAIL` Fade function init error

### Structures

struct `ledc_channel_config_t`

Configuration parameters of LEDC channel for `ledc_channel_config` function.

#### Public Members

int `gpio_num`

the LEDC output `gpio_num`, if you want to use `gpio16`, `gpio_num = 16`

`ledc_mode_t` `speed_mode`

LEDC speed `speed_mode`, high-speed mode (only exists on esp32) or low-speed mode

`ledc_channel_t` `channel`

LEDC channel (0 - LEDC\_CHANNEL\_MAX-1)

`ledc_intr_type_t` `intr_type`

configure interrupt, Fade interrupt enable or Fade interrupt disable

`ledc_timer_t` `timer_sel`

Select the timer source of channel (0 - LEDC\_TIMER\_MAX-1)

uint32\_t `duty`

LEDC channel duty, the range of duty setting is [0, (2\*\*duty\_resolution)]

int **hpoint**

LEDC channel hpoint value, the range is [0, (2\*\*duty\_resolution)-1]

unsigned int **output\_invert**

Enable (1) or disable (0) gpio output invert

struct *ledc\_channel\_config\_t*::[anonymous] **flags**

LEDC flags

struct **ledc\_timer\_config\_t**

Configuration parameters of LEDC Timer timer for ledc\_timer\_config function.

### Public Members

*ledc\_mode\_t* **speed\_mode**

LEDC speed speed\_mode, high-speed mode (only exists on esp32) or low-speed mode

*ledc\_timer\_bit\_t* **duty\_resolution**

LEDC channel duty resolution

*ledc\_timer\_t* **timer\_num**

The timer source of channel (0 - LEDC\_TIMER\_MAX-1)

uint32\_t **freq\_hz**

LEDC timer frequency (Hz)

*ledc\_clk\_cfg\_t* **clk\_cfg**

Configure LEDC source clock from ledc\_clk\_cfg\_t. Note that LEDC\_USE\_RC\_FAST\_CLK and LEDC\_USE\_XTAL\_CLK are non-timer-specific clock sources. You can not have one LEDC timer uses RC\_FAST\_CLK as the clock source and have another LEDC timer uses XTAL\_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.

struct **ledc\_cb\_param\_t**

LEDC callback parameter.

### Public Members

*ledc\_cb\_event\_t* **event**

Event name

uint32\_t **speed\_mode**

Speed mode of the LEDC channel group

uint32\_t **channel**

LEDC channel (0 - LEDC\_CHANNEL\_MAX-1)

uint32\_t **duty**

LEDC current duty of the channel, the range of duty is [0, (2\*\*duty\_resolution)]

struct **ledc\_cbs\_t**

Group of supported LEDC callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

### Public Members

*ledc\_cb\_t* **fade\_cb**

LEDC fade\_end callback function

### Macros

**LEDC\_ERR\_DUTY**

**LEDC\_ERR\_VAL**

### Type Definitions

typedef *intr\_handle\_t* **ledc\_isr\_handle\_t**

typedef bool (\***ledc\_cb\_t**)(const *ledc\_cb\_param\_t* \*param, void \*user\_arg)

Type of LEDC event callback.

**Param param** LEDC callback parameter

**Param user\_arg** User registered data

**Return** Whether a high priority task has been waken up by this function

### Enumerations

enum **ledc\_cb\_event\_t**

LEDC callback event type.

*Values:*

enumerator **LEDC\_FADE\_END\_EVT**

LEDC fade end event

### Header File

- [components/hal/include/hal/ledc\\_types.h](#)

### Type Definitions

typedef *soc\_periph\_ledc\_clk\_src\_legacy\_t* **ledc\_clk\_cfg\_t**

LEDC clock source configuration struct.

In theory, the following enumeration shall be placed in LEDC driver's header. However, as the next enumeration, *ledc\_clk\_src\_t*, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

## Enumerations

enum **ledc\_mode\_t**

*Values:*

enumerator **LEDC\_LOW\_SPEED\_MODE**

LEDC low speed speed\_mode

enumerator **LEDC\_SPEED\_MODE\_MAX**

LEDC speed limit

enum **ledc\_intr\_type\_t**

*Values:*

enumerator **LEDC\_INTR\_DISABLE**

Disable LEDC interrupt

enumerator **LEDC\_INTR\_FADE\_END**

Enable LEDC interrupt

enumerator **LEDC\_INTR\_MAX**

enum **ledc\_duty\_direction\_t**

*Values:*

enumerator **LEDC\_DUTY\_DIR\_DECREASE**

LEDC duty decrease direction

enumerator **LEDC\_DUTY\_DIR\_INCREASE**

LEDC duty increase direction

enumerator **LEDC\_DUTY\_DIR\_MAX**

enum **ledc\_slow\_clk\_sel\_t**

LEDC global clock sources.

*Values:*

enumerator **LEDC\_SLOW\_CLK\_RC\_FAST**

LEDC low speed timer clock source is RC\_FAST clock

enumerator **LEDC\_SLOW\_CLK\_PLL\_DIV**

LEDC low speed timer clock source is a PLL\_DIV clock

enumerator **LEDC\_SLOW\_CLK\_XTAL**

LEDC low speed timer clock source XTAL clock

enumerator **LEDC\_SLOW\_CLK\_RTC8M**

Alias of 'LEDC\_SLOW\_CLK\_RC\_FAST'

enum **ledc\_clk\_src\_t**

LEDC timer-specific clock sources.

Note: Setting numeric values to match `ledc_clk_cfg_t` values are a hack to avoid collision with `LEDC_AUTO_CLK` in the driver, as these enums have very similar names and user may pass one of these by mistake.

*Values:*

enumerator **LEDC\_SCLK**

Selecting this value for `LEDC_TICK_SEL_TIMER` let the hardware take its source clock from `LEDC_CLK_SEL`

enum **ledc\_timer\_t**

*Values:*

enumerator **LEDC\_TIMER\_0**

LEDC timer 0

enumerator **LEDC\_TIMER\_1**

LEDC timer 1

enumerator **LEDC\_TIMER\_2**

LEDC timer 2

enumerator **LEDC\_TIMER\_3**

LEDC timer 3

enumerator **LEDC\_TIMER\_MAX**enum **ledc\_channel\_t**

*Values:*

enumerator **LEDC\_CHANNEL\_0**

LEDC channel 0

enumerator **LEDC\_CHANNEL\_1**

LEDC channel 1

enumerator **LEDC\_CHANNEL\_2**

LEDC channel 2

enumerator **LEDC\_CHANNEL\_3**

LEDC channel 3

enumerator **LEDC\_CHANNEL\_4**

LEDC channel 4

enumerator **LEDC\_CHANNEL\_5**

LEDC channel 5

enumerator **LEDC\_CHANNEL\_MAX**

enum **ledc\_timer\_bit\_t**

*Values:*

enumerator **LEDC\_TIMER\_1\_BIT**

LEDC PWM duty resolution of 1 bits

enumerator **LEDC\_TIMER\_2\_BIT**

LEDC PWM duty resolution of 2 bits

enumerator **LEDC\_TIMER\_3\_BIT**

LEDC PWM duty resolution of 3 bits

enumerator **LEDC\_TIMER\_4\_BIT**

LEDC PWM duty resolution of 4 bits

enumerator **LEDC\_TIMER\_5\_BIT**

LEDC PWM duty resolution of 5 bits

enumerator **LEDC\_TIMER\_6\_BIT**

LEDC PWM duty resolution of 6 bits

enumerator **LEDC\_TIMER\_7\_BIT**

LEDC PWM duty resolution of 7 bits

enumerator **LEDC\_TIMER\_8\_BIT**

LEDC PWM duty resolution of 8 bits

enumerator **LEDC\_TIMER\_9\_BIT**

LEDC PWM duty resolution of 9 bits

enumerator **LEDC\_TIMER\_10\_BIT**

LEDC PWM duty resolution of 10 bits

enumerator **LEDC\_TIMER\_11\_BIT**

LEDC PWM duty resolution of 11 bits

enumerator **LEDC\_TIMER\_12\_BIT**

LEDC PWM duty resolution of 12 bits

enumerator **LEDC\_TIMER\_13\_BIT**

LEDC PWM duty resolution of 13 bits

enumerator **LEDC\_TIMER\_14\_BIT**

LEDC PWM duty resolution of 14 bits

enumerator **LEDC\_TIMER\_BIT\_MAX**

enum `ledc_fade_mode_t`

Values:

enumerator `LEDC_FADE_NO_WAIT`

LEDC fade function will return immediately

enumerator `LEDC_FADE_WAIT_DONE`

LEDC fade function will block until fading to the target duty

enumerator `LEDC_FADE_MAX`

## 2.6.10 SD SPI Host Driver

### Overview

The SD SPI host driver allows communication with one or more SD cards using the SPI Master driver, which utilizes the SPI host. Each card is accessed through an SD SPI device, represented by an SD SPI handle `sdspi_dev_handle_t`, which returns when the device is attached to an SPI bus by calling `sdspi_host_init_device()`. It is important to note that the SPI bus should be initialized beforehand by `spi_bus_initialize()`.

With the help of *SPI Master Driver* the SD SPI host driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

### How to Use

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize the structure `sdspi_device_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which are the same as the pin mappings of the SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use the `SDSPI_HOST_DEFAULT` macro to initialize the `sdmhc_host_t` structure, which is used to store the state and configurations of the upper layer (SD/SDIO/MMC driver). Modify the `slot` parameter of the structure to the SD SPI device SD SPI handle just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmhc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

### Other Details

Only the following driver's API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see *SD/SDIO/MMC Driver*.

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

---

**Warning:** If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see *Sharing the SPI bus among SD card and other SPI devices*.

### Related Docs

**Sharing the SPI bus among SD card and other SPI devices** The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

**Pin loading of other devices** When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

**AC loading** SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin's AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing requirements of an SD card may be violated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

(Terminology: **launch edge**: at which clock edge the data start to toggle; **latch edge**: at which clock edge the data is supposed to be sampled by the receiver, for SD card, it's the rising edge.)

1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.  
You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it's not as obvious as with an oscilloscope.
2. Try to use slower clock frequency.  
If the lower frequency can work while the higher frequency can't, it's an indication of the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.

**DC loading** The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current , it should be larger than 700uA, otherwise the device output may not be read correctly.

### Initialization sequence

**Note:** If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (`SDMMC_FREQ_PROBING = 400 KHz` for SD card) to avoid the influence of pin AC loading (see above section).

---

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also [storage/sd\\_card](#))

1. Initialize the SPI bus properly by `spi_bus_initialize`.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step.

You can do this by either:

1. Attach devices to the SPI bus by calling `spi_bus_add_device`. This function will initialize the GPIO that is used as CS to the idle level: high.
  2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
  3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).
3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount`.

This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.

If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.

4. Now you can talk to other SPI devices freely!

## API Reference

### Header File

- [components/driver/spi/include/driver/sdspi\\_host.h](#)

### Functions

`esp_err_t sdspi_host_init` (void)

Initialize SD SPI driver.

---

**Note:** This function is not thread safe

---

#### Returns

- ESP\_OK on success
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device` (const `sdspi_device_config_t` \*dev\_config, `sdspi_dev_handle_t` \*out\_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

---

**Note:** This function is not thread safe

---

---

**Note:** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

---

---

**Note:** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

---

#### Parameters

- **dev\_config** -- pointer to device configuration structure
- **out\_handle** -- Output of the handle to the sdspi device.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if `sdspi_host_init_device` has invalid arguments
- ESP\_ERR\_NO\_MEM if memory can not be allocated
- other errors from the underlying `spi_master` and `gpio` drivers

*esp\_err\_t* **sdspi\_host\_remove\_device** (*sdspi\_dev\_handle\_t* handle)

Remove an SD SPI device.

**Parameters** `handle` -- Handle of the SD SPI device

**Returns** Always ESP\_OK

*esp\_err\_t* **sdspi\_host\_do\_transaction** (*sdspi\_dev\_handle\_t* handle, *sdmmc\_command\_t* \*cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

---

**Note:** This function is not thread safe w.r.t. `init/deinit` functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

---

#### Parameters

- `handle` -- Handle of the sdspi device
- `cmdinfo` -- pointer to structure describing command and data to transfer

#### Returns

- ESP\_OK on success
- ESP\_ERR\_TIMEOUT if response or data transfer has timed out
- ESP\_ERR\_INVALID\_CRC if response or data transfer CRC check has failed
- ESP\_ERR\_INVALID\_RESPONSE if the card has sent an invalid response

*esp\_err\_t* **sdspi\_host\_set\_card\_clk** (*sdspi\_dev\_handle\_t* host, *uint32\_t* freq\_khz)

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

---

**Note:** This function is not thread safe

---

#### Parameters

- `host` -- Handle of the sdspi device
- `freq_khz` -- card clock frequency, in kHz

#### Returns

- ESP\_OK on success
- other error codes may be returned in the future

*esp\_err\_t* **sdspi\_host\_get\_real\_freq** (*sdspi\_dev\_handle\_t* handle, *int* \*real\_freq\_khz)

Calculate working frequency for specific device.

#### Parameters

- `handle` -- SDSPI device handle
- `real_freq_khz` -- [out] output parameter to hold the calculated frequency (in kHz)

#### Returns

- ESP\_ERR\_INVALID\_ARG : `handle` is NULL or invalid or `real_freq_khz` parameter is NULL
- ESP\_OK : Success

*esp\_err\_t* **sdspi\_host\_deinit** (void)

Release resources allocated using `sdspi_host_init`.

---

**Note:** This function is not thread safe

---

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_STATE if `sdspi_host_init` function has not been called

*esp\_err\_t* **sdspi\_host\_io\_int\_enable** (*sdspi\_dev\_handle\_t* handle)

Enable SDIO interrupt.

**Parameters** **handle** -- Handle of the sdspi device

#### Returns

- ESP\_OK on success

*esp\_err\_t* **sdspi\_host\_io\_int\_wait** (*sdspi\_dev\_handle\_t* handle, TickType\_t timeout\_ticks)

Wait for SDIO interrupt until timeout.

#### Parameters

- **handle** -- Handle of the sdspi device
- **timeout\_ticks** -- Ticks to wait before timeout.

#### Returns

- ESP\_OK on success

## Structures

struct **sdspi\_device\_config\_t**

Extra configuration for SD SPI device.

## Public Members

*spi\_host\_device\_t* **host\_id**

SPI host to use, SPIx\_HOST (see `spi_types.h`).

*gpio\_num\_t* **gpio\_cs**

GPIO number of CS signal.

*gpio\_num\_t* **gpio\_cd**

GPIO number of card detect signal.

*gpio\_num\_t* **gpio\_wp**

GPIO number of write protect signal.

*gpio\_num\_t* **gpio\_int**

GPIO number of interrupt line (input) for SDIO card.

## Macros

**SDSPI\_DEFAULT\_HOST**

**SDSPI\_DEFAULT\_DMA**

**SDSPI\_HOST\_DEFAULT ()**

Default *sdmmc\_host\_t* structure initializer for SD over SPI driver.

Uses SPI mode and max frequency set to 20MHz

'slot' should be set to an sdspi device initialized by *sdspi\_host\_init\_device ()*.

**SDSPI\_SLOT\_NO\_CS**

indicates that card select line is not used

**SDSPI\_SLOT\_NO\_CD**

indicates that card detect line is not used

**SDSPI\_SLOT\_NO\_WP**

indicates that write protect line is not used

**SDSPI\_SLOT\_NO\_INT**

indicates that interrupt line is not used

**SDSPI\_DEVICE\_CONFIG\_DEFAULT ()**

Macro defining default configuration of SD SPI device.

**Type Definitions**

```
typedef int sdspi_dev_handle_t
```

Handle representing an SD SPI device.

**2.6.11 SPI Flash API****Overview**

The *spi\_flash* component contains API functions related to reading, writing, erasing, memory mapping for data in the external flash.

For higher-level API functions which work with partitions defined in the *partition table*, see *Partitions API*

---

**Note:** *esp\_partition\_\** APIs are recommended to be used instead of the lower level *esp\_flash\_\** API functions when accessing the main SPI Flash chip, since they do bounds checking and are guaranteed to calculate correct offsets in flash based on the information in the partition table. *esp\_flash\_\** functions can still be used directly when accessing an external (secondary) SPI flash chip.

---

Different from the API before ESP-IDF v4.0, the functionality of *esp\_flash\_\** APIs is not limited to the "main" SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

---

**Note:** Instead of going through the cache connected to the SPI0 peripheral, most *esp\_flash\_\** APIs go through other SPI peripherals like SPI1, SPI2, etc. This makes them able to access not only the main flash, but also external (secondary) flash.

However, due to limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations are also on the cache side. The cache is not able to access external flash chips

or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

---

**Note:** Flash APIs after ESP-IDF v4.0 are no longer *atomic*. If a write operation occurs during another on-going read operation, and the flash addresses of both operations overlap, the data returned from the read operation may contain both old data and new data (that was updated written by the write operation).

---

**Note:** Encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

---

### Support for Features of Flash Chips

**Quad/Dual Mode Chips** Features of different flashes are implemented in different ways and thus need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all flashes with 24-bit address are supported, because they don't need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on following chip types:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

**Note:** Only when one flash series listed above is supported by ESP32-C2, this flash series is supported by the chip driver by default. You can use `Component config > SPI Flash driver > Auto-detect flash chips` in `menuconfig` to enable/disable a flash series.

---

### Optional Features

**Optional features for flash** Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- *Auto Suspend & Resume*
- *Flash unique ID*
- *High performance mode*
- *OPI flash support*
- *32-bit Address Flash Chips*

**Note:** When Flash optional features listed in this page are used, aside from the capability of ESP chips, and ESP-IDF version you are using, you will also need to make sure these features are supported by flash chips used.

- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact [Espressif's business team](#) to know if we can supply such products for you.
- If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.

**Attention:** This document only shows that IDF code has supported the features of those flash chips. It's not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own brought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

**Auto Suspend & Resume** This feature is only supported on ESP32-C3 for now.

The support for ESP32-S3, ESP32-C2, ESP32-C6, ESP32-H2 may be added in the future.

**Flash unique ID** This feature is supported on all Espressif chips.

Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

List of Flash chips that support this feature:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

**High performance mode** This feature is only supported on ESP32-S3 for now.

The support for ESP32-S2, ESP32-C3, ESP32-C6, ESP32-H2 may be added in the future.

**OPI flash support** This feature is only supported on ESP32-S3 for now.

OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

**32-bit Address Flash Chips** This feature is supported on all Espressif chips (with various restrictions to application).

Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regretfully, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

List of Flash chips that support this feature:

1. W25Q256
2. GD25Q256

---

**Important:** Over 16 MBytes space on flash mentioned above can be only used for data saving, like file system. If your data/instructions over 16 MBytes spaces need to be mapped to MMU (so as to be accessed by the CPU), please upgrade to ESP-IDF v5.2 and read the latest docs.

---

There are some features that are not supported by all flash chips, or not supported by all Espressif chips. These features include:

- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16 MB) that needs longer addresses.

- Flash unique ID - means that flash supports its unique 64-bit ID.

If you want to use these features, please ensure both ESP32-C2 and ALL flash chips in your product support these features. For more details, refer to [Optional features for flash](#).

You may also customise your own flash chip driver. See [Overriding Default Chip Drivers](#) for more details.

**Warning:** Customizing SPI Flash Chip Drivers is considered an "expert" feature. Users should only do so at their own risk. (See the notes below)

**Overriding Default Chip Drivers** During the SPI Flash driver's initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver will iterate through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the IDF, thus are updated in together with each IDF version. However IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public IDF functions, which have slight possibility to change between IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some IDF bug fixes to other chip drivers will not be automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

### Steps For Creating Custom Chip Drivers and Overriding the IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This will prevent compilation and linking of the Default Chip Driver List (`default_registered_chips`) provided by IDF. Instead, the linker will search for the structure of the same name (`default_registered_chips`) that must be provided by the user.
2. Add a new component in your project, e.g. `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in IDF. This may include:
  - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
  - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
  - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly. Including:

- Change the `default_registered_chips` variable to non-static and remove the `#ifdef` logic around it.
- Update `linker.lf` file to rename the fragment header and the library name to match the new component.
- If reusing other drivers, some header names need prefixing with `spi_flash/` when included from outside `spi_flash` component.

#### Note:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***(vendor)_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
  2. Write a function named `spi_flash_chip_***(vendor)_get_caps`. Take the example below as a reference. (if the flash support `suspend` and `read unique id`).
  3. Points the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```
spi_flash_caps_t spi_flash_chip_***(vendor)_get_caps(esp_flash_t *chip)
{
```

(continues on next page)

(continued from previous page)

```

spi_flash_caps_t caps_flags = 0;
// 32-bit-address flash is not supported
flash-suspend is supported
caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
// flash read unique id.
caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
return caps_flags;
}

```

```

const spi_flash_chip_t esp_flash_chip_eon = {
// Other function pointers
.get_chip_caps = spi_flash_chip_eon_get_caps,
};

```

- You also can see how to implement this in the example [storage/custom\\_flash\\_driver](#).

4. Write a new *CMakeLists.txt* file for the *custom\_chip\_driver* component, including an additional line to add a linker dependency from *spi\_flash* to *custom\_chip\_driver*:

```

idf_component_register(SRCS "spi_flash_chip_drivers.c"
                        "spi_flash_chip_mychip.c" # modify as needed
                        REQUIRES hal
                        PRIV_REQUIRES spi_flash
                        LDFRAGMENTS linker.1f)
idf_component_add_link_dependency(FROM spi_flash)

```

- An example of this component *CMakeLists.txt* can be found in [storage/custom\\_flash\\_driver/components/custom\\_chip\\_driver/CMakeLists.txt](#)
5. The *linker.1f* is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See [Linker Script Generation](#) for more details. Make sure this file covers all the source files that you add.
  6. Build your project, and you will see the new flash driver is used.

**Example** See also [storage/custom\\_flash\\_driver](#).

## Initializing a Flash Device

To use the `esp_flash_*` APIs, you need to initialise a flash chip on a certain SPI bus, as shown below:

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This function initializes the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device to the bus. This function allocates memory and fills the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This will also detect the chip type, and influence the following operations.

---

**Note:** Multiple flash chips can be attached to the same bus now.

---

## SPI Flash Access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the "main" SPI flash chip in favour of *partition-specific functions*.

### SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000.

By default, the SPI flash size is detected by `esptool.py` when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in the project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.

### Concurrency Constraints for Flash on SPI1

**Concurrency Constraints for Flash on SPI1** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32-C2, these caches must be disabled while reading/writing/erasing.

**When the Caches Are Disabled** Under this condition, all CPUs should always execute code and access data from internal RAM. The APIs documented in this file will disable the caches automatically and transparently.

The way that these APIs disable the caches will also disable non-IRAM-safe interrupts. These will be restored until the Flash operation completes.

See also *OS Functions* and *SPI Bus Lock*.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between internal RAM (e.g. IRAM, DRAM) and flash cache, please refer to the *application memory layout* documentation.

**IRAM-Safe Interrupt Handlers** For interrupt handlers which need to execute when the cache is disabled (e.g., for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the *interrupt handler is registered*.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See *How to Place Code in IRAM*.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

---

**Note:** When working with strings in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both `TAG` and format string are placed into DRAM in that case.

---

**Non-IRAM-Safe Interrupt Handlers** If the `ESP_INTR_FLAG_IRAM` flag is not set when registering, the interrupt handler will not get executed when the caches are disabled. Once the caches are restored, the non-IRAM-safe interrupts will be re-enabled. After this moment, the interrupt handler will run normally again. This means that as long as caches are disabled, users won't see the corresponding hardware event happening.

**Attention:** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) will cause significant influence to the whole system. See [Concurrency Constraints for Flash on SPI1](#) for more details.

### SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the [Flash Encryption documentation](#) for more details.

### Memory Mapping API

ESP32-C2 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when [flash encryption](#) is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in `spi_flash_mmap.h` and `esp_partition.h`:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition. It will adjust the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

---

**Note:** mmap is supported by cache, so it can only be used on main flash.

---

### SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g. lock, delay) in different stages (1st/2nd boot, or the app).

**Host Driver** The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_types.h` (in the `hal/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32-C2 memory-spi functionalities. However, due to the speed limitations of ESP32-C2, the HAL layer cannot provide high-speed implementations to some reading commands (so the support for it was dropped). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the `esp_flash` API can access the flash regardless of the low-level hardware.

**Chip Driver** The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status afterwards. Some chips need different commands or values, or need special communication ways.

There is a type of chip called `generic_chip` which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

**OS Functions** Currently the OS function layer provides entries of a lock and delay.

The lock (see [SPI Bus Lock](#)) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may require to use the bus monopolized during a period (especially when the device doesn't have a CS wire, or the wire is controlled by software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

OS functions can also help to avoid a watchdog timeout when erasing large flash areas. During this time, the CPU is occupied with the flash erasing task. This stops other tasks from being executed. Among these tasks is the idle task to feed the watchdog timer (WDT). If the configuration option `CONFIG_ESP_TASK_WDT_PANIC` is selected and the flash operation time is longer than the watchdog timeout period, the system will reboot.

It's pretty hard to totally eliminate this risk, because the erasing time varies with different flash chips, making it hard to be compatible in flash drivers. Therefore, users need to pay attention to it. Please use the following guidelines:

1. It is recommended to enable the `CONFIG_SPI_FLASH_YIELD_DURING_ERASE` option to allow the scheduler to re-schedule during erasing flash memory. Besides, following parameters can also be used.
  - Increase `CONFIG_SPI_FLASH_ERASE_YIELD_TICKS` or decrease `CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS` in menuconfig.
  - You can also increase `CONFIG_ESP_TASK_WDT_TIMEOUT_S` in menuconfig for a larger watchdog timeout period. However, with larger watchdog timeout period, previously detected timeouts may no longer be detected.
2. Please be aware of the consequences of enabling the `CONFIG_ESP_TASK_WDT_PANIC` option when doing long-running SPI flash operations which will trigger the panic handler when it times out. However, this option can also help dealing with unexpected exceptions in your application. Please decide whether this is needed to be enabled according to actual condition.
3. During your development, please carefully review the actual flash operation according to the specific requirements and time limits on erasing flash memory of your projects. Always allow reasonable redundancy based

on your specific product requirements when configuring the flash erasing timeout threshold, thus improving the reliability of your product.

### Implementation Details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation: - In a single-core setup, the SDK needs to disable interrupts or scheduler before performing the flash operation. - In a dual-core setup, the SDK needs to make sure that both CPUs are not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

**SPI Flash API ESP-IDF version vs Chip-ROM version** There is a set of SPI Flash drivers in Chip-ROM which you can use by enabling `CONFIG_SPI_FLASH_ROM_IMPL`. Most of the ESP-IDF SPI Flash driver code are in internal RAM, therefore enabling this option will free some internal RAM usage. Note if you enable this option, this means some SPI Flash driver features and bugfixes that are done in ESP-IDF might not be included in the Chip-ROM version.

### Feature Supported by ESP-IDF but not in Chip-ROM

- Octal Flash chip support. See *OPI flash support* for details.
- 32-bit-address support for GD25Q256. See *32-bit Address Flash Chips* for details.
- TH Flash chip support.
- Kconfig option `CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED`.
- `CONFIG_SPI_FLASH_VERIFY_WRITE`, enabling this option helps you detect bad writing.
- `CONFIG_SPI_FLASH_LOG_FAILED_WRITE`, enabling this option will print the bad writing.
- `CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE`, enabling this option will check if you're writing zero to one.
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`, enabling this option will check for flash programming to certain protected regions like bootloader, partition table or application itself.
- `CONFIG_SPI_FLASH_ENABLE_COUNTERS`, enabling this option to collect performance data for ESP-IDF SPI Flash driver APIs.

### Bugfixes Introduced in ESP-IDF but not in Chip-ROM

- Detected Flash physical size correctly, for larger than 256MBit Flash chips. (Commit ID: b4964279d44f73cce7cfd5cf684567fbdfd6fd9e)
- Fixed issue that only at most 128KB virtual address ranges can be mapped to instructions on Flash.

## ESP-IDF vs Chip-ROM SPI Flash Driver

Refer to *SPI Flash API ESP-IDF version vs Chip-ROM version*.

## API Reference - SPI Flash

### Header File

- `components/spi_flash/include/esp_flash_spi_init.h`

### Functions

`esp_err_t spi_bus_add_flash_device(esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)`

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by `spi_bus_initialization`.

#### Parameters

- `out_chip` -- Pointer to hold the initialized chip.
- `config` -- Configuration of the chips to initialize.

#### Returns

- `ESP_ERR_INVALID_ARG`: `out_chip` is NULL, or some field in the config is invalid.
- `ESP_ERR_NO_MEM`: failed to allocate memory for the chip structures.
- `ESP_OK`: success.

`esp_err_t spi_bus_remove_flash_device(esp_flash_t *chip)`

Remove a SPI Flash device from the SPI bus.

**Parameters** `chip` -- The flash device to remove.

#### Returns

- `ESP_ERR_INVALID_ARG`: The chip is invalid.
- `ESP_OK`: success.

### Structures

struct `esp_flash_spi_device_config_t`

Configurations for the SPI Flash to init.

### Public Members

`spi_host_device_t host_id`

Bus to use.

int `cs_io_num`

GPIO pin to output the CS signal.

`esp_flash_io_mode_t io_mode`

IO mode to read from the Flash.

enum `esp_flash_speed_s speed`

Speed of the Flash clock. Replaced by `freq_mhz`.

int `input_delay_ns`

Input delay of the data pins, in ns. Set to 0 if unknown.

int **cs\_id**

CS line ID, ignored when not `host_id` is not `SPI1_HOST`, or `CONFIG_SPI_FLASH_SHARE_SPI1_BUS` is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

int **freq\_mhz**

The frequency of flash chip(MHZ)

### Header File

- [components/spi\\_flash/include/esp\\_flash.h](#)

### Functions

*esp\_err\_t* **esp\_flash\_init** (*esp\_flash\_t* \*chip)

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

---

**Note:** Only the `host` and `read_mode` fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

---

---

**Note:** If the `chip->drv` pointer is NULL, `chip` `chip_drv` will be auto-detected based on its manufacturer & product IDs. See `esp_flash_registered_flash_drivers` pointer for details of this process.

---

**Parameters** `chip` -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

**Returns** `ESP_OK` on success, or a flash error code if initialisation fails.

bool **esp\_flash\_chip\_driver\_initialized** (const *esp\_flash\_t* \*chip)

Check if appropriate chip driver is set.

**Parameters** `chip` -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

**Returns** true if set, otherwise false.

*esp\_err\_t* **esp\_flash\_read\_id** (*esp\_flash\_t* \*chip, uint32\_t \*out\_id)

Read flash ID via the common "RDID" SPI flash command.

ID is a 24-bit value. Lower 16 bits of 'id' are the chip ID, upper 8 bits are the manufacturer ID.

**Parameters**

- `chip` -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- `out_id` -- [out] Pointer to receive ID value.

**Returns** `ESP_OK` on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_size** (*esp\_flash\_t* \*chip, uint32\_t \*out\_size)

Detect flash size based on flash ID.

---

**Note:** 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

- a. The `out_size` returned only stands for The `out_size` stands for the size in the binary image header. If you want to get the real size of the chip, please call `esp_flash_get_physical_size` instead.

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **out\_size** -- [out] Detected size in bytes, standing for the size in the binary image header.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_physical\_size** (*esp\_flash\_t* \*chip, uint32\_t \*flash\_size)

Detect flash size based on flash ID.

---

**Note:** Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn't follow this convention, the size may be incorrectly detected.

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`
- **flash\_size** -- [out] Detected size in bytes.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_read\_unique\_chip\_id** (*esp\_flash\_t* \*chip, uint64\_t \*out\_id)

Read flash unique ID via the common "RDUID" SPI flash command.

ID is a 64-bit value.

---

**Note:** This is an optional feature, which is not supported on all flash chips. READ PROGRAMMING GUIDE FIRST!

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`.
- **out\_id** -- [out] Pointer to receive unique ID value.

**Returns**

- ESP\_OK on success, or a flash error code if operation failed.
- ESP\_ERR\_NOT\_SUPPORTED if the chip doesn't support read id.

*esp\_err\_t* **esp\_flash\_erase\_chip** (*esp\_flash\_t* \*chip)

Erase flash chip contents.

**Parameters** **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

**Returns**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_erase\_region** (*esp\_flash\_t* \*chip, uint32\_t start, uint32\_t len)

Erase a region of the flash chip.

Sector size is specified in `chip->drv->sector_size` field (typically 4096 bytes.) ESP\_ERR\_INVALID\_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in `chip->drv->block_erase_size` field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **start** -- Address to start erasing flash. Must be sector aligned.
- **len** -- Length of region to erase. Must also be sector aligned.

**Returns**

- ESP\_OK on success,
- ESP\_ERR\_NOT\_SUPPORTED if the chip is not able to perform the operation. This is indicated by `WREN = 1` after the command is sent.
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_chip\_write\_protect** (*esp\_flash\_t* \*chip, bool \*write\_protected)

Read if the entire chip is write protected.

---

**Note:** A correct result for this flag depends on the SPI flash chip model and `chip_drv` in use (via the '`chip->drv`' field).

---

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **write\_protected** -- [out] Pointer to boolean, set to the value of the write protect flag.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_set\_chip\_write\_protect** (*esp\_flash\_t* \*chip, bool write\_protect)

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the '`chip->drv`' field).

---

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **write\_protect** -- Boolean value for the write protect flag

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_protectable\_regions** (const *esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*\*out\_regions, uint32\_t \*out\_num\_regions)

Read the list of individually protectable regions of this SPI flash chip.

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and `chip_drv` in use (via the '`chip->drv`' field).

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via `esp_flash_init()`

- **out\_regions** -- [out] Pointer to receive a pointer to the array of protectable regions of the chip.
- **out\_num\_regions** -- [out] Pointer to an integer receiving the count of protectable regions in the array returned in 'regions'.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_get\_protected\_region** (*esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*region, bool \*out\_protected)

Detect if a region of the SPI flash chip is protected.

---

**Note:** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

---

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip\_drv in use (via the 'chip->drv' field).

---

#### Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via esp\_flash\_init()
- **region** -- Pointer to a struct describing a protected region. This must match one of the regions returned from esp\_flash\_get\_protectable\_regions(...).
- **out\_protected** -- [out] Pointer to a flag which is set based on the protected status for this region.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_set\_protected\_region** (*esp\_flash\_t* \*chip, const *esp\_flash\_region\_t* \*region, bool protect)

Update the protected status for a region of the SPI flash chip.

---

**Note:** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

---

---

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip\_drv in use (via the 'chip->drv' field).

---

#### Parameters

- **chip** -- Pointer to identify flash chip. Must have been successfully initialised via esp\_flash\_init()
- **region** -- Pointer to a struct describing a protected region. This must match one of the regions returned from esp\_flash\_get\_protectable\_regions(...).
- **protect** -- Write protection flag to set.

**Returns** ESP\_OK on success, or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_read** (*esp\_flash\_t* \*chip, void \*buffer, uint32\_t address, uint32\_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

---

**Note:** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

---

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **buffer** -- Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- **address** -- Address on flash to read from. Must be less than `chip->size` field.
- **length** -- Length (in bytes) of data to read.

**Returns**

- `ESP_OK`: success
- `ESP_ERR_NO_MEM`: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_write** (*esp\_flash\_t* \*chip, const void \*buffer, uint32\_t address, uint32\_t length)

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**

- **chip** -- Pointer to identify flash chip. If NULL, `esp_flash_default_chip` is substituted. Must have been successfully initialised via `esp_flash_init()`
- **address** -- Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** -- Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** -- Length (in bytes) of data to write.

**Returns**

- `ESP_OK` on success,
- `ESP_FAIL`, bad write, this will be detected only when `CONFIG_SPI_FLASH_VERIFY_WRITE` is enabled
- `ESP_ERR_NOT_SUPPORTED` if the chip is not able to perform the operation. This is indicated by `WREN = 1` after the command is sent.
- Other flash error code if operation failed.

*esp\_err\_t* **esp\_flash\_write\_encrypted** (*esp\_flash\_t* \*chip, uint32\_t address, const void \*buffer, uint32\_t length)

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

---

**Note:** Both address & length must be 16 byte aligned, as this is the encryption block size

---

**Parameters**

- **chip** -- Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** -- Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** -- Pointer to a buffer with the data to write.
- **length** -- Length (in bytes) of data to write. 16 byte aligned.

**Returns**

- `ESP_OK`: on success
- `ESP_FAIL`: bad write, this will be detected only when `CONFIG_SPI_FLASH_VERIFY_WRITE` is enabled

- `ESP_ERR_NOT_SUPPORTED`: encrypted write not supported for this chip.
- `ESP_ERR_INVALID_ARG`: Either the address, buffer or length is invalid.

`esp_err_t esp_flash_read_encrypted` (`esp_flash_t` \*chip, uint32\_t address, void \*out\_buffer, uint32\_t length)

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

#### Parameters

- **chip** -- Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** -- Address on flash to read from.
- **out\_buffer** -- Pointer to a buffer for the data to read to.
- **length** -- Length (in bytes) of data to read.

#### Returns

- `ESP_OK`: on success
- `ESP_ERR_NOT_SUPPORTED`: encrypted read not supported for this chip.

static inline bool `esp_flash_is_quad_mode` (const `esp_flash_t` \*chip)

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Parameters** **chip** -- Pointer to SPI flash chip to use. If NULL, `esp_flash_default_chip` is substituted.

**Returns** true if flash works in quad mode, otherwise false

## Structures

struct `esp_flash_region_t`

Structure for describing a region of flash.

### Public Members

uint32\_t **offset**

Start address of this region.

uint32\_t **size**

Size of the region.

struct `esp_flash_os_functions_t`

OS-level integration hooks for accessing flash chips inside a running OS.

It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

### Public Members

`esp_err_t` (\***start**)(void \*arg)

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to 'end').

`esp_err_t` (\***end**)(void \*arg)

Called after completing any flash operation.

*esp\_err\_t* (\***region\_protected**)(void \*arg, size\_t start\_addr, size\_t size)

Called before any erase/write operations to check whether the region is limited by the OS

*esp\_err\_t* (\***delay\_us**)(void \*arg, uint32\_t us)

Delay for at least 'us' microseconds. Called in between 'start' and 'end'.

void (\***get\_temp\_buffer**)(void \*arg, size\_t request\_size, size\_t \*out\_size)

Called for get temp buffer when buffer from application cannot be directly read into/write from.

void (\***release\_temp\_buffer**)(void \*arg, void \*temp\_buf)

Called for release temp buffer.

*esp\_err\_t* (\***check\_yield**)(void \*arg, uint32\_t chip\_status, uint32\_t \*out\_request)

Yield to other tasks. Called during erase operations.

**Return** ESP\_OK means yield needs to be called (got an event to handle), while ESP\_ERR\_TIMEOUT means skip yield.

*esp\_err\_t* (\***yield**)(void \*arg, uint32\_t \*out\_status)

Yield to other tasks. Called during erase operations.

int64\_t (\***get\_system\_time**)(void \*arg)

Called for get system time.

void (\***set\_flash\_op\_status**)(uint32\_t op\_status)

Call to set flash operation status

struct **esp\_flash\_t**

Structure to describe a SPI flash chip connected to the system.

Structure must be initialized before use (passed to `esp_flash_init()`). It's in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn't be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

### Public Members

*spi\_flash\_host\_inst\_t* \***host**

Pointer to hardware-specific "host\_driver" structure. Must be initialized before used.

const *spi\_flash\_chip\_t* \***chip\_drv**

Pointer to chip-model-specific "adapter" structure. If NULL, will be detected during initialisation.

const *esp\_flash\_os\_functions\_t* \***os\_func**

Pointer to os-specific hook structure. Call `esp_flash_init_os_functions()` to setup this field, after the host is properly initialized.

void \***os\_func\_data**

Pointer to argument for os-specific hooks. Left NULL and will be initialized with `os_func`.

***esp\_flash\_io\_mode\_t* read\_mode**

Configured SPI flash read mode. Set before `esp_flash_init` is called.

**uint32\_t size**

Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call `esp_flash_get_physical_size`.

**uint32\_t chip\_id**

Detected chip id.

**uint32\_t busy**

This flag is used to verify chip's status.

**uint32\_t hpm\_dummy\_ena**

This flag is used to verify whether flash works under HPM status.

**uint32\_t reserved\_flags**

reserved.

## Macros

**SPI\_FLASH\_YIELD\_REQ\_YIELD**

**SPI\_FLASH\_YIELD\_REQ\_SUSPEND**

**SPI\_FLASH\_YIELD\_STA\_RESUME**

**SPI\_FLASH\_OS\_IS\_ERASING\_STATUS\_FLAG**

## Type Definitions

typedef struct *spi\_flash\_chip\_t* **spi\_flash\_chip\_t**

## Header File

- `components/spi_flash/include/spi_flash_mmap.h`

## Functions

*esp\_err\_t* **spi\_flash\_mmap** (size\_t src\_addr, size\_t size, *spi\_flash\_mmap\_memory\_t* memory, const void \*\*out\_ptr, *spi\_flash\_mmap\_handle\_t* \*out\_handle)

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if `mmap/munmap` are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use `spi_flash_mmap_dump()` function.

### Parameters

- **src\_addr** -- Physical address in flash where requested region starts. This address *must* be aligned to 64kB boundary (`SPI_FLASH_MMU_PAGE_SIZE`)

- **size** -- Size of region to be mapped. This size will be rounded up to a 64kB boundary
- **memory** -- Address space where the region should be mapped (data or instruction)
- **out\_ptr** -- [out] Output, pointer to the mapped memory region
- **out\_handle** -- [out] Output, handle which should be used for spi\_flash\_munmap call

**Returns** ESP\_OK on success, ESP\_ERR\_NO\_MEM if pages can not be allocated

*esp\_err\_t* **spi\_flash\_mmap\_pages** (const int \*pages, size\_t page\_count, *spi\_flash\_mmap\_memory\_t* memory, const void \*\*out\_ptr, *spi\_flash\_mmap\_handle\_t* \*out\_handle)

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as spi\_flash\_mmap() but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

#### Parameters

- **pages** -- An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- **page\_count** -- Number of entries in the pages array
- **memory** -- Address space where the region should be mapped (instruction or data)
- **out\_ptr** -- [out] Output, pointer to the mapped memory region
- **out\_handle** -- [out] Output, handle which should be used for spi\_flash\_munmap call

#### Returns

- ESP\_OK on success
- ESP\_ERR\_NO\_MEM if pages can not be allocated
- ESP\_ERR\_INVALID\_ARG if pagecount is zero or pages array is not in internal memory

void **spi\_flash\_munmap** (*spi\_flash\_mmap\_handle\_t* handle)

Release region previously obtained using spi\_flash\_mmap.

---

**Note:** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

---

**Parameters** **handle** -- Handle obtained from spi\_flash\_mmap

void **spi\_flash\_mmap\_dump** (void)

Display information about mapped regions.

This function lists handles obtained using spi\_flash\_mmap, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

uint32\_t **spi\_flash\_mmap\_get\_free\_pages** (*spi\_flash\_mmap\_memory\_t* memory)

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual spi\_flash\_mmap (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

**Parameters** **memory** -- memory type of MMU table free page

**Returns** number of free pages which can be mmaped

size\_t **spi\_flash\_cache2phys** (const void \*cached)

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have have been assigned via spi\_flash\_mmap(), any address in memory mapped flash space can be looked up.

**Parameters** **cached** -- Pointer to flashed cached memory.

**Returns**

- `SPI_FLASH_CACHE2PHYS_FAIL` If cache address is outside flash cache region, or the address is not mapped.
- Otherwise, returns physical offset in flash

const void \***spi\_flash\_phys2cache** (size\_t phys\_offs, *spi\_flash\_mmap\_memory\_t* memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via `spi_flash_mmap()`, any address in flash can be looked up.

---

**Note:** Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

---

---

**Note:** This function doesn't impose any alignment constraints, but if memory argument is `SPI_FLASH_MMAP_INST` and `phys_offs` is not 4-byte aligned, then reading from the returned pointer will result in a crash.

---

#### Parameters

- **phys\_offs** -- Physical offset in flash memory to look up.
- **memory** -- Address space type to look up a flash cache address mapping for (instruction or data)

#### Returns

- NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
- Cached memory address (in IROM or DROM space) corresponding to `phys_offs`.

### Macros

#### `ESP_ERR_FLASH_OP_FAIL`

This file contains `spi_flash_mmap_xx` APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

#### `ESP_ERR_FLASH_OP_TIMEOUT`

#### `SPI_FLASH_SEC_SIZE`

SPI Flash sector size

#### `SPI_FLASH_MMU_PAGE_SIZE`

Flash cache MMU mapping page size

#### `SPI_FLASH_CACHE2PHYS_FAIL`

### Type Definitions

typedef uint32\_t **spi\_flash\_mmap\_handle\_t**

Opaque handle for memory region obtained from `spi_flash_mmap`.

### Enumerations

enum **spi\_flash\_mmap\_memory\_t**

Enumeration which specifies memory space requested in an mmap call.

*Values:*

enumerator **SPI\_FLASH\_MMAP\_DATA**

map to data memory, allows byte-aligned access

enumerator **SPI\_FLASH\_MMAP\_INST**

map to instruction memory, allows only 4-byte-aligned access

### Header File

- [components/hal/include/hal/spi\\_flash\\_types.h](#)

### Structures

struct **spi\_flash\_trans\_t**

Definition of a common transaction. Also holds the return value.

### Public Members

uint8\_t **reserved**

Reserved, must be 0.

uint8\_t **mosi\_len**

Output data length, in bytes.

uint8\_t **miso\_len**

Input data length, in bytes.

uint8\_t **address\_bitlen**

Length of address in bits, set to 0 if command does not need an address.

uint32\_t **address**

Address to perform operation on.

const uint8\_t \***mosi\_data**

Output data to salve.

uint8\_t \***miso\_data**

[out] Input data from slave, little endian

uint32\_t **flags**

Flags for this transaction. Set to 0 for now.

uint16\_t **command**

Command to send.

uint8\_t **dummy\_bitlen**

Basic dummy bits to use.

uint32\_t **io\_mode**

Flash working mode when `SPI_FLASH_IGNORE_BASEIO` is specified.

struct **spi\_flash\_sus\_cmd\_conf**

Configuration structure for the flash chip suspend feature.

### Public Members

uint32\_t **sus\_mask**

SUS/SUS1/SUS2 bit in flash register.

uint32\_t **cmd\_rdsr**

Read flash status register(2) command.

uint32\_t **sus\_cmd**

Flash suspend command.

uint32\_t **res\_cmd**

Flash resume command.

uint32\_t **reserved**

Reserved, set to 0.

struct **spi\_flash\_encryption\_t**

Structure for flash encryption operations.

### Public Members

void (**\*flash\_encryption\_enable**)(void)

Enable the flash encryption.

void (**\*flash\_encryption\_disable**)(void)

Disable the flash encryption.

void (**\*flash\_encryption\_data\_prepare**)(uint32\_t address, const uint32\_t \*buffer, uint32\_t size)

Prepare flash encryption before operation.

---

**Note:** address and buffer must be 8-word aligned.

---

**Param address** The destination address in flash for the write operation.

**Param buffer** Data for programming

**Param size** Size to program.

void (**\*flash\_encryption\_done**)(void)

flash data encryption operation is done.

void (**\*flash\_encryption\_destroy**)(void)

Destroy encrypted result

bool (**\*flash\_encryption\_check**)(uint32\_t address, uint32\_t length)

Check if is qualified to encrypt the buffer

**Param address** the address of written flash partition.

**Param length** Buffer size.

struct **spi\_flash\_host\_inst\_t**

SPI Flash Host driver instance

### Public Members

const struct *spi\_flash\_host\_driver\_s* \***driver**

Pointer to the implementation function table.

struct **spi\_flash\_host\_driver\_s**

Host driver configuration and context structure.

### Public Members

*esp\_err\_t* (**\*dev\_config**)(*spi\_flash\_host\_inst\_t* \*host)

Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

*esp\_err\_t* (**\*common\_command**)(*spi\_flash\_host\_inst\_t* \*host, *spi\_flash\_trans\_t* \*t)

Send an user-defined spi transaction to the device.

*esp\_err\_t* (**\*read\_id**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t \*id)

Read flash ID.

void (**\*erase\_chip**)(*spi\_flash\_host\_inst\_t* \*host)

Erase whole flash chip.

void (**\*erase\_sector**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t start\_address)

Erase a specific sector by its start address.

void (**\*erase\_block**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t start\_address)

Erase a specific block by its start address.

*esp\_err\_t* (**\*read\_status**)(*spi\_flash\_host\_inst\_t* \*host, uint8\_t \*out\_sr)

Read the status of the flash chip.

*esp\_err\_t* (\***set\_write\_protect**)(*spi\_flash\_host\_inst\_t* \*host, bool wp)

Disable write protection.

void (\***program\_page**)(*spi\_flash\_host\_inst\_t* \*host, const void \*buffer, uint32\_t address, uint32\_t length)

Program a page of the flash. Check `max_write_bytes` for the maximum allowed writing length.

bool (\***supports\_direct\_write**)(*spi\_flash\_host\_inst\_t* \*host, const void \*p)

Check whether the SPI host supports direct write.

When cache is disabled, SPI1 doesn't support directly write when buffer isn't internal.

int (\***write\_data\_slicer**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t address, uint32\_t len, uint32\_t \*align\_addr, uint32\_t page\_size)

Slicer for write data. The `program_page` should be called iteratively with the return value of this function.

**Param address** Beginning flash address to write

**Param len** Length request to write

**Param align\_addr** Output of the aligned address to write to

**Param page\_size** Physical page size of the flash chip

**Return** Length that can be actually written in one `program_page` call

*esp\_err\_t* (\***read**)(*spi\_flash\_host\_inst\_t* \*host, void \*buffer, uint32\_t address, uint32\_t read\_len)

Read data from the flash. Check `max_read_bytes` for the maximum allowed reading length.

bool (\***supports\_direct\_read**)(*spi\_flash\_host\_inst\_t* \*host, const void \*p)

Check whether the SPI host supports direct read.

When cache is disabled, SPI1 doesn't support directly read when the given buffer isn't internal.

int (\***read\_data\_slicer**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t address, uint32\_t len, uint32\_t \*align\_addr, uint32\_t page\_size)

Slicer for read data. The `read` should be called iteratively with the return value of this function.

**Param address** Beginning flash address to read

**Param len** Length request to read

**Param align\_addr** Output of the aligned address to read

**Param page\_size** Physical page size of the flash chip

**Return** Length that can be actually read in one `read` call

uint32\_t (\***host\_status**)(*spi\_flash\_host\_inst\_t* \*host)

Check the host status, 0:busy, 1:idle, 2:suspended.

*esp\_err\_t* (\***configure\_host\_io\_mode**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t command, uint32\_t addr\_bitlen, int dummy\_bitlen\_base, *esp\_flash\_io\_mode\_t* io\_mode)

Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

void (\***poll\_cmd\_done**)(*spi\_flash\_host\_inst\_t* \*host)

Internal use, poll the HW until the last operation is done.

*esp\_err\_t* (\***flush\_cache**)(*spi\_flash\_host\_inst\_t* \*host, uint32\_t addr, uint32\_t size)

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

void (**\*check\_suspend**)(*spi\_flash\_host\_inst\_t* \*host)

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

void (**\*resume**)(*spi\_flash\_host\_inst\_t* \*host)

Resume flash from suspend manually

void (**\*suspend**)(*spi\_flash\_host\_inst\_t* \*host)

Set flash in suspend status manually

*esp\_err\_t* (**\*sus\_setup**)(*spi\_flash\_host\_inst\_t* \*host, const *spi\_flash\_sus\_cmd\_conf* \*sus\_conf)

Suspend feature setup for setting cmd and status register mask.

## Macros

**SPI\_FLASH\_TRANS\_FLAG\_CMD16**

Send command of 16 bits.

**SPI\_FLASH\_TRANS\_FLAG\_IGNORE\_BASEIO**

Not applying the basic io mode configuration for this transaction.

**SPI\_FLASH\_TRANS\_FLAG\_BYTE\_SWAP**

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

**SPI\_FLASH\_CONFIG\_CONF\_BITS**

OR the *io\_mode* with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

**SPI\_FLASH\_OPI\_FLAG**

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

**SPI\_FLASH\_READ\_MODE\_MIN**

Slowest io mode supported by ESP32, currently SlowRd.

## Type Definitions

typedef enum *esp\_flash\_speed\_s* **esp\_flash\_speed\_t**

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the *ESP\_FLASH\_SPEED\_MAX-1* or highest frequency supported by your flash, and decrease the speed until the probing success.

typedef struct *spi\_flash\_host\_driver\_s* **spi\_flash\_host\_driver\_t**

## Enumerations

enum **esp\_flash\_speed\_s**

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the *ESP\_FLASH\_SPEED\_MAX-1* or highest frequency supported by your flash, and decrease the speed until the probing success.

*Values:*

enumerator **ESP\_FLASH\_5MHZ**

The flash runs under 5MHz.

enumerator **ESP\_FLASH\_10MHZ**

The flash runs under 10MHz.

enumerator **ESP\_FLASH\_20MHZ**

The flash runs under 20MHz.

enumerator **ESP\_FLASH\_26MHZ**

The flash runs under 26MHz.

enumerator **ESP\_FLASH\_40MHZ**

The flash runs under 40MHz.

enumerator **ESP\_FLASH\_80MHZ**

The flash runs under 80MHz.

enumerator **ESP\_FLASH\_120MHZ**

The flash runs under 120MHz, 120MHz can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator **ESP\_FLASH\_SPEED\_MAX**

The maximum frequency supported by the host is ESP\_FLASH\_SPEED\_MAX-1.

enum **esp\_flash\_io\_mode\_t**

Mode used for reading from SPI flash.

*Values:*

enumerator **SPI\_FLASH\_SLOWRD**

Data read using single I/O, some limits on speed.

enumerator **SPI\_FLASH\_FASTRD**

Data read using single I/O, no limit on speed.

enumerator **SPI\_FLASH\_DOUT**

Data read using dual I/O.

enumerator **SPI\_FLASH\_DIO**

Both address & data transferred using dual I/O.

enumerator **SPI\_FLASH\_QOUT**

Data read using quad I/O.

enumerator **SPI\_FLASH\_QIO**

Both address & data transferred using quad I/O.

enumerator **SPI\_FLASH\_OPI\_STR**

Only support on OPI flash, flash read and write under STR mode.

enumerator **SPI\_FLASH\_OPI\_DTR**

Only support on OPI flash, flash read and write under DTR mode.

enumerator **SPI\_FLASH\_READ\_MODE\_MAX**

The fastest io mode supported by the host is `ESP_FLASH_READ_MODE_MAX-1`.

### Header File

- [components/hal/include/hal/esp\\_flash\\_err.h](#)

### Macros

**ESP\_ERR\_FLASH\_NOT\_INITIALISED**

`esp_flash_chip_t` structure not correctly initialised by `esp_flash_init()`.

**ESP\_ERR\_FLASH\_UNSUPPORTED\_HOST**

Requested operation isn't supported via this host SPI bus (`chip->spi` field).

**ESP\_ERR\_FLASH\_UNSUPPORTED\_CHIP**

Requested operation isn't supported by this model of SPI flash chip.

**ESP\_ERR\_FLASH\_PROTECTED**

Write operation failed due to chip's write protection being enabled.

### Enumerations

enum [**anonymous**]

*Values:*

enumerator **ESP\_ERR\_FLASH\_SIZE\_NOT\_MATCH**

The chip doesn't have enough space for the current partition table.

enumerator **ESP\_ERR\_FLASH\_NO\_RESPONSE**

Chip did not respond to the command, or timed out.

## API Reference - Flash Encrypt

### Header File

- [components/bootloader\\_support/include/esp\\_flash\\_encrypt.h](#)

### Functions

bool **esp\_flash\_encryption\_enabled** (void)

Is flash encryption currently enabled in hardware?

Flash encryption is enabled if the `FLASH_CRYPT_CNT` efuse has an odd number of bits set.

**Returns** true if flash encryption is enabled.

*esp\_err\_t* **esp\_flash\_encrypt\_check\_and\_update** (void)

bool **esp\_flash\_encrypt\_state** (void)

Returns the Flash Encryption state and prints it.

**Returns** True - Flash Encryption is enabled False - Flash Encryption is not enabled

bool **esp\_flash\_encrypt\_initialized\_once** (void)

Checks if the first initialization was done.

If the first initialization was done then FLASH\_CRYPT\_CNT != 0

**Returns** true - the first initialization was done false - the first initialization was NOT done

*esp\_err\_t* **esp\_flash\_encrypt\_init** (void)

The first initialization of Flash Encryption key and related eFuses.

**Returns** ESP\_OK if all operations succeeded

*esp\_err\_t* **esp\_flash\_encrypt\_contents** (void)

Encrypts flash content.

**Returns** ESP\_OK if all operations succeeded

*esp\_err\_t* **esp\_flash\_encrypt\_enable** (void)

Activates Flash encryption on the chip.

It burns FLASH\_CRYPT\_CNT eFuse based on the CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE option.

**Returns** ESP\_OK if all operations succeeded

bool **esp\_flash\_encrypt\_is\_write\_protected** (bool print\_error)

Returns True if the write protection of FLASH\_CRYPT\_CNT is set.

**Parameters** **print\_error** -- Print error if it is write protected

**Returns** true - if FLASH\_CRYPT\_CNT is write protected

*esp\_err\_t* **esp\_flash\_encrypt\_region** (uint32\_t src\_addr, size\_t data\_length)

Encrypt-in-place a block of flash sectors.

---

**Note:** This function resets RTC\_WDT between operations with sectors.

---

#### Parameters

- **src\_addr** -- Source offset in flash. Should be multiple of 4096 bytes.
- **data\_length** -- Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

**Returns** ESP\_OK if all operations succeeded, ESP\_ERR\_FLASH\_OP\_FAIL if SPI flash fails, ESP\_ERR\_FLASH\_OP\_TIMEOUT if flash times out.

void **esp\_flash\_write\_protect\_crypt\_cnt** (void)

Write protect FLASH\_CRYPT\_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

---

**Note:** On ESP32 V3 only, write protecting FLASH\_CRYPT\_CNT will also prevent disabling UART Down-load Mode. If both are wanted, call esp\_efuse\_disable\_rom\_download\_mode() before calling this function.

---

*esp\_flash\_enc\_mode\_t* **esp\_get\_flash\_encryption\_mode** (void)

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

#### Returns

void **esp\_flash\_encryption\_init\_checks** (void)

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn't match the project config in any way

---

**Note:** This function is called automatically during app startup, it doesn't need to be called from the app.

---

*esp\_err\_t* **esp\_flash\_encryption\_enable\_secure\_features** (void)

Set all secure eFuse features related to flash encryption.

#### Returns

- ESP\_OK - Successfully

bool **esp\_flash\_encryption\_cfg\_verify\_release\_mode** (void)

Returns the verification status for all physical security features of flash encryption in release mode.

If the device has flash encryption feature configured in the release mode, then it is highly recommended to call this API in the application startup code. This API verifies the sanity of the eFuse configuration against the release (production) mode of the flash encryption feature.

#### Returns

- True - all eFuses are configured correctly
- False - not all eFuses are configured correctly.

void **esp\_flash\_encryption\_set\_release\_mode** (void)

Switches Flash Encryption from "Development" to "Release".

If already in "Release" mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- "disable encrypt in dl mode"
- set FLASH\_CRYPT\_CNT efuse to max

### Enumerations

enum **esp\_flash\_enc\_mode\_t**

*Values:*

enumerator **ESP\_FLASH\_ENC\_MODE\_DISABLED**

enumerator **ESP\_FLASH\_ENC\_MODE\_DEVELOPMENT**

enumerator **ESP\_FLASH\_ENC\_MODE\_RELEASE**

## 2.6.12 SPI Master Driver

SPI Master driver is a program that controls ESP32-C2's SPI peripherals while they function as masters.

### Overview of ESP32-C2's SPI peripherals

ESP32-C2 integrates 2 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32-C2's attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. Currently, SPI Master driver does not support SPI1 bus.
- SPI2 is a general purpose SPI controller. It has an independent signal bus with the same name. The bus has 6 CS lines to drive up to 6 SPI slaves.

### Terminology

The terms used in relation to the SPI master driver are given in the table below.

Term	Definition
<b>Host</b>	The SPI controller peripheral inside ESP32-C2 that initiates SPI transmissions over the bus, and acts as an SPI Master.
<b>De-vice</b>	SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
<b>Bus</b>	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
<b>MOSI</b>	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.
<b>MISO</b>	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.
<b>SCLK</b>	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
<b>CS</b>	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
<b>QUADWP</b>	Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.
<b>QUADHD</b>	Hold signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.
<b>DATA4</b>	Data4 signal in Octal/OPI mode.
<b>DATA5</b>	Data5 signal in Octal/OPI mode.
<b>DATA6</b>	Data6 signal in Octal/OPI mode.
<b>DATA7</b>	Data7 signal in Octal/OPI mode.
<b>As- ser- tion</b>	The action of activating a line.
<b>De- asser- tion</b>	The action of returning the line back to inactive (back to idle) status.
<b>Trans- ac- tion</b>	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
<b>Launc- edge</b>	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
<b>Latch edge</b>	Edge of the clock at which the destination register <i>latches in</i> the signal.

## Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see [SPI Bus Lock](#).

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32-C2 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe**. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time. You can use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral related tasks to ensure thread safety.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

## SPI Features

### SPI Master

**SPI Bus Lock** To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices to the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For the SPI1 bus, the BG is the cache. The bus lock will disable the cache before device operations start, and enable it again after the device releases the lock. No devices on SPI1 are allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled. The SPI Master driver hasn't supported SPI1 bus. Only the SPI Flash driver can attach to the bus.
- For other buses, the driver can register the ISR as a BG. If a device task requests exclusive bus access, the bus lock will block the task, disable the ISR, and then unblock the task. After the task releases the lock, the lock will try to re-enable the ISR if there are still pending transactions in the ISR.

### SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

Phase	Description
<b>Com-mand</b>	In this phase, a command (0-16 bit) is written to the bus by the Host.
<b>Ad-dress</b>	In this phase, an address (0-32 bit) is transmitted over the bus by the Host.
<b>Dummy</b>	This phase is configurable and is used to meet the timing requirements.
<b>Write</b>	Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.
<b>Read</b>	Device sends data to its Host.

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device's configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `spi_transaction_t::tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see [Notes on Sending Mixed Transactions to the Same Device](#).

**Interrupt Transactions** Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host's status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see [Bus Acquiring](#).

**Transaction Line Mode** Supported line modes for ESP32-C2 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the *Transaction Flag* column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the *Bus IO setting Flag* column.

Mode name	Command Line Width	Address Line Width	Data Line Width	Transaction Flag	Bus IO setting Flag
Normal SPI	1	1	1	0	0
Dual Output	1	1	2	SPI_TRANS_MODE_DIO	SPICOMMON_BUSFLAG_DUAL
Dual I/O	1	2	2	SPI_TRANS_MODE_DIO   SPI_TRANS_MULTILINE_ADDR	
Quad Output	1	1	4	SPI_TRANS_MODE_QIO	SPICOMMON_BUSFLAG_QUAD
Quad I/O	1	4	4	SPI_TRANS_MODE_QIO   SPI_TRANS_MULTILINE_ADDR	

**Command and Address Phases** During the command and address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see *Transaction Line Mode*.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in *Transaction Line Mode*.

---

**Note:** Half-duplex transactions with both read and write phases are not supported. Please use full duplex mode.

---

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

## Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to `-1`.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device's handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the [peripherals/spi\\_master](#) directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `spi_transaction_t::tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `spi_transaction_t::rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `spi_transaction_t::tx_buffer` or `spi_transaction_t::rx_buffer` members, because they use the same memory locations as `spi_transaction_t::tx_data` and `spi_transaction_t::rx_data`.

**Transactions with Integers Other Than `uint8_t`** An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional "random" bits, so the reading must be performed correctly.

On top of that, ESP32-C2 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

**Notes on Sending Mixed Transactions to the Same Device** To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

**GPIO Matrix and IO\_MUX** Most of chip's peripheral signals have direct connection to their dedicated IO\_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80MHz or lower frequencies, routing SPI pins via GPIO matrix will behave the same comparing to routing them via IOMUX.

The IO\_MUX pins for SPI buses are given below.

Pin Name	GPIO Number (SPI2)
CS0 <sup>1</sup>	10
SCLK	6
MISO	2
MOSI	7
QUADWP	5
QUADHD	4

### Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

**Transaction Duration** Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See *Interrupt Transactions*. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

<sup>1</sup> Only the first Device attached to the bus can use the CS0 pin.

- Interrupt Transaction via DMA: 42  $\mu$ s.
- Interrupt Transaction via CPU: 40  $\mu$ s.
- Polling Transaction via DMA: 17  $\mu$ s.
- Polling Transaction via CPU: 15  $\mu$ s.

Note that these data are tested with `CONFIG_SPI_MASTER_ISR_IN_IRAM` enabled. SPI transaction related code are placed in the internal memory. If this option is turned off (for example, for internal memory optimization), the transaction duration may be affected.

**SPI Clock Frequency** Clock source of the GPSPI peripherals can be selected by setting `spi_device_handle_t::cfg::clock_source`. You can refer to `spi_clock_source_t` to know the supported clock sources. By default driver will set `spi_device_handle_t::cfg::clock_source` to `SPI_CLK_SRC_DEFAULT`. This usually stands for the highest frequency among GPSPI clock sources. Its value will be different among chips.

Actual clock frequency of a device may not be exactly equal to the number you set, it will be re-calculated by the driver to the nearest hardware compatible number, and not larger than the clock frequency of the clock source. You can call `spi_device_get_actual_freq()` to know the actual frequency computed by the driver.

Theoretical maximum transfer speed of Write or Read phase can be calculated according to the table below:

Line Width of Write/Read phase	Speed (Bps)
1-Line	$SPI\ Frequency / 8$
2-Line	$SPI\ Frequency / 4$
4-Line	$SPI\ Frequency / 2$

The transfer speed calculation of other phases(command, address, dummy) are similar.

**Cache Miss** The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

---

**Note:** SPI driver implementation is based on FreeRTOS APIs, to use `CONFIG_SPI_MASTER_IN_IRAM`, you should not enable `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`.

---

For an interrupt transaction, the overall cost is  $20+8n/F_{spi}[MHz]$  [us] for n bytes transferred in one transaction. Hence, the transferring speed is:  $n/(20+8n/F_{spi})$ . An example of transferring speed at 8 MHz clock speed is given in the following table.

Frequency (MHz)	Transaction Interval (us)	Transaction Length (bytes)	Total Time (us)	Total Speed (KBps)
8	25	1	26	38.5
8	25	8	33	242.4
8	25	16	41	490.2
8	25	64	89	719.1
8	25	128	153	836.6

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see [IRAM-Safe Interrupt Handlers](#).

## Application Example

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the [peripherals/spi\\_master/hd\\_eeprom](#) directory of ESP-IDF examples.

## API Reference - SPI Common

### Header File

- [components/hal/include/hal/spi\\_types.h](#)

### Structures

struct **spi\_line\_mode\_t**

Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

#### Public Members

uint8\_t **cmd\_lines**

The line width of command phase, e.g. 2-line-cmd-phase.

uint8\_t **addr\_lines**

The line width of address phase, e.g. 1-line-addr-phase.

uint8\_t **data\_lines**

The line width of data phase, e.g. 4-line-data-phase.

### Type Definitions

typedef *soc\_periph\_spi\_clk\_src\_t* **spi\_clock\_source\_t**

Type of SPI clock source.

### Enumerations

enum **spi\_host\_device\_t**

Enum with the three SPI peripherals that are software-accessible in it.

*Values:*

enumerator **SPI1\_HOST**

SPI1.

enumerator **SPI2\_HOST**

SPI2.

enumerator **SPI\_HOST\_MAX**

invalid host value

enum **spi\_event\_t**

SPI Events.

*Values:*

enumerator **SPI\_EV\_BUF\_TX**

The buffer has sent data to master.

enumerator **SPI\_EV\_BUF\_RX**

The buffer has received data from master.

enumerator **SPI\_EV\_SEND\_DMA\_READY**

Slave has loaded its TX data buffer to the hardware (DMA).

enumerator **SPI\_EV\_SEND**

Master has received certain number of the data, the number is determined by Master.

enumerator **SPI\_EV\_RECV\_DMA\_READY**

Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI\_EV\_RECV**

Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI\_EV\_CMD9**

Received CMD9 from master.

enumerator **SPI\_EV\_CMDA**

Received CMDA from master.

enumerator **SPI\_EV\_TRANS**

A transaction has done.

enum **spi\_command\_t**

SPI command.

*Values:*

enumerator **SPI\_CMD\_HD\_WRBUF**

enumerator **SPI\_CMD\_HD\_RDBUF**

enumerator **SPI\_CMD\_HD\_WRDMA**

enumerator **SPI\_CMD\_HD\_RDDMA**

enumerator **SPI\_CMD\_HD\_SEG\_END**

enumerator **SPI\_CMD\_HD\_EN\_QPI**

enumerator **SPI\_CMD\_HD\_WR\_END**

enumerator **SPI\_CMD\_HD\_INT0**

enumerator `SPI_CMD_HD_INT1`

enumerator `SPI_CMD_HD_INT2`

## Header File

- [components/driver/spi/include/driver/spi\\_common.h](#)

## Functions

*esp\_err\_t* **spi\_bus\_initialize** (*spi\_host\_device\_t* host\_id, const *spi\_bus\_config\_t* \*bus\_config, *spi\_dma\_chan\_t* dma\_chan)

Initialize a SPI bus.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

### Parameters

- **host\_id** -- SPI peripheral that controls this bus
- **bus\_config** -- Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- **dma\_chan** -- - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
  - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
  - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

### Returns

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

*esp\_err\_t* **spi\_bus\_free** (*spi\_host\_device\_t* host\_id)

Free a SPI bus.

**Warning:** In order for this to succeed, all devices have to be removed first.

**Parameters** **host\_id** -- SPI peripheral to free

### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if bus hasn't been initialized before, or not all devices on the bus are freed
- `ESP_OK` on success

## Structures

struct **spi\_bus\_config\_t**

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO\_MUX or are -1. In that case, the IO\_MUX is used, allowing for >40MHz speeds.

---

**Note:** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in *spi\_bus\_config\_t* referring to these lines will be ignored and can thus safely be left uninitialized.

---

## Public Members

int **mosi\_io\_num**

GPIO pin for Master Out Slave In (=spi\_d) signal, or -1 if not used.

int **data0\_io\_num**

GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int **miso\_io\_num**

GPIO pin for Master In Slave Out (=spi\_q) signal, or -1 if not used.

int **data1\_io\_num**

GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int **sclk\_io\_num**

GPIO pin for SPI Clock signal, or -1 if not used.

int **quadwp\_io\_num**

GPIO pin for WP (Write Protect) signal, or -1 if not used.

int **data2\_io\_num**

GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int **quadhd\_io\_num**

GPIO pin for HD (Hold) signal, or -1 if not used.

int **data3\_io\_num**

GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int **data4\_io\_num**

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int **data5\_io\_num**

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int **data6\_io\_num**

GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int **data7\_io\_num**

GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int **max\_transfer\_sz**

Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to `SOC_SPI_MAXIMUM_BUFFER_SIZE` if DMA is disabled.

uint32\_t **flags**

Abilities of bus to be checked by the driver. Or-ed value of `SPICOMMON_BUSFLAG_*` flags.

intr\_cpu\_id\_t **isr\_cpu\_id**

Select cpu core to register SPI ISR.

int **intr\_flags**

Interrupt flag for the bus to set the priority, and IRAM attribute, see `esp_intr_alloc.h`. Note that the `EDGE`, `INTRDISABLED` attribute are ignored by the driver. Note that if `ESP_INTR_FLAG_IRAM` is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

## Macros

**SPI\_MAX\_DMA\_LEN**

**SPI\_SWAP\_DATA\_TX** (DATA, LEN)

Transform unsigned integer of length  $\leq 32$  bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points `tx_buffer` to `&data`.

### Parameters

- **DATA** -- Data to be sent, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** -- Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPI\_SWAP\_DATA\_RX** (DATA, LEN)

Transform received data of length  $\leq 32$  bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

### Parameters

- **DATA** -- Data to be rearranged, can be `uint8_t`, `uint16_t` or `uint32_t`.
- **LEN** -- Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON\_BUSFLAG\_SLAVE**

Initialize I/O in slave mode.

**SPICOMMON\_BUSFLAG\_MASTER**

Initialize I/O in master mode.

**SPICOMMON\_BUSFLAG\_IOMUX\_PINS**

Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON\_BUSFLAG\_GPIO\_PINS**

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON\_BUSFLAG\_SCLK**

Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON\_BUSFLAG\_MISO**

Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON\_BUSFLAG\_MOSI**

Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON\_BUSFLAG\_DUAL**

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON\_BUSFLAG\_WPHD**

Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON\_BUSFLAG\_QUAD**

Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON\_BUSFLAG\_IO4\_IO7**

Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

**SPICOMMON\_BUSFLAG\_OCTAL**

Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON\_BUSFLAG\_NATIVE\_PINS****Type Definitions**

```
typedef spi_common_dma_t spi_dma_chan_t
```

**Enumerations**

```
enum spi_common_dma_t
```

SPI DMA channels.

*Values:*

```
enumerator SPI_DMA_DISABLED
```

Do not enable DMA for SPI.

```
enumerator SPI_DMA_CH_AUTO
```

Enable DMA, channel is automatically selected by driver.

## API Reference - SPI Master

### Header File

- `components/driver/spi/include/driver/spi_master.h`

### Functions

*esp\_err\_t* **spi\_bus\_add\_device** (*spi\_host\_device\_t* host\_id, const *spi\_device\_interface\_config\_t* \*dev\_config, *spi\_device\_handle\_t* \*handle)

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

---

**Note:** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

---

#### Parameters

- **host\_id** -- SPI peripheral to allocate device on
- **dev\_config** -- SPI interface protocol config for the device
- **handle** -- Pointer to variable to hold the device handle

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid or configuration combination is not supported (e.g. `dev_config->post_cb` isn't set while flag `SPI_DEVICE_NO_RETURN_RESULT` is enabled)
- `ESP_ERR_INVALID_STATE` if selected clock source is unavailable or spi bus not initialized
- `ESP_ERR_NOT_FOUND` if host doesn't have any free CS slots
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

*esp\_err\_t* **spi\_bus\_remove\_device** (*spi\_device\_handle\_t* handle)

Remove a device from the SPI bus.

**Parameters** **handle** -- Device handle to free

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if device already is freed
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_queue\_trans** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

---

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

#### Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute
- **ticks\_to\_wait** -- Ticks to wait until there's room in the queue; use `portMAX_DELAY` to never time out.

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- `ESP_ERR_TIMEOUT` if there was no room in the queue before `ticks_to_wait` expired
- `ESP_ERR_NO_MEM` if allocating DMA-capable temporary buffer failed
- `ESP_ERR_INVALID_STATE` if previous transactions are not finished
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_get\_trans\_result** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

#### Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use `portMAX_DELAY` to never time out.

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_NOT_SUPPORTED` if flag `SPI_DEVICE_NO_RETURN_RESULT` is set
- `ESP_ERR_TIMEOUT` if there was no completed transaction before `ticks_to_wait` expired
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or `polling_start/transmit` that hasn't been finalized.

---

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

#### Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute

#### Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

*esp\_err\_t* **spi\_device\_polling\_start** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Immediately start a polling transaction.

---

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

---

#### Parameters

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute

- **ticks\_to\_wait** -- Ticks to wait until there's room in the queue; currently only portMAX\_DELAY is supported.

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid. This can happen if SPI\_TRANS\_CS\_KEEP\_ACTIVE flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- ESP\_ERR\_TIMEOUT if the device cannot get control of the bus before `ticks_to_wait` expired
- ESP\_ERR\_NO\_MEM if allocating DMA-capable temporary buffer failed
- ESP\_ERR\_INVALID\_STATE if previous transactions are not finished
- ESP\_OK on success

*esp\_err\_t* **spi\_device\_polling\_end** (*spi\_device\_handle\_t* handle, TickType\_t ticks\_to\_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use portMAX\_DELAY to never time out.

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_TIMEOUT if the transaction cannot finish before `ticks_to_wait` expired
- ESP\_OK on success

*esp\_err\_t* **spi\_device\_polling\_transmit** (*spi\_device\_handle\_t* handle, *spi\_transaction\_t* \*trans\_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn't been finalized.

---

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

---

**Parameters**

- **handle** -- Device handle obtained using `spi_host_add_dev`
- **trans\_desc** -- Description of transaction to execute

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_TIMEOUT if the device cannot get control of the bus
- ESP\_ERR\_NO\_MEM if allocating DMA-capable temporary buffer failed
- ESP\_ERR\_INVALID\_STATE if previous transactions of same device are not finished
- ESP\_OK on success

*esp\_err\_t* **spi\_device\_acquire\_bus** (*spi\_device\_handle\_t* device, TickType\_t wait)

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

---

**Note:** The function will wait until all the existing transactions have been sent.

---

**Parameters**

- **device** -- The device to occupy the bus.
- **wait** -- Time to wait before the the bus is occupied by the device. Currently MUST set to portMAX\_DELAY.

**Returns**

- `ESP_ERR_INVALID_ARG` : `wait` is not set to `portMAX_DELAY`.
- `ESP_OK` : Success.

void **spi\_device\_release\_bus** (*spi\_device\_handle\_t* dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters** `dev` -- The device to release the bus.

*esp\_err\_t* **spi\_device\_get\_actual\_freq** (*spi\_device\_handle\_t* handle, int \*freq\_khz)

Calculate working frequency for specific device.

**Parameters**

- **handle** -- SPI device handle
- **freq\_khz** -- [out] output parameter to hold calculated frequency in kHz

**Returns**

- `ESP_ERR_INVALID_ARG` : `handle` or `freq_khz` parameter is `NULL`
- `ESP_OK` : Success

int **spi\_get\_actual\_clock** (int fapb, int hz, int duty\_cycle)

Calculate the working frequency that is most close to desired frequency.

**Parameters**

- **fapb** -- The frequency of apb clock, should be `APB_CLK_FREQ`.
- **hz** -- Desired working frequency
- **duty\_cycle** -- Duty cycle of the spi clock

**Returns** Actual working frequency that most fit.

void **spi\_get\_timing** (bool gpio\_is\_used, int input\_delay\_ns, int eff\_clk, int \*dummy\_o, int \*cycles\_remain\_o)

Calculate the timing settings of specified frequency and settings.

---

**Note:** If `**dummy_o` is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

---

**Parameters**

- **gpio\_is\_used** -- True if using GPIO matrix, or False if iomux pins are used.
- **input\_delay\_ns** -- Input delay from SCLK launch edge to MISO data valid.
- **eff\_clk** -- Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
- **dummy\_o** -- Address of dummy bits used output. Set to `NULL` if not needed.
- **cycles\_remain\_o** -- Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int **spi\_get\_freq\_limit** (bool gpio\_is\_used, int input\_delay\_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Parameters**

- **gpio\_is\_used** -- True if using GPIO matrix, or False if native pins are used.
- **input\_delay\_ns** -- Input delay from SCLK launch edge to MISO data valid.

**Returns** Frequency limit of current configurations.

*esp\_err\_t* **spi\_bus\_get\_max\_transaction\_len** (*spi\_host\_device\_t* host\_id, size\_t \*max\_bytes)

Get max length (in bytes) of one transaction.

**Parameters**

- **host\_id** -- SPI peripheral
- **max\_bytes** -- [out] Max length of one transaction, in bytes

**Returns**

- ESP\_OK: On success
- ESP\_ERR\_INVALID\_ARG: Invalid argument

**Structures**

struct **spi\_device\_interface\_config\_t**

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

uint8\_t **command\_bits**

Default amount of bits in command phase (0-16), used when SPI\_TRANS\_VARIABLE\_CMD is not used, otherwise ignored.

uint8\_t **address\_bits**

Default amount of bits in address phase (0-64), used when SPI\_TRANS\_VARIABLE\_ADDR is not used, otherwise ignored.

uint8\_t **dummy\_bits**

Amount of dummy bits to insert between address and data phase.

uint8\_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

*spi\_clock\_source\_t* **clock\_source**

Select SPI clock source, SPI\_CLK\_SRC\_DEFAULT by default.

uint16\_t **duty\_cycle\_pos**

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16\_t **cs\_ena\_pretrans**

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8\_t **cs\_ena\_posttrans**

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int **clock\_speed\_hz**

Clock speed, divisors of the SPI *clock\_source*, in Hz.

int **input\_delay\_ns**

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it's suggest to have the right value.

int **spics\_io\_num**

CS GPIO pin for this device, or -1 if not used.

uint32\_t **flags**

Bitwise OR of SPI\_DEVICE\_\* flags.

int **queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using spi\_device\_queue\_trans but not yet finished using spi\_device\_get\_trans\_result) at the same time.

*transaction\_cb\_t* **pre\_cb**

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP\_INTR\_FLAG\_IRAM.

*transaction\_cb\_t* **post\_cb**

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP\_INTR\_FLAG\_IRAM.

struct **spi\_transaction\_t**

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

## Public Members

uint32\_t **flags**

Bitwise OR of SPI\_TRANS\_\* flags.

uint16\_t **cmd**

Command data, of which the length is set in the `command_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be "command" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x0123 and `command_bits=12` to send command 0x12, 0x3\_ (in previous version, you may have to write 0x3\_12).

uint64\_t **addr**

Address data, of which the length is set in the `address_bits` of *spi\_device\_interface\_config\_t*.

**NOTE: this field, used to be "address" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.**

Example: write 0x123400 and `address_bits=24` to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size\_t **length**

Total data length, in bits.

size\_t **rxlength**

Total data length received, should be not greater than `length` in full-duplex mode (0 defaults this to the value of `length`).

void \***user**

User-defined variable. Can be used to store eg transaction ID.

const void \***tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

uint8\_t **tx\_data**[4]

If `SPI_TRANS_USE_TXDATA` is set, data set here is sent directly from this variable.

void \***rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8\_t **rx\_data**[4]

If `SPI_TRANS_USE_RXDATA` is set, data is received directly to this variable.

struct **spi\_transaction\_ext\_t**

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to `SPI_TRANS_VARIABLE_CMD_ADR` to use the bit length here.

### Public Members

struct *spi\_transaction\_t* **base**

Transaction data, so that pointer to *spi\_transaction\_t* can be converted into *spi\_transaction\_ext\_t*.

uint8\_t **command\_bits**

The command length in this transaction, in bits.

uint8\_t **address\_bits**

The address length in this transaction, in bits.

uint8\_t **dummy\_bits**

The dummy length in this transaction, in bits.

### Macros

**SPI\_MASTER\_FREQ\_8M**

SPI common used frequency (in Hz)

---

**Note:** SPI peripheral only has an integer divider, and the default clock source can be different on other targets, so the actual frequency may be slightly different from the desired frequency. 8MHz

---

**SPI\_MASTER\_FREQ\_9M**

8.89MHz

**SPI\_MASTER\_FREQ\_10M**

10MHz

**SPI\_MASTER\_FREQ\_11M**

11.43MHz

**SPI\_MASTER\_FREQ\_13M**

13.33MHz

**SPI\_MASTER\_FREQ\_16M**

16MHz

**SPI\_MASTER\_FREQ\_20M**

20MHz

**SPI\_MASTER\_FREQ\_26M**

26.67MHz

**SPI\_MASTER\_FREQ\_40M**

40MHz

**SPI\_MASTER\_FREQ\_80M**

80MHz

**SPI\_DEVICE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_DEVICE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_DEVICE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**SPI\_DEVICE\_3WIRE**

Use MOSI (=spid) for both sending and receiving data.

**SPI\_DEVICE\_POSITIVE\_CS**

Make CS positive during a transaction instead of negative.

**SPI\_DEVICE\_HALFDUPLEX**

Transmit data before receiving it, instead of simultaneously.

**SPI\_DEVICE\_CLK\_AS\_CS**

Output clock on CS line if CS is active.

**SPI\_DEVICE\_NO\_DUMMY**

There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you're going to work with output only, or read without dummy bits at your own risk.

**SPI\_DEVICE\_DDRCLK****SPI\_DEVICE\_NO\_RETURN\_RESULT**

Don't return the descriptor to the host on completion (use `post_cb` to notify instead)

**SPI\_TRANS\_MODE\_DIO**

Transmit/receive data in 2-bit mode.

**SPI\_TRANS\_MODE\_QIO**

Transmit/receive data in 4-bit mode.

**SPI\_TRANS\_USE\_RXDATA**

Receive into `rx_data` member of `spi_transaction_t` instead into memory at `rx_buffer`.

**SPI\_TRANS\_USE\_TXDATA**

Transmit `tx_data` member of `spi_transaction_t` instead of data at `tx_buffer`. Do not set `tx_buffer` when using this.

**SPI\_TRANS\_MODE\_DIOQIO\_ADDR**

Also transmit address in mode selected by `SPI_MODE_DIO/SPI_MODE_QIO`.

**SPI\_TRANS\_VARIABLE\_CMD**

Use the `command_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI\_TRANS\_VARIABLE\_ADDR**

Use the `address_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI\_TRANS\_VARIABLE\_DUMMY**

Use the `dummy_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI\_TRANS\_CS\_KEEP\_ACTIVE**

Keep CS active after data transfer.

**SPI\_TRANS\_MULTILINE\_CMD**

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

**SPI\_TRANS\_MODE\_OCT**

Transmit/receive data in 8-bit mode.

**SPI\_TRANS\_MULTILINE\_ADDR**

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

## Type Definitions

```
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
```

```
typedef struct spi_device_t *spi_device_handle_t
```

Handle for a device on a SPI bus.

### 2.6.13 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-C2's SPI peripherals while they function as slaves.

#### Overview of ESP32-C2's SPI peripherals

On ESP32-C2, 1 SPI controllers are available for general purpose usage. A certain SPI controller has an independent signal bus with the same name.

#### Terminology

The terms used in relation to the SPI slave driver are given in the table below.

Term	Definition
Host	The SPI controller peripheral external to ESP32-C2 that initiates SPI transmissions over the bus, and acts as an SPI Master.
Device	SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device's individual CS line.
Bus	A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.
MISO	Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.
MOSI	Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.
SCLK	Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.
CS	Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.
QUADWP	Write Protect signal. Only used for 4-bit (qio/qout) transactions.
QUADHD	Hold signal. Only used for 4-bit (qio/qout) transactions.
Assertion	The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <i>de-assertion</i> .
Transaction	One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.
Launch Edge	Edge of the clock at which the source register <i>launches</i> the signal onto the line.
Latch Edge	Edge of the clock at which the destination register <i>latches in</i> the signal.

#### Driver Features

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some *known issues* related to DMA.

The SPI slave driver supports registering the SPI ISR to a certain CPU core. If multiple tasks try to access the same SPI Device simultaneously, it is recommended that your application be refactored so that each SPI peripheral is only accessed by a single task at a time. Please also use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral related tasks to ensure thread safety.

### SPI Transactions

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you can choose to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. Similarly, if `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

---

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see [Transaction Interval](#).

---

### Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize()`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to `-1`.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

### Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::length` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**GPIO Matrix and IO\_MUX** Most of chip's peripheral signals have direct connection to their dedicated IO\_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80 MHz or lower frequencies, routing SPI pins via GPIO matrix will behave the same compared to routing them via IO\_MUX.

The IO\_MUX pins for SPI buses are given below.

Pin Name	GPIO Number (SPI2)
CS0	10
SCLK	6
MISO	2
MOSI	7
QUADWP	5
QUADHD	4

### Speed and Timing Considerations

**Transaction Interval** The ESP32-C2 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device's response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in [peripherals/spi\\_slave](#).

**SCLK Frequency Requirements** The SPI slaves are designed to operate at up to 60 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

### Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.  
Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

### Application Example

The code example for Device/Host communication can be found in the [peripherals/spi\\_slave](#) directory of ESP-IDF examples.

### API Reference

#### Header File

- [components/driver/spi/include/driver/spi\\_slave.h](#)

**Functions**

*esp\_err\_t* **spi\_slave\_initialize** (*spi\_host\_device\_t* host, const *spi\_bus\_config\_t* \*bus\_config, const *spi\_slave\_interface\_config\_t* \*slave\_config, *spi\_dma\_chan\_t* dma\_chan)

Initialize a SPI bus as a slave interface.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Parameters**

- **host** -- SPI peripheral to use as a SPI slave interface
- **bus\_config** -- Pointer to a *spi\_bus\_config\_t* struct specifying how the host should be initialized
- **slave\_config** -- Pointer to a *spi\_slave\_interface\_config\_t* struct specifying the details for the slave interface
- **dma\_chan** -- - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
  - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
  - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

**Returns**

- `ESP_ERR_INVALID_ARG` if configuration is invalid
- `ESP_ERR_INVALID_STATE` if host already is in use
- `ESP_ERR_NOT_FOUND` if there is no available DMA channel
- `ESP_ERR_NO_MEM` if out of memory
- `ESP_OK` on success

*esp\_err\_t* **spi\_slave\_free** (*spi\_host\_device\_t* host)

Free a SPI bus claimed as a SPI slave interface.

**Parameters** **host** -- SPI peripheral to free

**Returns**

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_ERR_INVALID_STATE` if not all devices on the bus are freed
- `ESP_OK` on success

*esp\_err\_t* **spi\_slave\_queue\_trans** (*spi\_host\_device\_t* host, const *spi\_slave\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

**Parameters**

- **host** -- SPI peripheral that is acting as a slave

- **trans\_desc** -- Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks\_to\_wait** -- Ticks to wait until there's room in the queue; use portMAX\_DELAY to never time out.

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_get\_trans\_result** (*spi\_host\_device\_t* host, *spi\_slave\_transaction\_t* \*\*trans\_desc, TickType\_t ticks\_to\_wait)

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

**Parameters**

- **host** -- SPI peripheral to that is acting as a slave
- **trans\_desc** -- [out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use portMAX\_DELAY to never time out.

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_ERR\_NOT\_SUPPORTED if flag `SPI_SLAVE_NO_RETURN_RESULT` is set
- ESP\_OK on success

*esp\_err\_t* **spi\_slave\_transmit** (*spi\_host\_device\_t* host, *spi\_slave\_transaction\_t* \*trans\_desc, TickType\_t ticks\_to\_wait)

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn't been finalized using `spi_slave_get_trans_result`.

**Parameters**

- **host** -- SPI peripheral to that is acting as a slave
- **trans\_desc** -- Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks\_to\_wait** -- Ticks to wait until there's a returned item; use portMAX\_DELAY to never time out.

**Returns**

- ESP\_ERR\_INVALID\_ARG if parameter is invalid
- ESP\_OK on success

**Structures**

struct **spi\_slave\_interface\_config\_t**

This is a configuration for a SPI host acting as a slave device.

**Public Members**

int **spics\_io\_num**

CS GPIO pin for this device.

**uint32\_t flags**

Bitwise OR of SPI\_SLAVE\_\* flags.

**int queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using spi\_slave\_queue\_trans but not yet finished using spi\_slave\_get\_trans\_result) at the same time.

**uint8\_t mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

***slave\_transaction\_cb\_t* post\_setup\_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP\_INTR\_FLAG\_IRAM.

***slave\_transaction\_cb\_t* post\_trans\_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see "Transferring Speed" section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP\_INTR\_FLAG\_IRAM.

**struct spi\_slave\_transaction\_t**

This structure describes one SPI transaction

**Public Members****size\_t length**

Total data length, in bits.

**size\_t trans\_len**

Transaction data length, in bits.

**const void \*tx\_buffer**

Pointer to transmit buffer, or NULL for no MOSI phase.

**void \*rx\_buffer**

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (`rx_buffer%4==0`), and has length of a multiple of 4 bytes.

**void \*user**

User-defined variable. Can be used to store eg transaction ID.

## Macros

### **SPI\_SLAVE\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

### **SPI\_SLAVE\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

### **SPI\_SLAVE\_BIT\_LSBFIRST**

Transmit and receive LSB first.

### **SPI\_SLAVE\_NO\_RETURN\_RESULT**

Don't return the descriptor to the host on completion (use `post_trans_cb` to notify instead)

## Type Definitions

```
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)
```

## 2.6.14 SPI Slave Half Duplex

### Introduction

The Half Duplex (HD) Mode is a special mode provided by ESP SPI Slave peripheral. Under this mode, the hardware provides more services than the Full Duplex (FD) Mode (the mode for general-purpose SPI transactions, see *SPI Slave Driver*). These services reduce the CPU load and the response time of SPI Slave. However, it is important to note that the communication format is determined by the hardware and is always in a half-duplex configuration, allowing only one-way data transfer at any given time. Hence, the mode is named Half Duplex Mode due to this characteristic.

When conducting an SPI transaction, transactions can be classified into several types based on the **command** phase of the transaction. Each transaction may consist of the following phases: command, address, dummy, and data. The command phase is mandatory, while the other phases may be determined by the command field. During the command, address, and dummy phases, the bus is always controlled by the master (usually the host), while the direction of the data phase depends on the command. The data phase can be either an input phase, where the master writes data to the slave (e.g., the host sends data to the slave), or an output phase, where the master reads data from the slave (e.g., the host receives data from the slave).

**Protocol** About the details of how master should communicate with the SPI Slave, see *ESP SPI Slave HD (Half Duplex) Mode Protocol*.

Through these different transactions, the slave provides these services to the master:

- A DMA channel for the master to write a great amount of data to the slave.
- A DMA channel for the master to read a great amount of data from the slave.
- Several general purpose registers, shared between the master and the slave.
- Several general purpose interrupts, for the master to interrupt the SW of the slave.

### Terminology

- Transaction
- Channel
- Sending
- Receiving
- Data Descriptor

## Driver Feature

- Transaction read/write by master in segments
- Queues for data to send and received

## Driver Usage

**Slave Initialization** Call `spi_slave_hd_init()` to initialize the SPI bus as well as the peripheral and the driver. The SPI Slave exclusively uses the SPI peripheral, pins of the bus before it is deinitialized, which means other devices are unable to use the above resources during initialization. Thus, to ensure SPI resources are correctly occupied and the connections work properly, most configurations of the slave should be done as soon as the slave is initialized.

The `spi_bus_config_t` specifies how the bus should be initialized, while `spi_slave_hd_slot_config_t` specifies how the SPI Slave driver should work.

**Deinitialization (Optional)** Call `spi_slave_hd_deinit()` to uninstall the driver. The resources, including the pins, SPI peripheral, internal memory used by the driver, and interrupt sources, are released by the `deinit()` function.

**Send/Receive Data by DMA Channels** To send data to the master through the sending DMA channel, the application should properly wrap the data in an `spi_slave_hd_data_t` descriptor structure before calling `spi_slave_hd_queue_trans()` with the data descriptor and the channel argument of `SPI_SLAVE_CHAN_TX`. The pointers to descriptors are stored in the queue, and the data is sent to the master in the same order they are enqueued using `spi_slave_hd_queue_trans()`, upon receiving the master's `Rd_DMA` command.

The application should check the result of data sending by calling `spi_slave_hd_get_trans_res()` with the channel set as `SPI_SLAVE_CHAN_TX`. This function blocks until the transaction with the command `Rd_DMA` from the master successfully completes (or timeout). The `out_trans` argument of the function outputs the pointer of the data descriptor which is just finished, providing information about the sending.

Receiving data from the master through the receiving DMA channel is quite similar. The application calls `spi_slave_hd_queue_trans()` with proper data descriptor and the channel argument of `SPI_SLAVE_CHAN_RX`. And the application calls the `spi_slave_hd_get_trans_res()` later to get the descriptor to the receiving buffer before it handles the data in the receiving buffer.

---

**Note:** This driver itself does not have an internal buffer for the data to send or just received. The application should provide data buffer for driver via data descriptors to send to the master, or to receive data from the master.

The application has to properly keep the data descriptor as well as the buffer it points, after the descriptor is successfully sent into the driver internal queue by `spi_slave_hd_queue_trans()`, and before returned by `spi_slave_hd_get_trans_res()`. During this period, the hardware as well as the driver may read or write to the buffer and the descriptor when required at any time.

---

Please note that, when using this driver for data transfer, the buffer does not have to be fully sent or filled before it is terminated. For example, in the segment transaction mode, the master has to send `CMD7` to terminate a `Wr_DMA` transaction or send `CMD8` to terminate an `Rd_DMA` transaction (in segments), no matter whether the send (receive) buffer is used up (full) or not.

**Using Data Descriptor with Customized User Arguments** Sometimes you may have initiator (sending data descriptor) and closure (handling returned descriptors) functions in different places. When you get the returned data descriptor in the closure, you may need some extra information when handling the finished data descriptor. For example, you may want to know which round it is for the returned descriptor when you send the same piece of data several times.

Set the `arg` member in the data descriptor to a variable indicating the transaction by force casting, or point it to a structure that wraps all the information you may need when handling the sending/receiving data. Then you can get what you need in your closure.

### Using Callbacks

**Note:** These callbacks are called in the ISR, so the required operations need to be processed quickly and returned as soon as possible to ensure that the system is functioning properly. You may need to be very careful to write the code in the ISR.

Since the interrupt handling is executed concurrently with the application, long delays or blocking may cause the system to respond slower or lead to unpredictable behavior. Therefore, when writing callback functions, avoid using operations that may cause delays or blocking, e.g., waiting, sleeping, resource locking, etc.

---

The `spi_slave_hd_callback_config_t` member in the `spi_slave_hd_slot_config_t` configuration structure passed when initializing the SPI Slave HD driver, allows you to have callbacks for each event you may concern.

The corresponding interrupt for each callback that is not `NULL` is enabled, so that the callbacks can be called immediately when the events happen. You do not need to provide callbacks for the unconcerned events.

The `arg` member in the configuration structure can help you pass some context to the callback or indicate the specific SPI Slave instance when using the same callbacks for multiple SPI Slave peripherals. You can set the `arg` member to a variable that indicates the SPI Slave instance by performing a forced type casting or point it to a context structure. All the callbacks are called with this `arg` argument you set when the callbacks are initialized.

There are two other arguments: the `event` and the `awoken`.

- The `event` passes the information of the current event to the callback. The `spi_slave_hd_event_t` type contains the information of the event, for example, event type, the data descriptor just finished (The *data argument* is very useful in this case!).
- The `awoken` argument serves as an output parameter. It informs the ISR that tasks have been awakened after the callback function, and the ISR should call `portYIELD_FROM_ISR()` to schedule these tasks. Simply pass the `awoken` argument to all FreeRTOS APIs that may unblock tasks, and the value of `awoken` will be returned to the ISR.

**Writing/Reading Shared Registers** Call `spi_slave_hd_write_buffer()` to write the shared buffer, and `spi_slave_hd_read_buffer()` to read the shared buffer.

---

**Note:** On ESP32-C2, the shared registers are read/written in words by the application but read/written in bytes by the master. There is no guarantee four continuous bytes read from the master are from the same word written by the slave's application. It is also possible that if the slave reads a word while the master is writing bytes of the word, the slave may get one word with half of them just written by the master, and the other half has not been written into.

The master can confirm that the word is not in transition by reading the word twice and comparing the values.

For the slave, it is more difficult to ensure the word is not in transition because the process of master writing four bytes can be very long (32 SPI clocks). You can put some CRC in the last (largest address) byte of a word so that when the byte is written, the word is sure to be all written.

Due to the conflicts that may be among read/write from SW (worse if there are multi-cores) and master, it is suggested that a word is only used in one direction (only written by the master or only written by the slave).

---

**Receiving General Purpose Interrupts from the Master** When the master sends `CMD8`, `CMD9` or `CMDA`, the slave corresponding is triggered. Currently the `CMD8` is permanently used to indicate the termination of `Rd_DMA` segments. To receive general-purpose interrupts, register callbacks for `CMD9` and `CMDA` when the slave is initialized, see *Using Callbacks*.

## Application Example

The code example for Device/Host communication can be found in the [peripherals/spi\\_slave\\_hd](#) directory of ESP-IDF examples.

## API Reference

### Header File

- [components/driver/spi/include/driver/spi\\_slave\\_hd.h](#)

### Functions

*esp\_err\_t* **spi\_slave\_hd\_init** (*spi\_host\_device\_t* host\_id, const *spi\_bus\_config\_t* \*bus\_config, const *spi\_slave\_hd\_slot\_config\_t* \*config)

Initialize the SPI Slave HD driver.

#### Parameters

- **host\_id** -- The host to use
- **bus\_config** -- Bus configuration for the bus used
- **config** -- Configuration for the SPI Slave HD driver

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: invalid argument given
- ESP\_ERR\_INVALID\_STATE: function called in invalid state, may be some resources are already in use
- ESP\_ERR\_NOT\_FOUND if there is no available DMA channel
- ESP\_ERR\_NO\_MEM: memory allocation failed
- or other return value from `esp_intr_alloc`

*esp\_err\_t* **spi\_slave\_hd\_deinit** (*spi\_host\_device\_t* host\_id)

Deinitialize the SPI Slave HD driver.

**Parameters** **host\_id** -- The host to deinitialize the driver

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: if the host\_id is not correct

*esp\_err\_t* **spi\_slave\_hd\_queue\_trans** (*spi\_host\_device\_t* host\_id, *spi\_slave\_chan\_t* chan, *spi\_slave\_hd\_data\_t* \*trans, TickType\_t timeout)

Queue transactions (segment mode)

#### Parameters

- **host\_id** -- Host to queue the transaction
- **chan** -- SPI\_SLAVE\_CHAN\_TX or SPI\_SLAVE\_CHAN\_RX
- **trans** -- Transaction descriptors
- **timeout** -- Timeout before the data is queued

#### Returns

- ESP\_OK: on success
- ESP\_ERR\_INVALID\_ARG: The input argument is invalid. Can be the following reason:
  - The buffer given is not DMA capable
  - The length of data is invalid (not larger than 0, or exceed the max transfer length)
  - The transaction direction is invalid
- ESP\_ERR\_TIMEOUT: Cannot queue the data before timeout. Master is still processing previous transaction.
- ESP\_ERR\_INVALID\_STATE: Function called in invalid state. This API should be called under segment mode.

*esp\_err\_t* **spi\_slave\_hd\_get\_trans\_res** (*spi\_host\_device\_t* host\_id, *spi\_slave\_chan\_t* chan, *spi\_slave\_hd\_data\_t* \*\*out\_trans, TickType\_t timeout)

Get the result of a data transaction (segment mode)

---

**Note:** This API should be called successfully the same times as the `spi_slave_hd_queue_trans`.

---

#### Parameters

- **host\_id** -- Host to queue the transaction
- **chan** -- Channel to get the result, `SPI_SLAVE_CHAN_TX` or `SPI_SLAVE_CHAN_RX`
- **out\_trans** -- [out] Pointer to the transaction descriptor (`spi_slave_hd_data_t`) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it's meaningless for TX.
- **timeout** -- Timeout before the result is got

#### Returns

- `ESP_OK`: on success
- `ESP_ERR_INVALID_ARG`: Function is not valid
- `ESP_ERR_TIMEOUT`: There's no transaction done before timeout
- `ESP_ERR_INVALID_STATE`: Function called in invalid state. This API should be called under segment mode.

void `spi_slave_hd_read_buffer` (`spi_host_device_t` host\_id, int addr, uint8\_t \*out\_data, size\_t len)

Read the shared registers.

#### Parameters

- **host\_id** -- Host to read the shared registers
- **addr** -- Address of register to read, 0 to `SOC_SPI_MAXIMUM_BUFFER_SIZE-1`
- **out\_data** -- [out] Output buffer to store the read data
- **len** -- Length to read, not larger than `SOC_SPI_MAXIMUM_BUFFER_SIZE-addr`

void `spi_slave_hd_write_buffer` (`spi_host_device_t` host\_id, int addr, uint8\_t \*data, size\_t len)

Write the shared registers.

#### Parameters

- **host\_id** -- Host to write the shared registers
- **addr** -- Address of register to write, 0 to `SOC_SPI_MAXIMUM_BUFFER_SIZE-1`
- **data** -- Buffer holding the data to write
- **len** -- Length to write, `SOC_SPI_MAXIMUM_BUFFER_SIZE-addr`

`esp_err_t` `spi_slave_hd_append_trans` (`spi_host_device_t` host\_id, `spi_slave_chan_t` chan, `spi_slave_hd_data_t` \*trans, TickType\_t timeout)

Load transactions (append mode)

---

**Note:** In this mode, user transaction descriptors will be appended to the DMA and the DMA will keep processing the data without stopping

---

#### Parameters

- **host\_id** -- Host to load transactions
- **chan** -- `SPI_SLAVE_CHAN_TX` or `SPI_SLAVE_CHAN_RX`
- **trans** -- Transaction descriptor
- **timeout** -- Timeout before the transaction is loaded

#### Returns

- `ESP_OK`: on success
- `ESP_ERR_INVALID_ARG`: The input argument is invalid. Can be the following reason:
  - The buffer given is not DMA capable
  - The length of data is invalid (not larger than 0, or exceed the max transfer length)
  - The transaction direction is invalid

- `ESP_ERR_TIMEOUT`: Master is still processing previous transaction. There is no available transaction for slave to load
- `ESP_ERR_INVALID_STATE`: Function called in invalid state. This API should be called under append mode.

`esp_err_t spi_slave_hd_get_append_trans_res` (`spi_host_device_t` host\_id, `spi_slave_chan_t` chan, `spi_slave_hd_data_t` \*\*out\_trans, TickType\_t timeout)

Get the result of a data transaction (append mode)

---

**Note:** This API should be called the same times as the `spi_slave_hd_append_trans`

---

#### Parameters

- `host_id` -- Host to load the transaction
- `chan` -- `SPI_SLAVE_CHAN_TX` or `SPI_SLAVE_CHAN_RX`
- `out_trans` -- [out] Pointer to the transaction descriptor (`spi_slave_hd_data_t`) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it's meaningless for TX.
- `timeout` -- Timeout before the result is got

#### Returns

- `ESP_OK`: on success
- `ESP_ERR_INVALID_ARG`: Function is not valid
- `ESP_ERR_TIMEOUT`: There's no transaction done before timeout
- `ESP_ERR_INVALID_STATE`: Function called in invalid state. This API should be called under append mode.

### Structures

struct `spi_slave_hd_data_t`

Descriptor of data to send/receive.

#### Public Members

`uint8_t *data`

Buffer to send, must be DMA capable.

`size_t len`

Len of data to send/receive. For receiving the buffer length should be multiples of 4 bytes, otherwise the extra part will be truncated.

`size_t trans_len`

For RX direction, it indicates the data actually received. For TX direction, it is meaningless.

`void *arg`

Extra argument indicating this data.

struct `spi_slave_hd_event_t`

Information of SPI Slave HD event.

#### Public Members

*spi\_event\_t* **event**

Event type.

*spi\_slave\_hd\_data\_t* \***trans**

Corresponding transaction for SPI\_EV\_SEND and SPI\_EV\_RECV events.

struct **spi\_slave\_hd\_callback\_config\_t**

Callback configuration structure for SPI Slave HD.

### Public Members

*slave\_cb\_t* **cb\_buffer\_tx**

Callback when master reads from shared buffer.

*slave\_cb\_t* **cb\_buffer\_rx**

Callback when master writes to shared buffer.

*slave\_cb\_t* **cb\_send\_dma\_ready**

Callback when TX data buffer is loaded to the hardware (DMA)

*slave\_cb\_t* **cb\_sent**

Callback when data are sent.

*slave\_cb\_t* **cb\_recv\_dma\_ready**

Callback when RX data buffer is loaded to the hardware (DMA)

*slave\_cb\_t* **cb\_recv**

Callback when data are received.

*slave\_cb\_t* **cb\_cmd9**

Callback when CMD9 received.

*slave\_cb\_t* **cb\_cmdA**

Callback when CMDA received.

void \***arg**

Argument indicating this SPI Slave HD peripheral instance.

struct **spi\_slave\_hd\_slot\_config\_t**

Configuration structure for the SPI Slave HD driver.

### Public Members

uint8\_t **mode**

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)

- 2: (1, 0)
- 3: (1, 1)

uint32\_t **spics\_io\_num**

CS GPIO pin for this device.

uint32\_t **flags**

Bitwise OR of SPI\_SLAVE\_HD\_\* flags.

uint32\_t **command\_bits**

command field bits, multiples of 8 and at least 8.

uint32\_t **address\_bits**

address field bits, multiples of 8 and at least 8.

uint32\_t **dummy\_bits**

dummy field bits, multiples of 8 and at least 8.

uint32\_t **queue\_size**

Transaction queue size. This sets how many transactions can be 'in the air' (queued using spi\_slave\_hd\_queue\_trans but not yet finished using spi\_slave\_hd\_get\_trans\_result) at the same time.

*spi\_dma\_chan\_t* **dma\_chan**

DMA channel to used.

*spi\_slave\_hd\_callback\_config\_t* **cb\_config**

Callback configuration.

## Macros

**SPI\_SLAVE\_HD\_TXBIT\_LSBFIRST**

Transmit command/address/data LSB first instead of the default MSB first.

**SPI\_SLAVE\_HD\_RXBIT\_LSBFIRST**

Receive data LSB first instead of the default MSB first.

**SPI\_SLAVE\_HD\_BIT\_LSBFIRST**

Transmit and receive LSB first.

**SPI\_SLAVE\_HD\_APPEND\_MODE**

Adopt DMA append mode for transactions. In this mode, users can load(append) DMA descriptors without stopping the DMA.

## Type Definitions

typedef bool (\***slave\_cb\_t**)(void \*arg, *spi\_slave\_hd\_event\_t* \*event, BaseType\_t \*awoken)

Callback for SPI Slave HD.

## Enumerations

enum `spi_slave_chan_t`

Channel of SPI Slave HD to do data transaction.

*Values:*

enumerator `SPI_SLAVE_CHAN_TX`

The output channel (RDDMA)

enumerator `SPI_SLAVE_CHAN_RX`

The input channel (WRDMA)

## 2.6.15 Temperature Sensor

### Introduction

The ESP32-C2 has a built-in sensor used to measure the chip's internal temperature. The temperature sensor module contains an 8-bit Sigma-Delta analog-to-digital converter (ADC) and a digital-to-analog converter (DAC) to compensate for the temperature measurement.

Due to restrictions of hardware, the sensor has predefined measurement ranges with specific measurement errors. See the table below for details.

Predefined Range (°C)	Error (°C)
50 ~ 125	< 3
20 ~ 100	< 2
-10 ~ 80	< 1
-30 ~ 50	< 2
-40 ~ 20	< 3

---

**Note:** The temperature sensor is designed primarily to measure the temperature changes inside the chip. The internal temperature of a chip is usually higher than the ambient temperature, and is affected by factors such as the microcontroller's clock frequency or I/O load, and the external thermal environment.

---

### Functional Overview

The description of the temperature sensor functionality is divided into the following sections:

- [Resource Allocation](#) - covers which parameters should be set up to get a temperature sensor handle and how to recycle the resources when the temperature sensor finishes working.
- [Enable and Disable Temperature Sensor](#) - covers how to enable and disable the temperature sensor.
- [Get Temperature Value](#) - covers how to get the real-time temperature value.
- [Power Management](#) - covers how the temperature sensor is affected when changing power mode (e.g., Light-sleep mode).
- [Thread Safety](#) - covers how to make the driver to be thread-safe.

**Resource Allocation** The ESP32-C2 has just one built-in temperature sensor hardware. The temperature sensor instance is represented by `temperature_sensor_handle_t`, which is also the bond of the context. By using `temperature_sensor_handle_t`, the temperature sensor properties can be accessed and modified in different function calls to control and manage the temperature sensor. The variable would always be the parameter of the temperature APIs with the information of hardware and configurations, so you can just create a pointer of type `temperature_sensor_handle_t` and passing to APIs as needed.

In order to install a built-in temperature sensor instance, the first thing is to evaluate the temperature range in your detection environment. For example, if the testing environment is in a room, the range you evaluate might be 10 °C ~ 30 °C; if the testing in a lamp bulb, the range you evaluate might be 60 °C ~ 110 °C. Based on that, configuration structure `temperature_sensor_config_t` should be defined in advance:

- `range_min`: The minimum value of the testing range you have evaluated.
- `range_max`: The maximum value of the testing range you have evaluated.

After the ranges are set, the structure could be passed to `temperature_sensor_install()`, which will instantiate the temperature sensor instance and return a handle.

As mentioned above, different measure ranges have different measurement errors. You do not need to care about the measurement error because we have an internal mechanism to choose the minimum error according to the given range.

If the temperature sensor is no longer needed, you need to call `temperature_sensor_uninstall()` to free the temperature sensor resource.

### Creating a Temperature Sensor Handle

- Step 1: Evaluate the testing range. In this example, the range is 20 °C ~ 50 °C.
- Step 2: Configure the range and obtain a handle.

```
temperature_sensor_handle_t temp_handle = NULL;
temperature_sensor_config_t temp_sensor = {
    .range_min = 20,
    .range_max = 50,
};
ESP_ERROR_CHECK(temperature_sensor_install(&temp_sensor, &temp_handle));
```

### Enable and Disable Temperature Sensor

1. Enable the temperature sensor by calling `temperature_sensor_enable()`. The internal temperature sensor circuit will start to work. The driver state will transit from init to enable.
2. To Disable the temperature sensor, please call `temperature_sensor_disable()`.

**Get Temperature Value** After the temperature sensor is enabled by `temperature_sensor_enable()`, you can get the current temperature by calling `temperature_sensor_get_celsius()`.

```
// Enable temperature sensor
ESP_ERROR_CHECK(temperature_sensor_enable(temp_handle));
// Get converted sensor data
float tsens_out;
ESP_ERROR_CHECK(temperature_sensor_get_celsius(temp_handle, &tsens_out));
printf("Temperature in %f °C\n", tsens_out);
// Disable the temperature sensor if it is not needed and save the power
ESP_ERROR_CHECK(temperature_sensor_disable(temp_handle));
```

**Power Management** As the temperature sensor does not use the APB clock, it will keep working no matter if the power management is enabled with `CONFIG_PM_ENABLE`.

**Thread Safety** In the temperature sensor driver, we do not add any protection to ensure the thread safety, because typically this driver is only supposed to be used in one task. If you have to use this driver in different tasks, please add extra locks to protect it.

### Unexpected Behaviors

1. The value you get from the chip is usually different from the ambient temperature. It is because the temperature sensor is built inside the chip. To some extent, it measures the temperature of the chip.
2. When installing the temperature sensor, the driver may print the boundary you gave cannot meet the range of internal temperature sensor. It is because the built-in temperature sensor has a testing limit. The error comes from the incorrect configuration of `temperature_sensor_config_t` as follow:
  - (1) Totally out of range, like 200 °C ~ 300 °C.
  - (2) Cross the boundary of each predefined measurement. like 40 °C ~ 110 °C.

### Application Example

- Temperature sensor reading example: [peripherals/temperature\\_sensor/temp\\_sensor](#).

### API Reference

#### Header File

- [components/driver/temperature\\_sensor/include/driver/temperature\\_sensor.h](#)

#### Functions

`esp_err_t temperature_sensor_install` (const `temperature_sensor_config_t` \*tsens\_config, `temperature_sensor_handle_t` \*ret\_tsens)

Install temperature sensor driver.

##### Parameters

- `tsens_config` -- Pointer to config structure.
- `ret_tsens` -- Return the pointer of temperature sensor handle.

##### Returns

- ESP\_OK if succeed

`esp_err_t temperature_sensor_uninstall` (`temperature_sensor_handle_t` tsens)

Uninstall the temperature sensor driver.

**Parameters** `tsens` -- The handle created by `temperature_sensor_install()`.

##### Returns

- ESP\_OK if succeed.

`esp_err_t temperature_sensor_enable` (`temperature_sensor_handle_t` tsens)

Enable the temperature sensor.

**Parameters** `tsens` -- The handle created by `temperature_sensor_install()`.

##### Returns

- ESP\_OK Success
- ESP\_ERR\_INVALID\_STATE if temperature sensor is enabled already.

`esp_err_t temperature_sensor_disable` (`temperature_sensor_handle_t` tsens)

Disable temperature sensor.

**Parameters** `tsens` -- The handle created by `temperature_sensor_install()`.

##### Returns

- ESP\_OK Success

- `ESP_ERR_INVALID_STATE` if temperature sensor is not enabled yet.

`esp_err_t temperature_sensor_get_celsius` (*temperature\_sensor\_handle\_t* tsens, float \*out\_celsius)

Read temperature sensor data that is converted to degrees Celsius.

---

**Note:** Should not be called from interrupt.

---

#### Parameters

- `tsens` -- The handle created by `temperature_sensor_install()`.
- `out_celsius` -- The measure output value.

#### Returns

- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` invalid arguments
- `ESP_ERR_INVALID_STATE` Temperature sensor is not enabled yet.
- `ESP_FAIL` Parse the sensor data into ambient temperature failed (e.g. out of the range).

### Structures

struct `temperature_sensor_config_t`

Configuration of measurement range for the temperature sensor.

---

**Note:** If you see the log the boundary you gave cannot meet the range of internal temperature sensor. You may need to refer to predefined range listed `doc/api-reference/peripherals/Temperature sensor`.

---

### Public Members

int `range_min`

the minimum value of the temperature you want to test

int `range_max`

the maximum value of the temperature you want to test

temperature\_sensor\_clk\_src\_t `clk_src`

the clock source of the temperature sensor.

### Macros

`TEMPERATURE_SENSOR_CONFIG_DEFAULT` (min, max)

*temperature\_sensor\_config\_t* default constructure

### Type Definitions

typedef struct `temperature_sensor_obj_t` \*`temperature_sensor_handle_t`

Type of temperature sensor driver handle.

## 2.6.16 Universal Asynchronous Receiver/Transmitter (UART)

## Introduction

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, and RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-C2 chip has 2 UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit, etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association (IrDA) protocols.

## Functional Overview

The overview describes how to establish communication between an ESP32-C2 and other UART devices using the functions and data types of the UART driver. A typical programming workflow is broken down into the sections provided below:

1. *Set Communication Parameters* - Setting baud rate, data bits, stop bits, etc.
2. *Set Communication Pins* - Assigning pins for connection to a device
3. *Install Drivers* - Allocating ESP32-C2's resources for the UART driver
4. *Run UART Communication* - Sending/receiving data
5. *Use Interrupts* - Triggering interrupts on specific communication events
6. *Deleting a Driver* - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver's functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Set Communication Parameters** UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to [peripherals/uart/uart\\_echo](#).

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

Table 4: Functions for Configuring specific parameters individually

Parameter to Configure	Function
Baud rate	<code>uart_set_baudrate()</code>
Number of transmitted bits	<code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code>
Parity control	<code>uart_set_parity()</code> selected out of <code>uart_parity_t</code>
Number of stop bits	<code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code>
Hardware flow control mode	<code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code>
Communication mode	<code>uart_set_mode()</code> selected out of <code>uart_mode_t</code>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

**Set Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro `UART_PIN_NO_CHANGE` should be specified for pins that will not be used.

```
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 18, 19));
```

**Install Drivers** Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, \
                                   uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Run UART Communication** Serial communication is controlled by each UART controller's finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will only write and read data from a specific buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

**Transmit Data** After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer's address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A 'serial break signal' means holding the Tx line low for a period longer than one data frame.

```
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a 'companion' function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_1;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_
↳ticks (TickType_t)
```

**Receive Data** Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Use Interrupts** There are many interrupts that can be generated depending on specific UART states or detected errors. The full list of available interrupts is provided in *ESP32-C2 Technical Reference Manual > UART Controller*

(UART) > *UART Interrupts and UHCI Interrupts* [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The `uart_driver_install()` function installs the driver's internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection:** There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in *Install Drivers*. An example of using Event detection can be found in `peripherals/uart/uart_events`.
- **FIFO space threshold or transmission timeout reached:** The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`
- **Pattern detection:** An interrupt triggered on detecting a 'pattern' of the same character being received/sent repeatedly. This functionality is demonstrated in the example `peripherals/uart/uart_events`. It can be used, e.g., to detect a command string with a specific number of identical characters (the 'pattern') at the end. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_baud_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros** The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

## Overview of RS485 Specific Communication Options

---

**Note:** The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see *ESP32-C2 Technical Reference Manual > UART Controller (UART) > Register Summary* [PDF]. Use the register name to navigate to the register description and then find the field/bit.

---

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter's output signal loops back to the receiver's input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-C2's RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is

supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section *Interface Connection Options*). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32-C2 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options** This section provides example schematics to demonstrate the basic aspects of ESP32-C2's RS485 interface connection.

#### Note:

- The schematics below do **not** necessarily contain **all required elements**.
- The **analog devices** ADM483 & ADM2483 are examples of common RS485 transceivers and **can be replaced** with other similar transceivers.

#### Circuit A: Collision Detection Circuit

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

#### Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection

(continues on next page)

(continued from previous page)

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

### Circuit C: Auto Switching Transmitter/Receiver

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` to 1 and `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` to 0. This setup can work in any RS485 UART mode or even in `UART_MODE_UART`.

### Application Examples

The table below describes the code examples available in the directory [peripherals/uart/](#).

Code Example	Description
<a href="#">peripherals/uart/uart_echo</a>	Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.
<a href="#">peripherals/uart/uart_events</a>	Reporting various communication events, using pattern detection interrupts.
<a href="#">peripherals/uart/uart_async_rxtxtasks</a>	Transmitting and receiving data in two separate FreeRTOS tasks over the same UART.
<a href="#">peripherals/uart/uart_select</a>	Using synchronous I/O multiplexing for UART file descriptors.
<a href="#">peripherals/uart/uart_echo_rs485</a>	Setting up UART driver to communicate over RS485 interface in half-duplex mode. This example is similar to <a href="#">peripherals/uart/uart_echo</a> but allows communication through an RS485 interface chip connected to ESP32-C2 pins.

### API Reference

### Header File

- [components/driver/uart/include/driver/uart.h](#)

## Functions

*esp\_err\_t* **uart\_driver\_install** (*uart\_port\_t* uart\_num, int rx\_buffer\_size, int tx\_buffer\_size, int queue\_size, *QueueHandle\_t* \*uart\_queue, int intr\_alloc\_flags)

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

---

**Note:** Rx\_buffer\_size should be greater than UART\_FIFO\_LEN. Tx\_buffer\_size should be either zero or greater than UART\_FIFO\_LEN.

---

### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **rx\_buffer\_size** -- UART RX ring buffer size.
- **tx\_buffer\_size** -- UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue\_size** -- UART event queue size/depth.
- **uart\_queue** -- UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr\_alloc\_flags** -- Flags used to allocate the interrupt. One or multiple (ORred) ESP\_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info. Do not set ESP\_INTR\_FLAG\_IRAM here (the driver's ISR handler is not located in IRAM)

### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_driver\_delete** (*uart\_port\_t* uart\_num)

Uninstall UART driver.

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

bool **uart\_is\_driver\_installed** (*uart\_port\_t* uart\_num)

Checks whether the driver is installed or not.

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

### Returns

- true driver is installed
- false driver is not installed

*esp\_err\_t* **uart\_set\_word\_length** (*uart\_port\_t* uart\_num, *uart\_word\_length\_t* data\_bit)

Set UART data bits.

### Parameters

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **data\_bit** -- UART data bits

### Returns

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_word\_length** (*uart\_port\_t* uart\_num, *uart\_word\_length\_t* \*data\_bit)

Get the UART data bit configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **data\_bit** -- Pointer to accept value of UART data bits.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*data\_bit)

*esp\_err\_t* **uart\_set\_stop\_bits** (*uart\_port\_t* uart\_num, *uart\_stop\_bits\_t* stop\_bits)

Set UART stop bits.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **stop\_bits** -- UART stop bits

**Returns**

- ESP\_OK Success
- ESP\_FAIL Fail

*esp\_err\_t* **uart\_get\_stop\_bits** (*uart\_port\_t* uart\_num, *uart\_stop\_bits\_t* \*stop\_bits)

Get the UART stop bit configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **stop\_bits** -- Pointer to accept value of UART stop bits.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*stop\_bit)

*esp\_err\_t* **uart\_set\_parity** (*uart\_port\_t* uart\_num, *uart\_parity\_t* parity\_mode)

Set UART parity mode.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **parity\_mode** -- the enum of uart parity configuration

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success

*esp\_err\_t* **uart\_get\_parity** (*uart\_port\_t* uart\_num, *uart\_parity\_t* \*parity\_mode)

Get the UART parity mode configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **parity\_mode** -- Pointer to accept value of UART parity mode.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*parity\_mode)

*esp\_err\_t* **uart\_get\_sclk\_freq** (*uart\_sclk\_t* sclk, uint32\_t \*out\_freq\_hz)

Get the frequency of a clock source for the UART.

**Parameters**

- **sclk** -- Clock source
- **out\_freq\_hz** -- [out] Output of frequency, in Hz

**Returns**

- ESP\_ERR\_INVALID\_ARG: if the clock source is not supported
- otherwise ESP\_OK

*esp\_err\_t* **uart\_set\_baudrate** (*uart\_port\_t* uart\_num, uint32\_t baudrate)

Set UART baud rate.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **baudrate** -- UART baud rate.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success

*esp\_err\_t* **uart\_get\_baudrate** (*uart\_port\_t* uart\_num, uint32\_t \*baudrate)

Get the UART baud rate configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **baudrate** -- Pointer to accept value of UART baud rate

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*baudrate)

*esp\_err\_t* **uart\_set\_line\_inverse** (*uart\_port\_t* uart\_num, uint32\_t inverse\_mask)

Set UART line inverse mode.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **inverse\_mask** -- Choose the wires that need to be inverted. Using the ORred mask of *uart\_signal\_inv\_t*

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* flow\_ctrl, uint8\_t rx\_thresh)

Set hardware flow control.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** -- Hardware flow control mode
- **rx\_thresh** -- Threshold of Hardware RX flow control (0 ~ UART\_FIFO\_LEN). Only when UART\_HW\_FLOWCTRL\_RTS is set, will the rx\_thresh value be set.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_sw\_flow\_ctrl** (*uart\_port\_t* uart\_num, bool enable, uint8\_t rx\_thresh\_xon, uint8\_t rx\_thresh\_xoff)

Set software flow control.

**Parameters**

- **uart\_num** -- UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- **enable** -- switch on or off
- **rx\_thresh\_xon** -- low water mark
- **rx\_thresh\_xoff** -- high water mark

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_hw\_flow\_ctrl** (*uart\_port\_t* uart\_num, *uart\_hw\_flowcontrol\_t* \*flow\_ctrl)

Get the UART hardware flow control configuration.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **flow\_ctrl** -- Option for different flow control mode.

**Returns**

- ESP\_FAIL Parameter error
- ESP\_OK Success, result will be put in (\*flow\_ctrl)

*esp\_err\_t* **uart\_clear\_intr\_status** (*uart\_port\_t* uart\_num, uint32\_t clr\_mask)

Clear UART interrupt status.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **clr\_mask** -- Bit mask of the interrupt status to be cleared.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t enable\_mask)

Set UART interrupt enable.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable\_mask** -- Bit mask of the enable bits.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_intr\_mask** (*uart\_port\_t* uart\_num, uint32\_t disable\_mask)

Clear UART interrupt enable bits.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **disable\_mask** -- Bit mask of the disable bits.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_rx\_intr** (*uart\_port\_t* uart\_num)

Enable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_rx\_intr** (*uart\_port\_t* uart\_num)

Disable UART RX interrupt (RX\_FULL & RX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_disable\_tx\_intr** (*uart\_port\_t* uart\_num)

Disable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Parameters** **uart\_num** -- UART port number

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_tx\_intr** (*uart\_port\_t* uart\_num, int enable, int thresh)

Enable UART TX interrupt (TX\_FULL & TX\_TIMEOUT INTERRUPT)

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **enable** -- 1: enable; 0: disable
- **thresh** -- Threshold of TX interrupt, 0 ~ UART\_FIFO\_LEN

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_pin** (*uart\_port\_t* uart\_num, int tx\_io\_num, int rx\_io\_num, int rts\_io\_num, int cts\_io\_num)

Assign signals of a UART peripheral to GPIO pins.

---

**Note:** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0's default TX pin and GPIO3 is UART0's default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

---

---

**Note:** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

---

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **tx\_io\_num** -- UART TX pin GPIO number.
- **rx\_io\_num** -- UART RX pin GPIO number.
- **rts\_io\_num** -- UART RTS pin GPIO number.
- **cts\_io\_num** -- UART CTS pin GPIO number.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_rts** (*uart\_port\_t* uart\_num, int level)

Manually set the UART RTS pin level.

---

**Note:** UART must be configured with hardware flow control disabled.

---

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** -- 1: RTS output low (active); 0: RTS output high (block)

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_dtr** (*uart\_port\_t* uart\_num, int level)

Manually set the UART DTR pin level.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **level** -- 1: DTR output low; 0: DTR output high

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_set\_tx\_idle\_num** (*uart\_port\_t* uart\_num, uint16\_t idle\_num)

Set UART idle interval after tx FIFO is empty.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

- **idle\_num** -- idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_param\_config** (*uart\_port\_t* uart\_num, const *uart\_config\_t* \*uart\_config)

Set UART configuration parameters.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **uart\_config** -- UART parameter settings

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_intr\_config** (*uart\_port\_t* uart\_num, const *uart\_intr\_config\_t* \*intr\_conf)

Configure UART interrupts.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **intr\_conf** -- UART interrupt settings

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_wait\_tx\_done** (*uart\_port\_t* uart\_num, TickType\_t ticks\_to\_wait)

Wait until UART TX FIFO is empty.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **ticks\_to\_wait** -- Timeout, count in RTOS ticks

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error
- ESP\_ERR\_TIMEOUT Timeout

int **uart\_tx\_chars** (*uart\_port\_t* uart\_num, const char \*buffer, uint32\_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

---

**Note:** This function should only be used when UART TX buffer is not enabled.

---

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buffer** -- data buffer address
- **len** -- data length to send

**Returns**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_write\_bytes** (*uart\_port\_t* uart\_num, const void \*src, size\_t size)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send

**Returns**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_write\_bytes\_with\_break** (*uart\_port\_t* uart\_num, const void \*src, size\_t size, int brk\_len)

Send data to the UART port from a given buffer and length,.

If the UART driver's parameter 'tx\_buffer\_size' is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the 'tx\_buffer\_size' > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **src** -- data buffer address
- **size** -- data length to send
- **brk\_len** -- break signal duration(unit: the time it takes to send one bit at current baudrate)

**Returns**

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

int **uart\_read\_bytes** (*uart\_port\_t* uart\_num, void \*buf, uint32\_t length, TickType\_t ticks\_to\_wait)

UART read bytes from UART buffer.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **buf** -- pointer to the buffer.
- **length** -- data length
- **ticks\_to\_wait** -- sTimeout, count in RTOS ticks

**Returns**

- (-1) Error
- OTHERS (>=0) The number of bytes read from UART buffer

*esp\_err\_t* **uart\_flush** (*uart\_port\_t* uart\_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

---

**Note:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_flush\_input** (*uart\_port\_t* uart\_num)

Clear input buffer, discard all the data is in the ring-buffer.

---

**Note:** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

---

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_buffered\_data\_len** (*uart\_port\_t* uart\_num, size\_t \*size)

UART get RX ring buffer cached data length.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **size** -- Pointer of size\_t to accept cached data length

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_get\_tx\_buffer\_free\_size** (*uart\_port\_t* uart\_num, size\_t \*size)

UART get TX ring buffer free space size.

**Parameters**

- **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).
- **size** -- Pointer of size\_t to accept the free space size

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_disable\_pattern\_det\_intr** (*uart\_port\_t* uart\_num)

UART disable pattern detect function. Designed for applications like 'AT commands'. When the hardware detects a series of one same character, the interrupt will be triggered.

**Parameters** **uart\_num** -- UART port number, the max port number is (UART\_NUM\_MAX -1).

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

*esp\_err\_t* **uart\_enable\_pattern\_det\_baud\_intr** (*uart\_port\_t* uart\_num, char pattern\_chr, uint8\_t chr\_num, int chr\_tout, int post\_idle, int pre\_idle)

UART enable pattern detect function. Designed for applications like 'AT commands'. When the hardware detect a series of one same character, the interrupt will be triggered.

**Parameters**

- **uart\_num** -- UART port number.
- **pattern\_chr** -- character of the pattern.
- **chr\_num** -- number of the character, 8bit value.
- **chr\_tout** -- timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at\_cmd char.
- **post\_idle** -- idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at\_cmd char
- **pre\_idle** -- idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at\_cmd char.

**Returns**

- ESP\_OK Success
- ESP\_FAIL Parameter error

int **uart\_pattern\_pop\_pos** (*uart\_port\_t* uart\_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos`. It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**Parameters** `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX` -1).

**Returns**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

int `uart_pattern_get_pos` (*uart\_port\_t* `uart_num`)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: `uart_flush_input`, `uart_read_bytes`, `uart_driver_delete`, `uart_pop_pattern_pos`. It is the application's responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

---

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

---

**Parameters** `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX` -1).

**Returns**

- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

*esp\_err\_t* `uart_pattern_queue_reset` (*uart\_port\_t* `uart_num`, int `queue_length`)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

**Parameters**

- `uart_num` -- UART port number, the max port number is (`UART_NUM_MAX` -1).
- `queue_length` -- Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

**Returns**

- `ESP_ERR_NO_MEM` No enough memory
- `ESP_ERR_INVALID_STATE` Driver not installed
- `ESP_FAIL` Parameter error
- `ESP_OK` Success

*esp\_err\_t* `uart_set_mode` (*uart\_port\_t* `uart_num`, *uart\_mode\_t* `mode`)

UART set communication mode.

---

**Note:** This function must be executed after `uart_driver_install()`, when the driver object is initialized.

---

**Parameters**

- `uart_num` -- Uart number to configure, the max port number is (`UART_NUM_MAX` -1).
- `mode` -- UART UART mode to set

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_set\_rx\_full\_threshold** (*uart\_port\_t* uart\_num, int threshold)

Set uart threshold value for RX fifo full.

---

**Note:** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

---

**Parameters**

- **uart\_num** -- UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- **threshold** -- Threshold value above which RX fifo full interrupt is generated

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_set\_tx\_empty\_threshold** (*uart\_port\_t* uart\_num, int threshold)

Set uart threshold values for TX fifo empty.

**Parameters**

- **uart\_num** -- UART\_NUM\_0, UART\_NUM\_1 or UART\_NUM\_2
- **threshold** -- Threshold value below which TX fifo empty interrupt is generated

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_set\_rx\_timeout** (*uart\_port\_t* uart\_num, const uint8\_t tout\_thresh)

UART set threshold timeout for TOUT feature.

**Parameters**

- **uart\_num** -- Uart number to configure, the max port number is (UART\_NUM\_MAX -1).
- **tout\_thresh** -- This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout\_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART\_RXFIFO\_TOUT\_INT interrupt is triggered. If tout\_thresh == 0, the TOUT feature is disabled.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_ERR\_INVALID\_STATE Driver is not installed

*esp\_err\_t* **uart\_get\_collision\_flag** (*uart\_port\_t* uart\_num, bool \*collision\_flag)

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision\_flag. \*collision\_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart\_write\_bytes()).

**Parameters**

- **uart\_num** -- Uart number to configure the max port number is (UART\_NUM\_MAX -1).
- **collision\_flag** -- Pointer to variable of type bool to return collision flag.

**Returns**

- ESP\_OK Success
- ESP\_ERR\_INVALID\_ARG Parameter error

*esp\_err\_t* **uart\_set\_wakeup\_threshold** (*uart\_port\_t* uart\_num, int wakeup\_threshold)

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter 'a' with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when 'a' is sent, set wakeup\_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To ensure that UART has correct Baud rate all the time, it is necessary to select a source clock which has a fixed frequency and remains active during sleep. For the supported clock sources of the chips, please refer to `uart_sclk_t` or `soc_periph_uart_clk_src_legacy_t`

---

**Note:** in ESP32, the wakeup signal can only be input via IO\_MUX (i.e. GPIO3 should be configured as function\_1 to wake up UART0, GPIO9 should be configured as function\_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

---

#### Parameters

- **uart\_num** -- UART number, the max port number is (UART\_NUM\_MAX -1).
- **wakeup\_threshold** -- number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if uart\_num is incorrect or wakeup\_threshold is outside of [3, 0x3ff] range.

*esp\_err\_t* **uart\_get\_wakeup\_threshold** (*uart\_port\_t* uart\_num, int \*out\_wakeup\_threshold)

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

#### Parameters

- **uart\_num** -- UART number, the max port number is (UART\_NUM\_MAX -1).
- **out\_wakeup\_threshold** -- [out] output, set to the current value of wakeup threshold for the given UART.

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if out\_wakeup\_threshold is NULL

*esp\_err\_t* **uart\_wait\_tx\_idle\_polling** (*uart\_port\_t* uart\_num)

Wait until UART tx memory empty and the last char send ok (polling mode).

•

#### Returns

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters** **uart\_num** -- UART number

*esp\_err\_t* **uart\_set\_loop\_back** (*uart\_port\_t* uart\_num, bool loop\_back\_en)

Configure TX signal loop back to RX module, just for the test usage.

•

**Returns**

- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_FAIL Driver not installed

**Parameters**

- **uart\_num** -- UART number
- **loop\_back\_en** -- Set true to enable the loop back function, else set it false.

void **uart\_set\_always\_rx\_timeout** (*uart\_port\_t* uart\_num, bool always\_rx\_timeout\_en)

Configure behavior of UART RX timeout interrupt.

When always\_rx\_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

**Parameters**

- **uart\_num** -- UART number
- **always\_rx\_timeout\_en** -- Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

**Structures**

struct **uart\_intr\_config\_t**

UART interrupt configuration parameters for `uart_intr_config` function.

**Public Members**

uint32\_t **intr\_enable\_mask**

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

uint8\_t **rx\_timeout\_thresh**

UART timeout interrupt threshold (unit: time of sending one byte)

uint8\_t **txfifo\_empty\_intr\_thresh**

UART TX empty interrupt threshold.

uint8\_t **rxfifo\_full\_thresh**

UART RX full interrupt threshold.

struct **uart\_event\_t**

Event structure used in UART event queue.

**Public Members**

*uart\_event\_type\_t* **type**

UART event type

size\_t **size**

UART data size for UART\_DATA event

bool **timeout\_flag**

UART data read timeout flag for UART\_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

## Macros

**UART\_NUM\_0**

UART port 0

**UART\_NUM\_1**

UART port 1

**UART\_NUM\_MAX**

UART port max

**UART\_PIN\_NO\_CHANGE**

**UART\_FIFO\_LEN**

Length of the UART HW FIFO.

**UART\_BITRATE\_MAX**

Maximum configurable bitrate.

## Type Definitions

typedef *intr\_handle\_t* **uart\_isr\_handle\_t**

## Enumerations

enum **uart\_event\_type\_t**

UART event types used in the ring buffer.

*Values:*

enumerator **UART\_DATA**

UART data event

enumerator **UART\_BREAK**

UART break event

enumerator **UART\_BUFFER\_FULL**

UART RX buffer full event

enumerator **UART\_FIFO\_OVF**

UART FIFO overflow event

- enumerator **UART\_FRAME\_ERR**  
UART RX frame error event
- enumerator **UART\_PARITY\_ERR**  
UART RX parity event
- enumerator **UART\_DATA\_BREAK**  
UART TX data and break event
- enumerator **UART\_PATTERN\_DET**  
UART pattern detected
- enumerator **UART\_WAKEUP**  
UART wakeup event
- enumerator **UART\_EVENT\_MAX**  
UART event max index

### Header File

- [components/hal/include/hal/uart\\_types.h](#)

### Structures

struct **uart\_at\_cmd\_t**

UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at confirguration.

#### Public Members

uint8\_t **cmd\_char**

UART AT cmd char

uint8\_t **char\_num**

AT cmd char repeat number

uint32\_t **gap\_tout**

gap time(in baud-rate) between AT cmd char

uint32\_t **pre\_idle**

the idle time(in baud-rate) between the non AT char and first AT char

uint32\_t **post\_idle**

the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart\_sw\_flowctrl\_t**

UART software flow control configuration parameters.

### Public Members

uint8\_t **xon\_char**

Xon flow control char

uint8\_t **xoff\_char**

Xoff flow control char

uint8\_t **xon\_thrd**

If the software flow control is enabled and the data amount in rxfifo is less than xon\_thrd, an xon\_char will be sent

uint8\_t **xoff\_thrd**

If the software flow control is enabled and the data amount in rxfifo is more than xoff\_thrd, an xoff\_char will be sent

struct **uart\_config\_t**

UART configuration parameters for `uart_param_config` function.

### Public Members

int **baud\_rate**

UART baud rate

*uart\_word\_length\_t* **data\_bits**

UART byte size

*uart\_parity\_t* **parity**

UART parity mode

*uart\_stop\_bits\_t* **stop\_bits**

UART stop bits

*uart\_hw\_flowcontrol\_t* **flow\_ctrl**

UART HW flow control mode (cts/rts)

uint8\_t **rx\_flow\_ctrl\_thresh**

UART HW RTS threshold

*uart\_sclk\_t* **source\_clk**

UART source clock selection

### Type Definitions

typedef int **uart\_port\_t**

UART port number, can be `UART_NUM_0 ~ (UART_NUM_MAX - 1)`.

typedef *soc\_periph\_uart\_clk\_src\_legacy\_t* **uart\_sclk\_t**

UART source clock.

## Enumerations

enum **uart\_mode\_t**

UART mode selection.

*Values:*

enumerator **UART\_MODE\_UART**

mode: regular UART mode

enumerator **UART\_MODE\_RS485\_HALF\_DUPLEX**

mode: half duplex RS485 UART mode control by RTS pin

enumerator **UART\_MODE\_IRDA**

mode: IRDA UART mode

enumerator **UART\_MODE\_RS485\_COLLISION\_DETECT**

mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART\_MODE\_RS485\_APP\_CTRL**

mode: application control RS485 UART mode (used for test purposes)

enum **uart\_word\_length\_t**

UART word length constants.

*Values:*

enumerator **UART\_DATA\_5\_BITS**

word length: 5bits

enumerator **UART\_DATA\_6\_BITS**

word length: 6bits

enumerator **UART\_DATA\_7\_BITS**

word length: 7bits

enumerator **UART\_DATA\_8\_BITS**

word length: 8bits

enumerator **UART\_DATA\_BITS\_MAX**

enum **uart\_stop\_bits\_t**

UART stop bits number.

*Values:*

enumerator **UART\_STOP\_BITS\_1**

stop bit: 1bit

enumerator **UART\_STOP\_BITS\_1\_5**

stop bit: 1.5bits

enumerator **UART\_STOP\_BITS\_2**

stop bit: 2bits

enumerator **UART\_STOP\_BITS\_MAX**

enum **uart\_parity\_t**

UART parity constants.

*Values:*

enumerator **UART\_PARITY\_DISABLE**

Disable UART parity

enumerator **UART\_PARITY\_EVEN**

Enable UART even parity

enumerator **UART\_PARITY\_ODD**

Enable UART odd parity

enum **uart\_hw\_flowcontrol\_t**

UART hardware flow control modes.

*Values:*

enumerator **UART\_HW\_FLOWCTRL\_DISABLE**

disable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_RTS**

enable RX hardware flow control (rts)

enumerator **UART\_HW\_FLOWCTRL\_CTS**

enable TX hardware flow control (cts)

enumerator **UART\_HW\_FLOWCTRL\_CTS\_RTS**

enable hardware flow control

enumerator **UART\_HW\_FLOWCTRL\_MAX**

enum **uart\_signal\_inv\_t**

UART signal bit map.

*Values:*

enumerator **UART\_SIGNAL\_INV\_DISABLE**

Disable UART signal inverse

enumerator **UART\_SIGNAL\_IRDA\_TX\_INV**

inverse the UART irda\_tx signal

enumerator **UART\_SIGNAL\_IRDA\_RX\_INV**

inverse the UART irda\_rx signal

enumerator **UART\_SIGNAL\_RXD\_INV**

inverse the UART rxd signal

enumerator **UART\_SIGNAL\_CTS\_INV**

inverse the UART cts signal

enumerator **UART\_SIGNAL\_DSR\_INV**

inverse the UART dsr signal

enumerator **UART\_SIGNAL\_TXD\_INV**

inverse the UART txd signal

enumerator **UART\_SIGNAL\_RTS\_INV**

inverse the UART rts signal

enumerator **UART\_SIGNAL\_DTR\_INV**

inverse the UART dtr signal

**GPIO Lookup Macros** The UART peripherals have dedicated IO\_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO\_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO\_MUX pins. You choose a macro based on either the IO\_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

---

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO\_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

---

1. `UART_NUM_2_TXD_DIRECT_GPIO_NUM` returns the IO\_MUX pin number of UART channel 2 TXD pin (pin 17)
2. `UART_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when connected to the UART peripheral via IO\_MUX (this is `UART_NUM_0`)
3. `UART_CTS_GPIO19_DIRECT_CHANNEL` returns the UART number of GPIO 19 when used as the UART CTS pin via IO\_MUX (this is `UART_NUM_0`). It is similar to the above macro but specifies the pin function which is also part of the IO\_MUX assignment.

### Header File

- `components/soc/esp32c2/include/soc/uart_channel.h`

### Macros

`UART_GPIO20_DIRECT_CHANNEL`

`UART_NUM_0_TXD_DIRECT_GPIO_NUM`

`UART_GPIO19_DIRECT_CHANNEL`

`UART_NUM_0_RXD_DIRECT_GPIO_NUM`

`UART_TXD_GPIO20_DIRECT_CHANNEL`

`UART_RXD_GPIO19_DIRECT_CHANNEL`

Code examples for this API section are provided in the [peripherals](#) directory of ESP-IDF examples.

## 2.7 Project Configuration

### 2.7.1 Introduction

The `esp-idf-kconfig` package that ESP-IDF uses is based on `kconfiglib`, which is a Python extension to the `Kconfig` system. `Kconfig` provides a compile-time project configuration mechanism and offers configuration options of several types (e.g., integers, strings, and booleans). `Kconfig` files specify dependencies between options, default values of options, the way options are grouped together, etc.

For the full list of available features, please see `Kconfig` and `kconfiglib` extensions.

### 2.7.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the `idf.py menuconfig` build target.

After being updated, this configuration is saved in the `sdkconfig` file under the project root directory. Based on `sdkconfig`, application build targets will generate the `sdkconfig.h` file under the build directory, and will make the `sdkconfig` options available to the project build system and source files.

### 2.7.3 Using `sdkconfig.defaults`

In some cases, for example, when the `sdkconfig` file is under revision control, it may be inconvenient for the build system to change the `sdkconfig` file. The build system offers a solution to prevent it from happening, which is to create the `sdkconfig.defaults` file. This file is never touched by the build system, and can be created manually or automatically. It contains all the options which matter to the given application and are different from the default ones. The format is the same as that of the `sdkconfig` file. `sdkconfig.defaults` can be created manually when one remembers all the changed configuration, or it can be generated automatically by running the `idf.py save-defconfig` command.

Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted or added to the ignore list of the revision control system (e.g., the `.gitignore` file for `git`). Project build targets will automatically create the `sdkconfig` file, populate it with the settings from the `sdkconfig.defaults` file, and configure the rest of the settings to their default values. Note that during the build process, settings from `sdkconfig.defaults` will not override those already in `sdkconfig`. For more information, see [Custom Sdkconfig Defaults](#).

### 2.7.4 Kconfig Format Rules

Format rules for `Kconfig` files are as follows:

- Option names in any menus should have consistent prefixes. The prefix currently should have at least 3 characters.
- The unit of indentation should be 4 spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 spaces, `config menu` by 4 spaces, `help in config` by 8 spaces, and the text under `help` by 12 spaces.
- No trailing spaces are allowed at the end of the lines.

- The maximum length of options is 40 characters.
- The maximum length of lines is 120 characters.

---

**Note:** The `help` section of each config in the menu is treated as `reStructuredText` to generate the reference documentation for each option.

---

### Format Checker

`tools/ci/check_kconfigs.py` is provided for checking `Kconfig` files against the above format rules. The checker checks all `Kconfig` and `Kconfig.projbuild` files in the ESP-IDF directory, and generates a new file with suffix `.new` with some suggestions about how to fix issues (if there are any). Please note that the checker cannot correct all format issues and the responsibility of the developer is to final check and make corrections in order to pass the tests. For example, indentations will be corrected if there isn't any misleading formatting, but it cannot come up with a common prefix for options inside a menu.

## 2.7.5 Backward Compatibility of Kconfig Options

The standard `Kconfig` tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases, then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:

1. `kconfgen` is used by the tool chain to pre-process `sdkconfig` files before anything else. For example, `menuconfig` would read them, so the settings for old options will be kept and not ignored.
2. `kconfgen` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new `Kconfig` option names. Old options are replaced by new ones in the `sdkconfig` file. Renames that should only appear for a single target can be placed in a target-specific rename file `sdkconfig.rename.TARGET`, where `TARGET` is the target name, e.g. `sdkconfig.rename.esp32s2`.
3. `kconfgen` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, and `auto.conf`) by adding a list of compatibility statements, i.e., the values of old options are set for new options after modification. If users still use old options in their code, this will prevent it from breaking.
4. *Deprecated options and their replacements* are automatically generated by `kconfgen`.

## 2.7.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options automatically generated from `Kconfig` files. Note that due to dependencies between options, some options listed here may not be visible by default in `menuconfig`.

By convention, all option names are upper-case letters with underscores. When `Kconfig` generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a `Kconfig` file and selected in `menuconfig`, then the `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In the following sections, option names are also prefixed with `CONFIG_`, same as in the source code.

### Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_BUILD_TYPE_PURE_RAM_APP`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

## CONFIG\_APP\_BUILD\_TYPE

Application build type

Found in: *Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG or UART. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for some kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash.

Note: when APP\_BUILD\_TYPE\_RAM is selected and loaded with JTAG, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:

```
xtensa-esp32-elf-gdb build/app-name.elf -x gdbinit
```

Example gdbinit files for other targets can be found in tools/test\_apps/system/gdb\_loadable\_elf/

When loading the BIN with UART, the ROM will jump to ram and run the app after finishing the ROM startup code, so there's no additional startup initialization required. You can use the *load\_ram* in esptool.py to load the generated .bin file into ram and execute.

**Example:** esptool.py --chip {chip} -p {port} -b {baud} --no-stub load\_ram {app.bin}

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG\_APP\_BUILD\_TYPE\_RAM is required, other options help reduce application memory footprint.

```
CONFIG_APP_BUILD_TYPE_RAM=y CONFIG_VFS_SUPPORT_TERMIOS= CON-
FIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE= CONFIG_ESP_ERR_TO_NAME_LOOKUP=
```

Available options:

- Default (binary application + 2nd stage bootloader) (CONFIG\_APP\_BUILD\_TYPE\_APP\_2NDBOOT)
- Build app runs entirely in RAM (EXPERIMENTAL) (CONFIG\_APP\_BUILD\_TYPE\_RAM)

## CONFIG\_APP\_BUILD\_TYPE\_PURE\_RAM\_APP

Build app without SPI\_FLASH/PSRAM support (saves ram)

Found in: *Build type*

If this option is enabled, external memory and related peripherals, such as Cache, MMU, Flash and PSRAM, won't be initialized. Corresponding drivers won't be introduced either. Components that depend on the spi\_flash component will also be unavailable, such as app\_update, etc. When this option is enabled, about 26KB of RAM space can be saved.

## CONFIG\_APP\_REPRODUCIBLE\_BUILD

Enable reproducible build

*Found in:* [Build type](#)

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create automatically. (or will be append if you have one already)

**Default value:**

- No (disabled)

## CONFIG\_APP\_NO\_BLOBS

No Binary Blobs

*Found in:* [Build type](#)

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling this Wi-Fi/Bluetooth will not work.

**Default value:**

- No (disabled)

## Bootloader config

Contains:

- [CONFIG\\_BOOTLOADER\\_LOG\\_LEVEL](#)
- [CONFIG\\_BOOTLOADER\\_COMPILER\\_OPTIMIZATION](#)
- [CONFIG\\_BOOTLOADER\\_APP\\_ROLLBACK\\_ENABLE](#)
- [CONFIG\\_BOOTLOADER\\_REGION\\_PROTECTION\\_ENABLE](#)
- [CONFIG\\_BOOTLOADER\\_APP\\_TEST](#)
- [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)
- [CONFIG\\_BOOTLOADER\\_HOLD\\_TIME\\_GPIO](#)
- [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)
- [Serial Flash Configurations](#)
- [CONFIG\\_BOOTLOADER\\_SKIP\\_VALIDATE\\_ALWAYS](#)
- [CONFIG\\_BOOTLOADER\\_SKIP\\_VALIDATE\\_ON\\_POWER\\_ON](#)
- [CONFIG\\_BOOTLOADER\\_SKIP\\_VALIDATE\\_IN\\_DEEP\\_SLEEP](#)
- [CONFIG\\_BOOTLOADER\\_WDT\\_ENABLE](#)
- [CONFIG\\_BOOTLOADER\\_VDDSDIO\\_BOOST](#)

## CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION

Bootloader optimization Level

*Found in:* [Bootloader config](#)

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default "Size" setting will add the -Os flag to CFLAGS.
- The "Debug" setting will add the -Og flag to CFLAGS.
- The "Performance" setting will add the -O2 flag to CFLAGS.
- The "None" setting will add the -O0 flag to CFLAGS.

Note that custom optimization levels may be unsupported.

Available options:

- Size (-Os) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_SIZE)
- Debug (-Og) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_DEBUG)

- Optimize for performance (-O2) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_PERF)
- Debug without optimization (-O0) (CONFIG\_BOOTLOADER\_COMPILER\_OPTIMIZATION\_NONE)

### CONFIG\_BOOTLOADER\_LOG\_LEVEL

Bootloader log verbosity

*Found in: [Bootloader config](#)*

Specify how much output to see in bootloader logs.

Available options:

- No output (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_NONE)
- Error (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_ERROR)
- Warning (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_WARN)
- Info (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_INFO)
- Debug (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_DEBUG)
- Verbose (CONFIG\_BOOTLOADER\_LOG\_LEVEL\_VERBOSE)

**Serial Flash Configurations** Contains:

- [CONFIG\\_BOOTLOADER\\_FLASH\\_DC\\_AWARE](#)
- [CONFIG\\_BOOTLOADER\\_FLASH\\_XMC\\_SUPPORT](#)

### CONFIG\_BOOTLOADER\_FLASH\_DC\_AWARE

Allow app adjust Dummy Cycle bits in SPI Flash for higher frequency (READ HELP FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

This will force 2nd bootloader to be loaded by DOUT mode, and will restore Dummy Cycle setting by resetting the Flash

### CONFIG\_BOOTLOADER\_FLASH\_XMC\_SUPPORT

Enable the support for flash chips of XMC (READ DOCS FIRST)

*Found in: [Bootloader config](#) > [Serial Flash Configurations](#)*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

DON'T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.

comment "Features below require specific hardware (READ DOCS FIRST!)"

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST

VDDSDIO LDO voltage

*Found in: [Bootloader config](#)*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

Available options:

- 1.8V (CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST\_1\_8V)
- 1.9V (CONFIG\_BOOTLOADER\_VDDSDIO\_BOOST\_1\_9V)

### CONFIG\_BOOTLOADER\_FACTORY\_RESET

GPIO triggers factory reset

*Found in: [Bootloader config](#)*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from "factory" partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_NUM\_PIN\_FACTORY\_RESET

Number of the GPIO input for factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

**Default value:**

- 4 if [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)

### CONFIG\_BOOTLOADER\_FACTORY\_RESET\_PIN\_LEVEL

Factory reset GPIO level

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

Pin level for factory reset, can be triggered on low or high.

Available options:

- Reset on GPIO low (CONFIG\_BOOTLOADER\_FACTORY\_RESET\_PIN\_LOW)
- Reset on GPIO high (CONFIG\_BOOTLOADER\_FACTORY\_RESET\_PIN\_HIGH)

### CONFIG\_BOOTLOADER\_OTA\_DATA\_ERASE

Clear OTA data on factory reset (select factory partition)

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

The device will boot from "factory" partition (or OTA slot 0 if no factory partition is present) after a factory reset.

### CONFIG\_BOOTLOADER\_DATA\_FACTORY\_RESET

Comma-separated names of partitions to clear on factory reset

*Found in: [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_FACTORY\\_RESET](#)*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: "nvs, phy\_init, ...") Make sure that the name specified in the partition table and here are the same. Partitions of type "app" cannot be specified here.

**Default value:**

- "nvs" if `CONFIG_BOOTLOADER_FACTORY_RESET`

### **CONFIG\_BOOTLOADER\_APP\_TEST**

GPIO triggers boot from test app partition

*Found in: [Bootloader config](#)*

Allows to run the test app from "TEST" partition. A boot from "test" partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

### **CONFIG\_BOOTLOADER\_NUM\_PIN\_APP\_TEST**

Number of the GPIO input to boot TEST partition

*Found in: [Bootloader config](#) > `CONFIG_BOOTLOADER_APP_TEST`*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**

- from 0 to 39 if `CONFIG_BOOTLOADER_APP_TEST`

**Default value:**

- 18 if `CONFIG_BOOTLOADER_APP_TEST`

### **CONFIG\_BOOTLOADER\_APP\_TEST\_PIN\_LEVEL**

App test GPIO level

*Found in: [Bootloader config](#) > `CONFIG_BOOTLOADER_APP_TEST`*

Pin level for app test, can be triggered on low or high.

Available options:

- Enter test app on GPIO low (`CONFIG_BOOTLOADER_APP_TEST_PIN_LOW`)
- Enter test app on GPIO high (`CONFIG_BOOTLOADER_APP_TEST_PIN_HIGH`)

### **CONFIG\_BOOTLOADER\_HOLD\_TIME\_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in: [Bootloader config](#)*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**

- 5 if `CONFIG_BOOTLOADER_FACTORY_RESET` || `CONFIG_BOOTLOADER_APP_TEST`

### CONFIG\_BOOTLOADER\_REGION\_PROTECTION\_ENABLE

Enable protection for unmapped memory regions

Found in: *Bootloader config*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_WDT\_ENABLE

Use RTC watchdog in start code

Found in: *Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC\_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow\_clk - and ends calling app\_main. Re-set timeout is needed due to WDT uses a SLOW\_CLK clock source. After changing a frequency slow\_clk a time of WDT needs to re-set for new frequency. slow\_clk depends on RTC\_CLK\_SRC (INTERNAL\_RC or EXTERNAL\_CRYSTAL).

**Default value:**

- Yes (enabled)

### CONFIG\_BOOTLOADER\_WDT\_DISABLE\_IN\_USER\_CODE

Allows RTC watchdog disable in user code

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_WDT\_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc\_wdt in the app's own code. If this option is not set (default), then rtc\_wdt will be disabled by ESP-IDF before calling the app\_main() function.

Use function rtc\_wdt\_feed() for resetting counter of rtc\_wdt. Use function rtc\_wdt\_disable() for disabling rtc\_wdt.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_WDT\_TIME\_MS

Timeout for RTC watchdog (ms)

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_WDT\_ENABLE*

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC\_WDT will reset while encryption operations will be performed.

**Range:**

- from 0 to 120000

**Default value:**

- 9000

## CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE

Enable app rollback support

Found in: *Bootloader config*

After updating the app, the bootloader runs a new app with the "ESP\_OTA\_IMG\_PENDING\_VERIFY" state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

### Default value:

- No (disabled)

## CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK

Enable app anti-rollback support

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.

### Default value:

- No (disabled) if *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE*

## CONFIG\_BOOTLOADER\_APP\_SECURE\_VERSION

eFuse secure version of app

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE* > *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see *BOOTLOADER\_APP\_SEC\_VER\_SIZE\_EFUSE\_FIELD* option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota\_0 + ota\_1 (without factory).

### Default value:

- 0 if *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

## CONFIG\_BOOTLOADER\_APP\_SEC\_VER\_SIZE\_EFUSE\_FIELD

Size of the efuse secure version field

Found in: *Bootloader config* > *CONFIG\_BOOTLOADER\_APP\_ROLLBACK\_ENABLE* > *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

### Range:

- from 1 to 4 if *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*
- from 1 to 16 if *CONFIG\_BOOTLOADER\_APP\_ANTI\_ROLLBACK*

**Default value:**

- 4 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`
- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**CONFIG\_BOOTLOADER\_EFUSE\_SECURE\_VERSION\_EMULATE**

Emulate operations with efuse secure version(only test)

*Found in:* `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: `EFUSE_VIRTUAL` and `EFUSE_VIRTUAL_KEEP_IN_FLASH`.

**Default value:**

- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_IN\_DEEP\_SLEEP**

Skip image validation when exiting deep sleep

*Found in:* `Bootloader config`

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if "allow insecure options" is enabled, however it's strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**

- No (disabled) if `SOC_RTC_FAST_MEM_SUPPORTED` && `CONFIG_SECURE_BOOT` && `CONFIG_SECURE_BOOT_INSECURE`

**CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ON\_POWER\_ON**

Skip image validation from power on reset (READ HELP FIRST)

*Found in:* `Bootloader config`

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it's not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it's not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.

Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_SKIP\_VALIDATE\_ALWAYS

Skip image validation always (READ HELP FIRST)

*Found in:* [Bootloader config](#)

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting "Skip image validation from power on reset" instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**

- No (disabled)

### CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC

Reserve RTC FAST memory for custom purposes

*Found in:* [Bootloader config](#)

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO\_CPU.

**Default value:**

- No (disabled) if SOC\_RTC\_FAST\_MEM\_SUPPORTED

### CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_IN\_CRC

Include custom memory in the CRC calculation

*Found in:* [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

This option allows the customer to use the legacy bootloader behavior when the RTC FAST memory CRC calculation takes place. When this option is enabled, the allocated user custom data will be taken into account in the CRC calculation. This means that any change to the custom data would need a CRC update to prevent the bootloader from marking this data as corrupted. If this option is disabled, the custom data will not be taken into account when calculating the RTC FAST memory CRC. The user custom data can be changed freely, without the need to update the CRC. THIS OPTION MUST BE THE SAME FOR BOTH THE BOOTLOADER AND THE APPLICATION BUILDS.

**Default value:**

- No (disabled) if [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

### CONFIG\_BOOTLOADER\_CUSTOM\_RESERVE\_RTC\_SIZE

Size in bytes for custom purposes

*Found in:* [Bootloader config](#) > [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc\_retain\_mem\_t) is reserved and has access from the bootloader and an application.

**Default value:**

- 0 if [CONFIG\\_BOOTLOADER\\_CUSTOM\\_RESERVE\\_RTC](#)

## Security features

Contains:

- `CONFIG_SECURE_BOOT_INSECURE`
- `CONFIG_SECURE_SIGNED_APPS_SCHEME`
- `CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT`
- `CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP`
- `CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE`
- `CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE`
- `CONFIG_SECURE_FLASH_ENC_ENABLED`
- `CONFIG_SECURE_BOOT`
- `CONFIG_SECURE_FLASH_ENCRYPT_ONLY_IMAGE_LEN_IN_APP_PART`
- `CONFIG_SECURE_BOOTLOADER_KEY_ENCODING`
- *Potentially insecure options*
- `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`
- `CONFIG_SECURE_BOOT_VERIFICATION_KEY`
- `CONFIG_SECURE_BOOTLOADER_MODE`
- `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`
- `CONFIG_SECURE_UART_ROM_DL_MODE`
- `CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT`

### **CONFIG\_SECURE\_SIGNED\_APPS\_NO\_SECURE\_BOOT**

Require signed app images

*Found in: Security features*

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

### **CONFIG\_SECURE\_SIGNED\_APPS\_SCHEME**

App Signing Scheme

*Found in: Security features*

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. **Secure boot V1**
  - Legacy custom secure boot scheme. Supported in ESP32 SoC.
2. **Secure boot V2**
  - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
  - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

Available options:

- ECDSA (`CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME`)  
Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.
- RSA (`CONFIG_SECURE_SIGNED_APPS_RSA_SCHEME`)  
Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.

- ECDSA (V2) (`CONFIG_SECURE_SIGNED_APPS_ECDSA_V2_SCHEME`)  
For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

### **CONFIG\_SECURE\_BOOT\_ECDSA\_KEY\_LEN\_SIZE**

ECDSA key size

*Found in: Security features*

Select the ECDSA key size. Two key sizes are supported

- 192 bit key using NISTP192 curve
- 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

Available options:

- Using ECC curve NISTP192 (`CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_192_BITS`)
- Using ECC curve NISTP256 (Recommended) (`CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_256_BITS`)

### **CONFIG\_SECURE\_SIGNED\_ON\_BOOT\_NO\_SECURE\_BOOT**

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn't add significant security by itself so most users will want to leave it disabled.

**Default value:**

- No (disabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT` && `CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME`

### **CONFIG\_SECURE\_SIGNED\_ON\_UPDATE\_NO\_SECURE\_BOOT**

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the `esp_ota_ops.h` APIs are used for OTA updates, or `esp_image_format.h` APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**Default value:**

- Yes (enabled) if `CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT`

## CONFIG\_SECURE\_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: [Security features](#)*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

### Default value:

- No (disabled)

## CONFIG\_SECURE\_BOOT\_VERSION

Select secure boot version

*Found in: [Security features](#) > [CONFIG\\_SECURE\\_BOOT](#)*

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

Available options:

- Enable Secure Boot version 1 (CONFIG\_SECURE\_BOOT\_V1\_ENABLED)  
Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.
- Enable Secure Boot version 2 (CONFIG\_SECURE\_BOOT\_V2\_ENABLED)  
Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer's Guide for this version before enabling.

## CONFIG\_SECURE\_BOOTLOADER\_MODE

Secure bootloader mode

*Found in: [Security features](#)*

Available options:

- One-time flash (CONFIG\_SECURE\_BOOTLOADER\_ONE\_TIME\_FLASH)  
On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot.  
Enabling this option means that the bootloader cannot be changed after the first time it is booted.
- Reflashable (CONFIG\_SECURE\_BOOTLOADER\_REFLASHABLE)  
Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.

This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.

This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

### **CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES**

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named in "Secure boot private signing key" will be used to sign the image.

If disabled, unsigned app/partition data will be built. They must be signed manually using `espsecure.py`. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

### **CONFIG\_SECURE\_BOOT\_SIGNING\_KEY**

Secure boot private signing key

*Found in: Security features > CONFIG\_SECURE\_BOOT\_BUILD\_SIGNED\_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: `espsecure.py generate_signing_key secure_boot_signing_key.pem`

See the Secure Boot section of the ESP-IDF Programmer's Guide for this version for details.

#### **Default value:**

- "secure\_boot\_signing\_key.pem" if `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

### **CONFIG\_SECURE\_BOOT\_VERIFICATION\_KEY**

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the `espsecure.py extract_public_key` command.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

### **CONFIG\_SECURE\_BOOT\_ENABLE\_AGGRESSIVE\_KEY\_REVOKE**

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

NOTE: Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT` && `SOC_SUPPORT_SECURE_BOOT_REVOKE_KEY`

## CONFIG\_SECURE\_BOOTLOADER\_KEY\_ENCODING

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with `espefuse.py`.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn't change any firmware code, it only changes the size of key binary which is generated at build time.

Available options:

- No encoding (256 bit key) (`CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_256BIT`)
- 3/4 encoding (192 bit key) (`CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_192BIT`)

## CONFIG\_SECURE\_BOOT\_INSECURE

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer's Guide for this version before enabling.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT`

## CONFIG\_SECURE\_FLASH\_ENC\_ENABLED

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

**Default value:**

- No (disabled)

## CONFIG\_SECURE\_FLASH\_ENCRYPTION\_KEYSIZE

Size of generated AES-XTS key

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

Size of generated AES-XTS key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

Available options:

- AES-128 key derived from 128 bits (SHA256(128 bits)) (CONFIG\_SECURE\_FLASH\_ENCRYPTION\_AES128\_DERIVED)
- AES-128 (256-bit key) (CONFIG\_SECURE\_FLASH\_ENCRYPTION\_AES128)
- AES-256 (512-bit key) (CONFIG\_SECURE\_FLASH\_ENCRYPTION\_AES256)

## CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE

Enable usage mode

*Found in: Security features > CONFIG\_SECURE\_FLASH\_ENC\_ENABLED*

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it's possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it's no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

When EFUSE\_VIRTUAL is enabled, SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE is not available. For CI tests we use IDF\_CI\_BUILD to bypass it ("export IDF\_CI\_BUILD=1"). We do not recommend bypassing it for other purposes.

Refer to the Flash Encryption section of the ESP-IDF Programmer's Guide for details.

Available options:

- Development (NOT SECURE) (CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE\_DEVELOPMENT)
- Release (CONFIG\_SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE)

### Potentially insecure options Contains:

- *CONFIG\_SECURE\_BOOT\_V2\_ALLOW\_EFUSE\_RD\_DIS*
- *CONFIG\_SECURE\_BOOT\_ALLOW\_SHORT\_APP\_PARTITION*
- *CONFIG\_SECURE\_BOOT\_ALLOW\_JTAG*
- *CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_ENC*
- *CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_CACHE*
- *CONFIG\_SECURE\_BOOT\_ALLOW\_UNUSED\_DIGEST\_SLOTS*
- *CONFIG\_SECURE\_FLASH\_REQUIRE\_ALREADY\_ENABLED*
- *CONFIG\_SECURE\_FLASH\_SKIP\_WRITE\_PROTECTION\_CACHE*

## CONFIG\_SECURE\_BOOT\_ALLOW\_JTAG

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

### Default value:

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` || `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

## CONFIG\_SECURE\_BOOT\_ALLOW\_SHORT\_APP\_PARTITION

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn't support 64KB aligned partition lengths.

## CONFIG\_SECURE\_BOOT\_V2\_ALLOW\_EFUSE\_RD\_DIS

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the `WR_DIS_RD_DIS` efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the `EFUSE_RD_DIS` efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the `BLK2` efuse (for ESP32) and `BLOCK4-BLOCK10` (i.e. `BLOCK_KEY0-BLOCK_KEY5`)(for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

NOTE: Once a `BLOCK` is read-protected, the application will read all zeros from that block

NOTE: If "UART ROM download mode (Permanently disabled (recommended))" or "UART ROM download mode (Permanently switch to Secure mode (recommended))" is set, then it is `__NOT__` possible to read/write efuses using `espefuse.py` utility. However, efuse can be read/written from the application

## CONFIG\_SECURE\_BOOT\_ALLOW\_UNUSED\_DIGEST\_SLOTS

Leave unused digest slots available (not revoke)

*Found in: Security features > Potentially insecure options*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called `esp_efuse_set_digest_revoke(num_digest)` for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE` &&  
`SOC_EFUSE_REVOKE_BOOT_KEY_DIGESTS`

**CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_ENC**

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG\_SECURE\_FLASH\_UART\_BOOTLOADER\_ALLOW\_CACHE**

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG\_SECURE\_FLASH\_REQUIRE\_ALREADY\_ENABLED**

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using `espefuse.py`.

**Default value:**

- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG\_SECURE\_FLASH\_SKIP\_WRITE\_PROTECTION\_CACHE**

Skip write-protection of DIS\_CACHE (DIS\_ICACHE, DIS\_DCACHE)

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on the first boot the bootloader will burn the write-protection of DIS\_CACHE(for ESP32) or DIS\_ICACHE/DIS\_DCACHE(for other chips) eFuse when Flash Encryption is enabled. Write protection for cache disable efuse prevents the chip from being blocked if it is set by accident. App and bootloader use cache so disabling it makes the chip useless for IDF. Due to other eFuses are linked with the same write protection bit (see the list below) then write-protection will not be done if these `SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`, `SECURE_BOOT_ALLOW_JTAG` or `SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE` options are selected to give a chance to turn on the chip into the release mode later.

List of eFuses with the same write protection bit: ESP32: MAC, MAC\_CRC, DISABLE\_APP\_CPU, DISABLE\_BT, DIS\_CACHE, VOL\_LEVEL\_HP\_INV.

ESP32-C3: DIS\_ICACHE, DIS\_USB\_JTAG, DIS\_DOWNLOAD\_ICACHE, DIS\_USB\_SERIAL\_JTAG, DIS\_FORCE\_DOWNLOAD, DIS\_TWAI, JTAG\_SEL\_ENABLE, DIS\_PAD\_JTAG, DIS\_DOWNLOAD\_MANUAL\_ENCRYPT.

ESP32-C6: SWAP\_UART\_SDIO\_EN, DIS\_ICACHE, DIS\_USB\_JTAG, DIS\_DOWNLOAD\_ICACHE, DIS\_USB\_SERIAL\_JTAG, DIS\_FORCE\_DOWNLOAD, DIS\_TWAI, JTAG\_SEL\_ENABLE, DIS\_PAD\_JTAG, DIS\_DOWNLOAD\_MANUAL\_ENCRYPT.

ESP32-H2: DIS\_ICACHE, DIS\_USB\_JTAG, POWERGLITCH\_EN, DIS\_FORCE\_DOWNLOAD, SPI\_DOWNLOAD\_MSPI\_DIS, DIS\_TWAI, JTAG\_SEL\_ENABLE, DIS\_PAD\_JTAG, DIS\_DOWNLOAD\_MANUAL\_ENCRYPT.

ESP32-S2: DIS\_ICACHE, DIS\_DCACHE, DIS\_DOWNLOAD\_ICACHE, DIS\_DOWNLOAD\_DCACHE, DIS\_FORCE\_DOWNLOAD, DIS\_USB, DIS\_TWAI, DIS\_BOOT\_REMAP, SOFT\_DIS\_JTAG, HARD\_DIS\_JTAG, DIS\_DOWNLOAD\_MANUAL\_ENCRYPT.

ESP32-S3: DIS\_ICACHE, DIS\_DCACHE, DIS\_DOWNLOAD\_ICACHE, DIS\_DOWNLOAD\_DCACHE, DIS\_FORCE\_DOWNLOAD, DIS\_USB\_OTG, DIS\_TWAI, DIS\_APP\_CPU, DIS\_PAD\_JTAG, DIS\_DOWNLOAD\_MANUAL\_ENCRYPT, DIS\_USB\_JTAG, DIS\_USB\_SERIAL\_JTAG, STRAP\_JTAG\_SEL, USB\_PHY\_SEL.

### CONFIG\_SECURE\_FLASH\_ENCRYPT\_ONLY\_IMAGE\_LEN\_IN\_APP\_PART

Encrypt only the app image that is present in the partition of type app

*Found in: Security features*

If set, optimise encryption time for the partition of type APP, by only encrypting the app image that is present in the partition, instead of the whole partition. The image length used for encryption is derived from the image metadata, which includes the size of the app image, checksum, hash and also the signature sector when secure boot is enabled.

If not set (default), the whole partition of type APP would be encrypted, which increases the encryption time but might be useful if there is any custom data appended to the firmware image.

### CONFIG\_SECURE\_FLASH\_CHECK\_ENC\_EN\_IN\_APP

Check Flash Encryption enabled on app startup

*Found in: Security features*

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

**Default value:**

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

### CONFIG\_SECURE\_UART\_ROM\_DL\_MODE

UART ROM download mode

*Found in: Security features*

Available options:

- UART ROM download mode (Permanently disabled (recommended)) (`CONFIG_SECURE_DISABLE_ROM_DL_MODE`)  
If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of `esptool.py`, `espefuse.py` and similar tools.  
Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.  
It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.  
It is also possible to permanently disable Download Mode by calling `esp_efuse_disable_rom_download_mode()` at runtime.
- UART ROM download mode (Permanently switch to Secure mode (recommended)) (`CONFIG_SECURE_ENABLE_SECURE_ROM_DL_MODE`)  
If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.  
Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (`get_security_info`).  
Secure Download mode is not compatible with the `esptool.py` flasher stub feature, `espefuse.py`, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.  
Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential "attack surface" for an attacker to try and bypass them with a successful physical attack.  
It is also possible to enable secure download mode at runtime by calling `esp_efuse_enable_rom_secure_download_mode()`  
Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).
- UART ROM download mode (Enabled (not recommended)) (`CONFIG_SECURE_INSECURE_ALLOW_DL_MODE`)  
This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option **SHOULD NOT BE ENABLED** for production use cases.

## Application manager

Contains:

- `CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR`
- `CONFIG_APP_EXCLUDE_PROJECT_VER_VAR`
- `CONFIG_APP_PROJECT_VER_FROM_CONFIG`
- `CONFIG_APP_RETRIEVE_LEN_ELF_SHA`
- `CONFIG_APP_COMPILE_TIME_DATE`

### `CONFIG_APP_COMPILE_TIME_DATE`

Use time/date stamp for app

*Found in:* [Application manager](#)

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

#### **Default value:**

- Yes (enabled)

### CONFIG\_APP\_EXCLUDE\_PROJECT\_VER\_VAR

Exclude PROJECT\_VER from firmware image

*Found in: Application manager*

The PROJECT\_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp\_app\_desc structure.

**Default value:**

- No (disabled)

### CONFIG\_APP\_EXCLUDE\_PROJECT\_NAME\_VAR

Exclude PROJECT\_NAME from firmware image

*Found in: Application manager*

The PROJECT\_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp\_app\_desc structure.

**Default value:**

- No (disabled)

### CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP\_PROJECT\_VER will be used for the variable PROJECT\_VER. Other ways to set PROJECT\_VER will be ignored.

**Default value:**

- No (disabled)

### CONFIG\_APP\_PROJECT\_VER

Project version

*Found in: Application manager > CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

Project version

**Default value:**

- 1 if *CONFIG\_APP\_PROJECT\_VER\_FROM\_CONFIG*

### CONFIG\_APP\_RETRIEVE\_LEN\_ELF\_SHA

The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read this many hex characters from the embedded APP ELF SHA-256 hash value and store it in static RAM. This ensures the app ELF SHA-256 value is always available if it needs to be printed by the panic handler code. Changing this value will change the size of a static buffer, in bytes.

**Range:**

- from 8 to 64

**Default value:**

- 16

## Boot ROM Behavior

Contains:

- [\*CONFIG\\_BOOT\\_ROM\\_LOG\\_SCHEME\*](#)

### CONFIG\_BOOT\_ROM\_LOG\_SCHEME

Permanently change Boot ROM output

*Found in: [Boot ROM Behavior](#)*

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

Available options:

- Always Log ([\*CONFIG\\_BOOT\\_ROM\\_LOG\\_ALWAYS\\_ON\*](#))  
Always print ROM logs, this is the default behavior.
- Permanently disable logging ([\*CONFIG\\_BOOT\\_ROM\\_LOG\\_ALWAYS\\_OFF\*](#))  
Don't print ROM logs.
- Log on GPIO High ([\*CONFIG\\_BOOT\\_ROM\\_LOG\\_ON\\_GPIO\\_HIGH\*](#))  
Print ROM logs when GPIO level is high during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.
- Log on GPIO Low ([\*CONFIG\\_BOOT\\_ROM\\_LOG\\_ON\\_GPIO\\_LOW\*](#))  
Print ROM logs when GPIO level is low during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

## Serial flasher config

Contains:

- [\*CONFIG\\_ESPTOOLPY\\_AFTER\*](#)
- [\*CONFIG\\_ESPTOOLPY\\_BEFORE\*](#)
- [\*CONFIG\\_ESPTOOLPY\\_HEADER\\_FLASHSIZE\\_UPDATE\*](#)
- [\*CONFIG\\_ESPTOOLPY\\_NO\\_STUB\*](#)
- [\*CONFIG\\_ESPTOOLPY\\_FLASH\\_SAMPLE\\_MODE\*](#)
- [\*CONFIG\\_ESPTOOLPY\\_FLASHSIZE\*](#)
- [\*CONFIG\\_ESPTOOLPY\\_FLASHMODE\*](#)
- [\*CONFIG\\_ESPTOOLPY\\_FLASHFREQ\*](#)

### CONFIG\_ESPTOOLPY\_NO\_STUB

Disable download stub

*Found in: [Serial flasher config](#)*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature

### CONFIG\_ESPTOOLPY\_FLASHMODE

Flash SPI mode

*Found in: [Serial flasher config](#)*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:

- QIO (CONFIG\_ESPTOOLPY\_FLASHMODE\_QIO)
- QOUT (CONFIG\_ESPTOOLPY\_FLASHMODE\_QOUT)
- DIO (CONFIG\_ESPTOOLPY\_FLASHMODE\_DIO)
- DOUT (CONFIG\_ESPTOOLPY\_FLASHMODE\_DOUT)
- OPI (CONFIG\_ESPTOOLPY\_FLASHMODE\_OPI)

### CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE

Flash Sampling Mode

*Found in: Serial flasher config*

Available options:

- STR Mode (CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE\_STR)
- DTR Mode (CONFIG\_ESPTOOLPY\_FLASH\_SAMPLE\_MODE\_DTR)

### CONFIG\_ESPTOOLPY\_FLASHFREQ

Flash SPI speed

*Found in: Serial flasher config*

Available options:

- 120 MHz (READ DOCS FIRST) (CONFIG\_ESPTOOLPY\_FLASHFREQ\_120M)
  - Optional feature for QSPI Flash. Read docs and enable *CONFIG\_SPI\_FLASH\_HPM\_ENA* first!
  - Flash 120 MHz SDR mode is stable.
  - Flash 120 MHz DDR mode is an experimental feature, it works when the temperature is stable.
    - Risks:** If your chip powers on at a certain temperature, then after the temperature increases or decreases by approximately 20 Celsius degrees (depending on the chip), the program will crash randomly.
- 80 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_80M)
- 64 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_64M)
- 60 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_60M)
- 48 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_48M)
- 40 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_40M)
- 32 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_32M)
- 30 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_30M)
- 26 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_26M)
- 24 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_24M)
- 20 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_20M)
- 16 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_16M)
- 15 MHz (CONFIG\_ESPTOOLPY\_FLASHFREQ\_15M)

### CONFIG\_ESPTOOLPY\_FLASHSIZE

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

Available options:

- 1 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_1MB)

- 2 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_2MB)
- 4 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_4MB)
- 8 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_8MB)
- 16 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_16MB)
- 32 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_32MB)
- 64 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_64MB)
- 128 MB (CONFIG\_ESPTOOLPY\_FLASHSIZE\_128MB)

### CONFIG\_ESPTOOLPY\_HEADER\_FLASHSIZE\_UPDATE

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

### CONFIG\_ESPTOOLPY\_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset to bootloader (CONFIG\_ESPTOOLPY\_BEFORE\_RESET)
- No reset (CONFIG\_ESPTOOLPY\_BEFORE\_NORESET)

### CONFIG\_ESPTOOLPY\_AFTER

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset after flashing (CONFIG\_ESPTOOLPY\_AFTER\_RESET)
- Stay in bootloader (CONFIG\_ESPTOOLPY\_AFTER\_NORESET)

### Partition Table

Contains:

- [CONFIG\\_PARTITION\\_TABLE\\_CUSTOM\\_FILENAME](#)
- [CONFIG\\_PARTITION\\_TABLE\\_MD5](#)
- [CONFIG\\_PARTITION\\_TABLE\\_OFFSET](#)
- [CONFIG\\_PARTITION\\_TABLE\\_TYPE](#)

**CONFIG\_PARTITION\_TABLE\_TYPE**

Partition Table

Found in: [Partition Table](#)

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition\_table directory. These are mostly intended for example and development use, it's expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:

- Single factory app, no OTA (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP)  
This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Single factory app (large), no OTA (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_LARGE)  
This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_large.csv  
This partition table is not suitable for an app that needs OTA (over the air update) capability.
- Factory app, two OTA definitions (CONFIG\_PARTITION\_TABLE\_TWO\_OTA)  
This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_two\_ota.csv
- Custom partition table CSV (CONFIG\_PARTITION\_TABLE\_CUSTOM)  
Specify the path to the partition table CSV to use for your project.  
Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.
- Single factory app, no OTA, encrypted NVS (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_ENCRYPTED\_NVS)  
This is a variation of the default "Single factory app, no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_encr\_nvs.csv
- Single factory app (large), no OTA, encrypted NVS (CONFIG\_PARTITION\_TABLE\_SINGLE\_APP\_LARGE\_ENC\_NVS)  
This is a variation of the "Single factory app (large), no OTA" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_singleapp\_large\_encr\_nvs.csv
- Factory app, two OTA definitions, encrypted NVS (CONFIG\_PARTITION\_TABLE\_TWO\_OTA\_ENCRYPTED\_NVS)  
This is a variation of the "Factory app, two OTA definitions" partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.  
The corresponding CSV file in the IDF directory is components/partition\_table/partitions\_two\_ota\_encr\_nvs.csv

### CONFIG\_PARTITION\_TABLE\_CUSTOM\_FILENAME

Custom partition CSV file

*Found in:* [Partition Table](#)

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- "partitions.csv"

### CONFIG\_PARTITION\_TABLE\_OFFSET

Offset of partition table

*Found in:* [Partition Table](#)

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION\_TABLE\_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**

- "0x8000"

### CONFIG\_PARTITION\_TABLE\_MD5

Generate an MD5 checksum for the partition table

*Found in:* [Partition Table](#)

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**

- Yes (enabled)

### Compiler options

Contains:

- [CONFIG\\_COMPILER\\_OPTIMIZATION\\_ASSERTION\\_LEVEL](#)
- [CONFIG\\_COMPILER\\_FLOAT\\_LIB\\_FROM](#)
- [CONFIG\\_COMPILER\\_OPTIMIZATION\\_CHECKS\\_SILENT](#)
- [CONFIG\\_COMPILER\\_DISABLE\\_GCC12\\_WARNINGS](#)
- [CONFIG\\_COMPILER\\_DUMP\\_RTL\\_FILES](#)
- [CONFIG\\_COMPILER\\_SAVE\\_RESTORE\\_LIBCALLS](#)
- [CONFIG\\_COMPILER\\_WARN\\_WRITE\\_STRINGS](#)
- [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS](#)
- [CONFIG\\_COMPILER\\_CXX\\_RTTI](#)
- [CONFIG\\_COMPILER\\_OPTIMIZATION](#)
- [CONFIG\\_COMPILER\\_HIDE\\_PATHS\\_MACROS](#)
- [CONFIG\\_COMPILER\\_STACK\\_CHECK\\_MODE](#)

## CONFIG\_COMPILER\_OPTIMIZATION

Optimization Level

*Found in: [Compiler options](#)*

This option sets compiler optimization level (gcc -O argument) for the app.

- The "Default" setting will add the -Og flag to CFLAGS.
- The "Size" setting will add the -Os flag to CFLAGS.
- The "Performance" setting will add the -O2 flag to CFLAGS.
- The "None" setting will add the -O0 flag to CFLAGS.

The "Size" setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The "Performance" setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

"None" with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOTLOADER\_COMPILER\_OPTIMIZATION setting.

Available options:

- Debug (-Og) (CONFIG\_COMPILER\_OPTIMIZATION\_DEFAULT)
- Optimize for size (-Os) (CONFIG\_COMPILER\_OPTIMIZATION\_SIZE)
- Optimize for performance (-O2) (CONFIG\_COMPILER\_OPTIMIZATION\_PERF)
- Debug without optimization (-O0) (CONFIG\_COMPILER\_OPTIMIZATION\_NONE)

## CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTION\_LEVEL

Assertion level

*Found in: [Compiler options](#)*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to "silent" to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:

- Enabled (CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTIONS\_ENABLE)  
Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTIONS\_SILENT)  
Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled (sets -DNDEBUG) (CONFIG\_COMPILER\_OPTIMIZATION\_ASSERTIONS\_DISABLE)  
If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

## CONFIG\_COMPILER\_FLOAT\_LIB\_FROM

Compiler float lib source

*Found in: [Compiler options](#)*

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is "fast", but it has a few exceptions from IEEE 754 compliance.

Available options:

- libgcc (CONFIG\_COMPILER\_FLOAT\_LIB\_FROM\_GCCLIB)
- librvfp (CONFIG\_COMPILER\_FLOAT\_LIB\_FROM\_RVFPLIB)

### CONFIG\_COMPILER\_OPTIMIZATION\_CHECKS\_SILENT

Disable messages in ESP\_RETURN\_ON\_\* and ESP\_EXIT\_ON\_\* macros

*Found in: [Compiler options](#)*

If enabled, the error messages will be discarded in following check macros: -  
ESP\_RETURN\_ON\_ERROR - ESP\_EXIT\_ON\_ERROR - ESP\_RETURN\_ON\_FALSE -  
ESP\_EXIT\_ON\_FALSE

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_HIDE\_PATHS\_MACROS

Replace ESP-IDF and project paths in binaries

*Found in: [Compiler options](#)*

When expanding the `__FILE__` and `__BASE_FILE__` macros, replace paths inside ESP-IDF with paths relative to the placeholder string "IDF", and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes `-fmacro-prefix-map` options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom `-fmacro-prefix-map` or `-ffile-prefix-map` arguments.

**Default value:**

- Yes (enabled)

### CONFIG\_COMPILER\_CXX\_EXCEPTIONS

Enable C++ exceptions

*Found in: [Compiler options](#)*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_COMPILER\\_CXX\\_EXCEPTIONS\\_EMG\\_POOL\\_SIZE](#)

### CONFIG\_COMPILER\_CXX\_EXCEPTIONS\_EMG\_POOL\_SIZE

Emergency Pool Size

Found in: *Compiler options* > *CONFIG\_COMPILER\_CXX\_EXCEPTIONS*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**

- 0 if *CONFIG\_COMPILER\_CXX\_EXCEPTIONS*

### CONFIG\_COMPILER\_CXX\_RTTI

Enable C++ run-time type info (RTTI)

Found in: *Compiler options*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_STACK\_CHECK\_MODE

Stack smashing protection mode

Found in: *Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected -- those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

Available options:

- None (*CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_NONE*)
- Normal (*CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_NORM*)
- Strong (*CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_STRONG*)
- Overall (*CONFIG\_COMPILER\_STACK\_CHECK\_MODE\_ALL*)

### CONFIG\_COMPILER\_WARN\_WRITE\_STRINGS

Enable `-Wwrite-strings` warning flag

Found in: *Compiler options*

Adds `-Wwrite-strings` flag for the C/C++ compilers.

For C, this gives string constants the type `const char []` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_SAVE\_RESTORE\_LIBCALLS

Enable `-msave-restore` flag to reduce code size

*Found in: [Compiler options](#)*

Adds `-msave-restore` to C/C++ compilation flags.

When this flag is enabled, compiler will call library functions to save/restore registers in function prologues/epilogues. This results in lower overall code size, at the expense of slightly reduced performance.

This option can be enabled for RISC-V targets only.

### CONFIG\_COMPILER\_DISABLE\_GCC12\_WARNINGS

Disable new warnings introduced in GCC 12

*Found in: [Compiler options](#)*

Enable this option if use GCC 12 or newer, and want to disable warnings which don't appear with GCC 11.

**Default value:**

- No (disabled)

### CONFIG\_COMPILER\_DUMP\_RTL\_FILES

Dump RTL files during compilation

*Found in: [Compiler options](#)*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

### Component config

Contains:

- *CONFIG\_APPTRACE\_UART\_TASK\_PRIO*
- *CONFIG\_APPTRACE\_UART\_TX\_MSG\_SIZE*
- *CONFIG\_APPTRACE\_UART\_TX\_GPIO*
- *CONFIG\_APPTRACE\_UART\_TX\_BUFF\_SIZE*

### **CONFIG\_APPTRACE\_DESTINATION1**

Data Destination 1

*Found in: [Component config](#) > [Application Level Tracing](#)*

Select destination for application trace: JTAG or none (to disable).

Available options:

- JTAG (CONFIG\_APPTRACE\_DEST\_JTAG)
- None (CONFIG\_APPTRACE\_DEST\_NONE)

### **CONFIG\_APPTRACE\_DESTINATION2**

Data Destination 2

*Found in: [Component config](#) > [Application Level Tracing](#)*

Select destination for application trace: UART(XX) or none (to disable).

Available options:

- UART0 (CONFIG\_APPTRACE\_DEST\_UART0)
- UART1 (CONFIG\_APPTRACE\_DEST\_UART1)
- UART2 (CONFIG\_APPTRACE\_DEST\_UART2)
- USB\_CDC (CONFIG\_APPTRACE\_DEST\_USB\_CDC)
- None (CONFIG\_APPTRACE\_DEST\_UART\_NONE)

### **CONFIG\_APPTRACE\_UART\_TX\_GPIO**

UART TX on GPIO#

*Found in: [Component config](#) > [Application Level Tracing](#)*

This GPIO is used for UART TX pin.

### **CONFIG\_APPTRACE\_UART\_RX\_GPIO**

UART RX on GPIO#

*Found in: [Component config](#) > [Application Level Tracing](#)*

This GPIO is used for UART RX pin.

### **CONFIG\_APPTRACE\_UART\_BAUDRATE**

UART baud rate

*Found in: [Component config](#) > [Application Level Tracing](#)*

This baud rate is used for UART.

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

**CONFIG\_APPTRACE\_UART\_RX\_BUFF\_SIZE**

UART RX ring buffer size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

**CONFIG\_APPTRACE\_UART\_TX\_BUFF\_SIZE**

UART TX ring buffer size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

**CONFIG\_APPTRACE\_UART\_TX\_MSG\_SIZE**

UART TX message size

*Found in: [Component config](#) > [Application Level Tracing](#)*

Maximum size of the single message to transfer.

**CONFIG\_APPTRACE\_UART\_TASK\_PRIO**

UART Task Priority

*Found in: [Component config](#) > [Application Level Tracing](#)*

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX\_PRIORITIES-1).

**Range:**

- from 1 to 32

**Default value:**

- 1

**CONFIG\_APPTRACE\_ONPANIC\_HOST\_FLUSH\_TMO**

Timeout for flushing last trace data to host on panic

*Found in: [Component config](#) > [Application Level Tracing](#)*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG\_APPTRACE\_POSTMORTEM\_FLUSH\_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: [Component config](#) > [Application Level Tracing](#)*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG\_APPTRACE\_BUF\_SIZE**

Size of the apptrace buffer

*Found in: [Component config](#) > [Application Level Tracing](#)*

Size of the memory buffer for trace data in bytes.

### CONFIG\_APPTRACE\_PENDING\_DATA\_SIZE\_MAX

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

### FreeRTOS SystemView Tracing Contains:

- *CONFIG\_APPTRACE\_SV\_CPU*
- *CONFIG\_APPTRACE\_SV\_EVT\_ISR\_ENTER\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_ISR\_EXIT\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_ISR\_TO\_SCHED\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_MAX\_TASKS*
- *CONFIG\_APPTRACE\_SV\_EVT\_IDLE\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_CREATE\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_EXEC\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_READY\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_EXEC\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_READY\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TASK\_TERMINATE\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_ENTER\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_EXIT\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_TS\_SOURCE*
- *CONFIG\_APPTRACE\_SV\_EVT\_OVERFLOW\_ENABLE*
- *CONFIG\_APPTRACE\_SV\_BUF\_WAIT\_TMO*

### CONFIG\_APPTRACE\_SV\_ENABLE

SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

### CONFIG\_APPTRACE\_SV\_DEST

SystemView destination

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG\_APPTRACE\_SV\_ENABLE*

SystemView will transfer data through defined interface.

Available options:

- Data destination JTAG (CONFIG\_APPTRACE\_SV\_DEST\_JTAG)  
Send SEGGER SystemView events through JTAG interface.
- Data destination UART (CONFIG\_APPTRACE\_SV\_DEST\_UART)  
Send SEGGER SystemView events through UART interface.

### CONFIG\_APPTRACE\_SV\_CPU

CPU to trace

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Define the CPU to trace by SystemView.

Available options:

- CPU0 (CONFIG\_APPTRACE\_SV\_DEST\_CPU\_0)  
Send SEGGER SystemView events for Pro CPU.
- CPU1 (CONFIG\_APPTRACE\_SV\_DEST\_CPU\_1)  
Send SEGGER SystemView events for App CPU.

### **CONFIG\_APPTRACE\_SV\_TS\_SOURCE**

Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:

- CPU cycle counter (CCOUNT) (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_CCOUNT)
- General Purpose Timer (Timer Group) (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_GPTIMER)
- esp\_timer high resolution timer (CONFIG\_APPTRACE\_SV\_TS\_SOURCE\_ESP\_TIMER)

### **CONFIG\_APPTRACE\_SV\_MAX\_TASKS**

Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures maximum supported tasks in sysview debug

### **CONFIG\_APPTRACE\_SV\_BUF\_WAIT\_TMO**

Trace buffer wait timeout

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

### **CONFIG\_APPTRACE\_SV\_EVT\_OVERFLOW\_ENABLE**

Trace Buffer Overflow Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables "Trace Buffer Overflow" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_ENTER\_ENABLE**

ISR Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables "ISR Enter" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_EXIT\_ENABLE**

ISR Exit Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "ISR Exit" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_ISR\_TO\_SCHED\_ENABLE**

ISR Exit to Scheduler Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "ISR to Scheduler" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_EXEC\_ENABLE**

Task Start Execution Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Start Execution" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_EXEC\_ENABLE**

Task Stop Execution Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Stop Execution" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_START\_READY\_ENABLE**

Task Start Ready State Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Start Ready State" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_STOP\_READY\_ENABLE**

Task Stop Ready State Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Stop Ready State" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_CREATE\_ENABLE**

Task Create Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Create" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TASK\_TERMINATE\_ENABLE**

Task Terminate Event

*Found in: [Component config](#) > [Application Level Tracing](#) > [FreeRTOS System View Tracing](#)*

Enables "Task Terminate" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_IDLE\_ENABLE**

System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "System Idle" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_ENTER\_ENABLE**

Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "Timer Enter" event.

### **CONFIG\_APPTRACE\_SV\_EVT\_TIMER\_EXIT\_ENABLE**

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS System View Tracing*

Enables "Timer Exit" event.

### **CONFIG\_APPTRACE\_GCOV\_ENABLE**

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.

### **CONFIG\_APPTRACE\_GCOV\_DUMP\_TASK\_STACK\_SIZE**

Gcov dump task stack size

*Found in: Component config > Application Level Tracing > CONFIG\_APPTRACE\_GCOV\_ENABLE*

Configures stack size of Gcov dump task

**Default value:**

- 2048 if *CONFIG\_APPTRACE\_GCOV\_ENABLE*

**Bluetooth** Contains:

- *Bluedroid Options*
- *CONFIG\_BT\_ENABLED*
- *Common Options*
- *Controller Options*
- *CONFIG\_BT\_HCI\_LOG\_DEBUG\_EN*
- *NimBLE Options*
- *CONFIG\_BT\_RELEASE\_IRAM*

### **CONFIG\_BT\_ENABLED**

Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

## CONFIG\_BT\_HOST

Host

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED*

This helps to choose Bluetooth host stack

Available options:

- **Bluedroid - Dual-mode (CONFIG\_BT\_BLUEDROID\_ENABLED)**  
This option is recommended for classic Bluetooth or for dual-mode usecases
- **NimBLE - BLE only (CONFIG\_BT\_NIMBLE\_ENABLED)**  
This option is recommended for BLE only usecases to save on memory
- **Disabled (CONFIG\_BT\_CONTROLLER\_ONLY)**  
This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

## CONFIG\_BT\_CONTROLLER

Controller

Found in: *Component config > Bluetooth > CONFIG\_BT\_ENABLED*

This helps to choose Bluetooth controller stack

Available options:

- **Enabled (CONFIG\_BT\_CONTROLLER\_ENABLED)**  
This option is recommended for Bluetooth controller usecases
- **Disabled (CONFIG\_BT\_CONTROLLER\_DISABLED)**  
This option is recommended for Bluetooth Host only usecases

**Bluedroid Options** Contains:

- *CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK*
- *CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG*
- *CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE*
- *CONFIG\_BT\_BTC\_TASK\_STACK\_SIZE*
- *CONFIG\_BT\_BLE\_ENABLED*
- *BT\_DEBUG\_LOG\_LEVEL*
- *CONFIG\_BT\_ACL\_CONNECTIONS*
- *CONFIG\_BT\_SMP\_MAX BONDS*
- *CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST*
- *CONFIG\_BT\_STACK\_NO\_LOG*
- *CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED*
- *CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED*
- *CONFIG\_BT\_BLE\_HIGH\_DUTY\_ADV\_INTERVAL*
- *CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE*
- *CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_SYNC\_TRANSFER*
- *CONFIG\_BT\_BLE\_FEAT\_CREATE\_SYNC\_ENH*
- *CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_ENH*
- *CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN*
- *CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN*
- *CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE*
- *CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT*
- *CONFIG\_BT\_BLE\_RPA\_TIMEOUT*
- *CONFIG\_BT\_BLE\_RPA\_SUPPORTED*

- `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY`

### **CONFIG\_BT\_BTC\_TASK\_STACK\_SIZE**

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btc task stack size

**Default value:**

- 3072 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLUEDROID\_PINNED\_TO\_CORE\_CHOICE**

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (`CONFIG_BT_BLUEDROID_PINNED_TO_CORE_0`)
- Core 1 (APP CPU) (`CONFIG_BT_BLUEDROID_PINNED_TO_CORE_1`)

### **CONFIG\_BT\_BTU\_TASK\_STACK\_SIZE**

Bluetooth Bluedroid Host Stack task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btu task stack size

**Default value:**

- 4352 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLUEDROID\_MEM\_DEBUG**

Bluedroid memory debug

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluedroid memory debug

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### **CONFIG\_BT\_BLE\_ENABLED**

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Bluetooth Low Energy

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_GATTS\_ENABLE

Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTS\_PPCP\_CHAR\_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This enables "Peripheral Preferred Connection Parameters" characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_BLE\_BLUFI\_ENABLE

Include blufi function

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option can be close when the app does not require blufi function.

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATT\_MAX\_SR\_PROFILES

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Server Profiles Count

**Range:**

- from 1 to 32 if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 8 if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATT\_MAX\_SR\_ATTRIBUTES

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Maximum GATT Service Attributes Count

**Range:**

- from 1 to 500 if *CONFIG\_BT\_GATTS\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 100 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_GATTS\_SEND\_SERVICE\_CHANGE\_MODE**

GATTS Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Service change indication mode for GATT Server.

Available options:

- GATTS manually send service change indication (`CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MANUAL`)  
Manually send service change indication through API `esp_ble_gatts_send_service_change_indication()`
- GATTS automatically send service change indication (`CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_AUTO`)  
Let Bluedroid handle the service change indication internally

**CONFIG\_BT\_GATTS\_ROBUST\_CACHING\_ENABLED**

Enable Robust Caching on Server Side

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

This option enables the GATT robust caching feature on the server. if turned on, the Client Supported Features characteristic, Database Hash characteristic, and Server Supported Features characteristic will be included in the GAP SERVICE.

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_GATTS\_DEVICE\_NAME\_WRITABLE**

Allow to write device name by GATT clients

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Enabling this option allows remote GATT clients to write device name

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_GATTS\_APPEARANCE\_WRITABLE**

Allow to write appearance by GATT clients

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTS\_ENABLE*

Enabling this option allows remote GATT clients to write appearance

**Default value:**

- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_GATTC\_ENABLE

Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app work only on gatt server mode

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTC\_MAX\_CACHE\_CHAR

Max gattc cache characteristic for discover

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

Maximum GATTC cache characteristic count

**Range:**

- from 1 to 500 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 40 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTC\_NOTIF\_REG\_MAX

Max gattc notify(indication) register number

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

Maximum GATTC notify(indication) register number

**Range:**

- from 1 to 64 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 5 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTC\_CACHE\_NVS\_FLASH

Save gattc cache data to nvs flash

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

This select can save gattc cache data to nvs flash

**Default value:**

- No (disabled) if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_GATTC\_CONNECT\_RETRY\_COUNT

The number of attempts to reconnect if the connection establishment failed

*Found in: Component config > Bluetooth > Blueroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_GATTC\_ENABLE*

The number of attempts to reconnect if the connection establishment failed

**Range:**

- from 0 to 255 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

**Default value:**

- 3 if *CONFIG\_BT\_GATTC\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_BLE\_SMP\_ENABLE

Include BLE security module(SMP)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be close when the app not used the ble security connect.

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_BLE\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_SMP\_SLAVE\_CON\_PARAMS\_UPD\_ENABLE

Slave enable connection parameters update during pairing

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG\_BT\_BLE\_ENABLED > CONFIG\_BT\_BLE\_SMP\_ENABLE*

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**

- No (disabled) if *CONFIG\_BT\_BLE\_SMP\_ENABLE* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### CONFIG\_BT\_STACK\_NO\_LOG

Disable BT debug logs (minimize bin size)

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the rodata code size

**Default value:**

- No (disabled) if *CONFIG\_BT\_BLUEDROID\_ENABLED* && *CONFIG\_BT\_BLUEDROID\_ENABLED*

### BT DEBUG LOG LEVEL Contains:

- *CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL*
- *CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL*

### **CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL**

HCI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for HCI layer

Available options:

- NONE (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_HCI\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL**

BTM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTM layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTM\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL**

L2CAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for L2CAP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_L2CAP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL**

RFCOMM layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for RFCOMM layer

Available options:

- NONE (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_RFCOMM\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL**

SDP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SDP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_SDP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL**

GAP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GAP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_GAP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL**

BNEP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Blueroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BNEP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BNEP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL**

PAN layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for PAN layer

Available options:

- NONE (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_PAN\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL**

A2D layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for A2D layer

Available options:

- NONE (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL**

AVDT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVDT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_EVENT)

- DEBUG (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVDT\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL**

AVCT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVCT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVCT\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL**

AVRC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for AVRC layer

Available options:

- NONE (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_AVRC\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL**

MCA layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for MCA layer

Available options:

- NONE (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_MCA\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL**

HID layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for HID layer

Available options:

- NONE (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_HID\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL**

APPL layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for APPL layer

Available options:

- NONE (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL**

GATT layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for GATT layer

Available options:

- NONE (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_GATT\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL**

SMP layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for SMP layer

Available options:

- NONE (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_SMP\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL**

BTIF layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTIF layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTIF\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL**

BTC layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for BTC layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BTC\_TRACE\_LEVEL\_VERBOSE)

### **CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL**

OSI layer

*Found in: [Component config](#) > [Bluetooth](#) > [Bluedroid Options](#) > [BT DEBUG LOG LEVEL](#)*

Define BT trace level for OSI layer

Available options:

- NONE (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_OSI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL

BLUFI layer

*Found in: Component config > Bluetooth > Blueroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BLUFI layer

Available options:

- NONE (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_WARNING)
- API (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_API)
- EVENT (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_EVENT)
- DEBUG (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BT\_LOG\_BLUFI\_TRACE\_LEVEL\_VERBOSE)

### CONFIG\_BT\_ACL\_CONNECTIONS

BT/BLE MAX ACL CONNECTIONS(1~9)

*Found in: Component config > Bluetooth > Blueroid Options*

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

**Range:**

- from 1 to 9 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 4 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_MULTI\_CONNECTION\_ENBALE

Enable BLE multi-connections

*Found in: Component config > Bluetooth > Blueroid Options*

Enable this option if there are multiple connections

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_ALLOCATION\_FROM\_SPIRAM\_FIRST

BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Blueroid Options*

This select can save the internal RAM if there have the PSRAM

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_DYNAMIC\_ENV\_MEMORY**

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluebird Options*

This select can make the allocation of memory will become more flexible

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_HOST\_QUEUE\_CONG\_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > Bluebird Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_SMP\_MAX\_BONDS**

BT/BLE maximum bond device count

*Found in: Component config > Bluetooth > Bluebird Options*

The number of security records for peer devices.

**CONFIG\_BT\_BLE\_ACT\_SCAN\_REP\_ADV\_SCAN**

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluebird Options*

Originally, when doing BLE active scan, Bluebird will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluebird will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG\_BT\_BLE\_ESTAB\_LINK\_CONN\_TOUT**

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluebird Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, `ESP_GATTC_OPEN_EVT` or `ESP_GATTS_OPEN_EVT` is triggered.

**Range:**

- from 1 to 60 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 30 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_MAX\_DEVICE\_NAME\_LEN

length of bluetooth device name

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can't fit in will be truncated.

**Range:**

- from 32 to 248 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 32 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_RPA\_SUPPORTED

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

### CONFIG\_BT\_BLE\_RPA\_TIMEOUT

Timeout of resolvable private address

*Found in: Component config > Bluetooth > Bluedroid Options*

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

**Range:**

- from 1 to 3600 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**

- 900 if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_50\_FEATURES\_SUPPORTED

Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Bluedroid Options*

Enabling this option activates BLE 5.0 features. This option is universally supported in chips that support BLE, except for ESP32.

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED

Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features.

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_SYNC\_TRANSFER

Enable BLE periodic advertising sync transfer feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE periodic advertising sync transfer feature

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_ENH

Enable periodic adv enhancements(adi support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the periodic advertising enhancements

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_FEAT\_CREATE\_SYNC\_ENH

Enable create sync enhancements(reporting disable and duplicate filtering enable support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the create sync enhancements

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_50_FEATURES_SUPPORTED` && `CONFIG_BT_BLUEDROID_ENABLED`

### CONFIG\_BT\_BLE\_HIGH\_DUTY\_ADV\_INTERVAL

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enable BLE high duty advertising interval feature

**Default value:**

- No (disabled) if `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**NimBLE Options** Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK`
- `BLE Services`
- `CONFIG_BT_NIMBLE_WHITELIST_SIZE`

- `CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_ROLE_BROADCASTER`
- `CONFIG_BT_NIMBLE_ROLE_CENTRAL`
- `CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL`
- `CONFIG_BT_NIMBLE_MESH`
- `CONFIG_BT_NIMBLE_ROLE_OBSERVER`
- `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL`
- `CONFIG_BT_NIMBLE_SECURITY_ENABLE`
- `CONFIG_BT_NIMBLE_BLUFI_ENABLE`
- `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`
- `CONFIG_BT_NIMBLE_DYNAMIC_SERVICE`
- `CONFIG_BT_NIMBLE_USE_ESP_TIMER`
- `CONFIG_BT_NIMBLE_DEBUG`
- `CONFIG_BT_NIMBLE_HS_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_VS_SUPPORT`
- `CONFIG_BT_NIMBLE_OPTIMIZE_MULTI_CONN`
- `CONFIG_BT_NIMBLE_ENC_ADV_DATA`
- `CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE`
- *GAP Service*
- *Host-controller Transport*
- `CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN`
- `CONFIG_BT_NIMBLE_MAX_BONDS`
- `CONFIG_BT_NIMBLE_MAX_CCCDS`
- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS`
- `CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM`
- `CONFIG_BT_NIMBLE_GATT_MAX_PROCS`
- `CONFIG_BT_NIMBLE_MEM_ALLOC_MODE`
- *Memory Settings*
- `CONFIG_BT_NIMBLE_LOG_LEVEL`
- `CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE`
- `CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS`
- `CONFIG_BT_NIMBLE_NVS_PERSIST`
- `CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU`
- `CONFIG_BT_NIMBLE_RPA_TIMEOUT`
- `CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST`

## **CONFIG\_BT\_NIMBLE\_MEM\_ALLOC\_MODE**

Memory allocation strategy

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:

- Internal memory (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL`)
- External SPIRAM (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL`)
- Default alloc mode (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT`)
- Internal IRAM (`CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT`)  
Allows to use IRAM memory region as 8bit accessible region.

Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### CONFIG\_BT\_NIMBLE\_LOG\_LEVEL

NimBLE Host log verbosity

*Found in: Component config > Bluetooth > NimBLE Options*

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in "Component config --> Log output --> Default log verbosity".

Available options:

- No logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_NONE)
- Error logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_ERROR)
- Warning logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_WARNING)
- Info logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_INFO)
- Debug logs (CONFIG\_BT\_NIMBLE\_LOG\_LEVEL\_DEBUG)

### CONFIG\_BT\_NIMBLE\_MAX\_CONNECTIONS

Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM\_CTRL\_BLE\_MAX\_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT\_CTRL\_BLE\_MAX\_ACT from controller menu. For ESP32C2, ESP32C6 and ESP32H2, each connection will take about 1k DRAM.

**Range:**

- from 1 to 2 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*
- from 1 to 9 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**Default value:**

- 2 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*
- 3 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MAX\_BONDS

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

**Default value:**

- 3 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_MAX\_CCCDS

Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

**Default value:**

- 8 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_L2CAP\_COC\_MAX\_NUM

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

**Range:**

- from 0 to 9 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_PINNED\_TO\_CORE\_CHOICE

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

Available options:

- Core 0 (PRO CPU) (`CONFIG_BT_NIMBLE_PINNED_TO_CORE_0`)
- Core 1 (APP CPU) (`CONFIG_BT_NIMBLE_PINNED_TO_CORE_1`)

### CONFIG\_BT\_NIMBLE\_HOST\_TASK\_STACK\_SIZE

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**

- 5120 if `CONFIG_BLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
- 4096 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_CENTRAL

Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables central role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_PERIPHERAL

Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*

Enable peripheral role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_BROADCASTER

Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables broadcaster role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ROLE\_OBSERVER

Enable BLE Observer role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables observer role

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_NVS\_PERSIST

Persist the BLE Bonding keys in NVS

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this flag to make bonding persistent across device reboots

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SECURITY\_ENABLE

Enable BLE SM feature

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE sm feature

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION`
- `CONFIG_BT_NIMBLE_SM_SC_LVL`
- `CONFIG_BT_NIMBLE_SM_LEGACY`
- `CONFIG_BT_NIMBLE_SM_SC`

### CONFIG\_BT\_NIMBLE\_SM\_LEGACY

Security manager legacy pairing

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_SECURITY\_ENABLE*

Enable security manager legacy pairing

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SM\_SC

Security manager secure connections (4.2)

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#)

Enable security manager secure connections

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_SM\_SC\_DEBUG\_KEYS

Use predefined public-private key pair

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) > [CONFIG\\_BT\\_NIMBLE\\_SM\\_SC](#)

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) && [CONFIG\\_BT\\_NIMBLE\\_SM\\_SC](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_ENCRYPTION

Enable LE encryption

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#)

Enable encryption connection

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_SM\_SC\_LVL

Security level

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#)

LE Security Mode 1 Levels: 1. No Security 2. Unauthenticated pairing with encryption 3. Authenticated pairing with encryption 4. Authenticated LE Secure Connections pairing with encryption using a 128-bit strength encryption key.

**Default value:**

- 0 if [CONFIG\\_BT\\_NIMBLE\\_SECURITY\\_ENABLE](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_DEBUG

Enable extra runtime asserts and host debugging

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This enables extra runtime asserts and host debugging

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_DYNAMIC\_SERVICE

Enable dynamic services

*Found in: Component config > Bluetooth > NimBLE Options*

This enables user to add/remove Gatt services at runtime

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_DEVICE\_NAME

BLE GAP default device name

*Found in: Component config > Bluetooth > NimBLE Options*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

**Default value:**

- "nimble" if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_GAP\_DEVICE\_NAME\_MAX\_LEN

Maximum length of BLE device name in octets

*Found in: Component config > Bluetooth > NimBLE Options*

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**

- 31 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ATT\_PREFERRED\_MTU

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

**Default value:**

- 256 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEARANCE

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Memory Settings** Contains:

- `CONFIG_BT_NIMBLE_TRANSPORT_ACL_FROM_LL_COUNT`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_DISCARD_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_BUF_FROM_HEAP`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_TRANSPORT_ACL_SIZE`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_COUNT`

- [CONFIG\\_BT\\_NIMBLE\\_TRANSPORT\\_EVT\\_SIZE](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_1\_BLOCK\_COUNT

MSYS\_1 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

MSYS is a system level mbuf registry. For prepare write & prepare responses Mbufs are allocated out of msys\_1 pool. For NIMBLE\_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**

- 24 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_1\_BLOCK\_SIZE

MSYS\_1 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 1

**Default value:**

- 128 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_2\_BLOCK\_COUNT

MSYS\_2 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory count

**Default value:**

- 24 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_2\_BLOCK\_SIZE

MSYS\_2 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 2

**Default value:**

- 320 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_MSYS\_BUF\_FROM\_HEAP

Get Msys Mbuf from heap

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This option sets the source of the shared msys mbuf memory between the Host and the Controller. Allocate the memory from the heap if this option is sets, from the mempool otherwise.

**Default value:**

- Yes (enabled) if `BT_LE_MSYS_INIT_IN_CONTROLLER` && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_ACL\_FROM\_LL\_COUNT

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

The number of ACL data buffers allocated for host.

**Default value:**

- 24 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_ACL\_SIZE

Transport ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**

- 255 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_EVT\_SIZE

Transport Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**

- 257 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
- 70 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_EVT\_COUNT

Transport Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

**Default value:**

- 30 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_EVT\_DISCARD\_COUNT

Discardable Transport Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the low priority HCI events' buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

**Default value:**

- 8 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_GATT\_MAX\_PROCS**

Maximum number of GATT client procedures

*Found in: Component config > Bluetooth > NimBLE Options*

Maximum number of GATT client procedures that can be executed.

**Default value:**

- 4 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL**

Enable Host Flow control

*Found in: Component config > Bluetooth > NimBLE Options*

Enable Host Flow control

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_ITVL**

Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL*

Host flow control interval in msecs

**Default value:**

- 1000 if *CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_THRESH**

Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**

- 2 if *CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL\_TX\_ON\_DISCONNECT**

Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_NIMBLE\_HS\_FLOW\_CTRL* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_RPA\_TIMEOUT**

RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change.

**Range:**

- from 1 to 41400 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**

- 900 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH

Enable BLE mesh functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)*

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: `./doc/..../esp32/api-guides/esp-ble-mesh/ble-mesh-index`

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_MESH_PROVISIONER`
- `CONFIG_BT_NIMBLE_MESH_PROV`
- `CONFIG_BT_NIMBLE_MESH_GATT_PROXY`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
- `CONFIG_BT_NIMBLE_MESH_RELAY`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_MESH_NODE_COUNT`

### CONFIG\_BT\_NIMBLE\_MESH\_PROXY

Enable mesh proxy functionality

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

Enable proxy. This is automatically set whenever `NIMBLE_MESH_PB_GATT` or `NIMBLE_MESH_GATT_PROXY` is set

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_PROV

Enable BLE mesh provisioning

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#)*

Enable mesh provisioning

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_PB\_ADV

Enable mesh provisioning over advertising bearer

*Found in: [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH](#) > [CONFIG\\_BT\\_NIMBLE\\_MESH\\_PROV](#)*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_PB\_GATT**

Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH > CONFIG\_BT\_NIMBLE\_MESH\_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_GATT\_PROXY**

Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_RELAY**

Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Support for acting as a Mesh Relay Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_LOW\_POWER**

Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Low Power Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### **CONFIG\_BT\_NIMBLE\_MESH\_FRIEND**

Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_DEVICE\_NAME

Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**

- "nimble-mesh-node" if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_NODE\_COUNT

Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Defines mesh node count.

**Default value:**

- 1 if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_MESH\_PROVISIONER

Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_MESH*

Enable mesh provisioner.

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_CRYPTOSTACK\_MBEDTLS

Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_HS\_STOP\_TIMEOUT\_MS

BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*

BLE Host stop procedure timeout in milliseconds.

**Default value:**

- 2000 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_ENABLE\_CONN\_REATTEMPT

Enable connection reattempts on connection establishment error

*Found in: Component config > Bluetooth > NimBLE Options*

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_BT\_NIMBLE\_MAX\_CONN\_REATTEMPT**

Maximum number connection reattempts

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#)

Defines maximum number of connection reattempts.

**Range:**

- from 1 to 255 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 3 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLE\\_CONN\\_REATTEMPT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT**

Enable BLE 5 feature

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable BLE 5 feature

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

Contains:

- [CONFIG\\_BT\\_NIMBLE\\_LL\\_CFG\\_FEAT\\_LE\\_2M\\_PHY](#)
- [CONFIG\\_BT\\_NIMBLE\\_LL\\_CFG\\_FEAT\\_LE\\_CODED\\_PHY](#)
- [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)
- [CONFIG\\_BT\\_NIMBLE\\_BLE\\_POWER\\_CONTROL](#)
- [CONFIG\\_BT\\_NIMBLE\\_MAX\\_PERIODIC\\_ADVERTISER\\_LIST](#)
- [CONFIG\\_BT\\_NIMBLE\\_MAX\\_PERIODIC\\_SYNC](#)
- [CONFIG\\_BT\\_NIMBLE\\_PERIODIC\\_ADV\\_ENH](#)

**CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_2M\_PHY**

Enable 2M Phy

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable 2M-PHY

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_LL\_CFG\_FEAT\_LE\_CODED\_PHY**

Enable coded Phy

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable coded-PHY

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_EXT\_ADV**

Enable extended advertising

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_MAX\_EXT\_ADV\_INSTANCES**

Maximum number of extended advertising instances.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. For ESP32C2, ESP32C6 and ESP32H2, each extended advertising instance will take about 0.5k DRAM.

**Range:**

- from 0 to 4 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)
- 0 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_EXT\_ADV\_MAX\_SIZE**

Maximum length of the advertising data.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Defines the length of the extended adv data. The value should not exceed 1650.

**Range:**

- from 0 to 1650 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 1650 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)
- 0 if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_ENABLE\_PERIODIC\_ADV**

Enable periodic advertisement.

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#)

Enable this option to start periodic advertisement.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**CONFIG\_BT\_NIMBLE\_PERIODIC\_ADV\_SYNC\_TRANSFER**

Enable Transfer Sync Events

*Found in:* *Component config* > *Bluetooth* > *NimBLE Options* > *CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT* > *CONFIG\_BT\_NIMBLE\_EXT\_ADV* > *CONFIG\_BT\_NIMBLE\_ENABLE\_PERIODIC\_ADV*

This enables controller transfer periodic sync events to host

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_NIMBLE\_ENABLE\_PERIODIC\_ADV* && *CONFIG\_BT\_NIMBLE\_EXT\_ADV* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_MAX\_PERIODIC\_SYNCS**

Maximum number of periodic advertising syncs

*Found in:* *Component config* > *Bluetooth* > *NimBLE Options* > *CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT*

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

**Range:**

- from 0 to 3 if *CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT* && *CONFIG\_BT\_NIMBLE\_ENABLED*
- from 0 to 8 if *CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**Default value:**

- 1 if *CONFIG\_BT\_NIMBLE\_ENABLE\_PERIODIC\_ADV* && *CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT* && *CONFIG\_BT\_NIMBLE\_ENABLED*
- 0 if *CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_MAX\_PERIODIC\_ADVERTISER\_LIST**

Maximum number of periodic advertiser list

*Found in:* *Component config* > *Bluetooth* > *NimBLE Options* > *CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT*

Set this option to set the upper limit for number of periodic advertiser list.

**Range:**

- from 1 to 5 if *CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**Default value:**

- 5 if *CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT* && *CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_BLE\_POWER\_CONTROL**

Enable support for BLE Power Control

*Found in:* *Component config* > *Bluetooth* > *NimBLE Options* > *CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT*

Set this option to enable the Power Control feature

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_50\_FEATURE\_SUPPORT* && *SOC\_BLE\_POWER\_CONTROL\_SUPPORTED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_PERIODIC\_ADV\_ENH

Periodic adv enhancements(adi support)

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable the periodic advertising enhancements

### CONFIG\_BT\_NIMBLE\_GATT\_CACHING

Enable GATT caching

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#)

Enable GATT caching

Contains:

- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING\\_MAX\\_CONNS](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING\\_MAX\\_CHRS](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING\\_MAX\\_DSCLS](#)
- [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING\\_MAX\\_SVCS](#)

### CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_CONNS

Maximum connections to be cached

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of connections to be cached.

**Default value:**

- 1 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_SVCS

Maximum number of services per connection

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of services per connection to be cached.

**Default value:**

- 64 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_CHRS

Maximum number of characteristics per connection

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of characteristics per connection to be cached.

**Default value:**

- 64 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_GATT\_CACHING\_MAX\_DSCS

Maximum number of descriptors per connection

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#) > [CONFIG\\_BT\\_NIMBLE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#)

Set this option to set the upper limit on number of descriptors per connection to be cached.

**Default value:**

- 64 if [CONFIG\\_BT\\_NIMBLE\\_GATT\\_CACHING](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_WHITELIST\_SIZE

BLE white list size

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

BLE list size

**Range:**

- from 1 to 15 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

**Default value:**

- 12 if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_TEST\_THROUGHPUT\_TEST

Throughput Test Mode enable

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Enable the throughput test mode

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_BLUFI\_ENABLE

Enable blufi functionality

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Set this option to enable blufi functionality.

**Default value:**

- No (disabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#) && [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_USE\_ESP\_TIMER

Enable Esp Timer for Nimble

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_NIMBLE\\_ENABLED](#)

### CONFIG\_BT\_NIMBLE\_BLE\_GATT\_BLOB\_TRANSFER

Blob transfer

*Found in:* [Component config](#) > [Bluetooth](#) > [NimBLE Options](#)

This option is used when data to be sent is more than 512 bytes. For peripheral role, BT\_NIMBLE\_MSYS\_1\_BLOCK\_COUNT needs to be increased according to the need.

**GAP Service** Contains:

- *GAP Appearance write permissions*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CENT\_ADDR\_RESOLUTION*
- *GAP device name write permissions*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MAX\_CONN\_INTERVAL*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MIN\_CONN\_INTERVAL*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SLAVE\_LATENCY*
- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SUPERVISION\_TMO*

**GAP Appearance write permissions** Contains:

- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE**

Write

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions*

Enable write permission (BLE\_GATT\_CHR\_F\_WRITE)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE\_ENC**

Write with encryption

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

Enable write with encryption permission (BLE\_GATT\_CHR\_F\_WRITE\_ENC)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE\_AUTHEN**

Write with authentication

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

Enable write with authentication permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHEN)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE\_AUTHOR**

Write with authorisation

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE*

Enable write with authorisation permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHOR)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_APPEAR\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

## CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CENT\_ADDR\_RESOLUTION

GAP Characteristic - Central Address Resolution

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Whether or not Central Address Resolution characteristic is supported on the device, and if supported, whether or not Central Address Resolution is supported.

- Central Address Resolution characteristic not supported
- Central Address Resolution not supported
- Central Address Resolution supported

Available options:

- Characteristic not supported (CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CAR\_CHAR\_NOT\_SUPP)
- Central Address Resolution not supported (CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CAR\_NOT\_SUPP)
- Central Address Resolution supported (CONFIG\_BT\_NIMBLE\_SVC\_GAP\_CAR\_SUPP)

**GAP device name write permissions** Contains:

- *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

## CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE

Write

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions*

Enable write permission (BLE\_GATT\_CHR\_F\_WRITE)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED*

## CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE\_ENC

Write with encryption

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

Enable write with encryption permission (BLE\_GATT\_CHR\_F\_WRITE\_ENC)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

## CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE\_AUTHEN

Write with authentication

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

Enable write with authentication permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHEN)

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE\_AUTHOR

Write with authorisation

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG\_BT\_NIMBLE\_SVC\_GAP\_NAME\_WRITE*

Enable write with authorisation permission (BLE\_GATT\_CHR\_F\_WRITE\_AUTHOR)

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MAX\_CONN\_INTERVAL

PPCP Connection Interval Max (Unit: 1.25 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Connection Interval maximum value Interval Max = value \* 1.25 ms

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_MIN\_CONN\_INTERVAL

PPCP Connection Interval Min (Unit: 1.25 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Connection Interval minimum value Interval Min = value \* 1.25 ms

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SLAVE\_LATENCY

PPCP Slave Latency

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Slave Latency

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_SVC\_GAP\_PPCP\_SUPERVISION\_TMO

PPCP Supervision Timeout (Unit: 10 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Supervision Timeout Timeout = Value \* 10 ms

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED`

**BLE Services** Contains:

- `CONFIG_BT_NIMBLE_HID_SERVICE`

### CONFIG\_BT\_NIMBLE\_HID\_SERVICE

HID service

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services*

Enable HID service support

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

Contains:

- *CONFIG\_BT\_NIMBLE\_SVC\_HID\_MAX\_RPTS*
- *CONFIG\_BT\_NIMBLE\_SVC\_HID\_MAX\_INSTANCES*

### CONFIG\_BT\_NIMBLE\_SVC\_HID\_MAX\_INSTANCES

Maximum HID service instances

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > CONFIG\_BT\_NIMBLE\_HID\_SERVICE*

Defines maximum number of HID service instances

**Default value:**

- 2 if *CONFIG\_BT\_NIMBLE\_HID\_SERVICE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_SVC\_HID\_MAX\_RPTS

Maximum HID Report characteristics per service instance

*Found in: Component config > Bluetooth > NimBLE Options > BLE Services > CONFIG\_BT\_NIMBLE\_HID\_SERVICE*

Defines maximum number of report characteristics per service instance

**Default value:**

- 3 if *CONFIG\_BT\_NIMBLE\_HID\_SERVICE* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_VS\_SUPPORT

Enable support for VSC and VSE

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used to enable support for sending Vendor Specific HCI commands and handling Vendor Specific HCI Events.

### CONFIG\_BT\_NIMBLE\_OPTIMIZE\_MULTI\_CONN

Enable the optimization of multi-connection

*Found in: Component config > Bluetooth > NimBLE Options*

This option enables the use of vendor-specific APIs for multi-connections, which can greatly enhance the stability of coexistence between numerous central and peripheral devices. It will prohibit the usage of standard APIs.

**Default value:**

- No (disabled) if *SOC\_BLE\_MULTI\_CONN\_OPTIMIZATION* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_ENC\_ADV\_DATA**

Encrypted Advertising Data

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used to enable encrypted advertising data.

**CONFIG\_BT\_NIMBLE\_MAX\_EADS**

Maximum number of EAD devices to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG\_BT\_NIMBLE\_ENC\_ADV\_DATA*

Defines maximum number of encrypted advertising data key material to save

**Default value:**

- 10 if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENC\_ADV\_DATA* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**CONFIG\_BT\_NIMBLE\_HIGH\_DUTY\_ADV\_ITVL**

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > NimBLE Options*

This enable BLE high duty advertising interval feature

**CONFIG\_BT\_NIMBLE\_HOST\_QUEUE\_CONG\_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > NimBLE Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

**Default value:**

- No (disabled) if *CONFIG\_BT\_NIMBLE\_ENABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

**Host-controller Transport** Contains:

- *CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*
- *CONFIG\_BT\_NIMBLE\_HCI\_UART\_CTS\_PIN*
- *CONFIG\_BT\_NIMBLE\_USE\_HCI\_UART\_FLOW\_CTRL*
- *CONFIG\_BT\_NIMBLE\_HCI\_UART\_RTS\_PIN*

**CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART**

Enable Uart Transport

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

Use UART transport

**Default value:**

- Yes (enabled) if *CONFIG\_BT\_CONTROLLER\_DISABLED* && *CONFIG\_BT\_NIMBLE\_ENABLED*

### CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART\_PORT

Uart port

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Uart port

**Default value:**

- 1 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_HCI\_USE\_UART\_BAUDRATE

Uart Hci Baud Rate

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Uart Baud Rate

Available options:

- 115200 (`CONFIG_UART_BAUDRATE_115200`)
- 230400 (`CONFIG_UART_BAUDRATE_230400`)
- 460800 (`CONFIG_UART_BAUDRATE_460800`)
- 921600 (`CONFIG_UART_BAUDRATE_921600`)

### CONFIG\_BT\_NIMBLE\_USE\_HCI\_UART\_PARITY

Uart PARITY

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Uart Parity

Available options:

- None (`CONFIG_UART_PARITY_NONE`)
- Odd (`CONFIG_UART_PARITY_ODD`)
- Even (`CONFIG_UART_PARITY_EVEN`)

### CONFIG\_BT\_NIMBLE\_UART\_RX\_PIN

UART Rx pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Rx pin for Nimble Transport

**Default value:**

- 5 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_UART\_TX\_PIN

UART Tx pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport > CONFIG\_BT\_NIMBLE\_TRANSPORT\_UART*

Tx pin for Nimble Transport

**Default value:**

- 4 if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_NIMBLE_TRANSPORT_UART` && `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_USE\_HCI\_UART\_FLOW\_CTRL

Uart Flow Control

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

Uart Flow Control

Available options:

- Disable (`CONFIG_UART_HW_FLOWCTRL_DISABLE`)
- Enable hardware flow control (`CONFIG_UART_HW_FLOWCTRL_CTS_RTS`)

### CONFIG\_BT\_NIMBLE\_HCI\_UART\_RTS\_PIN

UART Rts Pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

UART HCI RTS pin

**Default value:**

- 19 if `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_NIMBLE\_HCI\_UART\_CTS\_PIN

UART Cts Pin

*Found in: Component config > Bluetooth > NimBLE Options > Host-controller Transport*

UART HCI CTS pin

**Default value:**

- 23 if `CONFIG_BT_NIMBLE_ENABLED`

**Controller Options** Contains:

- `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP`
- `CONFIG_BT_LE_LL_DUP_SCAN_LIST_COUNT`
- `CONFIG_BT_LE_LL_RESOLV_LIST_SIZE`
- `CONFIG_BT_LE_LP_CLK_SRC`
- `CONFIG_BT_LE_LL_SCA`
- `CONFIG_BT_LE_WHITELIST_SIZE`
- `CONFIG_BT_LE_COEX_PHY_CODED_TX_RX_TLIM`
- `CONFIG_BT_LE_CONTROLLER_LOG_ENABLED`
- `CONFIG_BT_LE_CONTROLLER_TASK_STACK_SIZE`
- `CONFIG_BT_LE_50_FEATURE_SUPPORT`
- `CONFIG_BT_LE_ROLE_BROADCASTER_ENABLE`
- `CONFIG_BT_LE_ROLE_CENTROL_ENABLE`
- `CONFIG_BT_LE_ROLE_OBSERVER_ENABLE`

- `CONFIG_BT_LE_ROLE_PERIPHERAL_ENABLE`
- `CONFIG_BT_LE_SLEEP_ENABLE`
- `CONFIG_BT_LE_SECURITY_ENABLE`
- `CONFIG_BT_LE_TX_CCA_ENABLED`
- *HCI Config*
- `CONFIG_BT_LE_MAX_CONNECTIONS`
- *Memory Settings*
- `CONFIG_BT_LE_CRYPTO_STACK_MBEDTLS`
- `CONFIG_BT_LE_USE_ESP_TIMER`

**HCI Config** Contains:

- `CONFIG_BT_LE_HCI_UART_BAUD`
- `CONFIG_BT_LE_HCI_UART_CTS_PIN`
- `CONFIG_BT_LE_HCI_UART_FLOWCTRL`
- `CONFIG_BT_LE_HCI_UART_PORT`
- `CONFIG_BT_LE_HCI_UART_RTS_PIN`
- `CONFIG_BT_LE_HCI_UART_RX_PIN`
- `CONFIG_BT_LE_HCI_UART_TASK_STACK_SIZE`
- `CONFIG_BT_LE_HCI_UART_TX_PIN`
- `CONFIG_BT_LE_HCI_INTERFACE`
- `CONFIG_BT_LE_HCI_UART_PARITY`

### **CONFIG\_BT\_LE\_HCI\_INTERFACE**

Select HCI interface

*Found in: Component config > Bluetooth > Controller Options > HCI Config*

Available options:

- ram (`CONFIG_BT_LE_HCI_INTERFACE_USE_RAM`)  
Use RAM as HCI interface
- uart (`CONFIG_BT_LE_HCI_INTERFACE_USE_UART`)  
Use UART as HCI interface

### **CONFIG\_BT\_LE\_HCI\_UART\_PORT**

HCI UART port

*Found in: Component config > Bluetooth > Controller Options > HCI Config*

Set the port number of HCI UART

**Default value:**

- 1 if `CONFIG_BT_LE_HCI_INTERFACE_USE_UART` && `CONFIG_BT_CONTROLLER_ENABLED`

### **CONFIG\_BT\_LE\_HCI\_UART\_FLOWCTRL**

HCI uart Hardware Flow ctrl

*Found in: Component config > Bluetooth > Controller Options > HCI Config*

**Default value:**

- No (disabled) if `CONFIG_BT_LE_HCI_INTERFACE_USE_UART` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_HCI\_UART\_TX\_PIN**

HCI uart Tx gpio

*Found in: Component config > Bluetooth > Controller Options > HCI Config*

**Default value:**

- 19 if `CONFIG_BT_LE_HCI_INTERFACE_USE_UART` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_HCI\_UART\_RX\_PIN**

HCI uart Rx gpio

*Found in: Component config > Bluetooth > Controller Options > HCI Config*

**Default value:**

- 10 if `CONFIG_BT_LE_HCI_INTERFACE_USE_UART` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_HCI\_UART\_RTS\_PIN**

HCI uart RTS gpio

*Found in: Component config > Bluetooth > Controller Options > HCI Config*

**Default value:**

- 4 if `CONFIG_BT_LE_HCI_UART_FLOWCTRL` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_HCI\_UART\_CTS\_PIN**

HCI uart CTS gpio

*Found in: Component config > Bluetooth > Controller Options > HCI Config*

**Default value:**

- 5 if `CONFIG_BT_LE_HCI_UART_FLOWCTRL` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_HCI\_UART\_BAUD**

HCI uart baudrate

*Found in: Component config > Bluetooth > Controller Options > HCI Config*

HCI uart baud rate 115200 ~ 1000000

**Default value:**

- 921600 if `CONFIG_BT_LE_HCI_INTERFACE_USE_UART` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_HCI\_UART\_PARITY**

select uart parity

*Found in: Component config > Bluetooth > Controller Options > HCI Config*

Available options:

- `PARITY_DISABLE` (`CONFIG_BT_LE_HCI_UART_UART_PARITY_DISABLE`)  
`UART_PARITY_DISABLE`

- `PARITY_EVEN` (`CONFIG_BT_LE_HCI_UART_UART_PARITY_EVEN`)  
`UART_PARITY_EVEN`
- `PARITY_ODD` (`CONFIG_BT_LE_HCI_UART_UART_PARITY_ODD`)  
`UART_PARITY_ODD`

### **CONFIG\_BT\_LE\_HCI\_UART\_TASK\_STACK\_SIZE**

HCI uart task stack size

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [HCI Config](#)

Set the size of uart task stack

**Default value:**

- 1000 if `CONFIG_BT_LE_HCI_INTERFACE_USE_UART` && `CONFIG_BT_CONTROLLER_ENABLED`

### **CONFIG\_BT\_LE\_50\_FEATURE\_SUPPORT**

Enable BLE 5 feature

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#)

Enable BLE 5 feature

Contains:

- `CONFIG_BT_LE_LL_CFG_FEAT_LE_2M_PHY`
- `CONFIG_BT_LE_LL_CFG_FEAT_LE_CODED_PHY`
- `CONFIG_BT_LE_EXT_ADV`
- `CONFIG_BT_LE_MAX_PERIODIC_ADVERTISER_LIST`
- `CONFIG_BT_LE_MAX_PERIODIC_SYNC`

### **CONFIG\_BT\_LE\_LL\_CFG\_FEAT\_LE\_2M\_PHY**

Enable 2M Phy

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG\\_BT\\_LE\\_50\\_FEATURE\\_SUPPORT](#)

Enable 2M-PHY

**Default value:**

- Yes (enabled) if `CONFIG_BT_LE_50_FEATURE_SUPPORT` && `CONFIG_BT_CONTROLLER_ENABLED`

### **CONFIG\_BT\_LE\_LL\_CFG\_FEAT\_LE\_CODED\_PHY**

Enable coded Phy

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG\\_BT\\_LE\\_50\\_FEATURE\\_SUPPORT](#)

Enable coded-PHY

**Default value:**

- Yes (enabled) if `CONFIG_BT_LE_50_FEATURE_SUPPORT` && `CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BT\_LE\_EXT\_ADV

Enable extended advertising

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG\\_BT\\_LE\\_50\\_FEATURE\\_SUPPORT](#)

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_LE\\_50\\_FEATURE\\_SUPPORT](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

### CONFIG\_BT\_LE\_MAX\_EXT\_ADV\_INSTANCES

Maximum number of extended advertising instances.

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG\\_BT\\_LE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#)

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. Each extended advertising instance will take about 0.5k DRAM.

**Range:**

- from 0 to 4 if [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**Default value:**

- 1 if [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

### CONFIG\_BT\_LE\_EXT\_ADV\_MAX\_SIZE

Maximum length of the advertising data.

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG\\_BT\\_LE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#)

Defines the length of the extended adv data. The value should not exceed 1650.

**Range:**

- from 0 to 1650 if [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**Default value:**

- 1650 if [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

### CONFIG\_BT\_LE\_ENABLE\_PERIODIC\_ADV

Enable periodic advertisement.

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG\\_BT\\_LE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#)

Enable this option to start periodic advertisement.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**CONFIG\_BT\_LE\_PERIODIC\_ADV\_SYNC\_TRANSFER**

Enable Transfer Sync Events

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG\\_BT\\_LE\\_50\\_FEATURE\\_SUPPORT](#) > [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#) > [CONFIG\\_BT\\_LE\\_ENABLE\\_PERIODIC\\_ADV](#)

This enables controller transfer periodic sync events to host

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_LE\\_ENABLE\\_PERIODIC\\_ADV](#) && [CONFIG\\_BT\\_LE\\_EXT\\_ADV](#) && [CONFIG\\_BT\\_CONTROLLER\\_ENABLED](#)

**CONFIG\_BT\_LE\_MAX\_PERIODIC\_SYNCS**

Maximum number of periodic advertising syncs

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG\\_BT\\_LE\\_50\\_FEATURE\\_SUPPORT](#)

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

**CONFIG\_BT\_LE\_MAX\_PERIODIC\_ADVERTISER\_LIST**

Maximum number of periodic advertiser list

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [CONFIG\\_BT\\_LE\\_50\\_FEATURE\\_SUPPORT](#)

Set this option to set the upper limit for number of periodic advertiser list.

**Memory Settings** Contains:

- [CONFIG\\_BT\\_LE\\_ACL\\_BUF\\_COUNT](#)
- [CONFIG\\_BT\\_LE\\_ACL\\_BUF\\_SIZE](#)
- [CONFIG\\_BT\\_LE\\_HCI\\_EVT\\_BUF\\_SIZE](#)
- [CONFIG\\_BT\\_LE\\_HCI\\_EVT\\_HI\\_BUF\\_COUNT](#)
- [CONFIG\\_BT\\_LE\\_HCI\\_EVT\\_LO\\_BUF\\_COUNT](#)
- [CONFIG\\_BT\\_LE\\_MSYS\\_1\\_BLOCK\\_COUNT](#)
- [CONFIG\\_BT\\_LE\\_MSYS\\_1\\_BLOCK\\_SIZE](#)
- [CONFIG\\_BT\\_LE\\_MSYS\\_2\\_BLOCK\\_COUNT](#)
- [CONFIG\\_BT\\_LE\\_MSYS\\_2\\_BLOCK\\_SIZE](#)

**CONFIG\_BT\_LE\_MSYS\_1\_BLOCK\_COUNT**

MSYS\_1 Block Count

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [Memory Settings](#)

MSYS is a system level mbuf registry. For prepare write & prepare responses Mbufs are allocated out of msys\_1 pool. For NIMBLE\_MESH enabled cases, this block count is increased by 8 than user defined count.

**CONFIG\_BT\_LE\_MSYS\_1\_BLOCK\_SIZE**

MSYS\_1 Block Size

*Found in:* [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [Memory Settings](#)

Dynamic memory size of block 1

### **CONFIG\_BT\_LE\_MSYS\_2\_BLOCK\_COUNT**

MSYS\_2 Block Count

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [Memory Settings](#)*

Dynamic memory count

### **CONFIG\_BT\_LE\_MSYS\_2\_BLOCK\_SIZE**

MSYS\_2 Block Size

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [Memory Settings](#)*

Dynamic memory size of block 2

### **CONFIG\_BT\_LE\_ACL\_BUF\_COUNT**

ACL Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [Memory Settings](#)*

The number of ACL data buffers.

### **CONFIG\_BT\_LE\_ACL\_BUF\_SIZE**

ACL Buffer size

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [Memory Settings](#)*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

### **CONFIG\_BT\_LE\_HCI\_EVT\_BUF\_SIZE**

HCI Event Buffer size

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [Memory Settings](#)*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

### **CONFIG\_BT\_LE\_HCI\_EVT\_HI\_BUF\_COUNT**

High Priority HCI Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [Memory Settings](#)*

This is the high priority HCI events' buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

### **CONFIG\_BT\_LE\_HCI\_EVT\_LO\_BUF\_COUNT**

Low Priority HCI Event Buffer count

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#) > [Memory Settings](#)*

This is the low priority HCI events' buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

### CONFIG\_BT\_LE\_CONTROLLER\_TASK\_STACK\_SIZE

Controller task stack size

*Found in: Component config > Bluetooth > Controller Options*

This configures stack size of NimBLE controller task

**Default value:**

- 5120 if `CONFIG_BLE_MESH` && `CONFIG_BT_CONTROLLER_ENABLED`
- 4096 if `CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BT\_LE\_CONTROLLER\_LOG\_ENABLED

Controller log enable

*Found in: Component config > Bluetooth > Controller Options*

Enable controller log

**Default value:**

- No (disabled) if `CONFIG_BT_CONTROLLER_ENABLED`

Contains:

- `CONFIG_BT_LE_CONTROLLER_LOG_DUMP_ONLY`
- `CONFIG_BT_LE_CONTROLLER_LOG_CTRL_ENABLED`
- `CONFIG_BT_LE_CONTROLLER_LOG_HCI_ENABLED`
- `CONFIG_BT_LE_LOG_HCI_BUF_SIZE`
- `CONFIG_BT_LE_LOG_CTRL_BUF1_SIZE`
- `CONFIG_BT_LE_LOG_CTRL_BUF2_SIZE`

### CONFIG\_BT\_LE\_CONTROLLER\_LOG\_CTRL\_ENABLED

enable controller log module

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_LE\_CONTROLLER\_LOG\_ENABLED*

Enable controller log module

**Default value:**

- Yes (enabled) if `CONFIG_BT_LE_CONTROLLER_LOG_ENABLED` && `CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BT\_LE\_CONTROLLER\_LOG\_HCI\_ENABLED

enable HCI log module

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_LE\_CONTROLLER\_LOG\_ENABLED*

Enable hci log module

**Default value:**

- Yes (enabled) if `CONFIG_BT_LE_CONTROLLER_LOG_ENABLED` && `CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BT\_LE\_CONTROLLER\_LOG\_DUMP\_ONLY

Controller log dump mode only

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_LE\_CONTROLLER\_LOG\_ENABLED*

Only operate in dump mode

**Default value:**

- Yes (enabled) if `CONFIG_BT_LE_CONTROLLER_LOG_ENABLED` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_LOG\_CTRL\_BUF1\_SIZE**

size of the first BLE controller LOG buffer

*Found in:* `Component config > Bluetooth > Controller Options > CONFIG_BT_LE_CONTROLLER_LOG_ENABLED`

Configure the size of the first BLE controller LOG buffer.

**Default value:**

- 4096 if `CONFIG_BT_LE_CONTROLLER_LOG_ENABLED` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_LOG\_CTRL\_BUF2\_SIZE**

size of the second BLE controller LOG buffer

*Found in:* `Component config > Bluetooth > Controller Options > CONFIG_BT_LE_CONTROLLER_LOG_ENABLED`

Configure the size of the second BLE controller LOG buffer.

**Default value:**

- 1024 if `CONFIG_BT_LE_CONTROLLER_LOG_ENABLED` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_LOG\_HCI\_BUF\_SIZE**

size of the BLE HCI LOG buffer

*Found in:* `Component config > Bluetooth > Controller Options > CONFIG_BT_LE_CONTROLLER_LOG_ENABLED`

Configure the size of the BLE HCI LOG buffer.

**Default value:**

- 4096 if `CONFIG_BT_LE_CONTROLLER_LOG_ENABLED` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_LL\_RESOLV\_LIST\_SIZE**

BLE LL Resolving list size

*Found in:* `Component config > Bluetooth > Controller Options`

Configure the size of resolving list used in link layer.

**Range:**

- from 1 to 5 if `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 4 if `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_SECURITY\_ENABLE**

Enable BLE SM feature

*Found in:* `Component config > Bluetooth > Controller Options`

Enable BLE sm feature

Contains:

- `CONFIG_BT_LE_LL_CFG_FEAT_LE_ENCRYPTION`
- `CONFIG_BT_LE_SM_LEGACY`
- `CONFIG_BT_LE_SM_SC`

### **CONFIG\_BT\_LE\_SM\_LEGACY**

Security manager legacy pairing

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_LE\_SECURITY\_ENABLE*

Enable security manager legacy pairing

**Default value:**

- Yes (enabled) if `CONFIG_BT_LE_SECURITY_ENABLE` && `CONFIG_BT_CONTROLLER_ENABLED`

### **CONFIG\_BT\_LE\_SM\_SC**

Security manager secure connections (4.2)

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_LE\_SECURITY\_ENABLE*

Enable security manager secure connections

**Default value:**

- Yes (enabled) if `CONFIG_BT_LE_SECURITY_ENABLE` && `CONFIG_BT_CONTROLLER_ENABLED`

### **CONFIG\_BT\_LE\_SM\_SC\_DEBUG\_KEYS**

Use predefined public-private key pair

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_LE\_SECURITY\_ENABLE > CONFIG\_BT\_LE\_SM\_SC*

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**

- No (disabled) if `CONFIG_BT_LE_SECURITY_ENABLE` && `CONFIG_BT_LE_SM_SC` && `CONFIG_BT_CONTROLLER_ENABLED`

### **CONFIG\_BT\_LE\_LL\_CFG\_FEAT\_LE\_ENCRYPTION**

Enable LE encryption

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_LE\_SECURITY\_ENABLE*

Enable encryption connection

**Default value:**

- Yes (enabled) if `CONFIG_BT_LE_SECURITY_ENABLE` && `CONFIG_BT_CONTROLLER_ENABLED`

### **CONFIG\_BT\_LE\_CRYPTOSTACK\_MBEDTLS**

Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > Controller Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

### CONFIG\_BT\_LE\_WHITELIST\_SIZE

BLE white list size

*Found in: Component config > Bluetooth > Controller Options*

BLE list size

### CONFIG\_BT\_LE\_LL\_DUP\_SCAN\_LIST\_COUNT

BLE duplicate scan list count

*Found in: Component config > Bluetooth > Controller Options*

config the max count of duplicate scan list

**Range:**

- from 1 to 100 if *CONFIG\_BT\_CONTROLLER\_ENABLED*

**Default value:**

- 20 if *CONFIG\_BT\_CONTROLLER\_ENABLED*

### CONFIG\_BT\_LE\_LL\_SCA

BLE Sleep clock accuracy

*Found in: Component config > Bluetooth > Controller Options*

Sleep clock accuracy of our device (in ppm)

**Range:**

- from 0 to 500 if *CONFIG\_BT\_CONTROLLER\_ENABLED*

**Default value:**

- 60 if *CONFIG\_BT\_CONTROLLER\_ENABLED*

### CONFIG\_BT\_LE\_MAX\_CONNECTIONS

Maximum number of concurrent connections

*Found in: Component config > Bluetooth > Controller Options*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM\_CTRL\_BLE\_MAX\_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT\_CTRL\_BLE\_MAX\_ACT from controller menu. Each connection will take about 1k DRAM.

### CONFIG\_BT\_LE\_COEX\_PHY\_CODED\_TX\_RX\_TLIM

Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

*Found in: Component config > Bluetooth > Controller Options*

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

Available options:

- Force Enable (*CONFIG\_BT\_LE\_COEX\_PHY\_CODED\_TX\_RX\_TLIM\_EN*)  
Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (*CONFIG\_BT\_LE\_COEX\_PHY\_CODED\_TX\_RX\_TLIM\_DIS*)  
Disable the limitation on max tx/rx time for Coded-PHY connection

### CONFIG\_BT\_LE\_SLEEP\_ENABLE

Enable BLE sleep

*Found in: Component config > Bluetooth > Controller Options*

Enable BLE sleep

**Default value:**

- No (disabled) if `CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BT\_LE\_LP\_CLK\_SRC

BLE low power clock source

*Found in: Component config > Bluetooth > Controller Options*

Available options:

- Use main XTAL as RTC clock source (`CONFIG_BT_LE_LP_CLK_SRC_MAIN_XTAL`)  
User main XTAL as RTC clock source. This option is recommended if external 32.768k XTAL is not available. Using the external 32.768 kHz XTAL will have lower current consumption in light sleep compared to using the main XTAL.
- Use system RTC slow clock source (`CONFIG_BT_LE_LP_CLK_SRC_DEFAULT`)  
Use the same slow clock source as system RTC Using any clock source other than external 32.768 kHz XTAL at pin0 supports only legacy ADV and SCAN due to low clock accuracy.

### CONFIG\_BT\_LE\_USE\_ESP\_TIMER

Use Esp Timer for callout

*Found in: Component config > Bluetooth > Controller Options*

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

### CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP

BLE adv report flow control supported

*Found in: Component config > Bluetooth > Controller Options*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**

- Yes (enabled) if `CONFIG_BT_LE_ROLE_OBSERVER_ENABLE` && `CONFIG_BT_CONTROLLER_ENABLED`

### CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_NUM

BLE adv report flow control number

*Found in: Component config > Bluetooth > Controller Options > CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_FLOW\_CTRL\_SUPP*

The number of unprocessed advertising report that bluetooth host can save. If you set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a small value, this may cause adv packets lost. If you set `BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` to a large value, bluetooth host may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 \* 50 bytes. Please set

`BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM` according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**Range:**

- from 50 to 1000 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 100 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_CTRL\_BLE\_ADV\_REPORT\_DISCARD\_THRSHOLD**

BLE adv lost event threshold value

*Found in:* `Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP`

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set `BT_CTRL_BLE_ADV_REPORT_DISCARD_THRSHOLD` to a small value or printf every adv lost event, it may cause adv packets lost more.

**Range:**

- from 1 to 1000 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 20 if `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_TX\_CCA\_ENABLED**

Enable TX CCA feature

*Found in:* `Component config > Bluetooth > Controller Options`

Enable CCA feature to cancel sending the packet if the signal power is stronger than CCA threshold.

**Default value:**

- No (disabled) if `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_CCA\_RSSI\_THRESH**

CCA RSSI threshold value

*Found in:* `Component config > Bluetooth > Controller Options > CONFIG_BT_LE_TX_CCA_ENABLED`

Power threshold of CCA in unit of -1 dBm.

**Range:**

- from 20 to 100 if `CONFIG_BT_LE_TX_CCA_ENABLED` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

- 20 if `CONFIG_BT_LE_TX_CCA_ENABLED` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG\_BT\_LE\_ROLE\_CONTROL\_ENABLE**

Enable BLE Control role function

*Found in:* `Component config > Bluetooth > Controller Options`

Enable control role function.

### CONFIG\_BT\_LE\_ROLE\_PERIPHERAL\_ENABLE

Enable BLE Peripheral role function

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)*

Enable Peripheral role function.

### CONFIG\_BT\_LE\_ROLE\_BROADCASTER\_ENABLE

Enable BLE Broadcaster role function

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)*

Enable broadcaster role function.

### CONFIG\_BT\_LE\_ROLE\_OBSERVER\_ENABLE

Enable BLE Observer role function

*Found in: [Component config](#) > [Bluetooth](#) > [Controller Options](#)*

Enable observer role function.

### CONFIG\_BT\_RELEASE\_IRAM

Release Bluetooth text (READ DOCS FIRST)

*Found in: [Component config](#) > [Bluetooth](#)*

This option release Bluetooth text section and merge Bluetooth data, bss & text into a large free heap region when `esp_bt_mem_release` is called, total saving ~21kB or more of IRAM. ESP32-C2 only 3 configurable PMP entries available, rest of them are hard-coded. We cannot split the memory into 3 different regions (IRAM, BLE-IRAM, DRAM). So this option will disable the PMP (`ESP_SYSTEM_PMP_IDRAM_SPLIT`)

### CONFIG\_BT\_HCI\_LOG\_DEBUG\_EN

Enable Bluetooth HCI debug mode

*Found in: [Component config](#) > [Bluetooth](#)*

This option is used to enable bluetooth debug mode, which saves the hci layer data stream.

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` || `CONFIG_BT_NIMBLE_ENABLED`

### CONFIG\_BT\_HCI\_LOG\_DATA\_BUFFER\_SIZE

Size of the cache used for HCI data in Bluetooth HCI debug mode (N\*1024 bytes)

*Found in: [Component config](#) > [Bluetooth](#) > `CONFIG_BT_HCI_LOG_DEBUG_EN`*

This option is to configure the buffer size of the hci data steam cache in hci debug mode. This is a ring buffer, the new data will overwrite the oldest data if the buffer is full.

**Range:**

- from 1 to 100 if `CONFIG_BT_HCI_LOG_DEBUG_EN`

**Default value:**

- 5 if `CONFIG_BT_HCI_LOG_DEBUG_EN`

### CONFIG\_BT\_HCI\_LOG\_ADV\_BUFFER\_SIZE

Size of the cache used for adv report in Bluetooth HCI debug mode (N\*1024 bytes)

*Found in: Component config > Bluetooth > CONFIG\_BT\_HCI\_LOG\_DEBUG\_EN*

This option is to configure the buffer size of the hci adv report cache in hci debug mode. This is a ring buffer, the new data will overwrite the oldest data if the buffer is full.

**Range:**

- from 1 to 100 if *CONFIG\_BT\_HCI\_LOG\_DEBUG\_EN*

**Default value:**

- 8 if *CONFIG\_BT\_HCI\_LOG\_DEBUG\_EN*

**Common Options** Contains:

- *CONFIG\_BT\_ALARM\_MAX\_NUM*

### CONFIG\_BT\_ALARM\_MAX\_NUM

Maximum number of Bluetooth alarms

*Found in: Component config > Bluetooth > Common Options*

This option decides the maximum number of alarms which could be used by Bluetooth host.

**Default value:**

- 50

### CONFIG\_BLE\_MESH

ESP BLE Mesh Support

*Found in: Component config*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- *BLE Mesh and BLE coexistence support*
- *CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT*
- *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*
- *BLE Mesh NET BUF DEBUG LOG LEVEL*
- *CONFIG\_BLE\_MESH\_PROV*
- *CONFIG\_BLE\_MESH\_PROXY*
- *BLE Mesh specific test option*
- *BLE Mesh STACK DEBUG LOG LEVEL*
- *CONFIG\_BLE\_MESH\_NO\_LOG*
- *CONFIG\_BLE\_MESH\_IVU\_DIVIDER*
- *CONFIG\_BLE\_MESH\_FAST\_PROV*
- *CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC*
- *CONFIG\_BLE\_MESH\_EXPERIMENTAL*
- *CONFIG\_BLE\_MESH\_CRPL*
- *CONFIG\_BLE\_MESH\_RX\_SDU\_MAX*
- *CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT*
- *CONFIG\_BLE\_MESH\_APP\_KEY\_COUNT*
- *CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT*
- *CONFIG\_BLE\_MESH\_LABEL\_COUNT*
- *CONFIG\_BLE\_MESH\_SUBNET\_COUNT*
- *CONFIG\_BLE\_MESH\_TX\_SEG\_MAX*
- *CONFIG\_BLE\_MESH\_RX\_SEG\_MSG\_COUNT*

- `CONFIG_BLE_MESH_TX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_MEM_ALLOC_MODE`
- `CONFIG_BLE_MESH_MSG_CACHE_SIZE`
- `CONFIG_BLE_MESH_NOT_RELAY_REPLAY_MSG`
- `CONFIG_BLE_MESH_ADV_BUF_COUNT`
- `CONFIG_BLE_MESH_PB_GATT`
- `CONFIG_BLE_MESH_PB_ADV`
- `CONFIG_BLE_MESH_IVU_RECOVERY_IVI`
- `CONFIG_BLE_MESH_RELAY`
- `CONFIG_BLE_MESH_SETTINGS`
- `CONFIG_BLE_MESH_DEINIT`
- `CONFIG_BLE_MESH_USE_DUPLICATE_SCAN`
- Support for BLE Mesh Client/Server models
- Support for BLE Mesh Foundation models
- `CONFIG_BLE_MESH_NODE`
- `CONFIG_BLE_MESH_PROVISIONER`
- `CONFIG_BLE_MESH_FRIEND`
- `CONFIG_BLE_MESH_LOW_POWER`
- `CONFIG_BLE_MESH_HCI_5_0`
- `CONFIG_BLE_MESH_RANDOM_ADV_INTERVAL`
- `CONFIG_BLE_MESH_IV_UPDATE_TEST`
- `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT`

### **CONFIG\_BLE\_MESH\_HCI\_5\_0**

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG\_BLE\_MESH*

It is a temporary solution and needs further modifications.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_RANDOM\_ADV\_INTERVAL**

Support using random adv interval for mesh packets

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to allow using random advertising interval for mesh packets. And this could help avoid collision of advertising packets.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_USE\_DUPLICATE\_SCAN**

Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is "Scan Duplicate By Device Address and Advertising Data".

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

## CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE

Memory allocation strategy

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM (CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE\_INTERNAL)
- External SPIRAM (CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE\_EXTERNAL)
- Default alloc mode (CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE\_DEFAULT)  
Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.
- Internal IRAM (CONFIG\_BLE\_MESH\_MEM\_ALLOC\_MODE\_IRAM\_8BIT)  
Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

## CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC

Enable FreeRTOS static allocation

Found in: *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**Default value:**

- No (disabled) if ESP32\_IRAM\_AS\_8BIT\_ACCESSIBLE\_MEMORY && *CONFIG\_BLE\_MESH*

## CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_MODE

Memory allocation for FreeRTOS objects

Found in: *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC*

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_EXTERNAL)  
If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM\_ALLOW\_STACK\_EXTERNAL\_MEMORY is enabled. See the SPIRAM options for more details.
- Internal IRAM (CONFIG\_BLE\_MESH\_FREERTOS\_STATIC\_ALLOC\_IRAM\_8BIT)  
If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

### CONFIG\_BLE\_MESH\_DEINIT

Support de-initialize BLE Mesh stack

*Found in: Component config > CONFIG\_BLE\_MESH*

If enabled, users can use the function `esp_ble_mesh_deinit()` to de-initialize the whole BLE Mesh stack.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

**BLE Mesh and BLE coexistence support** Contains:

- *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_SCAN*
- *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV*

### CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV

Support sending normal BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support*

When selected, users can send normal BLE advertising packets with specific API.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_BLE\_ADV\_BUF\_COUNT

Number of advertising buffers for BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support > CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV*

Number of advertising buffers for BLE packets available.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_ADV* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SUPPORT\_BLE\_SCAN

Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FAST\_PROV

Enable BLE Mesh Fast Provisioning

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_NODE

Support for BLE Mesh Node

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

### CONFIG\_BLE\_MESH\_PROVISIONER

Support for BLE Mesh Provisioner

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

### CONFIG\_BLE\_MESH\_WAIT\_FOR\_PROV\_MAX\_DEV\_NUM

Maximum number of unprovisioned devices that can be added to device queue

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_PROVISIONER](#)*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**

- from 1 to 100 if [CONFIG\\_BLE\\_MESH\\_PROVISIONER](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 10 if [CONFIG\\_BLE\\_MESH\\_PROVISIONER](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_MAX\_PROV\_NODES

Maximum number of devices that can be provisioned by Provisioner

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_PROVISIONER](#)*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

**Range:**

- from 1 to 1000 if [CONFIG\\_BLE\\_MESH\\_PROVISIONER](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 10 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PBA\_SAME\_TIME**

Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

**Range:**

- from 1 to 10 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 2 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PBG\_SAME\_TIME**

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

**Range:**

- from 1 to 5 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_SUBNET\_COUNT**

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_PROVISIONER\_APP\_KEY\_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

**Range:**

- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**

- 3 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB

Support receiving Heartbeat messages

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB\_FILTER\_SIZE

Maximum number of filter entries for receiving Heartbeat messages

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PROVISIONER* > *CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_PROVISIONER\_RECV\_HB* && *CONFIG\_BLE\_MESH\_PROVISIONER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PROV

BLE Mesh Provisioning support

*Found in:* *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_PB\_ADV

Provisioning support using the advertising bearer (PB-ADV)

*Found in:* *Component config* > *CONFIG\_BLE\_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_UNPROVISIONED\_BEACON\_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

*Found in:* *Component config* > *CONFIG\_BLE\_MESH* > *CONFIG\_BLE\_MESH\_PB\_ADV*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of *BLE\_MESH\_FAST\_PROV* is selected, the value is better to be 3 seconds, or less.

**Range:**

- from 1 to 100 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

**Default value:**

- 5 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`
- 3 if `CONFIG_BLE_MESH_FAST_PROV` && `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PB\_GATT

Provisioning support using GATT (PB-GATT)

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

### CONFIG\_BLE\_MESH\_PROXY

BLE Mesh Proxy protocol support

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER

BLE Mesh GATT Proxy Server

*Found in:* `Component config` > `CONFIG_BLE_MESH`

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_NODE\_ID\_TIMEOUT

Node Identity advertising timeout

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_GATT_PROXY_SERVER`

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**

- from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

**Default value:**

- 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_PROXY\_FILTER\_SIZE

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

**Range:**

- from 1 to 32767 if *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 4 if *CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_GATT\_PROXY\_CLIENT

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG\_BLE\_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SETTINGS

Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG\_BLE\_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_STORE\_TIMEOUT

Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**

- from 0 to 1000000 if *CONFIG\_BLE\_MESH\_SETTINGS* && *CONFIG\_BLE\_MESH*

**Default value:**

- 0 if *CONFIG\_BLE\_MESH\_SETTINGS* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_SEQ\_STORE\_RATE

How often the sequence number gets updated in storage

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment. If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that's guaranteed to be larger than the last one used before power off.

**Range:**

- from 0 to 1000000 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 0 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_RPL\_STORE\_TIMEOUT

Minimum frequency that the RPL gets updated in storage

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

**Range:**

- from 0 to 1000000 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 0 if [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_SETTINGS\_BACKWARD\_COMPATIBILITY

A specific option for settings backward compatibility

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of "mesh/role" in nvs. In the new version mesh stack, key of "mesh/role" is added in nvs, recovering node information needs to check "mesh/role" key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of "mesh/role" because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_NODE](#) && [CONFIG\\_BLE\\_MESH\\_SETTINGS](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_SPECIFIC\_PARTITION

Use a specific NVS partition for BLE Mesh

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [CONFIG\\_BLE\\_MESH\\_SETTINGS](#)*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exist in the csv file. When Provisioner needs to store a large amount of nodes' information in the flash (e.g. more than 20), this option is recommended to be enabled.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_PARTITION\_NAME**

Name of the NVS partition for BLE Mesh

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS` > `CONFIG_BLE_MESH_SPECIFIC_PARTITION`

This value defines the name of the specified NVS partition used by the mesh stack.

**Default value:**

- "ble\_mesh" if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_USE\_MULTIPLE\_NAMESPACE**

Support using multiple NVS namespaces by Provisioner

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS`

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_MAX\_NVS\_NAMESPACE**

Maximum number of NVS namespaces

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_SETTINGS` > `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE`

This option specifies the maximum NVS namespaces supported by Provisioner.

**Range:**

- from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**Default value:**

- 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_SUBNET\_COUNT**

Maximum number of mesh subnets per network

*Found in:* `Component config` > `CONFIG_BLE_MESH`

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_APP\_KEY\_COUNT**

Maximum number of application keys per network

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_MODEL\_KEY\_COUNT**

Maximum number of application keys per model

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_MODEL\_GROUP\_COUNT**

Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

**Range:**

- from 1 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_LABEL\_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG\_BLE\_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

**Range:**

- from 0 to 4096 if *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_CRPL

Maximum capacity of the replay protection list

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

**Range:**

- from 2 to 65535 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 10 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_NOT\_RELAY\_REPLAY\_MSG

Not relay replayed messages in a mesh network

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

There may be many expired messages in a complex mesh network that would be considered replayed messages. Enable this option will refuse to relay such messages, which could help to reduce invalid packets in the mesh network. However, it should be noted that enabling this option may result in packet loss in certain environments. Therefore, users need to decide whether to enable this option according to the actual usage situation.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH\\_EXPERIMENTAL](#) && [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_MSG\_CACHE\_SIZE

Network message cache size

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

**Range:**

- from 2 to 65535 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 10 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_ADV\_BUF\_COUNT

Number of advertising buffers

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Number of advertising buffers available. The transport layer reserves ADV\_BUF\_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**

- from 6 to 256 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 60 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_IVU\_DIVIDER**

Divider for IV Update state refresh timer

*Found in: [Component config](#) > `CONFIG_BLE_MESH`*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn't necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).

**Range:**

- from 2 to 96 if `CONFIG_BLE_MESH`

**Default value:**

- 4 if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_IVU\_RECOVERY\_IVI**

Recovery the IV index when the latest whole IV update procedure is missed

*Found in: [Component config](#) > `CONFIG_BLE_MESH`*

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_TX\_SEG\_MSG\_COUNT**

Maximum number of simultaneous outgoing segmented messages

*Found in: [Component config](#) > `CONFIG_BLE_MESH`*

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to if `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_RX\_SEG\_MSG\_COUNT

Maximum number of simultaneous incoming segmented messages

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

**Range:**

- from 1 to 255 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 1 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_RX\_SDU\_MAX

Maximum incoming Upper Transport Access PDU length

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

**Range:**

- from 36 to 384 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 384 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_TX\_SEG\_MAX

Maximum number of segments in outgoing messages

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what's the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers ([BLE\\_MESH\\_ADV\\_BUF\\_COUNT](#)) as there are outgoing segments.

**Range:**

- from 2 to 32 if [CONFIG\\_BLE\\_MESH](#)

**Default value:**

- 32 if [CONFIG\\_BLE\\_MESH](#)

### CONFIG\_BLE\_MESH\_RELAY

Relay support

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#)*

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF**

Use separate advertising buffers for relay packets

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_RELAY`

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_RELAY\_ADV\_BUF\_COUNT**

Number of advertising buffers for relay packets

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_RELAY` > `CONFIG_BLE_MESH_RELAY_ADV_BUF`

Number of advertising buffers for relay packets available.

**Range:**

- from 6 to 256 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` && `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

**Default value:**

- 60 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` && `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_LOW\_POWER**

Support for Low Power features

*Found in:* `Component config` > `CONFIG_BLE_MESH`

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

**CONFIG\_BLE\_MESH\_LPN\_ESTABLISHMENT**

Perform Friendship establishment using low power

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_LPN\_AUTO**

Automatically start looking for Friend nodes once provisioned

*Found in:* `Component config` > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an

unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node starts to send Friend Request at a certain period until it finds a proper Friend node.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LPN\_AUTO\_TIMEOUT**

Time from last received message before going to LPN mode

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER > CONFIG\_BLE\_MESH\_LPN\_AUTO*

Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**

- from 0 to 3600 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 15 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LPN\_RETRY\_TIMEOUT**

Retry timeout for Friend requests

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**

- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LPN\_RSSI\_FACTOR**

RSSIFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_LPN\_RECV\_WIN\_FACTOR**

ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**

- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_LPN\_MIN\_QUEUE\_SIZE**

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The MinQueueSizeLog field is defined as  $\log_2(N)$ , where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives  $N = 2$ , and value 7 gives  $N = 128$ .

**Range:**

- from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 1 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_LPN\_RECV\_DELAY**

Receive delay requested by the local node

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

**Range:**

- from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 100 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_LPN\_POLL\_TIMEOUT**

The value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

**Range:**

- from 10 to 244735 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- 300 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG\_BLE\_MESH\_LPN\_INIT\_POLL\_TIMEOUT**

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

**Range:**

- from 10 to if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**

- if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

### CONFIG\_BLE\_MESH\_LPN\_SCAN\_LATENCY

Latency for enabling scanning

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

**Range:**

- from 0 to 50 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 10 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_GROUPS

Number of groups the LPN can subscribe to

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Maximum number of groups to which the LPN can subscribe.

**Range:**

- from 0 to 16384 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

**Default value:**

- 8 if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_LPN\_SUB\_ALL\_NODES\_ADDR

Automatically subscribe all nodes address

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_LOW\_POWER*

Automatically subscribe all nodes address when friendship established.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH\_LOW\_POWER* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND

Support for Friend feature

*Found in: Component config > CONFIG\_BLE\_MESH*

Enable this option to be able to act as a Friend Node.

### CONFIG\_BLE\_MESH\_FRIEND\_RECV\_WIN

Friend Receive Window

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Receive Window in milliseconds supported by the Friend node.

**Range:**

- from 1 to 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 255 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_QUEUE\_SIZE

Minimum number of buffers supported per Friend Queue

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.

**Range:**

- from 2 to 65536 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 16 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_SUB\_LIST\_SIZE

Friend Subscription List Size

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**

- from 0 to 1023 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 3 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_LPN\_COUNT

Number of supported LPN nodes

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 2 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_FRIEND\_SEG\_RX

Number of incomplete segment lists per LPN

*Found in: Component config > CONFIG\_BLE\_MESH > CONFIG\_BLE\_MESH\_FRIEND*

Number of incomplete segment lists tracked for each Friends' LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**Range:**

- from 1 to 1000 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

**Default value:**

- 1 if *CONFIG\_BLE\_MESH\_FRIEND* && *CONFIG\_BLE\_MESH*

### CONFIG\_BLE\_MESH\_NO\_LOG

Disable BLE Mesh debug logs (minimize bin size)

*Found in: Component config > CONFIG\_BLE\_MESH*

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH` && `CONFIG_BLE_MESH`

**BLE Mesh STACK DEBUG LOG LEVEL** Contains:

- `CONFIG_BLE_MESH_STACK_TRACE_LEVEL`

**CONFIG\_BLE\_MESH\_STACK\_TRACE\_LEVEL**

BLE\_MESH\_STACK

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh STACK DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh stack.

Available options:

- NONE (CONFIG\_BLE\_MESH\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BLE\_MESH\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BLE\_MESH\_TRACE\_LEVEL\_WARNING)
- INFO (CONFIG\_BLE\_MESH\_TRACE\_LEVEL\_INFO)
- DEBUG (CONFIG\_BLE\_MESH\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BLE\_MESH\_TRACE\_LEVEL\_VERBOSE)

**BLE Mesh NET BUF DEBUG LOG LEVEL** Contains:

- `CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL`

**CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL**

BLE\_MESH\_NET\_BUF

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL*

Define BLE Mesh trace level for BLE Mesh net buffer.

Available options:

- NONE (CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_NONE)
- ERROR (CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_ERROR)
- WARNING (CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_WARNING)
- INFO (CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_INFO)
- DEBUG (CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_DEBUG)
- VERBOSE (CONFIG\_BLE\_MESH\_NET\_BUF\_TRACE\_LEVEL\_VERBOSE)

**CONFIG\_BLE\_MESH\_CLIENT\_MSG\_TIMEOUT**

Timeout(ms) for client message response

*Found in: Component config > CONFIG\_BLE\_MESH*

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

**Range:**

- from 100 to 1200000 if *CONFIG\_BLE\_MESH*

**Default value:**

- 4000 if *CONFIG\_BLE\_MESH*

**Support for BLE Mesh Foundation models** Contains:

- *CONFIG\_BLE\_MESH\_CFG\_CLI*
- *CONFIG\_BLE\_MESH\_HEALTH\_CLI*
- *CONFIG\_BLE\_MESH\_HEALTH\_SRV*

**CONFIG\_BLE\_MESH\_CFG\_CLI**

Configuration Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

**CONFIG\_BLE\_MESH\_HEALTH\_CLI**

Health Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.

**CONFIG\_BLE\_MESH\_HEALTH\_SRV**

Health Server model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

**Support for BLE Mesh Client/Server models** Contains:

- *CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_CLI*
- *CONFIG\_BLE\_MESH\_GENERIC\_SERVER*
- *CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI*
- *CONFIG\_BLE\_MESH\_LIGHTING\_SERVER*
- *CONFIG\_BLE\_MESH\_SCENE\_CLI*
- *CONFIG\_BLE\_MESH\_SCHEDULER\_CLI*
- *CONFIG\_BLE\_MESH\_SENSOR\_CLI*
- *CONFIG\_BLE\_MESH\_SENSOR\_SERVER*
- *CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER*
- *CONFIG\_BLE\_MESH\_TIME\_CLI*

### **CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI**

Generic OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic OnOff Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI**

Generic Level Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Level Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI**

Generic Default Transition Time Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Default Transition Time Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI**

Generic Power OnOff Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power OnOff Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI**

Generic Power Level Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Power Level Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI**

Generic Battery Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Battery Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI**

Generic Location Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Location Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_CLI**

Generic Property Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic Property Client model.

### **CONFIG\_BLE\_MESH\_SENSOR\_CLI**

Sensor Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Sensor Client model.

### **CONFIG\_BLE\_MESH\_TIME\_CLI**

Time Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Time Client model.

### **CONFIG\_BLE\_MESH\_SCENE\_CLI**

Scene Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Scene Client model.

### **CONFIG\_BLE\_MESH\_SCHEDULER\_CLI**

Scheduler Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Scheduler Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI**

Light Lightness Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light Lightness Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI**

Light CTL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light CTL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI**

Light HSL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light HSL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI**

Light XYL Client model

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [Support for BLE Mesh Client/Server models](#)*

Enable support for Light XYL Client model.

### **CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI**

Light LC Client model

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Light LC Client model.

### **CONFIG\_BLE\_MESH\_GENERIC\_SERVER**

Generic server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Generic server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_SENSOR\_SERVER**

Sensor server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Sensor server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER**

Time and Scenes server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Time and Scenes server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_LIGHTING\_SERVER**

Lighting server models

*Found in: Component config > CONFIG\_BLE\_MESH > Support for BLE Mesh Client/Server models*

Enable support for Lighting server models.

**Default value:**

- Yes (enabled) if *CONFIG\_BLE\_MESH*

### **CONFIG\_BLE\_MESH\_IV\_UPDATE\_TEST**

Test the IV Update Procedure

*Found in: Component config > CONFIG\_BLE\_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

**Default value:**

- No (disabled) if *CONFIG\_BLE\_MESH*

**BLE Mesh specific test option** Contains:

- `CONFIG_BLE_MESH_DEBUG`
- `CONFIG_BLE_MESH_SHELL`
- `CONFIG_BLE_MESH_BQB_TEST`
- `CONFIG_BLE_MESH_SELF_TEST`
- `CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK`
- `CONFIG_BLE_MESH_TEST_USE_WHITE_LIST`

### **CONFIG\_BLE\_MESH\_SELF\_TEST**

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_BQB\_TEST**

Enable BLE Mesh specific internal test

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

This option is used to enable some internal functions for auto-pts test.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_TEST\_AUTO\_ENTER\_NETWORK**

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the provisioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_TEST\_USE\_WHITE\_LIST**

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_SHELL**

Enable BLE Mesh shell

*Found in: Component config > CONFIG\_BLE\_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH`

### **CONFIG\_BLE\_MESH\_DEBUG**

Enable BLE Mesh debug logs

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#)*

Enable debug logs for the BLE Mesh functionality.

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

### **CONFIG\_BLE\_MESH\_DEBUG\_NET**

Network layer debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Network layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_TRANS**

Transport layer debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Transport layer debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_BEACON**

Beacon debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Beacon-related debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_CRYPTO**

Crypto debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable cryptographic debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_PROV**

Provisioning debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Provisioning debug logs for the BLE Mesh functionality.

### **CONFIG\_BLE\_MESH\_DEBUG\_ACCESS**

Access layer debug

*Found in: [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)*

Enable Access layer debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_MODEL

Foundation model debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable Foundation Models debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_ADV

Advertising debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable advertising debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_LOW\_POWER

Low Power debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable Low Power debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_FRIEND

Friend debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable Friend debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_DEBUG\_PROXY

Proxy debug

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#) > [BLE Mesh specific test option](#) > [CONFIG\\_BLE\\_MESH\\_DEBUG](#)

Enable Proxy protocol debug logs for the BLE Mesh functionality.

### CONFIG\_BLE\_MESH\_EXPERIMENTAL

Make BLE Mesh experimental features visible

*Found in:* [Component config](#) > [CONFIG\\_BLE\\_MESH](#)

Make BLE Mesh Experimental features visible. Experimental features list: - CONFIG\_BLE\_MESH\_NOT\_RELAY\_REPLAY\_MSG

**Default value:**

- No (disabled) if [CONFIG\\_BLE\\_MESH](#)

**Driver Configurations** Contains:

- [Analog Comparator Configuration](#)
- [DAC Configuration](#)
- [GPIO Configuration](#)
- [GPTimer Configuration](#)
- [I2S Configuration](#)

- *Legacy ADC Configuration*
- *MCPWM Configuration*
- *Parallel IO Configuration*
- *PCNT Configuration*
- *RMT Configuration*
- *Sigma Delta Modulator Configuration*
- *SPI Configuration*
- *Temperature sensor Configuration*
- *TWAI Configuration*
- *UART Configuration*
- *USB Serial/JTAG Configuration*

**Legacy ADC Configuration** Contains:

- *CONFIG\_ADC\_DISABLE\_DAC*
- *Legacy ADC Calibration Configuration*
- *CONFIG\_ADC\_SUPPRESS\_DEPRECATED\_WARN*

### **CONFIG\_ADC\_DISABLE\_DAC**

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in: Component config > Driver Configurations > Legacy ADC Configuration*

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**

- Yes (enabled) if SOC\_DAC\_SUPPORTED

### **CONFIG\_ADC\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Legacy ADC Configuration*

Whether to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**Legacy ADC Calibration Configuration** Contains:

- *CONFIG\_ADC\_CALI\_SUPPRESS\_DEPRECATED\_WARN*

### **CONFIG\_ADC\_CALI\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration*

Whether to suppress the deprecation warnings when using legacy adc calibration driver (esp\_adc\_cal.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**SPI Configuration** Contains:

- [\*CONFIG\\_SPI\\_MASTER\\_ISR\\_IN\\_IRAM\*](#)
- [\*CONFIG\\_SPI\\_SLAVE\\_ISR\\_IN\\_IRAM\*](#)
- [\*CONFIG\\_SPI\\_MASTER\\_IN\\_IRAM\*](#)
- [\*CONFIG\\_SPI\\_SLAVE\\_IN\\_IRAM\*](#)

### **CONFIG\_SPI\_MASTER\_IN\_IRAM**

Place transmitting functions of SPI master into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

This configuration won't be available if `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH` is enabled.

During unit test, this is enabled to measure the ideal case of api.

### **CONFIG\_SPI\_MASTER\_ISR\_IN\_IRAM**

Place SPI master ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Enabling this configuration is possible only when `HEAP_PLACE_FUNCTION_INTO_FLASH` is disabled since the spi master uses can allocate transactions buffers into DMA memory section using the heap component API that ipso facto has to be placed in IRAM.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

### **CONFIG\_SPI\_SLAVE\_IN\_IRAM**

Place transmitting functions of SPI slave into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there's some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans`, `get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**Default value:**

- No (disabled)

### **CONFIG\_SPI\_SLAVE\_ISR\_IN\_IRAM**

Place SPI slave ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [SPI Configuration](#)*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**

- Yes (enabled)

**TWAI Configuration** Contains:

- [CONFIG\\_TWAI\\_ISR\\_IN\\_IRAM](#)

**CONFIG\_TWAI\_ISR\_IN\_IRAM**

Place TWAI ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [TWAI Configuration](#)*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled: - Users should also set the ESP\_INTR\_FLAG\_IRAM in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the TWAI\_ALERT\_AND\_LOG flag) will have no effect.

**Default value:**

- No (disabled) if SOC\_TWAI\_SUPPORTED

**Temperature sensor Configuration** Contains:

- [CONFIG\\_TEMP\\_SENSOR\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_TEMP\\_SENSOR\\_SUPPRESS\\_DEPRECATED\\_WARN](#)
- [CONFIG\\_TEMP\\_SENSOR\\_ISR\\_IRAM\\_SAFE](#)

**CONFIG\_TEMP\_SENSOR\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Whether to suppress the deprecation warnings when using legacy temperature sensor driver (driver/temp\_sensor.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

**CONFIG\_TEMP\_SENSOR\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Whether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**CONFIG\_TEMP\_SENSOR\_ISR\_IRAM\_SAFE**

Temperature sensor ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [Temperature sensor Configuration](#)*

Ensure the Temperature Sensor interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if `SOC_TEMPERATURE_SENSOR_INTR_SUPPORT`

**UART Configuration** Contains:

- [`CONFIG\_UART\_ISR\_IN\_IRAM`](#)

### **CONFIG\_UART\_ISR\_IN\_IRAM**

Place UART ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [UART Configuration](#)*

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

**GPIO Configuration** Contains:

- [`CONFIG\_GPIO\_CTRL\_FUNC\_IN\_IRAM`](#)

### **CONFIG\_GPIO\_CTRL\_FUNC\_IN\_IRAM**

Place GPIO control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPIO Configuration](#)*

Place GPIO control functions (like `intr_disable/set_level`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**

- No (disabled)

**Sigma Delta Modulator Configuration** Contains:

- [`CONFIG\_SDM\_ENABLE\_DEBUG\_LOG`](#)
- [`CONFIG\_SDM\_CTRL\_FUNC\_IN\_IRAM`](#)
- [`CONFIG\_SDM\_SUPPRESS\_DEPRECATED\_WARN`](#)

### **CONFIG\_SDM\_CTRL\_FUNC\_IN\_IRAM**

Place SDM control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Place SDM control functions (like `set_duty`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if `SOC_SDM_SUPPORTED`

### **CONFIG\_SDM\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Whether to suppress the deprecation warnings when using legacy sigma delta driver. If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if `SOC_SDM_SUPPORTED`

### CONFIG\_SDM\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Sigma Delta Modulator Configuration](#)*

Whether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_SDM\_SUPPORTED

### Analog Comparator Configuration

 Contains:

- [CONFIG\\_ANA\\_CMPR\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_ANA\\_CMPR\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_ANA\\_CMPR\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### CONFIG\_ANA\_CMPR\_ISR\_IRAM\_SAFE

Analog comparator ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [Analog Comparator Configuration](#)*

Ensure the Analog Comparator interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_ANA\_CMPR\_SUPPORTED

### CONFIG\_ANA\_CMPR\_CTRL\_FUNC\_IN\_IRAM

Place Analog Comparator control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [Analog Comparator Configuration](#)*

Place Analog Comparator control functions (like `ana_cmpr_set_internal_reference`) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_ANA\_CMPR\_SUPPORTED

### CONFIG\_ANA\_CMPR\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Analog Comparator Configuration](#)*

Whether to enable the debug log message for Analog Comparator driver. Note that, this option only controls the Analog Comparator driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_ANA\_CMPR\_SUPPORTED

### GPTimer Configuration

 Contains:

- [CONFIG\\_GPTIMER\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_GPTIMER\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_GPTIMER\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_GPTIMER\\_ISR\\_HANDLER\\_IN\\_IRAM](#)
- [CONFIG\\_GPTIMER\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_GPTIMER\_ISR\_HANDLER\_IN\_IRAM

Place GPTimer ISR handler into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Place GPTimer ISR handler into IRAM for better performance and fewer cache misses.

**Default value:**

- Yes (enabled)

### CONFIG\_GPTIMER\_CTRL\_FUNC\_IN\_IRAM

Place GPTimer control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### CONFIG\_GPTIMER\_ISR\_IRAM\_SAFE

GPTimer ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### CONFIG\_GPTIMER\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Whether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)

### CONFIG\_GPTIMER\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [GPTimer Configuration](#)*

Whether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won't affect other drivers.

**Default value:**

- No (disabled)

**PCNT Configuration** Contains:

- [CONFIG\\_PCNT\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_PCNT\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_PCNT\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_PCNT\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

**CONFIG\_PCNT\_CTRL\_FUNC\_IN\_IRAM**

Place PCNT control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_PCNT\_SUPPORTED

**CONFIG\_PCNT\_ISR\_IRAM\_SAFE**

PCNT ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_PCNT\_SUPPORTED

**CONFIG\_PCNT\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Whether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if SOC\_PCNT\_SUPPORTED

**CONFIG\_PCNT\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [PCNT Configuration](#)*

Whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_PCNT\_SUPPORTED

**RMT Configuration** Contains:

- [CONFIG\\_RMT\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_RMT\\_RECV\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_RMT\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_RMT\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_RMT\_ISR\_IRAM\_SAFE

RMT ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_RMT\_SUPPORTED

### CONFIG\_RMT\_RECV\_FUNC\_IN\_IRAM

Place RMT receive function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Place RMT receive function into IRAM, so that the receive function can be IRAM-safe and able to be called when the flash cache is disabled. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_RMT\_SUPPORTED

### CONFIG\_RMT\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Whether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if SOC\_RMT\_SUPPORTED

### CONFIG\_RMT\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [RMT Configuration](#)*

Whether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_RMT\_SUPPORTED

**MCPWM Configuration** Contains:

- [CONFIG\\_MCPWM\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_MCPWM\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_MCPWM\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_MCPWM\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_MCPWM\_ISR\_IRAM\_SAFE

Place MCPWM ISR function into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

**Default value:**

- No (disabled) if SOC\_MCPWM\_SUPPORTED

**CONFIG\_MCPWM\_CTRL\_FUNC\_IN\_IRAM**

Place MCPWM control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Place MCPWM control functions (like set\_compare\_value) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_MCPWM\_SUPPORTED

**CONFIG\_MCPWM\_SUPPRESS\_DEPRECATED\_WARN**

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Whether to suppress the deprecation warnings when using legacy MCPWM driver (driver/mcpwm.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if SOC\_MCPWM\_SUPPORTED

**CONFIG\_MCPWM\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [MCPWM Configuration](#)*

Whether to enable the debug log message for MCPWM driver. Note that, this option only controls the MCPWM driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_MCPWM\_SUPPORTED

**I2S Configuration** Contains:

- [CONFIG\\_I2S\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_I2S\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_I2S\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

**CONFIG\_I2S\_ISR\_IRAM\_SAFE**

I2S ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_I2S\_SUPPORTED

### CONFIG\_I2S\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Enable this option will suppress the deprecation warnings of using APIs in legacy I2S driver.

**Default value:**

- No (disabled) if SOC\_I2S\_SUPPORTED

### CONFIG\_I2S\_ENABLE\_DEBUG\_LOG

Enable I2S debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [I2S Configuration](#)*

Whether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

**Default value:**

- No (disabled) if SOC\_I2S\_SUPPORTED

### DAC Configuration

 Contains:

- [CONFIG\\_DAC\\_DMA\\_AUTO\\_16BIT\\_ALIGN](#)
- [CONFIG\\_DAC\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_DAC\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_DAC\\_CTRL\\_FUNC\\_IN\\_IRAM](#)
- [CONFIG\\_DAC\\_SUPPRESS\\_DEPRECATED\\_WARN](#)

### CONFIG\_DAC\_CTRL\_FUNC\_IN\_IRAM

Place DAC control functions into IRAM

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Place DAC control functions (e.g. 'dac\_one\_shot\_output\_voltage') into IRAM, so that this function can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC\_DAC\_SUPPORTED

### CONFIG\_DAC\_ISR\_IRAM\_SAFE

DAC ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Ensure the DAC interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_DAC\_SUPPORTED

### CONFIG\_DAC\_SUPPRESS\_DEPRECATED\_WARN

Suppress legacy driver deprecated warning

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Whether to suppress the deprecation warnings when using legacy DAC driver (driver/dac.h). If you want to continue using the legacy driver, and don't want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled) if SOC\_DAC\_SUPPORTED

**CONFIG\_DAC\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Whether to enable the debug log message for DAC driver. Note that, this option only controls the DAC driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_DAC\_SUPPORTED

**CONFIG\_DAC\_DMA\_AUTO\_16BIT\_ALIGN**

Align the continuous data to 16 bit automatically

*Found in: [Component config](#) > [Driver Configurations](#) > [DAC Configuration](#)*

Whether to left shift the continuous data to align every bytes to 16 bits in the driver. On ESP32, although the DAC resolution is only 8 bits, the hardware requires 16 bits data in continuous mode. By enabling this option, the driver will left shift 8 bits for the input data automatically. Only disable this option when you decide to do this step by yourself. Note that the driver will allocate a new piece of memory to save the converted data.

**Default value:**

- Yes (enabled) if SOC\_DAC\_DMA\_16BIT\_ALIGN && SOC\_DAC\_SUPPORTED

**USB Serial/JTAG Configuration** Contains:

- [CONFIG\\_USJ\\_NO\\_AUTO\\_LS\\_ON\\_CONNECTION](#)

**CONFIG\_USJ\_NO\_AUTO\_LS\_ON\_CONNECTION**

Don't enter the automatic light sleep when USB Serial/JTAG port is connected

*Found in: [Component config](#) > [Driver Configurations](#) > [USB Serial/JTAG Configuration](#)*

If enabled, the chip will constantly monitor the connection status of the USB Serial/JTAG port. As long as the USB Serial/JTAG is connected, a ESP\_PM\_NO\_LIGHT\_SLEEP power management lock will be acquired to prevent the system from entering light sleep. This option can be useful if serial monitoring is needed via USB Serial/JTAG while power management is enabled, as the USB Serial/JTAG cannot work under light sleep and after waking up from light sleep. Note. This option can only control the automatic Light-Sleep behavior. If `esp_light_sleep_start()` is called manually from the program, enabling this option will not prevent light sleep entry even if the USB Serial/JTAG is in use.

**Parallel IO Configuration** Contains:

- [CONFIG\\_PARLIO\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_PARLIO\\_ISR\\_IRAM\\_SAFE](#)

**CONFIG\_PARLIO\_ENABLE\_DEBUG\_LOG**

Enable debug log

*Found in: [Component config](#) > [Driver Configurations](#) > [Parallel IO Configuration](#)*

Whether to enable the debug log message for parallel IO driver. Note that, this option only controls the parallel IO driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_PARLIO\_SUPPORTED

**CONFIG\_PARLIO\_ISR\_IRAM\_SAFE**

Parallel IO ISR IRAM-Safe

*Found in: [Component config](#) > [Driver Configurations](#) > [Parallel IO Configuration](#)*

Ensure the Parallel IO interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled) if SOC\_PARLIO\_SUPPORTED

**eFuse Bit Manager** Contains:

- [CONFIG\\_EFUSE\\_VIRTUAL](#)
- [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)

**CONFIG\_EFUSE\_CUSTOM\_TABLE**

Use custom eFuse table

*Found in: [Component config](#) > [eFuse Bit Manager](#)*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**

- No (disabled)

**CONFIG\_EFUSE\_CUSTOM\_TABLE\_FILENAME**

Custom eFuse CSV file

*Found in: [Component config](#) > [eFuse Bit Manager](#) > [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- "main/esp\_efuse\_custom\_table.csv" if [CONFIG\\_EFUSE\\_CUSTOM\\_TABLE](#)

**CONFIG\_EFUSE\_VIRTUAL**

Simulate eFuse operations in RAM

*Found in: [Component config](#) > [eFuse Bit Manager](#)*

If "n" - No virtual mode. All eFuse operations are real and use eFuse registers. If "y" - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

If it is "y", then SECURE\_FLASH\_ENCRYPTION\_MODE\_RELEASE cannot be used. Because the EFUSE VIRT mode is for testing only.

During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**

- No (disabled)

## CONFIG\_EFUSE\_VIRTUAL\_KEEP\_IN\_FLASH

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG\_EFUSE\_VIRTUAL*

In addition to the "Simulate eFuse operations in RAM" option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition\_table should have the *efuse* partition. partition.csv: "efuse\_em, data, efuse, , 0x2000,"

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure\_boot and flash\_encryption).

## CONFIG\_EFUSE\_VIRTUAL\_LOG\_ALL\_WRITES

Log all virtual writes

*Found in: Component config > eFuse Bit Manager > CONFIG\_EFUSE\_VIRTUAL*

If enabled, log efuse burns. This shows changes that would be made.

## ESP-TLS Contains:

- [CONFIG\\_ESP\\_TLS\\_INSECURE](#)
- [CONFIG\\_ESP\\_TLS\\_LIBRARY\\_CHOOSE](#)
- [CONFIG\\_ESP\\_TLS\\_CLIENT\\_SESSION\\_TICKETS](#)
- [CONFIG\\_ESP\\_DEBUG\\_WOLFSSL](#)
- [CONFIG\\_ESP\\_TLS\\_SERVER](#)
- [CONFIG\\_ESP\\_TLS\\_PSK\\_VERIFICATION](#)
- [CONFIG\\_ESP\\_WOLFSSL\\_SMALL\\_CERT\\_VERIFY](#)
- [CONFIG\\_ESP\\_TLS\\_USE\\_DS\\_PERIPHERAL](#)

## CONFIG\_ESP\_TLS\_LIBRARY\_CHOOSE

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

Available options:

- mbedTLS (CONFIG\_ESP\_TLS\_USING\_MBEDTLS)
- wolfSSL (License info in wolfSSL directory README) (CONFIG\_ESP\_TLS\_USING\_WOLFSSL)

## CONFIG\_ESP\_TLS\_USE\_DS\_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

### Default value:

- Yes (enabled) if `CONFIG_ESP_TLS_USING_MBEDTLS` && `SOC_DIG_SIGN_SUPPORTED`

### CONFIG\_ESP\_TLS\_CLIENT\_SESSION\_TICKETS

Enable client session tickets

*Found in:* [Component config](#) > [ESP-TLS](#)

Enable session ticket support as specified in RFC5077.

### CONFIG\_ESP\_TLS\_SERVER

Enable ESP-TLS Server

*Found in:* [Component config](#) > [ESP-TLS](#)

Enable support for creating server side SSL/TLS session, available for mbedTLS as well as wolfSSL TLS library.

### CONFIG\_ESP\_TLS\_SERVER\_SESSION\_TICKETS

Enable server session tickets

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)

Enable session ticket support as specified in RFC5077

### CONFIG\_ESP\_TLS\_SERVER\_SESSION\_TICKET\_TIMEOUT

Server session ticket timeout in seconds

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#) > [CONFIG\\_ESP\\_TLS\\_SERVER\\_SESSION\\_TICKETS](#)

Sets the session ticket timeout used in the tls server.

**Default value:**

- 86400 if [CONFIG\\_ESP\\_TLS\\_SERVER\\_SESSION\\_TICKETS](#)

### CONFIG\_ESP\_TLS\_SERVER\_CERT\_SELECT\_HOOK

Certificate selection hook

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)

Ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc).

### CONFIG\_ESP\_TLS\_SERVER\_MIN\_AUTH\_MODE\_OPTIONAL

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in:* [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_SERVER](#)

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

`mbedtls_ssl_get_verify_result()` can be called after the handshake is complete to retrieve status of verification.

### CONFIG\_ESP\_TLS\_PSK\_VERIFICATION

Enable PSK verification

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

### CONFIG\_ESP\_TLS\_INSECURE

Allow potentially insecure options

*Found in: [Component config](#) > [ESP-TLS](#)*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

### CONFIG\_ESP\_TLS\_SKIP\_SERVER\_CERT\_VERIFY

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: [Component config](#) > [ESP-TLS](#) > [CONFIG\\_ESP\\_TLS\\_INSECURE](#)*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. `crt_bundle_attach`, `use_global_ca_store` etc.). WARNING : Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like `ca_store` etc.

### CONFIG\_ESP\_WOLFSSL\_SMALL\_CERT\_VERIFY

Enable SMALL\_CERT\_VERIFY

*Found in: [Component config](#) > [ESP-TLS](#)*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_TLS\\_USING\\_WOLFSSL](#)

### CONFIG\_ESP\_DEBUG\_WOLFSSL

Enable debug logs for wolfSSL

*Found in: [Component config](#) > [ESP-TLS](#)*

Enable detailed debug prints for wolfSSL SSL library.

### ADC and ADC Calibration

 Contains:

- [ADC Calibration Configurations](#)
- [CONFIG\\_ADC\\_CONTINUOUS\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_ADC\\_DISABLE\\_DAC\\_OUTPUT](#)
- [CONFIG\\_ADC\\_ONESHOT\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### CONFIG\_ADC\_ONESHOT\_CTRL\_FUNC\_IN\_IRAM

Place ISR version ADC oneshot mode read function into IRAM

*Found in: [Component config > ADC and ADC Calibration](#)*

Place ISR version ADC oneshot mode read function into IRAM.

**Default value:**

- No (disabled)

### CONFIG\_ADC\_CONTINUOUS\_ISR\_IRAM\_SAFE

ADC continuous mode driver ISR IRAM-Safe

*Found in: [Component config > ADC and ADC Calibration](#)*

Ensure the ADC continuous mode ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

**Default value:**

- No (disabled) if SOC\_ADC\_DMA\_SUPPORTED

## ADC Calibration Configurations

### CONFIG\_ADC\_DISABLE\_DAC\_OUTPUT

Disable DAC when ADC2 is in use

*Found in: [Component config > ADC and ADC Calibration](#)*

By default, this is set. The ADC oneshot driver will disable the output of the corresponding DAC channels: ESP32: IO25 and IO26 ESP32S2: IO17 and IO18

Disable this option so as to measure the output of DAC by internal ADC, for test usage.

**Default value:**

- Yes (enabled) if SOC\_DAC\_SUPPORTED

### Wireless Coexistence

 Contains:

- [CONFIG\\_ESP\\_COEX\\_EXTERNAL\\_COEXIST\\_ENABLE](#)
- [CONFIG\\_ESP\\_COEX\\_SW\\_COEXIST\\_ENABLE](#)

### CONFIG\_ESP\_COEX\_SW\_COEXIST\_ENABLE

Software controls WiFi/Bluetooth coexistence

*Found in: [Component config > Wireless Coexistence](#)*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**

- Yes (enabled) if [CONFIG\\_BT\\_ENABLED](#) || [CONFIG\\_IEEE802154\\_ENABLED](#) || ([CONFIG\\_IEEE802154\\_ENABLED](#) && [CONFIG\\_BT\\_ENABLED](#))

## CONFIG\_ESP\_COEX\_EXTERNAL\_COEXIST\_ENABLE

External Coexistence

*Found in: [Component config](#) > [Wireless Coexistence](#)*

If enabled, HW External coexistence arbitration is managed by GPIO pins. It can support three types of wired combinations so far which are 1-wired/2-wired/3-wired. User can select GPIO pins in application code with configure interfaces.

This function depends on BT-off because currently we do not support external coex and internal coex simultaneously.

**Common ESP-related** Contains:

- [CONFIG\\_ESP\\_ERR\\_TO\\_NAME\\_LOOKUP](#)

## CONFIG\_ESP\_ERR\_TO\_NAME\_LOOKUP

Enable lookup of error code strings

*Found in: [Component config](#) > [Common ESP-related](#)*

Functions `esp_err_to_name()` and `esp_err_to_name_r()` return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**

- Yes (enabled)

**Ethernet** Contains:

- [CONFIG\\_ETH\\_TRANSMIT\\_MUTEX](#)
- [CONFIG\\_ETH\\_USE\\_OPENETH](#)
- [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)

## CONFIG\_ETH\_USE\_SPI\_ETHERNET

Support SPI to Ethernet Module

*Found in: [Component config](#) > [Ethernet](#)*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**

- Yes (enabled)

Contains:

- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_DM9051](#)
- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_KSZ8851SNL](#)
- [CONFIG\\_ETH\\_SPI\\_ETHERNET\\_W5500](#)

## CONFIG\_ETH\_SPI\_ETHERNET\_DM9051

Use DM9051

*Found in: [Component config](#) > [Ethernet](#) > [CONFIG\\_ETH\\_USE\\_SPI\\_ETHERNET](#)*

DM9051 is a fast Ethernet controller with an SPI interface. It's also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

### CONFIG\_ETH\_SPI\_ETHERNET\_W5500

Use W5500 (MAC RAW)

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_SPI\_ETHERNET*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

### CONFIG\_ETH\_SPI\_ETHERNET\_KSZ8851SNL

Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_SPI\_ETHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.

### CONFIG\_ETH\_USE\_OPENETH

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**

- No (disabled)

Contains:

- *CONFIG\_ETH\_OPENETH\_DMA\_RX\_BUFFER\_NUM*
- *CONFIG\_ETH\_OPENETH\_DMA\_TX\_BUFFER\_NUM*

### CONFIG\_ETH\_OPENETH\_DMA\_RX\_BUFFER\_NUM

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if *CONFIG\_ETH\_USE\_OPENETH*

**Default value:**

- 4 if *CONFIG\_ETH\_USE\_OPENETH*

### CONFIG\_ETH\_OPENETH\_DMA\_TX\_BUFFER\_NUM

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG\_ETH\_USE\_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Range:**

- from 1 to 64 if *CONFIG\_ETH\_USE\_OPENETH*

**Default value:**

- 1 if *CONFIG\_ETH\_USE\_OPENETH*

### CONFIG\_ETH\_TRANSMIT\_MUTEX

Enable Transmit Mutex

*Found in: [Component config](#) > [Ethernet](#)*

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

**Default value:**

- No (disabled)

**Event Loop Library** Contains:

- [CONFIG\\_ESP\\_EVENT\\_LOOP\\_PROFILING](#)
- [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)

### CONFIG\_ESP\_EVENT\_LOOP\_PROFILING

Enable event loop profiling

*Found in: [Component config](#) > [Event Loop Library](#)*

Enables collections of statistics in the event loop library such as the number of events posted to/received by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_EVENT\_POST\_FROM\_ISR

Support posting events from ISRs

*Found in: [Component config](#) > [Event Loop Library](#)*

Enable posting events from interrupt handlers.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_EVENT\_POST\_FROM\_IRAM\_ISR

Support posting events from ISRs placed in IRAM

*Found in: [Component config](#) > [Event Loop Library](#) > [CONFIG\\_ESP\\_EVENT\\_POST\\_FROM\\_ISR](#)*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions `esp_event_post` and `esp_event_post_to` in IRAM.

**Default value:**

- Yes (enabled)

**GDB Stub** Contains:

- [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)

### CONFIG\_ESP\_GDBSTUB\_SUPPORT\_TASKS

Enable listing FreeRTOS tasks through GDB Stub

*Found in: [Component config](#) > [GDB Stub](#)*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using 'info threads' command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.

### CONFIG\_ESP\_GDBSTUB\_MAX\_TASKS

Maximum number of tasks supported by GDB Stub

*Found in: [Component config](#) > [GDB Stub](#) > [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)*

Set the number of tasks which GDB Stub will support.

**Default value:**

- 32 if [CONFIG\\_ESP\\_GDBSTUB\\_SUPPORT\\_TASKS](#)

**ESP HTTP client** Contains:

- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_BASIC\\_AUTH](#)
- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_DIGEST\\_AUTH](#)
- [CONFIG\\_ESP\\_HTTP\\_CLIENT\\_ENABLE\\_HTTPS](#)

### CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_HTTPS

Enable https

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_BASIC\_AUTH

Enable HTTP Basic Authentication

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

### CONFIG\_ESP\_HTTP\_CLIENT\_ENABLE\_DIGEST\_AUTH

Enable HTTP Digest Authentication

*Found in: [Component config](#) > [ESP HTTP client](#)*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

**Default value:**

- No (disabled)

**HTTP Server** Contains:

- `CONFIG_HTTPD_QUEUE_WORK_BLOCKING`
- `CONFIG_HTTPD_PURGE_BUF_LEN`
- `CONFIG_HTTPD_LOG_PURGE_DATA`
- `CONFIG_HTTPD_MAX_REQ_HDR_LEN`
- `CONFIG_HTTPD_MAX_URI_LEN`
- `CONFIG_HTTPD_ERR_RESP_NO_DELAY`
- `CONFIG_HTTPD_WS_SUPPORT`

**CONFIG\_HTTPD\_MAX\_REQ\_HDR\_LEN**

Max HTTP Request Header Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**

- 512

**CONFIG\_HTTPD\_MAX\_URI\_LEN**

Max HTTP URI Length

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the maximum supported size of HTTP request URI to be processed by the server

**Default value:**

- 512

**CONFIG\_HTTPD\_ERR\_RESP\_NO\_DELAY**

Use TCP\_NODELAY socket option when sending HTTP error responses

*Found in: [Component config](#) > [HTTP Server](#)*

Using TCP\_NODELAY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

**Default value:**

- Yes (enabled)

**CONFIG\_HTTPD\_PURGE\_BUF\_LEN**

Length of temporary buffer for purging data

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

**Default value:**

- 32

### CONFIG\_HTTPD\_LOG\_PURGE\_DATA

Log purged content data at Debug level

*Found in: [Component config](#) > [HTTP Server](#)*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**

- No (disabled)

### CONFIG\_HTTPD\_WS\_SUPPORT

WebSocket server support

*Found in: [Component config](#) > [HTTP Server](#)*

This sets the WebSocket server support.

**Default value:**

- No (disabled)

### CONFIG\_HTTPD\_QUEUE\_WORK\_BLOCKING

httpd\_queue\_work as blocking API

*Found in: [Component config](#) > [HTTP Server](#)*

This makes httpd\_queue\_work() API to wait until a message space is available on UDP control socket. It internally uses a counting semaphore with count set to `LWIP_UDP_RECVMBOX_SIZE` to achieve this. This config will slightly change API behavior to block until message gets delivered on control socket.

### ESP HTTPS OTA Contains:

- [CONFIG\\_ESP\\_HTTPS\\_OTA\\_ALLOW\\_HTTP](#)
- [CONFIG\\_ESP\\_HTTPS\\_OTA\\_DECRYPT\\_CB](#)

### CONFIG\_ESP\_HTTPS\_OTA\_DECRYPT\_CB

Provide decryption callback

*Found in: [Component config](#) > [ESP HTTPS OTA](#)*

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_HTTPS\_OTA\_ALLOW\_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: [Component config](#) > [ESP HTTPS OTA](#)*

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

**Default value:**

- No (disabled)

**ESP HTTPS server** Contains:

- [CONFIG\\_ESP\\_HTTPS\\_SERVER\\_ENABLE](#)

### **CONFIG\_ESP\_HTTPS\_SERVER\_ENABLE**

Enable ESP\_HTTPS\_SERVER component

*Found in: Component config > ESP HTTPS server*

Enable ESP HTTPS server component

**Hardware Settings** Contains:

- [Chip revision](#)
- [Crypto DPA Protection](#)
- [ETM Configuration](#)
- [GDMA Configuration](#)
- [MAC Config](#)
- [Main XTAL Config](#)
- [Peripheral Control](#)
- [RTC Clock Config](#)
- [Sleep Config](#)

**Chip revision** Contains:

- [CONFIG\\_ESP32C2\\_REV2\\_DEVELOPMENT](#)
- [CONFIG\\_ESP\\_REV\\_NEW\\_CHIP\\_TEST](#)
- [CONFIG\\_ESP32C2\\_REV\\_MIN](#)

### **CONFIG\_ESP32C2\_REV\_MIN**

Minimum Supported ESP32-C2 Revision

*Found in: Component config > Hardware Settings > Chip revision*

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

Available options:

- Rev v1.0 (ECO1) ([CONFIG\\_ESP32C2\\_REV\\_MIN\\_1](#))
- Rev v1.1 (ECO2) ([CONFIG\\_ESP32C2\\_REV\\_MIN\\_1\\_1](#))

### **CONFIG\_ESP32C2\_REV2\_DEVELOPMENT**

Develop on ESP32-C2 v2.0 (Preview)

*Found in: Component config > Hardware Settings > Chip revision*

**Default value:**

- Yes (enabled)

## CONFIG\_ESP\_REV\_NEW\_CHIP\_TEST

Internal test mode

*Found in: [Component config](#) > [Hardware Settings](#) > [Chip revision](#)*

For internal chip testing, a small number of new versions chips didn't update the version field in eFuse, you can enable this option to force the software recognize the chip version based on the rev selected in menuconfig.

**Default value:**

- No (disabled)

## MAC Config

 Contains:

- [CONFIG\\_ESP\\_MAC\\_USE\\_CUSTOM\\_MAC\\_AS\\_BASE\\_MAC](#)
- [CONFIG\\_ESP32C2\\_UNIVERSAL\\_MAC\\_ADDRESSES](#)

## CONFIG\_ESP32C2\_UNIVERSAL\_MAC\_ADDRESSES

Number of universally administered (by IEEE) MAC address

*Found in: [Component config](#) > [Hardware Settings](#) > [MAC Config](#)*

Configure the number of universally administered (by IEEE) MAC addresses.

During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address.

If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address.

If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively.

When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

Note that ESP32-C2 has no integrated Ethernet MAC. Although it's possible to use the `esp_read_mac()` API to return a MAC for Ethernet, this can only be used with an external MAC peripheral.

Available options:

- Two ([CONFIG\\_ESP32C2\\_UNIVERSAL\\_MAC\\_ADDRESSES\\_TWO](#))
- Four ([CONFIG\\_ESP32C2\\_UNIVERSAL\\_MAC\\_ADDRESSES\\_FOUR](#))

## CONFIG\_ESP\_MAC\_USE\_CUSTOM\_MAC\_AS\_BASE\_MAC

Enable using custom mac as base mac

*Found in: [Component config](#) > [Hardware Settings](#) > [MAC Config](#)*

When this configuration is enabled, the user can invoke `esp_read_mac` to obtain the desired type of MAC using a custom MAC as the base MAC.

**Default value:**

- No (disabled)

**Sleep Config** Contains:

- [CONFIG\\_ESP\\_SLEEP\\_GPIO\\_ENABLE\\_INTERNAL\\_RESISTORS](#)
- [CONFIG\\_ESP\\_SLEEP\\_CACHE\\_SAFE\\_ASSERTION](#)
- [CONFIG\\_ESP\\_SLEEP\\_EVENT\\_CALLBACKS](#)
- [CONFIG\\_ESP\\_SLEEP\\_DEBUG](#)
- [CONFIG\\_ESP\\_SLEEP\\_WAIT\\_FLASH\\_READY\\_EXTRA\\_DELAY](#)
- [CONFIG\\_ESP\\_SLEEP\\_GPIO\\_RESET\\_WORKAROUND](#)
- [CONFIG\\_ESP\\_SLEEP\\_POWER\\_DOWN\\_FLASH](#)
- [CONFIG\\_ESP\\_SLEEP\\_MSPI\\_NEED\\_ALL\\_IO\\_PU](#)
- [CONFIG\\_ESP\\_SLEEP\\_FLASH\\_LEAKAGE\\_WORKAROUND](#)
- [CONFIG\\_ESP\\_SLEEP\\_PSRAM\\_LEAKAGE\\_WORKAROUND](#)

### **CONFIG\_ESP\_SLEEP\_POWER\_DOWN\_FLASH**

Power down flash in light sleep when there is no SPIRAM

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

If enabled, chip will try to power down flash as part of `esp_light_sleep_start()`, which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using `esp_sleep_pd_config()` to set `ESP_PD_DOMAIN_VDDSDIO` to `ESP_PD_OPTION_OFF`. It should be noted that there is a risk in powering down flash, you can refer *ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash* for more details.

### **CONFIG\_ESP\_SLEEP\_FLASH\_LEAKAGE\_WORKAROUND**

Pull-up Flash CS pin in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of SPI Flash is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in Flash may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of Flash to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of SPI Flash in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don't deselect this option if you don't have external SPI Flash CS pin pullups.)

### **CONFIG\_ESP\_SLEEP\_PSRAM\_LEAKAGE\_WORKAROUND**

Pull-up PSRAM CS pin in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of PSRAM is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in PSRAM may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of PSRAM to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of PSRAM in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don't deselect this option if you don't have external PSRAM CS pin pullups.)

**Default value:**

- Yes (enabled) if SPIRAM

### CONFIG\_ESP\_SLEEP\_MSPI\_NEED\_ALL\_IO\_PU

Pull-up all SPI pins in light sleep

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

### CONFIG\_ESP\_SLEEP\_GPIO\_RESET\_WORKAROUND

light sleep GPIO reset workaround

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

esp32c2, esp32c3, esp32s3, esp32c6 and esp32h2 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition

- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open/floating, The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_SLEEP\_WAIT\_FLASH\_READY\_EXTRA\_DELAY

Extra delay (in us) after flash powerdown sleep wakeup to wait flash ready

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

When the chip exits sleep, the CPU and the flash chip are powered on at the same time. CPU will run rom code (deepsleep) or ram code (lightsleep) first, and then load or execute code from flash.

Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

(!!! Please adjust this value according to the Data Sheet of SPI Flash used in your project.) In Flash Data Sheet, the parameters that define the Flash ready timing after power-up (minimum time from Vcc(min) to CS active) usually named tVSL in ELECTRICAL CHARACTERISTICS chapter, and the configuration value here should be: ESP\_SLEEP\_WAIT\_FLASH\_READY\_EXTRA\_DELAY = tVSL - 900

For esp32 and esp32s3, the default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing "flash read err, 1000" message printed to the console after deep sleep reset on esp32, or triggered RTC\_WDT/LP\_WDT after lightsleep wakeup, try increasing this value. (For esp32, the delay will be executed in both deep sleep and light sleep wake up flow. For chips after esp32, the delay will be executed only in light sleep flow, the delay controlled by the EFUSE\_FLASH\_TPUW in ROM will be executed in deepsleep wake up flow.)

**Range:**

- from 0 to 5000

**Default value:**

- 0

### CONFIG\_ESP\_SLEEP\_DEBUG

esp sleep debug

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

Enable esp sleep debug.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_SLEEP\_GPIO\_ENABLE\_INTERNAL\_RESISTORS

Allow to enable internal pull-up/downs for the Deep-Sleep wakeup IOs

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

When using rtc gpio wakeup source during deepsleep without external pull-up/downs, you may want to make use of the internal ones.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_SLEEP\_EVENT\_CALLBACKS

Enable registration of sleep event callbacks

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

If enabled, it allows user to register sleep event callbacks. It is primarily designed for internal developers and customers can use PM\_LIGHT\_SLEEP\_CALLBACKS as an alternative.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible.

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

### CONFIG\_ESP\_SLEEP\_CACHE\_SAFE\_ASSERTION

Check the cache safety of the sleep wakeup code in sleep process

*Found in: [Component config](#) > [Hardware Settings](#) > [Sleep Config](#)*

Enabling it will check the cache safety of the code before the flash power is ready after light sleep wakeup, and check PM\_SLP\_IRAM\_OPT related code cache safety. This option is only for code quality inspection. Enabling it will increase the time overhead of entering and exiting sleep. It is not recommended to enable it in the release version.

**Default value:**

- No (disabled)

**RTC Clock Config** Contains:

- [CONFIG\\_RTC\\_CLK\\_CAL\\_CYCLES](#)
- [CONFIG\\_RTC\\_CLK\\_SRC](#)

## CONFIG\_RTC\_CLK\_SRC

RTC clock source

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

Choose which clock is used as RTC clock source.

Available options:

- Internal 136kHz RC oscillator (CONFIG\_RTC\_CLK\_SRC\_INT\_RC)
- External 32kHz oscillator at pin0 (CONFIG\_RTC\_CLK\_SRC\_EXT\_OSC)
- Internal 17.5MHz oscillator, divided by 256 (CONFIG\_RTC\_CLK\_SRC\_INT\_8MD256)

## CONFIG\_RTC\_CLK\_CAL\_CYCLES

Number of cycles for RTC\_SLOW\_CLK calibration

*Found in: [Component config](#) > [Hardware Settings](#) > [RTC Clock Config](#)*

When the startup code initializes RTC\_SLOW\_CLK, it can perform calibration by comparing the RTC\_SLOW\_CLK frequency with main XTAL frequency. This option sets the number of RTC\_SLOW\_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- **32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more.** In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

### Range:

- from 0 to 8190 if `CONFIG_RTC_CLK_SRC_EXT_OSC` || `CONFIG_RTC_CLK_SRC_INT_8MD256`
- from 0 to 32766

### Default value:

- 3000 if `CONFIG_RTC_CLK_SRC_EXT_OSC` || `CONFIG_RTC_CLK_SRC_INT_8MD256`
- 1024

**Peripheral Control** Contains:

- [CONFIG\\_PERIPH\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

## CONFIG\_PERIPH\_CTRL\_FUNC\_IN\_IRAM

Place peripheral control functions into IRAM

*Found in: [Component config](#) > [Hardware Settings](#) > [Peripheral Control](#)*

Place peripheral control functions (e.g. `periph_module_reset`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

### Default value:

- No (disabled)

**ETM Configuration** Contains:

- [CONFIG\\_ETM\\_ENABLE\\_DEBUG\\_LOG](#)

### CONFIG\_ETM\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [Hardware Settings](#) > [ETM Configuration](#)*

Whether to enable the debug log message for ETM core driver. Note that, this option only controls the ETM related driver log, won't affect other drivers.

**Default value:**

- No (disabled) if SOC\_ETM\_SUPPORTED

### GDMA Configuration

 Contains:

- [CONFIG\\_GDMA\\_ISR\\_IRAM\\_SAFE](#)
- [CONFIG\\_GDMA\\_CTRL\\_FUNC\\_IN\\_IRAM](#)

### CONFIG\_GDMA\_CTRL\_FUNC\_IN\_IRAM

Place GDMA control functions into IRAM

*Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configuration](#)*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled)

### CONFIG\_GDMA\_ISR\_IRAM\_SAFE

GDMA ISR IRAM-Safe

*Found in: [Component config](#) > [Hardware Settings](#) > [GDMA Configuration](#)*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

**Default value:**

- No (disabled)

### Main XTAL Config

 Contains:

- [CONFIG\\_XTAL\\_FREQ\\_SEL](#)

### CONFIG\_XTAL\_FREQ\_SEL

Main XTAL frequency

*Found in: [Component config](#) > [Hardware Settings](#) > [Main XTAL Config](#)*

This option selects the operating frequency of the XTAL (crystal) clock used to drive the ESP target. The selected value MUST reflect the frequency of the given hardware.

Note: The XTAL\_FREQ\_AUTO option allows the ESP target to automatically estimating XTAL clock's operating frequency. However, this feature is only supported on the ESP32. The ESP32 uses the internal 8MHZ as a reference when estimating. Due to the internal oscillator's frequency being temperature dependent, usage of the XTAL\_FREQ\_AUTO is not recommended in applications that operate in high ambient temperatures or use high-temperature qualified chips and modules.

Available options:

- 24 MHz (CONFIG\_XTAL\_FREQ\_24)
- 26 MHz (CONFIG\_XTAL\_FREQ\_26)
- 32 MHz (CONFIG\_XTAL\_FREQ\_32)
- 40 MHz (CONFIG\_XTAL\_FREQ\_40)
- Autodetect (CONFIG\_XTAL\_FREQ\_AUTO)

**Crypto DPA Protection** Contains:

- [CONFIG\\_ESP\\_CRYPTODPA\\_PROTECTION\\_AT\\_STARTUP](#)

### **CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_AT\_STARTUP**

Enable crypto DPA protection at startup

*Found in: [Component config](#) > [Hardware Settings](#) > [Crypto DPA Protection](#)*

This config controls the DPA (Differential Power Analysis) protection knob for the crypto peripherals. DPA protection dynamically adjusts the clock frequency of the crypto peripheral. DPA protection helps to make it difficult to perform SCA attacks on the crypto peripherals. However, there is also associated performance impact based on the security level set. Please refer to the TRM for more details.

**Default value:**

- Yes (enabled) if SOC\_CRYPTODPA\_PROTECTION\_SUPPORTED

### **CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_LEVEL**

DPA protection level

*Found in: [Component config](#) > [Hardware Settings](#) > [Crypto DPA Protection](#) > [CONFIG\\_ESP\\_CRYPTODPA\\_PROTECTION\\_AT\\_STARTUP](#)*

Configure the DPA protection security level

Available options:

- Security level low (CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_LEVEL\_LOW)
- Security level medium (CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_LEVEL\_MEDIUM)
- Security level high (CONFIG\_ESP\_CRYPTODPA\_PROTECTION\_LEVEL\_HIGH)

**LCD and Touch Panel** Contains:

- [LCD Peripheral Configuration](#)

**LCD Peripheral Configuration** Contains:

- [CONFIG\\_LCD\\_ENABLE\\_DEBUG\\_LOG](#)
- [CONFIG\\_LCD\\_PANEL\\_IO\\_FORMAT\\_BUF\\_SIZE](#)
- [CONFIG\\_LCD\\_RGB\\_RESTART\\_IN\\_VSYNC](#)
- [CONFIG\\_LCD\\_RGB\\_ISR\\_IRAM\\_SAFE](#)

### **CONFIG\_LCD\_PANEL\_IO\_FORMAT\_BUF\_SIZE**

LCD panel io format buffer size

*Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)*

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

**Default value:**

- 32

### CONFIG\_LCD\_ENABLE\_DEBUG\_LOG

Enable debug log

*Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)*

Whether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won't affect other drivers.

**Default value:**

- No (disabled)

### CONFIG\_LCD\_RGB\_ISR\_IRAM\_SAFE

RGB LCD ISR IRAM-Safe

*Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)*

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

**Default value:**

- No (disabled) if SOC\_LCD\_RGB\_SUPPORTED

### CONFIG\_LCD\_RGB\_RESTART\_IN\_VSYNC

Restart transmission in VSYNC

*Found in: [Component config](#) > [LCD and Touch Panel](#) > [LCD Peripheral Configuration](#)*

Reset the GDMA channel every VBlank to stop permanent desyncs from happening. Only need to enable it when in your application, the DMA can't deliver data as fast as the LCD consumes it.

**Default value:**

- No (disabled) if SOC\_LCD\_RGB\_SUPPORTED

### ESP NETIF Adapter

 Contains:

- [CONFIG\\_ESP\\_NETIF\\_BRIDGE\\_EN](#)
- [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)
- [CONFIG\\_ESP\\_NETIF\\_IP\\_LOST\\_TIMER\\_INTERVAL](#)
- [CONFIG\\_ESP\\_NETIF\\_USE\\_TCPIP\\_STACK\\_LIB](#)
- [CONFIG\\_ESP\\_NETIF\\_RECEIVE\\_REPORT\\_ERRORS](#)

### CONFIG\_ESP\_NETIF\_IP\_LOST\_TIMER\_INTERVAL

IP Address lost timer interval (seconds)

*Found in: [Component config](#) > [ESP NETIF Adapter](#)*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM\_EVENT\_STA\_LOST\_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**

- from 0 to 65535

**Default value:**

- 120

### CONFIG\_ESP\_NETIF\_USE\_TCPIP\_STACK\_LIB

TCP/IP Stack Library

*Found in:* [Component config](#) > [ESP NETIF Adapter](#)

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

Available options:

- LwIP (CONFIG\_ESP\_NETIF\_TCPIP\_LWIP)  
LwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (CONFIG\_ESP\_NETIF\_LOOPBACK)  
Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

### CONFIG\_ESP\_NETIF\_RECEIVE\_REPORT\_ERRORS

Use esp\_err\_t to report errors from esp\_netif\_receive

*Found in:* [Component config](#) > [ESP NETIF Adapter](#)

Enable if esp\_netif\_receive() should return error code. This is useful to inform upper layers that packet input to TCP/IP stack failed, so the upper layers could implement flow control. This option is disabled by default due to backward compatibility and will be enabled in v6.0 (IDF-7194)

**Default value:**

- No (disabled)

### CONFIG\_ESP\_NETIF\_L2\_TAP

Enable netif L2 TAP support

*Found in:* [Component config](#) > [ESP NETIF Adapter](#)

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.

### CONFIG\_ESP\_NETIF\_L2\_TAP\_MAX\_FDS

Maximum number of opened L2 TAP File descriptors

*Found in:* [Component config](#) > [ESP NETIF Adapter](#) > [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

Maximum number of opened File descriptors (FD's) associated with ESP TAP device. ESP TAP FD's take up a certain amount of memory, and allowing fewer FD's to be opened at the same time conserves memory.

**Range:**

- from 1 to 10 if [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

**Default value:**

- 5 if [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

### CONFIG\_ESP\_NETIF\_L2\_TAP\_RX\_QUEUE\_SIZE

Size of L2 TAP Rx queue

*Found in:* [Component config](#) > [ESP NETIF Adapter](#) > [CONFIG\\_ESP\\_NETIF\\_L2\\_TAP](#)

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

**Range:**

- from 1 to 100 if `CONFIG_ESP_NETIF_L2_TAP`

**Default value:**

- 20 if `CONFIG_ESP_NETIF_L2_TAP`

### CONFIG\_ESP\_NETIF\_BRIDGE\_EN

Enable LwIP IEEE 802.1D bridge

*Found in: `Component config > ESP NETIF Adapter`*

Enable LwIP IEEE 802.1D bridge support in ESP-NETIF. Note that "Number of clients store data in netif" (`LWIP_NUM_NETIF_CLIENT_DATA`) option needs to be properly configured to be LwIP bridge available!

**Default value:**

- No (disabled)

### Partition API Configuration

**PHY** Contains:

- `CONFIG_ESP_PHY_CALIBRATION_MODE`
- `CONFIG_ESP_PHY_PLL_TRACK_DEBUG`
- `CONFIG_ESP_PHY_IMPROVE_RX_11B`
- `CONFIG_ESP_PHY_ENABLE_USB`
- `CONFIG_ESP_PHY_MAX_WIFI_TX_POWER`
- `CONFIG_ESP_PHY_MAC_BB_PD`
- `CONFIG_ESP_PHY_REDUCE_TX_POWER`
- `CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE`
- `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

### CONFIG\_ESP\_PHY\_CALIBRATION\_AND\_DATA\_STORAGE

Store phy calibration data in NVS

*Found in: `Component config > PHY`*

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it's easy that your board calibrate bad data, choose 'n'. Two cases for example, you should choose 'n': 1.If your board is easy to be booted up with antenna disconnected. 2.Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose 'y'.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION

Use a partition to store PHY init data

*Found in: `Component config > PHY`*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: 'data', subtype: 'phy'). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose 'n'.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_ESP\\_PHY\\_DEFAULT\\_INIT\\_IF\\_INVALID](#)
- [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)

### CONFIG\_ESP\_PHY\_DEFAULT\_INIT\_IF\_INVALID

Reset default PHY init data if invalid

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose 'n'.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN

Support multiple PHY init data bin

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China's PHY init data bin is used by default. Can be modified by country information in API `esp_wifi_set_country()`. The priority of switching the PHY init data type is: 1. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_MANUAL`. 2. Country notified by the connected AP. 3. Country configured by API `esp_wifi_set_country()` and the parameter policy is `WIFI_COUNTRY_POLICY_AUTO`.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#) && [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN\_EMBED

Support embedded multiple phy init data bin to app bin

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#) > [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)

If enabled, multiple phy init data bin will embedded into app bin If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#) && [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#)

### CONFIG\_ESP\_PHY\_INIT\_DATA\_ERROR

Terminate operation when PHY init data error

*Found in:* [Component config](#) > [PHY](#) > [CONFIG\\_ESP\\_PHY\\_INIT\\_DATA\\_IN\\_PARTITION](#) > [CONFIG\\_ESP\\_PHY\\_MULTIPLE\\_INIT\\_DATA\\_BIN](#)

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

**Default value:**

- No (disabled) if `CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN` && `CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION`

**CONFIG\_ESP\_PHY\_MAX\_WIFI\_TX\_POWER**

Max WiFi TX power (dBm)

*Found in:* `Component config > PHY`

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**

- from 10 to 20

**Default value:**

- 20

**CONFIG\_ESP\_PHY\_MAC\_BB\_PD**

Power down MAC and baseband of Wi-Fi and Bluetooth when PHY is disabled

*Found in:* `Component config > PHY`

If enabled, the MAC and baseband of Wi-Fi and Bluetooth will be powered down when PHY is disabled. Enabling this setting reduces power consumption by a small amount but increases RAM use by approximately 4 KB(Wi-Fi only), 2 KB(Bluetooth only) or 5.3 KB(Wi-Fi + Bluetooth).

**Default value:**

- No (disabled) if `SOC_PM_SUPPORT_MAC_BB_PD` && `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

**CONFIG\_ESP\_PHY\_REDUCE\_TX\_POWER**

Reduce PHY TX power when brownout reset

*Found in:* `Component config > PHY`

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_PHY\_ENABLE\_USB**

Keep the USB PHY enabled when initializing WiFi

*Found in:* `Component config > PHY`

On some ESP targets, the USB PHY can interfere with WiFi thus lowering WiFi performance. As a result, on those affected ESP targets, the ESP PHY library's initialization will automatically disable the USB PHY to get best WiFi performance. This option controls whether or not the ESP PHY library will keep the USB PHY enabled on initialization.

Note: This option can be disabled to increase WiFi performance. However, disabling this option will also mean that the USB PHY cannot be used while WiFi is enabled.

**Default value:**

- Yes (enabled) if `CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG` || `CONFIG_ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG`
- No (disabled)

## CONFIG\_ESP\_PHY\_CALIBRATION\_MODE

Calibration mode

Found in: *Component config > PHY*

Select PHY calibration mode. During RF initialization, the partial calibration method is used by default for RF calibration. Full calibration takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. No calibration method is only used when the device wakes up from deep sleep.

Available options:

- Calibration partial (CONFIG\_ESP\_PHY\_RF\_CAL\_PARTIAL)
- Calibration none (CONFIG\_ESP\_PHY\_RF\_CAL\_NONE)
- Calibration full (CONFIG\_ESP\_PHY\_RF\_CAL\_FULL)

## CONFIG\_ESP\_PHY\_IMPROVE\_RX\_11B

Improve Wi-Fi receive 11b pkts

Found in: *Component config > PHY*

This is a workaround to improve Wi-Fi receive 11b pkts for some modules using AC-DC power supply with high interference, enable this option will sacrifice Wi-Fi OFDM receive performance. But to guarantee 11b receive performance serves as a bottom line in this case.

**Default value:**

- No (disabled)

## CONFIG\_ESP\_PHY\_PLL\_TRACK\_DEBUG

Enable pll track logging

Found in: *Component config > PHY*

If enabled, there will be some logs while pll tracking

**Default value:**

- No (disabled)

**Power Management** Contains:

- *CONFIG\_PM\_SLP\_DISABLE\_GPIO*
- *CONFIG\_PM\_LIGHT\_SLEEP\_CALLBACKS*
- *CONFIG\_PM\_POWER\_DOWN\_CPU\_IN\_LIGHT\_SLEEP*
- *CONFIG\_PM\_POWER\_DOWN\_PERIPHERAL\_IN\_LIGHT\_SLEEP*
- *CONFIG\_PM\_SLP\_IRAM\_OPT*
- *CONFIG\_PM\_RTOS\_IDLE\_OPT*
- *CONFIG\_PM\_ENABLE*

## CONFIG\_PM\_ENABLE

Support for power management

Found in: *Component config > Power Management*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

### CONFIG\_PM\_DFS\_INIT\_AUTO

Enable dynamic frequency scaling (DFS) at startup

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT\_CPU\_FREQ\_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp\_pm\_configure function.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_PROFILING

Enable profiling counters for PM locks

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, esp\_pm\_\* functions will keep track of the amount of time each of the power management locks has been held, and esp\_pm\_dump\_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_TRACE

Enable debug tracing of PM using GPIOs

*Found in: [Component config](#) > [Power Management](#) > [CONFIG\\_PM\\_ENABLE](#)*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm\_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_PM\_SLP\_IRAM\_OPT

Put lightsleep related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 1.8KB of lightsleep related source code would be in IRAM and chip would sleep longer for 760us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

### CONFIG\_PM\_RTOS\_IDLE\_OPT

Put RTOS IDLE related codes in internal RAM

*Found in: [Component config](#) > [Power Management](#)*

If enabled, about 260B of RTOS\_IDLE related source code would be in IRAM and chip would sleep longer for 40us at most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

### CONFIG\_PM\_SLP\_DISABLE\_GPIO

Disable all GPIO when chip at sleep

*Found in: [Component config](#) > [Power Management](#)*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200~300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call 'gpio\_sleep\_sel\_dis' to disable this feature on those pins. You can also keep this feature on and call 'gpio\_sleep\_set\_direction' and 'gpio\_sleep\_set\_pull\_mode' to have a different GPIO configuration at sleep. **Warning:** If you want to enable this option on ESP32, you should enable `GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL` at first, otherwise you will not be able to switch pullup/pulldown mode.

### CONFIG\_PM\_POWER\_DOWN\_CPU\_IN\_LIGHT\_SLEEP

Power down CPU in light sleep

*Found in: [Component config](#) > [Power Management](#)*

If enabled, the CPU will be powered down in light sleep, ESP chips supports saving and restoring CPU's running context before and after light sleep, the feature provides applications with seamless CPU powerdowned lightsleep without user awareness. But this will take up some internal memory. On esp32c3 soc, enabling this option will consume 1.68 KB of internal RAM and will reduce sleep current consumption by about 100 uA. On esp32s3 soc, enabling this option will consume 8.58 KB of internal RAM and will reduce sleep current consumption by about 650 uA.

**Default value:**

- Yes (enabled) if `SOC_PM_SUPPORT_CPU_PD`

### CONFIG\_PM\_POWER\_DOWN\_PERIPHERAL\_IN\_LIGHT\_SLEEP

Power down Digital Peripheral in light sleep (EXPERIMENTAL)

*Found in: [Component config](#) > [Power Management](#)*

If enabled, digital peripherals will be powered down in light sleep, it will reduce sleep current consumption by about 100 uA. Chip will save/restore register context at sleep/wake time to keep the system running. Enabling this option will increase static RAM and heap usage, the actual cost depends on the peripherals you have initialized. In order to save/restore the context of the necessary hardware for FreeRTOS to run, it will need at least 4.55 KB free heap at sleep time. Otherwise sleep will not power down the peripherals.

**Note1:** Please use this option with caution, the current IDF does not support the retention of all peripherals. When the digital peripherals are powered off and a sleep and wake-up is completed, the peripherals that have not saved the running context are equivalent to performing a reset. !!! Please confirm the peripherals used in your application and their sleep retention support status before enabling this option, peripherals sleep retention driver support status is tracked in `power_management.rst`

**Note2:** When this option is enabled simultaneously with `FREERTOS_USE_TICKLESS_IDLE`, since the UART will be powered down, the uart FIFO will be flushed before sleep to avoid data loss, however, this has the potential to block the sleep process and cause the wakeup time to be skipped, which will cause the tick of freertos to not be compensated correctly when returning from sleep and cause the system to crash. To avoid this, you can increase `FREERTOS_IDLE_TIME_BEFORE_SLEEP` threshold in `menuconfig`.

**Default value:**

- No (disabled) if `SOC_PAU_SUPPORTED`

## CONFIG\_PM\_LIGHT\_SLEEP\_CALLBACKS

Enable registration of pm light sleep callbacks

*Found in: [Component config](#) > [Power Management](#)*

If enabled, it allows user to register entry and exit callbacks which are called before and after entering auto light sleep.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

## ESP PSRAM

**ESP Ringbuf** Contains:

- [CONFIG\\_RINGBUF\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH](#)

## CONFIG\_RINGBUF\_PLACE\_FUNCTIONS\_INTO\_FLASH

Place non-ISR ringbuf functions into flash

*Found in: [Component config](#) > [ESP Ringbuf](#)*

Place non-ISR ringbuf functions (like xRingbufferCreate/xRingbufferSend) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

**Default value:**

- No (disabled)

## CONFIG\_RINGBUF\_PLACE\_ISR\_FUNCTIONS\_INTO\_FLASH

Place ISR ringbuf functions into flash

*Found in: [Component config](#) > [ESP Ringbuf](#) > [CONFIG\\_RINGBUF\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH](#)*

Place ISR ringbuf functions (like xRingbufferSendFromISR/xRingbufferReceiveFromISR) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which are configured to run the ISR from an IRAM context, e.g. [CONFIG\\_UART\\_ISR\\_IN\\_IRAM](#).

**Default value:**

- No (disabled) if [CONFIG\\_RINGBUF\\_PLACE\\_FUNCTIONS\\_INTO\\_FLASH](#)

**ESP System Settings** Contains:

- [CONFIG\\_ESP\\_SYSTEM\\_RTC\\_EXT\\_XTAL\\_BOOTSTRAP\\_CYCLES](#)
- [Brownout Detector](#)
- [Cache config](#)
- [CONFIG\\_ESP\\_CONSOLE\\_UART](#)
- [CONFIG\\_ESP\\_CONSOLE\\_SECONDARY](#)
- [CONFIG\\_ESP\\_DEFAULT\\_CPU\\_FREQ\\_MHZ](#)
- [CONFIG\\_ESP\\_SYSTEM\\_ALLOW\\_RTC\\_FAST\\_MEM\\_AS\\_HEAP](#)
- [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#)
- [CONFIG\\_ESP\\_SYSTEM\\_EVENT\\_TASK\\_STACK\\_SIZE](#)

- `CONFIG_ESP_SYSTEM_USE_EH_FRAME`
- `CONFIG_ESP_XT_WDT`
- `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`
- `CONFIG_ESP_INT_WDT`
- `CONFIG_ESP_MAIN_TASK_AFFINITY`
- `CONFIG_ESP_MAIN_TASK_STACK_SIZE`
- `CONFIG_ESP_DEBUG_OCDAWARE`
- *Memory protection*
- `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
- `CONFIG_ESP_DEBUG_STUBS_ENABLE`
- `CONFIG_ESP_SYSTEM_PANIC`
- `CONFIG_ESP_SYSTEM_PANIC_REBOOT_DELAY_SECONDS`
- `CONFIG_ESP_PANIC_HANDLER_IRAM`
- `CONFIG_ESP_SYSTEM_BBPLL_RECALIB`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
- `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
- `CONFIG_ESP_CONSOLE_UART_NUM`
- `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_TX_GPIO`

### **CONFIG\_ESP\_DEFAULT\_CPU\_FREQ\_MHZ**

CPU frequency

*Found in: Component config > ESP System Settings*

CPU frequency to be set on application startup.

Available options:

- 40 MHz (`CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_40`)
- 80 MHz (`CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_80`)
- 120 MHz (`CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_120`)

**Cache config** Contains:

- `CONFIG_ESP32C2_INSTRUCTION_CACHE_WRAP`

### **CONFIG\_ESP32C2\_INSTRUCTION\_CACHE\_WRAP**

Instruction cache wrap

*Found in: Component config > ESP System Settings > Cache config*

If enabled, instruction cache will use wrap mode to read spi flash. The wrap length is fixed to 32B

### **CONFIG\_ESP\_SYSTEM\_PANIC**

Panic handler behaviour

*Found in: Component config > ESP System Settings*

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler's action here.

Available options:

- Print registers and halt (CONFIG\_ESP\_SYSTEM\_PANIC\_PRINT\_HALT)  
Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (CONFIG\_ESP\_SYSTEM\_PANIC\_PRINT\_REBOOT)  
Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (CONFIG\_ESP\_SYSTEM\_PANIC\_SILENT\_REBOOT)  
Just resets the processor without outputting anything
- GDBStub on panic (CONFIG\_ESP\_SYSTEM\_PANIC\_GDBSTUB)  
Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.
- GDBStub at runtime (CONFIG\_ESP\_SYSTEM\_GDBSTUB\_RUNTIME)  
Invoke gdbstub on the serial port, allowing for gdb to attach to it and to do a debug on runtime.

### CONFIG\_ESP\_SYSTEM\_PANIC\_REBOOT\_DELAY\_SECONDS

Panic reboot delay (Seconds)

*Found in: Component config > ESP System Settings*

After the panic handler executes, you can specify a number of seconds to wait before the device reboots.

**Range:**

- from 0 to 99

**Default value:**

- 0

### CONFIG\_ESP\_SYSTEM\_RTC\_EXT\_XTAL\_BOOTSTRAP\_CYCLES

Bootstrap cycles for external 32kHz crystal

*Found in: Component config > ESP System Settings*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger "Number of cycles for RTC\_SLOW\_CLK calibration" (about 3000).

### CONFIG\_ESP\_SYSTEM\_ALLOW\_RTC\_FAST\_MEM\_AS\_HEAP

Enable RTC fast memory for dynamic allocations

*Found in: Component config > ESP System Settings*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

### CONFIG\_ESP\_SYSTEM\_USE\_EH\_FRAME

Generate and use eh\_frame for backtracing

*Found in: Component config > ESP System Settings*

Generate DWARF information for each function of the project. These information will be parsed and used to perform backtracing when panics occur. Activating this option will activate asynchronous frame unwinding and generation of both .eh\_frame and .eh\_frame\_hdr sections, resulting in a bigger binary

size (20% to 100% larger). The main purpose of this option is to be able to have a backtrace parsed and printed by the program itself, regardless of the serial monitor used. This option shall NOT be used for production.

**Default value:**

- No (disabled)

**Memory protection** Contains:

- [CONFIG\\_ESP\\_SYSTEM\\_PMP\\_IDRAM\\_SPLIT](#)
- [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)

### **CONFIG\_ESP\_SYSTEM\_PMP\_IDRAM\_SPLIT**

Enable IRAM/DRAM split protection

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#)*

If enabled, the CPU watches all the memory access and raises an exception in case of any memory violation. This feature automatically splits the SRAM memory, using PMP, into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE**

Enable memory protection

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#)*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**

- Yes (enabled) if `SOC_MEMPROT_SUPPORTED`

### **CONFIG\_ESP\_SYSTEM\_MEMPROT\_FEATURE\_LOCK**

Lock memory protection settings

*Found in: [Component config](#) > [ESP System Settings](#) > [Memory protection](#) > [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_SYSTEM\\_MEMPROT\\_FEATURE](#)

### **CONFIG\_ESP\_SYSTEM\_EVENT\_QUEUE\_SIZE**

System event queue size

*Found in: [Component config](#) > [ESP System Settings](#)*

Config system event queue size in different application.

**Default value:**

- 32

### CONFIG\_ESP\_SYSTEM\_EVENT\_TASK\_STACK\_SIZE

Event loop task stack size

*Found in: [Component config](#) > [ESP System Settings](#)*

Config system event task stack size in different application.

**Default value:**

- 2304

### CONFIG\_ESP\_MAIN\_TASK\_STACK\_SIZE

Main task stack size

*Found in: [Component config](#) > [ESP System Settings](#)*

Configure the "main task" stack size. This is the stack of the task which calls `app_main()`. If `app_main()` returns then this task is deleted and its stack memory is freed.

**Default value:**

- 3584

### CONFIG\_ESP\_MAIN\_TASK\_AFFINITY

Main task core affinity

*Found in: [Component config](#) > [ESP System Settings](#)*

Configure the "main task" core affinity. This is the used core of the task which calls `app_main()`. If `app_main()` returns then this task is deleted.

Available options:

- CPU0 (CONFIG\_ESP\_MAIN\_TASK\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_ESP\_MAIN\_TASK\_AFFINITY\_CPU1)
- No affinity (CONFIG\_ESP\_MAIN\_TASK\_AFFINITY\_NO\_AFFINITY)

### CONFIG\_ESP\_MINIMAL\_SHARED\_STACK\_SIZE

Minimal allowed size for shared stack

*Found in: [Component config](#) > [ESP System Settings](#)*

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

**Default value:**

- 2048

### CONFIG\_ESP\_CONSOLE\_UART

Channel for console output

*Found in: [Component config](#) > [ESP System Settings](#)*

Select where to send console output (through `stdout` and `stderr`).

- Default is to use UART0 on pre-defined GPIOs.
- If "Custom" is selected, UART0 or UART1 can be chosen, and any pins can be selected.
- If "None" is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.

- On chips with USB OTG peripheral, "USB CDC" option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
- On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

Available options:

- Default: UART0 (CONFIG\_ESP\_CONSOLE\_UART\_DEFAULT)
- USB CDC (CONFIG\_ESP\_CONSOLE\_USB\_CDC)
- USB Serial/JTAG Controller (CONFIG\_ESP\_CONSOLE\_USB\_SERIAL\_JTAG)
- Custom UART (CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM)
- None (CONFIG\_ESP\_CONSOLE\_NONE)

### CONFIG\_ESP\_CONSOLE\_SECONDARY

Channel for console secondary output

*Found in: Component config > ESP System Settings*

This secondary option supports output through other specific port like USB\_SERIAL\_JTAG when UART0 port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or input through this secondary port, please change the primary config to this port in *Channel for console output* menu.

Available options:

- No secondary console (CONFIG\_ESP\_CONSOLE\_SECONDARY\_NONE)
- USB\_SERIAL\_JTAG PORT (CONFIG\_ESP\_CONSOLE\_SECONDARY\_USB\_SERIAL\_JTAG)  
This option supports output through USB\_SERIAL\_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB\_SERIAL\_JTAG port, please change the primary config to ESP\_CONSOLE\_USB\_SERIAL\_JTAG above.

### CONFIG\_ESP\_CONSOLE\_UART\_NUM

UART peripheral to use for console output (0-1)

*Found in: Component config > ESP System Settings*

This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

Due to an ESP32 ROM bug, UART2 is not supported for console output via `esp_rom_printf`.

Available options:

- UART0 (CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_0)
- UART1 (CONFIG\_ESP\_CONSOLE\_UART\_CUSTOM\_NUM\_1)

### CONFIG\_ESP\_CONSOLE\_UART\_TX\_GPIO

UART TX on GPIO#

*Found in: Component config > ESP System Settings*

This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 46 if [CONFIG\\_ESP\\_CONSOLE\\_UART\\_CUSTOM](#)

**Default value:**

- 20 if [CONFIG\\_ESP\\_CONSOLE\\_UART\\_CUSTOM](#)
- 43 if [CONFIG\\_ESP\\_CONSOLE\\_UART\\_CUSTOM](#)

## CONFIG\_ESP\_CONSOLE\_UART\_RX\_GPIO

UART RX on GPIO#

*Found in: [Component config](#) > [ESP System Settings](#)*

This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn't read anything from the UART.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 0 to 46 if [CONFIG\\_ESP\\_CONSOLE\\_UART\\_CUSTOM](#)

**Default value:**

- 19 if [CONFIG\\_ESP\\_CONSOLE\\_UART\\_CUSTOM](#)
- 44 if [CONFIG\\_ESP\\_CONSOLE\\_UART\\_CUSTOM](#)

## CONFIG\_ESP\_CONSOLE\_UART\_BAUDRATE

UART console baud rate

*Found in: [Component config](#) > [ESP System Settings](#)*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app's maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF\_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**

- from 1200 to 1000000 if [CONFIG\\_PM\\_ENABLE](#)

**Default value:**

- 74880 if [CONFIG\\_XTAL\\_FREQ\\_26](#)
- 115200

## CONFIG\_ESP\_INT\_WDT

Interrupt watchdog

*Found in: [Component config](#) > [ESP System Settings](#)*

This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_INT\_WDT\_TIMEOUT\_MS**

Interrupt watchdog timeout (ms)

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**

- from 10 to 10000

**Default value:**

- 300

**CONFIG\_ESP\_INT\_WDT\_CHECK\_CPU1**

Also watch CPU1 tick interrupt

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_INT\\_WDT](#)*

Also detect if interrupts on CPU 1 are disabled for too long.

**CONFIG\_ESP\_TASK\_WDT\_EN**

Enable Task Watchdog Timer

*Found in: [Component config](#) > [ESP System Settings](#)*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will enable the Task Watchdog Timer. It can be either initialized automatically at startup or initialized after startup (see Task Watchdog Timer API Reference)

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_TASK\_WDT\_INIT**

Initialize Task Watchdog Timer on startup

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#)*

Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_TASK\_WDT\_PANIC**

Invoke panic handler on Task Watchdog timeout

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**

- No (disabled)

### CONFIG\_ESP\_TASK\_WDT\_TIMEOUT\_S

Task Watchdog timeout period (seconds)

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

**Range:**

- from 1 to 60

**Default value:**

- 5

### CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU0

Watch CPU0 Idle Task

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_TASK\_WDT\_CHECK\_IDLE\_TASK\_CPU1

Watch CPU1 Idle Task

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_EN](#) > [CONFIG\\_ESP\\_TASK\\_WDT\\_INIT](#)

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

### CONFIG\_ESP\_XT\_WDT

Initialize XTAL32K watchdog timer on startup

*Found in:* [Component config](#) > [ESP System Settings](#)

This watchdog timer can detect oscillation failure of the XTAL32K\_CLK. When such a failure is detected the hardware can be set up to automatically switch to BACKUP32K\_CLK and generate an interrupt.

### CONFIG\_ESP\_XT\_WDT\_TIMEOUT

XTAL32K watchdog timeout period

*Found in:* [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_XT\\_WDT](#)

Timeout period configuration for the XTAL32K watchdog timer based on RTC\_CLK.

**Range:**

- from 1 to 255 if [CONFIG\\_ESP\\_XT\\_WDT](#)

**Default value:**

- 200 if [CONFIG\\_ESP\\_XT\\_WDT](#)

### CONFIG\_ESP\_XT\_WDT\_BACKUP\_CLK\_ENABLE

Automatically switch to BACKUP32K\_CLK when timer expires

*Found in: [Component config](#) > [ESP System Settings](#) > [CONFIG\\_ESP\\_XT\\_WDT](#)*

Enable this to automatically switch to BACKUP32K\_CLK as the source of RTC\_SLOW\_CLK when the watchdog timer expires.

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_XT\\_WDT](#)

### CONFIG\_ESP\_PANIC\_HANDLER\_IRAM

Place panic handler code in IRAM

*Found in: [Component config](#) > [ESP System Settings](#)*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_DEBUG\_STUBS\_ENABLE

OpenOCD debug stubs

*Found in: [Component config](#) > [ESP System Settings](#)*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

### CONFIG\_ESP\_DEBUG\_OCDAWARE

Make exception and panic handlers JTAG/OCD aware

*Found in: [Component config](#) > [ESP System Settings](#)*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_SYSTEM\_CHECK\_INT\_LEVEL

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: [Component config](#) > [ESP System Settings](#)*

Interrupt level to use for Interrupt Watchdog and other system checks.

Available options:

- Level 5 interrupt ([CONFIG\\_ESP\\_SYSTEM\\_CHECK\\_INT\\_LEVEL\\_5](#))  
Using level 5 interrupt for Interrupt Watchdog and other system checks.

- Level 4 interrupt (`CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL_4`)  
Using level 4 interrupt for Interrupt Watchdog and other system checks.

**Brownout Detector** Contains:

- `CONFIG_ESP_BROWNOUT_DET`

### **CONFIG\_ESP\_BROWNOUT\_DET**

Hardware brownout detect & reset

*Found in: [Component config](#) > [ESP System Settings](#) > [Brownout Detector](#)*

The ESP32-C2 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**

- Yes (enabled)

### **CONFIG\_ESP\_BROWNOUT\_DET\_LVL\_SEL**

Brownout voltage level

*Found in: [Component config](#) > [ESP System Settings](#) > [Brownout Detector](#) > [CONFIG\\_ESP\\_BROWNOUT\\_DET](#)*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages #of the brownout threshold levels.

Available options:

- 2.51V (`CONFIG_ESP_BROWNOUT_DET_LVL_SEL_7`)
- 2.64V (`CONFIG_ESP_BROWNOUT_DET_LVL_SEL_6`)
- 2.76V (`CONFIG_ESP_BROWNOUT_DET_LVL_SEL_5`)
- 2.92V (`CONFIG_ESP_BROWNOUT_DET_LVL_SEL_4`)
- 3.10V (`CONFIG_ESP_BROWNOUT_DET_LVL_SEL_3`)
- 3.27V (`CONFIG_ESP_BROWNOUT_DET_LVL_SEL_2`)

### **CONFIG\_ESP\_SYSTEM\_BBPLL\_RECALIB**

Re-calibration BBPLL at startup

*Found in: [Component config](#) > [ESP System Settings](#)*

This configuration helps to address an BBPLL inaccurate issue when boot from certain bootloader version, which may increase about the boot-up time by about 200 us. Disable this when your bootloader is built with ESP-IDF version v5.2 and above.

**Default value:**

- Yes (enabled)

**IPC (Inter-Processor Call)** Contains:

- `CONFIG_ESP_IPC_TASK_STACK_SIZE`
- `CONFIG_ESP_IPC_USES_CALLERS_PRIORITY`

### CONFIG\_ESP\_IPC\_TASK\_STACK\_SIZE

Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**

- from 512 to 65536

**Default value:**

- 1024

### CONFIG\_ESP\_IPC\_USES\_CALLERS\_PRIORITY

IPC runs at caller's priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX\_PRIORITIES - 1) priority.

**High resolution timer (esp\_timer)** Contains:

- *CONFIG\_ESP\_TIMER\_PROFILING*
- *CONFIG\_ESP\_TIMER\_TASK\_AFFINITY*
- *CONFIG\_ESP\_TIMER\_TASK\_STACK\_SIZE*
- *CONFIG\_ESP\_TIMER\_INTERRUPT\_LEVEL*
- *CONFIG\_ESP\_TIMER\_SHOW\_EXPERIMENTAL*
- *CONFIG\_ESP\_TIMER\_SUPPORTS\_ISR\_DISPATCH\_METHOD*
- *CONFIG\_ESP\_TIMER\_ISR\_AFFINITY*

### CONFIG\_ESP\_TIMER\_PROFILING

Enable esp\_timer profiling features

*Found in: Component config > High resolution timer (esp\_timer)*

If enabled, esp\_timer\_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_TIMER\_TASK\_STACK\_SIZE

High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp\_timer)*

Configure the stack size of "timer\_task" task. This task is used to dispatch callbacks of timers created using ets\_timer and esp\_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see "FreeRTOS timer task stack size" option in "FreeRTOS".

**Range:**

- from 2048 to 65536

**Default value:**

- 3584

**CONFIG\_ESP\_TIMER\_INTERRUPT\_LEVEL**

Interrupt level

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

It sets the interrupt level for esp\_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp\_timer latency.

**Range:**

- from 1 to 1

**Default value:**

- 1

**CONFIG\_ESP\_TIMER\_SHOW\_EXPERIMENTAL**

show esp\_timer's experimental features

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

This shows some hidden features of esp\_timer. Note that they may break other features, use them with care.

**CONFIG\_ESP\_TIMER\_TASK\_AFFINITY**

esp\_timer task core affinity

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - "CPU0": (default) esp\_timer task is processed by CPU0. - "CPU1": esp\_timer task is processed by CPU1. - "No affinity": esp\_timer task can be processed by any CPU.

Available options:

- CPU0 (CONFIG\_ESP\_TIMER\_TASK\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_ESP\_TIMER\_TASK\_AFFINITY\_CPU1)
- No affinity (CONFIG\_ESP\_TIMER\_TASK\_AFFINITY\_NO\_AFFINITY)

**CONFIG\_ESP\_TIMER\_ISR\_AFFINITY**

timer interrupt core affinity

*Found in: [Component config](#) > [High resolution timer \(esp\\_timer\)](#)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - "CPU0": (default) timer interrupt is processed by CPU0. - "CPU1": timer interrupt is processed by CPU1. - "No affinity": timer interrupt can be processed by any CPU. It helps to reduce latency but there is a disadvantage it leads to the timer ISR running on every core. It increases the CPU time usage for timer ISRs by N on an N-core system.

Available options:

- CPU0 (CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_CPU1)
- No affinity (CONFIG\_ESP\_TIMER\_ISR\_AFFINITY\_NO\_AFFINITY)

**CONFIG\_ESP\_TIMER\_SUPPORTS\_ISR\_DISPATCH\_METHOD**

Support ISR dispatch method

*Found in: Component config > High resolution timer (esp\_timer)*

Allows using ESP\_TIMER\_ISR dispatch method (ESP\_TIMER\_TASK dispatch method is also available). - ESP\_TIMER\_TASK - Timer callbacks are dispatched from a high-priority esp\_timer task. - ESP\_TIMER\_ISR - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**

- No (disabled)

**Wi-Fi** Contains:

- *CONFIG\_ESP\_WIFI\_TESTING\_OPTIONS*
- *CONFIG\_ESP\_WIFI\_WPS\_SOFTAP\_REGISTRAR*
- *CONFIG\_ESP\_WIFI\_11KV\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_11R\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_DPP\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_ENTERPRISE\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_MBO\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_SUITE\_B\_192*
- *CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_OWE\_STA*
- *CONFIG\_ESP\_WIFI\_WAPI\_PSK*
- *CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_RX\_STATS*
- *CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_TX\_STATS*
- *CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_SAE*
- *CONFIG\_ESP\_WIFI\_SOFTAP\_BEACON\_MAX\_LEN*
- *CONFIG\_ESP\_WIFI\_CACHE\_TX\_BUFFER\_NUM*
- *CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM*
- *CONFIG\_ESP\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM*
- *CONFIG\_ESP\_WIFI\_RX\_MGMT\_BUF\_NUM\_DEF*
- *CONFIG\_ESP\_WIFI\_STATIC\_RX\_BUFFER\_NUM*
- *CONFIG\_ESP\_WIFI\_STATIC\_TX\_BUFFER\_NUM*
- *CONFIG\_ESP\_WIFI\_ESPNOW\_MAX\_ENCRYPT\_NUM*
- *CONFIG\_ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE*
- *CONFIG\_ESP\_WIFI\_DEBUG\_PRINT*
- *CONFIG\_ESP\_WIFI\_MGMT\_RX\_BUFFER*
- *CONFIG\_ESP\_WIFI\_TX\_BUFFER*
- *CONFIG\_ESP\_WIFI\_MBEDTLS\_CRYPTO*
- *CONFIG\_ESP\_WIFI\_AMPDU\_RX\_ENABLED*
- *CONFIG\_ESP\_WIFI\_AMPDU\_TX\_ENABLED*
- *CONFIG\_ESP\_WIFI\_AMSDU\_TX\_ENABLED*
- *CONFIG\_ESP\_WIFI\_NAN\_ENABLE*
- *CONFIG\_ESP\_WIFI\_CSI\_ENABLED*
- *CONFIG\_ESP\_WIFI\_EXTRA\_IRAM\_OPT*
- *CONFIG\_ESP\_WIFI\_FTM\_ENABLE*
- *CONFIG\_ESP\_WIFI\_GCMP\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_GMAC\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_IRAM\_OPT*
- *CONFIG\_ESP\_WIFI\_MGMT\_SBUF\_NUM*
- *CONFIG\_ESP\_WIFI\_ENHANCED\_LIGHT\_SLEEP*
- *CONFIG\_ESP\_WIFI\_NVS\_ENABLED*
- *CONFIG\_ESP\_WIFI\_RX\_IRAM\_OPT*
- *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*
- *CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT*
- *CONFIG\_ESP\_WIFI\_SOFTAP\_SUPPORT*
- *CONFIG\_ESP\_WIFI\_TASK\_CORE\_ID*

- [WPS Configuration Options](#)

### CONFIG\_ESP\_WIFI\_STATIC\_RX\_BUFFER\_NUM

Max number of WiFi static RX buffers

*Found in:* [Component config](#) > [Wi-Fi](#)

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when `esp_wifi_init` is called, they are not freed until `esp_wifi_deinit` is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If `ESP_WIFI_AMPDU_RX_ENABLED` is enabled, this value is recommended to set equal or bigger than `ESP_WIFI_RX_BA_WIN` in order to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 128 if `SOC_WIFI_HE_SUPPORT`

**Default value:**

- 16 if `SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

### CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM

Max number of WiFi dynamic RX buffers

*Found in:* [Component config](#) > [Wi-Fi](#)

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

**Range:**

- from 0 to 1024 if `CONFIG_LWIP_WND_SCALE`

**Default value:**

- 32

### CONFIG\_ESP\_WIFI\_TX\_BUFFER

Type of WiFi TX buffers

*Found in:* [Component config](#) > [Wi-Fi](#)

Select type of WiFi TX buffers:

If "Static" is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If "Dynamic" is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the Wifi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.

If PSRAM is enabled, "Static" should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, "Dynamic" should be selected to improve the utilization of RAM.

Available options:

- Static (`CONFIG_ESP_WIFI_STATIC_TX_BUFFER`)
- Dynamic (`CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER`)

### **CONFIG\_ESP\_WIFI\_STATIC\_TX\_BUFFER\_NUM**

Max number of WiFi static TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when `esp_wifi_init()` is called, they are not released until `esp_wifi_deinit()` is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 64 if `CONFIG_ESP_WIFI_STATIC_TX_BUFFER`

**Default value:**

- 16 if `CONFIG_ESP_WIFI_STATIC_TX_BUFFER`

### **CONFIG\_ESP\_WIFI\_CACHE\_TX\_BUFFER\_NUM**

Max number of WiFi cache TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

**Range:**

- from 16 to 128 if SPIRAM

**Default value:**

- 32 if SPIRAM

### **CONFIG\_ESP\_WIFI\_DYNAMIC\_TX\_BUFFER\_NUM**

Max number of WiFi dynamic TX buffers

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**

- from 1 to 128

**Default value:**

- 32

### CONFIG\_ESP\_WIFI\_MGMT\_RX\_BUFFER

Type of WiFi RX MGMT buffers

*Found in:* [Component config > Wi-Fi](#)

Select type of WiFi RX MGMT buffers:

If "Static" is selected, WiFi RX MGMT buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static RX MGMT buffer is fixed to about 500 Bytes.

If "Dynamic" is selected, each WiFi RX MGMT buffer is allocated as needed when a MGMT data frame is received. The MGMT buffer is freed after the MGMT data frame has been processed by the WiFi driver.

Available options:

- Static (CONFIG\_ESP\_WIFI\_STATIC\_RX\_MGMT\_BUFFER)
- Dynamic (CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_MGMT\_BUFFER)

### CONFIG\_ESP\_WIFI\_RX\_MGMT\_BUF\_NUM\_DEF

Max number of WiFi RX MGMT buffers

*Found in:* [Component config > Wi-Fi](#)

Set the number of WiFi RX\_MGMT buffers.

For Management buffers, the number of dynamic and static management buffers is the same. In order to prevent memory fragmentation, the management buffer type should be set to static first.

**Range:**

- from 1 to 10

**Default value:**

- 5

### CONFIG\_ESP\_WIFI\_CSI\_ENABLED

WiFi CSI(Channel State Information)

*Found in:* [Component config > Wi-Fi](#)

Select this option to enable CSI(Channel State Information) feature. CSI takes about CONFIG\_ESP\_WIFI\_STATIC\_RX\_BUFFER\_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**

- No (disabled) if SOC\_WIFI\_CSI\_SUPPORT

### CONFIG\_ESP\_WIFI\_AMPDU\_TX\_ENABLED

WiFi AMPDU TX

*Found in:* [Component config > Wi-Fi](#)

Select this option to enable AMPDU TX feature

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_TX\_BA\_WIN

WiFi AMPDU TX BA window size

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_AMPDU\_TX\_ENABLED*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

**Range:**

- from 2 to 64 if SOC\_WIFI\_HE\_SUPPORT && CONFIG\_ESP\_WIFI\_AMPDU\_TX\_ENABLED

**Default value:**

- 6

### CONFIG\_ESP\_WIFI\_AMPDU\_RX\_ENABLED

WiFi AMPDU RX

Found in: *Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_RX\_BA\_WIN

WiFi AMPDU RX BA window size

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_AMPDU\_RX\_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is preferred to allocate in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

**Range:**

- from 2 to 64 if SOC\_WIFI\_HE\_SUPPORT && CONFIG\_ESP\_WIFI\_AMPDU\_RX\_ENABLED

**Default value:**

- 16 if SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP && CONFIG\_ESP\_WIFI\_AMPDU\_RX\_ENABLED

### CONFIG\_ESP\_WIFI\_AMSDU\_TX\_ENABLED

WiFi AMSDU TX

Found in: *Component config > Wi-Fi*

Select this option to enable AMSDU TX feature

**Default value:**

- No (disabled) if SPIRAM

### CONFIG\_ESP\_WIFI\_NVS\_ENABLED

WiFi NVS flash

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WiFi NVS flash

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_TASK\_CORE\_ID

WiFi Task Core ID

*Found in: [Component config](#) > [Wi-Fi](#)*

Pinned WiFi task to core 0 or core 1.

Available options:

- Core 0 (CONFIG\_ESP\_WIFI\_TASK\_PINNED\_TO\_CORE\_0)
- Core 1 (CONFIG\_ESP\_WIFI\_TASK\_PINNED\_TO\_CORE\_1)

### CONFIG\_ESP\_WIFI\_SOFTAP\_BEACON\_MAX\_LEN

Max length of WiFi SoftAP Beacon

*Found in: [Component config](#) > [Wi-Fi](#)*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36\*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**

- from 752 to 1256

**Default value:**

- 752

### CONFIG\_ESP\_WIFI\_MGMT\_SBUF\_NUM

WiFi mgmt short buffer number

*Found in: [Component config](#) > [Wi-Fi](#)*

Set the number of WiFi management short buffer.

**Range:**

- from 6 to 32

**Default value:**

- 32

### CONFIG\_ESP\_WIFI\_IRAM\_OPT

WiFi IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_EXTRA\_IRAM\_OPT

WiFi EXTRA IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place additional frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 5Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_RX\_IRAM\_OPT

WiFi RX IRAM speed optimization

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_SAE

Enable WPA3-Personal

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP's. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENABLE\_SAE\_PK

Enable SAE-PK

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WPA3\\_SAE](#)*

Select this option to enable SAE-PK

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_SOFTAP\_SAE\_SUPPORT

Enable WPA3 Personal(SAE) SoftAP

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_SAE*

Select this option to enable SAE support in softAP mode.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENABLE\_WPA3\_OWE\_STA

Enable OWE STA

Found in: *Component config > Wi-Fi*

Select this option to allow the device to establish OWE connection with eligible AP's. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT

WiFi SLP IRAM speed optimization

Found in: *Component config > Wi-Fi*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP\_WIFI\_IRAM\_OPT and ESP\_WIFI\_RX\_IRAM\_OPT, or this one. If already enabled ESP\_WIFI\_IRAM\_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP\_WIFI\_RX\_IRAM\_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

### CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MIN\_ACTIVE\_TIME

Minimum active time

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT*

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**

- from 8 to 60 if *CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT*

**Default value:**

- 50 if *CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_DEFAULT\_MAX\_ACTIVE\_TIME

Maximum keep alive time

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT*

The maximum time that wifi keep alive, unit: seconds.

**Range:**

- from 10 to 60 if *CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT*

**Default value:**

- 10 if *CONFIG\_ESP\_WIFI\_SLP\_IRAM\_OPT*

**CONFIG\_ESP\_WIFI\_FTM\_ENABLE**

WiFi FTM

*Found in: [Component config](#) > [Wi-Fi](#)*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

**Default value:**

- No (disabled)

**CONFIG\_ESP\_WIFI\_FTM\_INITIATOR\_SUPPORT**

FTM Initiator support

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)*

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)

**CONFIG\_ESP\_WIFI\_FTM\_RESPONDER\_SUPPORT**

FTM Responder support

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)*

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_FTM\\_ENABLE](#)

**CONFIG\_ESP\_WIFI\_STA\_DISCONNECTED\_PM\_ENABLE**

Power Management for station at disconnected

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable power\_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_GCMP\_SUPPORT**

WiFi GCMP Support(GCMP128 and GCMP256)

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

**Default value:**

- No (disabled) if [SOC\\_WIFI\\_GCMP\\_SUPPORT](#)

**CONFIG\_ESP\_WIFI\_GMAC\_SUPPORT**

WiFi GMAC Support(GMAC128 and GMAC256)

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_SOFTAP\_SUPPORT

WiFi SoftAP Support

Found in: *Component config > Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENHANCED\_LIGHT\_SLEEP

WiFi modem automatically receives the beacon

Found in: *Component config > Wi-Fi*

The wifi modem automatically receives the beacon frame during light sleep.

**Default value:**

- No (disabled) if `CONFIG_ESP_PHY_MAC_BB_PD` &&  
`SOC_PM_SUPPORT_BEACON_WAKEUP`

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT

Wifi sleep optimize when beacon lost

Found in: *Component config > Wi-Fi*

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_TIMEOUT

Beacon loss timeout

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

**Range:**

- from 5 to 100 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**Default value:**

- 10 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

### CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_THRESHOLD

Maximum number of consecutive lost beacons allowed

Found in: *Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

**Range:**

- from 0 to 8 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**Default value:**

- 3 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

### CONFIG\_ESP\_WIFI\_SLP\_PHY\_ON\_DELTA\_EARLY\_TIME

Delta early time for RF PHY on

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Delta early time for rf phy on, When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item, Unit: 32 microsecond.

**Range:**

- from 0 to 100 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 2 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_SLP\_PHY\_OFF\_DELTA\_TIMEOUT\_TIME

Delta timeout time for RF PHY off

*Found in: Component config > Wi-Fi > CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

**Range:**

- from 0 to 8 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

**Default value:**

- 2 if *CONFIG\_ESP\_WIFI\_SLP\_BEACON\_LOST\_OPT*

### CONFIG\_ESP\_WIFI\_ESPNOW\_MAX\_ENCRYPT\_NUM

Maximum espnow encrypt peers number

*Found in: Component config > Wi-Fi*

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum number of connections of SoftAP = Max hardware keys number. When using ESP mesh, this value should be set to a maximum of 6.

**Range:**

- from 0 to 4

**Default value:**

- 2

### CONFIG\_ESP\_WIFI\_NAN\_ENABLE

WiFi Aware

*Found in: Component config > Wi-Fi*

Enable WiFi Aware (NAN) feature.

**Default value:**

- No (disabled) if SOC\_WIFI\_NAN\_SUPPORT

### CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_TX\_STATS

Enable Wi-Fi transmission statistics

*Found in: Component config > Wi-Fi*

Enable Wi-Fi transmission statistics. Total support 4 access category. Each access category will use 346 bytes memory.

**Default value:**

- Yes (enabled) if SOC\_WIFI\_HE\_SUPPORT

**CONFIG\_ESP\_WIFI\_MBEDTLS\_CRYPTO**

Use MbedTLS crypto APIs

*Found in:* [Component config](#) > [Wi-Fi](#)

Select this option to enable the use of MbedTLS crypto APIs. The internal crypto support within the supplicant is limited and may not suffice for all new security features, including WPA3.

It is recommended to always keep this option enabled. Additionally, note that MbedTLS can leverage hardware acceleration if available, resulting in significantly faster cryptographic operations.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_MBEDTLS\_TLS\_CLIENT**

Use MbedTLS TLS client for WiFi Enterprise connection

*Found in:* [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_MBEDTLS\\_CRYPTO](#)

Select this option to use MbedTLS TLS client for WPA2 enterprise connection. Please note that from MbedTLS-3.0 onwards, MbedTLS does not support SSL-3.0 TLS-v1.0, TLS-v1.1 versions. In case your server is using one of these version, it is advisable to update your server. Please disable this option for compatibility with older TLS versions.

**Default value:**

- Yes (enabled)

**CONFIG\_ESP\_WIFI\_WAPI\_PSK**

Enable WAPI PSK support

*Found in:* [Component config](#) > [Wi-Fi](#)

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**

- No (disabled) if SOC\_WIFI\_WAPI\_SUPPORT

**CONFIG\_ESP\_WIFI\_SUITE\_B\_192**

Enable NSA suite B support with 192 bit key

*Found in:* [Component config](#) > [Wi-Fi](#)

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

**Default value:**

- No (disabled) if SOC\_WIFI\_GCMP\_SUPPORT

**CONFIG\_ESP\_WIFI\_11KV\_SUPPORT**

Enable 802.11k, 802.11v APIs Support

*Found in:* [Component config](#) > [Wi-Fi](#)

Select this option to enable 802.11k 802.11v APIs(RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a

set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_WIFI\_SCAN\_CACHE**

Keep scan results in cache

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_11KV\\_SUPPORT](#)*

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**

- No (disabled) if [CONFIG\\_ESP\\_WIFI\\_11KV\\_SUPPORT](#)

**CONFIG\_ESP\_WIFI\_MBO\_SUPPORT**

Enable Multi Band Operation Certification Support

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WiFi Multiband operation certification support.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_WIFI\_DPP\_SUPPORT**

Enable DPP support

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WiFi Easy Connect Support.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_WIFI\_11R\_SUPPORT**

Enable 802.11R (Fast Transition) Support

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WiFi Fast Transition Support.

**Default value:**

- No (disabled)

**CONFIG\_ESP\_WIFI\_WPS\_SOFTAP\_REGISTRAR**

Add WPS Registrar support in SoftAP mode

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this option to enable WPS registrar support in softAP mode.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_RX\_STATS

Enable Wi-Fi reception statistics

*Found in:* [Component config](#) > [Wi-Fi](#)

Enable Wi-Fi reception statistics. Total support 2 access category. Each access category will use 190 bytes memory.

**Default value:**

- Yes (enabled) if SOC\_WIFI\_HE\_SUPPORT

### CONFIG\_ESP\_WIFI\_ENABLE\_WIFI\_RX\_MU\_STATS

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics

*Found in:* [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WIFI\\_RX\\_STATS](#)

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics. Will use 10932 bytes memory.

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_WIFI\\_ENABLE\\_WIFI\\_RX\\_STATS](#)

### WPS Configuration Options

 Contains:

- [CONFIG\\_ESP\\_WIFI\\_WPS\\_PASSPHRASE](#)
- [CONFIG\\_ESP\\_WIFI\\_WPS\\_STRICT](#)

### CONFIG\_ESP\_WIFI\_WPS\_STRICT

Strictly validate all WPS attributes

*Found in:* [Component config](#) > [Wi-Fi](#) > [WPS Configuration Options](#)

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_WPS\_PASSPHRASE

Get WPA2 passphrase in WPS config

*Found in:* [Component config](#) > [Wi-Fi](#) > [WPS Configuration Options](#)

Select this option to get passphrase during WPS configuration. This option fakes the virtual display capabilities to get the configuration in passphrase mode. Not recommended to be used since WPS credentials should not be shared to other devices, making it in readable format increases that risk, also passphrase requires pbkdf2 to convert in psk.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_DEBUG\_PRINT

Print debug messages from WPA Supplicant

*Found in:* [Component config](#) > [Wi-Fi](#)

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_TESTING\_OPTIONS

Add DPP testing code

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this to enable unity test for DPP.

**Default value:**

- No (disabled)

### CONFIG\_ESP\_WIFI\_ENTERPRISE\_SUPPORT

Enable enterprise option

*Found in: [Component config](#) > [Wi-Fi](#)*

Select this to enable/disable enterprise connection support.

disabling this will reduce binary size. disabling this will disable the use of any esp\_wifi\_sta\_wpa2\_ent\_\* (as APIs will be meaningless)

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_WIFI\_ENT\_FREE\_DYNAMIC\_BUFFER

Free dynamic buffers during WiFi enterprise connection

*Found in: [Component config](#) > [Wi-Fi](#) > [CONFIG\\_ESP\\_WIFI\\_ENTERPRISE\\_SUPPORT](#)*

Select this configuration to free dynamic buffers during WiFi enterprise connection. This will enable chip to reduce heap consumption during WiFi enterprise connection.

**Default value:**

- Yes (enabled)

### Core dump Contains:

- [CONFIG\\_ESP\\_COREDUMP\\_CHECK\\_BOOT](#)
- [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT](#)
- [CONFIG\\_ESP\\_COREDUMP\\_CHECKSUM](#)
- [CONFIG\\_ESP\\_COREDUMP\\_TO\\_FLASH\\_OR\\_UART](#)
- [CONFIG\\_ESP\\_COREDUMP\\_UART\\_DELAY](#)
- [CONFIG\\_ESP\\_COREDUMP\\_LOGS](#)
- [CONFIG\\_ESP\\_COREDUMP\\_DECODE](#)
- [CONFIG\\_ESP\\_COREDUMP\\_MAX\\_TASKS\\_NUM](#)
- [CONFIG\\_ESP\\_COREDUMP\\_STACK\\_SIZE](#)
- [CONFIG\\_ESP\\_COREDUMP\\_SUMMARY\\_STACKDUMP\\_SIZE](#)

### CONFIG\_ESP\_COREDUMP\_TO\_FLASH\_OR\_UART

Data destination

*Found in: [Component config](#) > [Core dump](#)*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition\_table directory.

Available options:

- Flash (CONFIG\_ESP\_COREDUMP\_ENABLE\_TO\_FLASH)
- UART (CONFIG\_ESP\_COREDUMP\_ENABLE\_TO\_UART)
- None (CONFIG\_ESP\_COREDUMP\_ENABLE\_TO\_NONE)

### CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT

Core dump data format

*Found in: [Component config](#) > [Core dump](#)*

Select the data format for core dump.

Available options:

- Binary format (CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT\_BIN)
- ELF format (CONFIG\_ESP\_COREDUMP\_DATA\_FORMAT\_ELF)

### CONFIG\_ESP\_COREDUMP\_CHECKSUM

Core dump data integrity check

*Found in: [Component config](#) > [Core dump](#)*

Select the integrity check for the core dump.

Available options:

- Use CRC32 for integrity verification (CONFIG\_ESP\_COREDUMP\_CHECKSUM\_CRC32)
- Use SHA256 for integrity verification (CONFIG\_ESP\_COREDUMP\_CHECKSUM\_SHA256)

### CONFIG\_ESP\_COREDUMP\_CHECK\_BOOT

Check core dump data integrity on boot

*Found in: [Component config](#) > [Core dump](#)*

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**

- Yes (enabled) if [CONFIG\\_ESP\\_COREDUMP\\_ENABLE\\_TO\\_FLASH](#)

### CONFIG\_ESP\_COREDUMP\_LOGS

Enable coredump logs for debugging

*Found in: [Component config](#) > [Core dump](#)*

Enable/disable coredump logs. Logs strings from espcoredump component are placed in DRAM. Disabling these helps to save ~5KB of internal memory.

**CONFIG\_ESP\_COREDUMP\_MAX\_TASKS\_NUM**

Maximum number of tasks

*Found in: [Component config](#) > [Core dump](#)*

Maximum number of tasks snapshots in core dump.

**CONFIG\_ESP\_COREDUMP\_UART\_DELAY**

Delay before print to UART

*Found in: [Component config](#) > [Core dump](#)*

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.

**Default value:**

- 0 if [CONFIG\\_ESP\\_COREDUMP\\_ENABLE\\_TO\\_UART](#)

**CONFIG\_ESP\_COREDUMP\_STACK\_SIZE**

Reserved stack size

*Found in: [Component config](#) > [Core dump](#)*

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

**CONFIG\_ESP\_COREDUMP\_SUMMARY\_STACKDUMP\_SIZE**

Size of the stack dump buffer

*Found in: [Component config](#) > [Core dump](#)*

Size of the buffer that would be reserved for extracting backtrace info summary. This buffer will contain the stack dump of the crashed task. This dump is useful in generating backtrace

**Range:**

- from 512 to 4096 if [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT\\_ELF](#) && [CONFIG\\_ESP\\_COREDUMP\\_ENABLE\\_TO\\_FLASH](#)

**Default value:**

- 1024 if [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT\\_ELF](#) && [CONFIG\\_ESP\\_COREDUMP\\_ENABLE\\_TO\\_FLASH](#)

**CONFIG\_ESP\_COREDUMP\_DECODE**

Handling of UART core dumps in IDF Monitor

*Found in: [Component config](#) > [Core dump](#)*

Available options:

- Decode and show summary (info\_corefile) ([CONFIG\\_ESP\\_COREDUMP\\_DECODE\\_INFO](#))
- Don't decode ([CONFIG\\_ESP\\_COREDUMP\\_DECODE\\_DISABLE](#))

**FAT Filesystem support** Contains:

- *CONFIG\_FATFS\_API\_ENCODING*
- *CONFIG\_FATFS\_VFS\_FSTAT\_BLKSIZE*
- *CONFIG\_FATFS\_USE\_FASTSEEK*
- *CONFIG\_FATFS\_LONG\_FILENAMES*
- *CONFIG\_FATFS\_MAX\_LFN*
- *CONFIG\_FATFS\_FS\_LOCK*
- *CONFIG\_FATFS\_VOLUME\_COUNT*
- *CONFIG\_FATFS\_CHOOSE\_CODEPAGE*
- *CONFIG\_FATFS\_ALLOC\_PREFER\_EXTRAM*
- *CONFIG\_FATFS\_SECTOR\_SIZE*
- *CONFIG\_FATFS\_TIMEOUT\_MS*
- *CONFIG\_FATFS\_PER\_FILE\_CACHE*

**CONFIG\_FATFS\_VOLUME\_COUNT**

Number of volumes

*Found in: Component config > FAT Filesystem support*

Number of volumes (logical drives) to use.

**Range:**

- from 1 to 10

**Default value:**

- 2

**CONFIG\_FATFS\_LONG\_FILENAMES**

Long filename support

*Found in: Component config > FAT Filesystem support*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

Available options:

- No long filenames (*CONFIG\_FATFS\_LFN\_NONE*)
- Long filename buffer in heap (*CONFIG\_FATFS\_LFN\_HEAP*)
- Long filename buffer on stack (*CONFIG\_FATFS\_LFN\_STACK*)

**CONFIG\_FATFS\_SECTOR\_SIZE**

Sector size

*Found in: Component config > FAT Filesystem support*

Specify the size of the sector in bytes for FATFS partition generator.

Available options:

- 512 (*CONFIG\_FATFS\_SECTOR\_512*)
- 4096 (*CONFIG\_FATFS\_SECTOR\_4096*)

## CONFIG\_FATFS\_CHOOSE\_CODEPAGE

OEM Code Page

*Found in: [Component config > FAT Filesystem support](#)*

OEM code page used for file name encodings.

If "Dynamic" is selected, code page can be chosen at runtime using `f_setcp` function. Note that choosing this option will increase application size by ~480kB.

Available options:

- Dynamic (all code pages supported) (CONFIG\_FATFS\_CODEPAGE\_DYNAMIC)
- US (CP437) (CONFIG\_FATFS\_CODEPAGE\_437)
- Arabic (CP720) (CONFIG\_FATFS\_CODEPAGE\_720)
- Greek (CP737) (CONFIG\_FATFS\_CODEPAGE\_737)
- KBL (CP771) (CONFIG\_FATFS\_CODEPAGE\_771)
- Baltic (CP775) (CONFIG\_FATFS\_CODEPAGE\_775)
- Latin 1 (CP850) (CONFIG\_FATFS\_CODEPAGE\_850)
- Latin 2 (CP852) (CONFIG\_FATFS\_CODEPAGE\_852)
- Cyrillic (CP855) (CONFIG\_FATFS\_CODEPAGE\_855)
- Turkish (CP857) (CONFIG\_FATFS\_CODEPAGE\_857)
- Portuguese (CP860) (CONFIG\_FATFS\_CODEPAGE\_860)
- Icelandic (CP861) (CONFIG\_FATFS\_CODEPAGE\_861)
- Hebrew (CP862) (CONFIG\_FATFS\_CODEPAGE\_862)
- Canadian French (CP863) (CONFIG\_FATFS\_CODEPAGE\_863)
- Arabic (CP864) (CONFIG\_FATFS\_CODEPAGE\_864)
- Nordic (CP865) (CONFIG\_FATFS\_CODEPAGE\_865)
- Russian (CP866) (CONFIG\_FATFS\_CODEPAGE\_866)
- Greek 2 (CP869) (CONFIG\_FATFS\_CODEPAGE\_869)
- Japanese (DBCS) (CP932) (CONFIG\_FATFS\_CODEPAGE\_932)
- Simplified Chinese (DBCS) (CP936) (CONFIG\_FATFS\_CODEPAGE\_936)
- Korean (DBCS) (CP949) (CONFIG\_FATFS\_CODEPAGE\_949)
- Traditional Chinese (DBCS) (CP950) (CONFIG\_FATFS\_CODEPAGE\_950)

## CONFIG\_FATFS\_MAX\_LFN

Max long filename length

*Found in: [Component config > FAT Filesystem support](#)*

Maximum long filename length. Can be reduced to save RAM.

## CONFIG\_FATFS\_API\_ENCODING

API character encoding

*Found in: [Component config > FAT Filesystem support](#)*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

Available options:

- API uses ANSI/OEM encoding (CONFIG\_FATFS\_API\_ENCODING\_ANSI\_OEM)
- API uses UTF-8 encoding (CONFIG\_FATFS\_API\_ENCODING\_UTF\_8)

### CONFIG\_FATFS\_FS\_LOCK

Number of simultaneously open files protected by lock function

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets the FATFS configuration value `_FS_LOCK`. The option `_FS_LOCK` switches file lock function to control duplicated file open and illegal operation to open objects.

\* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

\* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that the file lock control is independent of re-entrancy.

**Range:**

- from 0 to 65535

**Default value:**

- 0

### CONFIG\_FATFS\_TIMEOUT\_MS

Timeout for acquiring a file lock, ms

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option sets FATFS configuration value `_FS_TIMEOUT`, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and time out after amount of time set by this option.

**Default value:**

- 10000

### CONFIG\_FATFS\_PER\_FILE\_CACHE

Use separate cache for each file

*Found in: [Component config](#) > [FAT Filesystem support](#)*

This option affects FATFS configuration value `_FS_TINY`.

If this option is set, `_FS_TINY` is 0, and each open file has its own cache, size of the cache is equal to the `_MAX_SS` variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, `_FS_TINY` is 1, and single cache is used for all open files, size is also equal to `_MAX_SS` variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

**Default value:**

- Yes (enabled)

### CONFIG\_FATFS\_ALLOC\_PREFER\_EXTRAM

Prefer external RAM when allocating FATFS buffers

*Found in: [Component config](#) > [FAT Filesystem support](#)*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

**Default value:**

- Yes (enabled) if SPIRAM\_USE\_CAPS\_ALLOC || SPIRAM\_USE\_MALLOC

### CONFIG\_FATFS\_USE\_FASTSEEK

Enable fast seek algorithm when using lseek function through VFS FAT

*Found in: [Component config](#) > [FAT Filesystem support](#)*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

**Default value:**

- No (disabled)

### CONFIG\_FATFS\_FAST\_SEEK\_BUFFER\_SIZE

Fast seek CLMT buffer size

*Found in: [Component config](#) > [FAT Filesystem support](#) > [CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**

- 64 if [CONFIG\\_FATFS\\_USE\\_FASTSEEK](#)

### CONFIG\_FATFS\_VFS\_FSTAT\_BLKSIZE

Default block size

*Found in: [Component config](#) > [FAT Filesystem support](#)*

If set to 0, the 'newlib' library's default size (BLKSIZ) is used (128 B). If set to a non-zero value, the value is used as the block size. Default file buffer size is set to this value and the buffer is allocated when first attempt of reading/writing to a file is made. Increasing this value improves fread() speed, however the heap usage is increased as well.

NOTE: The block size value is shared by all the filesystem functions accessing target media for given file descriptor! See 'Improving I/O performance' section of 'Maximizing Execution Speed' documentation page for more details.

**Default value:**

- 0

**FreeRTOS** Contains:

- [Kernel](#)
- [Port](#)

**Kernel** Contains:

- [CONFIG\\_FREERTOS\\_CHECK\\_STACKOVERFLOW](#)
- [CONFIG\\_FREERTOS\\_ENABLE\\_BACKWARD\\_COMPATIBILITY](#)
- [CONFIG\\_FREERTOS\\_GENERATE\\_RUN\\_TIME\\_STATS](#)
- [CONFIG\\_FREERTOS\\_MAX\\_TASK\\_NAME\\_LEN](#)
- [CONFIG\\_FREERTOS\\_IDLE\\_TASK\\_STACKSIZE](#)
- [CONFIG\\_FREERTOS\\_THREAD\\_LOCAL\\_STORAGE\\_POINTERS](#)
- [CONFIG\\_FREERTOS\\_QUEUE\\_REGISTRY\\_SIZE](#)
- [CONFIG\\_FREERTOS\\_TASK\\_NOTIFICATION\\_ARRAY\\_ENTRIES](#)

- `CONFIG_FREERTOS_HZ`
- `CONFIG_FREERTOS_TIMER_QUEUE_LENGTH`
- `CONFIG_FREERTOS_TIMER_TASK_PRIORITY`
- `CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH`
- `CONFIG_FREERTOS_USE_IDLE_HOOK`
- `CONFIG_FREERTOS_OPTIMIZED_SCHEDULER`
- `CONFIG_FREERTOS_USE_TICK_HOOK`
- `CONFIG_FREERTOS_USE_TICKLESS_IDLE`
- `CONFIG_FREERTOS_USE_TRACE_FACILITY`
- `CONFIG_FREERTOS_UNICORE`
- `CONFIG_FREERTOS_SMP`
- `CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK`

### **CONFIG\_FREERTOS\_SMP**

Run the Amazon SMP FreeRTOS kernel instead (FEATURE UNDER DEVELOPMENT)

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Amazon has released an SMP version of the FreeRTOS Kernel which can be found via the following link: <https://github.com/FreeRTOS/FreeRTOS-Kernel/tree/smp>

IDF has added an experimental port of this SMP kernel located in `components/freertos/FreeRTOS-Kernel-SMP`. Enabling this option will cause IDF to use the Amazon SMP kernel. Note that THIS FEATURE IS UNDER ACTIVE DEVELOPMENT, users use this at their own risk.

Leaving this option disabled will mean the IDF FreeRTOS kernel is used instead, which is located in: `components/freertos/FreeRTOS-Kernel`. Both kernel versions are SMP capable, but differ in their implementation and features.

**Default value:**

- No (disabled)

### **CONFIG\_FREERTOS\_UNICORE**

Run FreeRTOS only on first core

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

### **CONFIG\_FREERTOS\_HZ**

`configTICK_RATE_HZ`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the FreeRTOS tick interrupt frequency in Hz (see `configTICK_RATE_HZ` documentation for more details).

**Range:**

- from 1 to 1000

**Default value:**

- 100

### **CONFIG\_FREERTOS\_OPTIMIZED\_SCHEDULER**

`configUSE_PORT_OPTIMISED_TASK_SELECTION`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables port specific task selection method. This option can speed up the search of ready tasks when scheduling (see `configUSE_PORT_OPTIMISED_TASK_SELECTION` documentation for more details).

### CONFIG\_FREERTOS\_CHECK\_STACKOVERFLOW

`configCHECK_FOR_STACK_OVERFLOW`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables FreeRTOS to check for stack overflows (see `configCHECK_FOR_STACK_OVERFLOW` documentation for more details).

Note: If users do not provide their own `vApplicationStackOverflowHook()` function, a default function will be provided by ESP-IDF.

Available options:

- No checking (`CONFIG_FREERTOS_CHECK_STACKOVERFLOW_NONE`)  
Do not check for stack overflows (`configCHECK_FOR_STACK_OVERFLOW = 0`)
- Check by stack pointer value (Method 1) (`CONFIG_FREERTOS_CHECK_STACKOVERFLOW_PTRVAL`)  
Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (`configCHECK_FOR_STACK_OVERFLOW = 1`)
- Check using canary bytes (Method 2) (`CONFIG_FREERTOS_CHECK_STACKOVERFLOW_CANARY`)  
Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (`configCHECK_FOR_STACK_OVERFLOW = 2`)

### CONFIG\_FREERTOS\_THREAD\_LOCAL\_STORAGE\_POINTERS

`configNUM_THREAD_LOCAL_STORAGE_POINTERS`

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the number of thread local storage pointers in each task (see `configNUM_THREAD_LOCAL_STORAGE_POINTERS` documentation for more details).

Note: In ESP-IDF, this value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

**Range:**

- from 1 to 256

**Default value:**

- 1

### CONFIG\_FREERTOS\_IDLE\_TASK\_STACKSIZE

`configMINIMAL_STACK_SIZE` (Idle task stack size)

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the idle task stack size in bytes (see `configMINIMAL_STACK_SIZE` documentation for more details).

Note:

- ESP-IDF specifies stack sizes in bytes instead of words.
- The default size is enough for most use cases.

- The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.
- Conversely, the stack size can be reduced to the minimum if non of the idle features are used.

**Range:**

- from 768 to 32768

**Default value:**

- 1536

### CONFIG\_FREERTOS\_USE\_IDLE\_HOOK

configUSE\_IDLE\_HOOK

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the idle task application hook (see configUSE\_IDLE\_HOOK documentation for more details).

**Note:**

- The application must provide the hook function `void vApplicationIdleHook( void );`
- `vApplicationIdleHook()` is called from FreeRTOS idle task(s)
- The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled simultaneously.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_USE\_MINIMAL\_IDLE\_HOOK

Use FreeRTOS minimal idle hook

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the minimal idle task application hook (see configUSE\_IDLE\_HOOK documentation for more details).

**Note:**

- The application must provide the hook function `void vApplicationMinimalIdleHook( void );`
- `vApplicationMinimalIdleHook()` is called from FreeRTOS minimal idle task(s)

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_SMP](#)

### CONFIG\_FREERTOS\_USE\_TICK\_HOOK

configUSE\_TICK\_HOOK

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables the tick hook (see configUSE\_TICK\_HOOK documentation for more details).

**Note:**

- The application must provide the hook function `void vApplicationTickHook( void );`
- `vApplicationTickHook()` is called from FreeRTOS's tick handling function `xTaskIncrementTick()`
- The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_MAX\_TASK\_NAME\_LEN

configMAX\_TASK\_NAME\_LEN

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the maximum number of characters for task names (see configMAX\_TASK\_NAME\_LEN documentation for more details).

Note: For most uses, the default of 16 characters is sufficient.

**Range:**

- from 1 to 256

**Default value:**

- 16

### CONFIG\_FREERTOS\_ENABLE\_BACKWARD\_COMPATIBILITY

configENABLE\_BACKWARD\_COMPATIBILITY

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enable backward compatibility with APIs prior to FreeRTOS v8.0.0. (see configENABLE\_BACKWARD\_COMPATIBILITY documentation for more details).

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_TIMER\_TASK\_PRIORITY

configTIMER\_TASK\_PRIORITY

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Sets the timer task's priority (see configTIMER\_TASK\_PRIORITY documentation for more details).

**Range:**

- from 1 to 25

**Default value:**

- 1

### CONFIG\_FREERTOS\_TIMER\_TASK\_STACK\_DEPTH

configTIMER\_TASK\_STACK\_DEPTH

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the timer task's stack size (see configTIMER\_TASK\_STACK\_DEPTH documentation for more details).

**Range:**

- from 1536 to 32768

**Default value:**

- 2048

### CONFIG\_FREERTOS\_TIMER\_QUEUE\_LENGTH

configTIMER\_QUEUE\_LENGTH

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the timer task's command queue length (see configTIMER\_QUEUE\_LENGTH documentation for more details).

**Range:**

- from 5 to 20

**Default value:**

- 10

**CONFIG\_FREERTOS\_QUEUE\_REGISTRY\_SIZE**

configQUEUE\_REGISTRY\_SIZE

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the size of the queue registry (see configQUEUE\_REGISTRY\_SIZE documentation for more details).

Note: A value of 0 will disable queue registry functionality

**Range:**

- from 0 to 20

**Default value:**

- 0

**CONFIG\_FREERTOS\_TASK\_NOTIFICATION\_ARRAY\_ENTRIES**

configTASK\_NOTIFICATION\_ARRAY\_ENTRIES

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Set the size of the task notification array of each task. When increasing this value, keep in mind that this means additional memory for each and every task on the system. However, task notifications in general are more light weight compared to alternatives such as semaphores.

**Range:**

- from 1 to 32

**Default value:**

- 1

**CONFIG\_FREERTOS\_USE\_TRACE\_FACILITY**

configUSE\_TRACE\_FACILITY

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables additional structure members and functions to assist with execution visualization and tracing (see configUSE\_TRACE\_FACILITY documentation for more details).

**Default value:**

- No (disabled)

**CONFIG\_FREERTOS\_USE\_STATS\_FORMATTING\_FUNCTIONS**

configUSE\_STATS\_FORMATTING\_FUNCTIONS

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)*

Set configUSE\_TRACE\_FACILITY and configUSE\_STATS\_FORMATTING\_FUNCTIONS to 1 to include the vTaskList() and vTaskGetRunTimeStats() functions in the build (see configUSE\_STATS\_FORMATTING\_FUNCTIONS documentation for more details).

**Default value:**

- No (disabled) if [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#)

### CONFIG\_FREERTOS\_VTASKLIST\_INCLUDE\_COREID

Enable display of xCoreID in vTaskList

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TRACE\\_FACILITY](#) > [CONFIG\\_FREERTOS\\_USE\\_STATS\\_FORMATTING\\_FUNCTIONS](#)*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

### CONFIG\_FREERTOS\_GENERATE\_RUN\_TIME\_STATS

configGENERATE\_RUN\_TIME\_STATS

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

Enables collection of run time statistics for each task (see configGENERATE\_RUN\_TIME\_STATS documentation for more details).

Note: The clock used for run time statistics can be configured in FREERTOS\_RUN\_TIME\_STATS\_CLK.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE

configUSE\_TICKLESS\_IDLE

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#)*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP option. This feature is also known as "automatic light sleep".

Note that timers created using esp\_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the "skip\_unhandled\_events" option as true.

If disabled, automatic light sleep support will be disabled.

**Default value:**

- No (disabled) if [CONFIG\\_PM\\_ENABLE](#)

### CONFIG\_FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP

configEXPECTED\_IDLE\_TIME\_BEFORE\_SLEEP

*Found in: [Component config](#) > [FreeRTOS](#) > [Kernel](#) > [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks. You can enable PM\_PROFILING feature in esp\_pm components and dump the sleep status with esp\_pm\_dump\_locks, if the proportion of rejected sleeps is too high, please increase this value to improve scheduling efficiency

**Range:**

- from 2 to 4294967295 if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

**Default value:**

- 3 if [CONFIG\\_FREERTOS\\_USE\\_TICKLESS\\_IDLE](#)

**Port** Contains:

- [CONFIG\\_FREERTOS\\_CHECK\\_MUTEX\\_GIVEN\\_BY\\_OWNER](#)
- [CONFIG\\_FREERTOS\\_RUN\\_TIME\\_STATS\\_CLK](#)
- [CONFIG\\_FREERTOS\\_INTERRUPT\\_BACKTRACE](#)
- [CONFIG\\_FREERTOS\\_WATCHPOINT\\_END\\_OF\\_STACK](#)

- `CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP`
- `CONFIG_FREERTOS_ENABLE_TASK_SNAPSHOT`
- `CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS`
- `CONFIG_FREERTOS_ISR_STACKSIZE`
- `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`
- `CONFIG_FREERTOS_PLACE_SNAPSHOT_FUNS_INTO_FLASH`
- `CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE`
- `CONFIG_FREERTOS_CORETIMER`
- `CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER`

## **CONFIG\_FREERTOS\_TASK\_FUNCTION\_WRAPPER**

Wrap task functions

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

**Default value:**

- Yes (enabled)

## **CONFIG\_FREERTOS\_WATCHPOINT\_END\_OF\_STACK**

Enable stack overflow debug watchpoint

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

FreeRTOS can check if a stack has overflowed its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See `CONFIG_FREERTOS_CHECK_STACKOVERFLOW` for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panicking) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.

Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**Default value:**

- No (disabled)

## **CONFIG\_FREERTOS\_TLSP\_DELETION\_CALLBACKS**

Enable thread local storage pointers deletion callbacks

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

ESP-IDF provides users with the ability to free TLSP memory by registering TLSP deletion callbacks. These callbacks are automatically called by FreeRTOS when a task is deleted. When this option is turned on, the memory reserved for TLSPs in the TCB is doubled to make space for storing the deletion callbacks. If the user does not wish to use TLSP deletion callbacks then this option could be turned off to save space in the TCB memory.

**Default value:**

- Yes (enabled)

**CONFIG\_FREERTOS\_ENABLE\_STATIC\_TASK\_CLEAN\_UP**

Enable static task clean up hook

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

Enable this option to make FreeRTOS call the static task clean up hook when a task is deleted.

Note: Users will need to provide a `void vPortCleanUpTCB ( void *pxTCB )` callback

**Default value:**

- No (disabled)

**CONFIG\_FREERTOS\_CHECK\_MUTEX\_GIVEN\_BY\_OWNER**

Check that mutex semaphore is given by owner task

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.

**CONFIG\_FREERTOS\_ISR\_STACKSIZE**

ISR stack size

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**Range:**

- from 2096 to 32768 if [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT\\_ELF](#)
- from 1536 to 32768

**Default value:**

- 2096 if [CONFIG\\_ESP\\_COREDUMP\\_DATA\\_FORMAT\\_ELF](#)
- 1536

**CONFIG\_FREERTOS\_INTERRUPT\_BACKTRACE**

Enable backtrace from interrupt to task context

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**Default value:**

- Yes (enabled)

**CONFIG\_FREERTOS\_CORETIMER**

Tick timer source (Xtensa Only)

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities.

Available options:

- Timer 0 (int 6, level 1) (CONFIG\_FREERTOS\_CORETIMER\_0)  
Select this to use timer 0
- Timer 1 (int 15, level 3) (CONFIG\_FREERTOS\_CORETIMER\_1)  
Select this to use timer 1
- SYSTIMER 0 (level 1) (CONFIG\_FREERTOS\_CORETIMER\_SYSTIMER\_LVL1)  
Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (CONFIG\_FREERTOS\_CORETIMER\_SYSTIMER\_LVL3)  
Select this to use systimer with the 3 interrupt priority.

### CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_CLK

Choose the clock source for run time stats

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

Choose the clock source for FreeRTOS run time stats. Options are CPU0's CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.

Available options:

- Use ESP TIMER for run time stats (CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_USING\_ESP\_TIMER)  
ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.
- Use CPU Clock for run time stats (CONFIG\_FREERTOS\_RUN\_TIME\_STATS\_USING\_CPU\_CLK)  
CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP\_DEFAULT\_CPU\_FREQ\_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

### CONFIG\_FREERTOS\_PLACE\_FUNCTIONS\_INTO\_FLASH

Place FreeRTOS functions into Flash

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

**Default value:**

- No (disabled)

### CONFIG\_FREERTOS\_PLACE\_SNAPSHOT\_FUNS\_INTO\_FLASH

Place task snapshot functions into flash

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

When enabled, the functions related to snapshots, such as `vTaskGetSnapshot` or `uxTaskGetSnapshotAll`, will be placed in flash. Note that if enabled, these functions cannot be called when cache is disabled.

### **CONFIG\_FREERTOS\_CHECK\_PORT\_CRITICAL\_COMPLIANCE**

Tests compliance with Vanilla FreeRTOS `port*_CRITICAL` calls

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

If enabled, context of `port*_CRITICAL` calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling `port*_CRITICAL` from ISR context would cause assert failure

**Default value:**

- No (disabled)

### **CONFIG\_FREERTOS\_ENABLE\_TASK\_SNAPSHOT**

Enable task snapshot functions

*Found in: [Component config](#) > [FreeRTOS](#) > [Port](#)*

When enabled, the functions related to snapshots, such as `vTaskGetSnapshot` or `uxTaskGetSnapshotAll`, are compiled and linked. Task snapshots are used by Task Watchdog (TWDT), GDB Stub and Core dump.

**Default value:**

- Yes (enabled)

### **Hardware Abstraction Layer (HAL) and Low Level (LL) Contains:**

- [CONFIG\\_HAL\\_DEFAULT\\_ASSERTION\\_LEVEL](#)
- [CONFIG\\_HAL\\_LOG\\_LEVEL](#)
- [CONFIG\\_HAL\\_SYSTIMER\\_USE\\_ROM\\_IMPL](#)
- [CONFIG\\_HAL\\_WDT\\_USE\\_ROM\\_IMPL](#)

### **CONFIG\_HAL\_DEFAULT\_ASSERTION\_LEVEL**

Default HAL assertion level

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can't exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can't be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

Available options:

- Same as system assertion level ([CONFIG\\_HAL\\_ASSERTION\\_EQUALS\\_SYSTEM](#))
- Disabled ([CONFIG\\_HAL\\_ASSERTION\\_DISABLE](#))
- Silent ([CONFIG\\_HAL\\_ASSERTION\\_SILENT](#))
- Enabled ([CONFIG\\_HAL\\_ASSERTION\\_ENABLE](#))

### **CONFIG\_HAL\_LOG\_LEVEL**

HAL layer log verbosity

*Found in: [Component config](#) > [Hardware Abstraction Layer \(HAL\) and Low Level \(LL\)](#)*

Specify how much output to see in HAL logs.

Available options:

- No output (CONFIG\_HAL\_LOG\_LEVEL\_NONE)
- Error (CONFIG\_HAL\_LOG\_LEVEL\_ERROR)
- Warning (CONFIG\_HAL\_LOG\_LEVEL\_WARN)
- Info (CONFIG\_HAL\_LOG\_LEVEL\_INFO)
- Debug (CONFIG\_HAL\_LOG\_LEVEL\_DEBUG)
- Verbose (CONFIG\_HAL\_LOG\_LEVEL\_VERBOSE)

### CONFIG\_HAL\_SYSTIMER\_USE\_ROM\_IMPL

Use ROM implementation of SysTimer HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. If making this as "y" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled)

### CONFIG\_HAL\_WDT\_USE\_ROM\_IMPL

Use ROM implementation of WDT HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. If making this as "y" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled)

### Heap memory debugging

 Contains:

- [CONFIG\\_HEAP\\_ABORT\\_WHEN\\_ALLOCATION\\_FAILS](#)
- [CONFIG\\_HEAP\\_TASK\\_TRACKING](#)
- [CONFIG\\_HEAP\\_PLACE\\_FUNCTION\\_INTO\\_FLASH](#)
- [CONFIG\\_HEAP\\_CORRUPTION\\_DETECTION](#)
- [CONFIG\\_HEAP\\_TRACING\\_DEST](#)
- [CONFIG\\_HEAP\\_TRACING\\_STACK\\_DEPTH](#)
- [CONFIG\\_HEAP\\_TLSF\\_CHECK\\_PATCH](#)
- [CONFIG\\_HEAP\\_USE\\_HOOKS](#)
- [CONFIG\\_HEAP\\_TRACE\\_HASH\\_MAP](#)
- [CONFIG\\_HEAP\\_TLSF\\_USE\\_ROM\\_IMPL](#)

### CONFIG\_HEAP\_CORRUPTION\_DETECTION

Heap corruption detection

*Found in: Component config > Heap memory debugging*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the "Heap Memory Debugging" page of the IDF documentation for a description of each level of heap corruption detection.

Available options:

- Basic (no poisoning) (CONFIG\_HEAP\_POISONING\_DISABLED)
- Light impact (CONFIG\_HEAP\_POISONING\_LIGHT)
- Comprehensive (CONFIG\_HEAP\_POISONING\_COMPREHENSIVE)

### CONFIG\_HEAP\_TRACING\_DEST

Heap tracing

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enables the heap tracing API defined in esp\_heap\_trace.h.

This function causes a moderate increase in IRAM code side and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it's best to keep it disabled unless tracing is being used.

Available options:

- Disabled (CONFIG\_HEAP\_TRACING\_OFF)
- Standalone (CONFIG\_HEAP\_TRACING\_STANDALONE)
- Host-based (CONFIG\_HEAP\_TRACING\_TOHOST)

### CONFIG\_HEAP\_TRACING\_STACK\_DEPTH

Heap tracing stack depth

*Found in: [Component config](#) > [Heap memory debugging](#)*

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

### CONFIG\_HEAP\_USE\_HOOKS

Use allocation and free hooks

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable the user to implement function hooks triggered for each successful allocation and free.

### CONFIG\_HEAP\_TASK\_TRACKING

Enable heap task tracking

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

### CONFIG\_HEAP\_TRACE\_HASH\_MAP

Use hash map mechanism to access heap trace records

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to use a hash map to increase performance in handling heap trace records.

Keeping this as "n" in your project will save RAM and heap memory but will lower the performance of the heap trace in adding, retrieving and removing trace records. Making this as "y" in your project, you will decrease free RAM and heap memory but, the heap trace performances in adding retrieving and removing trace records will be enhanced.

**Default value:**

- No (disabled) if `CONFIG_HEAP_TRACING_STANDALONE`

**CONFIG\_HEAP\_TRACE\_HASH\_MAP\_SIZE**

The number of entries in the hash map

*Found in: [Component config](#) > [Heap memory debugging](#) > `CONFIG_HEAP_TRACE_HASH_MAP`*

Defines the number of entries in the heap trace hashmap. The bigger this number is, the bigger the hash map will be in the memory. In case the tracing mode is set to `HEAP_TRACE_ALL`, the bigger the hashmap is, the better the performances are.

**Range:**

- from 1 to 10000 if `CONFIG_HEAP_TRACE_HASH_MAP`

**Default value:**

- 10 if `CONFIG_HEAP_TRACE_HASH_MAP`

**CONFIG\_HEAP\_ABORT\_WHEN\_ALLOCATION\_FAILS**

Abort if memory allocation fails

*Found in: [Component config](#) > [Heap memory debugging](#)*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**

- No (disabled)

**CONFIG\_HEAP\_TLSF\_USE\_ROM\_IMPL**

Use ROM implementation of heap tlsf library

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to use heap functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. If making this as "y" in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled)

**CONFIG\_HEAP\_PLACE\_FUNCTION\_INTO\_FLASH**

Force the entire heap component to be placed in flash memory

*Found in: [Component config](#) > [Heap memory debugging](#)*

Enable this flag to save up RAM space by placing the heap component in the flash memory

Note that it is only safe to enable this configuration if no functions from `esp_heap_caps.h` or `esp_heap_trace.h` are called from ISR.

### CONFIG\_HEAP\_TLSF\_CHECK\_PATCH

Patch the `tlsf_check_pool()` for ROM HEAP TLSF implementation

*Found in: [Component config](#) > [Heap memory debugging](#)*

ROM does not contain the patch of `tlsf_check_pool()` allowing perform the integrity checking on used blocks. The patch to allow such check needs to be applied.

**Default value:**

- Yes (enabled)

**IEEE 802.15.4** Contains:

- [CONFIG\\_IEEE802154\\_ENABLED](#)

### CONFIG\_IEEE802154\_ENABLED

IEEE802154 Enable

*Found in: [Component config](#) > [IEEE 802.15.4](#)*

**Default value:**

- Yes (enabled) if `SOC_IEEE802154_SUPPORTED`

### CONFIG\_IEEE802154\_RX\_BUFFER\_SIZE

The number of 802.15.4 receive buffers

*Found in: [Component config](#) > [IEEE 802.15.4](#) > [CONFIG\\_IEEE802154\\_ENABLED](#)*

The number of 802.15.4 receive buffers

**Range:**

- from 2 to 100 if [CONFIG\\_IEEE802154\\_ENABLED](#)

**Default value:**

- 20 if [CONFIG\\_IEEE802154\\_ENABLED](#)

### CONFIG\_IEEE802154\_CCA\_MODE

Clear Channel Assessment (CCA) mode

*Found in: [Component config](#) > [IEEE 802.15.4](#) > [CONFIG\\_IEEE802154\\_ENABLED](#)*

configure the CCA mode

Available options:

- Carrier sense only ([CONFIG\\_IEEE802154\\_CCA\\_CARRIER](#))  
configure the CCA mode to Energy above threshold
- Energy above threshold ([CONFIG\\_IEEE802154\\_CCA\\_ED](#))  
configure the CCA mode to Energy above threshold
- Carrier sense OR energy above threshold ([CONFIG\\_IEEE802154\\_CCA\\_CARRIER\\_OR\\_ED](#))  
configure the CCA mode to Carrier sense OR energy above threshold
- Carrier sense AND energy above threshold ([CONFIG\\_IEEE802154\\_CCA\\_CARRIER\\_AND\\_ED](#))  
configure the CCA mode to Carrier sense AND energy above threshold

**CONFIG\_IEEE802154\_CCA\_THRESHOLD**

CCA detection threshold

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

set the CCA threshold, in dB

**Range:**

- from -120 to 0 if *CONFIG\_IEEE802154\_ENABLED*

**Default value:**

- "-60" if *CONFIG\_IEEE802154\_ENABLED*

**CONFIG\_IEEE802154\_PENDING\_TABLE\_SIZE**

Pending table size

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

set the pending table size

**Range:**

- from 1 to 100 if *CONFIG\_IEEE802154\_ENABLED*

**Default value:**

- 20 if *CONFIG\_IEEE802154\_ENABLED*

**CONFIG\_IEEE802154\_MULTI\_PAN\_ENABLE**

Enable multi-pan feature for frame filter

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enable IEEE802154 multi-pan

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_ENABLED*

**CONFIG\_IEEE802154\_TIMING\_OPTIMIZATION**

Enable throughput optimization

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enabling this option increases throughput by ~5% at the expense of ~2.1k IRAM code size increase.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_ENABLED*

**CONFIG\_IEEE802154\_SLEEP\_ENABLE**

Enable IEEE802154 light sleep

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enabling this option allows the IEEE802.15.4 module to be powered down during automatic light sleep, which reduces current consumption.

**Default value:**

- No (disabled) if *CONFIG\_PM\_ENABLE* && *CONFIG\_IEEE802154\_ENABLED*

### CONFIG\_IEEE802154\_DEBUG

Enable IEEE802154 Debug

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED*

Enabling this option allows different kinds of IEEE802154 debug output. All IEEE802154 debug features increase the size of the final binary.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_ENABLED*

Contains:

- *CONFIG\_IEEE802154\_RECORD\_ABORT*
- *CONFIG\_IEEE802154\_RECORD\_CMD*
- *CONFIG\_IEEE802154\_RECORD\_EVENT*
- *CONFIG\_IEEE802154\_RECORD\_STATE*
- *CONFIG\_IEEE802154\_TXRX\_STATISTIC*
- *CONFIG\_IEEE802154\_ASSERT*

### CONFIG\_IEEE802154\_ASSERT

Enrich the assert information with IEEE802154 state and event

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED > CONFIG\_IEEE802154\_DEBUG*

Enabling this option to add some probe codes in the driver, and these informations will be printed when assert.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_DEBUG*

### CONFIG\_IEEE802154\_RECORD\_EVENT

Enable record event information for debugging

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED > CONFIG\_IEEE802154\_DEBUG*

Enabling this option to record event, when assert, the recorded event will be printed.

**Default value:**

- No (disabled) if *CONFIG\_IEEE802154\_DEBUG*

### CONFIG\_IEEE802154\_RECORD\_EVENT\_SIZE

Record event table size

*Found in: Component config > IEEE 802.15.4 > CONFIG\_IEEE802154\_ENABLED > CONFIG\_IEEE802154\_DEBUG > CONFIG\_IEEE802154\_RECORD\_EVENT*

set the record event table size

**Range:**

- from 1 to 50 if *CONFIG\_IEEE802154\_RECORD\_EVENT*

**Default value:**

- 30 if *CONFIG\_IEEE802154\_RECORD\_EVENT*

### CONFIG\_IEEE802154\_RECORD\_STATE

Enable record state information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record state, when assert, the recorded state will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

### CONFIG\_IEEE802154\_RECORD\_STATE\_SIZE

Record state table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_STATE`

set the record state table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_STATE`

**Default value:**

- 10 if `CONFIG_IEEE802154_RECORD_STATE`

### CONFIG\_IEEE802154\_RECORD\_CMD

Enable record command information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record the command, when assert, the recorded command will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

### CONFIG\_IEEE802154\_RECORD\_CMD\_SIZE

Record command table size

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_CMD`

set the record command table size

**Range:**

- from 1 to 50 if `CONFIG_IEEE802154_RECORD_CMD`

**Default value:**

- 10 if `CONFIG_IEEE802154_RECORD_CMD`

### CONFIG\_IEEE802154\_RECORD\_ABORT

Enable record abort information for debugging

*Found in:* `Component config > IEEE 802.15.4 > CONFIG_IEEE802154_ENABLED > CONFIG_IEEE802154_DEBUG`

Enabling this option to record the abort, when assert, the recorded abort will be printed.

**Default value:**

- No (disabled) if `CONFIG_IEEE802154_DEBUG`

### CONFIG\_IEEE802154\_RECORD\_ABORT\_SIZE

Record abort table size

*Found in:* [Component config](#) > [IEEE 802.15.4](#) > [CONFIG\\_IEEE802154\\_ENABLED](#) > [CONFIG\\_IEEE802154\\_DEBUG](#) > [CONFIG\\_IEEE802154\\_RECORD\\_ABORT](#)

set the record abort table size

**Range:**

- from 1 to 50 if [CONFIG\\_IEEE802154\\_RECORD\\_ABORT](#)

**Default value:**

- 10 if [CONFIG\\_IEEE802154\\_RECORD\\_ABORT](#)

### CONFIG\_IEEE802154\_TXRX\_STATISTIC

Enable record tx/rx packets information for debugging

*Found in:* [Component config](#) > [IEEE 802.15.4](#) > [CONFIG\\_IEEE802154\\_ENABLED](#) > [CONFIG\\_IEEE802154\\_DEBUG](#)

Enabling this option to record the tx and rx

**Default value:**

- No (disabled) if [CONFIG\\_IEEE802154\\_DEBUG](#)

**Log output** Contains:

- [CONFIG\\_LOG\\_DEFAULT\\_LEVEL](#)
- [CONFIG\\_LOG\\_TIMESTAMP\\_SOURCE](#)
- [CONFIG\\_LOG\\_MAXIMUM\\_LEVEL](#)
- [CONFIG\\_LOG\\_COLORS](#)

### CONFIG\_LOG\_DEFAULT\_LEVEL

Default log verbosity

*Found in:* [Component config](#) > [Log output](#)

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using `esp_log_level_set` function.

By default, this setting limits which log statements are compiled into the program. For example, selecting "Warning" would mean that changing log level to "Debug" at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

Available options:

- No output ([CONFIG\\_LOG\\_DEFAULT\\_LEVEL\\_NONE](#))
- Error ([CONFIG\\_LOG\\_DEFAULT\\_LEVEL\\_ERROR](#))
- Warning ([CONFIG\\_LOG\\_DEFAULT\\_LEVEL\\_WARN](#))
- Info ([CONFIG\\_LOG\\_DEFAULT\\_LEVEL\\_INFO](#))
- Debug ([CONFIG\\_LOG\\_DEFAULT\\_LEVEL\\_DEBUG](#))
- Verbose ([CONFIG\\_LOG\\_DEFAULT\\_LEVEL\\_VERBOSE](#))

### CONFIG\_LOG\_MAXIMUM\_LEVEL

Maximum log verbosity

*Found in:* [Component config](#) > [Log output](#)

This config option sets the highest log verbosity that it's possible to select at runtime by calling `esp_log_level_set()`. This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate "Bootloader log verbosity" setting.

Available options:

- Same as default (`CONFIG_LOG_MAXIMUM_EQUALS_DEFAULT`)
- Error (`CONFIG_LOG_MAXIMUM_LEVEL_ERROR`)
- Warning (`CONFIG_LOG_MAXIMUM_LEVEL_WARN`)
- Info (`CONFIG_LOG_MAXIMUM_LEVEL_INFO`)
- Debug (`CONFIG_LOG_MAXIMUM_LEVEL_DEBUG`)
- Verbose (`CONFIG_LOG_MAXIMUM_LEVEL_VERBOSE`)

### CONFIG\_LOG\_COLORS

Use ANSI terminal colors in log output

*Found in: [Component config](#) > [Log output](#)*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**

- Yes (enabled)

### CONFIG\_LOG\_TIMESTAMP\_SOURCE

Log Timestamps

*Found in: [Component config](#) > [Log output](#)*

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the chip's RTC and high resolution timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTP sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

Available options:

- Milliseconds Since Boot (`CONFIG_LOG_TIMESTAMP_SOURCE_RTOS`)
- System Time (`CONFIG_LOG_TIMESTAMP_SOURCE_SYSTEM`)

**LWIP** Contains:

- [CONFIG\\_LWIP\\_CHECK\\_THREAD\\_SAFETY](#)
- [Checksums](#)
- [CONFIG\\_LWIP\\_DHCP\\_COARSE\\_TIMER\\_SECS](#)

- *DHCP server*
- *CONFIG\_LWIP\_DHCP\_OPTIONS\_LEN*
- *CONFIG\_LWIP\_DHCP\_DISABLE\_CLIENT\_ID*
- *CONFIG\_LWIP\_DHCP\_DISABLE\_VENDOR\_CLASS\_ID*
- *CONFIG\_LWIP\_DHCP\_DOES\_ARP\_CHECK*
- *CONFIG\_LWIP\_DHCP\_RESTORE\_LAST\_IP*
- *DNS*
- *CONFIG\_LWIP\_PPP\_CHAP\_SUPPORT*
- *CONFIG\_LWIP\_L2\_TO\_L3\_COPY*
- *CONFIG\_LWIP\_IPV6\_DHCP6*
- *CONFIG\_LWIP\_IP4\_FRAG*

- *CONFIG\_LWIP\_IP6\_REASSEMBLY*
- *CONFIG\_LWIP\_SLIP\_SUPPORT*
- *CONFIG\_LWIP\_SO\_LINGER*
- *CONFIG\_LWIP\_SO\_RCVBUF*
- *CONFIG\_LWIP\_SO\_REUSE*
- *CONFIG\_LWIP\_NETIF\_STATUS\_CALLBACK*
- *CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING*
- *CONFIG\_LWIP\_NETIF\_API*
- *Hooks*
- *ICMP*
- *CONFIG\_LWIP\_LOCAL\_HOSTNAME*
- *CONFIG\_LWIP\_ND6*
- *LWIP RAW API*
- *CONFIG\_LWIP\_TCPIP\_TASK\_PRIO*
- *CONFIG\_LWIP\_IPV6\_ND6\_NUM\_NEIGHBORS*
- *CONFIG\_LWIP\_IPV6\_MEMP\_NUM\_ND6\_QUEUE*
- *CONFIG\_LWIP\_MAX\_SOCKETS*
- *CONFIG\_LWIP\_BRIDGEIF\_MAX\_PORTS*
- *CONFIG\_LWIP\_NUM\_NETIF\_CLIENT\_DATA*
- *CONFIG\_LWIP\_ESP\_GRATUITOUS\_ARP*
- *CONFIG\_LWIP\_ESP\_MLDV6\_REPORT*
- *SNTP*
- *CONFIG\_LWIP\_USE\_ONLY\_LWIP\_SELECT*
- *CONFIG\_LWIP\_NETIF\_LOOPBACK*
- *TCP*
- *CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY*

- [CONFIG\\_LWIP\\_TCPIP\\_TASK\\_STACK\\_SIZE](#)
- [CONFIG\\_LWIP\\_TCPIP\\_RECVMBOX\\_SIZE](#)
- [CONFIG\\_LWIP\\_IP\\_REASS\\_MAX\\_PBUFS](#)
- [CONFIG\\_LWIP\\_IP\\_DEFAULT\\_TTL](#)
- [UDP](#)
- [CONFIG\\_LWIP\\_IPV6\\_RDNSS\\_MAX\\_DNS\\_SERVERS](#)

### CONFIG\_LWIP\_LOCAL\_HOSTNAME

Local netif hostname

*Found in: [Component config](#) > [LWIP](#)*

The default name this device will report to other devices on the network. Could be updated at runtime with `esp_netif_set_hostname()`

**Default value:**

- "espressif"

### CONFIG\_LWIP\_NETIF\_API

Enable usage of standard POSIX APIs in LWIP

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, standard POSIX APIs: `if_indextoname()`, `if_nametoindex()` could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as `esp_netif_get_netif_impl_name()`)

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCPIP\_TASK\_PRIO

LWIP TCP/IP Task Priority

*Found in: [Component config](#) > [LWIP](#)*

LWIP tcpip task priority. In case of high throughput, this parameter could be changed up to `(config-MAX_PRIORITIES-1)`.

**Range:**

- from 1 to 24

**Default value:**

- 18

### CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING

Enable tcpip core locking

*Found in: [Component config](#) > [LWIP](#)*

If Enable tcpip core locking,Creates a global mutex that is held during TCPIP thread operations.Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See `LOCK_TCPIP_CORE()` and `UNLOCK_TCPIP_CORE()`.

If disable tcpip core locking,TCP IP will perform tasks through context switching

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING\_INPUT

Enable tcpip core locking input

Found in: *Component config* > *LWIP* > *CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING*

when LWIP\_TCPIP\_CORE\_LOCKING is enabled, this lets tcpip\_input() grab the mutex for input packets as well, instead of allocating a message and passing it to tcpip\_thread.

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_TCPIP\_CORE\_LOCKING*

### CONFIG\_LWIP\_CHECK\_THREAD\_SAFETY

Checks that lwip API runs in expected context

Found in: *Component config* > *LWIP*

Enable to check that the project does not violate lwip thread safety. If enabled, all lwip functions that require thread awareness run an assertion to verify that the TCP/IP core functionality is either locked or accessed from the correct thread.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DNS\_SUPPORT\_MDNS\_QUERIES

Enable mDNS queries in resolving host name

Found in: *Component config* > *LWIP*

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_L2\_TO\_L3\_COPY

Enable copy between Layer2 and Layer3 packets

Found in: *Component config* > *LWIP*

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IRAM\_OPTIMIZATION

Enable LWIP IRAM optimization

Found in: *Component config* > *LWIP*

If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn't help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_EXTRA\_IRAM\_OPTIMIZATION**

Enable LWIP IRAM optimization for TCP part

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, some tcp part functions relating to RX/TX in LWIP will be put into IRAM, it can improve TCP throughput. On the other hand, it needs about 17KB IRAM for these optimizations.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_TIMERS\_ONDEMAND**

Enable LWIP Timers on demand

*Found in: [Component config](#) > [LWIP](#)*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_ND6**

LWIP NDP6 Enable/Disable

*Found in: [Component config](#) > [LWIP](#)*

This option is used to disable the Network Discovery Protocol (NDP) if it is not required. Please use this option with caution, as the NDP is essential for IPv6 functionality within a local network.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_FORCE\_ROUTER\_FORWARDING**

LWIP Force Router Forwarding Enable/Disable

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ND6](#)*

This option is used to set the the router flag for the NA packets. When enabled, the router flag in NA packet will always set to 1, otherwise, never set router flag for NA packets.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_MAX\_SOCKETS**

Max number of open sockets

*Found in: [Component config](#) > [LWIP](#)*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

**Range:**

- from 1 to 16

**Default value:**

- 10

### CONFIG\_LWIP\_USE\_ONLY\_LWIP\_SELECT

Support LWIP socket select() only (DEPRECATED)

*Found in: [Component config](#) > [LWIP](#)*

This option is deprecated. Do not use this option, use VFS\_SUPPORT\_SELECT instead.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_LINGER

Enable SO\_LINGER processing

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows SO\_LINGER processing. l\_onoff = 1,l\_linger can set the timeout.

If l\_linger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If l\_linger!=0,Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_SO\_REUSE

Enable SO\_REUSEADDR option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows binding to a port which remains in TIME\_WAIT.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_SO\_REUSE\_RXTOALL

SO\_REUSEADDR copies broadcast/multicast to all matches

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_SO\\_REUSE](#)*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO\_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don't plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_SO\_RCVBUF

Enable SO\_RCVBUF option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for available data on a netconn.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_NETBUF\_RECVINFO

Enable IP\_PKTINFO option

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows checking for the destination address of a received IPv4 Packet.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP\_DEFAULT\_TTL

The value for Time-To-Live used by transport layers

*Found in: [Component config](#) > [LWIP](#)*

Set value for Time-To-Live used by transport layers.

**Range:**

- from 1 to 255

**Default value:**

- 64

### CONFIG\_LWIP\_IP4\_FRAG

Enable fragment outgoing IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IP6\_FRAG

Enable fragment outgoing IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IP4\_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows reassembling incoming fragmented IP4 packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP6\_REASSEMBLY

Enable reassembly incoming fragmented IP6 packets

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows reassembling incoming fragmented IP6 packets.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IP\_REASS\_MAX\_PBUFS

The maximum amount of pbufs waiting to be reassembled

*Found in: [Component config](#) > [LWIP](#)*

Set the maximum amount of pbufs waiting to be reassembled.

**Range:**

- from 10 to 100

**Default value:**

- 10

### CONFIG\_LWIP\_IP\_FORWARD

Enable IP forwarding

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV4\_NAPT

Enable NAT (new/experimental)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IP\\_FORWARD](#)*

Enabling this option allows Network Address and Port Translation.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_IP\\_FORWARD](#)

### CONFIG\_LWIP\_STATS

Enable LWIP statistics

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows LWIP statistics

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_ESP\_GRATUITOUS\_ARP

Send gratuitous ARP periodically

*Found in: [Component config](#) > [LWIP](#)*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues.If the ARP table of the AP is old, and the AP doesn't send ARP request to update it's ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it's ARP table.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_GARP\_TMR\_INTERVAL**

GARP timer interval(seconds)

*Found in: Component config > LWIP > CONFIG\_LWIP\_ESP\_GRATUITOUS\_ARP*

Set the timer interval for gratuitous ARP. The default value is 60s

**Default value:**

- 60

**CONFIG\_LWIP\_ESP\_MLDV6\_REPORT**

Send mldv6 report periodically

*Found in: Component config > LWIP*

Enable this option allows to send mldv6 report periodically.

This option solve the issue that failed to receive multicast data. Some routers fail to forward multicast packets. To solve this problem, send multicast mldv6 report to routers regularly.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_MLDV6\_TMR\_INTERVAL**

mldv6 report timer interval(seconds)

*Found in: Component config > LWIP > CONFIG\_LWIP\_ESP\_MLDV6\_REPORT*

Set the timer interval for mldv6 report. The default value is 30s

**Default value:**

- 40

**CONFIG\_LWIP\_TCPIP\_RECVMBOX\_SIZE**

TCPIP task receive mail box size

*Found in: Component config > LWIP*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**

- from 6 to 1024 if *CONFIG\_LWIP\_WND\_SCALE*

**Default value:**

- 32

**CONFIG\_LWIP\_DHCP\_DOES\_ARP\_CHECK**

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_DHCP\_DISABLE\_CLIENT\_ID**

DHCP: Disable Use of HW address as client identification

*Found in: [Component config](#) > [LWIP](#)*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to "y" in order to exclude option 61 from DHCP packets.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_DHCP\_DISABLE\_VENDOR\_CLASS\_ID**

DHCP: Disable Use of vendor class identification

*Found in: [Component config](#) > [LWIP](#)*

This option could be used to disable DHCP client vendor class identification. Set this option to "y" in order to exclude option 60 from DHCP packets.

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_DHCP\_RESTORE\_LAST\_IP**

DHCP: Restore last IP obtained from DHCP server

*Found in: [Component config](#) > [LWIP](#)*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_DHCP\_OPTIONS\_LEN**

DHCP total option length

*Found in: [Component config](#) > [LWIP](#)*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP\_ASSERT due to option value is too long. Please increase the LWIP\_DHCP\_OPTIONS\_LEN value.

**Range:**

- from 68 to 255

**Default value:**

- 68

**CONFIG\_LWIP\_NUM\_NETIF\_CLIENT\_DATA**

Number of clients store data in netif

*Found in: [Component config](#) > [LWIP](#)*

Number of clients that may store data in client\_data member array of struct netif.

**Range:**

- from 0 to 256

**Default value:**

- 0

**CONFIG\_LWIP\_DHCP\_COARSE\_TIMER\_SECS**

DHCP coarse timer interval(s)

*Found in: [Component config](#) > [LWIP](#)*

Set DHCP coarse interval in seconds. A higher value will be less precise but cost less power consumption.

**Range:**

- from 1 to 10

**Default value:**

- 1

**DHCP server** Contains:

- [CONFIG\\_LWIP\\_DHCPS](#)

**CONFIG\_LWIP\_DHCPS**

DHCPS: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCPS)

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#)*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**

- Yes (enabled)

**CONFIG\_LWIP\_DHCPS\_LEASE\_UNIT**

Multiplier for lease time, in seconds

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#) > [CONFIG\\_LWIP\\_DHCPS](#)*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**Range:**

- from 1 to 3600

**Default value:**

- 60

**CONFIG\_LWIP\_DHCPS\_MAX\_STATION\_NUM**

Maximum number of stations

*Found in: [Component config](#) > [LWIP](#) > [DHCP server](#) > [CONFIG\\_LWIP\\_DHCPS](#)*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it's address pool, without notification.

**Range:**

- from 1 to 64

**Default value:**

- 8

## CONFIG\_LWIP\_AUTOIP

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

**Default value:**

- No (disabled)

Contains:

- *CONFIG\_LWIP\_AUTOIP\_TRIES*
- *CONFIG\_LWIP\_AUTOIP\_MAX\_CONFLICTS*
- *CONFIG\_LWIP\_AUTOIP\_RATE\_LIMIT\_INTERVAL*

## CONFIG\_LWIP\_AUTOIP\_TRIES

DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG\_LWIP\_AUTOIP*

DHCP client will send this many probes before self-assigning a link local address.

From LWIP help: "This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP." (In the case of ESP-IDF, this means multiple SYSTEM\_EVENT\_STA\_GOT\_IP events.)

**Range:**

- from 1 to 100 if *CONFIG\_LWIP\_AUTOIP*

**Default value:**

- 2 if *CONFIG\_LWIP\_AUTOIP*

## CONFIG\_LWIP\_AUTOIP\_MAX\_CONFLICTS

Max IP conflicts before rate limiting

*Found in: Component config > LWIP > CONFIG\_LWIP\_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**

- from 1 to 100 if *CONFIG\_LWIP\_AUTOIP*

**Default value:**

- 9 if *CONFIG\_LWIP\_AUTOIP*

## CONFIG\_LWIP\_AUTOIP\_RATE\_LIMIT\_INTERVAL

Rate limited interval (seconds)

*Found in: Component config > LWIP > CONFIG\_LWIP\_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

**Range:**

- from 5 to 120 if *CONFIG\_LWIP\_AUTOIP*

**Default value:**

- 20 if *CONFIG\_LWIP\_AUTOIP*

### CONFIG\_LWIP\_IPV4

Enable IPv4

*Found in: [Component config](#) > [LWIP](#)*

Enable IPv4 stack. If you want to use IPv6 only TCP/IP stack, disable this.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IPV6

Enable IPv6

*Found in: [Component config](#) > [LWIP](#)*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP\_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_IPV6\_AUTOCONFIG

Enable IPV6 stateless address autoconfiguration (SLAAC)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IPV6](#)*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV6\_NUM\_ADDRESSES

Number of IPv6 addresses on each network interface

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IPV6](#)*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**

- 3

### CONFIG\_LWIP\_IPV6\_FORWARD

Enable IPv6 forwarding between interfaces

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_IPV6](#)*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_IPV6\_RDNSS\_MAX\_DNS\_SERVERS

Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in: [Component config](#) > [LWIP](#)*

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.

**Default value:**

- 0 if `CONFIG_LWIP_IPV6_AUTOCONFIG`

**CONFIG\_LWIP\_IPV6\_DHCP6**

Enable DHCPv6 stateless address autoconfiguration

*Found in: `Component config > LWIP`*

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using `dhcp6_enable_stateless(netif)`; Note that the stateful address autoconfiguration is not supported.

**Default value:**

- No (disabled) if `CONFIG_LWIP_IPV6_AUTOCONFIG`

**CONFIG\_LWIP\_NETIF\_STATUS\_CALLBACK**

Enable status callback for network interfaces

*Found in: `Component config > LWIP`*

Enable callbacks when the network interface is up/down and addresses are changed.

**Default value:**

- No (disabled)

**CONFIG\_LWIP\_NETIF\_LOOPBACK**

Support per-interface loopback

*Found in: `Component config > LWIP`*

Enabling this option means that if a packet is sent with a destination address equal to the interface's own IP address, it will "loop back" and be received by this interface. Disabling this option disables support of loopback interface in lwIP

**Default value:**

- Yes (enabled)

Contains:

- `CONFIG_LWIP_LOOPBACK_MAX_PBUFS`

**CONFIG\_LWIP\_LOOPBACK\_MAX\_PBUFS**

Max queued loopback packets per interface

*Found in: `Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK`*

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

**Range:**

- from 0 to 16

**Default value:**

- 8

**TCP** Contains:

- `CONFIG_LWIP_TCP_WND_DEFAULT`
- `CONFIG_LWIP_TCP_SND_BUF_DEFAULT`
- `CONFIG_LWIP_TCP_RECVMBOX_SIZE`
- `CONFIG_LWIP_TCP_RTO_TIME`
- `CONFIG_LWIP_MAX_ACTIVE_TCP`
- `CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT`
- `CONFIG_LWIP_MAX_LISTENING_TCP`
- `CONFIG_LWIP_TCP_MAXRTX`
- `CONFIG_LWIP_TCP_SYNMAXRTX`
- `CONFIG_LWIP_TCP_MSL`
- `CONFIG_LWIP_TCP_MSS`
- `CONFIG_LWIP_TCP_OVERSIZE`
- `CONFIG_LWIP_TCP_QUEUE_OOSEQ`
- `CONFIG_LWIP_WND_SCALE`
- `CONFIG_LWIP_TCP_HIGH_SPEED_RETRANSMISSION`
- `CONFIG_LWIP_TCP_TMR_INTERVAL`

**CONFIG\_LWIP\_MAX\_ACTIVE\_TCP**

Maximum active TCP Connections

*Found in:* `Component config > LWIP > TCP`

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**CONFIG\_LWIP\_MAX\_LISTENING\_TCP**

Maximum listening TCP Connections

*Found in:* `Component config > LWIP > TCP`

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**CONFIG\_LWIP\_TCP\_HIGH\_SPEED\_RETRANSMISSION**

TCP high speed retransmissions

*Found in:* `Component config > LWIP > TCP`

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCP\_MAXRTX

Maximum number of retransmissions of data segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of data segments.

**Range:**

- from 3 to 12

**Default value:**

- 12

### CONFIG\_LWIP\_TCP\_SYNMAXRTX

Maximum number of retransmissions of SYN segments

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum number of retransmissions of SYN segments.

**Range:**

- from 3 to 12

**Default value:**

- 12

### CONFIG\_LWIP\_TCP\_MSS

Maximum Segment Size (MSS)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP\_MSS Range: 576 <= TCP\_MSS <= 1460 IPv6 TCP\_MSS Range: 1220<= TCP\_MSS <= 1440

**Range:**

- from 536 to 1460

**Default value:**

- 1440

### CONFIG\_LWIP\_TCP\_TMR\_INTERVAL

TCP timer interval(ms)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**

- 250

### CONFIG\_LWIP\_TCP\_MSL

Maximum segment lifetime (MSL)

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 60000

### CONFIG\_LWIP\_TCP\_FIN\_WAIT\_TIMEOUT

Maximum FIN segment lifetime

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set maximum segment lifetime in milliseconds.

**Default value:**

- 20000

### CONFIG\_LWIP\_TCP\_SND\_BUF\_DEFAULT

Default send buffer size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with `lwip_setsockopt(s, TCP_SNDBUF, ...)`.

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**

- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5760

### CONFIG\_LWIP\_TCP\_WND\_DEFAULT

Default receive window size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with `lwip_setsockopt(s, TCP_WINDOW, ...)`.

Setting a smaller default receive window size can save some RAM, but will significantly decrease performance.

**Range:**

- from 2440 to 1024000 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 5760

### CONFIG\_LWIP\_TCP\_RECVMBOX\_SIZE

Default TCP receive mail box size

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is:  $LWIP\_TCP\_WND\_DEFAULT/TCP\_MSS + 2$ , e.g. if  $LWIP\_TCP\_WND\_DEFAULT=14360$ ,  $TCP\_MSS=1436$ , then the recommended receive mail box size is  $(14360/1436 + 2) = 12$ .

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can cache maximum `LWIP_TCP_RECVMBOX_SIZE` packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is

LWIP\_TCP\_RECVMBOX\_SIZE multiples the maximum TCP socket number. In other words, the bigger LWIP\_TCP\_RECVMBOX\_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 1024 if *CONFIG\_LWIP\_WND\_SCALE*

**Default value:**

- 6

### CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ

Queue incoming out-of-order segments

*Found in: Component config > LWIP > TCP*

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCP\_OOSEQ\_TIMEOUT

Timeout for each pbuf queued in TCP OOSEQ, in RTOs.

*Found in: Component config > LWIP > TCP > CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ*

The timeout value is TCP\_OOSEQ\_TIMEOUT \* RTO.

**Range:**

- from 1 to 30

**Default value:**

- 6

### CONFIG\_LWIP\_TCP\_OOSEQ\_MAX\_PBUFS

The maximum number of pbufs queued on OOSEQ per pcb

*Found in: Component config > LWIP > TCP > CONFIG\_LWIP\_TCP\_QUEUE\_OOSEQ*

If LWIP\_TCP\_OOSEQ\_MAX\_PBUFS = 0, TCP will not control the number of OOSEQ pbufs.

In a poor network environment, many out-of-order tcp pbufs will be received. These out-of-order pbufs will be cached in the TCP out-of-order queue which will cause Wi-Fi/Ethernet fail to release RX buffer in time. It is possible that all RX buffers for MAC layer are used by OOSEQ.

Control the number of out-of-order pbufs to ensure that the MAC layer has enough RX buffer to receive packets.

In the Wi-Fi scenario, recommended OOSEQ PBUFS Range:  $0 \leq \text{TCP\_OOSEQ\_MAX\_PBUFS} \leq \text{CONFIG\_ESP\_WIFI\_DYNAMIC\_RX\_BUFFER\_NUM}/(\text{MAX\_TCP\_NUMBER} + 1)$

In the Ethernet scenario, recommended Ethernet OOSEQ PBUFS Range:  $0 \leq \text{TCP\_OOSEQ\_MAX\_PBUFS} \leq \text{CONFIG\_ETH\_DMA\_RX\_BUFFER\_NUM}/(\text{MAX\_TCP\_NUMBER} + 1)$

Within the recommended value range, the larger the value, the better the performance.

MAX\_TCP\_NUMBER represent Maximum number of TCP connections in Wi-Fi(STA+SoftAP) and Ethernet scenario.

**Range:**

- from 0 to 12

**Default value:**

- 0 if SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP && [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)

### CONFIG\_LWIP\_TCP\_SACK\_OUT

Support sending selective acknowledgements

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_TCP\\_QUEUE\\_OOSEQ](#)

TCP will support sending selective acknowledgements (SACKs).

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_TCP\_OVERSIZE

Pre-allocate transmit PBUF size

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#)

Allows enabling "oversize" allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle's algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

Available options:

- MSS ([CONFIG\\_LWIP\\_TCP\\_OVERSIZE\\_MSS](#))
- 25% MSS ([CONFIG\\_LWIP\\_TCP\\_OVERSIZE\\_QUARTER\\_MSS](#))
- Disabled ([CONFIG\\_LWIP\\_TCP\\_OVERSIZE\\_DISABLE](#))

### CONFIG\_LWIP\_WND\_SCALE

Support TCP window scale

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#)

Enable this feature to support TCP window scaling.

**Default value:**

- No (disabled) if SPIRAM\_TRY\_ALLOCATE\_WIFI\_LWIP

### CONFIG\_LWIP\_TCP\_RCV\_SCALE

Set TCP receiving window scaling factor

*Found in:* [Component config](#) > [LWIP](#) > [TCP](#) > [CONFIG\\_LWIP\\_WND\\_SCALE](#)

Enable this feature to support TCP window scaling.

**Range:**

- from 0 to 14 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

**Default value:**

- 0 if [CONFIG\\_LWIP\\_WND\\_SCALE](#)

### CONFIG\_LWIP\_TCP\_RTO\_TIME

Default TCP rto time

*Found in: [Component config](#) > [LWIP](#) > [TCP](#)*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**

- 1500

**UDP** Contains:

- [CONFIG\\_LWIP\\_UDP\\_RECVMBOX\\_SIZE](#)
- [CONFIG\\_LWIP\\_MAX\\_UDP\\_PCBS](#)

### CONFIG\_LWIP\_MAX\_UDP\_PCBS

Maximum active UDP control blocks

*Found in: [Component config](#) > [LWIP](#) > [UDP](#)*

The maximum number of active UDP "connections" (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

### CONFIG\_LWIP\_UDP\_RECVMBOX\_SIZE

Default UDP receive mail box size

*Found in: [Component config](#) > [LWIP](#) > [UDP](#)*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum UDP\_RECVMBOX\_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP\_RECVMBOX\_SIZE multiplies the maximum UDP socket number. In other words, the bigger UDP\_RECVMBOX\_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**

- from 6 to 64

**Default value:**

- 6

**Checksums** Contains:

- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_ICMP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_IP](#)
- [CONFIG\\_LWIP\\_CHECKSUM\\_CHECK\\_UDP](#)

### CONFIG\_LWIP\_CHECKSUM\_CHECK\_IP

Enable LWIP IP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received IP messages

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_CHECKSUM\_CHECK\_UDP

Enable LWIP UDP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received UDP messages

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_CHECKSUM\_CHECK\_ICMP

Enable LWIP ICMP checksums

*Found in: [Component config](#) > [LWIP](#) > [Checksums](#)*

Enable checksum checking for received ICMP messages

**Default value:**

- Yes (enabled)

### CONFIG\_LWIP\_TCPIP\_TASK\_STACK\_SIZE

TCP/IP Task Stack Size

*Found in: [Component config](#) > [LWIP](#)*

Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**

- from 2048 to 65536

**Default value:**

- 3072

### CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY

TCP/IP task affinity

*Found in: [Component config](#) > [LWIP](#)*

Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to "TCP/IP" task and "Ping" task.

Available options:

- No affinity (CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY\_NO\_AFFINITY)
- CPU0 (CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY\_CPU0)
- CPU1 (CONFIG\_LWIP\_TCPIP\_TASK\_AFFINITY\_CPU1)

### CONFIG\_LWIP\_PPP\_SUPPORT

Enable PPP support

*Found in:* [Component config](#) > [LWIP](#)

Enable PPP stack. Now only PPP over serial is possible.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_PPP\\_ENABLE\\_IPV6](#)

### CONFIG\_LWIP\_PPP\_ENABLE\_IPV6

Enable IPV6 support for PPP connections (IPV6CP)

*Found in:* [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

Enable IPV6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPV6 addressing in the local link. If they are requested for IPV6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPV6 support.

**Default value:**

- Yes (enabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#) && [CONFIG\\_LWIP\\_IPV6](#)

### CONFIG\_LWIP\_IPV6\_MEMP\_NUM\_ND6\_QUEUE

Max number of IPv6 packets to queue during MAC resolution

*Found in:* [Component config](#) > [LWIP](#)

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**

- from 3 to 20

**Default value:**

- 3

### CONFIG\_LWIP\_IPV6\_ND6\_NUM\_NEIGHBORS

Max number of entries in IPv6 neighbor cache

*Found in:* [Component config](#) > [LWIP](#)

Config max number of entries in IPv6 neighbor cache

**Range:**

- from 3 to 10

**Default value:**

- 5

### CONFIG\_LWIP\_PPP\_NOTIFY\_PHASE\_SUPPORT

Enable Notify Phase Callback

*Found in:* [Component config](#) > [LWIP](#)

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_PPP\_PAP\_SUPPORT

Enable PAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Password Authentication Protocol (PAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_PPP\_CHAP\_SUPPORT

Enable CHAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Challenge Handshake Authentication Protocol (CHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_PPP\_MSCHAP\_SUPPORT

Enable MSCHAP support

*Found in: [Component config](#) > [LWIP](#)*

Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_PPP\_MPPE\_SUPPORT

Enable MPPE support

*Found in: [Component config](#) > [LWIP](#)*

Enable Microsoft Point-to-Point Encryption (MPPE) support

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_ENABLE\_LCP\_ECHO

Enable LCP ECHO

*Found in: [Component config](#) > [LWIP](#)*

Enable LCP echo keepalive requests

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_LCP\_ECHOINTERVAL

Echo interval (s)

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)*

Interval in seconds between keepalive LCP echo requests, 0 to disable.

**Range:**

- from 0 to 1000000 if [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)

**Default value:**

- 3 if [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)

### CONFIG\_LWIP\_LCP\_MAXECHOFAILS

Maximum echo failures

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)*

Number of consecutive unanswered echo requests before failure is indicated.

**Range:**

- from 0 to 100000 if [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)

**Default value:**

- 3 if [CONFIG\\_LWIP\\_ENABLE\\_LCP\\_ECHO](#)

### CONFIG\_LWIP\_PPP\_DEBUG\_ON

Enable PPP debug log output

*Found in: [Component config](#) > [LWIP](#)*

Enable PPP debug log output

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_PPP\\_SUPPORT](#)

### CONFIG\_LWIP\_SLIP\_SUPPORT

Enable SLIP support (new/experimental)

*Found in: [Component config](#) > [LWIP](#)*

Enable SLIP stack. Now only SLIP over serial is possible.

SLIP over serial support is experimental and unsupported.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_SLIP\\_DEBUG\\_ON](#)

### CONFIG\_LWIP\_SLIP\_DEBUG\_ON

Enable SLIP debug log output

*Found in: [Component config](#) > [LWIP](#) > [CONFIG\\_LWIP\\_SLIP\\_SUPPORT](#)*

Enable SLIP debug log output

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_SLIP\\_SUPPORT](#)

**ICMP** Contains:

- [CONFIG\\_LWIP\\_ICMP](#)
- [CONFIG\\_LWIP\\_BROADCAST\\_PING](#)
- [CONFIG\\_LWIP\\_MULTICAST\\_PING](#)

### CONFIG\_LWIP\_ICMP

ICMP: Enable ICMP

*Found in: [Component config](#) > [LWIP](#) > [ICMP](#)*

Enable ICMP module for check network stability

**Default value:**

- Yes (enabled)

### **CONFIG\_LWIP\_MULTICAST\_PING**

Respond to multicast pings

*Found in: [Component config](#) > [LWIP](#) > [ICMP](#)*

**Default value:**

- No (disabled)

### **CONFIG\_LWIP\_BROADCAST\_PING**

Respond to broadcast pings

*Found in: [Component config](#) > [LWIP](#) > [ICMP](#)*

**Default value:**

- No (disabled)

**LWIP RAW API** Contains:

- [CONFIG\\_LWIP\\_MAX\\_RAW\\_PCBS](#)

### **CONFIG\_LWIP\_MAX\_RAW\_PCBS**

Maximum LWIP RAW PCBs

*Found in: [Component config](#) > [LWIP](#) > [LWIP RAW API](#)*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**

- from 1 to 1024

**Default value:**

- 16

**SNTP** Contains:

- [CONFIG\\_LWIP\\_SNTP\\_MAX\\_SERVERS](#)
- [CONFIG\\_LWIP\\_SNTP\\_UPDATE\\_DELAY](#)
- [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

### **CONFIG\_LWIP\_SNTP\_MAX\_SERVERS**

Maximum number of NTP servers

*Found in: [Component config](#) > [LWIP](#) > [SNTP](#)*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of `sntp_setserver/sntp_setservername` functions is limited to this value.

**Range:**

- from 1 to 16

**Default value:**

- 1

### CONFIG\_LWIP\_DHCP\_GET\_NTP\_SRV

Request NTP servers from DHCP

*Found in:* [Component config](#) > [LWIP](#) > [SNTP](#)

If enabled, LWIP will add 'NTP' to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see `sntp_servermode_dhcp()` func.)

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_DHCP\_MAX\_NTP\_SERVERS

Maximum number of NTP servers aquired via DHCP

*Found in:* [Component config](#) > [LWIP](#) > [SNTP](#) > [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

Set maximum number of NTP servers aquired via DHCP-offer. Should be less or equal to "Maximum number of NTP servers", any extra servers would be just ignored.

**Range:**

- from 1 to 16 if [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

**Default value:**

- 1 if [CONFIG\\_LWIP\\_DHCP\\_GET\\_NTP\\_SRV](#)

### CONFIG\_LWIP\_SNTP\_UPDATE\_DELAY

Request interval to update time (ms)

*Found in:* [Component config](#) > [LWIP](#) > [SNTP](#)

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

**Range:**

- from 15000 to 4294967295

**Default value:**

- 3600000

**DNS** Contains:

- [CONFIG\\_LWIP\\_FALLBACK\\_DNS\\_SERVER\\_SUPPORT](#)
- [CONFIG\\_LWIP\\_DNS\\_MAX\\_SERVERS](#)

### CONFIG\_LWIP\_DNS\_MAX\_SERVERS

Maximum number of DNS servers

*Found in:* [Component config](#) > [LWIP](#) > [DNS](#)

Set maximum number of DNS servers. If fallback DNS servers are supported, the number of DNS servers needs to be greater than or equal to 3.

**Range:**

- from 1 to 4

**Default value:**

- 3

### CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_SUPPORT

Enable DNS fallback server support

*Found in:* [Component config](#) > [LWIP](#) > [DNS](#)

Enable this feature to support DNS fallback server.

**Default value:**

- No (disabled)

### CONFIG\_LWIP\_FALLBACK\_DNS\_SERVER\_ADDRESS

DNS fallback server address

*Found in:* [Component config](#) > [LWIP](#) > [DNS](#) > [CONFIG\\_LWIP\\_FALLBACK\\_DNS\\_SERVER\\_SUPPORT](#)

This option allows you to config dns fallback server address.

**Default value:**

- "114.114.114.114" if [CONFIG\\_LWIP\\_FALLBACK\\_DNS\\_SERVER\\_SUPPORT](#)

### CONFIG\_LWIP\_BRIDGEIF\_MAX\_PORTS

Maximum number of bridge ports

*Found in:* [Component config](#) > [LWIP](#)

Set maximum number of ports a bridge can consists of.

**Range:**

- from 1 to 63

**Default value:**

- 7

### CONFIG\_LWIP\_ESP\_LWIP\_ASSERT

Enable LWIP ASSERT checks

*Found in:* [Component config](#) > [LWIP](#)

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled.

If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.

**Hooks** Contains:

- [CONFIG\\_LWIP\\_HOOK\\_ND6\\_GET\\_GW](#)
- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_INPUT](#)
- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_ROUTE](#)
- [CONFIG\\_LWIP\\_HOOK\\_IP6\\_SELECT\\_SRC\\_ADDR](#)
- [CONFIG\\_LWIP\\_HOOK\\_NETCONN\\_EXTERNAL\\_RESOLVE](#)
- [CONFIG\\_LWIP\\_HOOK\\_TCP\\_ISN](#)

### CONFIG\_LWIP\_HOOK\_TCP\_ISN

TCP ISN Hook

*Found in:* [Component config](#) > [LWIP](#) > [Hooks](#)

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (*tcp\_next\_isn*) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to `LWIP_HOOK_TCP_ISN_CUSTOM` to provide custom implementation. Set to `LWIP_HOOK_TCP_ISN_NONE` to use lwIP implementation.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_TCP_ISN_NONE`)
- Default implementation (`CONFIG_LWIP_HOOK_TCP_ISN_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_TCP_ISN_CUSTOM`)

### **CONFIG\_LWIP\_HOOK\_IP6\_ROUTE**

IPv6 route Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 route hook. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_IP6_ROUTE_NONE`)
- Default (weak) implementation (`CONFIG_LWIP_HOOK_IP6_ROUTE_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_IP6_ROUTE_CUSTOM`)

### **CONFIG\_LWIP\_HOOK\_ND6\_GET\_GW**

IPv6 get gateway Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 route hook. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_ND6_GET_GW_NONE`)
- Default (weak) implementation (`CONFIG_LWIP_HOOK_ND6_GET_GW_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_ND6_GET_GW_CUSTOM`)

### **CONFIG\_LWIP\_HOOK\_IP6\_SELECT\_SRC\_ADDR**

IPv6 source address selection Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 source address selection. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR_NONE`)
- Default (weak) implementation (`CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR_CUSTOM`)

## CONFIG\_LWIP\_HOOK\_NETCONN\_EXTERNAL\_RESOLVE

Netconn external resolve Hook

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom DNS resolve hook. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_NONE)
- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_NETCONN\_EXT\_RESOLVE\_CUSTOM)

## CONFIG\_LWIP\_HOOK\_IP6\_INPUT

IPv6 packet input

*Found in: [Component config](#) > [LWIP](#) > [Hooks](#)*

Enables custom IPv6 packet input. Setting this to "default" provides weak implementation stub that could be overwritten in application code. Setting this to "custom" provides hook's declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG\_LWIP\_HOOK\_IP6\_INPUT\_NONE)
- Default (weak) implementation (CONFIG\_LWIP\_HOOK\_IP6\_INPUT\_DEFAULT)
- Custom implementation (CONFIG\_LWIP\_HOOK\_IP6\_INPUT\_CUSTOM)

## CONFIG\_LWIP\_DEBUG

Enable LWIP Debug

*Found in: [Component config](#) > [LWIP](#)*

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

**Default value:**

- No (disabled)

Contains:

- [CONFIG\\_LWIP\\_API\\_LIB\\_DEBUG](#)
- [CONFIG\\_LWIP\\_BRIDGEIF\\_FDB\\_DEBUG](#)
- [CONFIG\\_LWIP\\_BRIDGEIF\\_FW\\_DEBUG](#)
- [CONFIG\\_LWIP\\_BRIDGEIF\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DHCP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DHCP\\_STATE\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DNS\\_DEBUG](#)
- [CONFIG\\_LWIP\\_ETHARP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_ICMP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_ICMP6\\_DEBUG](#)
- [CONFIG\\_LWIP\\_IP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_IP6\\_DEBUG](#)
- [CONFIG\\_LWIP\\_NAPT\\_DEBUG](#)
- [CONFIG\\_LWIP\\_NETIF\\_DEBUG](#)
- [CONFIG\\_LWIP\\_PBUF\\_DEBUG](#)

- [CONFIG\\_LWIP\\_SNTP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_SOCKETS\\_DEBUG](#)
- [CONFIG\\_LWIP\\_TCP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_UDP\\_DEBUG](#)
- [CONFIG\\_LWIP\\_DEBUG\\_ESP\\_LOG](#)

### **CONFIG\_LWIP\_DEBUG\_ESP\_LOG**

Route LWIP debugs through ESP\_LOG interface

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

Enabling this option routes all enabled LWIP debugs through ESP\_LOGD.

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_NETIF\_DEBUG**

Enable netif debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_PBUF\_DEBUG**

Enable pbuf debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_ETHARP\_DEBUG**

Enable etharp debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_API\_LIB\_DEBUG**

Enable api lib debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_SOCKETS\_DEBUG**

Enable socket debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if [CONFIG\\_LWIP\\_DEBUG](#)

### **CONFIG\_LWIP\_IP\_DEBUG**

Enable IP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_ICMP\_DEBUG**

Enable ICMP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG* && *CONFIG\_LWIP\_ICMP*

### **CONFIG\_LWIP\_DHCP\_STATE\_DEBUG**

Enable DHCP state tracking

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_DHCP\_DEBUG**

Enable DHCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_IP6\_DEBUG**

Enable IP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_ICMP6\_DEBUG**

Enable ICMP6 debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_TCP\_DEBUG**

Enable TCP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_UDP\_DEBUG**

Enable UDP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_SNTP\_DEBUG**

Enable SNTP debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_DNS\_DEBUG**

Enable DNS debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_NAPT\_DEBUG**

Enable NAPT debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG* && *CONFIG\_LWIP\_IPV4\_NAPT*

### **CONFIG\_LWIP\_BRIDGEIF\_DEBUG**

Enable bridge generic debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_BRIDGEIF\_FDB\_DEBUG**

Enable bridge FDB debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

### **CONFIG\_LWIP\_BRIDGEIF\_FW\_DEBUG**

Enable bridge forwarding debug messages

*Found in: Component config > LWIP > CONFIG\_LWIP\_DEBUG*

**Default value:**

- No (disabled) if *CONFIG\_LWIP\_DEBUG*

**MBEDTLS** Contains:

- `CONFIG_MBEDTLS_ASYMMETRIC_CONTENT_LEN`
- *Certificate Bundle*
- *Certificates*
- `CONFIG_MBEDTLS_CHACHA20_C`
- `CONFIG_MBEDTLS_DHM_C`
- `CONFIG_MBEDTLS_ECP_C`
- `CONFIG_MBEDTLS_ECDH_C`
- `CONFIG_MBEDTLS_ECJPAKE_C`
- `CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED`
- `CONFIG_MBEDTLS_CMAC_C`
- `CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED`
- `CONFIG_MBEDTLS_ECDSA_DETERMINISTIC`
- `CONFIG_MBEDTLS_HARDWARE_ECDSA_VERIFY`
- `CONFIG_MBEDTLS_HARDWARE_ECDSA_SIGN`
- `CONFIG_MBEDTLS_ERROR_STRINGS`
- `CONFIG_MBEDTLS_ECP_FIXED_POINT_OPTIM`
- `CONFIG_MBEDTLS_HARDWARE_AES`
- `CONFIG_MBEDTLS_HARDWARE_ECC`
- `CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN`
- `CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY`
- `CONFIG_MBEDTLS_HARDWARE_MPI`
- `CONFIG_MBEDTLS_HARDWARE_SHA`
- `CONFIG_MBEDTLS_DEBUG`
- `CONFIG_MBEDTLS_ECP_RESTARTABLE`
- `CONFIG_MBEDTLS_HAVE_TIME`
- `CONFIG_MBEDTLS_RIPEMD160_C`
- `CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED`
- `CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED`
- `CONFIG_MBEDTLS_SHA512_C`
- `CONFIG_MBEDTLS_THREADING_C`
- `CONFIG_MBEDTLS_HKDF_C`
- *MBEDTLS v3.x related*
- `CONFIG_MBEDTLS_MEM_ALLOC_MODE`
- `CONFIG_MBEDTLS_ECP_NIST_OPTIM`
- `CONFIG_MBEDTLS_POLY1305_C`
- `CONFIG_MBEDTLS_SSL_ALPN`
- `CONFIG_MBEDTLS_SSL_PROTO_DTLS`
- `CONFIG_MBEDTLS_SSL_PROTO_GMTSSL1_1`
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`
- `CONFIG_MBEDTLS_SSL_RENEGOTIATION`
- *Symmetric Ciphers*
- *TLS Key Exchange Methods*
- `CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN`
- `CONFIG_MBEDTLS_TLS_MODE`
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`
- `CONFIG_MBEDTLS_ROM_MD5`
- `CONFIG_MBEDTLS_USE_CRYPTO_ROM_IMPL`
- `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

## CONFIG\_MBEDTLS\_MEM\_ALLOC\_MODE

Memory allocation strategy

Found in: *Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls\_platform\_set\_malloc\_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (\*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(\*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal memory (CONFIG\_MBEDTLS\_INTERNAL\_MEM\_ALLOC)
- External SPIRAM (CONFIG\_MBEDTLS\_EXTERNAL\_MEM\_ALLOC)
- Default alloc mode (CONFIG\_MBEDTLS\_DEFAULT\_MEM\_ALLOC)
- Custom alloc mode (CONFIG\_MBEDTLS\_CUSTOM\_MEM\_ALLOC)
- Internal IRAM (CONFIG\_MBEDTLS\_IRAM\_8BIT\_MEM\_ALLOC)

Allows to use IRAM memory region as 8bit accessible region.

TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

## CONFIG\_MBEDTLS\_SSL\_MAX\_CONTENT\_LEN

TLS maximum message content length

Found in: *Component config > mbedTLS*

Maximum TLS message length (in bytes) supported by mbedTLS.

16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max\_fragment\_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS\_ERR\_SSL\_INVALID\_RECORD (-0x7200).

## CONFIG\_MBEDTLS\_ASYMMETRIC\_CONTENT\_LEN

Asymmetric in/out fragment length

Found in: *Component config > mbedTLS*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_IN\_CONTENT\_LEN

TLS maximum incoming fragment length

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)*

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS\_SSL\_MAX\_CONTENT\_LEN).

**Range:**

- from 512 to 16384

**Default value:**

- 16384

### CONFIG\_MBEDTLS\_SSL\_OUT\_CONTENT\_LEN

TLS maximum outgoing fragment length

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ASYMMETRIC\\_CONTENT\\_LEN](#)*

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS\_SSL\_MAX\_CONTENT\_LEN).

**Range:**

- from 512 to 16384

**Default value:**

- 4096

### CONFIG\_MBEDTLS\_DYNAMIC\_BUFFER

Using dynamic TX/RX buffer

*Found in: [Component config](#) > [mbedtls](#)*

Using dynamic TX/RX buffer. After enabling this option, mbedtls will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedtls also allocate TX and RX buffer with the default value of "MBEDTLS\_SSL\_OUT\_CONTENT\_LEN" or "MBEDTLS\_SSL\_IN\_CONTENT\_LEN", so to save more heap, users can set the options to be an appropriate value.

### CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CONFIG\_DATA

Free private key and DHM data after its usage

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)*

Free private key and DHM data after its usage in handshake process.

The option will decrease heap cost when handshake, but also lead to problem:

Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#)

### CONFIG\_MBEDTLS\_DYNAMIC\_FREE\_CA\_CERT

Free SSL CA certificate after its usage

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_BUFFER](#) > [CONFIG\\_MBEDTLS\\_DYNAMIC\\_FREE\\_CONFIG\\_DATA](#)*

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA`

### **CONFIG\_MBEDTLS\_DEBUG**

Enable mbedTLS debugging

*Found in:* `Component config > mbedTLS`

Enable mbedTLS debugging functions at compile time.

If this option is enabled, you can include "mbedtls/esp\_debug.h" and call `mbedtls_esp_enable_debug_log()` at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_DEBUG\_LEVEL**

Set mbedTLS debugging level

*Found in:* `Component config > mbedTLS > CONFIG_MBEDTLS_DEBUG`

Set mbedTLS debugging level

Available options:

- Warning (`CONFIG_MBEDTLS_DEBUG_LEVEL_WARN`)
- Info (`CONFIG_MBEDTLS_DEBUG_LEVEL_INFO`)
- Debug (`CONFIG_MBEDTLS_DEBUG_LEVEL_DEBUG`)
- Verbose (`CONFIG_MBEDTLS_DEBUG_LEVEL_VERBOSE`)

### **mbedTLS v3.x related** Contains:

- *DTLS-based configurations*
- `CONFIG_MBEDTLS_PKCS7_C`
- `CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION`
- `CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK`
- `CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE`
- `CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY`
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`
- `CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT`
- `CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH`

### **CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_3**

Support TLS 1.3 protocol

*Found in:* `Component config > mbedTLS > mbedTLS v3.x related`

### **TLS 1.3 related configurations** Contains:

- `CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_EPHEMERAL`
- `CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE`
- `CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK_EPHEMERAL`
- `CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK`

### CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_COMPATIBILITY\_MODE

TLS 1.3 middlebox compatibility mode

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#) > [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#) > [TLS 1.3 related configurations](#)

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#)

### CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK

TLS 1.3 PSK key exchange mode

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#) > [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#) > [TLS 1.3 related configurations](#)

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#)

### CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_EPHEMERAL

TLS 1.3 ephemeral key exchange mode

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#) > [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#) > [TLS 1.3 related configurations](#)

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#)

### CONFIG\_MBEDTLS\_SSL\_TLS1\_3\_KEXM\_PSK\_EPHEMERAL

TLS 1.3 PSK ephemeral key exchange mode

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#) > [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#) > [TLS 1.3 related configurations](#)

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_SSL\\_PROTO\\_TLS1\\_3](#)

### CONFIG\_MBEDTLS\_SSL\_VARIABLE\_BUFFER\_LENGTH

Variable SSL buffer length

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_ECDH\_LEGACY\_CONTEXT

Use a backward compatible ECDH context (Experimental)

*Found in:* [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)

Use the legacy ECDH context format. Define this option only if you enable [MBEDTLS\\_ECP\\_RESTARTABLE](#) or if you want to access ECDH context fields directly.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_ECDH\\_C](#) && [CONFIG\\_MBEDTLS\\_ECP\\_RESTARTABLE](#)

### CONFIG\_MBEDTLS\_X509\_TRUSTED\_CERT\_CALLBACK

Enable trusted certificate callbacks

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedtls documentation for required API and more details.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_CONTEXT\_SERIALIZATION

Enable serialization of the TLS context structures

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Enable serialization of the TLS context structures This is a local optimization in handling a single, potentially long-lived connection.

See mbedtls documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_KEEP\_PEER\_CERTIFICATE

Keep peer certificate after handshake completion

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Keep the peer's certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedtls documentation for required API and more details.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_PKCS7\_C

Enable PKCS #7

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Enable PKCS #7 core for using PKCS #7-formatted signatures.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_CID\_PADDING\_GRANULARITY

Record plaintext padding

*Found in: [Component config](#) > [mbedtls](#) > [mbedtls v3.x related](#)*

Controls the use of record plaintext padding in TLS 1.3 and when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3` || `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**Default value:**

- 16 if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3` || `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**DTLS-based configurations** Contains:

- `CONFIG_MBEDTLS_SSL_DTLS_SRTP`
- `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID**

Support for the DTLS Connection ID extension

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**CONFIG\_MBEDTLS\_SSL\_CID\_IN\_LEN\_MAX**

Maximum length of CIDs used for incoming DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID*

Maximum length of CIDs used for incoming DTLS messages

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**

- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**CONFIG\_MBEDTLS\_SSL\_CID\_OUT\_LEN\_MAX**

Maximum length of CIDs used for outgoing DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG\_MBEDTLS\_SSL\_DTLS\_CONNECTION\_ID*

Maximum length of CIDs used for outgoing DTLS messages

**Range:**

- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**

- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**CONFIG\_MBEDTLS\_SSL\_DTLS\_SRTP**

Enable support for negotiation of DTLS-SRTP (RFC 5764)

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use\_srtp extension.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Certificate Bundle** Contains:

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`

**CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE**

Enable trusted root certificate bundle

*Found in:* [Component config](#) > [mbedTLS](#) > [Certificate Bundle](#)

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_DEFAULT\_CERTIFICATE\_BUNDLE**

Default certificate bundle options

*Found in:* [Component config](#) > [mbedTLS](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

Available options:

- Use the full default certificate bundle (`CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL`)
- Use only the most common certificates from the default bundles (`CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN`)  
Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
- Do not use the default certificate bundle (`CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE`)

**CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE**

Add custom certificates to the default bundle

*Found in:* [Component config](#) > [mbedTLS](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CUSTOM\_CERTIFICATE\_BUNDLE\_PATH**

Custom certificate bundle path

*Found in:* [Component config](#) > [mbedTLS](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#) > [CONFIG\\_MBEDTLS\\_CUSTOM\\_CERTIFICATE\\_BUNDLE](#)

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

### CONFIG\_MBEDTLS\_CERTIFICATE\_BUNDLE\_MAX\_CERTS

Maximum no of certificates allowed in certificate bundle

*Found in:* [Component config](#) > [mbedtls](#) > [Certificate Bundle](#) > [CONFIG\\_MBEDTLS\\_CERTIFICATE\\_BUNDLE](#)

**Default value:**

- 200

### CONFIG\_MBEDTLS\_ECP\_RESTARTABLE

Enable mbedtls ecp restartable

*Found in:* [Component config](#) > [mbedtls](#)

Enable "non-blocking" ECC operations that can return early and be resumed.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CMAC\_C

Enable CMAC mode for block ciphers

*Found in:* [Component config](#) > [mbedtls](#)

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HARDWARE\_AES

Enable hardware AES acceleration

*Found in:* [Component config](#) > [mbedtls](#)

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

### CONFIG\_MBEDTLS\_AES\_USE\_INTERRUPT

Use interrupt for long AES operations

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)

Use an interrupt to coordinate long AES operations.

This allows other code to run on the CPU while an AES operation is pending. Otherwise the CPU busy-waits.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)

### CONFIG\_MBEDTLS\_HARDWARE\_GCM

Enable partially hardware accelerated GCM

*Found in:* [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)

Enable partially hardware accelerated GCM. GHASH calculation is still done in software.

If MBEDTLS\_HARDWARE\_GCM is disabled and MBEDTLS\_HARDWARE\_AES is enabled then mbedtls will still use the hardware accelerated AES block operation, but on a single block at a time.

**Default value:**

- Yes (enabled) if SOC\_AES\_SUPPORT\_GCM && [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)

**CONFIG\_MBEDTLS\_GCM\_SUPPORT\_NON\_AES\_CIPHER**

Enable support for non-AES ciphers in GCM operation

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)*

Enable this config to support fallback to software definitions for a non-AES cipher GCM operation as we support hardware acceleration only for AES cipher. Some of the non-AES ciphers used in a GCM operation are DES, ARIA, CAMELLIA, CHACHA20, BLOWFISH.

If this config is disabled, performing a non-AES cipher GCM operation with the config MBEDTLS\_HARDWARE\_AES enabled will result in calculation of an AES-GCM operation instead for the given input values and thus could lead to failure in certificate validation which would ultimately lead to a SSL handshake failure.

This config being by-default enabled leads to an increase in binary size footprint of ~2.5KB. In case you are sure that your use case (for example, client and server configurations in case of a TLS handshake) would not involve any GCM operations using a non-AES cipher, you can safely disable this config, leading to reduction in binary size footprint.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_HARDWARE\\_AES](#)

**CONFIG\_MBEDTLS\_HARDWARE\_MPI**

Enable hardware MPI (bignum) acceleration

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC\_RSA\_MAX\_BIT\_LEN bit results.

These operations are used by RSA.

**CONFIG\_MBEDTLS\_LARGE\_KEY\_SOFTWARE\_MPI**

Fallback to software implementation for larger MPI values

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#)*

Fallback to software implementation for RSA key lengths larger than SOC\_RSA\_MAX\_BIT\_LEN. If this is not active then the ESP will be unable to process keys greater than SOC\_RSA\_MAX\_BIT\_LEN.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#)
- No (disabled) if [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#)

**CONFIG\_MBEDTLS\_MPI\_USE\_INTERRUPT**

Use interrupt for MPI exp-mod operations

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#)*

Use an interrupt to coordinate long MPI operations.

This allows other code to run on the CPU while an MPI operation is pending. Otherwise the CPU busy-waits.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_HARDWARE\\_MPI](#)

### CONFIG\_MBEDTLS\_HARDWARE\_SHA

Enable hardware SHA acceleration

*Found in: [Component config > mbedTLS](#)*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedTLS.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

### CONFIG\_MBEDTLS\_HARDWARE\_ECC

Enable hardware ECC acceleration

*Found in: [Component config > mbedTLS](#)*

Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedTLS

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_ECC\_OTHER\_CURVES\_SOFT\_FALLBACK

Fallback to software implementation for curves not supported in hardware

*Found in: [Component config > mbedTLS > CONFIG\\_MBEDTLS\\_HARDWARE\\_ECC](#)*

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_ROM\_MD5

Use MD5 implementation in ROM

*Found in: [Component config > mbedTLS](#)*

Use ROM MD5 in mbedTLS.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_HARDWARE\_ECDSA\_SIGN

Enable ECDSA signing using on-chip ECDSA peripheral

*Found in: [Component config > mbedTLS](#)*

Enable hardware accelerated ECDSA peripheral to sign data on curve SECP192R1 and SECP256R1 in mbedTLS.

Note that for signing, the private key has to be burnt in an efuse key block with key purpose set to ECDSA\_KEY. If no key is burnt, it will report an error

The key should be burnt in little endian format. `espfuse.py` utility handles it internally but care needs to be taken while burning using `esp_efuse` APIs

**Default value:**

- No (disabled) if SOC\_ECDSA\_SUPPORTED

### **CONFIG\_MBEDTLS\_HARDWARE\_ECDSA\_VERIFY**

Enable ECDSA signature verification using on-chip ECDSA peripheral

*Found in: [Component config](#) > [mbedtls](#)*

Enable hardware accelerated ECDSA peripheral to verify signature on curve SECP192R1 and SECP256R1 in mbedtls.

**Default value:**

- Yes (enabled) if SOC\_ECDSA\_SUPPORTED

### **CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_SIGN**

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_ATCA\_HW\_ECDSA\_VERIFY**

Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: [Component config](#) > [mbedtls](#)*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_HAVE\_TIME**

Enable mbedtls time support

*Found in: [Component config](#) > [mbedtls](#)*

Enable use of time.h functions (time() and gmtime()) by mbedtls.

This option doesn't require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn't call any standard timekeeping functions.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_PLATFORM\_TIME\_ALT**

Enable mbedtls time support: platform-specific

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)*

Enabling this config will provide users with a function "mbedtls\_platform\_set\_time()" that allows to set an alternative time function pointer.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_HAVE\_TIME\_DATE

Enable mbedtls certificate expiry check

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_HAVE\\_TIME](#)*

Enables X.509 certificate expiry checks in mbedtls.

If this option is disabled (default) then X.509 certificate "valid from" and "valid to" timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard `time()` and `gmtime()` functions. If the certificate is not valid for the current system time then verification will fail with code `MBEDTLS_X509_BADCERT_FUTURE` or `MBEDTLS_X509_BADCERT_EXPIRED`.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF's SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_ECDSA\_DETERMINISTIC

Enable deterministic ECDSA

*Found in: [Component config](#) > [mbedtls](#)*

Standard ECDSA is "fragile" in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SHA512\_C

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: [Component config](#) > [mbedtls](#)*

Enable `MBEDTLS_SHA512_C` adds support for SHA-384 and SHA-512.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_TLS\_MODE

TLS Protocol Role

*Found in: [Component config](#) > [mbedtls](#)*

mbedtls can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

Available options:

- Server & Client (`CONFIG_MBEDTLS_TLS_SERVER_AND_CLIENT`)

- Server (CONFIG\_MBEDTLS\_TLS\_SERVER\_ONLY)
- Client (CONFIG\_MBEDTLS\_TLS\_CLIENT\_ONLY)
- None (CONFIG\_MBEDTLS\_TLS\_DISABLED)

**TLS Key Exchange Methods** Contains:

- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_DHE\\_RSA](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ECJPAKE](#)
- [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_RSA](#)
- [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

### CONFIG\_MBEDTLS\_PSK\_MODES

Enable pre-shared-key ciphersuites

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to show configuration for different types of pre-shared-key TLS authentication methods.

Leaving this options disabled will save code size if they are not used.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_PSK

Enable PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_PSK

Enable DHE-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#) && [CONFIG\\_MBEDTLS\\_DHM\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_PSK

Enable ECDHE-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#) && [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA\_PSK

Enable RSA-PSK based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_PSK\\_MODES](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_RSA

Enable RSA-only based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_DHE\_RSA

Enable DHE-RSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

**Default value:**

- Yes (enabled) if [CONFIG\\_MBEDTLS\\_DHM\\_C](#)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ELLIPTIC\_CURVE

Support Elliptic Curve based ciphersuites

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#)

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_RSA

Enable ECDHE-RSA based ciphersuite modes

*Found in:* [Component config](#) > [mbedtls](#) > [TLS Key Exchange Methods](#) > [CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDHE\_ECDSA

Enable ECDHE-ECDSA based ciphersuite modes

*Found in:* [Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_ECDSA

Enable ECDH-ECDSA based ciphersuite modes

*Found in:* [Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECDH\_RSA

Enable ECDH-RSA based ciphersuite modes

*Found in:* [Component config > mbedTLS > TLS Key Exchange Methods > CONFIG\\_MBEDTLS\\_KEY\\_EXCHANGE\\_ELLIPTIC\\_CURVE](#)

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_KEY\_EXCHANGE\_ECJPAKE

Enable ECJPAKE based ciphersuite modes

*Found in:* [Component config > mbedTLS > TLS Key Exchange Methods](#)

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**

- No (disabled) if [CONFIG\\_MBEDTLS\\_ECJPAKE\\_C](#) && [CONFIG\\_MBEDTLS\\_ECP\\_DP\\_SECP256R1\\_ENABLED](#)

### CONFIG\_MBEDTLS\_SSL\_RENEGOTIATION

Support TLS renegotiation

*Found in:* [Component config > mbedTLS](#)

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don't need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_TLS1\_2

Support TLS 1.2 protocol

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_GMTSSL1\_1

Support GM/T SSL 1.1 protocol

*Found in: [Component config](#) > [mbedtls](#)*

Provisions for GM/T SSL 1.1 support

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_PROTO\_DTLS

Support DTLS protocol (all versions)

*Found in: [Component config](#) > [mbedtls](#)*

Requires TLS 1.2 to be enabled for DTLS 1.2

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_SSL\_ALPN

Support ALPN (Application Layer Protocol Negotiation)

*Found in: [Component config](#) > [mbedtls](#)*

Disabling this option will save some code size if it is not needed.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_CLIENT\_SSL\_SESSION\_TICKETS

TLS: Client Support for RFC 5077 SSL session tickets

*Found in: [Component config](#) > [mbedtls](#)*

Client support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_SERVER\_SSL\_SESSION\_TICKETS

TLS: Server Support for RFC 5077 SSL session tickets

*Found in: [Component config](#) > [mbedtls](#)*

Server support for RFC 5077 session tickets. See mbedtls documentation for more details. Disabling this option will save some code size.

**Default value:**

- Yes (enabled)

**Symmetric Ciphers** Contains:

- [CONFIG\\_MBEDTLS\\_AES\\_C](#)
- [CONFIG\\_MBEDTLS\\_BLOWFISH\\_C](#)
- [CONFIG\\_MBEDTLS\\_CAMELLIA\\_C](#)
- [CONFIG\\_MBEDTLS\\_CCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_DES\\_C](#)
- [CONFIG\\_MBEDTLS\\_GCM\\_C](#)
- [CONFIG\\_MBEDTLS\\_NIST\\_KW\\_C](#)
- [CONFIG\\_MBEDTLS\\_XTEA\\_C](#)

**CONFIG\_MBEDTLS\_AES\_C**

AES block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_CAMELLIA\_C**

Camellia block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_DES\_C**

DES block cipher (legacy, insecure)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_BLOWFISH\_C**

Blowfish block cipher (read help)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedtls TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_XTEA\_C**

XTEA block cipher

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enables the XTEA block cipher.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_CCM\_C

CCM (Counter with CBC-MAC) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_GCM\_C

GCM (Galois/Counter) block cipher modes

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.

This option is generally faster than CCM.

**Default value:**

- Yes (enabled)

### CONFIG\_MBEDTLS\_NIST\_KW\_C

NIST key wrapping (KW) and KW padding (KWP)

*Found in: [Component config](#) > [mbedtls](#) > [Symmetric Ciphers](#)*

Enable NIST key wrapping and key wrapping padding.

**Default value:**

- No (disabled)

### CONFIG\_MBEDTLS\_RIPEMD160\_C

Enable RIPEMD-160 hash algorithm

*Found in: [Component config](#) > [mbedtls](#)*

Enable the RIPEMD-160 hash algorithm.

**Default value:**

- No (disabled)

**Certificates** Contains:

- [CONFIG\\_MBEDTLS\\_PEM\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_PEM\\_WRITE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CRL\\_PARSE\\_C](#)
- [CONFIG\\_MBEDTLS\\_X509\\_CSR\\_PARSE\\_C](#)

### CONFIG\_MBEDTLS\_PEM\_PARSE\_C

Read & Parse PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable decoding/parsing of PEM formatted certificates.

If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_PEM\_WRITE\_C**

Write PEM formatted certificates

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Enable writing of PEM formatted certificates.

If writing certificate data only in DER format, disabling this option will save some code size.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_X509\_CRL\_PARSE\_C**

X.509 CRL parsing

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Support for parsing X.509 Certificate Revocation Lists.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_X509\_CSR\_PARSE\_C**

X.509 CSR parsing

*Found in: [Component config](#) > [mbedtls](#) > [Certificates](#)*

Support for parsing X.509 Certificate Signing Requests

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_ECP\_C**

Elliptic Curve Ciphers

*Found in: [Component config](#) > [mbedtls](#)*

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_DHM\_C**

Diffie-Hellman-Merkle key exchange (DHM)

*Found in: [Component config](#) > [mbedtls](#)*

Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file *mbedtls/dhm.h* file.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_ECDH\_C**

Elliptic Curve Diffie-Hellman (ECDH)

*Found in: [Component config](#) > [mbedtls](#)*

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_ECDSA\_C**

Elliptic Curve DSA

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_ECDH\\_C](#)*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_ECJPAKE\_C**

Elliptic curve J-PAKE

*Found in: [Component config](#) > [mbedtls](#)*

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP192R1\_ENABLED**

Enable SECP192R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP192R1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP224R1\_ENABLED**

Enable SECP224R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP224R1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP256R1\_ENABLED**

Enable SECP256R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP256R1 Elliptic Curve.

**Default value:**

- Yes (enabled)

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP384R1\_ENABLED**

Enable SECP384R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP384R1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP521R1\_ENABLED**

Enable SECP521R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP521R1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP192K1\_ENABLED**

Enable SECP192K1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP192K1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP224K1\_ENABLED**

Enable SECP224K1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP224K1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_SECP256K1\_ENABLED**

Enable SECP256K1 curve

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for SECP256K1 Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_BP256R1\_ENABLED**

Enable BP256R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

support for DP Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_BP384R1\_ENABLED**

Enable BP384R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

support for DP Elliptic Curve.

### **CONFIG\_MBEDTLS\_ECP\_DP\_BP512R1\_ENABLED**

Enable BP512R1 curve

*Found in: [Component config](#) > [mbedtls](#)*

support for DP Elliptic Curve.

**CONFIG\_MBEDTLS\_ECP\_DP\_CURVE25519\_ENABLED**

Enable CURVE25519 curve

*Found in: [Component config > mbedtls](#)*

Enable support for CURVE25519 Elliptic Curve.

**CONFIG\_MBEDTLS\_ECP\_NIST\_OPTIM**

NIST 'modulo p' optimisations

*Found in: [Component config > mbedtls](#)*

NIST 'modulo p' optimisations increase Elliptic Curve operation performance.

Disabling this option saves some code size.

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_ECP\_FIXED\_POINT\_OPTIM**

Enable fixed-point multiplication optimisations

*Found in: [Component config > mbedtls](#)*

This configuration option enables optimizations to speedup (about 3 ~ 4 times) the ECP fixed point multiplication using pre-computed tables in the flash memory. Disabling this configuration option saves flash footprint (about 29KB if all Elliptic Curve selected) in the application binary.

# end of Elliptic Curve options

**Default value:**

- Yes (enabled)

**CONFIG\_MBEDTLS\_POLY1305\_C**

Poly1305 MAC algorithm

*Found in: [Component config > mbedtls](#)*

Enable support for Poly1305 MAC algorithm.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CHACHA20\_C**

Chacha20 stream cipher

*Found in: [Component config > mbedtls](#)*

Enable support for Chacha20 stream cipher.

**Default value:**

- No (disabled)

**CONFIG\_MBEDTLS\_CHACHAPOLY\_C**

ChaCha20-Poly1305 AEAD algorithm

*Found in: [Component config > mbedtls](#) > [CONFIG\\_MBEDTLS\\_CHACHA20\\_C](#)*

Enable support for ChaCha20-Poly1305 AEAD algorithm.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_CHACHA20_C` && `CONFIG_MBEDTLS_POLY1305_C`

### **CONFIG\_MBEDTLS\_HKDF\_C**

HKDF algorithm (RFC 5869)

*Found in: [Component config](#) > [mbedtls](#)*

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_THREADING\_C**

Enable the threading abstraction layer

*Found in: [Component config](#) > [mbedtls](#)*

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

**Default value:**

- No (disabled)

### **CONFIG\_MBEDTLS\_THREADING\_ALT**

Enable threading alternate implementation

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_THREADING\\_C](#)*

Enable threading alt to allow your own alternate threading implementation.

**Default value:**

- Yes (enabled) if `CONFIG_MBEDTLS_THREADING_C`

### **CONFIG\_MBEDTLS\_THREADING\_PTHREAD**

Enable threading pthread implementation

*Found in: [Component config](#) > [mbedtls](#) > [CONFIG\\_MBEDTLS\\_THREADING\\_C](#)*

Enable the pthread wrapper layer for the threading layer.

**Default value:**

- No (disabled) if `CONFIG_MBEDTLS_THREADING_C`

### **CONFIG\_MBEDTLS\_ERROR\_STRINGS**

Enable error code to error string conversion

*Found in: [Component config](#) > [mbedtls](#)*

Enables `mbedtls_strerror()` for converting error codes to error strings. Disabling this config can save some code/rodata size as the error string conversion implementation is replaced with an empty stub.

**Default value:**

- Yes (enabled)

## CONFIG\_MBEDTLS\_USE\_CRYPTO\_ROM\_IMPL

Use ROM implementation of the crypto algorithm

*Found in: [Component config > mbedTLS](#)*

Enable this flag to use mbedtls crypto algorithm from ROM instead of ESP-IDF.

This configuration option saves flash footprint in the application binary. Note that the version of mbedtls crypto algorithm library in ROM is v2.16.12. We have done the security analysis of the mbedtls revision in ROM (v2.16.12) and ensured that affected symbols have been patched (removed). If in the future mbedtls revisions there are security issues that also affects the version in ROM (v2.16.12) then we shall patch the relevant symbols. This would increase the flash footprint and hence care must be taken to keep some reserved space for the application binary in flash layout.

**Default value:**

- No (disabled) if [CONFIG\\_IDF\\_EXPERIMENTAL\\_FEATURES](#)

## ESP-MQTT Configurations Contains:

- [CONFIG\\_MQTT\\_CUSTOM\\_OUTBOX](#)
- [CONFIG\\_MQTT\\_TRANSPORT\\_SSL](#)
- [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)
- [CONFIG\\_MQTT\\_PROTOCOL\\_311](#)
- [CONFIG\\_MQTT\\_PROTOCOL\\_5](#)
- [CONFIG\\_MQTT\\_TASK\\_CORE\\_SELECTION\\_ENABLED](#)
- [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)
- [CONFIG\\_MQTT\\_OUTBOX\\_EXPIRED\\_TIMEOUT\\_MS](#)
- [CONFIG\\_MQTT\\_REPORT\\_DELETED\\_MESSAGES](#)
- [CONFIG\\_MQTT\\_SKIP\\_PUBLISH\\_IF\\_DISCONNECTED](#)
- [CONFIG\\_MQTT\\_OUTBOX\\_DATA\\_ON\\_EXTERNAL\\_MEMORY](#)
- [CONFIG\\_MQTT\\_MSG\\_ID\\_INCREMENTAL](#)

## CONFIG\_MQTT\_PROTOCOL\_311

Enable MQTT protocol 3.1.1

*Found in: [Component config > ESP-MQTT Configurations](#)*

If not, this library will use MQTT protocol 3.1

**Default value:**

- Yes (enabled)

## CONFIG\_MQTT\_PROTOCOL\_5

Enable MQTT protocol 5.0

*Found in: [Component config > ESP-MQTT Configurations](#)*

If not, this library will not support MQTT 5.0

**Default value:**

- No (disabled)

## CONFIG\_MQTT\_TRANSPORT\_SSL

Enable MQTT over SSL

*Found in: [Component config > ESP-MQTT Configurations](#)*

Enable MQTT transport over SSL with mbedtls

**Default value:**

- Yes (enabled)

### **CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET**

Enable MQTT over Websocket

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Enable MQTT transport over Websocket.

**Default value:**

- Yes (enabled)

### **CONFIG\_MQTT\_TRANSPORT\_WEBSOCKET\_SECURE**

Enable MQTT over Websocket Secure

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)*

Enable MQTT transport over Websocket Secure.

**Default value:**

- Yes (enabled)

### **CONFIG\_MQTT\_MSG\_ID\_INCREMENTAL**

Use Incremental Message Id

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default)

**Default value:**

- No (disabled)

### **CONFIG\_MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED**

Skip publish if disconnected

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT\_SKIP\_PUBLISH\_IF\_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**

- No (disabled)

### **CONFIG\_MQTT\_REPORT\_DELETED\_MESSAGES**

Report deleted messages

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_USE\_CUSTOM\_CONFIG

MQTT Using custom configurations

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

Custom MQTT configurations.

**Default value:**

- No (disabled)

### CONFIG\_MQTT\_TCP\_DEFAULT\_PORT

Default MQTT over TCP port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over TCP port

**Default value:**

- 1883 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_SSL\_DEFAULT\_PORT

Default MQTT over SSL port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over SSL port

**Default value:**

- 8883 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_SSL](#)

### CONFIG\_MQTT\_WS\_DEFAULT\_PORT

Default MQTT over Websocket port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over Websocket port

**Default value:**

- 80 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#)

### CONFIG\_MQTT\_WSS\_DEFAULT\_PORT

Default MQTT over Websocket Secure port

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default MQTT over Websocket Secure port

**Default value:**

- 443 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET](#) && [CONFIG\\_MQTT\\_TRANSPORT\\_WEBSOCKET\\_SECURE](#)

### CONFIG\_MQTT\_BUFFER\_SIZE

Default MQTT Buffer Size

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

This buffer size using for both transmit and receive

**Default value:**

- 1024 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_TASK\_STACK\_SIZE

MQTT task stack size

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

MQTT task stack size

**Default value:**

- 6144 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_DISABLE\_API\_LOCKS

Disable API locks

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn't access MQTT API from multiple concurrent tasks

**Default value:**

- No (disabled) if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_TASK\_PRIORITY

MQTT task priority

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

MQTT task priority. Higher number denotes higher priority.

**Default value:**

- 5 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_POLL\_READ\_TIMEOUT\_MS

MQTT transport poll read timeout

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

Timeout when polling underlying transport for read.

**Default value:**

- 1000 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_EVENT\_QUEUE\_SIZE

Number of queued events.

*Found in: [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)*

A value higher than 1 enables multiple queued events.

**Default value:**

- 1 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

### CONFIG\_MQTT\_TASK\_CORE\_SELECTION\_ENABLED

Enable MQTT task core selection

*Found in: [Component config](#) > [ESP-MQTT Configurations](#)*

This will enable core selection

## CONFIG\_MQTT\_TASK\_CORE\_SELECTION

Core to use ?

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#) > [CONFIG\\_MQTT\\_TASK\\_CORE\\_SELECTION\\_ENABLED](#)

Available options:

- Core 0 (CONFIG\_MQTT\_USE\_CORE\_0)
- Core 1 (CONFIG\_MQTT\_USE\_CORE\_1)

## CONFIG\_MQTT\_OUTBOX\_DATA\_ON\_EXTERNAL\_MEMORY

Use external memory for outbox data

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Set to true to use external memory for outbox data.

**Default value:**

- No (disabled) if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

## CONFIG\_MQTT\_CUSTOM\_OUTBOX

Enable custom outbox implementation

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources: `idf_component_get_property(mqtt mqtt COMPONENT_LIB) set_property(TARGET ${mqtt} PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)`

**Default value:**

- No (disabled)

## CONFIG\_MQTT\_OUTBOX\_EXPIRED\_TIMEOUT\_MS

Outbox message expired timeout[ms]

*Found in:* [Component config](#) > [ESP-MQTT Configurations](#)

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**

- 30000 if [CONFIG\\_MQTT\\_USE\\_CUSTOM\\_CONFIG](#)

**Newlib** Contains:

- [CONFIG\\_NEWLIB\\_NANO\\_FORMAT](#)
- [CONFIG\\_NEWLIB\\_STDIN\\_LINE\\_ENDING](#)
- [CONFIG\\_NEWLIB\\_STDOUT\\_LINE\\_ENDING](#)
- [CONFIG\\_NEWLIB\\_TIME\\_SYSCALL](#)

## CONFIG\_NEWLIB\_STDOUT\_LINE\_ENDING

Line ending for UART output

*Found in:* [Component config](#) > [Newlib](#)

This option allows configuring the desired line endings sent to UART when a newline ('n', LF) appears on stdout. Three options are possible:

CRLF: whenever LF is encountered, prepend it with CR

LF: no modification is applied, stdout is sent as is

CR: each occurrence of LF is replaced with CR

This option doesn't affect behavior of the UART driver (drivers/uart.h).

Available options:

- CRLF (CONFIG\_NEWLIB\_STDOUT\_LINE\_ENDING\_CRLF)
- LF (CONFIG\_NEWLIB\_STDOUT\_LINE\_ENDING\_LF)
- CR (CONFIG\_NEWLIB\_STDOUT\_LINE\_ENDING\_CR)

### CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING

Line ending for UART input

*Found in: [Component config](#) > [Newlib](#)*

This option allows configuring which input sequence on UART produces a newline ('n', LF) on stdin. Three options are possible:

CRLF: CRLF is converted to LF

LF: no modification is applied, input is sent to stdin as is

CR: each occurrence of CR is replaced with LF

This option doesn't affect behavior of the UART driver (drivers/uart.h).

Available options:

- CRLF (CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING\_CRLF)
- LF (CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING\_LF)
- CR (CONFIG\_NEWLIB\_STDIN\_LINE\_ENDING\_CR)

### CONFIG\_NEWLIB\_NANO\_FORMAT

Enable 'nano' formatting options for printf/scanf family

*Found in: [Component config](#) > [Newlib](#)*

In most chips the ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called "nano" formatting option. This option doesn't support 64-bit integer formats and C99 features, such as positional arguments.

For more details about "nano" formatting option, please see newlib readme file, search for '--enable-newlib-nano-formatted-io': <https://sourceware.org/newlib/README>

If this option is enabled and the ROM contains functions from newlib-nano, the build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

Some chips (e.g. ESP32-C6) has the full formatting versions of printf/scanf in ROM instead of the nano versions and in this building with newlib nano might actually increase the size of the binary. Which functions are present in ROM can be seen from ROM caps: ESP\_ROM\_HAS\_NEWLIB\_NANO\_FORMAT and ESP\_ROM\_HAS\_NEWLIB\_NORMAL\_FORMAT.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

**Default value:**

- Yes (enabled)

**CONFIG\_NEWLIB\_TIME\_SYSCALL**

Timers used for gettimeofday function

*Found in: [Component config](#) > [Newlib](#)*

This setting defines which hardware timers are used to implement 'gettimeofday' and 'time' functions in C library.

- **If both high-resolution (systimer for all targets except ESP32) and RTC timers are used**, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.
- **If only high-resolution timer (systimer) is used, gettimeofday will** provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- **If only RTC timer is used, timekeeping will continue in** deep sleep, but time will be measured at 6.(6) microsecond resolution. Also the gettimeofday function itself may take longer to run.
- **If no timers are used, gettimeofday and time functions** return -1 and set errno to ENOSYS.
- **When RTC is used for timekeeping, two RTC\_STORE registers are** used to keep time in deep sleep mode.

Available options:

- RTC and high-resolution timer (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_RTC\_HRT)
- RTC (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_RTC)
- High-resolution timer (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_HRT)
- None (CONFIG\_NEWLIB\_TIME\_SYSCALL\_USE\_NONE)

**NVS** Contains:

- [CONFIG\\_NVS\\_ENCRYPTION](#)
- [CONFIG\\_NVS\\_COMPATIBLE\\_PRE\\_V4\\_3\\_ENCRYPTION\\_FLAG](#)
- [CONFIG\\_NVS\\_ASSERT\\_ERROR\\_CHECK](#)

**CONFIG\_NVS\_ENCRYPTION**

Enable NVS encryption

*Found in: [Component config](#) > [NVS](#)*

This option enables encryption for NVS. When enabled, AES-XTS is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition. This means enabling flash encryption is a pre-requisite for this feature.

**Default value:**

- Yes (enabled) if [CONFIG\\_SECURE\\_FLASH\\_ENC\\_ENABLED](#)

**CONFIG\_NVS\_COMPATIBLE\_PRE\_V4\_3\_ENCRYPTION\_FLAG**

NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in: [Component config](#) > [NVS](#)*

Enabling this will ignore "encrypted" flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have "encrypted" flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

## CONFIG\_NVS\_ASSERT\_ERROR\_CHECK

Use assertions for error checking

Found in: *Component config > NVS*

This option switches error checking type between assertions (y) or return codes (n).

**Default value:**

- No (disabled)

## OpenThread Contains:

- *CONFIG\_OPENTHREAD\_PLATFORM\_MSGPOOL\_MANAGEMENT*
- *CONFIG\_OPENTHREAD\_DEVICE\_TYPE*
- *CONFIG\_OPENTHREAD\_RADIO\_TYPE*
- *CONFIG\_OPENTHREAD\_BORDER\_ROUTER*
- *CONFIG\_OPENTHREAD\_COMMISSIONER*

- *Thread Address Query Config*
- *Thread Operational Dataset*
- *CONFIG\_OPENTHREAD\_DNS64\_CLIENT*

## CONFIG\_OPENTHREAD\_ENABLED

OpenThread

Found in: *Component config > OpenThread*

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**

- No (disabled)

### CONFIG\_OPENTHREAD\_LOG\_LEVEL\_DYNAMIC

Enable dynamic log level control

*Found in:* [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)

Select this option to enable dynamic log level control for OpenThread

**Default value:**

- Yes (enabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### CONFIG\_OPENTHREAD\_CONSOLE\_TYPE

OpenThread console type

*Found in:* [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)

Select OpenThread console type

Available options:

- OpenThread console type UART ([CONFIG\\_OPENTHREAD\\_CONSOLE\\_TYPE\\_UART](#))
- OpenThread console type USB Serial/JTAG Controller ([CONFIG\\_OPENTHREAD\\_CONSOLE\\_TYPE\\_USB\\_SERIAL\\_JTAG](#))

### CONFIG\_OPENTHREAD\_LOG\_LEVEL

OpenThread log verbosity

*Found in:* [Component config](#) > [OpenThread](#) > [CONFIG\\_OPENTHREAD\\_ENABLED](#)

Select OpenThread log level.

Available options:

- No logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_NONE](#))
- Error logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_CRIT](#))
- Warning logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_WARN](#))
- Notice logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_NOTE](#))
- Info logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_INFO](#))
- Debug logs ([CONFIG\\_OPENTHREAD\\_LOG\\_LEVEL\\_DEBG](#))

### Thread Operational Dataset

 Contains:

- [CONFIG\\_OPENTHREAD\\_NETWORK\\_EXTPANID](#)
- [CONFIG\\_OPENTHREAD\\_MESH\\_LOCAL\\_PREFIX](#)
- [CONFIG\\_OPENTHREAD\\_NETWORK\\_CHANNEL](#)
- [CONFIG\\_OPENTHREAD\\_NETWORK\\_MASTERKEY](#)
- [CONFIG\\_OPENTHREAD\\_NETWORK\\_NAME](#)
- [CONFIG\\_OPENTHREAD\\_NETWORK\\_PANID](#)
- [CONFIG\\_OPENTHREAD\\_NETWORK\\_PSKC](#)

### CONFIG\_OPENTHREAD\_NETWORK\_NAME

OpenThread network name

*Found in:* [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)

**Default value:**

- "OpenThread-ESP"

### CONFIG\_OPENTHREAD\_MESH\_LOCAL\_PREFIX

OpenThread mesh local prefix, format <address>/<plen>

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

A string in the format "<address>/<plen>", where <address> is an IPv6 address and <plen> is a prefix length. For example "fd00:db8:a0:0::/64"

**Default value:**

- "fd00:db8:a0:0::/64"

### CONFIG\_OPENTHREAD\_NETWORK\_CHANNEL

OpenThread network channel

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

**Range:**

- from 11 to 26

**Default value:**

- 15

### CONFIG\_OPENTHREAD\_NETWORK\_PANID

OpenThread network pan id

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

**Range:**

- from 0 to 0xFFFFE

**Default value:**

- "0x1234"

### CONFIG\_OPENTHREAD\_NETWORK\_EXTPANID

OpenThread extended pan id

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

The OpenThread network extended pan id in hex string format

**Default value:**

- dead00beef00cafe

### CONFIG\_OPENTHREAD\_NETWORK\_MASTERKEY

OpenThread network key

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

The OpenThread network network key in hex string format

**Default value:**

- 00112233445566778899aabbccddeeff

### CONFIG\_OPENTHREAD\_NETWORK\_PSKC

OpenThread pre-shared commissioner key

*Found in: [Component config](#) > [OpenThread](#) > [Thread Operational Dataset](#)*

The OpenThread pre-shared commissioner key in hex string format

**Default value:**

- 104810e2315100afd6bc9215a6bfac53

### CONFIG\_OPENTHREAD\_RADIO\_TYPE

Config the Thread radio type

*Found in: [Component config](#) > [OpenThread](#)*

Configure how OpenThread connects to the 15.4 radio

Available options:

- Native 15.4 radio (CONFIG\_OPENTHREAD\_RADIO\_NATIVE)  
Select this to use the native 15.4 radio.
- Connect via UART (CONFIG\_OPENTHREAD\_RADIO\_SPINEL\_UART)  
Select this to connect to a Radio Co-Processor via UART.
- Connect via SPI (CONFIG\_OPENTHREAD\_RADIO\_SPINEL\_SPI)  
Select this to connect to a Radio Co-Processor via SPI.

### CONFIG\_OPENTHREAD\_DEVICE\_TYPE

Config the Thread device type

*Found in: [Component config](#) > [OpenThread](#)*

OpenThread can be configured to different device types (FTD, MTD, Radio)

Available options:

- Full Thread Device (CONFIG\_OPENTHREAD\_FTD)  
Select this to enable Full Thread Device which can act as router and leader in a Thread network.
- Minimal Thread Device (CONFIG\_OPENTHREAD\_MTD)  
Select this to enable Minimal Thread Device which can only act as end device in a Thread network. This will reduce the code size of the OpenThread stack.
- Radio Only Device (CONFIG\_OPENTHREAD\_RADIO)  
Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

### CONFIG\_OPENTHREAD\_RCP\_TRANSPORT

The RCP transport type

*Found in: [Component config](#) > [OpenThread](#)*

Available options:

- UART RCP (CONFIG\_OPENTHREAD\_RCP\_UART)  
Select this to enable UART connection to host.
- SPI RCP (CONFIG\_OPENTHREAD\_RCP\_SPI)  
Select this to enable SPI connection to host.

### CONFIG\_OPENTHREAD\_NCP\_VENDOR\_HOOK

Enable vendor command for RCP

*Found in: [Component config](#) > [OpenThread](#)*

Select this to enable OpenThread NCP vendor commands.

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_RADIO`

### **CONFIG\_OPENTHREAD\_CLI**

Enable Openthread Command-Line Interface

*Found in: `Component config > OpenThread`*

Select this option to enable Command-Line Interface in OpenThread.

**Default value:**

- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

### **CONFIG\_OPENTHREAD\_DIAG**

Enable diag

*Found in: `Component config > OpenThread`*

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

**Default value:**

- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

### **CONFIG\_OPENTHREAD\_COMMISSIONER**

Enable Commissioner

*Found in: `Component config > OpenThread`*

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

### **CONFIG\_OPENTHREAD\_COMM\_MAX\_JOINER\_ENTRIES**

The size of max commissioning joiner entries

*Found in: `Component config > OpenThread > CONFIG_OPENTHREAD_COMMISSIONER`*

**Default value:**

- 2 if `CONFIG_OPENTHREAD_COMMISSIONER`

### **CONFIG\_OPENTHREAD\_JOINER**

Enable Joiner

*Found in: `Component config > OpenThread`*

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

### CONFIG\_OPENTHREAD\_SRP\_CLIENT

Enable SRP Client

*Found in: Component config > OpenThread*

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

**Default value:**

- Yes (enabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_SRP\_CLIENT\_MAX\_SERVICES

Specifies number of service entries in the SRP client service pool

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_SRP\_CLIENT*

Set the max buffer size of service entries in the SRP client service pool.

**Default value:**

- 5 if *CONFIG\_OPENTHREAD\_SRP\_CLIENT*

### CONFIG\_OPENTHREAD\_DNS\_CLIENT

Enable DNS Client

*Found in: Component config > OpenThread*

Select this option to enable DNS Client in OpenThread.

**Default value:**

- Yes (enabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_BORDER\_ROUTER

Enable Border Router

*Found in: Component config > OpenThread*

Select this option to enable border router features in OpenThread.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED*

### CONFIG\_OPENTHREAD\_PLATFORM\_MSGPOOL\_MANAGEMENT

Allocate message pool buffer from PSRAM

*Found in: Component config > OpenThread*

If enabled, the message pool is managed by platform defined logic.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED* && (SPIRAM\_USE\_CAPS\_ALLOC || SPIRAM\_USE\_MALLOC)

### CONFIG\_OPENTHREAD\_NUM\_MESSAGE\_BUFFERS

The number of openthread message buffers

*Found in: Component config > OpenThread*

**Default value:**

- 65 if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_SPINEL\_RX\_FRAME\_BUFFER\_SIZE**

The size of openthread spinel rx frame buffer

*Found in: Component config > OpenThread*

**Default value:**

- 2048 if *CONFIG\_OPENTHREAD\_ENABLED* || *CONFIG\_OPENTHREAD\_SPINEL\_ONLY*

**CONFIG\_OPENTHREAD\_MAC\_MAX\_CSMA\_BACKOFFS\_DIRECT**

Maximum backoffs times before declaring a channel access failure.

*Found in: Component config > OpenThread*

The maximum number of backoffs the CSMA-CA algorithm will attempt before declaring a channel access failure.

**Default value:**

- 4 if *CONFIG\_OPENTHREAD\_ENABLED* || *CONFIG\_OPENTHREAD\_SPINEL\_ONLY*

**CONFIG\_OPENTHREAD\_MLE\_MAX\_CHILDREN**

The size of max MLE children entries

*Found in: Component config > OpenThread*

**Default value:**

- 10 if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_TMF\_ADDR\_CACHE\_ENTRIES**

The size of max TMF address cache entries

*Found in: Component config > OpenThread*

**Default value:**

- 20 if *CONFIG\_OPENTHREAD\_ENABLED*

**CONFIG\_OPENTHREAD\_DNS64\_CLIENT**

Use dns64 client

*Found in: Component config > OpenThread*

Select this option to acquire NAT64 address from dns servers.

**Default value:**

- No (disabled) if *CONFIG\_OPENTHREAD\_ENABLED* && *CONFIG\_LWIP\_IPV4*

**CONFIG\_OPENTHREAD\_DNS\_SERVER\_ADDR**

DNS server address (IPv4)

*Found in: Component config > OpenThread > CONFIG\_OPENTHREAD\_DNS64\_CLIENT*

Set the DNS server IPv4 address.

**Default value:**

- "8.8.8.8" if *CONFIG\_OPENTHREAD\_DNS64\_CLIENT*

### **CONFIG\_OPENTHREAD\_UART\_BUFFER\_SIZE**

The uart received buffer size of openthread

*Found in: [Component config > OpenThread](#)*

Set the OpenThread UART buffer size.

**Default value:**

- 2048 if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### **CONFIG\_OPENTHREAD\_LINK\_METRICS**

Enable link metrics feature

*Found in: [Component config > OpenThread](#)*

Select this option to enable link metrics feature

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### **CONFIG\_OPENTHREAD\_MACFILTER\_ENABLE**

Enable mac filter feature

*Found in: [Component config > OpenThread](#)*

Select this option to enable mac filter feature

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### **CONFIG\_OPENTHREAD\_CSL\_ENABLE**

Enable CSL feature

*Found in: [Component config > OpenThread](#)*

Select this option to enable CSL feature

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

### **CONFIG\_OPENTHREAD\_XTAL\_ACCURACY**

The accuracy of the XTAL

*Found in: [Component config > OpenThread](#)*

The device's XTAL accuracy, in ppm.

**Default value:**

- 130

### **CONFIG\_OPENTHREAD\_CSL\_ACCURACY**

The current CSL rx/tx scheduling drift, in units of  $\pm$  ppm

*Found in: [Component config > OpenThread](#)*

The current accuracy of the clock used for scheduling CSL operations

**Default value:**

- 1 if [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#)

**CONFIG\_OPENTHREAD\_CSL\_UNCERTAIN**

The CSL Uncertainty in units of 10 us.

*Found in:* [Component config > OpenThread](#)

The fixed uncertainty of the Device for scheduling CSL Transmissions in units of 10 microseconds.

**Default value:**

- 1 if [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#)

**CONFIG\_OPENTHREAD\_CSL\_DEBUG\_ENABLE**

Enable CSL debug

*Found in:* [Component config > OpenThread](#)

Select this option to set rx on when sleep in CSL feature, only for debug

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_CSL\\_ENABLE](#)

**CONFIG\_OPENTHREAD\_DUA\_ENABLE**

Enable Domain Unicast Address feature

*Found in:* [Component config > OpenThread](#)

Only used for Thread1.2 certification

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

**CONFIG\_OPENTHREAD\_TIME\_SYNC**

Enable the time synchronization service feature

*Found in:* [Component config > OpenThread](#)

Select this option to enable time synchronization feature, the devices in the same Thread network could sync to the same network time.

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_ENABLED](#)

**CONFIG\_OPENTHREAD\_RADIO\_STATS\_ENABLE**

Enable Radio Statistics feature

*Found in:* [Component config > OpenThread](#)

Select this option to enable the radio statistics feature, you can use radio command to print some radio Statistics information.

**Default value:**

- No (disabled) if [CONFIG\\_OPENTHREAD\\_FTD](#) || [CONFIG\\_OPENTHREAD\\_MTD](#)

**CONFIG\_OPENTHREAD\_SPINEL\_ONLY**

Enable OpenThread External Radio Spinel feature

*Found in:* [Component config > OpenThread](#)

Select this option to enable the OpenThread Radio Spinel for external protocol stack, such as Zigbee.

**Default value:**

- No (disabled)

### CONFIG\_OPENTHREAD\_RX\_ON\_WHEN\_IDLE

Enable OpenThread radio capability rx on when idle

*Found in: Component config > OpenThread*

Select this option to enable OpenThread radio capability rx on when idle. Do not support this feature when SW coexistence is enabled.

**Default value:**

- No (disabled) if *CONFIG\_ESP\_COEX\_SW\_COEXIST\_ENABLE*

**Thread Address Query Config** Contains:

- *CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_RETRY\_DELAY*
- *CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_MAX\_RETRY\_DELAY*
- *CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_TIMEOUT*

### CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_TIMEOUT

Timeout value (in seconds) for a address notification response after sending an address query.

*Found in: Component config > OpenThread > Thread Address Query Config*

**Default value:**

- 3 if *CONFIG\_OPENTHREAD\_FTD* || *CONFIG\_OPENTHREAD\_MTD*

### CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_RETRY\_DELAY

Initial retry delay for address query (in seconds).

*Found in: Component config > OpenThread > Thread Address Query Config*

**Default value:**

- 15 if *CONFIG\_OPENTHREAD\_FTD* || *CONFIG\_OPENTHREAD\_MTD*

### CONFIG\_OPENTHREAD\_ADDRESS\_QUERY\_MAX\_RETRY\_DELAY

Maximum retry delay for address query (in seconds).

*Found in: Component config > OpenThread > Thread Address Query Config*

**Default value:**

- 120 if *CONFIG\_OPENTHREAD\_FTD* || *CONFIG\_OPENTHREAD\_MTD*

**Protocomm** Contains:

- *CONFIG\_ESP\_PROTOCOMM\_SUPPORT\_SECURITY\_VERSION\_0*
- *CONFIG\_ESP\_PROTOCOMM\_SUPPORT\_SECURITY\_VERSION\_1*
- *CONFIG\_ESP\_PROTOCOMM\_SUPPORT\_SECURITY\_VERSION\_2*

### CONFIG\_ESP\_PROTOCOMM\_SUPPORT\_SECURITY\_VERSION\_0

Support protocomm security version 0 (no security)

*Found in: Component config > Protocomm*

Enable support of security version 0. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_PROTOCOMM\_SUPPORT\_SECURITY\_VERSION\_1

Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption)

*Found in: [Component config](#) > [Protocomm](#)*

Enable support of security version 1. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**

- Yes (enabled)

### CONFIG\_ESP\_PROTOCOMM\_SUPPORT\_SECURITY\_VERSION\_2

Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption)

*Found in: [Component config](#) > [Protocomm](#)*

Enable support of security version 2. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**

- Yes (enabled)

**PThreads** Contains:

- [CONFIG\\_PTHREAD\\_TASK\\_NAME\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_CORE\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_PRIO\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_TASK\\_STACK\\_SIZE\\_DEFAULT](#)
- [CONFIG\\_PTHREAD\\_STACK\\_MIN](#)

### CONFIG\_PTHREAD\_TASK\_PRIO\_DEFAULT

Default task priority

*Found in: [Component config](#) > [PThreads](#)*

Priority used to create new tasks with default pthread parameters.

**Range:**

- from 0 to 255

**Default value:**

- 5

### CONFIG\_PTHREAD\_TASK\_STACK\_SIZE\_DEFAULT

Default task stack size

*Found in: [Component config](#) > [PThreads](#)*

Stack size used to create new tasks with default pthread parameters.

**Default value:**

- 3072

### CONFIG\_PTHREAD\_STACK\_MIN

Minimum allowed pthread stack size

*Found in: [Component config](#) > [PThreads](#)*

Minimum allowed pthread stack size set in attributes passed to pthread\_create

**Default value:**

- 768

### CONFIG\_PTHREAD\_TASK\_CORE\_DEFAULT

Default pthread core affinity

*Found in: [Component config](#) > [PThreads](#)*

The default core to which pthreads are pinned.

Available options:

- No affinity (CONFIG\_PTHREAD\_DEFAULT\_CORE\_NO\_AFFINITY)
- Core 0 (CONFIG\_PTHREAD\_DEFAULT\_CORE\_0)
- Core 1 (CONFIG\_PTHREAD\_DEFAULT\_CORE\_1)

### CONFIG\_PTHREAD\_TASK\_NAME\_DEFAULT

Default name of pthreads

*Found in: [Component config](#) > [PThreads](#)*

The default name of pthreads.

**Default value:**

- "pthread"

**SoC Settings** Contains:

- [MMU Config](#)

### MMU Config

**Main Flash configuration** Contains:

- [Optional and Experimental Features \(READ DOCS FIRST\)](#)
- [SPI Flash behavior when brownout](#)

**SPI Flash behavior when brownout** Contains:

- [CONFIG\\_SPI\\_FLASH\\_BROWNOUT\\_RESET\\_XMC](#)

### CONFIG\_SPI\_FLASH\_BROWNOUT\_RESET\_XMC

Enable sending reset when brownout for XMC flash chips

*Found in: [Component config](#) > [Main Flash configuration](#) > [SPI Flash behavior when brownout](#)*

When this option is selected, the patch will be enabled for XMC. Follow the recommended flow by XMC for better stability.

DO NOT DISABLE UNLESS YOU KNOW WHAT YOU ARE DOING.

**Optional and Experimental Features (READ DOCS FIRST)** Contains:

- `CONFIG_SPI_FLASH_HPM_DC`

### **CONFIG\_SPI\_FLASH\_HPM\_DC**

Support HPM using DC (READ DOCS FIRST)

*Found in: Component config > Main Flash configuration > Optional and Experimental Features (READ DOCS FIRST)*

This feature needs your bootloader to be compiled DC-aware (BOOT-LOADER\_FLASH\_DC\_AWARE=y). Otherwise the chip will not be able to boot after a reset.

Available options:

- Auto (Enable when bootloader support enabled (BOOT-LOADER\_FLASH\_DC\_AWARE)) (CONFIG\_SPI\_FLASH\_HPM\_DC\_AUTO)
- Disable (READ DOCS FIRST) (CONFIG\_SPI\_FLASH\_HPM\_DC\_DISABLE)

**SPI Flash driver** Contains:

- *Auto-detect flash chips*
- `CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE`
- `CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE`
- `CONFIG_SPI_FLASH_ENABLE_COUNTERS`
- `CONFIG_SPI_FLASH_ROM_DRIVER_PATCH`
- `CONFIG_SPI_FLASH_YIELD_DURING_ERASE`
- `CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED`
- `CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE`
- `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST`
- `CONFIG_SPI_FLASH_SIZE_OVERRIDE`
- `CONFIG_SPI_FLASH_ROM_IMPL`
- `CONFIG_SPI_FLASH_VERIFY_WRITE`
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`

### **CONFIG\_SPI\_FLASH\_VERIFY\_WRITE**

Verify SPI flash writes

*Found in: Component config > SPI Flash driver*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

### **CONFIG\_SPI\_FLASH\_LOG\_FAILED\_WRITE**

Log errors if verification fails

*Found in: Component config > SPI Flash driver > CONFIG\_SPI\_FLASH\_VERIFY\_WRITE*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

### **CONFIG\_SPI\_FLASH\_WARN\_SETTING\_ZERO\_TO\_ONE**

Log warning if writing zero bits to ones

*Found in: Component config > SPI Flash driver > CONFIG\_SPI\_FLASH\_VERIFY\_WRITE*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

### **CONFIG\_SPI\_FLASH\_ENABLE\_COUNTERS**

Enable operation counters

*Found in: [Component config](#) > [SPI Flash driver](#)*

This option enables the following APIs:

- `esp_flash_reset_counters`
- `esp_flash_dump_counters`
- `esp_flash_get_counters`

These APIs may be used to collect performance data for `spi_flash` APIs and to help understand behaviour of libraries which use SPI flash.

### **CONFIG\_SPI\_FLASH\_ROM\_DRIVER\_PATCH**

Enable SPI flash ROM driver patched functions

*Found in: [Component config](#) > [SPI Flash driver](#)*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

### **CONFIG\_SPI\_FLASH\_ROM\_IMPL**

Use `esp_flash` implementation in ROM

*Found in: [Component config](#) > [SPI Flash driver](#)*

Enable this flag to use new SPI flash driver functions from ROM instead of ESP-IDF.

If keeping this as "n" in your project, you will have less free IRAM. But you can use all of our flash features.

If making this as "y" in your project, you will increase free IRAM. But you may miss out on some flash features and support for new flash chips.

Currently the ROM cannot support the following features:

- `SPI_FLASH_AUTO_SUSPEND` (C3, S3)

### **CONFIG\_SPI\_FLASH\_DANGEROUS\_WRITE**

Writing to dangerous flash regions

*Found in: [Component config](#) > [SPI Flash driver](#)*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the `esp_rom_XXX` SPI flash ROM functions. These functions should not be called directly from IDF applications.

Available options:

- Aborts (`CONFIG_SPI_FLASH_DANGEROUS_WRITE_ABORTS`)
- Fails (`CONFIG_SPI_FLASH_DANGEROUS_WRITE_FAILS`)
- Allowed (`CONFIG_SPI_FLASH_DANGEROUS_WRITE_ALLOWED`)

### **CONFIG\_SPI\_FLASH\_BYPASS\_BLOCK\_ERASE**

Bypass a block erase and always do sector erase

*Found in: [Component config](#) > [SPI Flash driver](#)*

Some flash chips can have very high "max" erase times, especially for block erase (32KB or 64KB). This option allows to bypass "block erase" and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.

### **CONFIG\_SPI\_FLASH\_YIELD\_DURING\_ERASE**

Enables yield operation during flash erase

*Found in: [Component config](#) > [SPI Flash driver](#)*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks. Please use this configuration together with `SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS` and `SPI\_FLASH\_ERASE\_YIELD\_TICKS` after carefully checking flash datasheet to avoid a watchdog timeout. For more information, please check *SPI Flash API* reference documentation under section *OS Function*.

### **CONFIG\_SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS**

Duration of erasing to yield CPUs (ms)

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_YIELD\\_DURING\\_ERASE](#)*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

### **CONFIG\_SPI\_FLASH\_ERASE\_YIELD\_TICKS**

CPU release time (tick) for an erase operation

*Found in: [Component config](#) > [SPI Flash driver](#) > [CONFIG\\_SPI\\_FLASH\\_YIELD\\_DURING\\_ERASE](#)*

Defines how many ticks will be before returning to continue a erasing.

### **CONFIG\_SPI\_FLASH\_WRITE\_CHUNK\_SIZE**

Flash write chunk size

*Found in: [Component config](#) > [SPI Flash driver](#)*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

### CONFIG\_SPI\_FLASH\_SIZE\_OVERRIDE

Override flash size in bootloader header by ESPTOOLPY\_FLASHSIZE

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY\_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

### CONFIG\_SPI\_FLASH\_CHECK\_ERASE\_TIMEOUT\_DISABLED

Flash timeout checkout disabled

*Found in: Component config > SPI Flash driver*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

### CONFIG\_SPI\_FLASH\_OVERRIDE\_CHIP\_DRIVER\_LIST

Override default chip driver list

*Found in: Component config > SPI Flash driver*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.

When this option is enabled, the default list is no longer compiled or linked. Instead, the *default\_registered\_chips* structure must be provided by the user.

See example: `custom_chip_driver` under `examples/storage` for more details.

#### Auto-detect flash chips Contains:

- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_BOYA\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_GD\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_ISSI\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_MXIC\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_TH\\_CHIP](#)
- [CONFIG\\_SPI\\_FLASH\\_SUPPORT\\_WINBOND\\_CHIP](#)

### CONFIG\_SPI\_FLASH\_SUPPORT\_ISSI\_CHIP

ISSI

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

### CONFIG\_SPI\_FLASH\_SUPPORT\_MXIC\_CHIP

MXIC

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

### CONFIG\_SPI\_FLASH\_SUPPORT\_GD\_CHIP

GigaDevice

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip\_drv` member of the chip struct. If you are using Wrover modules, please don't disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

### CONFIG\_SPI\_FLASH\_SUPPORT\_WINBOND\_CHIP

Winbond

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

### CONFIG\_SPI\_FLASH\_SUPPORT\_BOYA\_CHIP

BOYA

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

### CONFIG\_SPI\_FLASH\_SUPPORT\_TH\_CHIP

TH

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of TH chips if chip vendor not directly given by `chip\_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

### CONFIG\_SPI\_FLASH\_ENABLE\_ENCRYPTED\_READ\_WRITE

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

### SPIFFS Configuration Contains:

- *Debug Configuration*
- *CONFIG\_SPIFFS\_USE\_MAGIC*
- *CONFIG\_SPIFFS\_GC\_STATS*
- *CONFIG\_SPIFFS\_PAGE\_CHECK*
- *CONFIG\_SPIFFS\_FOLLOW\_SYMLINKS*
- *CONFIG\_SPIFFS\_MAX\_PARTITIONS*
- *CONFIG\_SPIFFS\_USE\_MTIME*
- *CONFIG\_SPIFFS\_GC\_MAX\_RUNS*
- *CONFIG\_SPIFFS\_OBJ\_NAME\_LEN*
- *CONFIG\_SPIFFS\_META\_LENGTH*

- [SPIFFS Cache Configuration](#)
- [CONFIG\\_SPIFFS\\_PAGE\\_SIZE](#)
- [CONFIG\\_SPIFFS\\_MTIME\\_WIDE\\_64\\_BITS](#)

### CONFIG\_SPIFFS\_MAX\_PARTITIONS

Maximum Number of Partitions

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Define maximum number of partitions that can be mounted.

**Range:**

- from 1 to 10

**Default value:**

- 3

**SPIFFS Cache Configuration** Contains:

- [CONFIG\\_SPIFFS\\_CACHE](#)

### CONFIG\_SPIFFS\_CACHE

Enable SPIFFS Cache

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#)*

Enables/disable memory read caching of nucleus file system operations.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_CACHE\_WR

Enable SPIFFS Write Caching

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#) > [CONFIG\\_SPIFFS\\_CACHE](#)*

Enables memory write caching for file descriptors in hydrogen.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_CACHE\_STATS

Enable SPIFFS Cache Statistics

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [SPIFFS Cache Configuration](#) > [CONFIG\\_SPIFFS\\_CACHE](#)*

Enable/disable statistics on caching. Debug/test purpose only.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_PAGE\_CHECK

Enable SPIFFS Page Check

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**Default value:**

- Yes (enabled)

**CONFIG\_SPIFFS\_GC\_MAX\_RUNS**

Set Maximum GC Runs

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Define maximum number of GC runs to perform to reach desired free pages.

**Range:**

- from 1 to 10000

**Default value:**

- 10

**CONFIG\_SPIFFS\_GC\_STATS**

Enable SPIFFS GC Statistics

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Enable/disable statistics on gc. Debug/test purpose only.

**Default value:**

- No (disabled)

**CONFIG\_SPIFFS\_PAGE\_SIZE**

SPIFFS logical page size

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**Range:**

- from 256 to 1024

**Default value:**

- 256

**CONFIG\_SPIFFS\_OBJ\_NAME\_LEN**

Set SPIFFS Maximum Name Length

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS\_OBJ\_NAME\_LEN - 1.

SPIFFS\_OBJ\_NAME\_LEN + SPIFFS\_META\_LENGTH should not exceed SPIFFS\_PAGE\_SIZE - 64.

**Range:**

- from 1 to 256

**Default value:**

- 32

### CONFIG\_SPIFFS\_FOLLOW\_SYMLINKS

Enable symbolic links for image creation

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_USE\_MAGIC

Enable SPIFFS Filesystem Magic

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_USE\_MAGIC\_LENGTH

Enable SPIFFS Filesystem Length Magic

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [CONFIG\\_SPIFFS\\_USE\\_MAGIC](#)*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_META\_LENGTH

Size of per-file metadata field

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

$SPIFFS\_OBJ\_NAME\_LEN + SPIFFS\_META\_LENGTH$  should not exceed  $SPIFFS\_PAGE\_SIZE - 64$ .

**Default value:**

- 4

### CONFIG\_SPIFFS\_USE\_MTIME

Save file modification time

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**Default value:**

- Yes (enabled)

### CONFIG\_SPIFFS\_MTIME\_WIDE\_64\_BITS

The time field occupies 64 bits in the image instead of 32 bits

*Found in: [Component config](#) > [SPIFFS Configuration](#)*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS\_META\_LENGTH. If the chip already has the spiffs image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with 64-bit time\_t support.

**Default value:**

- No (disabled) if [CONFIG\\_SPIFFS\\_META\\_LENGTH](#) >= 8

### Debug Configuration

 Contains:

- [CONFIG\\_SPIFFS\\_DBG](#)
- [CONFIG\\_SPIFFS\\_API\\_DBG](#)
- [CONFIG\\_SPIFFS\\_CACHE\\_DBG](#)
- [CONFIG\\_SPIFFS\\_CHECK\\_DBG](#)
- [CONFIG\\_SPIFFS\\_TEST\\_VISUALISATION](#)
- [CONFIG\\_SPIFFS\\_GC\\_DBG](#)

### CONFIG\_SPIFFS\_DBG

Enable general SPIFFS debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print general debug messages to the console.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_API\_DBG

Enable SPIFFS API debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print API debug messages to the console.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_GC\_DBG

Enable SPIFFS Garbage Cleaner debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print GC debug messages to the console.

**Default value:**

- No (disabled)

### CONFIG\_SPIFFS\_CACHE\_DBG

Enable SPIFFS Cache debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print cache debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_CHECK\_DBG**

Enable SPIFFS Filesystem Check debug

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enabling this option will print Filesystem Check debug messages to the console.

**Default value:**

- No (disabled)

### **CONFIG\_SPIFFS\_TEST\_VISUALISATION**

Enable SPIFFS Filesystem Visualization

*Found in: [Component config](#) > [SPIFFS Configuration](#) > [Debug Configuration](#)*

Enable this option to enable SPIFFS\_vis function in the API.

**Default value:**

- No (disabled)

**TCP Transport** Contains:

- [Websocket](#)

**Websocket** Contains:

- [CONFIG\\_WS\\_TRANSPORT](#)

### **CONFIG\_WS\_TRANSPORT**

Enable Websocket Transport

*Found in: [Component config](#) > [TCP Transport](#) > [Websocket](#)*

Enable support for creating websocket transport.

**Default value:**

- Yes (enabled)

### **CONFIG\_WS\_BUFFER\_SIZE**

Websocket transport buffer size

*Found in: [Component config](#) > [TCP Transport](#) > [Websocket](#) > [CONFIG\\_WS\\_TRANSPORT](#)*

Size of the buffer used for constructing the HTTP Upgrade request during connect

**Default value:**

- 1024

### **CONFIG\_WS\_DYNAMIC\_BUFFER**

Using dynamic websocket transport buffer

*Found in: [Component config](#) > [TCP Transport](#) > [Websocket](#) > [CONFIG\\_WS\\_TRANSPORT](#)*

If enable this option, websocket transport buffer will be freed after connection succeed to save more heap.

**Default value:**

- No (disabled)

**Ultra Low Power (ULP) Co-processor** Contains:

- [CONFIG\\_ULP\\_COPROC\\_ENABLED](#)
- [ULP RISC-V Settings](#)

### CONFIG\_ULP\_COPROC\_ENABLED

Enable Ultra Low Power (ULP) Co-processor

*Found in:* [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#)

Enable this feature if you plan to use the ULP Co-processor. Once this option is enabled, further ULP co-processor configuration will appear in the menu.

**Default value:**

- No (disabled) if `SOC_ULP_SUPPORTED || SOC_RISCV_COPROC_SUPPORTED || SOC_LP_CORE_SUPPORTED`

### CONFIG\_ULP\_COPROC\_TYPE

ULP Co-processor type

*Found in:* [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [CONFIG\\_ULP\\_COPROC\\_ENABLED](#)

Choose the ULP Coprocessor type: ULP FSM (Finite State Machine) or ULP RISC-V.

Available options:

- ULP FSM (Finite State Machine) (`CONFIG_ULP_COPROC_TYPE_FSM`)
- ULP RISC-V (`CONFIG_ULP_COPROC_TYPE_RISCV`)
- LP core RISC-V (`CONFIG_ULP_COPROC_TYPE_LP_CORE`)

### CONFIG\_ULP\_COPROC\_RESERVE\_MEM

RTC slow memory reserved for coprocessor

*Found in:* [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [CONFIG\\_ULP\\_COPROC\\_ENABLED](#)

Bytes of memory to reserve for ULP Co-processor firmware & data. Data is reserved at the beginning of RTC slow memory.

**Range:**

- from 32 to 8176 if `CONFIG_ULP_COPROC_ENABLED && (SOC_ULP_SUPPORTED || SOC_RISCV_COPROC_SUPPORTED || SOC_LP_CORE_SUPPORTED)`

**Default value:**

- 4096 if `CONFIG_ULP_COPROC_ENABLED && (SOC_ULP_SUPPORTED || SOC_RISCV_COPROC_SUPPORTED || SOC_LP_CORE_SUPPORTED)`

**ULP RISC-V Settings** Contains:

- [CONFIG\\_ULP\\_RISCV\\_UART\\_BAUDRATE](#)
- [CONFIG\\_ULP\\_RISCV\\_I2C\\_RW\\_TIMEOUT](#)

**CONFIG\_ULP\_RISCV\_UART\_BAUDRATE**

Baudrate used by the bitbanged ULP RISC-V UART driver

*Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [ULP RISC-V Settings](#)*

The accuracy of the bitbanged UART driver is limited, it is not recommend to increase the value above 19200.

**Default value:**

- 9600 if `CONFIG_ULP_COPROC_TYPE_RISCV` && (SOC\_ULP\_SUPPORTED || SOC\_RISCV\_COPROC\_SUPPORTED || SOC\_LP\_CORE\_SUPPORTED)

**CONFIG\_ULP\_RISCV\_I2C\_RW\_TIMEOUT**

Set timeout for ULP RISC-V I2C transaction timeout in ticks.

*Found in: [Component config](#) > [Ultra Low Power \(ULP\) Co-processor](#) > [ULP RISC-V Settings](#)*

Set the ULP RISC-V I2C read/write timeout. Set this value to -1 if the ULP RISC-V I2C read and write APIs should wait forever. Please note that the tick rate of the ULP co-processor would be different than the OS tick rate of the main core and therefore can have different timeout value depending on which core the API is invoked on.

**Range:**

- from -1 to 4294967295 if `CONFIG_ULP_COPROC_TYPE_RISCV` && (SOC\_ULP\_SUPPORTED || SOC\_RISCV\_COPROC\_SUPPORTED || SOC\_LP\_CORE\_SUPPORTED)

**Default value:**

- 500 if `CONFIG_ULP_COPROC_TYPE_RISCV` && (SOC\_ULP\_SUPPORTED || SOC\_RISCV\_COPROC\_SUPPORTED || SOC\_LP\_CORE\_SUPPORTED)

**Unity unit testing library** Contains:

- `CONFIG_UNITY_ENABLE_COLOR`
- `CONFIG_UNITY_ENABLE_IDF_TEST_RUNNER`
- `CONFIG_UNITY_ENABLE_FIXTURE`
- `CONFIG_UNITY_ENABLE_BACKTRACE_ON_FAIL`
- `CONFIG_UNITY_ENABLE_64BIT`
- `CONFIG_UNITY_ENABLE_DOUBLE`
- `CONFIG_UNITY_ENABLE_FLOAT`

**CONFIG\_UNITY\_ENABLE\_FLOAT**

Support for float type

*Found in: [Component config](#) > [Unity unit testing library](#)*

If not set, assertions on float arguments will not be available.

**Default value:**

- Yes (enabled)

**CONFIG\_UNITY\_ENABLE\_DOUBLE**

Support for double type

*Found in: [Component config](#) > [Unity unit testing library](#)*

If not set, assertions on double arguments will not be available.

**Default value:**

- Yes (enabled)

### CONFIG\_UNITY\_ENABLE\_64BIT

Support for 64-bit integer types

*Found in: [Component config](#) > [Unity unit testing library](#)*

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to UNITY\_ASSERT\_EQUAL, as that will cause pointer-to-int-cast warnings.

**Default value:**

- No (disabled)

### CONFIG\_UNITY\_ENABLE\_COLOR

Colorize test output

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, Unity will colorize test results using console escape sequences.

**Default value:**

- No (disabled)

### CONFIG\_UNITY\_ENABLE\_IDF\_TEST\_RUNNER

Include ESP-IDF test registration/running helpers

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, then the following features will be available:

- TEST\_CASE macro which performs automatic registration of test functions
- Functions to run registered test functions: `unity_run_all_tests`, `unity_run_tests_with_filter`, `unity_run_single_test_by_name`.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via `unity_run_menu` function.

Disable if a different test registration mechanism is used.

**Default value:**

- Yes (enabled)

### CONFIG\_UNITY\_ENABLE\_FIXTURE

Include Unity test fixture

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, `unity_fixture.h` header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**

- No (disabled)

### CONFIG\_UNITY\_ENABLE\_BACKTRACE\_ON\_FAIL

Print a backtrace when a unit test fails

*Found in: [Component config](#) > [Unity unit testing library](#)*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as `TEST_ASSERT`, `TEST_FAIL` etc.

**Default value:**

- No (disabled)

**USB-OTG** Contains:

- [CONFIG\\_USB\\_HOST\\_ENABLE\\_ENUM\\_FILTER\\_CALLBACK](#)
- [CONFIG\\_USB\\_HOST\\_HW\\_BUFFER\\_BIAS](#)
- [CONFIG\\_USB\\_HOST\\_CONTROL\\_TRANSFER\\_MAX\\_SIZE](#)
- *Root Hub configuration*
- [CONFIG\\_USB\\_HOST\\_EXT\\_HUB\\_SUPPORT](#)

**CONFIG\_USB\_HOST\_CONTROL\_TRANSFER\_MAX\_SIZE**

Largest size (in bytes) of transfers to/from default endpoints

*Found in: Component config > USB-OTG*

Each USB device attached is allocated a dedicated buffer for its OUT/IN transfers to/from the device's control endpoint. The maximum size of that buffer is determined by this option. The limited size of the transfer buffer have the following implications: - The maximum length of control transfers is limited - Device's with configuration descriptors larger than this limit cannot be supported

**Default value:**

- 256 if SOC\_USB\_OTG\_SUPPORTED

**CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS**

Hardware FIFO size biasing

*Found in: Component config > USB-OTG*

The underlying hardware has size adjustable FIFOs to cache USB packets on reception (IN) or for transmission (OUT). The size of these FIFOs will affect the largest MPS (maximum packet size) and the maximum number of packets that can be cached at any one time. The hardware contains the following FIFOs: RX (for all IN packets), Non-periodic TX (for Bulk and Control OUT packets), and Periodic TX (for Interrupt and Isochronous OUT packets). This configuration option allows biasing the FIFO sizes towards a particular use case, which may be necessary for devices that have endpoints with large MPS. The MPS limits for each biasing are listed below:

Balanced: - IN (all transfer types), 408 bytes - OUT non-periodic (Bulk/Control), 192 bytes (i.e., 3 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 192 bytes

Bias IN: - IN (all transfer types), 600 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 128 bytes

Bias Periodic OUT: - IN (all transfer types), 128 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 600 bytes

Available options:

- Balanced (CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS\_BALANCED)
- Bias IN (CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS\_IN)
- Periodic OUT (CONFIG\_USB\_HOST\_HW\_BUFFER\_BIAS\_PERIODIC\_OUT)

**Root Hub configuration** Contains:

- [CONFIG\\_USB\\_HOST\\_DEBOUNCE\\_DELAY\\_MS](#)
- [CONFIG\\_USB\\_HOST\\_RESET\\_HOLD\\_MS](#)
- [CONFIG\\_USB\\_HOST\\_RESET\\_RECOVERY\\_MS](#)
- [CONFIG\\_USB\\_HOST\\_SET\\_ADDR\\_RECOVERY\\_MS](#)

### CONFIG\_USB\_HOST\_DEBOUNCE\_DELAY\_MS

Debounce delay in ms

*Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)*

On connection of a USB device, the USB 2.0 specification requires a "debounce interval with a minimum duration of 100ms" to allow the connection to stabilize (see USB 2.0 chapter 7.1.7.3 for more details). During the debounce interval, no new connection/disconnection events are registered.

The default value is set to 250 ms to be safe.

**Default value:**

- 250 if SOC\_USB\_OTG\_SUPPORTED

### CONFIG\_USB\_HOST\_RESET\_HOLD\_MS

Reset hold in ms

*Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)*

The reset signaling can be generated on any Hub or Host Controller port by request from the USB System Software. The USB 2.0 specification requires that "the reset signaling must be driven for a minimum of 10ms" (see USB 2.0 chapter 7.1.7.5 for more details). After the reset, the hub port will transition to the Enabled state (refer to Section 11.5).

The default value is set to 30 ms to be safe.

**Default value:**

- 30 if SOC\_USB\_OTG\_SUPPORTED

### CONFIG\_USB\_HOST\_RESET\_RECOVERY\_MS

Reset recovery delay in ms

*Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)*

After a port stops driving the reset signal, the USB 2.0 specification requires that the "USB System Software guarantees a minimum of 10 ms for reset recovery" before the attached device is expected to respond to data transfers (see USB 2.0 chapter 7.1.7.3 for more details). The device may ignore any data transfers during the recovery interval.

The default value is set to 30 ms to be safe.

**Default value:**

- 30 if SOC\_USB\_OTG\_SUPPORTED

### CONFIG\_USB\_HOST\_SET\_ADDR\_RECOVERY\_MS

SetAddress() recovery time in ms

*Found in: [Component config](#) > [USB-OTG](#) > [Root Hub configuration](#)*

"After successful completion of the Status stage, the device is allowed a SetAddress() recovery interval of 2 ms. At the end of this interval, the device must be able to accept Setup packets addressed to the new address. Also, at the end of the recovery interval, the device must not respond to tokens sent to the old address (unless, of course, the old and new address is the same)." See USB 2.0 chapter 9.2.6.3 for more details.

The default value is set to 10 ms to be safe.

**Default value:**

- 10 if SOC\_USB\_OTG\_SUPPORTED

## CONFIG\_USB\_HOST\_ENABLE\_ENUM\_FILTER\_CALLBACK

Enable enumeration filter callback

*Found in:* [Component config](#) > [USB-OTG](#)

The enumeration filter callback is called before enumeration of each newly attached device. This callback allows users to control whether a device should be enumerated, and what configuration number to use when enumerating a device.

If enabled, the enumeration filter callback can be set via 'usb\_host\_config\_t' when calling 'usb\_host\_install()'.

### Default value:

- No (disabled) if SOC\_USB\_OTG\_SUPPORTED

## CONFIG\_USB\_HOST\_EXT\_HUB\_SUPPORT

Support USB HUB (Experimental)

*Found in:* [Component config](#) > [USB-OTG](#)

Feature is under development.

### Default value:

- No (disabled) if [CONFIG\\_IDF\\_EXPERIMENTAL\\_FEATURES](#) &&  
SOC\_USB\_OTG\_SUPPORTED

**Virtual file system** Contains:

- [CONFIG\\_VFS\\_SUPPORT\\_IO](#)

## CONFIG\_VFS\_SUPPORT\_IO

Provide basic I/O functions

*Found in:* [Component config](#) > [Virtual file system](#)

If enabled, the following functions are provided by the VFS component.

open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:

close, read, write, ioctl, fcntl.

### Default value:

- Yes (enabled)

## CONFIG\_VFS\_SUPPORT\_DIR

Provide directory related functions

*Found in:* [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)

If enabled, the following functions are provided by the VFS component.

stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir\_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

**Default value:**

- Yes (enabled)

**CONFIG\_VFS\_SUPPORT\_SELECT**

Provide select function

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)*

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for "select" on UART file descriptors is not required.

**CONFIG\_VFS\_SUPPRESS\_SELECT\_DEBUG\_OUTPUT**

Suppress select() related debug outputs

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#) > [CONFIG\\_VFS\\_SUPPORT\\_SELECT](#)*

Select() related functions might produce an unconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

**Default value:**

- Yes (enabled)

**CONFIG\_VFS\_SELECT\_IN\_RAM**

Make VFS driver select() callbacks IRAM-safe

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#) > [CONFIG\\_VFS\\_SUPPORT\\_SELECT](#)*

If enabled, VFS driver select() callback function will be placed in IRAM.

**Default value:**

- No (disabled)

**CONFIG\_VFS\_SUPPORT\_TERMIOS**

Provide termios.h functions

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)*

Disabling this option can save memory when the support for termios.h is not required.

**Default value:**

- Yes (enabled)

**CONFIG\_VFS\_MAX\_COUNT**

Maximum Number of Virtual Filesystems

*Found in: [Component config](#) > [Virtual file system](#) > [CONFIG\\_VFS\\_SUPPORT\\_IO](#)*

Define maximum number of virtual filesystems that can be registered.

**Range:**

- from 1 to 20

**Default value:**

- 8

**Host File System I/O (Semihosting)** Contains:

- [CONFIG\\_VFS\\_SEMIHOSTFS\\_MAX\\_MOUNT\\_POINTS](#)

### **CONFIG\_VFS\_SEMIHOSTFS\_MAX\_MOUNT\_POINTS**

Host FS: Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > CONFIG\_VFS\_SUPPORT\_IO > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.

**Default value:**

- 1

**Wear Levelling** Contains:

- [CONFIG\\_WL\\_SECTOR\\_MODE](#)
- [CONFIG\\_WL\\_SECTOR\\_SIZE](#)

### **CONFIG\_WL\_SECTOR\_SIZE**

Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

Available options:

- 512 (CONFIG\_WL\_SECTOR\_SIZE\_512)
- 4096 (CONFIG\_WL\_SECTOR\_SIZE\_4096)

### **CONFIG\_WL\_SECTOR\_MODE**

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

Available options:

- Performance (CONFIG\_WL\_SECTOR\_MODE\_PERF)
- Safety (CONFIG\_WL\_SECTOR\_MODE\_SAFE)

**Wi-Fi Provisioning Manager** Contains:

- `CONFIG_WIFI_PROV_BLE_BONDING`
- `CONFIG_WIFI_PROV_BLE_SEC_CONN`
- `CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION`
- `CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV`
- `CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES`
- `CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT`
- `CONFIG_WIFI_PROV_STA_SCAN_METHOD`

**CONFIG\_WIFI\_PROV\_SCAN\_MAX\_ENTRIES**

Max Wi-Fi Scan Result Entries

*Found in: Component config > Wi-Fi Provisioning Manager*

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager

**Range:**

- from 1 to 255

**Default value:**

- 16

**CONFIG\_WIFI\_PROV\_AUTOSTOP\_TIMEOUT**

Provisioning auto-stop timeout

*Found in: Component config > Wi-Fi Provisioning Manager*

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

**Range:**

- from 5 to 600

**Default value:**

- 30

**CONFIG\_WIFI\_PROV\_BLE\_BONDING**

Enable BLE bonding

*Found in: Component config > Wi-Fi Provisioning Manager*

This option is applicable only when provisioning transport is BLE.

**CONFIG\_WIFI\_PROV\_BLE\_SEC\_CONN**

Enable BLE Secure connection flag

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enable Secure connection support when provisioning transport is BLE.

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG\_WIFI\_PROV\_BLE\_FORCE\_ENCRYPTION**

Force Link Encryption during characteristic Read / Write

*Found in: Component config > Wi-Fi Provisioning Manager*

Used to enforce link encryption when attempting to read / write characteristic

### CONFIG\_WIFI\_PROV\_KEEP\_BLE\_ON\_AFTER\_PROV

Keep BT on after provisioning is done

Found in: *Component config > Wi-Fi Provisioning Manager*

### CONFIG\_WIFI\_PROV\_DISCONNECT\_AFTER\_PROV

Terminate connection after provisioning is done

Found in: *Component config > Wi-Fi Provisioning Manager > CONFIG\_WIFI\_PROV\_KEEP\_BLE\_ON\_AFTER\_PROV*

**Default value:**

- Yes (enabled) if *CONFIG\_WIFI\_PROV\_KEEP\_BLE\_ON\_AFTER\_PROV*

### CONFIG\_WIFI\_PROV\_STA\_SCAN\_METHOD

Wifi Provisioning Scan Method

Found in: *Component config > Wi-Fi Provisioning Manager*

Available options:

- All Channel Scan (*CONFIG\_WIFI\_PROV\_STA\_ALL\_CHANNEL\_SCAN*)  
Scan will end after scanning the entire channel. This option is useful in Mesh WiFi Systems.
- Fast Scan (*CONFIG\_WIFI\_PROV\_STA\_FAST\_SCAN*)  
Scan will end after an AP matching with the SSID has been detected.

### CONFIG\_IDF\_EXPERIMENTAL\_FEATURES

Make experimental features visible

Found in:

By enabling this option, ESP-IDF experimental feature options will be visible.

Note you should still enable a certain experimental feature option to use it, and you should read the corresponding risk warning and known issue list carefully.

**Default value:**

- No (disabled)

### Deprecated options and their replacements

- **CONFIG\_A2D\_INITIAL\_TRACE\_LEVEL** (*CONFIG\_BT\_LOG\_A2D\_TRACE\_LEVEL*)
  - CONFIG\_A2D\_TRACE\_LEVEL\_NONE
  - CONFIG\_A2D\_TRACE\_LEVEL\_ERROR
  - CONFIG\_A2D\_TRACE\_LEVEL\_WARNING
  - CONFIG\_A2D\_TRACE\_LEVEL\_API
  - CONFIG\_A2D\_TRACE\_LEVEL\_EVENT
  - CONFIG\_A2D\_TRACE\_LEVEL\_DEBUG
  - CONFIG\_A2D\_TRACE\_LEVEL\_VERBOSE
- **CONFIG\_ADC2\_DISABLE\_DAC** (*CONFIG\_ADC\_DISABLE\_DAC*)
- **CONFIG\_APPL\_INITIAL\_TRACE\_LEVEL** (*CONFIG\_BT\_LOG\_APPL\_TRACE\_LEVEL*)
  - CONFIG\_APPL\_TRACE\_LEVEL\_NONE
  - CONFIG\_APPL\_TRACE\_LEVEL\_ERROR
  - CONFIG\_APPL\_TRACE\_LEVEL\_WARNING
  - CONFIG\_APPL\_TRACE\_LEVEL\_API

- CONFIG\_APPL\_TRACE\_LEVEL\_EVENT
- CONFIG\_APPL\_TRACE\_LEVEL\_DEBUG
- CONFIG\_APPL\_TRACE\_LEVEL\_VERBOSE
